Introduction

Dell OpenManage™ Server Administrator produces event messages stored primarily in the operating system or Server Administrator event logs and sometimes in SNMP traps. This document describes the event messages created by Server Administrator version 2.0 or later and displayed in the Server Administrator Alert log.

Server Administrator creates events in response to sensor status changes and other monitored parameters. The Server Administrator event monitor uses these status change events to add descriptive messages to the operating system event log or the Server Administrator Alert log.

Each event message that Server Administrator adds to the alert log consists of a unique identifier called the event ID for a specific event source category and a descriptive message. The event message includes the severity, cause of the event, and other relevant information, such as the event location and the monitored item's previous state.

Tables provided in this guide list all Server Administrator event IDs in numeric order. Each entry includes the event ID's corresponding description, severity level, and cause. Message text in angle brackets (for example, *<State>*) describes the event-specific information provided by the Server Administrator.

What's New in this Release

The following changes in Server Administrator are documented in this guide:

- Support for additional Storage Management messages
- Removed support for Novell® NetWare®

Messages Not Described in This Guide

This guide describes only event messages created by Server Administrator and displayed in the Server Administrator Alert log. For information on other messages produced by your system, consult one of the following sources:

- Your system's Installation and Troubleshooting Guide
- Other system documentation
- Operating system documentation
- Application program documentation

For more information on Array Manager event messages, see the Array Manager documentation.

Understanding Event Messages

This section describes the various types of event messages generated by the Server Administrator. When an event occurs on your system, the Server Administrator sends information about one of the following event types to the systems management console:

Table 1-1. Understanding Event Messages

lcon	Alert Severity	Component Status
⊘	OK/Normal	An event that describes the successful operation of a unit. The alert is provided for informational purposes and does not indicate an error condition. For example, the alert may indicate the normal start or stop of an operation, such as power supply or a sensor reading returning to normal.
Warning/Non-critical problem. For example, a Warning/Non-critical alert r		An event that is not necessarily significant, but may indicate a possible future problem. For example, a Warning/Non-critical alert may indicate that a component (such as a temperature probe in an enclosure) has crossed a warning threshold.
*	Critical/Failure/Error	A significant event that indicates actual or imminent loss of data or loss of function. For example, crossing a failure threshold or a hardware failure such as an array disk.

Server Administrator generates events based on status changes in the following sensors:

- Temperature Sensor Helps protect critical components by alerting the systems management console when temperatures become too high inside a chassis; also monitors a variety of locations in the chassis and in any attached systems.
- Fan Sensor Monitors fans in various locations in the chassis and in any attached systems.
- Voltage Sensor Monitors voltages across critical components in various chassis locations and in any attached systems.
- Current Sensor Monitors the current (or amperage) output from the power supply (or supplies) in the chassis and in any attached systems.
- Chassis Intrusion Sensor Monitors intrusion into the chassis and any attached systems.
- Redundancy Unit Sensor Monitors redundant units (critical units such as fans, AC power cords, or power supplies) within the chassis; also monitors the chassis and any attached systems. For example, redundancy allows a second or *n*th fan to keep the chassis components at a safe temperature when another fan has failed. Redundancy is normal when the intended number of critical components are operating. Redundancy is degraded when a component fails, but others are still operating. Redundancy is lost when there is one less critical redundancy device than required.
- Power Supply Sensor Monitors power supplies in the chassis and in any attached systems.
- Memory Prefailure Sensor Monitors memory modules by counting the number of Error Correction Code (ECC) memory corrections.

- Fan Enclosure Sensor Monitors protective fan enclosures by detecting their removal from and insertion into the system, and by measuring how long a fan enclosure is absent from the chassis. This sensor monitors the chassis and any attached systems.
- AC Power Cord Sensor Monitors the presence of AC power for an AC power cord.
- **Hardware Log Sensor** Monitors the size of a hardware log.
- **Processor Sensor** Monitors the processor status in the system.
- Pluggable Device Sensor Monitors the addition, removal, or configuration errors for some pluggable devices, such as memory cards.

Sample Event Message Text

The following example shows the format of the event messages logged by Server Administrator.

EventID: 1000

Source: Server Administrator

Category: Instrumentation Service

Type: Information

Date and Time: Wed Mar 15 10:38:00 2006

Computer: <computer name>

Description:

Server Administrator starting

Data: Bytes in Hex

Viewing Alerts and Event Messages

An event log is used to record information about important events.

Storage Management generates alerts that are added to the Microsoft[®] Windows[®] application alert log and to the Server Administrator Alert log. To view these alerts in Server Administrator:

- **1** Select the **System** object in the tree view.
- **2** Select the **Logs** tab.
- **3** Select the **Alert** subtab.

You can also view the event log using your operating system's event viewer. Each operating system's event viewer accesses the applicable operating system event log.

The location of the event log file depends on the operating system you are using.

- In the Microsoft Windows 2000 Advanced Server and Windows Server[®] 2003 operating systems, messages are logged to the system event log and optionally to a unicode text file, dcsys32.log (viewable using Notepad), that is located in the install path\oma\log directory. The default install path is C:\Program Files\Dell\SysMgt.
- In the Red Hat[®] Enterprise Linux operating system, messages are logged to the system log file. The default name of the system log file is /var/log/messages. You can view the messages file using a text editor such as vi or emacs.

NOTE: Logging messages to a unicode text file is optional. By default, the feature is disabled. To enable this feature, modify the Event Manager section of the dcemdy32.ini file as follows:

- In Windows, locate the file at install_path\dataeng\ini and set UnitextLog.enabled=True. The default install_path is C:\Program Files\Dell\SysMgt. Restart the Systems Management Event Manager service.
- In Red Hat Enterprise Linux, locate the file at install_path/dataeng/ini and set UnitextLog.enabled=True. The default install path is opt/dell/syradmin. Issue the service dataeng restart command to restart the systems management event manager service. This will also restart the systems management data manager and SNMP services.

The following subsections explain the procedure to open the Windows 2000 Advanced Server, Windows Server 2003, and Red Hat Enterprise Linux event viewers.

Viewing Events in Windows 2000 and Windows Server 2003

- 1 Click the Start button, point to Settings, and click Control Panel.
- 2 Double-click Administrative Tools, and then double-click Event Viewer.
- **3** In the Event Viewer window, click the Tree tab and then click System Log. The **System Log** window displays a list of recently logged events.
- **4** To view the details of an event, double-click one of the event items.

NOTE: You can also look up the dcsys32.log file, in the install_path\omsa\log directory, to view the separate event log file. The default install_path is C:\Program Files\Dell\SysMgt.

Viewing Events in Red Hat Enterprise Linux

- **1** Log in as **root**.
- **2** Use a text editor such as vi or emacs to view the file named /var/log/messages.

The following example shows the Red Hat Enterprise Linux message log, var/log/messages. The text in boldface type indicates the message text.

NOTE: These messages are typically displayed as one long line. In the following example, the message is displayed using line breaks to help you see the message text more clearly.

Feb 6 14:20:51 server01 Server Administrator: Instrumentation Service EventID: 1000

Server Administrator starting

Feb 6 14:20:51 server01 Server Administrator: Instrumentation Service EventID: 1001

Server Administrator startup complete

Feb 6 14:21:21 server01 Server Administrator: Instrumentation Service EventID: 1254 Chassis intrusion detected Sensor location: Main chassis intrusion Chassis location: Main System Chassis Previous state was: OK (Normal) Chassis intrusion state: Open

Feb 6 14:21:51 server01 Server Administrator: Instrumentation Service EventID: 1252 Chassis intrusion returned to normal Sensor location: Main chassis intrusion Chassis location: Main System Chassis Previous state was: Critical (Failed) Chassis intrusion state: Closed

Viewing the Event Information

The event log for each operating system contains some or all of the following information:

- **Date** The date the event occurred.
- **Time** The local time the event occurred.
- Type A classification of the event severity: Information, Warning, or Error.
- User The name of the user on whose behalf the event occurred.
- Computer The name of the system where the event occurred.
- **Source** The software that logged the event.
- **Category** The classification of the event by the event source.
- Event ID The number identifying the particular event type.
- **Description** A description of the event. The format and contents of the event description vary, depending on the event type.

Understanding the Event Description

Table 1-2 lists in alphabetical order each line item that may appear in the event description.

Table 1-2. Event Description Reference

Description Line Item	Explanation			
Action performed was: <action></action>	Specifies the action that was performed, for example:			
	Action performed was: Power cycle			
Action requested was: <action></action>	Specifies the action that was requested, for example:			
	Action requested was: Reboot, shutdown OS first			
Additional Details: <additional details="" event="" for="" the=""></additional>	Specifies additional details available for the hot plug event, for example:			
	Memory device: DIMM1_A Serial number: FFFF30B1			
<additional power="" status<="" supply="" td=""><td>Specifies information pertaining to the event, for example:</td></additional>	Specifies information pertaining to the event, for example:			
information>	Power supply input AC is off, Power supply POK (power OK) signal is not normal, Power supply is turned off			
Chassis intrusion state:	Specifies the chassis intrusion state (open or closed), for example:			
<intrusion state=""></intrusion>	Chassis intrusion state: Open			
Chassis location: <name chassis="" of=""></name>	Specifies name of the chassis that generated the message, for example:			
	Chassis location: Main System Chassis			
Configuration error type: <type< td=""><td colspan="3">Specifies the type of configuration error that occurred, for example:</td></type<>	Specifies the type of configuration error that occurred, for example:			
of configuration error>	Configuration error type: Revision mismatch			
Current sensor value (in Amps):	Specifies the current sensor value in amps, for example:			
<reading></reading>	Current sensor value (in Amps): 7.853			
Date and time of action: <date< td=""><td colspan="3">Specifies the date and time the action was performed, for example:</td></date<>	Specifies the date and time the action was performed, for example:			
and time>	Date and time of action: Tue Mar 21 16:20:33 2006			
Device location: <location chassis="" in=""></location>	Specifies the location of the device in the specified chassis, for example:			
	Device location: Memory Card A			
Discrete current state: <state></state>	Specifies the state of the current sensor, for example:			
	Discrete current state: Good			
Discrete temperature state:	Specifies the state of the temperature sensor, for example:			
<state></state>	Discrete temperature state: Good			

Table 1-2. Event Description Reference (continued)

Description Line Item	Explanation		
Discrete voltage state: <state></state>	Specifies the state of the voltage sensor, for example:		
	Discrete voltage state: Good		
Fan sensor value: <reading></reading>	Specifies the fan speed in revolutions per minute (RPM) or On/Off, for example:		
	Fan sensor value (in RPM): 2600		
	Fan sensor value: Off		
Log type: <log type=""></log>	Specifies the type of hardware log, for example:		
	Log type: ESM		
Memory device bank location: <bank chassis="" in="" name=""></bank>	Specifies the name of the memory bank in the system that generated the message, for example:		
	Memory device bank location: Bank_1		
<pre>Memory device location: <device chassis="" in="" name=""></device></pre>	Specifies the location of the memory module in the chassis, for example:		
	Memory device location: DIMM_A		
Number of devices required for full redundancy: <number></number>	Specifies the number of power supply or cooling devices required to achieve full redundancy, for example:		
	Number of devices required for full redundancy: 4		
Possible memory module event cause: <pre>causes></pre>	Specifies a list of possible causes for the memory module event, for example:		
	Possible memory module event cause: Single bit warning error rate exceeded		
	Single bit error logging disabled		
Power Supply type: <type of<="" td=""><td>Specifies the type of power supply, for example:</td></type>	Specifies the type of power supply, for example:		
power supply>	Power Supply type: VRM		
Previous redundancy state was: <state></state>	Specifies the status of the previous redundancy message, for example:		
	Previous redundancy state was: Lost		
Previous state was: <state></state>	Specifies the previous state of the sensor, for example:		
	Previous state was: OK (Normal)		
Processor sensor status:	Specifies the status of the processor sensor, for example:		
<status></status>	Processor sensor status: Configuration error		

Table 1-2. Event Description Reference (continued)

Description Line Item	Explanation		
Redundancy unit: <redundancy chassis="" in="" location=""></redundancy>	Specifies the location of the redundant power supply or cooling unit in the chassis, for example:		
	Redundancy unit: Fan Enclosure		
Sensor location: <location chassis="" in=""></location>	Specifies the location of the sensor in the specified chassis, for example:		
	Sensor location: CPU1		
Temperature sensor value:	Specifies the temperature in degrees Celsius, for example:		
<reading></reading>	Temperature sensor value (in degrees Celsius): 30		
Voltage sensor value (in Volts):	: Specifies the voltage sensor value in volts, for example:		
<reading></reading>	Voltage sensor value (in Volts): 1.693		

Event Message Reference

The following tables list in numerical order each event ID and its corresponding description, along with its severity and cause.

NOTE: For corrective actions, see the appropriate documentation.

Miscellaneous Messages

Miscellaneous messages in Table 2-1 indicate that certain alert systems are up and working.

Table 2-1. Miscellaneous Messages

Event ID	Description	Severity	Cause
0000	Log was cleared	Information	User cleared the log from Server Administrator.
0001	Log backup created	Information	The log was full, copied to backup, and cleared.
1000	Server Administrator starting	Information	Server Administrator is beginning to initialize.
1001	Server Administrator startup complete	Information	Server Administrator completed its initialization.
1002	A system BIOS update has been scheduled for the next reboot	Information	The user has chosen to update the flash basic input/output system (BIOS).
1003	A previously scheduled system BIOS update has been canceled	Information	The user has decided to cancel the flash BIOS update, or an error has occurred during the flash.
1004	Thermal shutdown protection has been initiated	Error	This message is generated when a system is configured for thermal shutdown due to an error event. If a temperature sensor reading exceeds the error threshold for which the system is configured, the operating system shuts down and the system powers off. This event may also be initiated on certain systems when a fan enclosure is removed from the system for an extended period of time.

