

Dell Networking Command-Line Reference Guide for the Z9500 Switch

9.13.0.0

Notes, cautions, and warnings

 **NOTE:** A NOTE indicates important information that helps you make better use of your product.

 **CAUTION:** A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

 **WARNING:** A WARNING indicates a potential for property damage, personal injury, or death.

Chapter 1: About this Guide	41
Objectives.....	41
Audience.....	41
Conventions.....	41
Information Icons.....	42
Chapter 2: CLI Basics	43
Accessing the Command Line.....	43
Multiple Configuration Users.....	43
Obtaining Help.....	44
Navigating the CLI.....	45
Using the no Command.....	46
Filtering show Commands.....	46
Command Modes.....	47

About this Guide

This guide provides information about the Dell EMC Networking operating system (OS) command line interface (CLI). This book also includes information about the protocols and features supported in Dell EMC Networking OS.

References

For more information about your system, go to the [Dell EMC Networking Support page](#) and refer to the following documents:

- *Dell EMC Networking OS Configuration Guide*
- *Dell EMC Networking OS Installation Guide*
- *Dell EMC Networking OS Quick Start Guide*
- *Dell EMC Networking OS Release Notes*

Topics:

- [Objectives](#)
- [Audience](#)
- [Conventions](#)
- [Information Icons](#)

Objectives

This information is intended as a reference guide for the Dell EMC Networking OS CLI commands, with detailed syntax statements, along with usage information and sample output.

 **NOTE:** For more information about when to use the CLI commands, see the *Dell EMC Networking OS Configuration Guide* for your specific system.

Audience

The *Dell EMC Networking OS CLI Guide* is intended for system administrators with an understanding of Layer 2 and Layer 3 networking technologies, who are responsible for configuring or maintaining networks.

Conventions

This guide uses the following conventions to describe command syntax:

Keyword	Keywords are in Courier font and must be entered in the CLI as listed.
<i>parameter</i>	Parameters are in italics and require a number or word to be entered in the CLI.
{X}	Keywords and parameters within braces must be entered in the CLI.
[X]	Keywords and parameters within brackets are optional.
x y	Keywords and parameters separated by a bar require you to choose one option.
x y	Keywords and parameters separated by a double bar allow you to choose any or all of the options.

Information Icons

This guide uses the following information symbols:

 **NOTE:** The Note icon signals important operational information.

 **CAUTION:** The Caution icon signals information about situations that could result in equipment damage or loss of data.

 **NOTE:** The Warning icon signals information about hardware handling that could result in injury.

CLI Basics

This chapter describes the command line interface (CLI) structure and command modes. The Dell EMC Networking operating software commands are in a text-based interface that allows you to use the launch commands, change command modes, and configure interfaces and protocols.

Topics:

- [Accessing the Command Line](#)
- [Multiple Configuration Users](#)
- [Obtaining Help](#)
- [Navigating the CLI](#)
- [Using the no Command](#)
- [Filtering show Commands](#)
- [Command Modes](#)

Accessing the Command Line

Access the CLI through a serial console port or a Telnet session.

When the system successfully boots, enter the command line in EXEC mode.

NOTE: You must have a password configured on a virtual terminal line before you can Telnet into the system. Therefore, you must use a console connection when connecting to the system for the first time.

Example

```
telnet 172.31.1.53
Trying 172.31.1.53...
Connected to 172.31.1.53.
Escape character is '^]'.
Login: username
Password: DellEMC>
```

After you log in to the switch, the prompt provides you with the current command-level information. For example:

Prompt	CLI Command Mode
DellEMC>	EXEC
DellEMC#	EXEC Privilege
DellEMC (conf) #	CONFIGURATION

NOTE: For a list of all the command mode prompts, refer to the [Command Modes](#) section.

Multiple Configuration Users

When a user enters CONFIGURATION mode and another user is already in CONFIGURATION mode, the Dell EMC Networking operating software generates an alert warning message similar to the following:

```
DellEMC#conf

% Warning: The following users are currently configuring the system:

User "" on line console0
User "admin" on line vty0 ( 123.12.1.123 )
```

```
User "admin" on line vty1 ( 123.12.1.123 )
User "Irene" on line vty3 ( 123.12.1.321 )
DellEMC#conf
```

When another user enters CONFIGURATION mode, Dell EMC Networking OS sends a message similar to the following:

```
% Warning: User "admin" on line vty2 "172.16.1.210" is in configuration
```

In this case, the user is “admin” on vty2.

Obtaining Help

As soon as you are in a Command mode, there are several ways to access help:

To obtain a list of keywords at any command mode: Type a ? at the prompt or after a keyword. There must always be a space before the ?.

To obtain a list of keywords with a brief functional description: Type help at the prompt.

To obtain a list of available options: Type a keyword, and then enter a space and a ?.

To obtain a list of partial keywords using a partial keyword: Type a partial keyword, and then enter a ?.

Example The following is an example of entering ip ? at the prompt:

```
DellEMC (conf) #ip ?
access-list          Named access-list
as-path              BGP autonomous system path filter
community-list      Add a community list entry
control-plane        Control plane configuration
dhcp                 DHCP configuration commands
domain-list          Domain name to complete unqualified host name
domain-lookup        Enable IP Domain Name System hostname translation
domain-name          Define the default domain name
ecmp                  Weighted Ecmp Configuration
ecmp-group            ECMP Group Configuration
extcommunity-list    Add a Extended community list entry
ftp                  FTP configuration commands
helper-address        DHCP relay agent configuration
host                  Add an entry to the ip hostname table
http                  HTTP configuration commands
icmp                  ICMP configuration commands
igmp                  Internet Group Management Protocol
max-frag-count        Max. fragmented packets allowed in IP re-assembly
mroute                Multicast routes and counters
msdp                  Multicast source discovery protocol
multicast-limit       Max entries in Multicast TIB
multicast-msdp        Enable IP multicast MSDP protocol
multicast-routing     Enable IP multicast forwarding
name-server           Specify address of name server to use
pim                   Protocol Independent Multicast
prefix-list           Build a prefix list
radius                Interface configuration for RADIUS
redirect-list         Named redirect-list
route                  Establish static routes
route-export          Export routes
route-import          Import routes
scp                    SCP configuration commands
source-route          Process packets with source routing header options
ssh                    SSH configuration commands
tacacs                Interface configuration for TACACS+
tcp                    global tcp settings
telnet                Specify telnet options
tftp                  TFTP configuration commands
unicast-host-route    Configuration for ip unicast address-family
unknown-unicast       Enable IPv4 unknown-unicast packets to CPU
vlan-flooding          Vlan flooding
vrf                    Configure VRF instance
```

When entering commands, you can take advantage of the following timesaving features:

- Commands are not case-sensitive.
- Enter partial (truncated) command keywords. For example, you can enter `int teng 1/1` for the `interface tengigabitethernet 1/1` command.
- Use the TAB key to complete keywords in commands.
- Use the up Arrow key to display the last enabled command.
- Use either the Backspace key or Delete key to erase the previous character.
- Use the left and right Arrow keys to navigate left or right in the Dell EMC Networking OS command line.

The shortcut key combinations at the Dell EMC Networking OS command line are as follows:

Key Combination	Action
CNTL-A	Moves the cursor to the beginning of the command line.
CNTL-B	Moves the cursor back one character.
CNTL-D	Deletes the character at the cursor.
CNTL-E	Moves the cursor to the end of the line.
CNTL-F	Moves the cursor forward one character.
CNTL-I	Completes a keyword.
CNTL-K	Deletes all the characters from the cursor to the end of the command line.
CNTL-L	Re-enters the previous command.
CNTL-N	Returns to the more recent commands in the history buffer after recalling commands with Ctrl-P or the up Arrow key.
CNTL-P	Recalls commands, beginning with the last command.
CNTL-R	Re-enters the previous command.
CNTL-U	Deletes the line.
CNTL-W	Deletes the previous word.
CNTL-X	Deletes the line.
CNTL-Z	Ends continuous scrolling of the command outputs.
Esc B	Moves the cursor back one word.
Esc F	Moves the cursor forward one word.
Esc D	Deletes all the characters from the cursor to the end of the word.

Navigating the CLI

The Dell EMC Networking OS displays a CLI prompt comprised of the host name and CLI mode.

- Host name is the initial part of the prompt and is "Dell" by default. You can change the host name with the `hostname` command.
- CLI mode is the second part of the prompt and reflects the current CLI mode. For a list of the Dell EMC Networking OS command modes, see the *command mode list* in [Accessing the Command Line](#).

The CLI prompt changes as you move up and down the levels of the command structure. Starting with CONFIGURATION mode, the command prompt adds modifiers to further identify the mode. For more information about command modes, see [Command Modes](#).

Using the no Command

To disable, delete or return to default values, use the `no` form of the commands.

For most commands, if you type the keyword `no` in front of the command, you disable that command or delete it from the running configuration. In this guide, the `no` form of the command is described in the Syntax portion of the command description.

Filtering show Commands

You can filter commands using the `show` command to find specific information, display certain information only, or begin the command output at the first instance of a regular expression or phrase.

Execute a `show` command and a pipe (`|`), and one of the following parameters and a regular expression to show output that either excludes or includes the specified parameters.

NOTE: The Dell EMC Networking OS accepts a space before or after the pipe, no space before or after the pipe, or any combination. For example: `command | grep gigabit |except regular-expression | find regular-expression`.

except Displays only the text that does not match the pattern (or regular expression).

find Searches for the first occurrence of a pattern.

grep Displays text that matches a pattern.

The `grep` command option has an `ignore-case` suboption that makes the search case-insensitive. For example, the commands:

```
show run | grep Ethernet interface TenGigabitEthernet 1/1.
```

```
show run | grep ethernet Does not return the previous search result because it only searches for instances containing a noncapitalized ethernet.
```

```
show run | grep Ethernet ignore-case Returns instances containing both Ethernet and ethernet.
```

no-more Does not paginate the display output.

save Copies the output to a file for future use.

Displaying All Output

Use the `no-more` option after the pipe to display all output at once — not one screen at a time. This operation is similar to terminal `length screen-length` except that the `no-more` option affects the output of just the specified command. For example: `show running-config|no-more`.

Filtering the Command Output Multiple Times

You can filter a single command output multiple times. To filter a command output multiple times, place the `save` option as the last filter. For example: `command | grep regular-expression | except regular-expression | grep other-regular-expression | find regular-expression | no-more | save`.

Command Modes

To navigate and launch various CLI modes, use specific commands. Navigation to these modes is described in the following sections.

BGP ADDRESS-FAMILY Mode

To enable or configure IPv4 for BGP, use BGP ADDRESS-FAMILY mode. For more information, see [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enter BGP ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER BGP mode.
2. Enter the `address-family` command.
3. Enter the protocol type:
 - For IPv4, enter the `ipv4 multicast` command. The prompt changes to include `conf-router_bgp_af` for IPv4.

CLASS-MAP Mode

To create or configure a class map, use CLASS-MAP mode. For more information, see [Policy-Based QoS Commands](#).

To enter CLASS-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `class-map` command, and then enter the class map name. The prompt changes to include `config-class-map`.

You can return to CONFIGURATION mode by using the `exit` command.

CONFIGURATION Mode

In EXEC Privilege mode, use the `configure` command to enter CONFIGURATION mode and configure routing protocols and access interfaces.

To enter CONFIGURATION mode:

1. Verify that you are logged in to EXEC Privilege mode.
2. Enter the `configure` command. The prompt changes to include `conf`.

From this mode, you can enter INTERFACE mode by using the `interface` command.

CONTROL-PLANE Mode

To manage control-plane traffic, use CONTROL-PLANE mode. For more information, see [Control Plane Policing \(CoPP\)](#).

To enter CONTROL-PLANE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `control-plane-cpuqos` command. The prompt changes to include `conf-control-cpuqos`.

You can return to CONFIGURATION mode by using the `exit` command.

DHCP Mode

To enable and configure Dynamic Host Configuration Protocol (DHCP), use DHCP mode. For more information, see [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip dhcp server` command. The prompt changes to include `config-dhcp`.

You can return to CONFIGURATION mode by using the `exit` command.

DHCP POOL Mode

To create an address pool, use DHCP POOL mode. For more information, see [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP POOL mode:

1. Verify that you are logged in to DHCP mode.
2. Enter the `pool` command then the pool name. The prompt changes to include `config-dhcp-pool-name`.

You can return to DHCP mode by using the `exit` command.

ECMP GROUP Mode

To enable or configure traffic distribution monitoring on an ECMP link bundle, use ECMP GROUP mode. For more information, see [ecmp_overview](#).

To enter ECMP GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ecmp-group` command then enter the ECMP group ID. The prompt changes to include `conf-ecmp-group-ecmp-group-id`.

You can return to CONFIGURATION mode by using the `exit` command.

EIS Mode

To enable or configure Egress Interface Selection (EIS), use EIS mode.

To enter EIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `management egress-interface-selection` command. The prompt changes to include `conf-mgmt-eis`.

You can return to CONFIGURATION mode by using the `exit` command.

EXEC Mode

When you initially log in to the switch, by default, you are logged in to EXEC mode. This mode allows you to view settings and enter EXEC Privilege mode, which is used to configure the device.

When you are in EXEC mode, the `>` prompt is displayed following the host name prompt, which is “Dell” by default. You can change the host name prompt using the `hostname` command.

 **NOTE:** Each mode prompt is preceded by the host name.

EXEC Privilege Mode

The `enable` command accesses EXEC Privilege mode. If an administrator has configured an “Enable” password, you are prompted to enter it.

EXEC Privilege mode allows you to access all the commands accessible in EXEC mode, plus other commands, such as to clear address resolution protocol (ARP) entries and IP addresses. In addition, you can access CONFIGURATION mode to configure interfaces, routes and protocols on the switch. While you are logged in to EXEC Privilege mode, the `#` prompt is displayed.

EXTENDED COMMUNITY LIST Mode

To enable and configure a BGP extended community, use EXTENDED COMMUNITY LIST mode.

To enter EXTENDED COMMUNITY LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip extcommunity-list` command then a community list name. The prompt changes to include `conf-ext-community-list`.

You can return to CONFIGURATION mode by using the `exit` command.

FRRP Mode

To enable or configure Force10 Resilient Ring Protocol (FRRP), use FRRP mode. For more information, see [Force10 Resilient Ring Protocol \(FRRP\)](#).

To enter FRRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol frrp` command then the ring ID. The prompt changes to include `conf-frrp-ring-id`.

You can return to CONFIGURATION mode by using the `exit` command.

INTERFACE Mode

Use INTERFACE mode to configure interfaces or IP services on those interfaces. An interface can be physical (for example, a Gigabit Ethernet port) or virtual (for example, the Null interface).

To enter INTERFACE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `interface` command and then enter an interface type and interface number that is available on the switch.

NOTE: In Dell EMC Networking OS, the stack unit number and interfaces start from 0. But in Dell EMC Networking OS Open Networking platforms, the stack unit number and interfaces start from 1.

The prompt changes to include the designated interface and slot/port number. For example:

Prompt	Interface Type
DellEMC (conf-if) #	INTERFACE mode
DellEMC (conf-if-gi-0/0) #	Gigabit Ethernet interface then the slot/port information
DellEMC (conf-if-te-0/0) #	Ten-Gigabit Ethernet interface then slot/port information
DellEMC (conf-if-fo-0/0) #	Forty-Gigabit Ethernet interface then slot/port information
DellEMC (conf-if-lo-0) #	Loopback interface number
DellEMC (conf-if-nu-0) #	Null Interface then zero
DellEMC (conf-if-po-0) #	Port-channel interface number. The range is from 1 to 512.
DellEMC (conf-if-vl-0) #	VLAN Interface then VLAN number (range 1–4094)
DellEMC (conf-if-ma-0/0) #	Management Ethernet interface then slot/port information
DellEMC (conf-if-tu-0) #	Tunnel interface then tunnel ID.
DellEMC (conf-if-range) #	Designated interface range (used for bulk configuration).

IP ACCESS LIST Mode

To enter IP ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `ip access-list standard` command or the `ip access-list extended` command.

To enter IP ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter either the `ip access-list standard` command or the `ip access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-nacl` or `conf-ext-nacl`.
You can return to CONFIGURATION mode by using the `exit` command.

ISIS ADDRESS-FAMILY Mode

To enable or configure IPv6 for ISIS, use ISIS ADDRESS-FAMILY mode. For more information, see [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ISIS ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER ISIS mode.
2. Enter the `address-family ipv6 unicast` command. The prompt changes to include `conf-router_isis-af_ipv6`.

LLDP Mode

To enable and configure Link Layer Discovery Protocol (LLDP), use LLDP mode. For more information, see [Link Layer Discovery Protocol \(LLDP\)](#).

To enter LLDP mode:

1. To enable LLDP globally, verify that you are logged in to CONFIGURATION mode. To enable LLDP on an interface, verify that you are logged in to INTERFACE mode.
2. Enter the `protocol lldp` command. The prompt changes to include `conf-lldp` or `conf-if-interface-lldp`.

LLDP MANAGEMENT INTERFACE Mode

To enable and configure Link Layer Discovery Protocol (LLDP) on management interfaces, use LLDP MANAGEMENT INTERFACE mode.

To enter LLDP MANAGEMENT INTERFACE mode:

1. Verify that you are logged in to LLDP mode.
2. Enter the `management-interface` command. The prompt changes to include `conf-lldp-mgmtIf`.

LINE Mode

To configure the console or virtual terminal parameters, use LINE mode.

To enter LINE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `line` command. Include the keywords `console` or `vtty` and their line number available on the switch. The prompt changes to include `config-line-console` or `config-line-vty`.

You can exit this mode by using the `exit` command.

MAC ACCESS LIST Mode

To enter MAC ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `mac access-list standard` or `mac access-list extended` command.

To enter MAC ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `mac access-list standard` command or the `mac access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-macl` or `conf-ext-macl`.

You can return to CONFIGURATION mode by using the `exit` command.

MONITOR SESSION Mode

To enable and configure a traffic monitoring session using port monitoring, use MONITOR SESSION mode. For more information, see [Port Monitoring](#).

To enter MONITOR SESSION mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `monitor session` command, and then the session ID. The prompt changes to include `conf-mon-sess-sessionID`.

MULTIPLE SPANNING TREE (MSTP) Mode

To enable and configure MSTP, use MULTIPLE SPANNING TREE mode. For more information, see [Multiple Spanning Tree Protocol \(MSTP\)](#).

To enter MULTIPLE SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree mstp` command. The prompt changes to include `conf-mstp`. You can return to CONFIGURATION mode by using the `exit` command.

OPENFLOW INSTANCE Mode

To enable and configure OpenFlow instances, use OPENFLOW INSTANCE mode.

To enter OPENFLOW INSTANCE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `openflow of-instance` command, and then the OpenFlow ID number of the instance you want to create or configure. The prompt changes to include `conf-of-instance of-id`. You can return to the CONFIGURATION mode by entering the `exit` command.

Per-VLAN SPANNING TREE (PVST+) Plus Mode

To enable and configure the Per-VLAN Spanning Tree (PVST+) protocol, use PVST+ mode. For more information, see [Per-VLAN Spanning Tree Plus \(PVST+\)](#).

 **NOTE:** The protocol name is PVST+, but the plus sign is dropped at the CLI prompt.

To enter PVST+ mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree pvst` command. The prompt changes to include `conf-pvst`. You can return to CONFIGURATION mode by using the `exit` command.

PORT-CHANNEL FAILOVER-GROUP Mode

To configure shared LAG state tracking, use PORT-CHANNEL FAILOVER-GROUP mode. For more information, see [Port Channel Commands](#).

To enter PORT-CHANNEL FAILOVER-GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `port-channel failover-group` command. The prompt changes to include `conf-po-failover-grp`. You can return to CONFIGURATION mode by using the `exit` command.

PREFIX-LIST Mode

To configure a prefix list, use PREFIX-LIST mode.

To enter PREFIX-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip prefix-list` command and the name for the prefix list. The prompt changes to include `conf-nprefixl`. You can return to CONFIGURATION mode by using the `exit` command.

PROTOCOL GVRP Mode

To enable and configure GARP VLAN Registration Protocol (GVRP), use PROTOCOL GVRP mode. For more information, see [GARP VLAN Registration \(GVRP\)](#).

To enter PROTOCOL GVRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol gvrp` command. The prompt changes to include `config-gvrp`.

You can return to CONFIGURATION mode by using the `exit` command.

RAPID SPANNING TREE (RSTP) Mode

To enable and configure RSTP, use RSTP mode. For more information, see [Rapid Spanning Tree Protocol \(RSTP\)](#).

To enter RSTP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree rstp` command. The prompt changes to include `conf-rstp`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTE-MAP Mode

To configure a route map, use ROUTE-MAP mode.

To enter ROUTE-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `route-map map-name [permit | deny] [sequence-number]` command. The prompt changes to include `config-route-map`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTER BGP Mode

To enable and configure Border Gateway Protocol (BGP), use ROUTER BGP mode. For more information, see [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enter ROUTER BGP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router bgp` command, and then enter the AS number. The prompt changes to include `conf-router_bgp`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTER ISIS Mode

To enable and configure Intermediate System to Intermediate System (ISIS), use ROUTER ISIS mode. For more information, see [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ROUTER ISIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router isis` command. The prompt changes to include `conf-router_isis`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTER OSPF Mode

To configure OSPF, use ROUTER OSPF mode. For more information, see [Open Shortest Path First \(OSPFv2\)](#).

To enter ROUTER OSPF mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router ospf {process-id}` command. The prompt changes to include `conf-router_ospf-id`.

You can switch to INTERFACE mode by using the `interface` command or you can switch to ROUTER RIP mode by using the `router rip` command.

ROUTER OSPFV3 Mode

To configure OSPF for IPv6, use ROUTER OSPFV3 mode.

To enter ROUTER OSPFV3 mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ipv6 router ospf {process-id}` command. The prompt changes to include `conf-ipv6-router_ospf`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTER RIP Mode

To enable and configure Router Information Protocol (RIP), use ROUTER RIP mode. For more information, see [Routing Information Protocol \(RIP\)](#).

To enter ROUTER RIP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router rip` command. The prompt changes to include `conf-router_rip`.

You can return to CONFIGURATION mode by using the `exit` command.

SPANNING TREE Mode

To enable and configure the Spanning Tree protocol, use SPANNING TREE mode. For more information, see [Spanning Tree Protocol \(STP\)](#).

To enter SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree stp-id` command. The prompt changes to include `conf-stp`.

You can return to CONFIGURATION mode by using the `exit` command.

SupportAssist Mode

To enable and configure the SupportAssist, use SupportAssist mode. For more information, see [SupportAssist](#).

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `support-assist` command. The prompt changes to include `conf-supportassist`.

You can return to CONFIGURATION mode by using the `exit` command.

TRACE-LIST Mode

To configure a Trace list, use TRACE-LIST mode.

To enter TRACE-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip trace-list` command, and the name of the Trace list. The prompt changes to include `conf-trace-acl`.

You can exit this mode by using the `exit` command.

VLT DOMAIN Mode

To enable and configure the VLT domain protocol, use VLT DOMAIN mode. For more information, see [Virtual Link Trunking \(VLT\)](#).

To enter VLT DOMAIN mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `vlt domain` command, and then the VLT domain number. The prompt changes to include `conf-vlt-domain`. You can return to CONFIGURATION mode by entering the `exit` command.

VRRP Mode

To enable and configure Virtual Router Redundancy Protocol (VRRP), use VRRP mode. For more information, see [Virtual Router Redundancy Protocol \(VRRP\)](#).

To enter VRRP mode:

1. To enable VRRP globally, verify that you are logged in to CONFIGURATION mode.
2. Enter the `vrrp-group` command, and then enter the VRRP group ID. The prompt changes to include `conf-if-interface-type-slot/port-vrid-vrrp-group-id`.

File Management

This section contains command line interface (CLI) commands needed to manage the configuration files, as well as other file management commands.

Topics:

- [boot system](#)
- [format flash](#)
- [restore factory-defaults](#)
- [show boot system](#)
- [show bootvar](#)
- [show file](#)
- [show os-version](#)
- [show running-config](#)
- [show startup-config](#)
- [show version](#)
- [upgrade boot](#)
- [upgrade fpga-image linecard booted](#)
- [upgrade fpga-image system cpld booted](#)
- [upgrade fpga-image system fpga booted](#)
- [upgrade system](#)
- [verify](#)

boot system

Specify the location where the Dell EMC Networking OS image used to boot the system is stored.

Syntax `boot system {gateway ip address | {default | primary | secondary} {system {A: | B:} | tftp: | ftp:}}`

To return to the default boot sequence, use the `no boot system` command.

Parameters		
gateway		Enter the IP address of the default next-hop gateway for the management subnet.
ip-address		Enter an IP address in dotted decimal format.
default		Enter the keyword <code>default</code> to use the default Dell EMC Networking OS image.
primary		Enter the keyword <code>primary</code> to use the primary Dell EMC Networking OS image.
secondary		Enter the keyword <code>secondary</code> to use the secondary Dell EMC Networking OS image.
system A: B:		Enter <code>A:</code> or <code>B:</code> to boot one of the system partitions.
tftp:		Enter the keyword <code>TFTP:</code> to retrieve the image from a TFTP server: <code>tftp://host-ip/filepath</code> .
ftp:		Enter the keyword <code>FTP:</code> to retrieve the image from an FTP server: <code>ftp://userid:password@host-ip/filepath</code> .

Defaults Not configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced the support for <code>bmp-boot</code> on the S-Series and Z-Series switches.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Usage Information

To display these changes in the `show bootvar` command output, save the running configuration to the startup configuration (using the `copy` command) and reload system.

format flash

Erase all existing files and reformat the file system in the internal flash memory or the USB drive. After the file system is formatted, files cannot be restored.

Syntax `format [flash: | slot0: | usbflash:]`

Parameters **flash: | usbflash:**

- `flash:` reformat the file system in the internal flash memory.
- `usbflash:` reformat the file system in the usbflash.

Defaults **flash memory**

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.

Usage Information

Include the colon (:) when entering this command.

CAUTION: This command deletes all files, including the startup configuration file. So, after executing this command, consider saving the running config as the startup config (use the `write memory` command or `copy run start` command).

restore factory-defaults

Restore factory defaults.

Syntax `restore factory-defaults stack-unit {stack-unit-number | all} {clear-all | bootvar | nvram}`

Parameters	factory-defaults	Return the system to its factory default mode.
	stack-unit-number	Enter the stack member unit identifier to restore only the mentioned stack-unit.
	all	Enter the keyword <code>all</code> to restore all units in the stack.
	bootvar	Enter the keyword <code>bootvar</code> to reset boot line.
	clear-all	Enter the keywords <code>clear-all</code> to reset the NvRAM, boot environment variables, and the system startup configuration.
	nvram	Enter the keyword <code>nvram</code> to reset the NvRAM only.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Added <i>bootvar</i> as a new parameter.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

Usage Information Restoring factory defaults deletes the existing startup configuration and all persistent settings (stacking, fan-out, and so forth).

When restoring all units in a stack, all the units in the stack are placed into stand-alone mode.

When restoring a single unit in a stack, that unit placed in stand-alone mode. No other units in the stack are affected.

When restoring units in stand-alone mode, the units remain in stand-alone mode after the restoration. After the restore is complete, the units power cycle immediately.

 **CAUTION: There is no undo for this command.**

Following are the factory-default environment variables:

- baudrate
- primary_boot
- secondary_boot
- default_boot
- ipaddr
- gatewayip
- netmask
- macaddr

- mgmtautoneg
- mgmtspeek100
- mgmtfullduplex

Each boot path variable (primary_boot, secondary_boot, and default_boot) is further split into the following three independent variables:

- primary_server, primary_file, and primary_type
- secondary_server, secondary_file, and secondary_type
- default_server, default_file, and default_type

i **NOTE:** For information on the default values that these variables take, refer to the Restoring Factory Default Environment Variables section in the *Dell EMC Networking OS Configuration guide*.

Example (all stack units)

```
DellEMC# restore factory-defaults stack-unit all clear-all
*****
* Warning - Restoring factory defaults will delete the existing *
* startup-config and all persistent settings (stacking, fanout, etc.)*
* All the units in the stack will be split into standalone units. *
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
*****
Proceed with factory settings? Confirm [yes/no]:yes
-- Restore status --
Unit Nvram      Config
-----
1      Success   Success
2      Success   Success
3      Success   Success
4      Not present
5      Not present
Power-cycling the unit(s).
DellEMC#
```

Example (single stack)

```
DellEMC# restore factory-defaults stack-unit 1 clear-all
*****
* Warning - Restoring factory defaults will delete the existing *
* startup-config and all persistent settings (stacking, fanout, etc.)*
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
*****
Proceed with factory settings? Confirm [yes/no]:yes
-- Restore status --
Unit Nvram      Config
-----
1      Success   Success
Power-cycling the unit(s).
DellEMC#
```

Example (NvRAM all stack units)

```
DellEMC# restore factory-defaults stack-unit all nvram
*****
* Warning - Restoring factory defaults will delete the existing *
* persistent settings (stacking, fanout, etc.) *
* All the units in the stack will be split into standalone units. *
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
*****
Proceed with factory settings? Confirm [yes/no]:yes
-- Restore status --
Unit Nvram      Config
-----
1      Success
2      Success
3      Success
4      Not present
```

```
5      Not present
Power-cycling the unit(s).
DellEMC#
```

**Example
(NvRAM, single
unit)**

```
DellEMC# restore factory-defaults stack-unit 1 nvram
*****
* Warning - Restoring factory defaults will delete the existing *
* persistent settings (stacking, fanout, etc.) *
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
*****
Proceed with factory settings? Confirm [yes/no]:yes
-- Restore status --
Unit Nvram   Config
-----
1      Success
Power-cycling the unit(s).
DellEMC#
```

show boot system

Displays information about boot images currently configured on the system.

- Syntax** `show boot system stack-unitall`
- Parameters** **all** Enter the keyword `all` to display the boot image information for all stack units.
- Defaults** none
- Command Modes** • EXEC
 • EXEC Privilege
- Command History** This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series and E-Series.

Example

```
DellEMC# show boot system all
Current system image information in the system:
```

```

=====
Type           Boot Type      A      B
-----
CP             DOWNLOAD BOOT 9-3    9-3
RP             DOWNLOAD BOOT 9-3    9-3
linecard 0 is not present.
linecard 1 is not present.
linecard 2     DOWNLOAD BOOT 9-3    9-3
DelleMC#

```

show bootvar

Display the variable settings for the boot parameters.