Table 2-1. Miscellaneous Messages (continued)

Event ID	Description	Severity	Cause
1005	SMBIOS data is absent	Warning	The system management BIOS does not contain the required systems management BIOS version 2.2 or higher, or the BIOS is corrupted.
1006	Automatic System Recovery (ASR) action was performed Action performed was: <action> Date and time of action: <date and="" time=""></date></action>	Error	This message is generated when an automatic system recovery action is performed due to a non-responsive operating system. The action performed and the time of action are provided.
1007	User initiated host system control action Action requested was: <action></action>	Information	User requested a host system control action to reboot, power off, or power cycle the system. Alternatively, the user had indicated protective measures to be initiated in the event of a thermal shutdown.
1008	Systems Management Data Manager Started	Information	Systems Management Data Manager services were started.
1009	Systems Management Data Manager Stopped	Information	Systems Management Data Manager services were stopped.

Temperature Sensor Messages

Temperature sensors listed in Table 2-2 help protect critical components by alerting the systems management console when temperatures become too high inside a chassis. The temperature sensor messages use additional variables: sensor location, chassis location, previous state, and temperature sensor value or state.

Table 2-2. Temperature Sensor Messages

Event ID	Description	Severity	Cause
1050	Temperature sensor has failed	Information	A temperature sensor on the backplane board, system board, or the carrier in the specified system failed. The sensor location, chassis location, previous state, and temperature sensor value are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	If sensor type is not discrete:		
	Temperature sensor value (in degrees Celsius): <reading></reading>		
	If sensor type is discrete:		
	Discrete temperature state: <state></state>		
1051	Temperature sensor value unknown	Information	A temperature sensor on the backplane board, system board, or drive carrier in the specified system could not obtain a reading. The sensor location, chassis location, previous state, and a nominal temperature sensor value are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	If sensor type is not discrete:		
	Temperature sensor value (in degrees Celsius): <reading></reading>		
	If sensor type is discrete:		
	Discrete temperature state: <state></state>		
1052	Temperature sensor returned to a normal value	Information	A temperature sensor on the backplane board, system board, or drive carrier in the specified system returned to a valid range after crossing a failure threshold. The sensor location, chassis location, previous state, and temperature sensor value are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	If sensor type is not discrete:		
	Temperature sensor value (in degrees Celsius): <reading></reading>		
	If sensor type is discrete:		
	Discrete temperature state: <state></state>		

 Table 2-2.
 Temperature Sensor Messages (continued)

Event ID	Description	Severity	Cause		
1053	Temperature sensor detected a warning value	Warning	A temperature sensor on the backplane board, system		
	Sensor location: <location chassis="" in=""></location>		board, or drive carrier in the specified system exceeded its warning threshold. The sensor location, chassis location, previous state, and temperature sensor value are provided.		
	Chassis location: <name chassis="" of=""></name>				
	Previous state was: <state></state>				
	If sensor type is not discrete:				
	Temperature sensor value (in degrees Celsius): <reading></reading>				
	If sensor type is discrete:				
	Discrete temperature state: <state></state>				
1054	Temperature sensor detected a failure value	Error	A temperature sensor on the backplane board, system		
	Sensor location: <location chassis="" in=""></location>		board, or drive carrier in the		
	Chassis location: <name chassis="" of=""></name>		specified system exceeded its failure threshold. The sensor location, chassis location, previous state, and temperature sensor value are provided.		
	Previous state was: <state></state>				
	If sensor type is not discrete:				
	Temperature sensor value (in degrees Celsius): <reading></reading>				
	If sensor type is discrete:				
	Discrete temperature state: <state></state>				
1055	Temperature sensor detected a non-recoverable value	Error	A temperature sensor on the backplane board, system board, or drive carrier in the specified system detected an error from which it cannot recover. The sensor location, chassis location, previous state, and temperature		
	Sensor location: <location chassis="" in=""></location>				
	Chassis location: <name chassis="" of=""></name>				
	Previous state was: <state></state>				
	If sensor type is not discrete:				
	Temperature sensor value (in degrees Celsius): <reading></reading>		sensor value are provided.		
	If sensor type is discrete:				
	Discrete temperature state: <state></state>				

Cooling Device Messages

Cooling device sensors listed in Table 2-3 monitor how well a fan is functioning. Cooling device messages provide status and warning information for fans in a particular chassis.

Table 2-3. Cooling Device Messages

Event ID	Description	Severity	Cause	
1100	Fan sensor has failed	Information		A fan sensor in the specified
	Sensor location: <location chassis="" in=""></location>		system is not functioning. The sensor location, chassis location,	
	Chassis location: <name chassis="" of=""></name>		previous state, and fan sensor	
	Previous state was: <state></state>		value are provided.	
	Fan sensor value: <reading></reading>			
1101	Fan sensor value unknown	Information	A fan sensor in the specified	
	Sensor location: <location chassis="" in=""></location>		system could not obtain a	
	Chassis location: <name chassis="" of=""></name>		reading. The sensor location, chassis location, previous state,	
	Previous state was: <state></state>		and a nominal fan sensor value	
	Fan sensor value: <reading></reading>		are provided.	
1102	Fan sensor returned to a normal value	Information	A fan sensor reading on the	
	Sensor location: <location chassis="" in=""></location>		specified system returned to a	
	Chassis location: <name chassis="" of=""></name>		valid range after crossing a warning threshold. The sensor	
	Previous state was: <state></state>		location, chassis location,	
	Fan sensor value: <reading></reading>		previous state, and fan sensor value are provided.	
1103	Fan sensor detected a warning value	Warning	A fan sensor reading in the	
	Sensor location: <location chassis="" in=""></location>		specified system exceeded a warning threshold. The sensor	
	Chassis location: <name chassis="" of=""></name>		location, chassis location,	
	Previous state was: <state></state>		previous state, and fan sensor	
	Fan sensor value: <reading></reading>		value are provided.	
1104	Fan sensor detected a failure value	Error	A fan sensor in the specified	
	Sensor location: <location chassis="" in=""></location>		system detected the failure of one or more fans. The sensor	
	Chassis location: <name chassis="" of=""></name>		location, chassis location,	
	Previous state was: <state></state>		previous state, and fan sensor	
	Fan sensor value: <reading></reading>		value are provided.	

Table 2-3. Cooling Device Messages (continued)

Event ID	Description	Severity	Cause
1105	Fan sensor detected a non-recoverable value	Error	A fan sensor detected an error from which it cannot recover.
	Sensor location: <location chassis="" in=""></location>	>	The sensor location, chassis location, previous state, and fan sensor value are provided.
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Fan sensor value: <reading></reading>		

Voltage Sensor Messages

Voltage sensors listed in Table 2-4 monitor the number of volts across critical components. Voltage sensor messages provide status and warning information for voltage sensors in a particular chassis.

Table 2-4. Voltage Sensor Messages

Event ID	Description	Severity	Cause
1150	Voltage sensor has failed	Information	A voltage sensor in the specified
	Sensor location: <location chassis="" in=""></location>		system failed. The sensor location, chassis location,
	Chassis location: <name chassis="" of=""></name>		previous state, and voltage
	Previous state was: <state></state>		sensor value are provided.
	If sensor type is not discrete:		
	Voltage sensor value (in Volts): <reading></reading>		
	If sensor type is discrete:		
	Discrete voltage state: <state></state>		
1151	Voltage sensor value unknown	Information	A voltage sensor in the specified system could not obtain a reading. The sensor location, chassis location, previous state,
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		and a nominal voltage sensor

	<pre>Voltage sensor value (in Volts): <reading></reading></pre>			
	If sensor type is discrete:			
	Discrete voltage state: <state></state>			

Table 2-4. Voltage Sensor Messages (continued)

Event ID	Description	Severity	Cause
1155	Voltage sensor detected a non-recoverable value	Error	A voltage sensor in the specified system detected an error from
	Sensor location: <location chassis="" in=""></location>	•	which it cannot recover. The sensor location, chassis location,
	Chassis location: <name chassis="" of=""></name>		previous state, and voltage
	Previous state was: <state></state>		sensor value are provided.
	If sensor type is not discrete:		
	Voltage sensor value (in Volts): <reading></reading>		
	If sensor type is discrete:		
	Discrete voltage state: <state></state>		

Current Sensor Messages

Current sensors listed in Table 2-5 measure the amount of current (in amperes) that is traversing critical components. Current sensor messages provide status and warning information for current sensors in a particular chassis.

Table 2-5. Current Sensor Messages

Event ID	Description	Severity	Cause
1200	Current sensor has failed	Information	A current sensor on the power supply for the specified system failed. The sensor location, chassis location, previous state,
	Sensor location: <location chassis="" in=""></location>	•	
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		and current sensor value
<pre>If sensor type is not discrete: Current sensor value (in Amps): <reading> If sensor type is discrete:</reading></pre>	If sensor type is not discrete:		are provided.
	If sensor type is discrete:

	If sensor type is not discrete:		are provided.
	<pre>Current sensor value (in Amps): <reading></reading></pre>		
	If sensor type is discrete:		
	Discrete current state: <state></state>		
1205	Current sensor detected a non-recoverable value	Error	A current sensor in the specified system detected an error from which it cannot recover. The sensor location, chassis location, previous state, and current
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		sensor value are provided.
	If sensor type is not discrete:		
	<pre>Current sensor value (in Amps): <reading></reading></pre>		
	If sensor type is discrete:		
	Discrete current state: <state></state>		

Chassis Intrusion Messages

Chassis intrusion messages listed in Table 2-6 are a security measure. Chassis intrusion means that someone is opening the cover to a system's chassis. Alerts are sent to prevent unauthorized removal of parts from a chassis.

Table 2-6. Chassis Intrusion Messages

Event ID	Description	Severity	Cause
1250	Chassis intrusion sensor has failed	Information	A chassis intrusion sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system failed. The
	Chassis location: <name chassis="" of=""></name>		sensor location, chassis location, previous state, and chassis
	Previous state was: <state></state>		intrusion state are provided.
	Chassis intrusion state: <intrusion state=""></intrusion>		
1251	Chassis intrusion sensor value unknown	Information	A chassis intrusion sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system could not
	Chassis location: <name chassis="" of=""></name>		obtain a reading. The sensor location, chassis location,
	Previous state was: <state></state>		previous state, and chassis
	Chassis intrusion state: <intrusion state=""></intrusion>		intrusion state are provided.
1252	Chassis intrusion returned to normal	Information	A chassis intrusion sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system detected that a cover was opened while the
	Chassis location: <name chassis="" of=""></name>		system was operating but has
	Previous state was: <state></state>		since been replaced. The sensor
	Chassis intrusion state: <intrusion state=""></intrusion>		location, chassis location, previous state, and chassis intrusion state are provided.
1253	Chassis intrusion in progress	Warning	A chassis intrusion sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system detected that a
	Chassis location: <name chassis="" of=""></name>		system cover is currently being opened and the system is
	Previous state was: <state></state>		operating. The sensor location,
	Chassis intrusion state: <intrusion state=""></intrusion>		chassis location, previous state, and chassis intrusion state are provided.

Table 2-6. Chassis Intrusion Messages (continued)

Event ID	Description	Severity	Cause
1254	Chassis intrusion detected	Error	A chassis intrusion sensor in the
	Sensor location: <location chassis<="" in="" td=""><td>></td><td>specified system detected that the system cover was opened</td></location>	>	specified system detected that the system cover was opened
	Chassis location: <name chassis="" of=""></name>		while the system was operating.
	Previous state was: <state></state>		The sensor location, chassis
	Chassis intrusion state: <intrusion state=""></intrusion>		location, previous state, and chassis intrusion state are provided.
1255	Chassis intrusion sensor detected a non-recoverable value	Error	A chassis intrusion sensor in the specified system detected an
	Sensor location: <location chassis<="" in="" td=""><td>></td><td rowspan="4">error from which it cannot recover. The sensor location, chassis location, previous state, and chassis intrusion state are provided.</td></location>	>	error from which it cannot recover. The sensor location, chassis location, previous state, and chassis intrusion state are provided.
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Chassis intrusion state: <intrusion state=""></intrusion>		

Redundancy Unit Messages

Redundancy means that a system chassis has more than one of certain critical components. Fans and power supplies, for example, are so important for preventing damage or disruption of a system that a chassis may have "extra" fans or power supplies installed. Redundancy allows a second or *n*th fan to keep the chassis components at a safe temperature when the primary fan has failed. Redundancy is normal when the intended number of critical components are operating. Redundancy is degraded when a component fails but others are still operating. Redundancy is lost when the number of components functioning falls below the redundancy threshold. Table 2-7 lists the redundancy unit messages.

The number of devices required for full redundancy is provided as part of the message when applicable for the redundancy unit and the platform. For details on redundancy computation, see the respective platform documentation.

Table 2-7. Redundancy Unit Messages

Event ID	Description	Severity	Cause
1300	Redundancy sensor has failed	Information	A redundancy sensor in the
	Redundancy unit: <redundancy chassis="" in="" location=""></redundancy>		specified system failed. The redundancy unit location, chassis location, previous
	Chassis location: <name chassis="" of=""></name>		redundancy state, and the
	Previous redundancy state was: <state></state>	•	number of devices required for full redundancy are provided.

Table 2-7. Redundancy Unit Messages (continued)

Event ID	Description	Severity	Cause
1301	Redundancy sensor value unknown Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Information	A redundancy sensor in the specified system could not obtain a reading. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.
1302	Redundancy not applicable Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Information	A redundancy sensor in the specified system detected that a unit was not redundant. The redundancy location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.
1303	Redundancy is offline Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Information	A redundancy sensor in the specified system detected that a redundant unit is offline. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.
1304	Redundancy regained Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Information	A redundancy sensor in the specified system detected that a "lost" redundancy device has been reconnected or replaced; full redundancy is in effect. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.

Table 2-7. Redundancy Unit Messages (continued)

Event ID	Description	Severity	Cause
1305	Redundancy degraded Redundancy unit: <redundancy chassis="" in="" location=""></redundancy>	Warning	A redundancy sensor in the specified system detected that one of the components of the redundancy unit has failed but
	Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name>		the unit is still redundant. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.
1306	Redundancy lost Redundancy unit: <redundancy chassis="" in="" location=""> Chassis location: <name chassis="" of=""> Previous redundancy state was: <state></state></name></redundancy>	Warning or Error (depending on the number of units that are functional)	A redundancy sensor in the specified system detected that one of the components in the redundant unit has been disconnected, has failed, or is not present. The redundancy unit location, chassis location, previous redundancy state, and the number of devices required for full redundancy are provided.

Power Supply Messages

Power supply sensors monitor how well a power supply is functioning. Power supply messages listed in Table 2-8 provide status and warning information for power supplies present in a particular chassis.

Table 2-8. Power Supply Messages

Event ID	Description	Severity	Cause
1350	Power supply sensor has failed	Information	A power supply sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system failed. The sensor location, chassis location,
	Chassis location: <name chassis="" of=""></name>		previous state, and additional
	Previous state was: <state></state>		power supply status information
	Power Supply type: <type of="" power="" supply=""></type>		are provided.
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		

Table 2-8. Power Supply Messages (continued)

Event ID	Description	Severity	Cause
1351	Power supply sensor value unknown	Information	A power supply sensor in the specified system could not obtain a reading. The sensor location, chassis location, previous state, and additional power supply status information are provided.
	Sensor location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Power Supply type: <type of="" power="" supply=""></type>		
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		
1352	Power supply returned to normal	Information	A power supply has been
	Sensor location: <location chassis="" in=""></location>		reconnected or replaced. The sensor location, chassis location, previous state, and additional power supply status information are provided.
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Power Supply type: <type of="" power="" supply=""></type>		
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		
1353	Power supply detected a warning	Warning	A power supply sensor reading i
	Sensor location: <location chassis="" in=""></location>		the specified system exceeded a user-definable warning
	Chassis location: <name chassis="" of=""></name>		threshold. The sensor location,
	Previous state was: <state></state>		chassis location, previous state,
	Power Supply type: <type of="" power="" supply=""></type>		and additional power supply status information are provided.
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		

Table 2-8. Power Supply Messages (continued)

Event ID	Description	Severity	Cause
1354	Power supply detected a failure	Error	A power supply has been
	Sensor location: <location chassis="" in=""></location>		disconnected or has failed. The sensor location, chassis location, previous state, and additional
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		power supply status information
	Power Supply type: <type of="" power="" supply=""></type>		are provided.
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		
1355	Power supply sensor detected a non-recoverable value	Error	A power supply sensor in the specified system detected an
	Sensor location: <location chassis="" in=""></location>		error from which it cannot recover. The sensor location, chassis location, previous state, and additional power supply status information are provided.
	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		
	Power Supply type: <type of="" power="" supply=""></type>		
	<pre><additional information="" power="" status="" supply=""></additional></pre>		
	If in configuration error state:		
	Configuration error type: <type configuration="" error="" of=""></type>		

Memory Device Messages

Memory device messages listed in Table 2-9 provide status and warning information for memory modules present in a particular system. Memory devices determine health status by monitoring the ECC memory correction rate and the type of memory events that have occurred.

NOTE: A critical status does not always indicate a system failure or loss of data. In some instances, the system has exceeded the ECC correction rate. Although the system continues to function, you should perform system maintenance as described in Table 2-9.

NOTE: In Table 2-9, <status> can be either critical or non-critical.

Table 2-9. Memory Device Messages

Event ID	Description	Severity	Cause
1403	Memory device status is <status> Memory device location: <location chassis="" in=""> Possible memory module event cause: t of causes></location></status>	Warning	A memory device correction rate exceeded an acceptable value. The memory device status and location are provided.
1404	Memory device status is <status> Memory device location: <location chassis="" in=""> Possible memory module event cause: t of causes></location></status>	Error	A memory device correction rate exceeded an acceptable value, a memory spare bank was activated, or a multibit ECC error occurred. The system continues to function normally (except for a multibit error). Replace the memory module identified in the message during the system's next scheduled maintenance. Clear the memory error on multibit ECC error. The memory device status and location are provided.

Fan Enclosure Messages

Some systems are equipped with a protective enclosure for fans. Fan enclosure messages listed in Table 2-10 monitor whether foreign objects are present in an enclosure and how long a fan enclosure is missing from a chassis.

Table 2-10. Fan Enclosure Messages

Event ID	Description	Severity	Cause
1450	Fan enclosure sensor has failed	Information	The fan enclosure sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system failed. The sensor location and chassis location
	Chassis location: <name chassis="" of=""></name>		are provided.
1451	Fan enclosure sensor value unknown	Information	The fan enclosure sensor in the
	Sensor location: <location chassis="" in=""></location>		specified system could not obtain a reading. The sensor location and
	Chassis location: <name chassis="" of=""></name>		chassis location are provided.
1452	Fan enclosure inserted into system	Information	A fan enclosure has been inserted
	Sensor location: <location chassis="" in=""></location>		into the specified system. The sensor location and chassis location
	Chassis location: <name chassis="" of=""></name>		are provided.

Table 2-10. Fan Enclosure Messages (continued)

Event ID	Description	Severity	Cause
1453	Fan enclosure removed from system	Warning	A fan enclosure has been removed
	Sensor location: <location chassis="" in=""></location>	>	from the specified system. The sensor location and chassis location
	Chassis location: <name chassis="" of=""></name>		are provided.
1454	Fan enclosure removed from system for an extended amount of time	Error	A fan enclosure has been removed from the specified system for a
	Sensor location: <location chassis="" in=""></location>	>	user-definable length of time. The sensor location and chassis location
	Chassis location: <name chassis="" of=""></name>		are provided.
1455	Fan enclosure sensor detected a non-recoverable value	Error	A fan enclosure sensor in the specified system detected an error
	Sensor location: <location chassis="" in=""></location>	>	from which it cannot recover. The sensor location and chassis location
	Chassis location: <name chassis="" of=""></name>		are provided.

AC Power Cord Messages

AC power cord messages listed in Table 2-11 provide status and warning information for power cords that are part of an AC power switch, if your system supports AC switching.

Table 2-11. AC Power Cord Messages

Event ID	Description	Severity	Cause
1500	AC power cord sensor has failed Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>		An AC power cord sensor in the specified system failed. The AC power cord status cannot be monitored. The sensor location and chassis location information are provided.
1501	AC power cord is not being monitored Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>		The AC power cord status is not being monitored. This occurs when a system's expected AC power configuration is set to nonredundant. The sensor location and chassis location information are provided.
1502	AC power has been restored Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>		An AC power cord that did not have AC power has had the power restored. The sensor location and chassis location information are provided.

Table 2-11. AC Power Cord Messages (continued)

Event ID	Description	Severity	Cause
1503	AC power has been lost Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>	Warning	An AC power cord has lost its power, but there is sufficient redundancy to classify this as a warning. The sensor location and chassis location information are provided.
1504	AC power has been lost Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>	Error	An AC power cord has lost its power, and lack of redundancy requires this to be classified as an error. The sensor location and chassis location information are provided.
1505	AC power has been lost Sensor location: <location chassis="" in=""> Chassis location: <name chassis="" of=""></name></location>	Error	An AC power cord sensor in the specified system failed. The AC power cord status cannot be monitored. The sensor location and chassis location information are provided.

Hardware Log Sensor Messages

Hardware logs provide hardware status messages to systems management software. On certain systems, the hardware log is implemented as a circular queue. When the log becomes full, the oldest status messages are overwritten when new status messages are logged. On some systems, the log is not circular. On these systems, when the log becomes full, subsequent hardware status messages are lost. Hardware log sensor messages listed in Table 2-12 provide status and warning information about the noncircular logs that may fill up, resulting in lost status messages.

Table 2-12. Hardware Log Sensor Messages

Event ID	Description	Severity	Cause
1550	Log monitoring has been disabled	Information	A hardware log sensor in the
	Log type: <log type=""></log>		specified system is disabled. The log type information is provided.
1551	Log status is unknown	Information	A hardware log sensor in the
	Log type: <log type=""></log>		specified system could not obtain a reading. The log type information is provided.

Table 2-12. Hardware Log Sensor Messages *(continued)*

Event ID	Description	Severity	Cause
1552	Log size is no longer near or at Information capacity Log type: <log type=""></log>	Information	The hardware log on the specified system is no longer near or at its
			capacity, usually as the result of clearing the log. The log type information is provided.
1553	Log size is near or at capacity	Warning	The size of a hardware log on the
	Log type: <log type=""></log>		specified system is near or at the capacity of the hardware log. The log type information is provided.
1554	Log size is full	Error	The size of a hardware log on the
	Log type: <log type=""></log>		specified system is full. The log type information is provided.
1555	Log sensor has failed	Error	A hardware log sensor in the
	Log type: <log type=""></log>		specified system failed. The hardware log status cannot be monitored. The log type information is provided.

Processor Sensor Messages

Processor sensors monitor how well a processor is functioning. Processor messages listed in Table 2-13 provide status and warning information for processors in a particular chassis.

Table 2-13. Processor Sensor Messages

Event ID	Description	Severity	Cause
1600	Processor sensor has failed		A processor sensor in the specified
	Sensor location: <location chassis="" in=""></location>		system is not functioning. The sensor location, chassis location,
	Chassis location: <name chassis="" of=""></name>		previous state and processor sensor status are provided.
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		
1601	Processor sensor value unknown	Information	A processor sensor in the specified
	Sensor location: <location chassis="" in=""></location>		system could not obtain a reading. The sensor location, chassis location, previous state and
Previous state was: <i><state></state></i>	Chassis location: <name chassis="" of=""></name>		
	Previous state was: <state></state>		processor sensor status are
	Processor sensor status: <status></status>		provided.

Table 2-13. Processor Sensor Messages (continued)

Event ID	Description	Severity	Cause
1602	Processor sensor returned to a normal value	Information	A processor sensor in the specified system transitioned back to a
	Sensor location: <location chassis="" in=""></location>		normal state. The sensor location,
	Chassis location: <name chassis="" of=""></name>		chassis location, previous state and processor sensor status
	Previous state was: <state></state>		are provided.
	Processor sensor status: <status></status>		
1603	Processor sensor detected a warning value	Warning	A processor sensor in the specified system is in a throttled state. The
	Sensor location: <location chassis="" in=""></location>		sensor location, chassis location, previous state and processor sensor
	Chassis location: <name chassis="" of=""></name>		status are provided.
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		
1604	Processor sensor detected a failure value	Error	A processor sensor in the specified system is disabled, has a
	Sensor location: <location chassis="" in=""></location>		configuration error, or experienced a thermal trip. The sensor location,
	Chassis location: <name chassis="" of=""></name>		chassis location, previous state and
	Previous state was: <state></state>		processor sensor status
	Processor sensor status: <status></status>		are provided.
1605	Processor sensor detected a non-recoverable value	Error	A processor sensor in the specified system has failed. The sensor
	Sensor location: <location chassis="" in=""></location>		location, chassis location, previous state and processor sensor status
	Chassis location: <name chassis="" of=""></name>		are provided.
	Previous state was: <state></state>		
	Processor sensor status: <status></status>		

Pluggable Device Messages

The pluggable device messages listed in Table 2-14 provide status and error information when some devices, such as memory cards, are added or removed.

Table 2-14. Pluggable Device Messages

Event ID	Description	Severity	Cause
1650	<device event="" plug="" type="" unknown=""></device>	Information	A pluggable device event message of unknown type was received. The device location, chassis location, and additional event details, if available, are provided.
	Device location: <location available="" chassis,="" if="" in=""></location>		
	Chassis location: <name available="" chassis,="" if="" of=""></name>		
	Additional details: <additional available="" details="" events,="" for="" if="" the=""></additional>		
1651	Device added to system	Information	A device was added in the specified system. The device location, chassis location, and additional event details, if available, are provided.
	Device location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Additional details: <additional details="" events="" for="" the=""></additional>		
1652	Device removed from system	Information	A device was removed from the specified system. The device location, chassis location, and additional event details, if available, are provided.
	Device location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Additional details: <additional details="" events="" for="" the=""></additional>		
1653	Device configuration error detected	Error	A configuration error was detected for a pluggable device in the specified system. The device may have been added to the system incorrectly.
	Device location: <location chassis="" in=""></location>		
	Chassis location: <name chassis="" of=""></name>		
	Additional details: <additional details="" events="" for="" the=""></additional>		

System Event Log Messages for IPMI Systems

The following tables list the system event log (SEL) messages, their severity, and cause.

NOTE: For corrective actions, see the appropriate documentation.

Temperature Sensor Events

The temperature sensor event messages help protect critical components by alerting the systems management console when the temperature rises inside the chassis. These event messages use additional variables, such as sensor location, chassis location, previous state, and temperature sensor value or state.