Syntax `show bootvar`

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	Output expanded to display current reload mode (normal or Jumpstart).
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Example

```

DelleMC# show bootvar
PRIMARY IMAGE FILE = ftp://box:password@10.31.1.205//home/5.3.1/5.3.1.0/
FTOS-ZC-9.2.1.0.bin
SECONDARY IMAGE FILE = variable does not exist
DEFAULT IMAGE FILE = flash://FTOS-ZC-9.2.1.0.bin
LOCAL CONFIG FILE = variable does not exist
PRIMARY HOST CONFIG FILE = variable does not exist
SECONDARY HOST CONFIG FILE = variable does not exist
PRIMARY NETWORK CONFIG FILE = variable does not exist
SECONDARY NETWORK CONFIG FILE = variable does not exist
CURRENT IMAGE FILE = ftp://box:password@10.31.1.205//home/5.3.1/5.3.1.0/
FTOS-ZC-9.2.1.0.bin
CURRENT CONFIG FILE 1 = flash://startup-config
CURRENT CONFIG FILE 2 = variable does not exist
CONFIG LOAD PREFERENCE = local first

```

```
BOOT INTERFACE GATEWAY IP ADDRESS = variable does not exist
DelleMC#
```

show file

Display contents of a text file in the local filesystem.

Syntax `show file filesystem`

Parameters ***filesystem*** Enter one of the following:

- For internal flash, enter `flash`:
- For USB flash and external flash, enter `usbflash`:

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series
7.5.1.0	Introduced on the C-Series
E-Series	Original command

Example

```

```

Related Commands

show os-version

Display the release and software image version information of the image file specified.

Syntax `show os-version [file-url]`

Parameters *file-url* (OPTIONAL) Enter the following location keywords and information:

- For a file on the internal flash, enter `flash://` followed by the filename.
- For a file on an FTP server, enter `ftp://user:password@hostip/filepath`.
- For a file on the external Flash, enter `slot0://` followed by the filename.
- For a file on a TFTP server, enter `tftp://hostip/filepath`.
- For a file on the USB port, enter `usbflash://filepath`.

Defaults none

Usage Information

i **NOTE:** A filepath that contains a dot (.) is not supported.

show running-config

Display the current configuration and display changes from the default values.

Syntax

```
show running-config [entity] [configured] [status]
```

Parameters

entity

(OPTIONAL) To display that entity's current (non-default) configuration, enter one of the following keywords:

i **NOTE:** If you did not configure anything that entity, nothing displays and the prompt returns.

aaa	for the current AAA configuration
acl	for the current ACL configuration
arp	for the current static ARP configuration
as-path	for the current AS-path configuration
bfd	for the current BFD configuration
bgp	for the current BGP configuration
boot	for the current boot configuration
class-map	for the current class-map configuration
community-list	for the current community-list configuration
ecmp-group	for the current ECMP group configuration
eis	for the current EIS configuration

ethernet	for the current Ethernet CFM configuration
fehd	for the current FEFD configuration
ftp	for the current FTP configuration
frrp	for the current FRRP configuration
fvrp	for the current FVRP configuration
gvrp	for the current GVRP configuration
host	for the current host configuration
hardware-monitor	for hardware-monitor action-on-error settings
hypervisor	for the current hypervisor configuration
igmp	for the current IGMP configuration
interface	for the current interface configuration
interface port-channel	for the current port-channel interface configuration.
interface tunnel	for all configured tunnels. For a specific tunnel, enter the tunnel ID. The range is from 1 to 16383.
ip	for the current IP configuration
isis	for the current ISIS configuration
line	for the current line configuration
lldp	for the current LLDP configuration
load-balance	for the current port-channel load-balance configuration
logging	for the current logging configuration
mac	for the current MAC ACL configuration
mac-address-table	for the current MAC configuration
management-eis	for the current management EIS configuration
management-route	for the current Management port forwarding configuration
mld	for the current MLD configuration
monitor	for the current Monitor configuration
mroute	for the current Mroutes configuration
msdp	for the current MSDP configuration
ntp	for the current NTP configuration
ospf	for the current OSPF configuration
pim	for the current PIM configuration
policy-map-input	for the current input policy map configuration
policy-map-output	for the current output policy map configuration
po-failover-group	for the current port-channel failover-group configuration
prefix-list	for the current prefix-list configuration
privilege	for the current privilege configuration

qos-policy-input	for the current input QoS policy configuration
qos-policy-output	for the current output QoS policy configuration
radius	for the current RADIUS configuration
redirect-list	for the current redirect-list configuration
redundancy	for the current RPM redundancy configuration
resolve	for the current DNS configuration
rip	for the current RIP configuration
rmon	for the current RMON configuration
route-map	for the current route map configuration
sflow	for the current sFlow configuration
snmp	for the current SNMP configuration
spanning-tree	for the current spanning tree configuration
static	for the current static route configuration
status	for the file status information
support-assist	for the current SupportAssist configuration
tacacs+	for the current TACACS+ configuration
tftp	for the current TFTP configuration
trace-group	for the current trace-group configuration
trace-list	for the current trace-list configuration
uplink-state-group	for the uplink state group configuration
users	for the current users configuration
vlt	for the current VLT configuration
wred-profile	for the current wred-profile configuration

configured	(OPTIONAL) Enter the keyword <code>configuration</code> to display line card interfaces with non-default configurations only.
status	(OPTIONAL) Enter the keyword <code>status</code> to display the checksum for the running configuration and the start-up configuration.
compressed	(Optional) Enter the keyword <code>compressed</code> to display the compressed group configuration. Displays the compressed configuration by grouping all similar configurations. The compression is done only for interface related configurations.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Added support for the tunnel and EIS interface types.
9.0.0.0	Added support for the VLT option.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Added the hardware-monitor option.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Expanded to include the last configuration change, start-up last updated (date and time), and who made the change.
6.5.4.0	Added the status option.

Example

Example

```
DellEMC# show running-config status
running-config bytes 10257, checksum 0xFD33339F
startup-config bytes 10257, checksum 0xFD33339F
```

Usage Information

The `status` option allows you to display the size and checksum of the running configuration and the startup configuration.

show startup-config

Display the startup configuration.

Syntax `show startup-config`

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on S-Series
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Expanded to include the last configuration change, start-up last updated (date and time), and who made the change.

Example

```
DellEMC# show startup-config
! Version 9.2(1.0B2)
! Last configuration change at Mon Feb  3 11:24:00 2014 by default
! Startup-config last updated at Mon Feb  3 11:24:05 2014 by default
!
boot system primary system: A:
boot system secondary system: A:
boot system default system: A:
boot system gateway 1.1.1.1
!
...
```

Related Commands

- [show running-config](#) – displays the current (running) configuration.

show version

Display the current Dell EMC Networking Operating System (OS) version information on the system.

Syntax `show version`

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
7.6.1.0	Introduced on the S-Series
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Command Fields

Lines Beginning With	Description
Dell EMC Network...	Name of the operating system
Dell EMC Operating...	OS version number
Dell EMC Application...	Software version
Copyright (c)...	Copyright information
Build Time...	Software build's date stamp
Build Path...	Location of the software build files loaded on the system
Dell EMC Networking OS uptime is...	Amount of time the system has been up
System image...	Image file name
System Type:	System name
Control Processor:...	Control processor information and amount of memory on processor
128K bytes...	Amount and type of memory on system
1 Route Processor...	Hardware configuration of the system, including the number and type of physical interfaces available

upgrade boot

Upgrade the bootflash or bootselector image running in all Z9500 CPUs, including the Control Processor, Route Processor, and line cards. To upgrade the operating system image, use the `upgrade system` command.

Z9500

Syntax `upgrade boot {bootflash-image | bootselector-image} system all {booted | flash: | ftp: | scp: | tftp: | usbflash:} file-url {A: |B:}`

Parameters

bootflash-image	Enter the keyword <code>bootflash-image</code> to upgrade the GRUB bootloader image.
bootselector-image	Enter the keyword <code>bootselector-image</code> to upgrade the BIOS system image. Use this option only with TAC supervision.
system all	Enter the keywords <code>system all</code> to upgrade the bootflash or bootselector image on all Z9500 CPUs: Control Processor, Route Processor, and line-card CPUs.
booted	Enter the keyword <code>booted</code> to upgrade Z9500 CPUs using the currently loaded operating system (OS) image.

flash: | ftp: | scp: Enter one of the file transfer methods and locations to specify where the OS image (*file-url*), which you want to use to upgrade the currently loaded image, is stored:
| tftp: | usbflash: *file-url*

- `flash://filepath`.
- `ftp://userid:password@host-ip/filepath` to upgrade from an FTP server, where *host-ip* is either an IPv4 dotted decimal address or an IPv6 [x:x:x:x] format address.
- `scp://userid:password@hostip/filepath` to upgrade using secure copy.
- `tftp://host-ip/filepath` to upgrade from a TFTP server, where *host-ip* is either an IPv4 dotted decimal address or an IPv6 [x:x:x:x] format address.
- `usbflash://filepath` to upgrade from an external flash device.

A: | B: Specify the boot-flash partition to be upgraded.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0(0.0)	Added support for IPv6 for the <i>file-url</i> parameter.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000. Added support for the SSD on the Z9000 only.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for TFTP and SCP.
7.6.1.0	Introduced on the S-Series.

Usage Information A system message displays with status information about the bootflash upgrade.

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X:X:X:X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

Reload the system after executing this command.

Example

```
Dell# upgrade boot all system all booted

Current Boot information in the system:
=====
Card BootFlash Current Version New Version
-----
Linecard0 Boot Flash 3.2.1.0 3.2.1.0
Linecard1 Boot Flash 3.2.1.0 3.2.1.0
Linecard2 Boot Flash 3.2.1.0 3.2.1.0
*****
* Warning - Upgrading boot flash is inherently risky and should only *
* be attempted when necessary. A failure at this upgrade may cause *
* a board RMA. Proceed with caution ! *
*****
Dell#
```

upgrade fpga-image linecard booted

Use this command to upgrade the FPGA and CPLD devices in Z9500 line-card CPUs using the currently running Dell Networking operating-system image (and only when required by the upgrade procedure in the Z9500 release notes).

Z9500

Syntax upgrade fpga-image linecard {slot-id | all} booted

Parameters **linecard slot-id** Enter the slot ID number to specify the line-card CPU to upgrade. The range of Z9500 slot IDs is 0 to 2. Enter `linecard all` to upgrade all Z9500 line cards.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z-Series.

Example

```
Dell# upgrade fpga-image linecard all booted

Current FPGA information in the system:
=====

Card           FPGA Name      Current Version  New Version
-----
Linecard0      PORTCARD CPLD  0xac             0xb2
Linecard1      PORTCARD CPLD  0xab             0xb2

*****
* Warning - Upgrading FPGA is inherently risky and should *
* only be attempted when necessary. A failure at this upgrade may *
* cause a board RMA. Proceed with caution ! *
*****

*****
* When the upgrade has successfully completed, the system will be *
* automatically rebooted to reload the upgraded components. *
*****

Upgrade CPLD image for system [yes/no]: yes

FPGA upgrade in progress!!! Please do NOT power off the unit
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
```

Usage Information Do not restart the switch while an upgrade is progressing. Restarting the chassis during an upgrade may corrupt critical boot components.

When an upgrade of FPGA devices successfully completes, the switch reloads automatically.

Related Commands

- [upgrade fpga-image system fpga booted](#) — upgrades the FPGA devices in all Z9500 CPUs.

upgrade fpga-image system cpld booted

Use this command to upgrade the CPLD devices in the Z9500 Route Processor and Control Processor CPUs using the currently running Dell Networking operating-system image (and only when required by the upgrade procedure in the Z9500 release notes).

Z9500

Syntax upgrade fpga-image system cpld booted

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z-Series.
8.3.1.0	Added the rpm option.
7.5.1.0	Introduced on the C-Series.

Example

```
Dell# upgrade fpga-image system cpld booted

Current information in the system:
=====

Card          FPGA Name      Current Version  New Version
-----
CP            SYSTEM CPLD    0x07            0x08

*****
* Warning - Upgrading FPGA is inherently risky and should *

Example

```
Dell# upgrade fpga-image system fpga booted

Current FPGA information in the system:
=====

Card          FPGA Name      Current Version  New Version
-----
CP            FPGA           0x14             0x13

*****
* Warning - Upgrading FPGA is inherently risky and should      *
* only be attempted when necessary. A failure at this upgrade may *
* cause a board RMA. Proceed with caution !                    *
*****

Upgrade FPGA image for system [yes/no]: yes

FPGA upgrade in progress!!! Please do NOT power off the unit
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
```

Usage Information Do not restart the switch while an upgrade is progressing. Restarting the chassis during an upgrade may corrupt critical boot components.

When an upgrade of FPGA devices successfully completes, the switch reloads automatically.

Related Commands

- [upgrade fpga-image linecard booted](#) — upgrades the FPGA devices in Z9500 line cards.

upgrade system

Upgrade the Dell EMC Networking OS image on all Z9500 CPUs, including the Control Processor, Route Processor, and line cards. To upgrade the boot flash or boot selector image, use the `upgrade boot` command.

Syntax upgrade system {flash: | ftp: | nfsmount: | scp: | stack-unit {stack-unit-id | all} | tftp: | usbflash:} file-url {A: |B:}

Parameters **system** Enter the keyword `system` to upgrade the operating system (OS) image.

flash: <i>file-url</i>	Enter the keyword <code>flash:</code> and specify the location of the image file in the format <code>//directory-path</code> or press Enter to launch a prompt sequence.
ftp: <i>file-url</i>	Enter the keyword <code>ftp:</code> and specify the location of the image file in the format <code>//userid:password@host-ip/filepath</code> or press Enter to launch a prompt sequence.
nfsmount:// <mount-point>/ <i>filepath</i>	Enter the keyword <code>nfsmount:</code> and specify the location of the image file in the format <code>//<mount-point>/filepath</code> .
scp: <i>file-url</i>	Enter the keyword <code>scp:</code> and specify the location of the image file in the format <code>userid:password@host-ip/filepath</code> or press Enter to launch a prompt sequence.
stack-unit <i>stack-unit-id</i>	Enter the keyword <code>stack-unit</code> and specify the stack-unit ID to sync the image to that stack-unit.
stack-unit all	Enter the keyword <code>stack-unit</code> followed by the keyword <code>all</code> to sync the image on all stack-units.
tftp: <i>file-url</i>	Enter the keyword <code>tftp:</code> and specify the location of the image file in the format <code>//host-ip/filepath</code> or press Enter to launch a prompt sequence.
usbflash: <i>file-path</i>	Enter the keyword <code>usbflash:</code> and specify the location of the source file in the format <code>//directory-path</code> to upgrade from an external flash device or press Enter to launch a prompt sequence.
A: B:	Specify the flash partition of the operating-system image to be upgraded.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for NFS mount.
9.2(1.0)	Introduced on the Z9500.
9.0(0.0)	Added support for IPv6 for the <code>file-url</code> parameter.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000. Added support for the SSD on the Z9000 only.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for TFTP and SCP.
7.6.1.0	Introduced on the S-Series.

Usage Information RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X:X:X:X:X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

After you upgrade the system image, using the `upgrade system` command, specify the default boot location using the `boot system` command. Save the configuration to the startup configuration file using the `write memory` command and reload the system using the `reload` command to use the new Dell EMC Networking OS software.

NOTE: You can apply a set of configurations, available only in the new version to which you want to upgrade the system to, without having to re-boot the system twice. In order to accomplish this seamless upgrade, perform the following tasks:

1. Upgrade the system image to the new image and configure the primary partition to boot from the new image using the `boot system` command.
2. Update the startup configuration file with the new set of configurations and then reload the device using the `reload` command.

The new set of configurations are parsed from the startup configuration file and applied to the NVRAM. During the system boot up, the new set of configurations are applied to the system from the updated NVRAM configurations.

The following commands require NVRAM write to take effect in a single reload:

- Forwarding CLIs:
 - `hardware forwarding-table mode {scaled-12-switch | scaled-13-routes | scaled-13-hosts}`
 - `cam-ipv6 extended-prefix {1024 | 2048 | 3072}`
 - `ip ecmp-group maximum-paths 2-64`
- ACL CAM carving related CLIs:
 - `cam-acl cli`
 - `cam-acl-vlan cli`
 - `cam-acl-egress cli`
- Feature keyword CLIs:
 - `feature udf-acl`
 - `feature acl-range`

Example

verify

Validate the software image on the flash drive after the image has been transferred to the system, but before the image has been installed.

Syntax `verify { md5 | sha256 } [flash://] img-file [hash-value]`

Parameters	md5	Enter the <code>md5</code> keyword to use the MD5 message-digest algorithm.
	sha256	Enter the <code>sha256</code> keyword to use the SHA256 Secure Hash Algorithm
	flash://	(Optional). Enter the <code>flash://</code> keyword. The default is to use the flash drive. You can just enter the image file name.
	img-file	Enter the name the Dell EMC Networking software image file to validate.
	hash-value	(Optional). Enter the relevant hash published on i-Support.

Defaults flash drive

Command Modes EXEC mode

Command History Version 9.5.(0.0)

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.5(0.0)	Introduced on the Z9000, S6000, S4820T, S4810, and MXL.

Usage Information

You can enter this command in the following ways:

- **verify md5 flash:***//img-file*
- **verify md5 flash:***//img-file <hash-value>*
- **verify sha256 flash:***//img-file*
- **verify sha256 flash:***//img-file <hash-value>*

Example

Without Entering the Hash Value for Verification using SHA256

```
DellEMC# verify sha256 flash://FTOS-SE-9.5.0.0.bin
SHA256 hash for FTOS-SE-9.5.0.0.bin:
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e933
```

Entering the Hash Value for Verification using SHA256

```
DellEMC# verify sha256 flash://FTOS-SE-9.5.0.0.bin
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e933
SHA256 hash VERIFIED for FTOS-SE-9.5.0.0.bin
```

Control and Monitoring

asf-mode

Enable alternate store and forward (ASF) mode and forward packets as soon as a threshold is reached.

Syntax

```
asf-mode linecard {slot-id | all}
```

To return to standard Store and Forward mode, use the `no asf-mode` command.

Parameters

linecard *slot-id* Enter the slot ID of a line card. The range of slot IDs is from 0 to 2. Enter `all` to enable ASF mode on all line cards on the switch.

Defaults

Not configured

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P1)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Usage Information

You *must* save the configuration and reload the system to implement ASF. When you enter the command, the system sends a message stating that the new mode is enabled when the system reloads.

banner exec

Configure a message that is displayed when you enter EXEC mode.

Syntax	<code>banner exec c line c</code> To delete a banner, use the <code>no banner exec</code> command.
Parameters	<p>c Enter the keywords <code>banner exec</code>, then enter a character delineator, represented here by the letter <code>c</code>. Press ENTER.</p> <p>line Enter a text string for your banner message ending the message with your delineator. In the following example, the delineator is a percent character (%); the banner message is "testing, testing".</p>
Defaults	No banner is displayed.
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original Command

Usage Information

After entering the banner login command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

Example

```
DelleMC(conf)# banner exec ?
LINE c banner-text c, where 'c' is a delimiting character
DelleMC(conf)# banner exec %
Enter TEXT message. End with the character '%'.
This is the banner%
DelleMC(conf)# end
DelleMC# exit
2d18h1m: %STKUNIT1-M:CP %SEC-5-LOGOUT: Exec session is terminated on
console

This is the banner

Dell con0 now available

Press RETURN to get started.
2d18h2m: %STKUNIT1-M:CP %SEC-5-LOGIN_SUCCESS: Login successful on console

This is the banner
DelleMC>
```

Related Commands

- [line](#) — enables and configures the console and virtual terminal lines to the system.

banner login

Set a message of the day banner to appear after logging on to the system.

Syntax

```
banner login {acknowledgement | keyboard-interactive | c line c}
```

Enter `no banner login` to delete the banner text. Enter `no banner login keyboard-interactive` to automatically go to the banner message prompt (does not require a carriage return).

Parameters

keyboard-interactive	Enter the <code>keyboard-interactive</code> keyword and then press Enter (carriage return) to retrieve the message banner prompt.
acknowledgement	Enter the <code>acknowledgement</code> keyword to require a positive acknowledgement from the user while logging in to the system.
c	Enter a delineator character to specify the start and end of the text banner. You cannot use the delineator character in the banner message.
line	Enter text string for your text banner message, with a maximum of 50 lines and up to 255 characters per line.

Defaults

No banner is configured and a carriage return (CR) is required when creating a banner.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced the <code>acknowledgement</code> keyword.
9.8(2.0)	Introduced on the S3100 series.

8.2.1.0	Introduced the keyword <code>keyboard-interactive</code> .
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

Usage Information Enter the `banner login` command, type one or more spaces and a delineator character, type the banner text, and then type the second delineator character. The message of the day banner displays first when you are connected to the router; otherwise the login banner and prompt appear. After you have logged in, the banner EXEC (if configured) displays.

Example

```
DellEMC(conf)#banner login ?
acknowledgement      Require positive acknowledgment after login
prompt
keyboard-interactive  Press enter key to get prompt
LINE                 c banner-text(max length 255) c, where 'c' is a
delimiting character
DellEMC(conf)#no banner login ?
acknowledgement      Disable positive acknowledgment required after
login prompt
keyboard-interactive  Prompt will be displayed by default
```

If you configure the `acknowledgement` keyword, the system requires a positive acknowledgement from the user while logging in to the system.

```
$ telnet 10.11.178.16
Trying 10.11.178.16...
Connected to 10.11.178.16.
Escape character is '^]'.
THIS IS A LOGIN BANNER. PRESS 'Y' TO ACKNOWLEDGE. ACKNOWLEDGE?

[y/n]: y
Login: admin
Password:
```

Related Commands

- [banner motd](#) — sets a Message of the Day banner.
- [banner exec](#) — enables the display of a text string when you enter EXEC mode.

banner motd

Set a message of the day (MOTD) banner.

Syntax	<code>banner motd c line c</code> To delete a Message of the Day banner, enter no banner motd .
Parameters	<p>c Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).</p> <p>line Enter a text string for your MOTD banner the message with your delineator. The delineator is a percent character (%).</p>
Defaults	No banner is configured.

cam-acl

Allocate content addressable memory (CAM) for IPv4 and IPv6 ACLs.

Syntax

Parameters

default

Use the default CAM profile settings and set the CAM as follows:

- L2Acl : 2
- Ipv4Acl : 2
- Ipv6Acl : 0
- Ipv4Qos : 2
- L2Qos : 2
- L2PT : 0
- IpMacAcl : 1
- VmanQos : 0
- EtsAcl : 0
- FcoeAcl : 0
- iscsiOptAcl : 0
- ipv4pbr : 0
- vrfv4Acl : 0
- Openflow : 0
- fedgovacl : 0
- nlbclusteracl : 0

Allocate space to each CAM region.

Enter the CAM profile name then the amount of CAM space to be allotted. The total space allocated must equal to . The ipv6acl range must be a factor of 2.

Enter 4 or 8 for the number of OpenFlow FP blocks.

- 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2(0.2)	Added support for the <code>fcoe</code> parameter on the S4810 and S4820T.
9.1(0.0)	Added support for OpenFlow on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Added the keywords <code>fcoeacl</code> and <code>iscsioptacl</code> on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Added the keywords <code>ecfmacl</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

Usage Information

For the new settings to take effect, save the new CAM settings to the startup-config (`write mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from 1 to 8.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the `ipv6acl` profile which is from 0 to 10. The `ipv6acl` allocation must be a factor of .

If you enabled BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the `reload conditional nvram-cfg-change` command.

cam-acl (Configuration)

Select the default CAM allocation settings or reconfigure a new CAM allocation for Layer 2, IPv4, and IPv6 ACLs, Layer 2 and Layer 3 (IPv4) QoS, Layer 2 Protocol Tunneling (L2PT), IP and MAC source address validation for DHCP, Ethernet Connectivity Fault Management (CFM) ACLs, OpenFlow, and Policy-based Routing (PBR).

Syntax

```
cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos number l2qos number l2pt number ipmacacl number [vman-qos | vman-dual-qos number] ecfmacacl number [nlbclusteracl number] ipv4pbr number }openflow number | fcoe number} [iscsiptacl number] [ipv4udfmirracl number] [ipv4mirracl number][vrfv4acl number]
```

Parameters

default	Use the default CAM profile settings and set the CAM as follows: <ul style="list-style-type: none">• L2Acl : 6• IPV4Acl : 4• IPV6Acl : 0• IPV4Qos : 2• L2Qos : 1• L2PT : 0• IpMacAcl : 0• VmanQos : 0• VmanDualQos : 0• EcfmAcl : 0• nlbclusteracl: 0• FcoeAcl : 0• iscsiOptAcl : 0• ipv4pbr : 0• ipv4udfmirracl: 0• Openflow : 0• fedgovacl : 0
l2acl number	Enter the keyword <code>l2acl</code> and then the number of l2acl blocks. The range is from 1 to 8.
ipv4acl number	Enter the keyword <code>ipv4acl</code> and then the number of FP blocks for IPv4. The range is from 0 to 8.
ipv6acl number	Enter the keyword <code>ipv6acl</code> and then the number of FP blocks for IPv6. The range is from 0 to 4.
ipv4qos number	Enter the keyword <code>ipv4qos</code> and then the number of FP blocks for IPv4. The range is from 0 to 8.
l2qos number	Enter the keyword <code>l2qos</code> and then the number of FP blocks for l2 qos. The range is from 1 to 8.
l2pt number	Enter the keyword <code>l2pt</code> and then the number of FP blocks for l2 protocol tunnelling. The range is from 0 to 1.

ipmacacl <i>number</i>	Enter the keyword <code>ipmacacl</code> and then the number of FP blocks for IP and MAC ACL. The range is from 0 to 6.
ecfmacl <i>number</i>	Enter the keyword <code>ecfmacacl</code> and then the number of FP blocks for ECFM ACL. The range is from 0 to 5.
nlbclusteracl <i>number</i>	<p>Enter the keyword <code>nlbclusteracl</code> and then the number of FP blocks for nlbcluster ACL. The range is from 0 to 2. By default, the value is 0 and it supports 8 NLB arp entries reserved for internal functionality.</p> <p>i NOTE: When you reconfigure CAM allocation, use the <code>nlbclusteracl <i>number</i></code> command to change the number of NLB ARP entries. The range is from 0 to 2. The default value is 0. At the default value of 0, eight NLB ARP entries are available for use. This platform supports up to 512 CAM entries. Select 1 to configure 256 entries. Select 2 to configure 512 entries. Even though you can perform CAM carving to allocate the maximum number of NLB entries, Dell EMC Networking recommends that you use a maximum of 64 NLB ARP entries.</p>
vman-qos	Enter the keyword <code>vman-qos</code> and then the number of FP blocks for VMAN QoS. The range is from 0 to 6.
vman-dual-qos <i>number</i>	Enter the keyword <code>vman-dual-qos</code> and then the number of FP blocks for VMAN dual QoS. The range is from 0 to 4.
ipv4pbr <i>number</i>	Enter the keyword <code>ipv4pbr</code> and then the number of FP blocks for ipv4pbr ACL. The range is from 0 to 8.
Openflow <i>number</i>	Enter the keyword <code>openflow</code> and then the number of FP blocks for open flow (multiples of 4). The range is from 0 to 8.
fcoeacl <i>number</i>	Enter the keyword <code>fcoeacl</code> and then the number of FP blocks for FCOE ACL. The range is from 0 to 6.
iscsiptacl <i>number</i>	Enter the keyword <code>iscsiptacl</code> and then the number of FP blocks for iSCSI optimization ACL. The range is from 0 to 2.
l2acl <i>number</i>	Allocate space to each CAM region.
ipv4acl <i>number</i>	Enter 4 or 8 for the number of OpenFlow FP blocks.
ipv6acl <i>number</i>	<ul style="list-style-type: none"> • 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality) • 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)
ipv4qos <i>number</i>	
l2qos <i>number</i>	The fcoe range is 0–6 groups. Each group has 128 entries; the value given must be an even number. This information is stored in the NVRAM and is effective after rebooting the switch.
l2pt <i>number</i>	
ipmacacl <i>number</i>	
ecfmacl <i>number</i>	
{nlbclusteracl}	
[vman-qos 	
vman-dual-qos	
<i>number</i>]	
ipv4pbr	
<i>number</i>	
openflow	
{4 8}	
 	
fcoe <i>number</i>	
[iscsiptacl	
<i>number</i>]	
[vrfv4acl	
<i>number</i>]	
ipv4udfmirracl	Enter the keyword <code>ipv4udfmirracl</code> and then the number of FP blocks for IPv4 UDF mirror ACL. The range is from 0 to 8.
[ipv4mirracl	Enter the <code>ipv4mirracl</code> keyword and then the number of FP blocks for IPv4 mirror ACL. The range is from 0 to 8. You cannot use the <code>ipv4mirracl</code> and <code>ipv4udfmirracl</code> commands at the same time.

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Added the keyword <code>ipv4mirracl</code> .
9.11(0.0)	Added the keyword <code>ipv4udfmirracl</code> .
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>n1bcluster ACL</code> keyword. Introduced on the S6000-ON.
9.4.(0.0)	Added support for PBR and VRF.
9.2(1.0)	Introduced on the Z9500.
9.2(0.2)	Added support for fcoe.
9.1.(0.0)	Added support for OpenFlow.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.2	Clarified block information for the S4810.
8.3.10.0	Introduced on the S4810.
8.3.1.0	Added the keywords <code>ecfmacl</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

Usage Information

Save the new CAM settings to the startup-config (`write mem` or `copy run start`) then reload the system for the new settings to take effect.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks; these blocks cannot be reallocated. Only number of blocks can be configured by the user .

The `ipv6acl` allocation must be a factor of 2.

If allocation values are not entered for the CAM regions, the value is 0.

If you enable BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the command `reload conditional nvram-cfg-change`.

cam-audit linecard

Enable audit of the IPv4 forwarding table on all line cards.

Syntax