Table 3-1. Temperature Sensor Events

Event Message	Severity	Cause	
<pre><sensor location="" name=""> temperature sensor detected a failure <reading> where <sensor location="" name=""> is the entity that this sensor is monitoring. For example, "PROC Temp" or "Planar Temp."</sensor></reading></sensor></pre>	Critical	Temperature of the backplane board, system board, or the carrier in the specified system <i>Sensor Name/Location</i> exceeded the critical threshold.	
Reading is specified in degree Celsius. For example 100 C.			
<pre><sensor location="" name=""> temperature sensor detected a warning <reading>.</reading></sensor></pre>	Warning	Temperature of the backplane board, system board, or the carrier in the specified system <i><sensor location="" name=""></sensor></i> exceeded the non-critical threshold.	
<pre><sensor location="" name=""> temperature sensor returned to warning state <reading>.</reading></sensor></pre>	Warning	Temperature of the backplane board, system board, or the carrier in the specified system <i><sensor location="" name=""></sensor></i> returned from critical state to non-critical state.	
<pre><sensor location="" name=""> temperature sensor returned to normal state <reading>.</reading></sensor></pre>	Information	Temperature of the backplane board, system board, or the carrier in the specified system <i><sensor location="" name=""></sensor></i> returned to normal operating range.	

Voltage Sensor Events

The voltage sensor event messages monitor the number of volts across critical components. These messages provide status and warning information for voltage sensors for a particular chassis.

Table 3-2. Voltage Sensor Events

Event Message	Severity	Cause
<pre><sensor location="" name=""> voltage sensor detected a failure <reading> where <sensor location="" name=""> is the entity that this sensor is monitoring. For example, "CMOS Battery."</sensor></reading></sensor></pre>	Critical	The voltage of the monitored device is out of critical threshold.
Reading is specified in volts. For example, 3.860 V.		
<pre><sensor location="" name=""> voltage sensor state asserted.</sensor></pre>	Critical	The voltage specified by <i>Sensor</i> Name/Location is in critical state.
<pre><sensor location="" name=""> voltage sensor state de-asserted.</sensor></pre>	Information	The voltage of a previously reported <i>Sensor Name/Location></i> is returned to normal state.
<pre><sensor location="" name=""> voltage sensor detected a warning <reading>.</reading></sensor></pre>	Warning	Voltage of the monitored entity <i>Sensor Name/Location</i> > exceeded the warning threshold.
<pre><sensor location="" name=""> voltage sensor returned to normal<reading>.</reading></sensor></pre>	Information	The voltage of a previously reported <i>Sensor Name/Location></i> is returned to normal state.

Fan Sensor Events

The cooling device sensors monitor how well a fan is functioning. These messages provide status warning and failure messages for fans for a particular chassis.

Table 3-3. Fan Sensor Events

Event Message	Severity	Cause
<pre><sensor location="" name=""> Fan sensor detected a failure <reading> where <sensor location="" name=""> is the entity that this sensor is monitoring. For example "BMC Back Fan" or "BMC Front Fan."</sensor></reading></sensor></pre>	Critical	The speed of the specified <i>Sensor Name/Location></i> fan is not sufficient to provide enough cooling to the system.
Reading is specified in RPM. For example, 100 RPM.		
<pre><sensor location="" name=""> Fan sensor returned to normal state <reading>.</reading></sensor></pre>	Information	The fan specified by <i>Sensor</i> Name/Location has returned to its normal operating speed.
<pre><sensor location="" name=""> Fan sensor detected a warning <reading>.</reading></sensor></pre>	Warning	The speed of the specified <i>Sensor Name/Location></i> fan may not be sufficient to provide enough cooling to the system.
<pre><sensor location="" name=""> Fan Redundancy sensor redundancy degraded.</sensor></pre>	Information	The fan specified by <i>Sensor</i> Name/Location> may have failed and hence, the redundancy has been degraded.
<pre><sensor location="" name=""> Fan Redundancy sensor redundancy lost.</sensor></pre>	Critical	The fan specified by <i>Sensor</i> Name/Location> may have failed and hence, the redundancy that was degraded previously has been lost.
<pre><sensor location="" name=""> Fan Redundancy sensor redundancy regained</sensor></pre>	Information	The fan specified by <i>Sensor</i> Name/Location> may have started functioning again and hence, the redundancy has been regained.

Processor Status Events

The processor status messages monitor the functionality of the processors in a system. These messages provide processor health and warning information of a system.

Table 3-4. Processor Status Events

Event Message	Severity	Cause
<pre><processor entity=""> status processor sensor IERR, where <processor entity=""> is the processor that generated the event. For example, PROC for a single processor system and PROC # for multiprocessor system.</processor></processor></pre>	Critical	IERR internal error generated by the <pre></pre> <pre><processor entity="">.</processor></pre>
<pre><processor entity=""> status processor sensor Thermal Trip.</processor></pre>	Critical	The processor generates this event before it shuts down because of excessive heat caused by lack of cooling or heat synchronizating.
<pre><processor entity=""> status processor sensor recovered from IERR.</processor></pre>	Information	This event is generated when a processor recovers from the internal error.
<pre><processor entity=""> status processor sensor disabled.</processor></pre>	Warning	This event is generated for all processors that are disabled.
<pre><processor entity=""> status processor sensor terminator not present.</processor></pre>	Information	This event is generated if the terminator is missing on an empty processor slot.

Power Supply Events

The power supply sensors monitor the functionality of the power supplies. These messages provide status and warning information for power supplies for a particular system.

Table 3-5. Power Supply Events

Event Message	Severity	Cause
<pre><power name="" sensor="" supply=""> power supply sensor removed.</power></pre>	Critical	This event is generated when the power supply sensor is removed.
<pre><power name="" sensor="" supply=""> power supply sensor AC recovered.</power></pre>	Information	This event is generated when the power supply has been replaced.
<pre><power name="" sensor="" supply=""> power supply sensor returned to normal state.</power></pre>	Information	This event is generated when the power supply that failed or removed was replaced and the state has returned to normal.

Table 3-5. Power Supply Events (continued)

Event Message	Severity	Cause
<pre><entity name=""> PS Redundancy sensor redundancy degraded.</entity></pre>	Information	Power supply redundancy is degraded if one of the power supply sources is removed or failed.
<pre><entity name=""> PS Redundancy sensor redundancy lost.</entity></pre>	Critical	Power supply redundancy is lost if only one power supply is functional.
<pre><entity name=""> PS Redundancy sensor redundancy regained.</entity></pre>	Information	This event is generated if the power supply has been reconnected or replaced.

Memory ECC Events

The memory ECC event messages monitor the memory modules in a system. These messages monitor the ECC memory correction rate and the type of memory events that occurred.

Table 3-6. Memory ECC Events

Event Message	Severity	Cause
ECC error correction detected on Bank # DIMM [A/B].	Information	This event is generated when there is a memory error correction on a particular Dual Inline Memory Module (DIMM).
ECC uncorrectable error detected on Bank # [DIMM].	Critical	This event is generated when the chipset is unable to correct the memory errors. Usually, a bank number is provided and DIMM may or may not be identifiable, depending on the error.
Correctable memory error logging disabled.	Critical	This event is generated when the chipset in the ECC error correction rate exceeds a predefined limit.

BMC Watchdog Events

The BMC watchdog operations are performed when the system hangs or crashes. These messages monitor the status and occurrence of these events in a system.

Table 3-7. BMC Watchdog Events

Event Message	Severity	Cause
BMC OS Watchdog timer expired.	Information	This event is generated when the BMC watchdog timer expires and no action is set.
BMC OS Watchdog performed system reboot.	Critical	This event is generated when the BMC watchdog detects that the system has crashed (timer expired because no response was received from Host) and the action is set to reboot.
BMC OS Watchdog performed system power off.	Critical	This event is generated when the BMC watchdog detects that the system has crashed (timer expired because no response was received from Host) and the action is set to power off.
BMC OS Watchdog performed system power cycle.	Critical	This event is generated when the BMC watchdog detects that the system has crashed (timer expired because no response was received from Host) and the action is set to power cycle.

Memory Events

The memory modules can be configured in different ways in particular systems. These messages monitor the status, warning, and configuration information about the memory modules in the system.

Table 3-8. Memory Events

Event Message	Severity	Cause
Memory RAID redundancy degraded.	Information	This event is generated when there is a memory failure in a RAID-configured memory configuration.
Memory RAID redundancy lost.	Critical	This event is generated when redundancy is lost in a RAID-configured memory configuration.
Memory RAID redundancy regained	l Information	This event is generated when the redundancy lost or degraded earlier is regained in a RAID-configured memory configuration.
Memory Mirrored redundancy degraded.	Information	This event is generated when there is a memory failure in a mirrored memory configuration.
Memory Mirrored redundancy lost.	Critical	This event is generated when redundancy is lost in a mirrored memory configuration.

Table 3-8. Memory Events (continued)

Event Message	Severity	Cause
Memory Mirrored redundancy regained.	Information	This event is generated when the redundancy lost or degraded earlier is regained in a mirrored memory configuration.
Memory Spared redundancy degraded.	Information	This event is generated when there is a memory failure in a spared memory configuration.
Memory Spared redundancy lost.	Critical	This event is generated when redundancy is lost in a spared memory configuration.
Memory Spared redundancy regained.	Information	This event is generated when the redundancy lost or degraded earlier is regained in a spared memory configuration.

Hardware Log Sensor Events

The hardware logs provide hardware status messages to the system management software. On particular systems, the subsequent hardware messages are not displayed when the log is full. These messages provide status and warning messages when the logs are full.

Table 3-9. Hardware Log Sensor Events

Event Message	Severity	Cause
Log full detected.	Critical	This event is generated when the SEL device detects that only one entry can be added to the SEL before it is full.
Log cleared.	Information	This event is generated when the SEL is cleared.

Drive Events

The drive event messages monitor the health of the drives in a system. These events are generated when there is a fault in the drives indicated.

Table 3-10. Drive Events

Event Message	Severity	Cause
Drive <drive #=""> asserted fault state.</drive>	Critical	This event is generated when the specified drive in the array is faulty.
Drive <drive #=""> de-asserted fault state.</drive>	Information	This event is generated when the specified drive recovers from a faulty condition.

Intrusion Events

The chassis intrusion messages are a security measure. Chassis intrusion alerts are generated when the system's chassis is opened. Alerts are sent to prevent unauthorized removal of parts from the chassis.

Table 3-11. Intrusion Events

Event Message	Severity	Cause
<pre><intrusion name="" sensor=""> sensor detected an intrusion.</intrusion></pre>	Critical	This event is generated when the intrusion sensor detects an intrusion.
<pre><intrusion name="" sensor=""> sensor returned to normal state.</intrusion></pre>	Information	This event is generated when the earlier intrusion has been corrected.

BIOS Generated System Events

The BIOS generated messages monitor the health and functionality of the chipsets, I/O channels, and other BIOS-related functions. These system events are generated by the BIOS.

Table 3-12. BIOS Generated System Events

Event Message	Severity	Cause
System Event I/O channel chk.	Critical	This event is generated when a critical interrupt is generated in the I/O Channel.
System Event PCI Parity Err.	Critical	This event is generated when a parity error is detected on the PCI bus.
System Event Chipset Err.	Critical	This event is generated when a chip error is detected.
System Event PCI System Err.	Critical	This event indicates historical data, and is generated when the system has crashed and recovered.
System Event PCI Fatal Err.	Critical	This error is generated when a fatal error is detected on the PCI bus.
System Event PCIE Fatal Err.	Critical	This error is generated when a fatal error is detected on the PCIE bus.

Storage Management Message Reference

Storage Management's alert or event management features let you monitor the health of storage resources such as controllers, connectors, array disks, and virtual disks.

Alert Monitoring and Logging

The Storage Management Service performs alert monitoring and logging. By default, the Storage Management Service starts when the managed system starts up. If you stop the Storage Management Service, then alert monitoring and logging stops. Alert monitoring does the following:

- Updates the status of the storage object that generated the alert.
- Propagates the storage object's status to all the related higher objects in the storage hierarchy. For example, the status of a lower-level object will be propagated up to the status displayed on the Health tab for the top-level storage object.
- Logs an alert into the Alert log and the Windows application log.
- Sends an SNMP trap if the operating system's SNMP service is installed and enabled.

For updated information, lookup the Storage Management Online Help and the Dell OpenManage™ Server Administrator Storage Management User's Guide.

Alert Descriptions and Corrective Actions

The following sections describe alerts generated by the RAID or SCSI controllers supported by Storage Management. The alerts are displayed in the Server Administrator Alert subtab or through the Windows Event Viewer. These alerts can also be forwarded as SNMP traps to other applications.

SNMP traps are generated for the alerts listed in the following sections. These traps are included in the Storage Management management information base (MIB). The SNMP traps for these alerts use all of the SNMP trap variables. For more information on SNMP support and the MIB, see the SNMP Reference Guide.

To locate an alert, scroll through the following table to find the alert number displayed on the Server Administrator Alert tab or search this file for the alert message text or number. See "Understanding Event Messages" for more information on severity levels.

NOTE: If you have an Array Manager installation, the Array Manager console reports the status of storage components through error icons and graphical displays. When there is a change in status, Array Manager sends events to the Array Manager event log, which can be viewed from the Array Manager console. For more information, see the *Dell OpenManageTM Array Manager User's Guide*.

For more information regarding alert descriptions and the appropriate corrective actions, see the online help.