```
cam-audit linecard all ipv4-fib interval time-in-minutes
```

Parameters

all	Enter the keyword <code>all</code> to enable CAM audit on all line cards.
ipv4-fib	Enter the keyword <code>ipv4-fib</code> to designate the CAM audit on the IPv4 forwarding entries.
interval <i>time-in-minutes</i>	Enter the keyword <code>interval</code> followed by the frequency in minutes of the CAM audit. Range: 5 to 1440 minutes (24 hours). Default: 60 minutes .

Defaults	Disabled
Command Modes	CONFIGURATION
Command History	Version 7.4.1.0 Introduced on the E-Series.
Usage Information	Enables periodic audits of the software and hardware copies of the IPv4 forwarding table.

clear alarms

Clear alarms on the system.

Syntax	<code>clear alarms</code>
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information	This command clears alarms that are no longer active. If an alarm situation is still active, it is seen in the system output.
--------------------------	---

clear average-power

Reset the average power and average power start time.

Syntax	<code>clear average-power stack-unit {stack-unit-number}</code>	
Parameters	stack-unit-number	Enter the stack unit number.
Defaults	None	
Command Modes	EXEC Privilege	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.11(2.1P1)	Introduced on all Dell EMC Networking OS platforms

Usage Information

This command resets the average power and average power start time to the current time. Average power and average power start time will be calculated from the reset time (i.e current time).

Example

```
DellEMC#clear average-power
Proceed to clear Average power ? Confirm [yes/no]:yes
DellEMC#
```

clear line

Reset a terminal line.

Syntax

```
clear line {line-number | console 0 | vty number}
```

Parameters

<i>line-number</i>	Enter a number for one of the 12 terminal lines on the system. The range is from 0 to 11.
aux 0	Enter the keywords <code>aux 0</code> to reset the auxiliary port.
console 0	Enter the keywords <code>console 0</code> to reset the console port.
<i>vty number</i>	Enter the keyword <code>vty</code> then a number to clear a terminal line. The range is from 0 to 9.

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

clear trace

Clear the software trace log file from a Z9500 CPU.

Z9500

Syntax	<code>clear trace software [rp linecard slot-id]</code>	
Parameters	rp	Enter the keyword <code>rp</code> to clear the software trace log from the Route Processor CPU.
	linecard slot-id	Enter the <code>linecard slot-id</code> parameters to specify the line-card CPU whose software trace log you want to clear.
Defaults	Clear the trace log files from all Z9500 CPUs.	
Command Modes	CONFIGURATION	
Command History	Version 9.2(1.0)	Introduced on the Z9500.
	Version 8.1.1.0	Introduced on the E-Series ExaScale.
	Version 7.5.1.0	Introduced on the C-Series.
Usage Information	Trace log information is uploaded to <code>flash:/TRACE_LOG_DIR</code> .	

configure

Enter CONFIGURATION mode from EXEC Privilege mode.

Syntax

`configure [terminal]`

Parameters

terminal (OPTIONAL) Enter the keyword `terminal` to specify that you are configuring from the terminal.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Example

```
DellEMC# configure
DellEMC(conf)#
```

debug cpu-traffic-stats

Enable the collection of computer processor unit (CPU) traffic statistics.

Syntax `debug cpu-traffic-stats`
To disable the debugging, use the `no debug cpu-traffic-stats` command.

Defaults Disabled

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

Usage Information

This command enables (and disables) the collection of CPU traffic statistics from the time this command is executed (not from system boot). However, excessive traffic a CPU receives automatically triggers (turn on) the collection of CPU traffic statistics.

The following message is an indication that collection of CPU traffic is automatically turned on. To view the traffic statistics, use the `show cpu-traffic-stats` command.

If the CPU receives excessive traffic, traffic is rate controlled.

NOTE: This command must be enabled before the `show cpu-traffic-stats` command displays traffic statistics. Dell Networking recommends disabling debugging (`no debug cpu-traffic-stats`) after troubleshooting is complete.

Related Commands

`show cpu-traffic-stats` — displays the cpu traffic statistics.

debug ftpserver

View transactions during an FTP session when a user is logged into the FTP server.

Syntax `debug ftpserver`

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

disable

Return to EXEC mode.

Syntax `disable [level]`

Parameters *level* (OPTIONAL) Enter a number for a privilege level of the Dell EMC Networking OS. The range is from 0 to 15. The default is **1**.

Defaults 1

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

do

Allows the execution of most EXEC-level commands from all CONFIGURATION levels without returning to the EXEC level.

Syntax `do command`

Parameters `command` Enter an EXEC-level command.

Defaults none

Command Modes

- CONFIGURATION
- INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information

The following commands are *not* supported by the do command:

- enable
- disable
- exit
- config

Example

```
DellEMC(conf-if-te-5/1)# do clear counters
Clear counters on all interfaces [confirm]
DellEMC(conf-if-te-5/1)#
DellEMC(conf-if-te-5/1)# do clear logging
Clear logging buffer [confirm]
DellEMC(conf-if-te-5/1)#
DellEMC(conf-if-te-5/1)# do reload
System configuration has been modified. Save? [yes/no]: n
Proceed with reload [confirm yes/no]: n
```

enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

Syntax enable [*level*]

Parameters *level* (OPTIONAL) Enter a number for a privilege level of Dell EMC Networking OS. The range is from 0 to 15.

Defaults 15

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the `enable password` command to configure a password for the `enable` command at a specific privilege level. If no privilege level is specified, the default is privilege level **15**.

 **NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an `enable password`.

Related Commands

- `enable password` — configures a password for the `enable` command and to access a privilege level.

enable optic-info-update interval

Enable polling intervals of optical information updates for simple network management protocol (SNMP).

Syntax

`enable optic-info-update [interval seconds]`

To disable optical power information updates, use the `no enable optic-info-update interval` command.

Parameters

interval seconds Enter the keyword `interval` then the polling interval in seconds. The range is from 120 to 6000 seconds. The default is **300 seconds** (5 minutes).

Defaults

Disabled

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Replacement command for the S4820T. Replaces the <code>enable xfp-power-updates</code> command.
8.3.11.4	Replacement command for the Z9000. Replaces the <code>enable xfp-power-updates</code> command.
8.3.10.0	Replacement command for the S4810 only. Replaces the <code>enable xfp-power-updates</code> command.

Usage Information

To enable polling and to configure the polling frequency, use this command.

end

Return to EXEC Privilege mode from other command modes (for example, CONFIGURATION or ROUTER OSPF modes).

Syntax `end`

- Command Modes**
- CONFIGURATION
 - SPANNING TREE
 - MULTIPLE SPANNING TREE
 - LINE
 - INTERFACE
 - TRACE-LIST
 - VRRP
 - ACCESS-LIST
 - PREFIX-LIST
 - AS-PATH ACL
 - COMMUNITY-LIST
 - ROUTER OSPF
 - ROUTER RIP
 - ROUTER ISIS
 - ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and E-Series.
E-Series	Original command.

Related Commands

- `exit` — returns to the lower command mode.

exec-timeout

Set a time interval that the system waits for input on a line before disconnecting the session.

Syntax `exec-timeout minutes [seconds]`
 To return to default settings, use the `no exec-timeout` command.

Parameters

minutes Enter the number of minutes of inactivity on the system before disconnecting the current session. The range is from 0 to 35791. The default is **10 minutes** for the console line and **30 minutes** for the VTY line.

seconds (OPTIONAL) Enter the number of seconds. The range is from 0 to 2147483. The default is **0 seconds**.

Defaults **10 minutes** for console line; **30 minutes** for VTY lines; **0 seconds**

Command Modes LINE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Related Commands

- `end` — returns to EXEC Privilege mode.

ftp-server enable

Enable FTP server functions on the system.

Syntax `ftp-server [vrf vrf-name] enable`

Parameters `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to enable the FTP server to listen to that VRF instance.

 **NOTE:** Use this attribute to specify the VRF that is used by the FTP server to accept client connections. If no VRF is specified, then the default VRF is used.

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Example

```
morpheus% ftp 10.31.1.111
Connected to 10.31.1.111.

329 bytes received in 0.018 seconds (17.95 Kbytes/s)
ftp>

```

ftp-server topdir

Specify the top-level directory to be accessed when an incoming FTP connection request is made.

Syntax `ftp-server topdir directory`

Parameters ***directory*** Enter the directory path.

Defaults The internal flash is the default directory.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information After you enable FTP server functions with the `ftp-server enable` command, Dell EMC Networking recommends specifying a top-level directory path. Without a top-level directory path specified, the Dell EMC Networking OS directs users to the flash directory when logging in to the FTP server.

Related Commands

- [ftp-server enable](#) — enables FTP server functions on the E-Series.
- [ftp-server username](#) — sets a username and password for incoming FTP connections to the E-Series.

ftp-server username

Create a user name and associated password for incoming FTP server sessions.

Syntax `ftp-server username username password [encryption-type] password`
To delete a user name and its password, use the `no ftp-server username username` command.

Parameters

<i>username</i>	Enter a text string up to 40 characters long as the user name.
<i>password</i> <i>password</i>	Enter the keyword <code>password</code> then a string up to 40 characters long as the password. Without specifying an encryption type, the password is unencrypted.
<i>encryption-type</i>	(OPTIONAL) After the keyword <code>password</code> , enter one of the following numbers: <ul style="list-style-type: none">• 0 (zero) for an unencrypted (clear text) password• 7 (seven) for a hidden text password

Defaults Not enabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information

The password is listed in the configuration file; you can view the password by entering the `show running-config ftp` command.

Use the `ip ftp password` command when you use the `ftp: password` parameter in the `copy` command.

Related Commands

ip ftp source-interface

Specify an interface's IP address as the source IP address for FTP connections.

Syntax

```
ip ftp source-interface interface
```

To delete an interface, use the `no ip ftp source-interface interface` command.

Parameters

interface

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.2.1.0	Increased number of VLANs on ExaScale to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

ip ftp username

Assign a user name for outgoing FTP connection requests.

Syntax `ip ftp username username`

To return to anonymous FTP connections, use the `no ip ftp username [username]` command.

Parameters `username` Enter a text string as the user name up to 40 characters long.

Defaults No user name is configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information

Configure a password with the `ip ftp password` command.

Related Commands

- `ip ftp password` — sets the password for FTP connections.

ip http source-interface

Configure an interface's IP address as the source IP address for HTTP connections.

Syntax

`ip http source-interface interface`

To delete an interface, use the `no ip http source-interface interface` command.

Parameters

interface

Enter the following keywords and slot/port or number information:

- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16383.
- For a Port Channel interface, enter the keyword `port-channel` then a number. The range is from 1 to 512.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Command Modes

CONFIGURATION

Command History

Version	Description
9.5(0.1)	Introduced on the Z9500.
9.3(0.1)	Introduced on the S4810, S4820T, S6000, and Z9000.
9.2(1.0)	Introduced on the Z9500.
8.3.11.1	Introduced on the Z9000
8.2.1.0	Increased number of VLANs on ExaScale to 4094 (was 2094)
8.1.1.0	Introduced on E-Series ExaScale
7.6.1.0	Support added for S-Series
7.5.1.0	Introduced on C-Series

ip telnet server enable

Enable the Telnet server on the switch.

Syntax `ip telnet server enable`

To disable the Telnet server, use the `no ip telnet server enable` command.

Defaults Enabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Related Commands

- [ip ssh server](#) — enables the secure shell (SSH) server on the system.

ip telnet source-interface

Set an interface's IP address as the source address in outgoing packets for Telnet sessions.

Syntax `ip telnet source-interface interface`

To return to the default setting, use the `no ip telnet source-interface [interface]` command.

Parameters *interface*

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.

- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

Defaults The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

7.5.1.0	Introduced on the C-Series.
E-Series	Original command

Related Commands [telnet](#) — telnet to another device.

ip tftp source-interface

Assign an interface's IP address in outgoing packets for TFTP traffic.

Syntax `ip tftp source-interface interface`

To return to the default setting, use the `no ip tftp source-interface interface` command.

Parameters ***interface*** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

line

Enable and configure console and virtual terminal lines to the system. This command accesses LINE mode, where you can set the access conditions for the designated line.

Syntax `line {aux 0 | console 0 | vty number [end-number]}`

Parameters	Description
aux 0	Enter the keyword aux 0 to configure the auxiliary terminal connection.
console 0	Enter the keyword <code>console 0</code> to configure the console port. The console option is <code><0-0></code> .
vty number	Enter the keyword <code>vty</code> then a number from 0 to 9 to configure a virtual terminal line for remote sessions. The system supports 10 remote sessions.
end-number	(OPTIONAL) Enter a number from 1 to 9 as the last virtual terminal line to configure. You can configure multiple lines at one time.

Defaults Not configured

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

Usage Information

You cannot delete a terminal connection.

Related Commands

- [access-class](#) — restricts the incoming connections to a particular IP address in an IP access control list (ACL).
- [password](#) — specifies a password for users on terminal lines.

login concurrent-session

Configures the limit of concurrent sessions for all users on console and virtual terminal lines.

Syntax

```
login concurrent-session {limit number-of-sessions | clear-line enable}
no login concurrent-session {limit number-of-sessions | clear-line enable}
```

Parameters

- limit *number-of-sessions*** Sets the number of concurrent sessions that any user can have on console and virtual terminal lines. The range is from 1 to 12 (10 VTY lines, one console, and one AUX line).
- clear-line enable** Enables you to clear your existing sessions.

Defaults

Not configured. You can use all the available sessions.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

Usage Information

You must have either the System Administrator or Security Administrator privileges to configure login concurrent-session limit or to enable clear-line.

To limit the number of concurrent sessions that any user can have on console, auxiliary, and virtual terminal lines, use the `login concurrent-session limit number-of-sessions` command.

If the `login concurrent-session clear-line enable` command is configured, you are provided with an option to clear any of your existing sessions after a successful login authentication. When you reach the maximum concurrent session limit, you can still log in by clearing any of your existing sessions.

Example

The following example shows how to limit the number of concurrent sessions that any user can have to four:

```
DellEMC(conf)# login concurrent-session limit 4
DellEMC(conf)#
```

The following example shows how to use the `login concurrent-session clear-line enable` command.

```
DellEMC(conf)# login concurrent-session clear-line enable
DellEMC(conf)#
```

When you try to log in, the following message appears with all your existing concurrent sessions, providing an option to close any one of the existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Current sessions for user admin:
Line          Location
2 vty 0       10.14.1.97
3 vty 1       10.14.1.97
Clear existing session? [line number/Enter to cancel]:
```

When you try to create more than the permitted number of sessions, the following message appears, prompting you to close one of your existing sessions. Close any of your existing sessions to log in to the system.

```

 - [show login statistics](#) — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

login statistics

Enable and configure user login statistics on console and virtual terminal lines.

Syntax

```
login statistics {enable | time-period days}
no login statistics {enable | time-period days}
```

Parameters

enable Enables login statistics for the last 30 days by default.

time-period *days* Sets the number of days the system stores user login statistics; range is from 1 to 30.

Defaults Not configured

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

Usage Information Only the system and security administrators can configure login activity tracking and view the login activity details of other users.

If you enable user login statistics, the system displays the last successful login details of the current user, the details of any failed login attempts by others, and if the current user's permissions have changed since the last login.

If you use the `login statistics time-period days` command to set a custom time period, the system only reports the login statistics during that interval.

NOTE: Login statistics are not applicable for login sessions that do not use authentication on user names. For example, the system does not report login activity for a telnet session that prompts only a password field.

Example When you log into the system, it displays a message similar to the following:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 Line vty0 (
10.11.178.14 ).
There were 1 unsuccessful login attempt(s) since the last successful
```

```
login.
There were 1 unsuccessful login attempt(s) for user admin in the last 30
day(s).
There were 1 successful login attempt(s) for user admin in the last 30
day(s).
```

The preceding message shows that the user had previously logged in to the system using the VTY line from 10.11.178.14. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts in the last 30 days.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 on console
There were 2 unsuccessful login attempt(s) since the last successful
login.
There were 3 unsuccessful login attempt(s) for user admin in last 12
day(s).
There were 1 successful login attempt(s) for user admin in the last 30
day(s).
```

The preceding message shows that the user had previously logged in to the system using the console line. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts during a custom time period.

Related Commands

- [login concurrent-session](#) — configures the limit of concurrent sessions for all users on console and virtual terminal lines.
- [show login statistics](#) — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

logging coredump server

Designate a server to upload core dumps.

Syntax `logging coredump server {ipv4-address | ipv6-address} username name password [type] password`

Parameters

<i>{ipv4-address ipv6-address}</i>	Enter the server IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X::X).
<i>name</i>	Enter a username to access the target server.
<i>type</i>	Enter the password type: <ul style="list-style-type: none"> • Enter 0 to enter an unencrypted password. • Enter 7 to enter a password that has already been encrypted using a Type 7 hashing algorithm.
<i>password</i>	Enter a password to access the target server.

Defaults Crash kernel files are uploaded to flash by default.

Command Modes CONFIGURATION

Command History

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.4.1.0	Added support for IPv6.
7.7.1.0	Restructured command to accommodate core dumps for CP. Introduced on C-Series and S-Series.
6.1.1.0	Introduced

Usage Information

Because flash space may be limited, using this command ensures your entire crash kernel files are uploaded successfully and completely. Only a single coredump server can be configured. Configuration of a new coredump server over-writes any previously configured server.

 **NOTE:** You must disable logging coredump before you designate a new server destination for your core dumps.

ping

Test connectivity between the system and another device by sending echo requests and waiting for replies.

Syntax

```
ping [host | ip-address | ipv6-address] [count {number | continuous}]  
[datagram-size] [timeout] [source (ip src-ipv4-address) | interface] [tos]  
[df-bit (y|n)] [validate-reply(y|n)] [outgoing-interface] [pattern pattern]  
[sweep-min-size] [sweep-max-size] [sweep-interval] [ointerface (ip src-  
ipv4-address) | interface] [ethernet | vrf vrf-name]
```

Parameters

- host** (OPTIONAL) Enter the host name of the devices to which you are testing connectivity.
- ip-address** (OPTIONAL) Enter the IPv4 address of the device to which you are testing connectivity. The address must be in the dotted decimal format.
- ipv6-address** (OPTIONAL) Enter the IPv6 address, in the x:x:x:x format, to which you are testing connectivity.
-  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.
- count** Enter the number of echo packets to be sent. The default is **5**.
- number: from 1 to 2147483647
 - continuous: transmit echo request continuously
- datagram size** Enter the ICMP datagram size. The range is from 36 to 15360 bytes. The default is **100**.
- timeout** Enter the interval to wait for an echo reply before timing out. The range is from 0 to 3600 seconds. The default is **2 seconds**.
- source** Enter the IPv4 or IPv6 source ip address or the source interface. For IPv6 addresses, you may enter global addresses only. Enter the IP address in A.B.C.D format.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
 - For a Tunnel interface, enter the keyword `tunnel` then a number from 1 to 16383.
- tos** (IPv4 only) Enter the type of service required. The range is from 0 to 255. The default is **0**.
- df-bit** (IPv4 only) Enter `Y` or `N` for the “don't fragment” bit in IPv4 header.
- `N`: Do not set the “don't fragment” bit.
 - `Y`: Do set “don't fragment” bit
- Default is **No**.
- validate-reply** (IPv4 only) Enter `Y` or `N` for reply validation.
- `N`: Do not validate reply data.
 - `Y`: Do validate reply data.
- Default is **No**.

<i>outgoing-interface</i>	(IPv6 link-local address) Enter the outgoing interface for ping packets to a destination link-local address.
<i>pattern pattern</i>	(IPv4 only) Enter the IPv4 data pattern. Range: 0-FFFF. Default: 0xABCD .
<i>sweep-min-size</i>	Enter the minimum size of datagram in sweep range. The range is from 52 to 15359 bytes.
<i>sweep-max-size</i>	Enter the maximum size of datagram in sweep range. The range is from 53 to 15359 bytes.
<i>sweep-interval</i>	Enter the incremental value for sweep size. The range is from 1 to 15308 seconds.
<i>interface</i>	(IPv4 only) Enter the outgoing interface for multicast packets. Enter the IP address in A.B.C.D format. <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For a port channel interface, enter the keywords <code>port-channel</code> then a number. • For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.
<i>ethernet</i>	Enter the keyword <code>ethernet</code> to test layer2 connectivity.
<i>vrf vrf-name</i>	Enter the keyword <code>vrf</code> followed by the name of the VRF to test connectivity to the VRF.

Defaults None.

 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)P5	Introduced on the S4048-ON.
9.8(0.0)P2	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T. Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4820T.
8.3.12.0	Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards.
8.4.1.0	IPv6 ping available on management interface.

Version	Description
8.3.1.0	Introduced extended ping options.
8.2.1.0	Introduced on the E-Series (IPv6).
8.1.1.0	Introduced on the E-Series (IPv4).
7.9.1.0	Introduced VRF.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for IPv6 address on the E-Series.

Usage Information

When you enter the `ping` command without specifying an IP/IPv6 address (Extended Ping), you are prompted for a target IP/IPv6 address, a repeat count, a datagram size (up to 1500 bytes), a timeout (in seconds), and for Extended Commands.

The following table provides descriptions for the `ping` command status response symbols displayed in the output.

Symbol	Description
!	Each exclamation point indicates receipt of a reply.
.	Each period indicates the network server timed out while waiting for a reply.
U	A destination unreachable error PDU was received.
Q	Source quench (destination too busy).
M	Could not fragment.
?	Unknown packet type.
&	Packet lifetime exceeded.

Example (IPv4)

```
DellEMC# ping 172.31.1.255

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2 seconds:
Reply to request 1 from 172.31.1.208 0 ms
Reply to request 1 from 172.31.1.216 0 ms
Reply to request 1 from 172.31.1.205 16 ms
::
Reply to request 5 from 172.31.1.209 0 ms
Reply to request 5 from 172.31.1.66 0 ms
Reply to request 5 from 172.31.1.87 0 ms
DellEMC#
```

Example (IPv6)

```
DellEMC# ping 100::1

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 100::1, timeout is 2 seconds:
!!!!
Success rate is 100.0 percent (5/5), round-trip min/avg/max = 0/0/0 (ms)
DellEMC#
```

reload

Reboot the system.

Syntax `reload [conditional nvramp-cfg-change | no-confirm [discard-running]]`

Parameters	conditional	(OPTIONAL) Reload into the Dell EMC Networking Operating System (OS) if the condition is true. A configuration change to the NVRAM requires a switch reload. To reload the switch, select <code>nvr-am-cfg-change</code> .
	no-confirm [discard-running]	Reload the chassis without prompting for further confirmation.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced the <code>no-confirm</code> option.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
9.1(0.0)	Added 'conditional' parameter.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information

If you use only the `reload` command, the system boots into the Dell EMC Networking OS.

If there is a change in the running configuration, the system prompts you to save the new configuration when you reload the system using the `reload` command. You can also save your running configuration manually using the `copy running-config` command.

You can use the `conditional` parameter if any configuration changes made to the NVRAM, such as, `stack-group` and `fanout` configurations, must be saved.

When you use the `reload` command after making configuration changes, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.

Example

```
DelleMC# reload
Verified startup-configuration is enabled, Hash for startup-
configuration is invalid.
Please update Hash for the startup-configuration before reload.
```

send

Send messages to one or all terminal line users.

Syntax `send [*] | [line] | [console] | [vty]`

Parameters

- `*` Enter the asterisk character `*` to send a message to all tty lines.
- `line` Send a message to a specific line. The range is from 0 to 11.
- `console` Enter the keyword `console` to send a message to the primary terminal line.
- `vty` Enter the keyword `vty` to send a message to the virtual terminal.

Defaults none

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	Introduced on the E-Series.

Usage Information Messages can contain an unlimited number of lines; however, each line is limited to 255 characters. To move to the next line, use `<CR>`. To send the message use `CTR-Z`; to abort a message, use `CTR-C`.

service timestamps

To debug and log messages, add time stamps. This command adds either the uptime or the current time and date.

Syntax `service timestamps {debug | log} [datetime [localtime] [msec] [show-timezone] | uptime]`

To disable timestamping, use the `no service timestamps [debug | log]` command.

Parameters	debug	(OPTIONAL) Enter the keyword <code>debug</code> to add timestamps to debug messages.
	log	(OPTIONAL) Enter the keyword <code>log</code> to add timestamps to log messages with severity from 0 to 6.
	datetime	(OPTIONAL) Enter the keyword <code>datetime</code> to have the current time and date added to the message.
	localtime	(OPTIONAL) Enter the keyword <code>localtime</code> to include the localtime in the timestamp.
	msec	(OPTIONAL) Enter the keyword <code>msec</code> to include milliseconds in the timestamp.
	show-timezone	(OPTIONAL) Enter the keyword <code>show-timezone</code> to include the time zone information in the timestamp.
	uptime	(OPTIONAL) Enter the keyword <code>uptime</code> to have the timestamp based on time elapsed since system reboot.

Defaults `datetime`

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

show console lp

View the buffered boot-up log of a line card.

Syntax `show console lp number`

Parameters *number* Enter the line card slot number. Range:

- 0–7 for the C300
- 0–13 for the E1200
- 0–6 for the E600
- 0–5 for the E300

Defaults none

Command Modes

- EXEC
- EXEC Privilege

Command History

Version 7.5.1.0 Introduced on the C-Series.

E-Series Original command.

Usage Information  **CAUTION: Use this command only when you are working directly with a technical support representative to troubleshoot a problem. Do not use this command unless a technical support representative instructs you to do so.**

show cpu-traffic-stats

View the CPU traffic statistics.

Syntax `show cpu-traffic-stats [port number | all | cp]`

Parameters

port number (OPTIONAL) Enter the port number to display traffic statistics on that port only. The range is from 1 to 1568.

all (OPTIONAL) Enter the keyword `all` to display traffic statistics on all the interfaces receiving traffic, sorted based on the traffic.

cp (OPTIONAL) Enter the keyword `cp` to display traffic statistics on the specified CPU.

Defaults **all**

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series
6.2.1.1	Introduced on the E-Series.

Usage Information

Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces. The traffic statistics are collected only after the `debug cpu-traffic-stats` command is executed; not from the system bootup.

NOTE: After debugging is complete, use the `no debug cpu-traffic-stats` command to shut off traffic statistics collection.

Example

```
DellEMC# show cpu-traffic-stats
Processor : CP
-----
Received 100% traffic on TenGigabitEthernet 8/2 Total packets:100
LLC:0, SNAP:0, IP:100, ARP:0, other:0
Unicast:100, Multicast:0, Broadcast:0
Processor : RP1
-----
Received 62% traffic on TenGigabitEthernet 8/2 Total packets:500
LLC:0, SNAP:0, IP:500, ARP:0, other:0
Unicast:500, Multicast:0, Broadcast:0
Received 37% traffic on TenGigabitEthernet 8/1 Total packets:300
LLC:0, SNAP:0, IP:300, ARP:0, other:0
Unicast:300, Multicast:0, Broadcast:0
Processor : RP2
-----
No CPU traffic statistics.
DellEMC#
```

show cpu-interface-stats

View CPU interface statistics.

Syntax

```
show cpu-interface-stats [cp | rp | linecard {0-2} |all]
```

Parameters

cp	Enter the keyword <code>cp</code> to display the interface statistics only from the Control Processor.
rp	Enter the keyword <code>rp</code> to display the interface statistics only from the Route Processor.

- linecard *slot-id*** Enter the `linecard slot-id` parameters to display the interface statistics only from a specified line card. The range of line-card slot IDs is from 0 to 2.
- all** Enter the keyword `all` to display the interface statistics from all Z9500 CPUs, including the Control Processor, Route Processor, and line cards.

Defaults Display interface statistics from all Z9500 CPUs.

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.12.0** Introduced on the S4810.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 7.6.1.0** Introduced on the S-Series.
- Version 7.5.1.0** Introduced on the C-Series.
- Version 6.2.1.1** Introduced on the E-Series.

Usage Information Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces.

**Related
Commands**

[debug cpu-traffic-stats](#) — enables CPU traffic statistics for debugging.

show debugging

View a list of all enabled debugging processes.

Syntax `show debugging`

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series
E-Series	Original command.

Example

```

DellEMC# show debug
Generic IP:
  IP packet debugging is on for
  ManagementEthernet 0/0

```

```

Port-channel 1-2
Port-channel 5
GigabitEthernet 4/0-3,5-6,10-11,20
GigabitEthernet 5/0-1,5-6,10-11,15,17,19,21
ICMP packet debugging is on for
GigabitEthernet 5/0,2,4,6,8,10,12,14,16
DellEMC#

```

show environment

View system component status (for example, temperature or voltage).

Syntax `show environment [all | fan | pem | stack-unit unit-id]`

Parameters

- all** Enter the keyword `all` to view all components.
- fan** Enter the keyword `fan` to view information on the fans. The output of this command is chassis-dependent.
- pem** Enter the keyword `pem` to view only information on power entry modules.
- stack-unit *unit-id*** Enter the keywords `stack-unit` then the `unit-id` to display information on a specific stack member.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.1P1)	The CLI has been enhanced to show the power, average power and average power start time.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	The output of the <code>show environment fan</code> command for the S Series is changed to display fan speeds instead of showing the fan status as up or down.

Usage Information The following example shows the output of the `show environment` command.

Example (all)

```
DellEMC# show environment

-- Fan Status --
Unit Bay TrayStatus Fan0 Speed Fan1 Speed
-----
0 0 up up 6971 up 7072
0 1 up up 6971 up 7021

```

show inventory

Display the switch type, components (including media), and Dell EMC Networking Operating System (OS), including hardware identification numbers and configured protocols.

Syntax `show inventory [media slot]`

Parameters **media slot** (OPTIONAL) Enter the keyword `media` then the stack ID of the stack member for which you want to display pluggable media inventory.

NOTE: This parameter is available but not supported in Dell EMC Networking Operating System version 8.3.11.4. Because stacking is not supported, if you use this parameter, the output displays "Media not present or accessible" (refer to the *Usage Information* section).

Defaults	none
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .
Version	Description
9.11(0.0)	Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.4	Output expanded to include Piece Part ID (PPID) and eSR4 optics.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced this version of the command for S-Series. S-Series output differs from E-Series.
Usage Information	If there are no fiber ports in the unit, just the header under <i>show inventory media</i> displays. If there are fiber ports but no optics inserted, the output displays <i>Media not present or accessible</i> .
Related Commands	<ul style="list-style-type: none"> • show interfaces — displays the interface configuration.

show login statistics

Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

Syntax	<code>show login statistics [all [[successful-attempts unsuccessful-attempts] [user login-id] [time-period days]] user login-id]</code>	
Parameters	all	(Optional)Displays the login statistics of all users in the last 30 days or the custom defined time period.
	time-period days	(Optional)Displays the number of failed login attempts by the current user in the specified period.
	successful-attempts	(Optional)Displays the number of successful login attempts by the current user in the last 30 days or the custom defined time period
	unsuccessful-attempts	(Optional)Displays the number of failed login attempts by the current user in the last 30 days or the custom defined time period.

user login-id (Optional)Displays the login statistics of a specific user in the last 30 days or the custom defined time period. When you use it with the `unsuccessful-attempts` keyword, the system displays the number of failed login attempts by a specific user in the last 30 days or the custom defined time period

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced the <code>successful-attempts</code> keyword.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

Usage Information

To view the successful and failed login details of the current user in the last 30 days or the custom defined period, use the `show login statistics` command.

To view the successful and failed login details of all users in the last 30 days or the custom defined period, use the `show login statistics all` command. You can use this command only if you have system or security administrator rights.

To view the successful and failed login details of a specific user in the last 30 days or the custom defined time period, use the `show login statistics user user-id` command. If you have system or security administrator rights, you can view the login statistics of other users. If you do not have system or security administrator rights, you can view your login statistics but not the login statistics of others.

NOTE: By default, these commands display the details for the last 30 days. If you set a custom-defined time period for login statistics using the `login statistics time-period days` command, these commands display details only for that period.

Example

The following is sample output of the `show login statistics` command.