Table 4-1. Storage Management Messages

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2048	Device failed	Critical / Failure / Error	Cause: A physical disk in the array failed. The failed disk may have been identified by the controller or channel. Performing a consistency check can also identify a failed disk.	854, 904, 954, 1004, 1054, 1104, 1154, 1204	500
			Action: Replace the failed array disk. You can identify which disk has failed by locating the disk that has a red "X" for its status. Perform a rescan after replacing the disk.		
2049	Array disk removed	Non-critical	Cause: A physical disk has been removed from the array. A user may have also executed the "Prepare to Remove" task. This alert can also be caused by loose or defective cables or by problems with the enclosure.		501
			Action: If a physical disk was removed from the array, either replace the disk or restore the original disk. You can identify which disk has been removed by locating the disk that has a red "X" for its status. Perform a rescan after replacing or restoring the disk. If a disk has not been removed from the array, then check for problems with the cables. See the online help for more information on checking the cables. Make sure that the enclosure is powered on. If the problem persists, check the enclosure documentation for further diagnostic information.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2050	Array disk offline	Warning / Non-critical	Cause: A physical disk in the array is offline. A disk can be made offline during a "Prepare to Remove" operation or because a user manually put the disk offline.	903	502
			Action: Perform a rescan. You can also select the offline disk and perform a Make Online operation.		
2051 Array disk degraded	Warning / Non-critical	Cause: An array disk has reported an error condition and may be degraded. The array disk may have reported the error condition in response to a consistency check or other operation.	903	503	
			Action: Replace the degraded array disk. You can identify which disk is degraded by locating the disk that has a red "X" for its status. Perform a rescan after replacing the disk.		
2052	Array disk inserted	Ok / Normal	Cause: This alert is provided for informational purposes.	901	504
			Action: None		
2053	Virtual disk created	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	505
			Action: None		
2054	Virtual disk deleted	Warning / Non-critical	Cause: A virtual disk has been deleted. "Performing a Reset Configuration" operation may detect that a virtual disk has been deleted and generate this alert.	1203	506
			Action: None		
2055	Virtual disk configuration changed	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	1201	507

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2056	Virtual disk failed	Critical / Failure / Error	Cause: One or more physical disks included in the virtual disk have failed. If the virtual disk is non-redundant (does not use mirrored or parity data), then the failure of a single physical disk can cause the virtual disk to fail. If the virtual disk is redundant, then more physical disks have failed than can be rebuilt using mirrored or parity information.	1204	508
			Action: Create a new virtual disk and restore from a backup.		
2057	Virtual disk degraded	tual disk degraded Warning / Cause 1: This alert message occurs when a Non-critical physical disk included in a redundant virtual disk fails. Because the virtual disk is redundant (uses mirrored or parity information) and only one physical disk has failed, the virtual disk can be rebuilt.	1203	509	
			Action 1: Configure a hot spare for the virtual disk if one is not already configured. Rebuild the virtual disk. When using a Expandable RAID Controller (PERC) 2/SC, 3/SC, 2/DC, 3/DCL, 3/DC, 3/QC, 4/SC, 4/DC, 4e/DC, 4/Di, or CERC ATA100/4ch controller, rebuild the virtual disk by first configuring a hot spare for the disk, and then initiating a write operation to the disk. The write operation will initiate a rebuild of the disk.		
			Cause 2: A physical disk in the array has been removed.		
			Action 2: If a physical disk was removed from the array, either replace the disk or restore the original disk. You can identify which disk has been removed by locating the disk that has a red "X" for its status. Perform a rescan after replacing the disk.		
2058	Virtual disk check consistency started	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	520
			Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2059	Virtual disk format started	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	521
			Action: None		
2061	Virtual disk initialization started	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	523
			Action: None		
2063	Virtual disk reconfiguration	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	525
	started		Action: None		
2064		Ok / Normal	Cause: This alert is provided for informational purposes.	1201	526
			Action: None		
2065	Array disk rebuild started	Ok / Normal	Cause: This alert is provided for informational purposes.	901	527
			Action: None		
2067	Virtual disk check consistency cancelled	Ok / Normal	Cause: The check consistency operation cancelled because a physical disk in the array has failed or because a user cancelled the check consistency operation.	1201	529
			Action: If the physical disk failed, then replace the physical disk. You can identify which disk failed by locating the disk that has a red "X" for its status. Perform a rescan after replacing the disk. When performing a consistency check, be aware that the consistency check can take a long time. The time it takes depends on the size of the physical disk or the virtual disk.		

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2070	Virtual disk initialization cancelled	nitialization Normal cancelled the value of the value of the value of the value of the plant of	Cause: The virtual disk initialization cancelled because a physical disk included in the virtual disk has failed or because a user cancelled the virtual disk initialization.	1201	532
			Action: If a physical disk failed, then replace the physical disk. You can identify which disk has failed by locating the disk that has a red "X" for its status. Perform a rescan after replacing the disk. Restart the format array disk operation. Restart the virtual disk initialization.		
2074	Array disk rebuild cancelled	Ok / Normal	Cause: A user has cancelled the rebuild operation.	901	536
			Action: Restart the rebuild operation.		
2076	Virtual disk check consistency failed	Critical / Failure / Error	Cause: An array disk included in the virtual disk failed or there is an error in the parity information. A failed array disk can cause errors in parity information.	1204	538
			Action: Replace the failed array disk. You can identify which disk has failed by locating the disk that has a red "X" for its status. Rebuild the array disk. When finished, restart the check consistency operation.		
2077	Virtual disk format failed.	Critical / Failure /	Cause: An array disk included in the virtual disk failed.	1204	539
		Error	Action: Replace the failed array disk. You can identify which array disk has failed by locating the disk that has a red "X" for its status. Rebuild the array disk. When finished, restart the virtual disk format operation.		
	Virtual disk initialization failed	Critical / Failure / Error	Cause: An array disk included in the virtual disk has failed or a user has cancelled the initialization.	1204	541
			Action: If an array disk has failed, then replace the array disk.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2080	Array disk initialize	Critical /	Cause: The array disk has failed or is corrupt.	904	542
	failed	Failure / Error	Action: Replace the failed or corrupt disk. You can identify a disk that has failed by locating the disk that has a red "X" for its status. Restart the initialization.		
2081	Virtual disk reconfiguration failed	Critical / Failure / Error	Cause: An array disk included in the virtual disk has failed or is corrupt. A user may also have cancelled the reconfiguration.	1204	543
			Action: Replace the failed or corrupt disk. You can identify a disk that has failed by locating the disk that has a red "X" for its status. If the array disk is part of a redundant array, then rebuild the array disk. When finished, restart the reconfiguration.		
2082	Virtual disk rebuild failed	Critical / Failure / Error	Cause: An array disk included in the virtual disk has failed or is corrupt. A user may also have cancelled the rebuild.	1204	544
			Action: Replace the failed or corrupt disk. You can identify a disk that has failed by locating the disk that has a red "X" for its status. Restart the virtual disk rebuild.		
2083	Array disk rebuild failed	•	Cause: An array disk included in the virtual disk has failed or is corrupt. A user may also have cancelled the rebuild.	904	545
			Action: Replace the failed or corrupt disk. You can identify a disk that has failed by locating the disk that has a red "X" for its status. Rebuild the virtual disk rebuild.		
2085	Virtual disk check consistency	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	547
	completed		Action: None		
2086	Virtual disk format completed	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	548
	-		Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2088	Virtual disk initialization completed	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	1201	550
2089	Array disk initialize completed	Ok / Normal	Cause: This alert is provided for informational purposes.	901	551
2090	Virtual disk reconfiguration	Ok / Normal	Action: None Cause: This alert is provided for informational purposes.	1201	552
2091	completed Virtual disk rebuild completed	Ok / Normal	Action: None Cause: This alert is provided for informational purposes.	1201	553
	1		Action: None		
2092	Array disk rebuild completed	Ok / Normal	Cause: This alert is provided for informational purposes.	901	554
			Action: None		
2094	part of a redundant virtual disk, select the "Offline" option and then replace the disk. Then configure a hot spare and it will start the rebuild automatically. If this	Warning / Non-critical	Cause: The array disk is predicted to fail. Many array disks contain Self Monitoring Analysis and Reporting Technology (S.M.A.R.T.). When enabled, SMART monitors the health of the disk based on indications such as the number of write operations that have been performed on the disk. Action: Replace the array disk. Even though the disk may not have failed yet, it is strongly	903	570
	disk is a hot spare, select the "Prepare to Remove" option and then replace the disk. If this disk is part of a non-redundant disk, you should back up your data immediately. If the disk fails, you will not be able to recover the data.		recommended that you replace the disk. Review the message text for additional information.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2095	SCSI sense data. If this disk is part of a	Warning / Non-critical	Cause: An array disk has failed, is corrupt, or is otherwise experiencing a problem.	903	571
	redundant virtual disk, select the "Offline" option and then replace the disk. Then configure a hot spare and it will start the rebuild automatically. If this disk is a hot spare, select the "Prepare to Remove" option and then replace the disk. If this disk is part of a non-redundant disk, you should back up your data immediately. If the disk fails, you will not be able to recover the data.		Action: Replace the array disk. Even though the disk may not have failed yet, it is strongly recommended that you replace the disk. Review the message text for additional information.		
2098	Global hot spare assigned	Ok / Normal	Cause: A user has assigned an array disk as a global hot spare. This alert is provided for informational purposes.	901	574
			Action: None		
2099	Global hot spare unassigned	Ok / Normal	Cause: A user has unassigned an array disk as a global hot spare. This alert is provided for informational purposes. Action: None	901	575

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2100	Temperature exceeded the maximum warning threshold	Warning / Non-critical	Cause: The array disk enclosure is too hot. A variety of factors can cause the excessive temperature. For example, a fan may have failed, the thermostat may be set too high, or the room temperature may be too hot.	1053	591
			Action: Check for factors that may cause overheating. For example, verify that the enclosure fan is working. You should also check the thermostat settings and examine whether the enclosure is located near a heat source. Make sure the enclosure has enough ventilation and that the room temperature is not too hot. See the enclosure documentation for more diagnostic information.		
2101	Temperature dropped below the minimum warning threshold	Warning / Non-critical	Cause: The array disk enclosure is too cool. Action: Check whether the thermostat setting is too low and whether the room temperature is too cool.	1053	592
2102	Temperature exceeded the maximum failure threshold	Critical / Failure / Error	Cause: The array disk enclosure is too hot. A variety of factors can cause the excessive temperature. For example, a fan may have failed, the thermostat may be set too high, or the room temperature may be too hot.	1054	593
			Action: Check for factors that may cause overheating. For example, verify that the enclosure fan is working. You should also check the thermostat settings and examine whether the enclosure is located near a heat source. Make sure the enclosure has enough ventilation and that the room temperature is not too hot. See the enclosure documentation for more diagnostic information.		
2103	Temperature dropped below the minimum failure threshold	Critical / Failure / Error	Cause: The array disk enclosure is too cool. Action: Check whether the thermostat setting is too low and whether the room temperature is too cool.	1054	594