```
DellEMC#show login statistics
-----
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
-----
```

The following is sample output of the `show login statistics all` command.

```
DellEMC#show login statistics all
-----
User: admin
Last login time: 08:54:28 UTC Wed Mar 23 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
-----
```

```

Successful login attempt(s) in last 30 day(s): 4
-----

-----
User: admin1
Last login time: 12:49:19 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
-----

-----
User: admin2
Last login time: 12:49:27 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
-----

-----
User: admin3
Last login time: 13:18:42 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
-----

```

The following is sample output of the `show login statistics user user-id` command.

```

DellEMC# show login statistics user admin
-----
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
-----

```

The following is sample output of the `show login statistics unsuccessful-attempts` command.

```

DellEMC#show login statistics unsuccessful-attempts
There were 3 unsuccessful login attempt(s) for user admin in last 30
day(s) .

```

The following is sample output of the `show login statistics unsuccessful-attempts time-period days` command.

```

DellEMC# show login statistics unsuccessful-attempts time-period 15
There were 0 unsuccessful login attempt(s) for user admin in last 15
day(s) .

```

The following is sample output of the `show login statistics unsuccessful-attempts user login-id` command.

```

DellEMC# show login statistics unsuccessful-attempts user admin
There were 3 unsuccessful login attempt(s) for user admin in last 12
day(s) .

```

The following is sample output of the `show login statistics successful-attempts` command.

```
DellEMC#show login statistics successful-attempts
There were 4 successful login attempt(s) for user admin in last 30
day(s).
```

Related Commands

- [login statistics](#) — enable and configure user login statistics on console and virtual terminal lines.
- [login concurrent-session](#) — configures the limit of concurrent sessions for all users on console and virtual terminal lines.

show memory

View current memory usage on the system.

Syntax `show memory [cp | rp | linecard {slot-id | all}]`

Parameters

- cp** Enter the keyword `cp` to display memory usage on the Control Processor CPU.
- rp** Enter the keyword `rp` to display memory usage on the Route Processor CPU.
- linecard slot-id** Enter the slot ID of the line card for which you want to display memory usage. The range of Z9500 slot IDs is from 0 to 2. Enter `linecard all` to display memory usage on all line cards.

- Command Modes**
- EXEC
 - EXEC Privilege

Defaults Display memory usage on all CPUs (Control Processor, Route Processor, and line cards).

- Command History**
- 9.2(1.0)** Introduced on the Z9500.
 - 8.3.19.0** Introduced on the S4820T.
 - 8.3.11.1** Introduced on the Z9000.
 - 8.3.7.0** Introduced on the S4810.
 - 7.5.1.0** Introduced on the C-Series.
 - E-Series** Original command.

Usage Information

The output for `show memory` displays the memory usage of the line-card processor (LP) part (`sysdip`) of the system. The `sysdip` is an aggregate task that handles all the tasks running on the LP.

The total counter size in `show memory` and `show processes memory` differs based on which OS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the `show processes memory` output, the memory size is equal to the size of the application processes plus the size of the system processes.

Examples

```
Dell#show memory

      Statistics On  CP Processor
      =====
      Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
      3203928064      6953130      3196974934      3196941986      3196974934
      Statistics On  RP Processor
      =====
      Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
      3203928064      17806442      3186121622      3186088674      3186121622

Dell#show memory cp
      Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
      3203928064      6953130      3196974934      3196974934      3196974934
```

```
Dell#show memory rp
  Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
3203928064      17174702      3186753362      3186753362      3186753362

Dell#show memory lp 2
  Total (b)      Used (b)      Free (b)      Lowest (b)      Largest (b)
3203928064      8555410      3195372654      3195372654      3195372654FTOS#
```

“Lowest” displays the memory usage the system went to in the lifetime of the system. Indirectly, it indicates the maximum usage in the lifetime of the system: Total minus Lowest.

“Largest” displays the current largest available. This relates to the block size and is not related to the amount of memory on the system.

show processes cpu

View information on CPU usage for processes running in the system.

Syntax	<code>show processes cpu [cp rp linecard {slot-id [0-2] all}] [summary details]</code>
Parameters	<p>cp Enter the keyword <code>cp</code> to view CPU usage for the Control Processor.</p> <p>rp Enter the keyword <code>rp</code> to view CPU usage for the Route Processor.</p> <p>linecard slot-id [0-2] Enter the slot ID of the line card for which you want to view CPU usage. The range of Z9500 slot IDs is from 0 to 2. Enter <code>linecard all</code> to display CPU usage for all line cards.</p> <p>The optional line card 0-2 parameter displays tasks in order of the highest CPU usage in the past five seconds.</p> <p>all Enter the keyword <code>all</code> to display usage information for all Z9500 CPUs: Control Processor, Route Processor, and line cards.</p> <p>summary Enter the keyword <code>summary</code> to view a summary of CPU usage.</p> <p>details Enter the keyword <code>details</code> to view detailed information about CPU usage.</p>
Command Modes	<ul style="list-style-type: none"> • EXEC • EXEC Privilege
Defaults	Display detailed information on CPU usage for all Z9500 CPUs (Control Processor, Route Processor, and line cards).
Command History	<p>Version 9.2(1.0) Introduced on the Z9500.</p> <p>Version 8.3.11.1 Introduced on the Z9000.</p> <p>Version 8.3.7.0 Introduced on the S4810.</p> <p>Version 7.5.1.0 Introduced on the C-Series.</p>
Usage Information	In the following example, the CPU utilization for the last five seconds is 10%/0%. The first number (10%) is the CPU utilization for the last five seconds. The second number (0%) indicates the percent of CPU time spent at the interrupt level.
Example: show processes cpu lp	<pre>Dell#show processes cpu lp 2 30 CPU utilization for five seconds: 10%/0%; one minute: 10%; five minutes: 10% PID Runtime (ms) Invoked uSecs 5Sec 1Min 5Min TTY Process 0x00000000 995730 99573 10000 10.08% 10.10% 10.12% 0 system 0x0000012e 54470 5447 10000 0.00% 0.43% 0.46% 0 sysdlp 0x00000125 0 0 0 0.00% 0.00% 0.00% 0</pre>

show processes ipc

Display the IPC messaging used internally between Dell Networking OS processes.

Syntax `show processes ipc [recv-stats | send-stats] [cp | rp | linecard {slot-id | all}]`

- Parameters**
- recv-stats** Enter the keyword `recv-stats` to display information on IPC receiver-side messages.
 - send-stats** Enter the keyword `send-stats` to display information on IPC sender-side messages.
 - cp** Enter the keyword `cp` to view IPC message statistics on the Control Processor CPU.
 - rp** Enter the keyword `rp` to view IPC message statistics on the Route Processor CPU.
 - linecard slot-id** Enter the slot ID of the line card for which you want to view IPC message statistics. The range of Z9500 slot IDs is from 0 to 2. Enter `linecard all` to view IPC statistics for all line cards.

Defaults Display IPC message statistics on all Z9500 CPUs: Control Processor, Route Processor, and line cards.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.12.0** Introduced on the S4810.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.1.1.0** Introduced on the E-Series ExaScale.
- Version 7.6.1.0** Introduced on the S-Series.
- Version 7.5.1.0** Introduced on the C-Series and E-Series.

Usage Information

Important Points:

- Use show processes ipc commands only when you are working directly with Dell Technical Support to troubleshoot a problem.

Example: show processes ipc send-stats

```
Dell#show processes ipc send-stats rp
IPC Send Statistics on RP
Memory Used by Send DB on this processor: 1451880 bytes
SeqNo - Last sent guaranteed IPC pkt sequence no from this source to
destination
Success - No of successfull guaranteed IPC packets sent from source to
destination
1st-R - No of first retry attempts
2nd-R - No of second retry attempts
Fails - No of guaranteed IPC pkts that could not be transmitted
RTT(ms) - Avg. Round Trip time for guaranteed IPC packets in millisecs
NonG-S - No of non-guaranteed IPC pkts succesfully sent. This does not
include those sent by SWP
NonG-F - No of non-guaranteed IPC pkt transmission failures
SWP-S - No of non-guaranteed SWP IPC pkts succesfully sent
SWP-F - No of non-guaranteed SWP IPC pkt transmission failures

show processes ipc flow-control

Display the single window protocol queue (SWPQ) statistics.

Syntax	<code>show processes ipc flow-control [cp rp lp {slot-id all}]</code>
Parameters	
cp	(OPTIONAL) Enter the keyword <code>cp</code> to view the control processor's SWPQ statistics.
rp	(OPTIONAL) Enter the keyword <code>rp</code> to view the Control Processor's SWPQ statistics on Route Processor.
lp slot-id	Enter the slot ID of the line card for which you want to view SWPQ statistics. The range of Z9500 slot IDs is from 0 to 2.
Defaults	none
Command Modes	<ul style="list-style-type: none"> • EXEC • EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and E-Series.

Usage Information

Field	Description
Source QID /Tx Process	Source Service Identifier
Destination QID/Rx Process	Destination Service Identifier
Cur Len	Current number of messages enqueued
High Mark	Highest number of packets in the queue at any time
#of to / Timeout	Timeout count
#of Retr /Retries	Number of retransmissions
#msg Sent/Msg Sent/	Number of messages sent
#msg Ackd/Ack Rcvd	Number of messages acknowledged
Retr /Available Retra	Number of retries left
Total/ Max Retra	Number of retries allowed

Important Points:

- The SWP provides flow control-based reliable communication between the sending and receiving software tasks.
- A sending task enqueues messages into the SWP queue3 for a receiving task and waits for an acknowledgement.
- If no response is received within a defined period of time, the SWP timeout mechanism resubmits the message at the head of the FIFO queue.
- After retrying a defined number of times, the SWP-2-NOMORETIMEOUT timeout message is generated.
- In the S-Series example, a retry (Retries) value of zero indicates that the SWP mechanism reached the maximum number of retransmissions without an acknowledgement.

Example

```
DellEMC# show processes ipc flow-control cp

show processes memory

View information about memory usage for processes running in the system.

Syntax `show processes memory [cp | rp | linecard {slot-id | all |summary}]`

Parameters

- cp** Enter the keyword `cp` to view memory usage for the Control Processor.
- rp** Enter the keyword `rp` to view memory usage for the Route Processor.
- linecard slot-id** Enter the slot ID of the line card for which you want to view CPU memory usage. The range of Z9500 slot IDs is from 0 to 2. Enter `linecard all` to display memory usage on all line card CPUs. Enter `linecard summary` to display a summary of memory usage on all line card CPUs.

Command Modes

- EXEC
- EXEC Privilege

Defaults Display detailed information on memory usage on all Z9500 CPUs (Control Processor, Route Processor, and line cards).

Command History

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.12.0** Introduced on the S4810.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.1.1.2** Introduced on the E-Series ExaScale E600i.
- Version 8.1.1.0** Introduced on the E-Series ExaScale E1200i.
- Version 7.5.1.0** Introduced on the C-Series.

Usage Information

show processes memory output Field

Description

Total: Total system memory available

MaxUsed: Total maximum memory used ever (history indicated with a time stamp)

CurrentUsed: Total memory currently in use

CurrentFree: Total system memory available

SharedUsed: Total used shared memory

SharedFree: Total free shared memory

PID Process ID

Process Process Name

ResSize Actual resident size of the process in memory

Size Process test, stack, and data size

Allocs Total dynamic memory allocated

show	Description
processes	
memory	
output Field	
Frees	Total dynamic memory freed
Max	Maximum dynamic memory allocated
Current	Current dynamic memory in use

The output for `show process memory` displays the memory usage statistics running on the CP part (sysd) of the system. The sysd is an aggregate task that handles all the tasks running on the Control Processor.

The total counter size in `show memory` and `show processes memory` differs based on which OS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the `show processes memory` output, the memory size is equal to the size of the application processes plus the size of the system processes.

Example: show processes memory cp

```
Dell#show processes memory
Total      : 3203928064, MaxUsed      : 804720640 [01/27/2014 06:16:44]
CurrentUsed: 804720640, CurrentFree: 2399207424
SharedUsed : 9776664, SharedFree  : 16437760
```

show reset-reason

Display the reason for the last system reboot.

Syntax `show reset-reason [stack-unit {stack-unit-number | all}]`

Parameters

stack-unit unit-number (OPTIONAL) Enter the keyword `stack-unit` and the stack unit number to view the reason for the last system reboot for that stack unit.

all (OPTIONAL) Enter the keyword `stack-unit` and the keyword `all` to view the reason for the last system reboot of all stack units in the stack.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced on the S3048-ON, S3100 series, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, C9010, MXL, M-IOA, and FN-IOM.

Usage Information

You can use the `show reset-reason` without the `stack-unit` option to view the reason for the last system reboot of the local system.

Example — User-initiated reboot with the `reload` command

```
DellEMC#show reset-reason
Cause      : Reset by User through CLI command
Reset Time: 11/05/2017-08:36
```

Example — System reboot due to the `upgrade` command

```
DellEMC# show reset-reason
Cause: Reboot by Software upgrade Module.
Reset Time: 8/9/2017 1:39 PM.
```

Example — System reboot for unknown reasons

```
DellEMC# show reset-reason
Cause: N/A
Reload Time: N/A
```

Example — System reboot due to power loss or pressing the power button off and on.

The example shows the reason for the last reboot as N/A for warm reset.

```
DellEMC#show reset-reason
Cause      : N/A
Reset Time  : N/A.
```

Example — System reboot due to watchdog timeout

```
DellEMC#show reset-reason
Cause: N/A.
Reset Time: N/A
```

Example — System reboot due to thermal shutdown

The example shows the reason for the last reboot as N/A for thermal shutdown.

```
DellEMC# show reset-reason
Cause: N/A
Reload Time: N/A
```

Example — System reboot due to BIOS boot fail

The example shows the reason for the last reboot as N/A for BIOS boot fail.

```
DellEMC#show reset-reason
Cause: NA
Reset Time: N/A.
```

Example — Unknown reason

If the reason for the last system reboot is not available, the system displays the reason as N/A.

```
DellEMC# show reload-reason
Cause: N/A
Time: N/A
```

show software ifm

Display interface management (IFM) data.

Syntax

```
show software ifm {clients [summary] | ifagt number | ifcb interface |
stack-unit unit-ID | trace-flags}
```

Parameters

clients	Enter the keyword <code>clients</code> to display IFM client information.
summary	(OPTIONAL) Enter the keyword <code>summary</code> to display brief information about IFM clients.
ifagt number	Enter the keyword <code>ifagt</code> then the number of an interface agent to display software pipe and IPC statistics.
ifcb interface	Enter the keyword <code>ifcb</code> then one of the following interface IDs then the interface information to display interface control block information for that interface: <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
stack-unit unit-ID	Enter the keyword <code>stack-unit</code> then the stack member number to display IFM information for that unit.
trace-flags	Enter the keyword <code>trace-flags</code> to display IFM information for internal trace flags.

Defaults

None.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
7.6.1.0	Introduced for the C-Series and S-Series.

Example

```

```

```

DellEMC# show software ifm linecard 0 | save flash://sh_sf_ifm_linecard0
Start saving show command report .....
DellEMC#

```

show system

Display the status of all stack members or a specific member.

Syntax `show system [brief | linecard slot-id]`

Parameters

- brief** (OPTIONAL) Enter the keyword `brief` to view an abbreviated list of system information.
- linecard slot-id** (OPTIONAL) Enter the keyword `linecard` and a slot number to identify the switch ports. The slot ID range is from 0 to 2.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Network OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for the <code>disabled-ports</code> parameter.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	The <code>brief</code> parameter no longer displays the current Reload mode. To display Reload mode, use the <code>show reload-type</code> command. Modified the <code>show system stack-unit</code> command output to support Piece Part ID (PPID).
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	The Boot Flash field displays the code level for boot code 2.8.1.1 and newer, while older boot codes display as "Present".
7.7.1.0	Added Master Priority field.
7.6.1.0	Introduced on the S-Series.

Example (show system brief)

```
DelleMC# show system brief

System MAC : 74:86:7a:ff:6f:06
Reload-Type: normal-reload [Next boot : normal-reload]

show trace

View results of trace operations on the switch or a specified line card.

Syntax `show trace [linecard slot-id | rp]`

Parameters

- linecard slot-id** Enter the slot ID of the line card for which you want to collect information for tech support. The range of Z9500 slot IDs is from 0 to 2.
- rp** Enter the keyword `rp` to collect information about the Route Processor for tech support.

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.7.0** Introduced on the S4810.

Example

```
Dell#show trace linecard 2

Related Commands

- [traceroute](#) — displays packet route to a destination device.
-

show tech-support

Display a collection of data from other `show` commands, necessary for Dell EMC Networking technical support to perform troubleshooting.

Syntax `show tech-support [stack-unit unit-id | page]`

Parameters

stack-unit (OPTIONAL) Enter the keywords `stack-unit` to view CPU memory usage for the stack member designated by `unit-id`.

page (OPTIONAL) Enter the keyword `page` to view 24 lines of text at a time. Press the SPACE BAR to view the next 24 lines. Press the ENTER key to view the next line of text.

When using the pipe command (`|`), enter one of these keywords to filter command output. For details about filtering commands, refer to [CLI Basics](#).

save Enter the keyword `save` to save the command output.

`flash:` Save to local flash drive (`flash://filename`). A maximum of 20 characters.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced <code>save</code> to the file options.
7.6.1.0	Introduced on the S-Series.

Usage Information Without the `page` or `stack-unit` option, the command output is continuous. To interrupt the command output, use Ctrl-z.

The `save` option works with other filtering commands. This allows you to save specific information of a `show` command. The `save` entry must always be the last option. For example: `DellEMC#show tech-`

```
support |grep regular-expression |except regular-expression | find regular-  
expression | save flash://result
```

This display output is an accumulation of the same information that is displayed when you execute one of the following show commands:

- show version
- show clock
- show running-config
- show system stack-ports
- show interfaces
- show process memory
- show process cpu
- show file system
- show system
- show environment
- show ip traffic
- show ip management route
- show ip route summary
- show Inventory
- show log summary
- show command-history (last 20 commands)
- show log

Example (S-Series)

```
DelleMC# show tech-support ?  
page          Page through output  
stack-unit    Unit Number  
|            Pipe through a command

Example

show util-threshold cpu

Display the utilization thresholds of Z9500 CPUs.

Syntax show util-threshold cpu

Defaults None

Command Modes EXEC PRIVILEGE

Command History

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series, E-Series, S25 and S50.

Example

```
Dell# show util-threshold cpu
```

Processor	5Sec		1Min		5Min	
	High	Low	High	Low	High	Low
CP	0	0	85	75	80	70
RP	0	0	85	75	80	70
LP 0	0	0	85	75	80	70
LP 1	0	0	85	75	80	70
LP 2	0	0	85	75	80	70

Usage Information

Use the `show util-threshold cpu` command to display the CPU utilization thresholds used to send SNMP traps. When Z9500 CPUs exceed the configured time to process packets or data, a threshold notification is sent as an SNMP trap. To reconfigure the currently configured values, use the `util-threshold cpu` command.

Related Commands

- [util-threshold cpu](#) – Configure CPU utilization thresholds.
- [util-threshold mem](#) – Configure memory utilization thresholds.

show util-threshold memory

Display the memory utilization thresholds of Z9500 CPUs.

Syntax `show util-threshold memory`

Defaults None

Command Modes EXEC PRIVILEGE

Command History

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series, E-Series, S25 and S50.

Example

```
Dell# show util-threshold memory
```

Processor	High	Low
CP	92	82
RP	92	82
LP 0	92	82
LP 1	92	82
LP 2	92	82

Usage Information

Use the `show util-threshold memory` command to display the memory utilization thresholds used to send SNMP traps. When Z9500 CPUs exceed the configured (high or low) memory percentage to process packets or data, a threshold notification is sent as an SNMP trap. To reconfigure the currently configured values, use the `util-threshold memory` command.

- Related Commands**
- [util-threshold mem](#) – Configure memory utilization thresholds.
 - [util-threshold cpu](#) – Configure CPU utilization thresholds.

system location-led

Toggle the location LED of the chassis and (optionally) the location LED of a specified Z9500 port on or off.

Syntax `system location-led [interface {fortyGigE | tengigabitethernet} slot/port] {on | off}`

Parameters

interface {fortyGigE tengigabitethernet}	Specify the port type: 40-Gigabit Ethernet or 10-Gigabit Ethernet.
slot / port	Enter the slot and port number. The range of Z9500 slot numbers is 0 to 2.
on off	Turn the location LEDs of the chassis and a specified port on or off.

Defaults The location LEDs of the chassis and Z9500 ports are turned off.

Command Modes EXEC

Command History

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.2.1.0	Introduced on the E-Series ExaScale.

Usage Information Use the `system location-led` command to locate the chassis and (optionally) a port on the I/O side of the Z9500 chassis. The location LED setting is not saved through power cycles.

telnet

Connect through Telnet to a server. The Telnet client and server in Dell EMC Networking support IPv4 and IPv6 connections. You can establish a Telnet session directly to the router or a connection can be initiated from the router.

NOTE: The Telnet server and client are VRF-aware. Using the `vrf` parameter in this command, you can make a Telnet server or client to listen to a specific VRF. This capability enables a Telnet server or client to look up the correct routing table and establish a connection.

Syntax `telnet {host | ip-address | ipv6-address prefix-length | vrf vrf instance name} [/source-interface]`

Parameters

host	Enter the name of a server.
ip-address	Enter the IPv4 address in dotted decimal format of the server.
ipv6-address prefix-length	Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.
	NOTE: The :: notation specifies successive hexadecimal fields of zeros.
vrf instance	(Optional) Enter the keyword <code>vrf</code> then the VRF instance name.
source-interface	(OPTIONAL) Enter the keywords <code>/source-interface</code> then the interface information to include the source interface. Enter the following keywords and the interface information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For Tunnel interface types, enter the keyword `tunnel` then the slot/ port information. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults Not configured.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810. Added support for <i>source-interface</i> for link-local IPv6 addressing.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced on the E-Series (IPv6). Increased the number of VLANs to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series (IPv4).
7.9.1.0	Introduced VRF.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and added support for IPv6 address on the E-Series only.

Usage Information

The VRF configured using this command has a higher precedence than a VRF configured using the `ip telnet vrf vrf-name` command. If you do not use the VRF attribute in this command, then TELNET client uses the VRF configured using the `ip telnet vrf vrf-name` command.

The source interface configured using this command has a higher precedence than the source interface configured using the `ip telnet source-interface` command. If you do not configure a source interface using this command, then the TELNET client uses the source interface configured using the `ip telnet source-interface` command.

In case there is a mismatch between the VRF telnet source interface and the telnet VRF, then an error is reported.

Example

```
DellEMC# telnet vrf vrf1 10.10.10.2
```

terminal length

Configure the number of lines displayed on the terminal screen.

Syntax `terminal length screen-length`

Parameters ***screen-length*** Enter a number of lines. Entering zero causes the terminal to display without pausing. The range is from 0 to 512.

Defaults 24 lines

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

traceroute

View a packet's path to a specific device.

Syntax `traceroute {host | vrf instance | ip-address | ipv6-address}`

Parameters

host Enter the name of device.

vrf instance (Optional) E-Series Only: Enter the keyword `vrf` then the VRF Instance name.

ip-address Enter the IP address of the device in dotted decimal format.

ipv6-address Enter the IPv6 address, in the x:x:x::x format, to which you are testing connectivity.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

Defaults

- Timeout = **5 seconds**
- Probe count = **3**
- 30 hops max
- 40 byte packet size
- UDP port = **33434**

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced on the E-Series with IPv6.
8.1.1.0	Introduced on the E-Series (IPv4 only).
7.9.1.0	Introduced VRF.
7.6.1.0	Added support for the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for IPv6 address on the E-Series.
E-Series	Original command.

Usage Information

When you enter the `traceroute` command without specifying an IP address (Extended Traceroute), you are prompted for a target and source IP address, timeout (in seconds) (default is **5**), a probe count (default is **3**), minimum TTL (default is **1**), maximum TTL (default is **30**), and port number (default is **33434**). To keep the default setting for those parameters, press the ENTER key.

For IPv6, you are prompted for a minimum hop count (default is **1**) and a maximum hop count (default is **64**).

Example (IPv4)

```
DellEMC# traceroute www.Dell EMC Networking.com
```

```

Translating "www.Dell EMC Networking.com"...domain server (10.11.0.1)
[OK]
Type Ctrl-C to abort.

-----
Tracing the route to www.Dell EMC Networking.com (10.11.84.18),
30 hops max, 40 byte packets
-----
TTL Hostname          Probe1      Probe2      Probe3
 1  10.11.199.190 001.000 ms 001.000 ms 002.000 ms

DellEMC#

```

Related Commands

- [ping](#) — tests the connectivity to a device.

undebug all

Disable all debug operations on the system.

Syntax undebug all

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

upload trace-log

Upload a trace log file from a Z9500 CPU.

Syntax `upload trace-log {rp | linecard slot-id} {cmd-history | hw-trace | sw-trace}`

Parameters		
rp	Enter the keyword <code>rp</code> to upload a trace log from the Route Processor CPU.	
linecard slot-id	Enter the <code>linecard slot-id</code> parameters to specify the line-card CPU whose trace log you want to upload.	
cmd-history	Enter the keyword <code>cmd-history</code> to upload the command history from the specified CPU.	
hw-trace	Enter the keyword <code>hw-trace</code> to upload the hardware trace log from the specified CPU.	
sw-trace	Enter the keyword <code>sw-trace</code> to upload the software trace log from the specified CPU.	

Defaults None.

Command Modes CONFIGURATION

Command History	Version	Description
	9.2(1.0)	Introduced on the Z9500.
	8.1.1.0	Introduced on the E-Series ExaScale.
	7.5.1.0	Introduced on the C-Series.

Usage Information Trace log information is uploaded to `flash:/TRACE_LOG_DIR`.

util-threshold cpu

Configure the high or low CPU utilization thresholds for SNMP traps.

Syntax `util-threshold cpu {5sec | 1min | 5min} {cp | rp | linecard slot-id | all} {high {0-100} | low {0-100}}`

Parameters	cpu-utilization-time	Enter one of the following values to configure the threshold level for the time in which a Z9500 CPU can be used: <ul style="list-style-type: none">• 5sec• 1min• 5min
	cp	Enter the keyword <code>cp</code> to configure the CPU utilization time for the Control Processor CPU.
	rp	Enter the keyword <code>rp</code> to configure the CPU utilization time for the Route Processor CPU.
	linecard slot-id	Enter the slot ID of the line card for which you want to configure the CPU utilization time. The range of Z9500 slot IDs is from 0 to 2.
	all	Enter the keyword <code>all</code> to configure the CPU utilization time on all Z9500 CPUs: Control Processor, Route Processor, and line cards.
	{{high low} cpu-utilization-threshold-percentage}	Enter a percentage value to configure the high or low threshold level for the time in which a Z9500 CPU can be used. The percentage of CPU use ranges from 0 to 100.  NOTE: A threshold level of 0 will disable Syslog and SNMP traps.

- Defaults**
- High CPU utilization threshold: 1min = 85%, 5min = 80%
 - Low CPU utilization threshold: 1min = 75%, 5min = 70%

Command Modes CONFIGURATION

Command History	Version	Description
	9.2(1.0)	Introduced on the Z9500.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.

Example `Dell(conf)# util-threshold cpu 5sec cp high 50`

In this example, the low threshold value is not specified so it will take the value set for the high threshold value. In all other cases, the low threshold value must be equal to or less than that of the high threshold value.

Usage Information When the total CPU utilization exceeds the configured threshold for the specified time, a threshold notification is sent as an SNMP trap. If a low threshold value is not specified, the low threshold value is set to the same value as the high threshold value. The system will generate a Syslog and SNMP trap each time the configured CPU threshold is crossed.

 **NOTE:** The 5sec `util-threshold cpu` command is disabled by default on all switches. To enable the command, enter `util-threshold cpu 5sec all high {value greater than zero}`. To disable the Syslog and traps for the 5sec CPU utilization thresholds, enter `util-threshold cpu 5sec all high 0` or `no util-threshold cpu 5sec {cp | rp | linecard slot-id | all}`.

- Related Commands**
- [show util-threshold cpu](#) – Display the configured values of CPU utilization thresholds.
 - [show util-threshold memory](#) – Display the configured values of memory utilization thresholds.

util-threshold memory

Configure the high or low memory utilization thresholds for SNMP traps.

Syntax	<code>util-threshold memory {cp rp linecard slot-id all} {[high {0-100}] [low {0-100}]}</code>	
Parameters	cp	Enter the keyword <code>cp</code> to configure the memory utilization threshold for the Control Processor CPU.
	rp	Enter the keyword <code>rp</code> to configure the memory utilization threshold for the Route Processor CPU.
	linecard slot-id	Enter the slot ID of the line card for which you want to configure the memory utilization threshold. The range of Z9500 slot IDs is from 0 to 2.
	all	Enter the keyword <code>all</code> to configure the memory utilization threshold on all Z9500 CPUs: Control Processor, Route Processor, and line cards.
	{{high low} cpu-utilization-threshold-percentage}	Enter a percentage value to configure the high or low threshold level for the percentage of memory a Z9500 CPU can use. The percentage of memory utilization ranges from 0 to 100.

 **NOTE:** A threshold level of 0 will disable Syslog and SNMP traps.

- Defaults**
- High threshold: 92%
 - Low threshold: 82%

Command Modes CONFIGURATION

Command History	Version	Description
	9.2(1.0)	Introduced on the Z9500.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.

Example Dell(conf)# util-threshold memory cp high 75 low 67

Usage Information When the total memory utilization for a CPU exceeds the configured high/low threshold for a given time, a threshold notification is sent as a SNMP trap. If a low threshold value is not specified, the low threshold value is set to the same value as the high threshold value.

To return the memory thresholds to the default values, enter the `no util-threshold mem cp | rp | linecard slot-id | all` command.

- Related Commands**
- [show util-threshold memory](#) – Display the configured values of memory utilization thresholds.
 - [show util-threshold cpu](#) – Display the configured values of CPU utilization thresholds.

virtual-ip

Configure a virtual IP address for the active management interface. You can configure virtual addresses both for IPv4 and IPv6 independently.

Syntax `virtual-ip {ipv4-address | ipv6-address}`
To return to the default, use the `no virtual-ip {ipv4-address | ipv6-address}` command.

- Parameters**
- ipv4-address** Enter the IP address of the active management interface in a dotted decimal format (A.B.C.D.).
 - ipv6-address** Enter an IPv6 address of the active management interface, in the x:x:x:x:x format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

Defaults none

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information You can configure both IPv4 and IPv6 virtual addresses simultaneously, but only one of each. Each time this command is issued, it replaces the previously configured address of the same family, IPv4 or IPv6. The `no virtual-ip` command takes an address/prefix-length argument, so that the desired address only is removed. If you enter the `no virtual-ip` command without any specified address, then both IPv4 and IPv6 virtual addresses are removed.

Related Commands

- [ip address](#) — assigns a primary and secondary IP address to the interface.

write

Copy the current configuration to either the startup-configuration file or the terminal.

Syntax `write [memory [compressed] | terminal]`

Parameters

memory Enter the keyword `memory` to copy the current running configuration to the startup configuration file. This command is similar to the `copy running-config startup-config` command.

compressed Enter the keyword `compressed` to write the operating configuration to the startup-config file in the compressed mode.

terminal Enter the keyword `terminal` to copy the current running configuration to the terminal. This command is similar to the `show running-config` command.

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

Usage Information

The `write memory` command saves the running-configuration to the file labeled startup-configuration. When using a LOCAL CONFIG FILE other than the startup-config not named "startup-configuration" (for example, you used a specific file during the `boot config` command), the running-config is not saved to that file; use the `copy` command to save any running-configuration changes to that local file.

When you use the `write memory` command to copy the running configuration to the startup configuration file with the startup configuration verification feature enabled, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.

Access Control Lists (ACL)

Access control lists (ACLs) are supported by the Dell EMC Networking OS.

Dell EMC Networking OS supports the following types of ACL, IP prefix list, and route maps:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands

 **NOTE:** For ACL commands that use the Trace function, see *Trace List Commands* section in [Security](#).

 **NOTE:** For IPv6 ACL commands, see [IPv6 Access Control Lists \(IPv6 ACLs\)](#).

Topics:

- [Commands Common to all ACL Types](#)
- [Common IP ACL Commands](#)
- [Standard IP ACL Commands](#)
- [Extended IP ACL Commands](#)
- [ACL VLAN Group Commands](#)
- [Common MAC Access List Commands](#)
- [Standard MAC ACL Commands](#)
- [Extended MAC ACL Commands](#)
- [IP Prefix List Commands](#)
- [Route Map Commands](#)
- [AS-Path Commands](#)
- [IP Community List Commands](#)
- [UDF ACL Commands](#)

Commands Common to all ACL Types

The following commands are available within each ACL mode and do not have mode-specific options. Some commands in this chapter may use similar names, but require different options to support the different ACL types (for example, the `deny` and `permit` commands).

remark

Enter a description for an ACL entry.

Syntax `remark [remark-number] [description]`

Parameters **remark-number** Enter the remark number. The range is from 0 to 65535 for MAC ACL and 0 to 4294967290 for IP ACL.

 **NOTE:** You can use the same sequence number for the remark and an ACL rule.

description Enter a description of up to 80 characters.

Defaults Not configured.

Command Modes

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced on the E-Series.

Usage Information The `remark` command is available in each ACL mode. You can configure up to 4294967291 remarks for a given IP ACL and 65536 remarks for a given MAC ACL.

The following example shows the use of the `remark` command twice within CONFIGURATION-STANDARD-ACCESS-LIST mode. The same sequence number was used for the remark and for an associated ACL rule. The remark precedes the rule in the running-config because it is assumed that the remark is for the rule with the same sequence number, or the group of rules that follow the remark.

Example

```
DellEMC(config-std-nacl) # remark 10 Deny rest of the traffic
DellEMC(config-std-nacl) # remark 5 Permit traffic from XYZ Inc.
DellEMC(config-std-nacl) # show config
!
ip access-list standard test
remark 5 Permit traffic from XYZ Inc.
seq 5 permit 1.1.1.0/24
remark 10 Deny rest of the traffic
seq 10 deny any
DellEMC(config-std-nacl) #
```

Related Commands

- `show config` — display the current ACL configuration.

show config

Display the current ACL configuration.

Syntax `show config`

- Command Modes**
- CONFIGURATION-STANDARD-ACCESS-LIST
 - CONFIGURATION-EXTENDED-ACCESS-LIST
 - CONFIGURATION-MAC ACCESS LIST-STANDARD
 - CONFIGURATION-MAC ACCESS LIST-EXTENDED

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Example

```
DellEMC(config-std-nacl)# show conf
!
ip access-list standard test
 remark 5 Permit traffic from XYZ Inc.
 seq 5 permit 1.1.1.0/24 count
 remark 10 Deny traffic from ABC
 seq 10 deny 2.1.1.0/24 count
DellEMC(config-std-nacl)#
```

Common IP ACL Commands

The following commands are available within both Ingress and Egress IP ACL modes (Standard and Extended) and do not have mode-specific options. When an ACL is created without a rule and then is applied to an interface, ACL behavior reflects an implicit permit.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) section.

clear counters ip access-group

Erase all counters maintained for access lists.

Syntax `clear counters ip access-group [access-list-name]`

Parameters **access-list-name** (OPTIONAL) Enter the name of a configured access-list, up to 140 characters.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

ip access-group

Assign an IP access list (IP ACL) to an interface.

Syntax `ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [vrf vrf-name]`

To delete an IP access-group configuration, use the `no ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [layer3] [vrf vrf-name]` command.

Parameters

- access-list-name** Enter the name of a configured access list, up to 140 characters.
- in** Enter the keyword `in` to apply the ACL to incoming traffic.
- out** Enter the keyword `out` to apply the ACL to outgoing traffic.
- implicit-permit** (OPTIONAL) Enter the keyword `implicit-permit` to change the default action of the ACL from `implicit-deny` to `implicit-permit` (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).

vlan <i>vlan-id</i>	(OPTIONAL) Enter the keyword <code>vlan</code> then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).
vrf <i>vrf-name</i>	(OPTIONAL) Enter the keyword <code>vrf</code> then the ID numbers of the VRFs. The range is from 1 to 63 (you can use IDs from 1 to 63). <i>i</i> NOTE: When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.
layer3	(OPTIONAL) Enter the keyword <code>layer3</code> to enable layer 3 mode. It ensures that all the ACL rules in the access-group are applied only for L3 router packets.

Defaults Not enabled.

Command Modes INTERFACE/VRF MODE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

Usage Information You can assign one ingress ACL and one egress ACL to an interface.

i **NOTE:** This command supports Loopback interfaces EE3 and EF series route processor modules (RPMs). This command does not support Loopback interfaces ED series RPMs and S-Series Loopback interfaces.

i **NOTE:** If you apply outbound(egress) IP acl on a switch port, the filter applies only for routed traffic egressing out of that port.

To associate an access-list to a non-default VRF, use the `vrf` attribute of this command. You can use this command at the interface context (physical/LAG) to apply the access-list to a range of VRFs.

The VRF MODE is not available for the default and management VRFs.

In the Dell EMC Networking OS versions prior to 9.13(0.0), the system does not install any of your ACL rules if the available CAM space is lesser than what is required for your set of ACL rules. Effective with the Dell EMC Networking OS version 9.13(0.0), the system installs your ACL rules until all the allocated CAM memory is used. If there is no implicit permit in your rule, the Dell EMC Networking OS ensures that an implicit deny is installed at the end of your rule. This behavior is applicable for IPv4 and IPv6 ingress and egress ACLs.

- Related Commands**
- [ip access-list standard](#) — configure a standard ACL.
 - [ip access-list extended](#) — configure an extended ACL.

ip mirror-access-group

Assign an IP mirror access control to an interface.

Syntax `ip mirror-access-group access-list-name {in} [implicit-permit] [vlan vlan-id] [optimized]`

To remove an IP mirror-access-group configuration, use the `no ip mirror-access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [optimized]` command.

- Parameters**
- access-list-name** Enter the name of a configured access list, up to 140 characters.
 - in** Enter the keyword `in` to apply the ACL to incoming traffic.
 - implicit-permit** (OPTIONAL) Enter the keyword `implicit-permit` to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).
 - vlan vlan-id** (OPTIONAL) Enter the keyword `vlan` then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).
 - optimized** (OPTIONAL) Enter the keyword `optimized` to enable ACL optimization.

Defaults Not enabled.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command-Line Reference Guide*.

Version	Description
9.11(0.0)	Introduced on the S4048-ON, S4048T-ON, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, and Z9500.

- Related Commands**
- [ip access-list standard](#) — configure a standard ACL.
 - [ip access-list extended](#) — configure an extended ACL.

ip control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv4 CPU traffic.

Syntax `ip control-plane egress-filter`

Defaults Not enabled.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

show ip access-lists

Display all of the IP ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

Syntax `show ip access-lists [access-list-name] [interface interface] [in | out] [vrf vrf-name]`

Parameters	
access-list-name	Enter the name of a configured MAC ACL, up to 140 characters.
interface interface	Enter the keyword <code>interface</code> followed by the one of the following keywords and slot/port or number information: <ul style="list-style-type: none"> For a VLAN interface, enter the keyword <code>vlan</code> followed by the slot/port number. For a Port Channel interface, enter the keyword <code>port-channel</code> followed by a number. For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> followed by the slot/port information. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
in out	Identify whether ACL is applied on the ingress or egress side.
vrf vrf-name	Enter the keyword <code>vrf</code> and then the name of the VRF to display the access-lists that are configured on either the default or non-default VRFs.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.5.1.0	Added support for the 4-port 40G line cards on the E-Series.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.

show ip accounting access-list

Display the IP access-lists created on the switch and the sequence of filters.

Syntax	<code>show ip accounting {access-list access-list-name cam_count} interface interface [vrf vrf-name]</code>
Parameters	<p>access-list-name Enter the name of the ACL to be displayed.</p> <p>cam_count List the count of the CAM rules for this ACL.</p> <p>interface interface Enter the keyword <code>interface</code> then the one of the following keywords and the interface information:</p> <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. For a port channel interface, enter the keywords <code>port-channel</code> then a number. For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094. <p>in out Identify whether ACL is applied on the ingress or egress side.</p> <p>vrf vrf-name (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to view the IP accounting information on either a default or a non-default VRF.</p>
Command Modes	<ul style="list-style-type: none"> EXEC EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Updated the show command output to include monitor option.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for the 4-port 40G line cards.
8.3.7.0	Introduced on the S4810.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced.

Usage Information

 **NOTE:** The vrf option is available only when VRF feature is enabled.

show ip accounting access-lists Field	Description
---------------------------------------	-------------

“Extended IP...”	Displays the name of the IP ACL.
“seq 5...”	Displays the filter. If the keywords <code>count</code> or <code>byte</code> were configured in the filter, the number of packets or bytes the filter processes is displayed at the end of the line.
“order 4”	Displays the QoS order of priority for the ACL entry.

Example

Standard IP ACL Commands

When you create an ACL without any rule and then apply it to an interface, the ACL behavior reflects an implicit permit. The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

deny

To drop packets with a certain IP address, configure a filter.

Syntax `deny {source | any | host {ip-address}} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

Parameters

source	Enter the IP address in dotted decimal format of the network from which the packet was sent.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address only.
count	(OPTIONAL) Enter the keyword <code>count</code> to count the packets.
bytes	(OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.
log	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.
dscp	(OPTIONAL) Enter the keyword <code>dscp</code> to match the IP DSCP values. The range is from 0 to 63.
ecn	(OPTIONAL) Enter the keyword <code>ecn</code> to match the ECN bits. The range is from 0 to 3.

order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  NOTE: For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-STANDARD-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the *Quality of Service* section in the *Dell EMC Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the `count` `byte` options, only bytes increment.

- Related Commands**
- [ip access-list standard](#) — configure a standard ACL.
 - [permit](#) — configure a permit filter.

ip access-list standard

Create a standard IP access list (IP ACL) to filter based on IP address.

Syntax `ip access-list standard access-list-name`
 To delete an access list, use the `no ip access-list standard access-list-name` command.

Parameters ***access-list-name*** Enter a string up to 140 characters long as the ACL name.

Defaults All IP access lists contain an implicit “deny any,” that is, if no match occurs, the packet is dropped.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information Dell EMC Networking OS supports one ingress and one egress IP ACL per interface.

Prior to Dell EMC Networking OS version 7.8.1.0, names are up to 16 characters long.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications on entries allowed per ACL, refer to your line card documentation.

Example

```
DellEMC(conf)# ip access-list standard TestList
DellEMC(config-std-nacl)#
```

- Related Commands**
- [ip access-list extended](#) — create an extended access list.
 - [show config](#) — display the current configuration.

permit

To permit packets from a specific source IP address to leave the switch, configure a filter.

Syntax `permit {source [mask] | any | host ip-address} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

Parameters

source	Enter the IP address in dotted decimal format of the network from which the packet was sent.
mask	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
count	(OPTIONAL) Enter the keyword <code>count</code> to count the packets.
bytes	(OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.
log	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.
dscp	(OPTIONAL) Enter the keyword <code>dscp</code> to match the IP DSCP values. The range is from 0 to 63.
ecn	(OPTIONAL) Enter the keyword <code>ecn</code> to match the ECN bits. The range is from 0 to 3.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  NOTE: For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-STANDARD-ACCESS-LIST

7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

Related Commands

- `deny` — assign a IP ACL filter to deny IP packets.
- `ip access-list standard` — create a standard ACL.

resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

Syntax `resequence access-list {ipv4 | ipv6 | mac} {access-list-name StartingSeqNum Step-to-Increment}`

- Parameters**
- ipv4 | ipv6 | mac** Enter the keyword `ipv4` or `mac` to identify the access list type to resequence.
 - access-list-name** Enter the name of a configured IP access list.
 - StartingSeqNum** Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
 - Step-to-Increment** Enter the step to increment the sequence number. The range is from 1 to 4294967290.

Defaults None

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

8.1.1.0	Introduced on the E-Series (IPv4).
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information

When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing access-list.

resequence prefix-list ipv4

Re-assign sequence numbers to entries of an existing prefix list.

Syntax `resequence prefix-list ipv4 {prefix-list-name StartingSeqNum Step-to-increment}`

Parameters

- prefix-list-name*** Enter the name of the configured prefix list, up to 140 characters long.
- StartingSeqNum*** Enter the starting sequence number to resequence. The range is from 0 to 65535.
- Step-to-Increment*** Enter the step to increment the sequence number. The range is from 1 to 65535.

Defaults none

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information

When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing prefix list.

Related Commands

[resequence access-list](#) — resequences an access-list.

seq

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address} [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]
```

To delete a filter, use the `no seq sequence-number` command.

Parameters

sequence-number	Enter a number from 0 to 4294967290.
deny	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
permit	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
source	Enter an IP address in dotted decimal format of the network from which the packet was received.
mask	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
bytes	(OPTIONAL) Enter the keyword <code>bytes</code> to count bytes the filter processes.
log	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.
dscp	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DCSCP values. The range is from 0 to 63.
ecn	(OPTIONAL) Enter the keyword <code>ecn</code> to match to the ECN values. The range is from 0 to 3.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.

NOTE: For more information, see “Flow-based Monitoring” in the Port Monitoring section of the *Dell EMC Networking OS Configuration Guide*.

no-drop Enter the keywords `no-drop` to match only the forwarded packets.

Defaults Not configured

Command Modes CONFIGURATION-STANDARD-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

Extended IP ACL Commands

When an ACL is created without any rule and then applied to an interface, ACL behavior reflects an implicit permit.

The following commands configure extended IP ACLs, which in addition to the IP address, also examine the packet's protocol type.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

deny

Configure a filter that drops IP packets meeting the filter criteria.

Syntax

```
deny {ip | ip-protocol-number} {source mask | any | host ip-address}
{destination mask | any | host ip-address} [ttl operator] [count [byte] |
log] [dscp value] [order] [monitor] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

ip	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list denies all IP protocols.
ip-protocol-number	Enter a number from 0 to 255 to deny based on the protocol identified in the IP protocol header.
source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
destination	Enter the IP address of the network or host to which the packets are sent.
ttl	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none">• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets that the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes that the filter processes.
log	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to enter ACL matches in the log.
dscp	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.

order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the noncontiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section in the *Dell EMC Networking OS Configuration Guide*.

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see [Port Monitoring](#).

The C-Series and S-Series cannot count both packets and bytes, when you enter the count byte options, only bytes are incremented.

NOTE: When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- [deny tcp](#) — assign a filter to deny TCP packets.
- [deny udp](#) — assign a filter to deny UDP packets.
- [ip access-list extended](#) — create an extended ACL.

deny icmp

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

Syntax

```
deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [dscp] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
destination	Enter the IP address of the network or host to which the packets are sent.
ttl	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none">• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
dscp	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the

lowest; lower order numbers have a higher priority) If you did not use the keyword `order`, the ACLs have the lowest order by default (255).

- fragments** Enter the keyword `fragments` to use ACLs to control packet fragments.
- monitor** (OPTIONAL) Enter the keyword `monitor` to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see *Flow-based Monitoring* in the Port Monitoring section in the *Dell EMC Networking OS Configuration Guide*.
- no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>t11</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(2.0P0)	Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the *Quality of Service* section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see [Port Monitoring](#).

deny tcp

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]]  
{destination mask | any | host ip-address} [ttl operator] [dscp] [bit]  
[operator port [port]] [count [bytes] [order] [fragments] [monitor] [no-  
drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address of the network or host from which the packets are sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
ttl	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none">• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
dscp	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
bit	Enter a flag or combination of bits: <ul style="list-style-type: none">• <code>ack</code>: acknowledgement field• <code>fin</code>: finish (no more data from the user)• <code>psh</code>: push function• <code>rst</code>: reset the connection• <code>syn</code>: synchronize sequence numbers• <code>urg</code>: urgent field
operator	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none">• <code>eq</code> = equal to• <code>neq</code> = not equal to• <code>gt</code> = greater than• <code>lt</code> = less than• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)
port port	Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none">• 23 = Telnet• 20 and 21 = FTP

- 25 = SMTP
- 169 = SNMP

destination	Enter the IP address of the network or host to which the packets are sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(2.0P0)	Added the <code>established</code> parameter on the on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>ds cp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

NOTE: When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	00001111110100000	11111111111100000	4000	4031	32
2	00001111111000000	11111111111000000	4032	4095	64
3	00010000000000000	11111000000000000	4096	6143	2048
4	00011000000000000	11111100000000000	6144	7167	1024
5	00011100000000000	11111110000000000	7168	7679	512
6	00011110000000000	11111111000000000	7680	7935	256
7	00011111000000000	11111111100000000	7936	7999	64
8	00011111010000000	11111111111111111	8000	8000	1

Total Ports: 4001

Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	00000000000000000	11111100000000000	0	1023	1024

Total Ports: 1024

Related Commands

- `deny` — assign a filter to deny IP traffic.
- `deny udp` — assign a filter to deny UDP traffic.

deny udp

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

Syntax

```
deny udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.

- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
ttl	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value. • <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
dscp	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
operator	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code> = equal to • <code>neq</code> = not equal to • <code>gt</code> = greater than • <code>lt</code> = less than • <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)
port port	Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.
destination	Enter the IP address of the network or host to which the packets are sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see <i>Flow-based Monitoring</i> in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>t11</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

NOTE: When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt` or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```
Rule#  Data                               Mask                               From To #Covered
1  0000111111010000  1111111111100000  4000 4031 32
```

```

2 0000111111000000 1111111111000000 4032 4095 64
3 0001000000000000 1111100000000000 4096 6143 2048
4 0001100000000000 1111110000000000 6144 7167 1024
5 0001110000000000 1111111000000000 7168 7679 512
6 0001111000000000 1111111100000000 7680 7935 256
7 0001111100000000 1111111110000000 7936 7999 64
8 0001111101000000 1111111111111111 8000 8000 1

Total Ports: 4001

```

Example

An ACL rule with a TCP port 1023 uses only one entry in the CAM.

```

Rule# Data Mask From To #Covered
1 0000000000000000 1111110000000000 0 1023 1024

Total Ports: 1024

```

Related Commands

- [deny](#) — assign a filter to deny IP traffic.
- [deny tcp](#) — assign a filter to deny TCP traffic.

ip access-list extended

Name (or select) an extended IP access list (IP ACL) based on IP addresses or protocols.

Syntax

```
ip access-list extended access-list-name
```

To delete an access list, use the `no ip access-list extended access-list-name` command.

Parameters

access-list-name Enter a string up to 140 characters long as the access list name.

Defaults

All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specification about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

Example

```
DellEMC(conf)# ip access-list extended TESTListEXTEND
DellEMC(config-ext-nacl)#
```

Related Commands

- [ip access-list standard](#) — configure a standard IP access list.
- [show config](#) — display the current configuration.

permit

To pass IP packets meeting the filter criteria, configure a filter.

Syntax

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [count [bytes]] [dscp value] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address in dotted decimal format of the network from which the packet was sent.
mask	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
destination	Enter the IP address of the network or host to which the packets are sent.
ttl	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value. • <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
bytes	(OPTIONAL) Enter the keyword <code>bytes</code> to count bytes processed by the filter.
dscp	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DCSCP values.

order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

Related Commands

- [ip access-list extended](#) — create an extended ACL.
-
- [permit tcp](#) — assign a permit filter for TCP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

permit icmp

Configure a filter to allow all or specific ICMP messages.

Syntax

```
permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [dscp] [message-type] [count [byte] | log] [order] [monitor] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
any	Enter the keyword <code>any</code> to match and drop specific Ethernet traffic on the interface.
host ip-address	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.
destination	Enter the IP address of the network or host to which the packets are sent.
dscp	Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is 0 to 63.
message-type	(OPTIONAL) Enter an ICMP message type, either with the type (and code, if necessary) numbers or with the name of the message type. The range is 0 to 255 for ICMP type and 0 to 255 for ICMP code.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
log	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to have the information kept in an ACL log file.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  NOTE: For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the <i>FTOS Configuration Guide</i> .
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults

Not configured.

Command Modes CONFIGURATION-STANDARD-ACCESS-LIST

Command History	Version	Description
	9.11(2.0)	Added the <i>type</i> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.8(0.0)	Added the no-drop parameter.
	9.2(1.0)	Introduced on the Z9500.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.
	8.3.1.0	Added the keyword <i>dscp</i> .
	8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
	8.1.1.0	Introduced on the E-Series ExaScale.
	7.4.1.0	Added support for noncontiguous mask and added the <i>monitor</i> option.
	6.5.10	Expanded to include the optional QoS <i>order</i> priority for the ACL entry.

Usage Information

The *order* option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *FTOS Configuration Guide*.

When you use the *log* option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The *monitor* option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

 **NOTE:** When ACL logging and byte counters are configured simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

permit tcp

To pass TCP packets meeting the filter criteria, configure a filter.

Syntax

```
permit tcp {source mask | any | host ip-address} [bit] [operator port
[port]] {destination mask | any | host ip-address} [bit] [ttl operator]
[dscp] [operator port [port]] [count [byte] [order] [fragments] [monitor]
[no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <i>any</i> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <i>host</i> then the IP address to specify a host IP address.
bit	Enter a flag or combination of bits: <ul style="list-style-type: none"> • <i>ack</i>: acknowledgement field • <i>fin</i>: finish (no more data from the user) • <i>psh</i>: push function • <i>rst</i>: reset the connection

- `syn`: synchronize sequence numbers
- `urg`: urgent field

ttl	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value. • <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
dscp	Enter the keyword <code>dscp</code> to permit a packet based on the DSCP value. The range is from 0 to 63.
operator	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code> = equal to • <code>neq</code> = not equal to • <code>gt</code> = greater than • <code>lt</code> = less than • <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)
port port	Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none"> • 23 = Telnet • 20 and 21 = FTP • 25 = SMTP • 169 = SNMP
destination	Enter the IP address of the network or host to which the packets are sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

8 0001111101000000 1111111111111111 8000 8000 1

Total Ports: 4001

```

Example

An ACL rule with a TCP port 1023 uses only one entry in the CAM.

```

DellEMC# Data          Mask          From To    #Covered
1 0000000000000000 1111110000000000 0      1023 1024

Total Ports: 1024

```

Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit udp](#) — assign a permit filter for UDP packets.

permit udp

To pass UDP packets meeting the filter criteria, configure a filter.

Syntax

```

permit udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator
port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]

```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.
ttl	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value. • <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
dscp	Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
operator	(OPTIONAL) Enter one of the following logical operand:

- `eq` = equal to
- `neq` = not equal to
- `gt` = greater than
- `lt` = less than
- `range` = inclusive range of ports (you must specify two ports for the `port` parameter)

<i>port port</i>	Enter the application layer port number. Enter two port numbers if you are using the <code>range</code> logical operand. The range is 0 to 65535.
<i>destination</i>	Enter the IP address of the network or host to which the packets are sent.
<code>count</code>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<code>byte</code>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<code>order</code>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<code>fragments</code>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<code>monitor</code>	(OPTIONAL) Enter the keyword <code>monitor</code> to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
<code>no-drop</code>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter. Removed the <code>session-ID</code> option from the <code>monitor</code> parameter.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>ds cp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. .
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

NOTE: When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```
DellEMC# Data          Mask          From To    #Covered
1 00001111110100000 1111111111100000 4000 4031 32
2 00001111111000000 1111111111100000 4032 4095 64
3 00010000000000000 11111000000000000 4096 6143 2048
4 00011000000000000 11111100000000000 6144 7167 1024
5 00011100000000000 11111110000000000 7168 7679 512
6 00011110000000000 11111111000000000 7680 7935 256
7 00011111000000000 11111111100000000 7936 7999 64
8 00011111010000000 11111111111111111 8000 8000 1

Total Ports: 4001
```

Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

```
DellEMC# Data          Mask          From To    #Covered
1 00000000000000000 11111100000000000 0    1023 1024

Total Ports: 1024
```

Related Commands

- [ip access-list extended](#) — create an extended ACL.
- [permit](#) — assign a permit filter for IP packets.
- [permit tcp](#) — assign a permit filter for TCP packets.

resequence prefix-list ipv4

Re-assign sequence numbers to entries of an existing prefix list.

Syntax `resequence prefix-list ipv4 {prefix-list-name StartingSeqNum Step-to-increment}`

Parameters

- prefix-list-name*** Enter the name of the configured prefix list, up to 140 characters long.
- StartingSeqNum*** Enter the starting sequence number to resequence. The range is from 0 to 65535.

Step-to-Increment Enter the step to increment the sequence number. The range is from 1 to 65535.

Defaults none

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing prefix list.

Related Commands [resequence access-list](#) — resequences an access-list.

seq

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

Syntax