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2104	Controller battery is reconditioning	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	581
			Action: None		
2105	Controller battery recondition is	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	582
	completed		Action: None		
2106	Smart FPT exceeded	Warning / Non-critical	Cause: A disk on the specified controller has received a SMART alert (predictive failure) indicating that the disk is likely to fail in the near future.	903	585
			Action: Replace the disk that has received the SMART alert. If the array disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk. Removing an array disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.		
2107	Smart configuration change Critical / Failure / Error	Cause: A disk has received a SMART alert (predictive failure) after a configuration change. The disk is likely to fail in the near future.	904	586	
			Action: Replace the disk that has received the SMART alert. If the array disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk. Removing an array disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.		
2108	Smart warning	Warning / Non-critical	Cause: A disk has received a SMART alert (predictive failure). The disk is likely to fail in the near future.	903	587
			Action: Replace the disk that has received the SMART alert. If the array disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk. Removing an array disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2109	Smart warning temperature	Warning / Non-critical	Cause: A disk has reached an unacceptable temperature and received a SMART alert (predictive failure). The disk is likely to fail in the near future.	903	588
			First Action: Determine why the array disk has reached an unacceptable temperature. A variety of factors can cause the excessive temperature. For example, a fan may have failed, the thermostat may be set too high, or the room temperature may be too hot or cold. Verify that the fans in the server or enclosure are working. If the array disk is in an enclosure, you should check the thermostat settings and examine whether the enclosure is located near a heat source. Make sure the enclosure has enough ventilation and that the room temperature is not too hot. See the enclosure documentation for more diagnostic information.		
		Second Action: If you cannot identify why the disk has reached an unacceptable temperature, then replace the disk. If the array disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk. Removing an array disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.			
2110	Smart warning degraded	Warning / Non-critical	Cause: A disk is degraded and has received a SMART alert (predictive failure). The disk is likely to fail in the near future.	903	589
			Action: Replace the disk that has received the SMART alert. If the array disk is a member of a non-redundant virtual disk, then back up the data before replacing the disk. Removing an array disk that is included in a non-redundant virtual disk will cause the virtual disk to fail and may cause data loss.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2111	Failure prediction threshold exceeded	Warning / Non-critical	Cause: A disk has received a SMART alert (predictive failure) due to test conditions.	903	590
	due to test - No action needed		Action: None		
2112	Enclosure was shut down	Critical / Failure / Error	Cause: The array disk enclosure is either hotter or cooler than the maximum or minimum allowable temperature range.	854	602
			Action: Check for factors that may cause overheating or excessive cooling. For example, verify that the enclosure fan is working. You should also check the thermostat settings and examine whether the enclosure is located near a heat source. Make sure the enclosure has enough ventilation and that the room temperature is not too hot or too cold. See the enclosure documentation for more diagnostic information.		
2114	A consistency check on a virtual disk has	Ok / Normal	Cause: The check consistency operation on a virtual disk was paused by a user.	1201	604
	been paused (suspended)		Action: To resume the check consistency operation, right-click the virtual disk in the Storage Management tree view and select Resume Check Consistency.		
2115	A consistency check on a virtual disk has been resumed	Ok / Normal	Cause: The check consistency operation on a virtual disk has resumed processing after being paused by a user.	1201	605
			Action: This alert is provided for informational purposes.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2116	A virtual disk and its mirror have been split	Ok / Normal	Cause: A user has caused a mirrored virtual disk to be split. When a virtual disk is mirrored, its data is copied to another virtual disk in order to maintain redundancy. After being split, both virtual disks retain a copy of the data, although because the mirror is no longer intact, updates to the data are no longer copied to the mirror.	1201	606
			Action: This alert is provided for informational purposes.		
2117	A mirrored virtual disk has been unmirrored	Ok / Normal	Cause: A user has caused a mirrored virtual disk to be unmirrored. When a virtual disk is mirrored, its data is copied to another virtual disk in order to maintain redundancy. After being unmirrored, the disk formerly used as the mirror returns to being an array disk and becomes available for inclusion in another virtual disk.	1201	607
			Action: This alert is provided for informational purposes.		
2118	Change write policy	Ok / Normal	Cause: A user has changed the write policy for a virtual disk.	1201	601
			Action: This alert is provided for informational purposes.		
2120	Enclosure firmware mismatch	Warning / Non-critical	Cause: The firmware on the enclosure management modules (EMM) is not the same version. It is required that both modules have the same version of the firmware. This alert may be caused when a user attempts to insert an EMM module that has a different firmware version than an existing module.	853	672
			Action: Download the same version of the firmware to both EMM modules.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2121	Device returned to normal	Ok / Normal	rmal error state has returned to a normal state. 89 For example, if an enclosure became too hot and subsequently cooled down, then you may 10	1102,	None
			Action: This alert is provided for informational purposes.	1152, 1202	
2122	Redundancy degraded	Warning / Non-critical	Cause: One or more of the enclosure components has failed. For example, a fan or power supply may have failed. Although the enclosure is currently operational, the failure of additional components could cause the enclosure to fail.		None
			Action: Identify and replace the failed component. To identify the failed component, select the enclosure in the tree view and click the Health subtab. Any failed component will be identified with a red X on the enclosure's Health subtab. Alternatively, you can select the Storage object and click the Health subtab. The controller status displayed on the Health subtab indicates whether a controller has a failed or degraded component. See the enclosure documentation for information on replacing enclosure components and for other diagnostic information.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2123	Redundancy lost	Warning / Non-critical	Cause: A virtual disk or an enclosure has lost data redundancy. In the case of a virtual disk, one or more array disks included in the virtual disk have failed. Due to the failed array disk or disks, the virtual disk is no longer maintaining redundant (mirrored or parity) data. The failure of an additional array disk will result in lost data. In the case of an enclosure, more than one enclosure component has failed. For example, the enclosure may have suffered the loss of all fans or all power supplies.	1306	None
			Action: Identify and replace the failed components. To identify the failed components, select the Storage object and click the Health subtab. The controller status displayed on the Health subtab indicates whether a controller has a failed or degraded component. Click the controller that displays a Warning or Failed status. This action displays the controller Health subtab which displays the status of the individual controller components. Continue clicking the components with a Warning or Health status until you identify the failed component. See the online help for more information. See the enclosure documentation for information on replacing enclosure components and for other diagnostic information.		
2124	Redundancy normal	Ok / Normal	Cause: Data redundancy has been restored to a virtual disk or an enclosure that previously suffered a loss of redundancy.	1304	None
			Action: This alert is provided for informational purposes.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2126	SCSI sense sector reassign	eassign Non-critical of the state of the sta	Cause: A sector of the disk is corrupted and data cannot be maintained on this portion of the disk.	903	None
			Action: If the disk is part of a non-redundant virtual disk, then replace the disk. Any data residing on the corrupt portion of the disk may be lost and you may need to restore from backup. If the disk is part of a redundant virtual disk, then any data residing on the corrupt portion of the disk will be reallocated elsewhere in the virtual disk.		
2127	Background initialization (BGI) started	Ok / Normal	Cause: BGI of a virtual disk has started. This alert is provided for informational purposes.	1201	683
			Action: None		
2128	BGI cancelled	Ok / Normal	Cause: BGI of a virtual disk has been cancelled. A user or the firmware may have stopped BGI.	1201	684
			Action: None		
2129	BGI failed	Critical /	Cause: BGI of a virtual disk has failed.	1204	685
		Failure / Error	Action: None		
2130	BGI completed	Ok / Normal	Cause: BGI of a virtual disk has completed. This alert is provided for informational purposes.	1201	686
			Action: None		
2131	Firmware version mismatch	Warning / Non-critical	Cause: The firmware on the controller is not a supported version.	753	None
			Action: Install a supported version of the firmware. If you do not have a supported version of the firmware available, it can be downloaded from the Dell™ support website at support.dell.com. If you do not have a supported version of the firmware available, check with your support provider for information on how to obtain the most current firmware.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2132	Driver version mismatch	Warning / Non-critical	Cause: The controller driver is not a supported version.	753	None
			Action: Install a supported version of the driver. If you do not have a supported driver version available, it can be downloaded from the Dell support site at support.dell.com. If you do not have a supported version of the driver available, check with your support provider for information on how to obtain the most current driver.		
2135	Array Manager is installed on the system	Warning / Non-critical	Cause: Storage Management has been installed on a system that has an Array Manager installation.	103	None
			Action: Installing Storage Management and Array Manager on the same system is not a supported configuration. Uninstall either Storage Management or Array Manager.		
2136	Virtual disk initialization	Ok / Normal	Cause: Virtual disk initialization is in progress. This alert is provided for informational purposes.	1201	None
			Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
	Communication timeout	Warning / Non-critical	Cause: The controller is unable to communicate with an enclosure. There are several reasons why communcation may be lost. For example, there may be a bad or loose cable. An unusual amount of I/O may also interrupt communication with the enclosure. In addition, communication loss may be caused by software, hardware, or firmware problems, bad or failed power supplies, and enclosure shutdown.	853	688, 610, 611
			When viewed in the Alert Log, the description for this event displays several variables. These variables are: Controller and enclosure names, type of communication problem, return code, and SCSI status.		
			Action: Check for problems with the cables. See the online help for more information on checking the cables. You should also check to see if the enclosure has degraded or failed components. To do so, select the enclosure object in the tree view and click the Health subtab. The Health subtab displays the status of the enclosure components. Verify that the controller has supported driver and firmware versions installed and that the EMMs are each running the same version of supported firmware.		
2138	Enclosure alarm enabled	Ok / Normal	Cause: A user has enabled the enclosure alarm. This alert is provided for informational purposes.	851	676
			Action: None		
2139	Enclosure alarm disabled	Ok / Normal	Cause: A user has disabled the enclosure alarm. Action: None	851	677
2140	Dead disk segments restored	Ok / Normal	Cause: Disk space that was formerly "dead" or inaccessible to a redundant virtual disk has been restored. This alert is provided for informational purposes.	1201	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2141	Array disk dead segments recovered	Ok / Normal	Cause: Portions of the array disk that were formerly inaccessible have been recovered. This alert is provided for informational purposes.	901	None
			Action: None		
2142	Controller rebuild rate has changed	Ok / Normal	Cause: A user has changed the controller rebuild rate. This alert is provided for informational purposes.	751	680
			Action: None		
2143	Controller alarm enabled	Ok / Normal	Cause: A user has enabled the controller alarm. This alert is provided for informational purposes.	751	678
			Action: None		
2144		lisabled Normal a	Cause: A user has disabled the controller alarm. This alert is provided for informational purposes.	751	679
			Action: None		
2145	Controller battery low	ontroller battery low Warning/	Cause: The controller battery charge is low.	1153	580
		Non-critical	Action: Recondition the battery. See the online help for more information		
2146	Bad block	Warning/	Cause: A portion of an array disk is damaged.	753	691
	replacement error	Non-critical	Action: See the Storage Management online help or the Dell OpenManage Server Administrator Storage Management User's Guide for more information.		
2147	Bad block sense error	Warning /	Cause: A portion of an array disk is damaged.	753	691
		Non-critical	Action: See the online help for more information.		
2148	Bad block medium	Warning/	Cause: A portion of an array disk is damaged.	753	691
	error	Non-critical	Action: See the online help for more information.		
2149	Bad block extended	Warning/	Cause: A portion of an array disk is damaged.	753	691
	sense error	Non-critical	Action: See the online help for more information.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2150	Bad block extended	Warning/	Cause: A portion of an array disk is damaged.	753	691
	medium error	Non-critical	Action: See the online help for more information.		
2151	Asset tag changed	Ok / Normal	Cause: A user has changed the enclosure asset tag. This alert is provided as an information.	851	None
			Action: None		
2152	Asset name changed	Ok / Normal	Cause: A user has changed the enclosure asset name. This alert is provided for informational purposes.	851	None
			Action: None		
2153	Service tag changed	Warning / Non-critical	Cause: An enclosure service tag was changed. In most circumstances, this service tag should only be changed by Dell support or your service provider.	753	None
			Action: Ensure that the tag was changed under authorized circumstances.		
2154	Maximum temperature probe warning threshold value changed	remperature probe Normal r warning threshold t	Cause: A user has changed the value for the maximum temperature probe warning threshold. This alert is provided for informational purposes.	1051	None
			Action: None		
2155	Minimum temperature probe warning threshold value changed	Ok / Normal	Cause: A user has changed the value for the minimum temperature probe warning threshold. This alert is provided for informational purposes. Action: None	1051	None
2156	Controller alarm has been tested	Ok / Normal	Cause: The controller alarm test has run successfully. This alert is provided for informational purposes. Action: None	751	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2157	Controller configuration has been reset	Ok / Normal	Cause: A user has reset the controller configuration. See the online help for more information. This alert is provided for informational purposes.	751	None
			Action: None		
2158	Array disk online	Ok / Normal	Cause: An offline array disk has been made online. This alert is provided for informational purposes.	901	None
			Action: None		
2159	Virtual disk renamed	Ok / Normal	Cause: A user has renamed a virtual disk. This alert is provided for informational purposes. NOTE: When renaming a virtual disk on a PERC 2, 2/Si, 3/Si, 3/Di, CERC SATA 1.5/6ch, or CERC SATA 1.5/2s controller, this alert displays the new virtual disk name. On the PERC 2/SC, 2/DC, 3/SC, 3/DCL, 3/DC, 3/QC, 4/SC, 4/DC, 4e/DC, 4/Di, 4/IM, 4e/Si, 4e/Di, and CERC ATA 100/4ch controllers, this alert displays the original virtual disk name.	1201	608
			Action: None		
2160	Dedicated hotspare assigned	Ok / Normal	Cause: A user has assigned an array disk as a dedicated hot spare to a virtual disk. See the online help for more information. This alert is provided for informational purposes.	901	574
			Action: None		
2161	Dedicated hotspare unassigned	Ok / Normal	Cause: A user has unassigned an array disk as a dedicated hot spare to a virtual disk. See the online help for more information. This alert is provided for informational purposes.	901	575
			Action: None		
2162	Communication regained	Ok / Normal	Cause: Communication with an enclosure has been restored. This alert is provided for informational purposes.	851	None
			Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2163	Rebuild completed with errors	Ok / Normal	See the online help for more information.	904	690
2164	See the Readme file for a list of validated controller driver versions	Ok / Normal	Cause: Storage Management is unable to determine whether the system has the minimum required versions of the RAID controller drivers.	101	None
			Action: This alert is generated for informational purposes. See the Readme file for driver and firmware requirements. In particular, if Storage Management experiences performance problems, you should verify that you have the minimum supported versions of the drivers and firmware installed.		
2165	The RAID controller firmware and driver validation was not performed. The configuration file cannot be opened.	Warning / Non-critical	Cause: Storage Management is unable to determine whether the system has the minimum required versions of the RAID controller firmware and drivers. This situation may occur for a variety of reasons. For example, the installation directory path to the configuration file may not be correct. The configuration file may also have been removed or renamed.	753	None
			Action: Reinstall Storage Management		
2166	The RAID controller firmware and driver validation was not performed. The configuration file is out of date or corrupted.	Warning / Non-critical	Cause: Storage Management is unable to determine whether the system has the minimum required versions of the RAID controller firmware and drivers. This situation has occurred because a configuration file is unreadable or missing data. The configuration file may be corrupted.	753	None
			Action: Reinstall Storage Management.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
version and RAID SCS version are the minimal required let See the Re- for a list of	The current kernel version and the non-RAID SCSI driver version are older than the minimum required levels.	Warning / Non-critical	Cause: The version of the kernel and the driver do not meet the minimum requirements. Storage Management may not be able to display the storage or perform storage management functions until you have updated the system to meet the minimum requirements.	103	None
	See the Readme file for a list of validated kernel and driver versions.		Action: See the Readme file for kernel and driver requirements. Update the system to meet the minimum requirements and then reinstall Storage Management.		
dri tha	driver version is older than the minimum required level.	Warning / Non-critical	Cause: The version of the driver does not meet the minimum requirements. Storage Management may not be able to display the storage or perform storage management functions until you have updated the system	103	None
	See the Readme file for the validated driver version.		to meet the minimum requirements. Action: See the Readme file for the driver requirements. Update the system to meet the minimum requirements and then reinstall Storage Management.		
2169	The controller battery needs to be replaced.		Cause: The controller battery cannot recharge. The battery may be old or it may have been already recharged the maximum number of times. In addition, the battery charger may not be working.	1154	None
			Action: Replace the battery pack.		
2170	The controller battery charge level is normal.		Cause: This alert is provided for informational purposes.	1151	None
			Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2171		emperature is above Non-critical cormal.	Cause: The battery may be recharging, the room temperature may be too hot, or the fan in the system may be degraded or failed.	1153	None
			Action: If this alert was generated due to a battery recharge, the situation will correct when the recharge is complete. You should also check if the room temperature is normal and that the system components are functioning properly.		
2172	The controller battery temperature is	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
normal.	normal.	ıal.	Action: None		
2174	The controller battey has been removed.		Cause: The controller cannot communicate with the battery, the battery may be removed, or the contact point between the controller and the battery may be burnt or corroded.	1153	None
			Action: Replace the battery if it is not in. If the contact point between the battery and the controller is burnt or corroded, you will need to replace either the battery or the controller, or both. See the hardware documentation for information on how to safely access, remove, and replace the battery.		
2175	The controller battery has been replaced.	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
			Action: None		
2176	The controller battery Learn cycle has	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
	started.		Action: None		
2177	The controller battery Learn cycle has completed.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	1151	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2178	The controller battery Learn cycle has timed out.		Cause: The controller battery must be fully charged before the Learn cycle can begin. The battery may be unable to maintain a full charge causing the Learn cycle to timeout. Additionally, the battery must be able to maintain cached data for a specified period of time in the event of a power loss. For example, some batteries maintain cached data for 24 hours. If the battery is unable to maintain cached data for the required period of time, then the Learn cycle will timeout.	1153	None
			Action: Replace the battery pack as the battery is unable to maintain a full charge.		
2179	The controller battery Learn cycle has been postponed.		Cause: This alert is provided for informational purposes.	1151	None
			Action: None		
2180	The controller battery C Learn cycle will start in %1 days. NOTE: The %1 is a variable that will be filled in with the number of days before which the Learn cycle will start. You can set the duration to start the Learn cycle.	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
			Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2181	The controller battery Learn cycle will start in % hours. NOTE: The %1 is a variable that will be filled in with the number of hours before which the Learn cycle will start. You can set the duration to start the Learn cycle.		Cause: This alert is provided for informational purposes. Action: None	1151	None
2182	An invalid SAS configuration has been detected.	Critical / Failure / Error	Cause: The controller and attached enclosures are not cabled correctly. Action: See the hardware documentation for information on correct cabling configurations.	754	None
2186	The controller cache has been discarded.	Warning / Non-critical	Cause: The controller has flushed the cache and any data in the cache has been lost. This may happen if the system has memory or battery problems that cause the controller to distrust the cache. Although user data may have been lost, this alert does not always indicate that relevant or user data has been lost. Action: Verify that the battery and memory	753	None
2187	Single-bit ECC error limit exceeded.	Warning / Non-critical	are functioning properly. Cause: The system memory is malfunctioning.	753	None
			Action: Replace the battery pack.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2188	The controller write policy has been changed to "Write Through."	Warning / Non-critical	Cause: The controller battery is unable to maintain cached data for the required period of time. For example, if the required period of time is 24 hours, the battery is unable to maintain cached data for 24 hours. It is normal to receive this alert during the battery Learn cycle as the Learn cycle discharges the battery before recharging it. When discharged, the battery cannot maintain cached data.	1153	None
			Action: Check the health of the battery. If the battery is weak, replace the battery pack.		
2189	The controller write policy has been changed to "Write Back."	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
			Action: None		
2191	Multiple enclosures are attached to the controller. This is an unsupported configuration.	Critical / Failure / Error	Cause: Many enclosures are attached to the controller port. When the enclosure limit is exceeded, the controller loses contact with all enclosures attached to the port. Action: Remove the last enclosure. You must remove the enclosure that has been added last and is causing the enclosure limit to exceed.	854	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2192	The virtual disk "Check Consistency" has made corrections and completed.	Ok / Normal	Cause: The virtual disk "Check Consistency" has identified errors and made corrections. For example, the "Check Consistency" may have encountered a bad disk block and remapped the disk block to restore data consistency. This alert is provided for informational purposes.	1203	None
			Action: Monitor the battery and cache health to make sure they are functioning properly. Monitor the Alert Log for events related to the battery and write policy changes. You should also monitor the Alert Log for events related to disk errors. If you suspect that the battery or a disk have problems, replace the battery pack or the disk.		
2193	The virtual disk reconfigure has	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	None
	resumed.		Action: None		
2194	The virtual disk read policy has changed.	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	None
			Action: None		
2199	The virtual disk cache policy has changed.	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	None
			Action: None		
2201	A global hot spare failed.	Warning / Non-critical	Cause: The controller is unable to communicate with a disk that is assigned as a global hot spare. The disk may have failed or been removed. There may also be a bad or loose cable.	903	None
			Action: Check if the disk is healthy and that it has not been removed. Check the cables.		
			If necessary, replace the disk and reassign the hot spare.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2202	A global hot spare has been removed.		Cause: The controller is unable to communicate with a disk that is assigned as a global hot spare. The disk may have been removed. There may also be a bad or loose cable.	903	None
			Action: Check if the disk is healthy and that it has not been removed. Check the cables.		
			If necessary, replace the disk and reassign the hot spare.		
2203	A dedicated hot spare failed.		Cause: The controller is unable to communicate with a disk that is assigned as a dedicated hot spare. The disk may have failed or been removed. There may also be a bad or loose cable.	903	None
			Action: Check if the disk is healthy and that it has not been removed. Check the cables.		
			If necessary, replace the disk and reassign the hot spare.		
2204	A dedicated hot spare has been removed.		Cause: The controller is unable to communicate with a disk that is assigned as a dedicated hot spare. The disk may have been removed. There may also be a bad or loose cable.	903	None
			Action: Check if the disk is healthy and that it has not been removed. Check the cables.		
			If necessary, replace the disk and reassign the hot spare.		
2205	A dedicated hot spare has been automatically		Cause: The hot spare is no longer required because the virtual disk it was assigned to has been deleted.	903	None
	unassigned.		Action: None.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2206	The only hot spare available is a SATA disk. SATA disks cannot replace SAS disks.	Warning / Non-critical	Cause: The only array disk available to be assigned as a hot spare is using SATA technology. The array disks in the virtual disk are using SAS technology. Due to this difference in technology, the hot spare cannot rebuild data if one of the array disks in the virtual disk fails.	903	None
			Action: Add a SAS disk that is large enough to be used as the hot spare and assign the new disk as a hot spare.		
2207	The only hot spare available is a SAS disk. SAS disks cannot replace SATA disks.	Warning / Non-critical	Cause: The only array disk available to be assigned as a hot spare is using SAS technology. The array disks in the virtual disk are using SATA technology. Due to this difference in technology, the hot spare cannot rebuild data if one of the array disks in the virtual disk fails.		None
			Action: Add a SATA disk that is large enough to be used as the hot spare and assign the new disk as a hot spare.		
2211	The physical disk is not supported.	supported. Non-critical	Cause: The physical disk may not have a supported version of the firmware or the disk may not be supported by Dell.	903	None
			Action: If the disk is supported by Dell, update the firmware to a supported version. If the disk is not supported by Dell, replace the disk with one that is supported.		
2232	The controller alarm is silenced.	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
			Action: None		
2233	The BGI rate has changed.	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
			Action: None		
2234	The "Patrol Read" rate has changed.	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
			Action: None

			Action: None		
2259	An enclosure blink operation has initiated.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	851	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2260	An enclosure blink has ceased.		Cause: This alert is provided for informational purposes.	851	None
			Action: None		
2261	A global rescan has initiated.	Ok / Normal	Cause: This alert is provided for informational purposes.	101	None
			Action: None		
2262	Smart thermal shutdown is enabled.	Ok / Normal	Cause: This alert is provided for informational purposes.	101	None
			Action: None		
2263	Smart thermal shutdown is disabled.	Ok / Normal	Cause: This alert is provided for informational purposes.	101	None
			Action: None		
2264	A device is missing.	Warning / Non-critical	Cause: The controller cannot communicate with a device. The device may be removed. There may also be a bad or loose cable.	753, 803, 853, 903, 953, 1003, 1053, 1103, 1153, 1203	None
			Action: Check if the device is in and connected. If it is in, check the cables.		
			Also check the connection to the controller battery and the battery health. A battery with a weak or depleted charge may cause this alert.		
2265		inknown state. Non-critical v E c F i:	Cause: The controller cannot communicate with a device. The state of the device cannot be determined. There may be a bad or loose cable. The system may also be experiencing problems with the application programming interface (API). There could also be a problem with the driver or firmware.	753, 803, 853, 903, 953, 1003, 1053, 1103, 1153, 1203	None
			Action: Check the cables.		
			Check if the controller has a supported version of the driver and firmware. You can download the most current version of the driver and firmware from support.dell.com. Rebooting the system may also resolve this problem.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2266	Controller log file entry: %1 %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Ok/ Normal	Cause: This alert is provided for informational purposes. Action: None	751	None
2267	The controller reconstruct rate has changed.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	751	None
2268	Management has lost communication with this RAID controller and attached storage. An immediate reboot is strongly recommended to avoid further problems. If the reboot does not restore communication, there may be a hardware failure. NOTE: %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Critical / Failure / Error	Cause: Storage Management has lost communication with a device. There may be faulty hardware or loose or defective cables. Action: Reboot the system. If the problem is not resolved, check for hardware failures. Any failed component must be replaced. Make sure the cables are attached securely. See the hardware documentation for more diagnostics information.	104	None
2269	The array disk "Clear" operation has completed.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	901	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2270	2270 The array disk "Clear" operation failed.		904	None	
			Action: Check if the disk is in and not in a failed state. Make sure the cables are attached securely.		
			Restart the "Clear" operation.		
2271	The "Patrol Read" corrected a media	Ok / Normal	Cause: This alert is provided for informational purposes.	901	None
	error.		Action: None		
2272	"Patrol Read" found an uncorrectable media error.	Critical / Failure / Error	Cause: The "Patrol Read" task has faced an error that cannot be corrected. There may be a bad disk block that cannot be remapped.	903	None
			Action: Replace the array disk to avoid future data loss.		
2273	Bad media.	Critical / Failure / Error	Cause: A source (array) disk in a redundant virtual disk has a bad disk block. The algorithm that maintains redundant data has created a similar bad block on the target redundant disk to maintain consistency in disk block addressing. Data has been lost.	904	None
			Action: Restore from backup.		
2274	The array disk rebuild has resumed.	Ok / Normal	Cause: This alert is provided for informational purposes.	901	None
			Action: None		
2276	The dedicated hot spare is too small.	Warning / Non-critical	Cause: The dedicated hot spare is not large enough to protect all virtual disks that reside on the disk group.	903	None
			Action: Assign a larger disk as the dedicated hot spare.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2277	The global hot spare is too small.		903	None	
			Action: Assign a larger disk as the global hot spare.		
2278	The controller battery charge level is below a normal threshold.		Cause: The battery is discharging. A battery discharge is a normal activity during the battery Learn cycle. Before completing, the battery Learn cycle recharges the battery. You should receive alert 2179 when the recharge occurs.	1154	None
			Action: Check if the battery Learn cycle is in progress. Alert 2176 indicates that the battery Learn cycle has initiated. The battery also displays the Learn state while the Learn cycle is in progress. If a Learn cycle is not in progress, replace the battery pack.		
2279	The controller battery charge level is above a normal threshold.		Cause: This alert is provided for informational purposes. This alert indicates that the battery is recharging during the battery Learn cycle.	1151	None
			Action: None		
2280	A disk media error has been corrected.	Ok/ Normal	Cause: A disk media error was detected while the controller was completing a background task. A bad disk block was identified. The disk block has been remapped.	1201	None
			Action: Consider replacing the disk. If you receive this alert frequently, be sure to replace the disk. You should also routinely back up your data.		
2281	Virtual disk has inconsistent data.	Ok / Normal	Cause: This alert is provided for informational purposes.	1201	None
			Action: None		