```
seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator [portnumber ]] [ttl operator] [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]
```

Parameters

sequence-number	Enter a number from 0 to 4294967290.
deny	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
permit	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
ip-protocol-number	Enter a number from 0 to 255 to filter based on the protocol identified in the IP protocol header.
icmp	Enter the keyword <code>icmp</code> to configure an ICMP access list filter.
ip	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols.
tcp	Enter the keyword <code>tcp</code> to configure a TCP access list filter.
udp	Enter the keyword <code>udp</code> to configure a UDP access list filter.
source	Enter an IP address in dotted decimal format of the network from which the packet was received.

mask	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-address	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address or hostname.
operator	(OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> • <code>eq</code> = equal to • <code>neq</code> = not equal to • <code>gt</code> = greater than • <code>lt</code> = less than • <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter.)
portnumber	(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none"> • 23 = Telnet • 20 and 21 = FTP-DATA and FTP • 25 = SMTP • 169 = SNMP
destination	Enter the IP address of the network or host to which the packets are sent.
ttl	Enter the keyword <code>ttl</code> to permit or deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value. • <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
count	(OPTIONAL) Enter the keyword <code>count</code> to count the packets.
bytes	(OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.
log	(OPTIONAL) Enter the keyword <code>log</code> to enter ACL matches in the log.
dscp	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values. The range is from 0 to 63.
ecn	(OPTIONAL) Enter the keyword <code>ecn</code> to match to the ECN values. The range is from 0 to 3.
order	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.  NOTE: For more information, see “Flow-based Monitoring” in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .
fragments	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.

no-drop Enter the keywords `no-drop` to match only the forwarded packets.

Defaults Not configured

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.11(2.0P0)	Included support for using logical names of a protocol to configure an IP access list in both TCP and UDP on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11(0.0)	Added support for <code>session-ID</code> to the <code>monitor</code> parameter.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

Usage Information The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

If you configure the `sequence-number`, the `sequence-number` is used as a tie breaker for rules with the same order.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related
Commands**

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

ACL VLAN Group Commands

Use the commands in this section to configure ACL VLAN groups and CAM optimization for ACLs applied to VLAN groups.

acl-vlan-group

Create an ACL VLAN group.

Syntax `acl-vlan-group group name`

To remove an ACL VLAN group, use the `no acl-vlan-group group name` command.

Parameters `group-name` Enter the name of the ACL VLAN group (140 characters maximum).

Default No default behavior or values

Command Modes ACL-VLAN-GROUP CONFIGURATION

Command History	Version	Description
	9.5(0.1)	Introduced on the Z9500.
	9.3(0.0)	Introduced on the S4810, S4820T and Z9000.

Usage Information You can configure up to eight different ACL VLAN groups at a time on the switch. When you configure an ACL VLAN group, you enter ACL VLAN Group configuration mode.

To avoid the problem of excessive consumption of CAM area, you can configure ACL VLAN groups that combines all the VLANs that are applied with the same ACL in a single group. A unique identifier for each of ACL attached to the VLAN is used as a handle or locator in the CAM area instead of the VLAN id. This method of processing significantly reduces the number of entries in the CAM area and saves memory space in CAM.

You can create an ACL VLAN group and attach the ACL with the VLAN members. Optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL maps with the VLAN and increased CAM space utilization occurs.

Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.

cam-acl-vlan

Configure the number of flow processor (FP) blocks of CAM allocated to ACL VLAN services on the switch.

Syntax `cam-acl-vlan {default | vlanopenflow <0-2> | vlaniscsi <0-2> | vlnaclopt <0-2>}`

Parameters	<p>default Reset the number of FP blocks to the default value. By default, 0 FP blocks of CAM are allocated for ACL VLAN services, such as iSCSI counters, Open Flow, and ACL VLAN optimization.</p> <p> NOTE: CAM optimization for ACL VLAN groups is not enabled by default. You must allocate FP blocks of ACL VLAN CAM to enable ACL CAM optimization.</p> <p>vlanopenflow <0-2> Allocate a number FP blocks of CAM for VLAN Open Flow operations.</p> <p>vlaniscsi <0-2> Allocate a number FP blocks of CAM for VLAN iSCSI counters.</p> <p>vlanaclopt <0-2> Allocate a number of FP blocks of CAM for CAM optimization of ACL VLAN operation.</p>
Default	To reset the number FP blocks allocated for ACL VLAN processes, enter the <code>default</code> keyword with the <code>cam-acl-vlan</code> command. By default, 0 FP blocks are allocated for ACL VLAN operations on the switch.
Command Modes	ACL-VLAN-GROUP CONFIGURATION
Command History	<p>Version 9.5(0.1) Introduced on the Z9500.</p> <p>Version 9.3(0.0) Introduced on the S4810 and Z9000.</p>
Usage Information	The VLAN ContentAware Processor (VACP) application is a pre-ingress CAP that modifies the VLAN settings before packets are forwarded. To support the ACL CAM optimization functionality, the CAM carving feature is enhanced. A total of four VACP groups are present, of which two are for fixed groups and the other two are for dynamic groups. Out of the total of two dynamic groups, you can allocate zero, one, or two flow processor (FP) blocks to iSCSI counters, Open Flow and ACL VLAN optimization. You can configure CAM FP blocks for only two of these ACL VLAN services at a time.

description (ACL VLAN Group)

Add a text description of an ACL VLAN group.

Syntax	<code>description text</code>
Parameters	<p>description Enter a text to identify the ACL VLAN group (80 characters maximum).</p>
Default	No default behavior or values
Command Modes	ACL-VLAN-GROUP CONFIGURATION (conf-acl-vl-grp)
Command History	<p>Version 9.5.(0.0) Introduced on the Z9500.</p> <p>Version 9.3.(0.0) Introduced on the S4810, S4820T, and Z9000.</p>
Usage Information	Enter a description for each ACL VLAN group that you create for effective administrative and logging purposes.

ip access-group (ACL VLAN Group)

Apply an egress IP ACL to the ACL VLAN group.

Syntax	<code>ip access-group access-list-name out implicit-permit</code>
Parameters	<p>access-list-name Enter the name of the egress IP ACL to be applied to member interfaces of the VLAN group (140 characters maximum).</p> <p>out Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.</p> <p>implicit-permit Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from <code>implicit-deny</code> to <code>implicit-permit</code> (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).</p>

Default	None	
Command Modes	ACL-VLAN-GROUP CONFIGURATION (conf-acl-vl-grp)	
Command History	Version	Description
	9.5.(0.0)	Introduced on the Z9500.
	9.3.(0.0)	Introduced on the S4810, S4820T, and Z9000.
Usage Information	You can apply only an egress IP ACL on an ACL VLAN group.	

member vlan (ACL VLAN Group)

Add VLAN members to an ACL VLAN group.

Syntax	<code>member vlan {VLAN-range}</code>	
Parameters	VLAN-range	Enter the member VLANs using comma-separated VLAN IDs, a range of VLAN IDs, a single VLAN ID, or a combination. For example: Comma-separated: 3, 4, 6 Range: 5-10 Combination: 3, 4, 5-10, 8

Default	None	
Command Modes	ACL-VLAN-GROUP CONFIGURATION (conf-acl-vl-grp)	
Command History	Version	Description
	9.5.(0.0)	Introduced on the Z9500.
	9.3.(0.0)	Introduced on the S4810, S4820T, and Z9000.
Usage Information	<p>At a maximum, there can be only 32 VLAN members in all ACL VLAN groups. A VLAN can belong to only one ACL VLAN group at a time.</p> <p>You can create an ACL VLAN group and attach the ACL with the VLAN members. The optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL has a mapping with the VLAN and increased CAM space utilization occurs.</p> <p>Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.</p>	

show acl-vlan-group

Display the configured ACL VLAN groups on the switch.

Syntax	<code>show acl-vlan-group {group-name detail}</code>	
Parameters	group-name	Display the configuration of an ACL VLAN group.
	detail	Display information about all configured ACL VLAN groups in a line-by-line format.
Default	No default behavior or values	
Command Modes	EXEC EXEC Privilege	

Command History

Version	Description
9.5(0.0)	Introduced on the Z9500.
9.3(0.0)	Introduced on the S4810, S4820T, Z9000 and MXL.

Usage Information

When an ACL VLAN group name or the access-list name contains more than 30 characters, the name is truncated in the `show show acl-vlan-group group-name` command output.

Examples

The following example displays the output of the `show acl-vlan-group` command.

NOTE: Some group names and some access list names are truncated.

```
Dell#show acl-vlan-group
Group Name                Egress IP Acl          Vlan Members
TestGroupSeventeenTwenty  SpecialAccessOnlyExperts 100,200,300
CustomerNumberIdentifica AnyEmployeeCustomerEleve 2-10,99
HostGroup                  Group5                   1,1000
```

The following sample output shows the line-by-line style display when using the `show acl-vlan-group detail` option.

```
Dell#show acl-vlan-group detail

Group Name :
  TestGroupSeventeenTwenty
Egress IP Acl :
  SpecialAccessOnlyExpertsAllowed
Vlan Members :
  100,200,300

Group Name :
  CustomerNumberIdentificationEleven
Egress IP Acl :
  AnyEmployeeCustomerElevenGrantedAccess
Vlan Members :
  2-10,99

Group Name :
  HostGroup
Egress IP Acl :
  Group5
Vlan Members :
  1,1000
```

NOTE: No group or access list names are truncated

show cam-acl-vlan

Display the number of FP blocks of CAM that are allocated for different ACL VLAN services, including ACL VLAN optimization, VLAN iSCSI counters, and Open Flow.

Syntax `show cam-acl-vlan`

Command Modes EXEC Privilege

Command History

Version	Description
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.5(0.0)	Introduced on the Z9500.
9.3(0.0)	Introduced on the S4810, S4820T, Z9000 and MXL.

Usage Information

After you allocate FP blocks of CAM to ACL VLAN operation, you must reboot the switch to enable ACL VLAN optimization.

The following table describes the output fields of the `show cam-acl-vlan` command:

Table 1. Allocating FP blocks of CAM to ACL VLAN operation

Field	Description
Chassis Vlan Cam ACL	Details about the CAM blocks allocated for ACLs for various VLAN operations at a system-wide, global level.
Stack Unit <number>	Details about the CAM blocks allocated for ACLs for various VLAN operations for a particular stack unit.
Current Settings(in block sizes)	Information about the number of FP blocks that are currently in use or allocated.
VlanOpenFlow	Number of FP blocks for VLAN open flow operations.
VlanIscsi	Number of FP blocks for VLAN internet small computer system interface (iSCSI) counters.
VlanHp	Number of FP blocks for VLAN high performance processes.
VlanFcoe	Number of FP blocks for VLAN Fiber Channel over Ethernet (FCoE) operations.
VlanAclopt	Number of FP blocks for ACL VLAN optimization feature.

Example

```
Dell#show cam-acl-vlan
-- Chassis Vlan Cam ACL --
      Current Settings(in block sizes)
VlanOpenFlow :      0
VlanIscsi    :      2
VlanHp       :      1
VlanFcoe     :      1
VlanAclopt   :      0

-- Stack unit 0 --
      Current Settings(in block sizes)
VlanOpenFlow :      0
VlanIscsi    :      2
VlanHp       :      1
VlanFcoe     :      1
VlanAclopt   :      0
```

show cam-usage

Display the amount of memory space used and available in each CAM partition (including Layer 2 ACL, Layer 3 ACL, and IPv4Flow).

Syntax `show cam-usage [acl | router | switch]`

Parameters

- acl** (OPTIONAL) Enter the keyword `acl` to display Layer 2 and Layer 3 ACL CAM usage.
- router** (OPTIONAL) Enter the keyword `router` to display Layer 3 CAM usage.

switch (OPTIONAL) Enter the keyword `switch` to display Layer 2 CAM usage.

Command Modes EXEC
EXEC Privilege

Command History

Version	Description
9.11(0.0)	The <code>show cam-usage</code> command is updated to display ECMP group count information.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.5.(0.0)	Introduced on the Z9500.
9.3.(0.0)	Introduced on the S4810, S4820T, Z9000 and MXL.

Usage Information

The following regions must be provided in the `show cam-usage` output:

- L3AclCam
- L2AclCam
- V6AclCam

The following table describes the output fields of the `show cam-usage` command.

Table 2. Output fields of the show cam-usage command

Field	Description
Stackunit	Number of the stack unit that contains information on ACL VLAN groups
Portpipe	The hardware path that packets follow through a system for ACL optimization
CAM-Region	Type of area in the CAM block that is used for ACL VLAN groups
Total CAM space	Total amount of space in the CAM block
Used CAM	Amount of CAM space that is currently in use
Available CAM	Amount of CAM space that is free and remaining to be allocated for ACLs

Example 1: Output of the show cam-usage Command

```
Stackunit|Portpipe| CAM Partition | Total CAM | Used CAM |
Available CAM

show running config acl-vlan-group

Display the running configuration of ACL VLAN groups.

Syntax `show running config acl-vlan-group group-name`

Parameters *group-name* Display the specified ACL VLAN group (140 characters maximum).

Default None

Command Modes EXEC
EXEC Privilege

Command History

Version	Description
9.5.(0.0)	Introduced on the Z9500.
9.3.(0.0)	Introduced on the S4810, S4820T, Z9000 and MXL.
9.2(1.0)	Introduced on the Z9500.

Examples The following sample output shows the line-by-line style display when using the `show running-config acl-vlan-group` option. Note that no group or access list names are truncated.

```
Dell#show running-config acl-vlan-group
!
acl-vlan-group group1
  description Acl Vlan Group1
  member vlan 1-10,400-410,500
  ip access-group acl1 out implicit-permit
!
acl-vlan-group group2
  member vlan 20
  ip access-group acl2 out
Dell#

Dell#show running-config acl-vlan-group group1
!
acl-vlan-group group1
  description Acl Vlan Group1
  member vlan 1-10,400-410,500
  ip access-group acl1 out implicit-permit
```

Common MAC Access List Commands

The following commands are available within both MAC ACL modes (Standard and Extended) and do not have mode-specific options. These commands allow you to clear, display, and assign MAC ACL configurations.

The platform supports both Ingress and Egress MAC ACLs.

The MAC ACL can be applied on Physical, Port-channel and VLAN interfaces. As per the specified rules in the ACL, the traffic on the interface/ VLAN members or Port-channel members will be permitted or denied.

clear counters mac access-group

Clear counters for all or a specific MAC ACL.

Syntax `clear counters mac access-group [mac-list-name]`

Parameters **mac-list-name** (OPTIONAL) Enter the name of a configured MAC access list.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

mac access-group

Apply a MAC ACL to traffic entering or exiting an interface. You can apply a MAC ACL on a physical, port-channel, or VLAN interface.

Syntax `mac access-group access-list-name {in [vlan vlan-range] | out}`

To delete a MAC access-group, use the `no mac access-group mac-list-name` command.

Parameters **access-list-name** Enter the name of a configured MAC access list, up to 140 characters.
 **NOTE:** This option is available only with the keyword `in` option.

vlan vlan-range (OPTIONAL) Enter the keyword `vlan` and then enter a range of VLANs. The range is from 1 to 4094 (you can use IDs 1 to 4094).
 **NOTE:** This option is available only with the keyword `in` option.

optimized Enter the keyword `optimized` to enable ACL optimization.

in Enter the keyword `in` to configure the ACL to filter incoming traffic.

out Enter the keyword `out` to configure the ACL to filter outgoing traffic.

NOTE:

1. If the MAC ACL is applied on VLAN, none of the VLAN members should have an access list applied for that VLAN.
2. If the MAC ACL is applied on a Physical or Port Channel interface, the VLAN in which this port is associated should not have an access list applied.
3. If the MAC ACL is applied on a VLAN, then that VLAN should not belong to VLAN ACL group.
4. If the MAC ACL is applied on a VLAN ACL group, then none of the VLANs in that group should have an access list applied on it.

Defaults none

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information You can assign one ingress ACL and one egress ACL (standard or extended) to an interface.

- Related Commands**
- [mac access-list standard](#) — configure a standard MAC ACL.
 - [mac access-list extended](#) — configure an extended MAC ACL.

show mac access-lists

Display all of the Layer 2 ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

Syntax `show mac access-lists [access-list-name] [interface interface] [in | out]`

Parameters

access-list-name Enter the name of a configured MAC ACL, up to 140 characters.

interface interface Enter the keyword `interface` then the one of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

in | out Identify whether ACL is applied on ingress or egress side.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.4.1.0	Introduced.

show mac accounting access-list

Display MAC access list configurations and counters (if configured).

Syntax `show mac accounting access-list access-list-name interface interface in | out`

Parameters

access-list-name Enter the name of a configured MAC ACL, up to 140 characters.

interface interface Enter the keyword `interface` then the one of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

in | out

Identify whether ACL is applied on ingress or egress side.

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series
6.1.1.0	Introduced on the E-Series.

Usage Information The ACL hit counters increment the counters for each matching rule, not just the first matching rule.

Example

Standard MAC ACL Commands

When you create an access control list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. These commands configure standard MAC ACLs and support both Ingress and Egress MAC ACLs.

 **NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

deny

To drop packets with a the MAC address specified, configure a filter.

Syntax `deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

Parameters

any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
mac-source-address	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
mac-source-address-mask	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
log	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see the "Flow-based Monitoring" in the Port Monitoring section in the <i>Dell EMC Networking OS Configuration Guide</i> .

Defaults Not enabled.

Command Modes CONFIGURATION-MAC ACCESS LIST-STANDARD

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.

Usage Information

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- `permit` — configures a MAC address filter to pass packets.
- `seq` — configures a MAC address filter with a specified sequence number.

mac access-list standard

To configure a standard MAC ACL, name a new or existing MAC access control list (MAC ACL) and enter MAC ACCESS LIST mode. Also refer to the Commands Common to all ACL Types section and the Common MAC Access List Commands section.

Syntax

```
mac access-list standard mac-list-name
```

To delete a MAC access list, use the `no mac access-list standard mac-list-name` command.

Parameters

mac-list-name Enter a text string as the name of the standard MAC access list (140 character maximum).

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information

Dell EMC Networking OS supports one ingress and one egress MAC ACL per interface.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, see your line card documentation.

 **NOTE:** Ingress ACLs are supported on C-Series and S-Series platforms only.

Example

```
DellEMC(conf)# mac-access-list access-list standard TestMAC
DellEMC(config-std-macl)# permit 00:00:00:00:00:00 00:00:00:00:ff:ff
count
DellEMC(config-std-macl)# deny any count
DellEMC(config-std-macl)#
```

permit

To forward packets from a specific source MAC address, configure a filter.

Syntax `permit {any | mac-source-address [mac-source-address-mask]} [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]] [monitor]]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

Parameters

any	Enter the keyword <code>any</code> to forward all packets received with a MAC address.
mac-source-address	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
mac-source-address-mask	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
log	(OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.
threshold-in-msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .

Defaults Not configured.

Command Modes CONFIGURATION-MAC ACCESS LIST-STANDARD

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging inst"ad.

By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Use the `monitor` option only when you are using flow-based monitoring. For more information, see the "Port Monitoring" section in the *Z9500 Configuration Guide*.

Related Commands

- `deny` — configure a MAC ACL filter to drop packets.
- `seq` — configure a MAC ACL filter with a specified sequence number.

seq

To a deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

Syntax

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]]
[log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

Parameters

any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
mac-source-address	Enter a MAC address in nn:nn:nn:nn:nn:nn format.
mac-source-address-mask	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
log	(OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.
threshold-in-msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding

which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

interval *minutes* (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.

monitor (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section in the *Dell EMC Networking OS Configuration Guide*.

Defaults Not configured

Command Modes CONFIGURATION-MAC ACCESS LIST-STANDARD

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
6.1.1.0	Introduced on the E-Series.

Usage Information When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

Extended MAC ACL Commands

When an access-list is created without any rule and then applied to an interface, ACL behavior reflects implicit permit. The following commands configure Extended MAC ACLs.

The platform supports both Ingress and Egress MAC ACLs.

 **NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

deny

To drop packets that match the filter criteria, configure a filter.

Syntax

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ether-type-operator] [count [byte]] [log [interval minutes] [threshold-in-msgs count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

Parameters

any	Enter the keyword <code>any</code> to drop all packets.
host <i>mac-address</i>	Enter the keyword <code>host</code> and then enter a MAC address to drop packets with that host address.
<i>mac-source-address</i>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<i>mac-source-address-mask</i>	Specify which bits in the MAC address must match. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<i>mac-destination-address</i>	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.
<i>mac-destination-address-mask</i>	Specify which bits in the MAC address must match. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<i>ether-type-operator</i>	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none">• <code>ev2</code> - is the Ethernet II frame format• <code>llc</code> - is the IEEE 802.3 frame format• <code>snap</code> - is the IEEE 802.3 SNAP frame format
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
log	(OPTIONAL) Enter the keyword <code>log</code> to include ACL messages in the log.
<i>threshold-in-msgs count</i>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<i>interval minutes</i>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see "Flow-based Monitoring" in the Port Monitoring section of the <i>Dell EMC Networking OS Configuration Guide</i> .

7.4.1.0	Added the <code>monitor</code> option.
6.1.1.0	Introduced on the E-Series.

Usage Information When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- `permit` — configure a MAC address filter to pass packets.
- `seq` — configure a MAC address filter with a specified sequence number.

mac access-list extended

Name a new or existing extended MAC access control list (extended MAC ACL).

Syntax `mac access-list extended access-list-name [cpu-qos]`

To delete a MAC access list, use the `no mac access-list extended access-list-name` command.

Parameters

- access-list-name*** Enter a text string as the MAC access list name, up to 140 characters.
- cpu-qos*** Enter the keywords `cpu-qos` to assign this ACL to control plane traffic only (CoPP).

Defaults None

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

Example

Related Commands

- [mac access-list standard](#) — configure a standard MAC access list.
- [show mac accounting access-list](#) — display MAC access list configurations and counters (if configured).

permit

To pass packets matching the criteria specified, configure a filter.

Syntax

```
permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype operator] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | mac-destination-address mac-destination-address-mask}` command.

Parameters

any	Enter the keyword <code>any</code> to forward all packets.
host	Enter the keyword <code>host</code> then a MAC address to forward packets with that host address.

mac-source-address	Enter a MAC address in nn:nn:nn:nn:nn:nn format.
mac-source-address-mask	(OPTIONAL) Specify which bits in the MAC address must match. The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.
mac-destination-address	Enter the destination MAC address and mask in nn:nn:nn:nn:nn:nn format.
mac-destination-address-mask	Specify which bits in the MAC address must be matched. The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.
ethertype operator	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> • ev2 - is the Ethernet II frame format • 11c - is the IEEE 802.3 frame format • snap - is the IEEE 802.3 SNAP frame format
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
log	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  NOTE: For more information, see Flow-based Monitoring in the “Port Monitoring” section of the <i>Dell EMC Networking OS Configuration Guide</i> .

Defaults Not configured.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
6.1.1.0	Introduced on the E-Series.

Usage Information

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

NOTE: When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- `deny` — configure a MAC ACL filter to drop packets.
- `seq` — configure a MAC ACL filter with a specified sequence number.

seq

Configure a filter with a specific sequence number.

Syntax

```
seq sequence-number {deny | permit} {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype operator] [count [byte]] [log] [monitor] [no-drop]
```

To delete a filter, use the `no seq sequence-number` command.

Parameters

sequence-number	Enter a number as the filter sequence number. The range is from zero (0) to 65535.
deny	Enter the keyword <code>deny</code> to drop any traffic matching this filter.
permit	Enter the keyword <code>permit</code> to forward any traffic matching this filter.
any	Enter the keyword <code>any</code> to filter all packets.
host mac-address	Enter the keyword <code>host</code> and then enter a MAC address to filter packets with that host address.
mac-source-address	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
mac-source-address-mask	Specify which bits in the MAC address must be matched.
mac-destination-address	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.
mac-destination-address-mask	Specify which bits in the MAC address must be matched. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
ethertype operator	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> • <code>ev2</code> - is the Ethernet II frame format. • <code>11c</code> - is the IEEE 802.3 frame format. • <code>snap</code> - is the IEEE 802.3 SNAP frame format.

count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
log	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.  NOTE: For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the <i>Dell Networking OS Configuration Guide</i> .
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-MAC ACCESS LIST-STANDARD

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the <code>no-drop</code> parameter. Introduced on the S3048-ON and S4048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

 **NOTE:** When ACL logging and byte counters are configured simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands `deny` — configures a filter to drop packets.
`permit` — configures a filter to forward packets.

IP Prefix List Commands

When you create an access-list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. To configure or enable IP prefix lists, use these commands.

access-class

Apply a standard ACL to a terminal line.

Syntax `access-class access-list-name [ipv4 | ipv6]`
 To remove an ACL, use the `no access-class` command.

Parameters	<p><i>access-list-name</i> Enter the name of a configured Standard ACL, up to 140 characters.</p> <p>ipv4 Enter the keyword <code>ipv4</code> to configure an IPv4 access class.</p> <p>ipv6 Enter the keyword <code>ipv6</code> to configure an IPv6 access class.</p>
Defaults	Not configured.
Command Modes	LINE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>ipv4</code> and <code>ipv6</code> parameters to the command.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

Usage Information

When you use the `access-class access-list-name` command without specifying the `ipv4` or `ipv6` attribute, both IPv4 as well as IPv6 rules that are defined in that ACL are applied to the terminal. This method is a generic way of configuring access restrictions.

To be able to filter access exclusively using either IPv4 or IPv6 rules, use either the `ipv4` or `ipv6` attribute along with the `access-class access-list-name` command. Depending on the attribute that you specify (`ipv4` or `ipv6`), the ACL processes either IPv4 or IPv6 rules, but not both. Using this configuration, you can set up two different types of access classes with each class processing either IPv4 or IPv6 rules separately.

However, if you already have configured generic IP ACL on a terminal line, then you cannot further apply IPv4 or IPv6 specific filtering on top of this configuration. Because, both IPv4 and IPv6 access classes are already configured on this terminal line. Before applying either IPv4 or IPv6 filtering, first undo the generic configuration using the `no access-class access-list-name` command.

Similarly, if you have configured either IPv4 or IPv6 specific filtering on a terminal line, you cannot apply generic IP ACLs on top of this configuration. Before applying the generic ACL configuration, first undo the existing configuration using the `no access-class access-list-name [ipv4 | ipv6]` command.

clear ip prefix-list

Reset the number of times traffic meets the conditions (“hit” counters) of the configured prefix lists.

Syntax	<code>clear ip prefix-list [prefix-name]</code>
Parameters	prefix-name (OPTIONAL) Enter the name of the configured prefix list to clear only counters for that prefix list, up to 140 characters long.
Defaults	Clears “hit” counters for all prefix lists unless a prefix list is specified.
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description

6.2.1.1	Introduced on the E-Series.

Related Commands	<ul style="list-style-type: none">• ip prefix-list — configure a prefix list.
-------------------------	---

deny

To drop packets meeting the criteria specified, configure a filter.

Syntax	<code>deny ip-prefix [ge min-prefix-length] [le max-prefix-length]</code> To delete a drop filter, use the <code>no deny ip-prefix</code> command.
Parameters	ip-prefix Specify an IP prefix in the network/length format. For example, 35.0.0.0/ 8 means match the first 8 bits of address 35.0.0.0. ge min-prefix-length (OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.

le max-prefix-length (OPTIONAL) Enter the keyword `le` and then enter the maximum prefix length, which is a number from zero (0) to 32.

Defaults Not configured.

Command Modes PREFIX-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information Sequence numbers for this filter are automatically assigned starting at sequence number 5. If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

ip prefix-list

Enter the PREFIX-LIST mode and configure a prefix list.

Syntax `ip prefix-list prefix-name`
To delete a prefix list, use the `no ip prefix-list prefix-name` command.

Parameters **prefix-name** Enter a string up to 16 characters long as the name of the prefix list, up to 140 characters long.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

Usage Information

Prefix lists redistribute OSPF and RIP routes meeting specific criteria.

Related Commands

- [show ip route list](#) — display IP routes in an IP prefix list.
- [show ip prefix-list summary](#) — display a summary of the configured prefix lists.

permit

Configure a filter that passes packets meeting the criteria specified.

Syntax

```
permit ip-prefix [ge min-prefix-length] [le max-prefix-length]
```

To delete a forward filter, use the `no permit ip-prefix` command.

Parameters

ip-prefix	Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
ge min-prefix-length	(OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.
le max-prefix-length	(OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.

Command Modes

PREFIX-LIST

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

Usage Information

Sequence numbers for this filter are automatically assigned starting at sequence number 5. If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

Related Commands

`deny` — configures a filter to drop packets.
`seq` — configures a drop or permit filter with a specified sequence number.

seq

To a deny or permit filter in a prefix list while configuring the filter, assign a sequence number.

Syntax

```
seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]
```

To delete a specific filter, use the `no seq sequence-number {deny | permit} {any} | [ip-prefix {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]`.

Parameters

sequence-number	Enter a number. The range is from 1 to 4294967294.
deny	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition..
permit	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition.
any	(OPTIONAL) Enter the keyword <code>any</code> to match any packets.
ip-prefix /nn	(OPTIONAL) Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
ge min-prefix-length	(OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.
le max-prefix-length	(OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.
bitmask number	Enter the keyword <code>bitmask</code> then enter a bit mask number in dotted decimal format.

Defaults

Not configured.

Command Modes

PREFIX-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Added the <code>bit mask</code> option.

Usage Information

If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

show config

Display the current PREFIX-LIST configurations.

Syntax `show config`

Command Modes PREFIX-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC(conf-nprefix1)# show config
!
ip prefix-list snickers
DellEMC(conf-nprefix1)#
```

show ip prefix-list detail

Display details of the configured prefix lists.

Syntax `show ip prefix-list detail [prefix-name]`

Parameters **prefix-name** (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC# show ip prefix-list detail
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
  seq 5 permit 1.1.1.0/24 (hit count: 0)
  seq 10 deny 2.1.0.0/16 ge 23 (hit count: 0)
  seq 25 permit 192.0.0.0 bitmask 192.0.0.0 (hit count: 800)
DellEMC#
```

show ip prefix-list summary

Display a summary of the configured prefix lists.

Syntax	<code>show ip prefix-list summary [prefix-name]</code>
Parameters	prefix-name (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
DellEMC#
```

Route Map Commands

When you create an access-list without any rule and then applied to an interface, the ACL behavior reflects implicit permit.

To configure route maps and their redistribution criteria, use the following commands.

continue

To a route-map entry with a higher sequence number, configure a route-map.

Syntax	<code>continue [sequence-number]</code>
Parameters	sequence-number (OPTIONAL) Enter the route map sequence number. The range is from 1 to 65535.
Defaults	Not configured.
Command Modes	ROUTE-MAP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information The `continue` feature allows movement from one route-map entry to a specific route-map entry (the sequence number). If you do not specify the sequence number, the `continue` feature simply moves to the next sequence number (also known as an implied continue). If a match clause exists, the `continue` feature executes only after a successful match occurs. If there are no successful matches, the `continue` feature is ignored.

Match clause with Continue clause

The `continue` feature can exist without a match clause. A continue clause without a match clause executes and jumps to the specified route-map entry.

With a match clause and a continue clause, the match clause executes first and the continue clause next in a specified route map entry. The continue clause launches only after a successful match. The behavior is:

- A successful match with a continue clause, the route map executes the set clauses and then goes to the specified route map entry upon execution of the continue clause.
- If the next route map entry contains a continue clause, the route map executes the continue clause if a successful match occurs.
- If the next route map entry does not contain a continue clause, the route map evaluates normally. If a match does not occur, the route map does not continue and falls through to the next sequence number, if one exists.

Set Clause with Continue Clause

If the route-map entry contains sets with the continue clause, set actions are performed first then the continue clause jumps to the specified route map entry.

- If a set action occurs in the first route map entry and then the same set action occurs with a different value in a subsequent route map entry, the last set of actions overrides the previous set of actions with the same `set` command.
- If `set community additive` and `set as-path prepend` are configured, the communities and AS numbers are prepended.

Related Commands

- [set community](#) — specify a COMMUNITY attribute.
- [set as-path](#) — configure a filter to modify the AS path.

description

Add a description to this route map.

Syntax `description {description}`

To remove the description, use the `no description {description}` command.

Parameters *description* Enter a description to identify the route map (80 characters maximum).

Defaults None

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description

pre-7.7.1.0	Introduced.

Related Commands

- [route-map](#) — enable a route map.

match as-path

To match routes that have a certain AS number in their BGP path, configure a filter.

Syntax `match as-path as-path-name`

To delete a match AS path filter, use the `no match as-path as-path-name` command.

Parameters *as-path-name* Enter the name of an established AS-PATH ACL, up to 140 characters.

Defaults Not configured.

Command Modes ROUTE-MAP

Related Commands

- [set as-path](#) — add information to the BGP AS_PATH attribute.

match community

To match routes that have a certain COMMUNITY attribute in their BGP path, configure a filter.

Syntax

```
match community community-list-name [exact]
```

To delete a community match filter, use the `no match community` command.

Parameters

<i>community-list-name</i>	Enter the name of a configured community list.
exact	(OPTIONAL) Enter the keywords <code>exact</code> to process only those routes with this community list name.

Defaults

Not configured.

Related Commands

- [set community](#) — specify a COMMUNITY attribute.

match interface

To match routes whose next hop is on the interface specified, configure a filter.

Syntax

`match interface interface`

To remove a match, use the `no match interface interface` command.

Parameters

interface

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults

Not configured.

match ip next-hop

To match based on the next-hop IP addresses specified in an IP access list or IP prefix list, configure a filter.

Syntax

`match ip next-hop {prefix-list prefix-list-name}`

To delete a match, use the `no match ip next-hop {prefix-list prefix-list-name}` command.

Parameters

prefix-list *prefix-list-name* Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

Defaults

Not configured.

match ip route-source

To match based on the routes advertised by routes specified in IP access lists or IP prefix lists, configure a filter.

Syntax

```
match ip route-source {prefix-list prefix-list-name}
```

To delete a match, use the `no match ip route-source {prefix-list prefix-list-name}` command.

Parameters

prefix-list *prefix-list-name* Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

Defaults

Not configured.

Command Modes

ROUTE-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match metric](#) — redistribute routes that match a specific metric.
- [match route-type](#) — redistribute routes that match a route type.
- [match tag](#) — redistribute routes that match a specific tag.

match metric

To match on a specified value, configure a filter.

Syntax `match metric metric-value`
 To delete a value, use the `no match metric [metric-value]` command.

Parameters *metric-value* Enter a value to match. The range is from zero (0) to 4294967295.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match ip route-source](#) — redistribute routes that match routes advertised by other routers.
- [match route-type](#) — redistribute routes that match a route type.
- [match tag](#) — redistribute routes that match a specific tag.

match origin

To match routes based on the value found in the BGP path ORIGIN attribute, configure a filter.

Syntax `match origin {egp | igp | incomplete}`
 To disable matching filter, use the `no match origin {igp | egp | incomplete}` command.

Parameters

egp	Enter the keyword <code>egp</code> to match routes originating outside the AS.
igp	Enter the keyword <code>igp</code> to match routes originating within the same AS.
incomplete	Enter the keyword <code>incomplete</code> to match routes with incomplete routing information.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
pre-6.1.1.0	Introduced on the E-Series.

match route-type

To match routes based on the how the route is defined, configure a filter.

Syntax `match route-type {external [type-1 | type-2] | internal | level-1 | level-2 | local}`

To delete a match, use the `no match route-type {local | internal | external [type-1 | type-2] | level-1 | level-2}` command.

Parameters	external [type-1] type-2]	Enter the keyword <code>external</code> then either <code>type-1</code> or <code>type-2</code> to match only on OSPF Type 1 routes or OSPF Type 2 routes.
	internal	Enter the keyword <code>internal</code> to match only on routes generated within OSPF areas.
	level-1	Enter the keyword <code>level-1</code> to match IS-IS Level 1 routes.
	level-2	Enter the keyword <code>level-2</code> to match IS-IS Level 2 routes.
	local	Enter the keyword <code>local</code> to match only on routes generated within the switch.

Defaults Not configured.

Command Modes ROUTE-MAP

- Related Commands**
- [match interface](#) — redistribute routes that match the next-hop interface.
 - [match ip address](#) — redistribute routes that match an IP address.
 - [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
 - [match ip route-source](#) — redistribute routes that match routes advertised by other routers.
 - [match metric](#) — redistribute routes that match a specific metric.
 - [match tag](#) — redistribute routes that match a specific tag.

match tag

To redistribute only routes that match a specified tag value, configure a filter.

Syntax `match tag tag-value`

To remove a match, use the `no match tag` command.

Parameters **tag-value** Enter a value as the tag on which to match. The range is from zero (0) to 4294967295.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [match interface](#) — redistribute routes that match the next-hop interface.
- [match ip address](#) — redistribute routes that match an IP address.
- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.
- [match ip route-source](#) — redistribute routes that match routes advertised by other routers.
- [match metric](#) — redistribute routes that match a specific metric.
- [match route-type](#) — redistribute routes that match a route type.

route-map

Enable a route map statement and configure its action and sequence number. This command also places you in ROUTE-MAP mode.

Syntax `route-map map-name [permit | deny] [sequence-number]`

To delete a route map, use the `no route-map map-name [permit | deny] [sequence-number]` command.

Parameters	<i>map-name</i>	Enter a text string of up to 140 characters to name the route map for easy identification.
	permit	(OPTIONAL) Enter the keyword <code>permit</code> to set the route map default as permit. If you do not specify a keyword, the default is <code>permit</code> .
	deny	(OPTIONAL) Enter the keyword <code>deny</code> to set the route map default as deny.
	<i>sequence-number</i>	(OPTIONAL) Enter a number to identify the route map for editing and sequencing with other route maps. You are prompted for a sequence number if there are multiple instances of the route map. The range is from 1 to 65535.

Defaults Not configured.
If you do not define a keyword (`permit` or `deny`) for the route map, the `permit` action is the default.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information Use caution when you delete route maps because if you do not specify a sequence number, all route maps with the same *map-name* are deleted when you use the `no route-map map-name` command.

Example

```
DellEMC(conf)# route-map dempsey
DellEMC(config-route-map)#
```

Related Commands

- [show config](#) — display the current configuration.

set as-path

To modify the AS path for border gateway protocol (BGP) routes, configure a filter.

Syntax	<code>set as-path prepend as-number [... as-number]</code> To remove an AS-Path setting, use the <code>no set as-path {prepend as-number tag}</code> command.
Parameters	prepend as-number Enter the keyword <code>prepend</code> and then enter up to eight AS numbers to be inserted into the BGP path information. The range is from 1 to 65535.
Defaults	Not configured.
Command Modes	ROUTE-MAP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information	You can prepend up to eight AS numbers to a BGP route. This command influences best path selection in BGP by inserting a tag or AS number into the AS_PATH attribute.
Related Commands	<ul style="list-style-type: none">• match as-path — redistribute routes that match an AS-PATH attribute.

set automatic-tag

To automatically compute the tag value of the route, configure a filter.

Syntax	<code>set automatic-tag</code> To return to the default, enter <code>no set automatic-tag</code> .
Defaults	Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the metric type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

set comm-list delete

To remove the specified community list from the BGP route's COMMUNITY attribute, configure a filter.

Syntax `set comm-list community-list-name delete`

To insert the community list into the COMMUNITY attribute, use the `no set comm-list community-list-name delete` command.

Parameters ***community-list-name*** Enter the name of an established Community list, up to 140 characters.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

The community list used in the `set comm-list delete` command must be configured so that each filter contains only one community. For example, the filter `deny 100:12` is acceptable, but the filter `deny 120:13 140:33` results in an error.

If the `set comm-list delete` command and the `set community` command are configured in the same route map sequence, the deletion command (`set comm-list delete`) is processed before the insertion command (`set community`).

Related Commands

- [match community](#) — redistribute routes that match the COMMUNITY attribute.
- [set community](#) — specify a COMMUNITY attribute.

set community

Allows you to assign a BGP COMMUNITY attribute.

Syntax

```
set community {community-number | local-as | no-advertise | no-export | none} [additive]
```

To delete a BGP COMMUNITY attribute assignment, use the `no set community {community-number | local-as | no-advertise | no-export | none}` command.

Parameters

community-number	Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.
local-AS	Enter the keywords <code>local-AS</code> to drop all routes with the COMMUNITY attribute of <code>NO_EXPORT_SUBCONFED</code> . All routes with the <code>NO_EXPORT_SUBCONFED</code> (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.
no-advertise	Enter the keywords <code>no-advertise</code> to drop all routes containing the well-known community attribute of <code>NO_ADVERTISE</code> . All routes with the <code>NO_ADVERTISE</code> (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.

no-export	Enter the keywords <code>no-export</code> to drop all routes containing the well-known community attribute of NO_EXPORT. All routes with the NO_EXPORT (0xFFFFFFFF) community attribute must not be advertised outside a BGP confederation boundary.
none	Enter the keyword <code>none</code> to remove the community attribute from routes meeting the route map criteria.
additive	(OPTIONAL) Enter the keyword <code>additive</code> to add the communities to already existing communities.

Defaults Not configured.

Command Modes ROUTE-MAP

7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [match community](#) — redistribute routes that match the COMMUNITY attribute.
- [show ip bgp community](#) — display BGP community groups.

set level

To specify the IS-IS level or OSPF area to which matched routes are redistributed, configure a filter.

Syntax `set level {backbone | level-1 | level-1-2 | level-2 | stub-area}`
To remove a set level condition, use the `no set level {backbone | level-1 | level-1-2 | level-2 | stub-area}` command.

Parameters

backbone	Enter the keyword <code>backbone</code> to redistribute matched routes to the OSPF backbone area (area 0.0.0.0).
level-1	Enter the keyword <code>level-1</code> to redistribute matched routes to IS-IS Level 1.

level-1-2	Enter the keyword <code>level-1-2</code> to redistribute matched routes to IS-IS Level 1 and Level 2.
level-2	Enter the keyword <code>level-2</code> to redistribute matched routes to IS-IS Level 2.
stub-area	Enter the keyword <code>stub</code> to redistributed matched routes to OSPF stub areas.

Defaults Not configured.

Command Modes ROUTE-MAP

7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [set automatic-tag](#) — compute the tag value of the route.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the metric type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

set local-preference

To set the BGP LOCAL_PREF attribute for routers within the local autonomous system, configure a filter.

Syntax `set local-preference value`

To delete a BGP LOCAL_PREF attribute, use the `no set local-preference` command.

Parameters **value** Enter a number as the LOCAL_PREF attribute value. The range is from 0 to 4294967295.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

pre-6.1.1.0	Introduced on the E-Series.

Usage Information

The `set local-preference` command changes the LOCAL_PREF attribute for routes meeting the route map criteria. To change the LOCAL_PREF for all routes, use the `bgp default local-preference` command.

Related Commands

- [bgp default local-preference](#) — change the default LOCAL_PREF attribute for all routes.

set metric

To assign a new metric to redistributed routes, configure a filter.

Syntax `set metric [+ | -] metric-value`
To delete a setting, enter `no set metric`.

Parameters

+	(OPTIONAL) Enter + to add a metric-value to the redistributed routes.
-	(OPTIONAL) Enter - to subtract a metric-value from the redistributed routes.
metric-value	Enter a number as the new metric value. The range is from zero (0) to 4294967295.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric-type](#) — specify the route type assigned to redistributed routes.
- [set tag](#) — specify the tag assigned to redistributed routes.

set metric-type

To assign a new route type for routes redistributed to OSPF, configure a filter.

Syntax `set metric-type {internal | external | type-1 | type-2}`

To delete a setting, use the `no set metric-type` command.

Parameters	internal	external	type-1	type-2
	Enter the keyword <code>internal</code> to assign the Interior Gateway Protocol metric of the next hop as the route's BGP MULTI_EXIT_DES (MED) value.	Enter the keyword <code>external</code> to assign the IS-IS external metric.	Enter the keyword <code>type-1</code> to assign the OSPF Type 1 metric.	Enter the keyword <code>type-2</code> to assign the OSPF Type 2 metric.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Implemented the keyword <code>internal</code> .
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- `set automatic-tag` — compute the tag value of the route.
- `set level` — specify the OSPF area for route redistribution.
- `set metric` — specify the metric value assigned to redistributed routes.
- `set tag` — specify the tag assigned to redistributed routes.

set next-hop

To specify an IP address as the next hop, configure a filter.

Syntax `set next-hop ip-address`
 To delete the setting, use the `no set next-hop ip-address` command.

Parameters `ip-address` Specify an IP address in dotted decimal format.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

If you configure the `set next-hop` command, its configuration takes precedence over the `neighbor next-hop-self` command in the ROUTER BGP mode.

If you configure the `set next-hop` command with the interface's IP address (either Loopback or physical), the software declares the route unreachable.

Related Commands

- [match ip next-hop](#) — redistribute routes that match the next-hop IP address.

set origin

To manipulate the BGP ORIGIN attribute, configure a filter.

Syntax

```
set origin {igp | egp | incomplete}
```

To delete an ORIGIN attribute setting, use the `no set origin` command.

Parameters

egp	Enter the keyword <code>egp</code> to set routes originating from outside the local AS.
igp	Enter the keyword <code>igp</code> to set routes originating within the same AS.
incomplete	Enter the keyword <code>incomplete</code> to set routes with incomplete routing information.

Defaults

Not configured.

Command Modes

ROUTE-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

set tag

To specify a tag for redistributed routes, configure a filter.

Syntax `set tag tag-value`
 To delete a setting, use the `no set tag` command.

Parameters **tag-value** Enter a number as the tag. The range is from zero (0) to 4294967295.

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [set automatic-tag](#) — compute the tag value of the route.
- [set level](#) — specify the OSPF area for route redistribution.
- [set metric](#) — specify the metric value assigned to redistributed routes.
- [set metric-type](#) — specify the route type assigned to redistributed routes.

set weight

To add a non-RFC compliant attribute to the BGP route to assist with route selection, configure a filter.

Syntax `set weight weight`

To delete a weight specification, use the `no set weight weight` command.

Parameters **weight** Enter a number as the weight used by the route meeting the route map specification. The range is from 0 to 65535. The default is router-originated = **32768** and all other routes = **0**.
When there are multiple routes to the same destination, the routes with a higher weight are preferred.

Defaults router-originated = **32768**; all other routes = **0**

Defaults Not configured.

Command Modes ROUTE-MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information If you do not use the `set weight` command, router-originated paths have a weight attribute of 32768 and all other paths have a weight attribute of zero.

show config

Display the current route map configuration.

Syntax `show config`

Command Modes ROUTE-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC(conf-nprefix1)# show config
!
ip prefix-list PL_OSPF to_RIP
 seq 5 permit 1.1.1.0/24
 seq 10 deny 2.1.0.0/16 ge 23
 seq 25 permit 192.0.0.0 bitmask 192.0.0.0
DellEMC(conf-nprefix1)#
```

show route-map

Display the current route map configurations.

Syntax `show route-map [map-name]`

Parameters `map-name` (OPTIONAL) Enter the name of a configured route map, up to 140 characters.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC# show route-map
route-map firpo, permit, sequence 10
Match clauses:
Set clauses:
tag 34
DellEMC#
```

Related Commands

- [route-map](#) — configure a route map.

AS-Path Commands

The following commands configure AS-Path ACLs.

ip as-path access-list

Enter AS-PATH ACL mode and configure an access control list based on the BGP AS_PATH attribute.

Syntax `ip as-path access-list as-path-name`

Parameters `as-path-name` Enter the access-list name, up to 140 characters.

Defaults Not configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0	Introduced on the E-Series.

Usage Information

To apply the AS-PATH ACL to BGP routes, use the `match as-path` or `neighbor filter-list` commands.

Example

```
DellEMC(conf)# ip as-path access-list TestPath
DellEMC(config-as-path)#
```

Related Commands

- [match as-path](#) — match on routes contain a specific AS-PATH.

show ip as-path-access-lists

Display the all AS-PATH access lists configured on the E-Series.

Syntax `show ip as-path-access-lists`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC# show ip as-path-access-lists
ip as-path access-list acc
  permit 750
  deny 10
DellEMC#
```

IP Community List Commands

IP community list commands are supported on the Dell EMC Networking OS.

ip community-list

Enter COMMUNITY-LIST mode and create an IP community-list for BGP.

Syntax `ip community-list comm-list-name`
To delete a community-list, use the `no ip community-list comm-list-name` command.

Parameters ***comm-list-name*** Enter a text string as the name of the community-list, up to 140 characters.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0	Introduced on the E-Series.

Example

```
DelleMC(conf)# ip community-list TestComList
DelleMC(config-community-list)#
```

show ip community-lists

Display configured IP community lists in alphabetic order.

Syntax `show ip community-lists [name]`

Parameters ***name*** (OPTIONAL) Enter the name of the standard or extended IP community list, up to 140 characters.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC# show ip community-lists
ip community-list ABC
  permit local-AS
  deny no-advertise
  permit no-export
DellEMC#
```

UDF ACL Commands

The following commands are available within each UDF ACL mode.

deny ip

Disassociate the UDF in IP access-list.

Syntax `deny ip {source mask | any | host ip-address} {destination mask | any | host ip-address} udf-pkt-format name udf-qualifier-value name`

To remove this filter, use the `no seq sequence-number` command.

Parameters

<i>source</i>	Enter the IP address of the network or host from which the packets were sent.
<i>mask</i>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
any	Enter the keyword any to specify that all routes are subject to the filter.
host <i>ip-address</i>	Enter the keyword host then the IP address to specify a host IP address.
<i>destination</i>	Enter the IP address of the network or host to which the packets are sent.
udf-pkt-format <i>name</i>	Enter the keywords udf-pkt-format then the UDF ACL profile name.
udf-qualifier-value <i>name</i>	Enter the keywords udf-qualifier-value then the UDF qualifier value profile name.

Command Modes CONFIGURATION-STANDARD-ACCESS-LIST mode
CONFIGURATION-EXTENDED-ACCESS-LIST mode

Example

```
Dell(config-ext-nacl)#deny ip any any udf-pkt-format ipinip udf-
qualifier-value ipnip_val1
```

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

Related Commands

- [ip access-list standard](#) — configures a standard ACL.
- [ip access-list extended](#) — creates an extended ACL.

feature udf-acl

Enable udf-acl feature on a switch.

Syntax `feature udf-acl`
 To disable the udf-acl feature, use the `no feature udf-acl` command.

Defaults Disabled

Command Modes CONFIGURATION

Example

```
Dell(conf)#feature udf-acl
```

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

key

Configure UDF data context for parsing the different header location offset and required bytes.

Syntax `key description udf-id id packetbase PacketBase offset bytes length bytes`
 To return to the default settings, use the `no key description udf-id id packetbase PacketBase offset bytes length bytes` command.

Parameters

- description** Enter the key name for reference, up to 64 characters.
- udf-id id** Enter the keywords `udf-id` then the ID used in the actual UDF ACL group. The range is from 1 to 12.
- packetbase PacketBase** Enter the keyword `packetbase` then the option to refer to start of packet offset. The options are:
 - `innerL3Header` — Offset is at inner L3 header.
 - `innerL4Header` — Offset is at inner L4 header.
 - `outerL3Header` — Offset is at outer L3 header.
 - `outerL4Header` — Offset is at outer L4 header.
 - `packetStart` — Offset is at packet start.
- offset bytes** Enter the keyword `offset` then the offset value. The range is from 0 to 126, in multiples of 2.
- length bytes** Enter the keyword `length` then the length value. The range is from 2 to 24, in multiples of 2 bytes.

Defaults None

Command Modes CONFIGURATION-UDF TCAM

Example

```
Dell(conf-udf-tcam)#key innerL3header udf-id 6 packetbase innerL3Header
offset 0 length 2
```

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

Related Commands

[udf-tcam](#) — creates a context for UDF TCAM.
[show config](#) — displays the current UDF TCAM profile configuration.

match

Configure the packet type to match for which the UDF offset bytes have to be parsed.

Syntax

```
match l2ethertype ipv4 ipprotocol value vlantag tagStatus
```

To return to the default settings, use the `no match l2ethertype ipv4 ipprotocol value vlantag tagStatus` command.

Parameters

l2ethertype	Enter the keyword <code>l2ethertype</code> to match the L2 Ethertype.
ipv4	Enter the keyword <code>ipv4</code> to match the IPv4 packet.
ipprotocol value	Enter the keyword <code>ipprotocol</code> then the option to match the IPv4 protocol. The options are: <ul style="list-style-type: none">• IP protocol number. The range is from 0 to 255.• <code>icmp</code> — Internet control message protocol.• <code>tcp</code> — Transmission control protocol.• <code>udp</code> — User datagram protocol.
vlantag tagStatus	Enter the keyword <code>vlantag</code> then the option to match the VLAN packet. The options are: <ul style="list-style-type: none">• <code>any</code> — Any VLAN packet.• <code>double-tagged</code> — Double tagged VLAN packet.• <code>single-tagged</code> — Single tagged VLAN packet.• <code>untagged</code> — Untagged VLAN packet.

Defaults

None

Command Modes

CONFIGURATION-UDF TCAM

Example

```
Dell(conf-udf-tcam)#match l2ethertype ipv4 ipprotocol 4 vlantag any
```

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

Related Commands

[udf-tcam](#) — creates a context for UDF TCAM.
[show config](#) — displays the current UDF TCAM profile configuration.

permit ip

Associate the UDF in IP access-list.

Syntax `permit ip {source mask | any | host ip-address} {destination mask | any | host ip-address} udf-pkt-format name udf-qualifier-value name`
To remove this filter, use the `no seq sequence-number` command.

Parameters

source	Enter the IP address of the network or host from which the packets were sent.
mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
any	Enter the keyword any to specify that all routes are subject to the filter.
host ip-address	Enter the keyword host then the IP address to specify a host IP address.
destination	Enter the IP address of the network or host to which the packets are sent.
udf-pkt-format name	Enter the keywords udf-pkt-format then the UDF ACL profile name.
udf-qualifier-value name	Enter the keywords udf-qualifier-value then the UDF qualifier value profile name.

Command Modes CONFIGURATION-STANDARD-ACCESS-LIST mode
CONFIGURATION-EXTENDED-ACCESS-LIST mode

Example

```
Dell(config-ext-nacl)#permit ip any any udf-pkt-format ipnip udf-qualifier-value ipnip_val1
```

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

Related Commands [ip access-list standard](#) — configures a standard ACL.
[ip access-list extended](#) — creates an extended ACL.

show config

Display the current UDF TCAM profile configuration.

Syntax `show config`

Command Modes CONFIGURATION-UDF TCAM

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500, and S4048-ON.

Example

```
Dell(conf-udf-tcam)#show config
!
udf-tcam ipnip seq 1
```

```
key innerL3header udf-id 6 packetbase innerL3Header offset 0 length 2
match l2ethertype ipv4 ipprotocol 4 vlantag any
!
udf-qualifier-value ipnip_val1
Dell(conf-udf-tcam)#
```

udf-id

Assign value for each configured UDF ID in the given UDF TCAM profile.

Syntax `udf-id id value mask`
To return to the default settings, use the `no udf-id 1-12 value mask` command.

Parameters

id	Enter the UDF ID range. The range is from 1 to 12.
value	Enter the value for the UDF in Hex, up to 24 bytes.
mask	Enter the mask for the UDF in Hex, up to 24 bytes.

Defaults None

Command Modes CONFIGURATION-UDF-Qualifier-Value Profile

Example

```
Dell(conf-udf-tcam-qual-val)#udf-id 1 aa ff
```

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

Related Commands

- [udf-qualifier-value](#) — creates a UDF qualifier value.
- [udf-tcam](#) — creates a context for UDF TCAM.
- [show config](#) — displays the current UDF -Qualifier-Value Profile configuration.

udf-qualifier-value

Create a UDF qualifier value to assign values for all UDF IDs.

Syntax `udf-qualifier-value name`
To return to the default settings, use the `no udf-qualifier-value name` command.

Parameters

name	Enter the UDF qualifier value profile name, up to 64 characters.
-------------	--

Defaults None

Command Modes CONFIGURATION-UDF TCAM

Example

```
Dell(conf-udf-tcam)# udf-qualifier-value ipnip_val1
```

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

Related Commands

- [udf-id](#) — assigns value for each configured UDF ID in the given UDF TCAM profile.
- [udf-tcam](#) — creates a context for UDF TCAM.
- [show config](#) — displays the current UDF-Qualifier-Value Profile configuration.

udf-tcam

Create a context for UDF TCAM.

Syntax `udf-tcam name seq number`
 To return to the default settings, use the `no udf-tcam name seq number` command.

Parameters

- name** Enter the UDF ACL profile name, up to 64 characters.
- number** Enter the keyword `seq` then the sequence number of the Udf-Tcam table. The range is from 1 to 512.

Defaults None

Command Modes CONFIGURATION

Example

```
Dell(conf)#udf-tcam ipnip seq 1
```

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S6000, Z9500.

802.1X

802.1X is a port-based Network Access Control (PNAC) that provides an authentication mechanism to devices wishing to attach to a LAN or WLAN. Until the authentication, only extensible authentication protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell EMC Networking OS supports remote authentication dial-in service (RADIUS) and active directory environments using 802.1X Port Authentication.

Important Points to Remember

Dell EMC Networking OS limits network access for certain users by using virtual local area network (VLAN) assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server, if configured.
- If no VLAN is supplied by the RADIUS server or if you disable 802.1X authorization, the port configures in its access VLAN after successful authentication.
- If you enable 802.1X authorization but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This safeguard prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If you enable 802.1X authorization and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If you enable port security on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If you disable 802.1X on the port, it returns to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

debug dot1x

Display 802.1X debugging information.

Syntax `debug dot1x [all | auth-pae-fsm | backend-fsm | eapol-pdu] [interface interface]`

Parameters	all	Enable all debugs in dot1x.
	auth-pae-fsm	Enable Authentication PAE FSM debugs in dot1x.
	backend-fsm	Enable Backend Auth FSM debugs in dot1x.
	eapol-pdu	Enable EAPOL frame trace in dot1x.
	interface interface	Restricts the debugging information to an interface. The interface option is available only when the interface is either operationally up or dot1x related interface configuration exists before enabling debugging for that interface.

Defaults Disabled

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

Syntax `dot1x auth-fail-vlan vlan-id [max-attempts number]`

To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

Parameters	<i>vlan-id</i>	Enter the VLAN Identifier. The range is from 1 to 4094.
	max-attempts <i>number</i>	(OPTIONAL) Enter the keywords <code>max-attempts</code> followed number of attempts desired before authentication fails. The range is from 1 to 5. The default is 3 .
Defaults	3	attempts
Command Modes	CONFIGURATION (<i>conf-if-interface-slot/port</i>)	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

Usage Information If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface moves to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next reauthentication interval (`dot1x reauthentication`).

- Related Commands**

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Introduced on the C-Series and S-Series.

Usage Information

The prerequisites for enabling MAB-only authentication on a port are:

- Enable 802.1X authentication globally on the switch and on the port (the `dot1x authentication` command).
- Enable MAC authentication bypass on the port (the `dot1x mac-auth-bypass` command).

In MAB-only authentication mode, a port authenticates using the host MAC address even though 802.1x authentication is enabled. If the MAB-only authentication fails, the host is placed in the guest VLAN (if configured).

To disable MAB-only authentication on a port, enter the `no dot1x auth-type mab-only` command.

Related Commands

- [dot1x mac-auth-bypass](#) — enable MAC authentication bypass.

dot1x authentication (Configuration)

Enable dot1x globally. Enable dot1x both globally and at the interface level.

Syntax

```
dot1x authentication
```

To disable dot1x on a globally, use the `no dot1x authentication` command.

Defaults

Disabled

**Related
Commands**

- [dot1x authentication \(Configuration\)](#) — enable dot1x globally.

dot1x critical-vlan

Configure critical-VLAN for users or devices when authentication server is not reachable.

Syntax `[no] dot1x critical-vlan vlan-id`

Parameters *vlan-id* Enter the VLAN identifier. The VLAN-ID range is from 1 to 4094.

Defaults Not Configured.

Command Modes INTERFACE
INTERFACE (BATCH MODE)

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9000 Series.

Usage Information

The `dot1x critical-vlan` command configures critical VLAN for the interface. If the authentication server is not reachable or not responding, the authenticator places the port or the supplicant in critical VLAN within the first attempt.

Use this command in Interface Batch mode to configure critical VLAN for users in a dual-homing setup.

Example

```
DellEMC(conf)#show dot1x interface twentyFiveGigE 1/41
```

```
802.1x information on Tf 1/41:
-----
Dot1x Status:           Enable
Port Control:           AUTO
Port Auth Status:       AUTHORIZED (CRITICAL-VLAN)
Re-Authentication:      Enable
Untagged VLAN id:       400
Guest VLAN:             Enable
Guest VLAN id:          400
Auth-Fail VLAN:         Enable

Auth-Fail Max-Attempts: 3
Critical VLAN:          Enable
Critical VLAN id:       400
Mac-Auth-Bypass:        Disable
Mac-Auth-Bypass Only:   Disable
Tx Period:               30 seconds
Quiet Period:            60 seconds
ReAuth Max:              2
Supplicant Timeout:     30 seconds
Server Timeout:         30 seconds
Re-Auth Interval:       60 seconds
Max-EAP-Req:             2
Host Mode:               SINGLE_HOST
Auth PAE State:          Authenticated
Backend State:           Idle
```

dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

Syntax

```
dot1x guest-vlan vlan-id
```

To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

Parameters

vlan-id Enter the VLAN Identifier. The range is from 1 to 4094.

Defaults

Not configured.

Command Modes CONFIGURATION (*conf-if-interface-slot/port*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series, E-Series, and S-Series.

Usage Information

1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication, for the device, occurs at the next reauthentication interval (`dot1x reauthentication`).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

NOTE: You can create the Layer 3 portion of a guest VLAN and authentication fail VLANs regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

Related Commands

- `dot1x auth-fail-vlan` — Configure an authentication failure VLAN.
- `dot1x reauthentication` — Enable periodic re-authentication of the client.
- `dot1x reauth-max` —

Configure the maximum number of times to re-authenticate a port before it becomes unauthorized

dot1x host-mode

Enable single-host or multi-host authentication.

Syntax `dot1x host-mode {single-host | multi-host | multi-auth}`

Parameters

single-host	Enable single-host authentication.
multi-host	Enable multi-host authentication.
multi-auth	Enable multi-suplicant authentication.

Defaults `single-host`

Command Modes INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Added the <code>multi-auth</code> option on the C-Series and S-Series.
8.3.2.0	Added the <code>single-host</code> and <code>multi-host</code> options on the C-Series, E-Series, and S-Series.

Usage Information

- Single-host mode authenticates only one host per authenticator port and drops all other traffic on the port.
- Multi-host mode authenticates the first host to respond to an Identity Request and then permits all other traffic on the port.
- Multi-supPLICANT mode authenticates every device attempting to connect to the network on the authenticator port.

Related Commands

- [show dot1x interface](#) — display the 802.1X configuration of an interface.

dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell EMC Networking OS attempts to authenticate the host based on its MAC address.