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2282	Hot spare SMART polling failed.	Critical / Failure / Error	Cause: The controller firmware attempted to do SMART polling on the hot spare but was unable to complete it. The controller has lost communication with the hot spare.	904	None
			Action: Check the health of the disk assigned as a hot spare. You may need to replace the disk and reassign the hot spare. Make sure the cables are attached securely.		
2283	2283 A redundant path is broken.	Warning / Non-critical	Cause: The controller has two connectors that are connected to the same enclosure. The communication path on one connector has lost connection with the enclosure. The communication path on the other connector is reporting this loss.	903	None
			Action: Make sure the cables are attached securely.		
			Make sure both EMMs are healthy.		
2284	A redundant path has been restored.	Ok / Normal	Cause: This alert is provided for informational purposes.	901	None
			Action: None		
2285	A disk media error was corrected during	Ok / Normal	Cause: This alert is provided for informational purposes.	901	None
	recovery.		Action: None		
2286	A Learn cycle start is pending while the	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
	battery charges.		Action: None		
2287	The "Patrol Read" is paused.	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
			Action: None		
2288	The "Patrol Read" has resumed.	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
			Action: None		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2289 Multi-bit ECC error.	Critical / Failure / Error	Cause: An error involving multiple bits has been encountered during a read or write operation. The error correction algorithm recalculates parity data during read and write operations. If an error involves only a single bit, it may be possible for the error correction algorithm to correct the error and maintain parity data. An error involving multiple bits, however, usually indicates data loss. In some cases, if the multi-bit error occurs during a read operation, the data on the disk may be alright. If the multi-bit error occurrs during a write operation, data loss has occurred.	754	None	
			Action: Replace the dual in-line memory module (DIMM). The DIMM is a part of the controller battery pack. See your hardware documentation for information on replacing the DIMM. You may need to restore data from backup.		
2290	Single-bit ECC error.		Cause: An error involving a single bit has been encountered during a read or write operation. The error correction algorithm has corrected this error.	753	None
			Action: None		
2291	An EMM has been discovered.	Ok / Normal	Cause: This alert is provided for informational purposes.	851	None
			Action: None		
the enclo	Communication with the enclosure has been lost.	Critical / Failure / Error	Cause: The controller has lost communication with an EMM. The cables may be loose or defective.	854	None
			Action: Make sure the cables are attached securely.		
			Reboot the system.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2293 The EMM has	The EMM has failed.	Failure / Pailure /	Cause: The failure may be caused by a loss of power to the EMM. The EMM self test may also have identified a failure. There could also be a firmware problem or a multi-bit error.	854	None
			Action: Replace the EMM. See the hardware documentation for information on replacing the EMM.		
2294	A device has been inserted.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	752, 802, 852, 902, 952, 1002, 1052, 1102, 1152, 1202	None
2295	A device has been removed.	Critical / Failure / Error	Cause: A device has been removed and the system is no longer functioning in optimal condition. Action: Replace the device.	754, 804, 854, 904, 954, 1004, 1054, 1104, 1154, 1204	None
2296	An EMM has been inserted.	Ok/ Normal	Cause: This alert is provided for informational purposes. Action: None	851	None
2297	An EMM has been removed.	Critical / Failure / Error	Cause: An EMM has been removed. Action: Replace the EMM. See the hardware documentation for information on replacing the EMM.	854	None
2298	There is a bad sensor on an enclosure.	Warning / Non-critical	Cause: The enclosure has a bad sensor. The enclosure sensors monitor the fan speeds, temperature probes, etc. Action: See the hardware documentation for more information.	853	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2299	Bad PHY %1 NOTE: %1 is a	Critical / Failure /	Cause: There is a problem with a physical connection or PHY.	854	None
	substitution variable that will appear in the alert description for specific details about the alert.	Error	Action: Replace the EMM that contains the bad PHY. See the hardware documentation for information on replacing the EMM. Attach the storage to a different connector, if available. Make sure the cables are attached securely.		
2300	The enclosure is unstable.	Critical / Failure / Error	Cause: The controller is not receiving a consistent response from the enclosure. There could be a firmware problem or an invalid cabling configuration. If the cables are too long, they will degrade the signal.		None
			Action: Power down all enclosures attached to the system and reboot the system. If the problem persists, upgrade the firmware to the latest supported version. You can download the most current version of the driver and firmware from support.dell.com. Make sure the cable configuration is valid. See the hardware documentation for valid cabling configurations.		
2301	The enclosure has a hardware error.	Critical / Failure /	Cause: The enclosure or an enclosure component is in a Failed or Degraded state.	854	None
		Error	Action: Check the health of the enclosure and its components. Replace any hardware that is in a Failed state. See the hardware documentation for more information.		
2302	The enclosure is not responding.	Critical / Failure / Error	Cause: The enclosure or an enclosure component is in a Failed or Degraded state. Action: Check the health of the enclosure and its components. Replace any hardware that is in a Failed state. See the hardware documentation for more information.	854	None

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2303	The enclosure cannot support both SAS and SATA array disks. Array disks may be disabled.	- ,	Cause: This alert is provided for informational purposes. Action: None	851	None
2304	An attempt to hot plug an EMM has been detected. This type of hot plug is not supported.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	751	None
2305	The array disk is too small to be used for a rebuild.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	901	None
2306	Bad block table is 80% full.	80% full. Non-critical rebails to the second	Cause: The bad block table is used for remapping bad disk blocks. This table fills, as bad disk blocks are remapped. When the table is full, bad disk blocks can no longer be remapped, and disk errors can no longer be corrected. At this point, data loss can occur. The bad block table is now 80% full.	903	None
			Action: Back up your data. Replace the disk generating this alert and restore from back up.		
2307	Bad block table is full. Unable to log block %1 NOTE: %1 is a substitution variable that will appear in the alert description for specific details about	Critical / Failure / Error	Cause: The bad block table is used for remapping bad disk blocks. This table fills, as bad disk blocks are remapped. When the table is full, bad disk blocks can no longer be remapped and disk errors can no longer be corrected. At this point, data loss can occur. Action: Replace the disk generating this alert and restore from backup. You may have	904	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2309	An array disk is incompatible.	Warning / Non-critical	Cause: You have attempted to replace a disk with another disk that is using an incompatible technology. For example, you may have replaced one side of a mirror with a SAS disk when the other side of the mirror is using SATA technology.	903	None
			Action: See the hardware documentation for information on replacing disks.		
2310	A virtual disk is permanently degraded.	Critical / Failure / Error	Cause: A redundant virtual disk has lost redundancy. This may occur when the virtual disk suffers the failure of multiple array disks. In this case, both the source array disk and the target disk with redundant data have failed. A rebuild is not possible because there is no longer redundancy.	1204	None
			Action: Replace the failed disks and restore from backup.		
EMMs is not th same version. E %1 EMM1 %2 NOTE: %1 and % substitution vari	The firmware on the EMMs is not the same version. EMM0 %1 EMM1 %2 NOTE: %1 and %2 are substitution variables that will appear in the	Warning / Non-critical	Cause: The firmware on the EMM modules is not the same version. It is required that both modules have the same version of the firmware. This alert may be caused if you attempt to insert an EMM module that has a different firmware version than an existing module.	853	None
	alert description for specific details about the alert.		Action: Upgrade to the same version of the firmware on both EMM modules.		
2312	A power supply in the		Cause: The power supply has an AC failure.	1003	None
	enclosure has an AC failure.	Non-critical	Action: Replace the power supply.		
2313	A power supply in the	_	Cause: The power supply has a DC failure.	1003	None
	enclosure has a DC failure.	Non-critical	Action: Replace the power supply.

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2324	The AC power supply cable has been removed.	Critical / Failure / Error	Cause: The power cable may be pulled out or removed. The power cable may also have overheated and become warped and nonfunctional.	1004	None
			Action: Replace the power cable.		
2325	The power supply cable has been	Ok / Normal	Cause: This alert is provided for informational purposes.	1001	None
	inserted.		Action: None		
2326	A foreign configuration has been detected.	Ok / Normal	Cause: This alert is provided for informational purposes. The controller has array disks that were moved from another controller. These array disks contain virtual disks that were created on the other controller. See Import Foreign Configuration and Clear Foreign Configuration for more information.	751	None
			Action: None		
2327	The NVRAM has corrupted data. The controller is reinitializing the	rrupted data. The Non-critical introller is initializing the VRAM.	Cause: The NVRAM has corrupted data. This may ocurr after a power surge, a battery failure, or for other reasons. The controller is reinitializing the NVRAM.	753	None
	NVRAM.		Action: None. The controller is taking the required corrective action. If this alert is generated often (such as during each reboot), replace the controller.		
2328	The NVRAM has corrupt data.	Warning / Non-critical	Cause: The NVRAM has corrupt data. The controller is unable to correct the situation. Action: Replace the controller.	753	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
SAS port report: %1 NOTE: %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Warning / Non-critical	Cause: The text for this alert is generated by the controller and can vary depending on the situation.	753	None	
		Action: Make sure the cables are attached securely.			
	'		If the problem persists, replace the cable with a valid cable according to SAS specifications. If the problem still persists, you may need to replace some devices such as the controller or EMM. See the hardware documentation for more information.		
2330	SAS port report: %l NOTE: %1 is a	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
	substitution variable that will appear in the alert description for specific details about the alert.		Action: None		
2331	A bad disk block has been reassigned.	reassigned. Non-critical	Cause: The disk has a bad block. Data has been readdressed to another disk block and no data loss has occurred.	903	None
			Action: Monitor the disk for other alerts or indications of poor health. For example, you may receive alert 2306. Replace the disk if you suspect there is a problem.		
2332	A controller hot plug has been detected.	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
			Action: None		
2333	An enclosure temperature sensor differential has been	Warning / Non-critical	Cause: The firmware has detected a temperature sensor differential in the enclosure.	853	None
detected.	detected.	ected.	Action: Monitor the enclosure for other alerts related to the temperature. For example, you may receive alerts related to the fan or temperature probes. Check the health of the enclosure and its components. Replace any component that is failed.		

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2334	Controller event log: %1 NOTE: %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	751	None
2335	Controller event log: %1 NOTE: %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Warning / Non-critical	Cause: The text for this alert is generated by the controller and can vary depending on the situation. This text is from events in the controller event log that were generated while Storage Management was not running. Action: If there is a problem, review the controller event log and the Server Administrator Alert Log for significant events or alerts that may assist in diagnosing the problem. Check the health of the storage components. See the hardware documentation for more information.	753	None
2336	Controller event log: %1 NOTE: %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Critical / Failure / Error	Cause: The text for this alert is generated by the controller and can vary depending on the situation. This text is from events in the controller event log that were generated while Storage Management was not running. Action: See the hardware documentation for more information.	754	None
2337	The controller is unable to recover cached data from the battery backup unit (BBU).	Critical / Failure / Error	Cause: The controller was unable to recover data from the cache. Action: Check if the battery is charged and in good health. When the battery charge is unacceptably low, it cannot maintain cached data. Check if the battery has reached its recharge limit. The battery may need to be recharged or replaced.	1154	None

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2338	The controller has recovered cached data	Ok / Normal	Cause: This alert is provided for informational purposes.	1151	None
	from the BBU.		Action: None		
2339	The factory default settings have been	Ok / Normal	Cause: This alert is provided for informational purposes.	751	None
	restored.		Action: None		
2340	The BGI completed with uncorrectable errors.	Critical / Failure / Error	Cause: The BGI task encountered errors that cannot be corrected. The virtual disk contains array disks that have unusable disk space or disk errors that cannot be corrected.	1204	None
			Action: Replace the array disk that contains the disk errors. Review other alert messages to identify the array disk that has errors. If the virtual disk is redundant, you can replace the array disk and continue using the virtual disk. If the virtual disk is non-redundant, you may need to recreate the virtual disk after replacing the array disk. After replacing the array disk, run a "Check Consistency" task to check the data.		
2341	The "Check Consistency" operation made corrections and	Ok / Normal	Cause: This alert is provided for informational purposes. Action: None	1201	None
	completed.				
2342	The "Check Consistency" task found inconsistent	Warning / Non-critical	Cause: The data on a source disk and the redundant data on a target disk is inconsistent.	1203	None
	parity data. Data redundancy may be lost.		Action: Restart the "Check Consistency" task. If you receive this alert again, check the health of the array disks included in the virtual disk. Review the alert messages for significant alerts related to the array disks. If you suspect that an array disk has a problem, replace it and restore from backup.		

Table 4-1. Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2343	The "Check Consistency" logging	Warning / Non-critical	Cause: The "Check Consistency" operation can no longer report errors in the parity data.	1203	None
	of inconsistent parity data is disabled.		Action: See the hardware documentation for more information.		
2344	The virtual disk initialization	Warning / Non-critical	Cause: A user has cancelled the virtual disk initialization.	1203	None
	terminated.		Action: Restart the initialization.		
2345	The virtual disk initialization failed.	Critical / Failure / Error	Cause: The controller cannot communicate with the attached devices. A disk may be removed or contain errors. The cables may also be loose or defective.	ny ices.	None
			Action: Check the health of attached devices. Review the Alert Log for significant events and make sure the cables are attached securely.		
2346	Error occurred: %1 NOTE: %1 is a substitution variable	%1 is a Non-critical tion variable appear in the scription for details about	Cause: The text for this alert is generated by the firmware and can vary depending on the situation.	903	None
	that will appear in the alert description for specific details about the alert.		Action: Check the health of attached devices. Review the Alert Log for significant events. You may need to replace faulty hardware. Make sure the cables are attached securely.		
			See the hardware documentation for more information.		
2347	The rebuild failed due to errors on the	Critical / Failure /	Cause: You are attempting to rebuild data that resides on a defective disk.	904	None

	media error during the rebuild.		Action: Replace the disk.		
2351	A physical disk is marked as missing.	Ok / Normal	Cause: This alert is provided for informational purposes.	901	None
			Action: None.		
2352	A physical disk that was marked as	Ok / Normal	Cause: This alert is provided for informational purposes.	901	None
	missing has been replaced.		Action: None.		
2353		,	Cause: This alert is provided for informational purposes.	851	None
	returned to normal.		Action: None.		
2354	Enclosure firmware download in progress.	Ok / Normal	Cause: This alert is provided for informational purposes.	851	None
			Action: None.		

 Table 4-1.
 Storage Management Messages (continued)

Event ID	Description	Severity	Cause and Action	SNMP Trap Numbers	Array Manager Event Number
2355	Enclosure firmware download failed. The system was unable to download firmware to the enclosure. The controller may have lost communication with the enclosure. There may have been problems with the data transfer or the download media may be corrupt.	Warning / Non-critical	Cause: The system was unable to download firmware to the enclosure. The controller may have lost communication with the enclosure. There may have been problems with the data transfer or the download media may be corrupt.	853	None
			Action: Attempt to download the enclosure firmware again. If problems continue, check if the controller can communicate with the enclosure. Make sure that the enclosure is powered on. Check the cables and the health of the enclosure and its components.		
			To check the health of the enclosure, select the enclosure object in the tree view. The Health subtab displays a red X or yellow exclamation point for enclosure components that are failed or degraded.		
2356	SAS SMP communications error %1. NOTE: %1 is a substitution variable that will appear in the alert description for specific details about the alert.	Critical / r Failure / Error	Cause: The text for this alert is generated by the firmware and can vary depending on the situation. The reference to SMP in this text refers to SAS Management Protocol.	754	None
			Action: There may be a SAS topology error. See the hardware documentation for information on correct SAS topology configurations. There may be problems with the cables such as a loose connection or an invalid cabling configuration. See the hardware documentation for information on correct cabling configurations. Check if the firmware is a supported version.