Syntax

```
dot1x mac-auth-bypass
```

To disable MAC authentication bypass on a port, use the `no dot1x mac-auth-bypass` command.

Defaults

Disabled

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

Usage Information

To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

Syntax `dot1x max-eap-req number`

To return to the default, use the `no dot1x max-eap-req` command.

Parameters *number* Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

Defaults **2**

7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

dot1x max-suplicants

Restrict the number of supplicants that can be authenticated and permitted to access the network through the port. This configuration is only takes effect in Multi-auth mode.

Syntax `dot1x max-suplicants number`

Parameters *number* Enter the number of supplicants that can be authenticated on a single port in Multi-auth mode. The range is from 1 to 128. The default is **128**.

Defaults 128 hosts can be authenticated on a single authenticator port.

Command Modes INTERFACE

Related Commands

- [dot1x host-mode](#) — enable single-host or multi-host authentication.

dot1x port-control

Enable port control on an interface.

Syntax `dot1x port-control {force-authorized | auto | force-unauthorized}`

Parameters	force-authorized	Enter the keywords <code>force-authorized</code> to forcibly authorize a port.
	auto	Enter the keyword <code>auto</code> to authorize a port based on the 802.1X operation result.
	force-unauthorized	Enter the keywords <code>force-unauthorized</code> to forcibly de-authorize a port.

Defaults None

Command Modes Auto

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information The authenticator completes authentication only when you set `port-control` to `auto`.

dot1x profile

Configure a dot1x profile to define a list of trusted supplicant MAC addresses.

Syntax `[no] dot1x profile profile-name`

Parameters **profile-name** Enter a dot1x `profile-name`. The profile name length is limited to 32 characters.

Defaults None

Command Modes CONFIGURATION
CONFIGURATION TERMINAL BATCH

Error Strings NONE

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

Usage Information

The `dot1x profile` command configures a dot1x profile to define a list of trusted supplicant MAC addresses. Maximum number of dot1x profiles is limited to 10. This command launches dot1x profile mode for entering profile related commands such as the `mac` command. The `dot1x static-mab` command assigns the dot1x profile to an interface.

Use this command in Configuration Terminal Batch mode to configure the dot1x profile in a dual-homing setup.

Related Commands

- [mac](#)

dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

Syntax

```
dot1x quiet-period seconds
```

To disable quiet time, use the `no dot1x quiet-time` command.

Parameters

seconds Enter the number of seconds. The range is from 1 to 65535. The default is **60**.

Defaults

60 seconds

7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

dot1x server-timeout

Configure the amount of time after which exchanges with the server time-out.

Syntax `dot1x server-timeout seconds`
 To return to the default, use the `no dot1x server-timeout` command.

Parameters **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

Defaults **30** seconds

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information

When you configure the `dot1x server-timeout` value, take into account the communication medium used to communicate with an authentication server and the number of RADIUS servers configured. Ideally, the `dot1x server-timeout` value (in seconds) is based on the configured RADIUS-server timeout and retransmit values and calculated according to the following formula: `dot1x server-timeout seconds > (radius-server retransmit seconds + 1) * radius-server timeout seconds`.

Where the default values are as follows: `dot1x server-timeout` (30 seconds), `radius-server retransmit` (3 seconds), and `radius-server timeout` (5 seconds).

Example

```
DellEMC(conf)# radius-server host 10.11.197.105 timeout 6
DellEMC(conf)# radius-server host 10.11.197.105 retransmit 4
DellEMC(conf)# interface tengigabitethernet 2/23
DellEMC(conf-if-te-2/23)# dot1x server-timeout 40
DellEMC(conf-if-te-2/23)#
```

dot1x static-mab

Enable static MAC authorization bypass (MAB) and configure static MAB profile to an interface.

Syntax [no] `dot1x static-mab profile profile-name`

Parameters **profile profile-name** Enter the keyword `profile` and the `profile-name` to configure the static MAB profile name. The profile name length is limited to 32 characters.

Defaults Disabled.

Command Modes INTERFACE

INTERFACE (BATCH MODE)

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

Usage Information

The `dot1x static-mab` command enables static MAB (mac auth bypass) and configures the associated profile on a `dot1x` interface. Static MAB bypasses the authentication server for the supplicant MAC addresses configured in the associated profile.

Before you enable static MAB, you must do the following:

- Enable MAC authentication bypass on the port by configuring the `dot1x mac-auth-bypass` command.

- Ensure that no configured profile exists at the time of configuring the `static-mab` command.
- Use this command in Interface Batch Mode to enable static MAB in a dual-homing setup.

Example

```
DellEMC(conf)#do show dot1x interface twentyFiveGigE 1/41
```

```
802.1x information on Tf 1/41:

Backend State:        Idle
```

dot1x supplicant-timeout

Configure the amount of time after which exchanges with the supplicant time-out.

Syntax `dot1x supplicant-timeout seconds`

To return to the default, use the `no dot1x supplicant-timeout` command.

Parameters **seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

Defaults **30** seconds

mac

Configure a list of supplicant MAC addresses for dot1x profile represented with a profile-name.

Syntax [no] mac {*mac-address1 mac-address2... mac-address6*}

Parameters

<i>mac-address1</i>	Enter the keyword <code>mac</code> and type the 48-bit MAC addresses using the H.H.H
<i>mac-address2...</i>	format. A maximum of 6 MAC addresses are allowed.
<i>mac-address6</i>	

Defaults None

Command Modes DOT1X PROFILE CONFIG (conf-dot1x-profile)
CONFIGURATION TERMINAL BATCH

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

Usage Information The `mac` command configures a list of supplicant MAC addresses for a dot1x profile represented with a profile-name. You can configure up to 6 MAC addresses in a single `mac` command. The maximum number of MAC addresses that you can configure in a single profile is limited to 100.

Use this command in Configuration Terminal Batch mode to configure a list of supplicant MAC addresses for dot1x profile in a dual-homing setup.

Example

```
DellEMC(conf)#dot1x profile mySupplicants
DellEMC(conf-dot1x-profile)#mac 00:50:56:AA:01:10 00:50:56:AA:01:11

DellEMC(conf-dot1x-profile)#show config
dot1x profile mySupplicants
 mac 00:50:56:aa:01:10
 mac 00:50:56:aa:01:11
DellEMC(conf-dot1x-profile)#
DellEMC(conf-dot1x-profile)#exit
```

show dot1x cos-mapping interface

Display the CoS priority-mapping table the RADIUS server provides and applies to authenticated supplicants on an 802.1X-enabled system.

Syntax show dot1x cos-mapping interface *interface* [*mac-address mac-address*]

Parameters

<i>interface</i>	Enter one of the following keywords and the interface information: <ul style="list-style-type: none">For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
<i>mac-address</i>	(Optional) MAC address of an 802.1X-authenticated supplicant.

Defaults None

- Command Modes**
- EXEC
 - EXEC privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

show dot1x interface

Display the 802.1X configuration of an interface.

Syntax `show dot1x interface interface [mac-address mac-address]`

Parameters

interface Enter one of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

mac-address (Optional) MAC address of a supplicant.

Defaults None

Command Modes

- EXEC
- EXEC privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Added the <code>mac-address</code> option on the C-Series and S-Series.
7.6.1.0	Introduced on the C-Series, E-Series, and S-Series.

Usage Information If you enable 802.1X multi-supplicant authentication on a port, additional 802.1X configuration details (Port Authentication status, Untagged VLAN ID, Authentication PAE state, and Backend state) display for each supplicant, as shown in the following example.

Example

```
DellEMC# show dot1x interface tengigabitethernet 1/32
```

```

802.1x information on Te 1/32:
-----
Dot1x Status:           Enable
Port Control:           AUTO
Port Auth Status:       AUTHORIZED (MAC-AUTH-BYPASS)
Re-Authentication:      Disable
Untagged VLAN id:       400
Guest VLAN:             Enable
Guest VLAN id:          100
Auth-Fail VLAN:         Disable
Auth-Fail VLAN id:      NONE
Auth-Fail Max-Attempts: NONE
Mac-Auth-Bypass:        Enable
Mac-Auth-Bypass Only:   Enable
Tx Period:              3 seconds
Quiet Period:           60 seconds
ReAuth Max:             2
Supplicant Timeout:     30 seconds
Server Timeout:         30 seconds
Re-Auth Interval:       3600 seconds
Max-EAP-Req:            2
Host Mode:              SINGLE_HOST
Auth PAE State:         Authenticated
Backend State:          Idle
DellEMC#

```

Example (mac-address)

```

DellEMC# show dot1x interface tengigabitethernet 1/32 mac-address
00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

```

DellEMC#

```

show dot1x profile

Display all the dot1x profiles or the details of a specific profile configured in the system.

Syntax `show dot1x profile profile-name`

Parameters ***profile-name*** Specify a static dot1x *profile-name*. The maximum character limit for a profile name is 32 characters.

Defaults None

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series, S4048-ON, S4048-ON, S4810, S4820T, S5000, S6000, S6000-ON, S6100-ON, C9010, Z9100-ON, and Z9500.
9.9(0.0)	Introduced on the C9010.

Example

```

DellEMC#show dot1x profile

802.1x profile information
-----
Dot1x Profile mySupplicants
Profile MACs
 00:50:56:aa:01:10 00:50:56:aa:01:11

```

Bidirectional Forwarding Detection (BFD)

Bidirectional forwarding detection (BFD) is a detection protocol that provides fast forwarding path failure detection.

The Dell EMC Networking OS implementation is based on the standards specified in the IETF Draft draft-ietf-bfd-base-03, and supports BFD on all Layer 3 physical interfaces including VLAN interfaces and port-channels

Topics:

- [bfd all-neighbors](#)
- [bfd disable](#)
- [bfd enable \(Configuration\)](#)
- [bfd enable \(Interface\)](#)
- [bfd interval](#)
- [bfd protocol-liveness](#)
- [ip route bfd](#)
- [ip ospf bfd all-neighbors](#)
- [ipv6 ospf bfd all-neighbors](#)
- [ipv6 route bfd](#)
- [neighbor bfd](#)
- [neighbor bfd disable](#)
- [show bfd neighbors](#)
- [vrrp bfd](#)

bfd all-neighbors

Enable BFD sessions with all neighbors discovered by Layer 3 protocols virtual router redundancy protocol (VRRP), intermediate system to intermediate system (IS-IS), open shortest path first (OSPF), OSPFv3, or border gateway protocol (BGP) on router interfaces, and (optionally) reconfigure the default timer values.

Syntax	<code>bfd all-neighbors [interval <i>interval</i> min_rx <i>min_rx</i> multiplier <i>value</i> role {active passive}]</code>	
Parameters	interval <i>milliseconds</i>	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200 . Dell EMC recommends using more than 100 milliseconds.
	min_rx <i>milliseconds</i>	Enter the keyword <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is 200 . Dell EMC recommends using more than 100 milliseconds.
	multiplier <i>value</i>	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3 .
	role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none"> • <code>Active</code> — The active system initiates the BFD session. Both systems can be active for the same session. • <code>Passive</code> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system. The default is active .
Defaults	See <i>Parameters</i> .	
Command Modes	ROUTER OSPF	

ROUTER OSPFv3

ROUTER BGP

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
9.11(2.1P1)	Introduced support for enabling BFD on non-default VRFs for OSPFv2 on all the remaining Dell EMC Networking OS platforms. Introduced support for enabling BFD on non-default VRFs for OSPFv3 on all the Dell EMC Networking OS platforms.
9.10(0.2)	Introduced support for enabling BFD on non-default VRFs for OSPFv2 on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, Z9100-ON, and S6100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced BFD for VRRP and OSPFv3 on Z9000, S4810, and S4820T.
9.0.0.0	Introduced BFD for BGP on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced BFD for BGP on the S4810.
8.4.1.3	Introduced BFD for BGP on the E-Series.
8.2.1.0	Introduced BFD for OSPF and ISIS on the E-Series.
7.6.1.0	Introduced BFD for OSPF on the C-Series.
7.5.1.0	Introduced BFD for ISIS on the E-Series.
7.4.1.0	Introduced BFD for OSPF on the E-Series.

Usage Information

All neighbors inherit the timer values configured with the `bfd neighbor` command except in the following cases:

- Timer values configured with the `isis bfd all-neighbors` or `ip ospf bfd all-neighbors` commands in INTERFACE mode override timer values configured with the `bfd neighbor` command. Likewise, using the `no bfd neighbor` command does not disable BFD on an interface if you explicitly enable BFD using the `isis bfd all-neighbors` command.
- Neighbors that have been explicitly enabled or disabled for a BFD session with the `bfd neighbor` or `neighbor bfd disable` commands in ROUTER BGP mode do not inherit the global BFD enable/disable values configured with the `bfd neighbor` command or configured for the peer group to which a neighbor belongs. The neighbors inherit only the global timer values (configured with the `bfd neighbor` command).

You can only enable BFD for VRRP in INTERFACE command mode (`vrrp bfd all-neighbors`).

You can enable BFD on both default and nondefault VRFs for OSPF and BGP protocols for both IPv4 and IPv6 neighbors.

 **NOTE:** The `bfd all-neighbors` command is applicable for both IPv4 and IPv6 BGP sessions.

bfd disable

Disable BFD on an interface.

Syntax `bfd disable`

Re-enable BFD using the `no bfd disable` command.

Defaults BFD is disabled by default.

Command Modes VRRP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2(0.2)	Introduced on S4810.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

bfd enable (Configuration)

Enable BFD on all interfaces.

Syntax `bfd enable`

Disable BFD using the `no bfd enable` command.

Defaults BFD is disabled by default.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

bfd enable (Interface)

Enable BFD on an interface.

Syntax `bfd enable`

Defaults BFD is enabled on all interfaces when you enable BFD from CONFIGURATION mode.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

bfd interval

Specify non-default BFD session parameters beginning with the transmission interval.

Syntax `bfd interval interval min_rx min_rx multiplier value role {active | passive}`

Parameters	interval <i>milliseconds</i>	Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200 . Dell EMC recommends using more than 100 milliseconds.
	min_rx <i>milliseconds</i>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is 200 . Dell EMC recommends using more than 100 milliseconds.
	multiplier <i>value</i>	Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3 .
	role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none"> • <code>Active</code> — The active system initiates the BFD session. Both systems can be active for the same session. • <code>Passive</code> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system. <p>The default is Active.</p>

Defaults Refer to *Parameters*.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Example

```
DellEMC(conf-if-te-1/3)# bfd interval 250 min_rx 300 multiplier 4 role
passive
DellEMC(conf-if-te-1/3)#
```

bfd protocol-liveness

Enable the BFD protocol liveness feature.

Syntax `bfd protocol-liveness`

Defaults Disabled

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
7.4.1.0	Introduced on the E-Series.

Usage Information

Protocol Liveness is a feature that notifies the BFD Manager when a client protocol (for example, OSPF and ISIS) is disabled. When a client is disabled, all BFD sessions for that protocol are torn down. Neighbors on the remote system receive an Admin Down control packet and are placed in the Down state. Peer routers might take corrective action by choosing alternative paths for the routes that originally pointed to this router.

ip route bfd

Enable BFD for all neighbors configured through static routes.

Syntax

```
ip route bfd [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]
```

To disable BFD for all neighbors configured through static routes, use the `no ip route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

Parameters

prefix-list <i>prefix-list-name</i>	(Optional) Enter the keyword <code>prefix-list</code> followed by the name of the prefix list to enable or disable BFD on specific neighbors.
interval <i>milliseconds</i>	(OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200 .
min_rx <i>milliseconds</i>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200 .
multiplier <i>value</i>	Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3 .
role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none">• Active — active system initiates the BFD session. Both systems can be active for the same session.• Passive — passive system does not initiate a session. It only responds to a request for session initialization from the active system. The default is Active .

Defaults

See *Parameters*.

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced the <code>vrf</code> keyword on S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
9.12(1.0)	Introduced on the S5048F-ON.
9.11(2.5)	Introduced the <code>vrf</code> keyword on the Z9100-ON.
9.11(0.0)	Introduced the <code>prefix-list</code> keyword.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.3.(0.0)	Introduced on S6000.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on Z9000, S4810, and S4820T.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

ip ospf bfd all-neighbors

Establish BFD sessions with all OSPF neighbors on a single interface or use non-default BFD session parameters.

Syntax

```
ip ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]
```

To disable all BFD sessions on an OSPF interface implicitly, use the `no ip ospf bfd all-neighbors disable` command in interface mode..

Parameters

disable	(OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.
interval milliseconds	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200 .
min_rx milliseconds	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200 .
multiplier value	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3 .
role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none">• <code>Active</code> — active system initiates the BFD session. Both systems can be active for the same session.

- *Passive* — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

Defaults See *Parameters*.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.2)	Introduced support for enabling BFD on non-default VRFs for OSPFv2.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2.0.0	Introduced on the Z9000, S4820T, and S4810.

Usage Information This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

Syntax `ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]`

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode..

Parameters	
disable	(OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.
interval milliseconds	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200 .
min_rx milliseconds	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200 .
multiplier value	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3 .
role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none"> • <i>Active</i> — active system initiates the BFD session. Both systems can be active for the same session. • <i>Passive</i> — passive system does not initiate a session. It only responds to a request for session initialization from the active system. The default is Active .

Defaults See *Parameters*.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2.0.0	Introduced on the Z9000, S4820T, and S4810.

Usage Information This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

ipv6 route bfd

Enable BFD for all IPv6 neighbors configured through static routes.

Syntax `ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]`

To disable BFD for all IPv6 neighbors configured through static routes, use the `no ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

Parameters	
vrf vrf-name	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to enable or disable BFD on the next-hop IPv6 neighbor corresponding to that VRF.
prefix-list prefix-list-name	(Optional) Enter the keyword <code>prefix-list</code> followed by the name of the prefix list to enable or disable BFD on specific IPv6 neighbors.
interval milliseconds	(OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200 .
min_rx milliseconds	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200 .
multiplier value	Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3 .
role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none">• <code>Active</code> — active system initiates the BFD session. Both systems can be active for the same session.• <code>Passive</code> — passive system does not initiate a session. It only responds to a request for session initialization from the active system. The default is Active .

Defaults See *Parameters*.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6100-ON, C9010, and the Z9500.
9.12(1.0)	Introduced on the S5048F-ON.
9.11(2.5)	Introduced the <code>ipv6 route bfd</code> command on the Z9100-ON.

Example

```
DellEMC(conf)#ipv6 route bfd
DellEMC(conf)#ipv6 route bfd vrf vrf1 prefix-list p6_le
```

neighbor bfd

Explicitly enable or disable a BFD session with a BGP neighbor or a BGP peer group.

Syntax `neighbor {ip-address | ipv6-address | peer-group-name} bfd`

Parameters

- ip-address*** Enter the IP address of the BGP neighbor that you want to explicitly enable for BFD sessions in dotted decimal format (A.B.C.D).
- peer-group-name*** Enter the name of the peer group that you want to explicitly enable for BFD sessions.

Defaults None

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.
8.4.1.3	Introduced on the E-Series.

Usage Information

When you enable a BFD session with a specified BGP neighbor or peer group using the `bfd neighbor` command, the default BFD session parameters are used (interval: **200** milliseconds, `min_rx`: **200** milliseconds, multiplier: **3** packets, and role: **active**) if you have not specified parameters with the `bfd neighbor` command.

When you explicitly enable a BGP neighbor for a BFD session with the `bfd neighbor` command:

- The neighbor does not inherit the global BFD enable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
 - The neighbor only inherits the global timer values configured with the `bfd neighbor` command: interval, `min_rx`, and multiplier.
- [neighbor bfd disable](#) — disable a BFD session explicitly with a BGP neighbor or a BGP peer group.

Related Commands

neighbor bfd disable

Explicitly disable a BFD session with a BGP neighbor or a BGP peer group.

Syntax `neighbor {ip-address | ipv6-address | peer-group-name} bfd disable`

Parameters

- ip-address*** Enter the IP address of the BGP neighbor that you want to explicitly disable for BFD sessions in dotted decimal format (A.B.C.D).
- peer-group-name*** Enter the name of the peer group that you want to explicitly disable for BFD sessions.

Defaults None

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced support for enabling BFD on non-default VRFs for IPv4 BGP, default, and non-default VRFs for IPv6 BGP on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, C9010, Z9500, and Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.
8.4.1.3	Introduced on the E-Series.

Usage Information

When you explicitly disable a BGP neighbor for a BFD session with the `neighbor bfd disable` command:

- The neighbor does not inherit the global BFD disable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: `interval`, `min_rx`, and `multiplier`.

When you remove the Disabled state of a BFD for a BGP session with a specified neighbor by entering the `no neighbor bfd disable` command, the BGP link with the neighbor returns to normal operation and uses the BFD session parameters globally configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.

show bfd neighbors

Display BFD neighbor information on all interfaces or a specified interface.

Syntax

```
show bfd [vrf vrf name] neighbors [interface] [detail]
```

Parameters

- vrf vrf name** (Optional) Enter the keyword `vrf` and then the name of the VRF to display the BFD sessions with all neighbors within the VRF.
- interface** (OPTIONAL) Enter one of the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- detail** (OPTIONAL) Enter the keyword `detail` to view detailed information about BFD neighbors.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.1P1)	Introduced the <code>vrf</code> keyword on all the remaining Dell EMC Networking OS platforms.
9.10(0.2)	Introduced the <code>vrf</code> keyword on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON, Z9100-ON, and S6100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Added support for BFD for BGP on the S4810.

Version	Description
8.4.1.3	Added support for BFD for BGP on the E-Series.
8.2.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Added support for BFD for VLAN and port-channel interfaces on the E-Series.
7.4.1.0	Introduced BFD on physical ports on the E-Series.

Example

The following example shows the `show bfd neighbors` command output for the default VRF.

```
DellEMC# show bfd neighbors

*          - Active session role

Related Commands

- [bfd all-neighbors](#) — establish BFD sessions with all neighbors discovered by the IS-IS protocol or OSPF protocol out of all interfaces.

vrrp bfd

Establish a VRRP BFD session.

Syntax `vrrp bfd {all-neighbors | neighbor ip-address} [interval interval min_rx min_rx multiplier value role {active | passive}]`

To undo your VRRP BFD configuration, use the `no vrrp bfd {all-neighbors | neighbor ip-address} [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

Parameters	all-neighbors	Establish BFD sessions with all BFD neighbors on an interface.
	neighbor ip-address	Enter the IP address of the BFD neighbor.
	interval milliseconds	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is 50 to 1000. The default is 100 .
	min_rx milliseconds	Enter the keyword <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is 50 to 1000. The default is 100 .
	multiplier	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is 3 to 50. The default is 3 .
	role [active passive]	Enter the role that the local system assumes: <ul style="list-style-type: none">• Active—The active system initiates the BFD session. Both systems can be active for the same session.• Passive—The passive system does not initiate a session. It only responds to a request for session initialization from the active system. The default is Active .

Defaults See Parameters.

Border Gateway Protocol

BGP is an external gateway protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP version 4 (BGPv4) supports classless inter-domain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically sent messages to update those routing tables.

NOTE: For more information about configuring the border gateway protocol (BGP), see the *BGP* section in the *Dell EMC Networking OS Configuration Guide*.

Topics:

- [BGP IPv4 Commands](#)
- [MBGP Commands](#)
- [BGP Extended Communities \(RFC 4360\)](#)

- [IPv6 MBGP Commands](#)

BGP IPv4 Commands

Border Gateway Protocol (BGP) is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). BGP supports classless interdomain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

NOTE: Dell EMC Networking OS supports 2-byte (16-bit) and 4-byte (32-bit) format for autonomous system numbers (ASNs), where the 2-byte format is 1 to 65535 and the 4-byte format is 1 to 4294967295.

NOTE: Dell EMC Networking OS supports dotted format as well as the traditional plain format for AS numbers. The dot format is displayed when using the `show ip bgp` commands. To determine the comparable dot format for an ASN from a traditional format, use `ASN/65536`. `ASN%65536`. For more information about using the 2- or 4-byte format, refer to the *Dell EMC Networking OS Configuration Guide*.

address-family

Enable the IPv4 multicast or the IPv6 address family.

Syntax	<code>address-family {ipv4multicast ipv6 unicast} [vrf vrf-name]</code>	
Parameters	ipv4 multicast	Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to enable BGPv4 multicast mode.
	vrf vrf-name	Enter the keyword <code>vrf</code> and then the name of the VRF to enable VRF mode. NOTE: It is not be possible to enable VRF mode for IPv6 unicast without configuring the corresponding IPv4 unicast mode for the same VRF. While deletion, whenever the IPv4 VRF mode is deleted for the VRF, Dell EMC Networking OS automatically deletes the IPv6 VRF configurations as well.
	ipv6 unicast	Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to enable BGPv6 mode.
Defaults	Not configured.	
Command Modes	ROUTER BGP	

Command History

aggregate-address

To minimize the number of entries in the routing table, summarize a range of prefixes.

Z9500

Syntax

```
aggregate-address ip-address mask [advertise-map map-name] [as-set]  
[attribute-map map-name] [summary-only] [suppress-map map-name]
```

Parameters

<i>ip-address mask</i>	Enter the IP address and mask of the route to be the aggregate address. Enter the IP address in dotted decimal format (A.B.C.D) and mask in /prefix format (/x).
<i>advertise-map map-name</i>	(OPTIONAL) Enter the keywords <i>advertise-map</i> then the name of a configured route map to set filters for advertising an aggregate route.
<i>as-set</i>	(OPTIONAL) Enter the keyword <i>as-set</i> to generate path attribute information and include it in the aggregate. AS_SET includes AS_PATH and community information from the routes included in the aggregated route.
<i>attribute-map map-name</i>	(OPTIONAL) Enter the keywords <i>attribute-map</i> then the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.
<i>summary-only</i>	(OPTIONAL) Enter the keyword <i>summary-only</i> to advertise only the aggregate address. Specific routes are not advertised.
<i>suppress-map map-name</i>	(OPTIONAL) Enter the keywords <i>suppress-map</i> then the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.

Defaults

Not configured.

Command Modes

- ROUTER BGP ADDRESS FAMILY
- ROUTER BGP ADDRESS FAMILY IPv6

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active.

If routes within the aggregate are constantly changing, do not add the `as-set` parameter to the aggregate as the aggregate flaps to keep track of the changes in the `AS_PATH`.

In route maps used in the `suppress-map` parameter, routes meeting the `deny` clause are not suppressed; in other words, they are allowed. The opposite is also true: routes meeting the `permit` clause are suppressed.

If the route is injected via the `network` command, that route still appears in the routing table if the `summary-only` parameter is configured in the `aggregate-address` command.

The `summary-only` parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the `neighbor distribute-list` command.

In the `show ip bgp` command, aggregates contain an 'a' in the first column and routes suppressed by the aggregate contain an 's' in the first column.

When an aggregate address is denied using a peer's outbound route-map, individual routes suppressed by the aggregate address are advertised to that peer.

The attribute-map corresponding to an aggregate address is applied during the outbound update creation time; the value set in that attribute-map will not be shown in the output of the `show ip bgp aggregate route` command.

bgp add-path

Allow the advertisement of multiple paths for the same address prefix without the new paths replacing any previous ones.

Syntax

```
bgp add-path [send | receive | both] path-count
```

Parameters

send	Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.
receive	Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.
both	Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.

path-count Enter the number paths supported. The range is from 2 to 64.

Defaults Disabled

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced command.
7.7.1.0	Introduced on the C-Series.

Usage Information

Any update without a MED attribute is the least preferred route.

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

bgp asnotation

Allows you to implement a method for AS number representation in the command line interface (CLI).

Syntax `bgp asnotation [asplain | asdot+ | asdot]`
 To disable a dot or dot+ representation and return to ASPLAIN, enter the `no bgp asnotation` command.

Defaults `asplain`

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the dynamic application of AS notation changes.
8.2.1.0	Introduced.

Usage Information

Before enabling this feature, enable the `enable bgp four-octet-as-support` command. If you disable the `four-octet-support` command after using dot or dot+ format, the AS numbers revert to asplain text.

When you apply an asnotation, it is reflected in the running-configuration. If you change the notation type, the running-config updates dynamically and the new notation shows.

Example

```
DellEMC(conf)# router bgp 1
DellEMC(conf-router_bgp)#bgp asnotation asdot
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run | grep bgp

router bgp 1
  bgp four-octet-as-support
```

```

    bgp asnotation asdot

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asdot+
DellEMC(conf-router_bgp)# ex

DellEMC(conf)#do show run | grep bgp
router bgp 1
    bgp four-octet-as-support
    bgp asnotation asdot+

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asplain
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run |grep bgp
router bgp 1
    bgp four-octet-as-support

DellEMC(conf)#

```

**Related
Commands**

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

bgp bestpath as-path ignore

Ignore the AS PATH in BGP best path calculations.

Syntax `bgp bestpath as-path ignore`
 To return to the default, enter the `no bgp bestpath as-path ignore` command.

Defaults Disabled (that is, the software considers the AS_PATH when choosing a route as best).

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information If you enable this command, use the `clear ip bgp *` command to recompute the best path.

bgp bestpath as-path multipath-relax

Include prefixes received from different AS paths during multipath calculation.

Syntax `bgp bestpath as-path multipath-relax`
To return to the default BGP routing process, use the `no bgp bestpath as-path multipath-relax` command.

Defaults Disabled

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Usage Information The `bestpath router bgp configuration mode` command changes the default bestpath selection algorithm. The `multipath-relax` option allows load-sharing across providers with different (but equal-length) autonomous system paths. Without this option, ECMP expects the AS paths to be identical for load-sharing.

bgp bestpath med confed

Enable MULTI_EXIT_DISC (MED) attribute comparison on paths learned from BGP confederations.

Syntax `bgp bestpath med confed`
To disable MED comparison on BGP confederation paths, enter the `no bgp bestpath med confed` command.

Defaults Disabled

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the `clear ip bgp *` command to recompute the best path.

bgp bestpath med missing-as-best

During path selection, indicate preference to paths with missing MED (MULTI_EXIT_DISC) over paths with an advertised MED attribute.

Syntax

`bgp bestpath med missing-as-best`

To return to the default selection, use the `no bgp bestpath med missing-as-best` command.

Defaults

Disabled

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
6.3.1.0	Introduced

Usage Information

The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During path selection, paths with a lower MED are preferred over paths with a higher MED.

bgp bestpath router-id ignore

Do not compare router-id information for external paths during best path selection.

Syntax	<code>bgp bestpath router-id ignore</code> To return to the default selection, use the <code>no bgp bestpath router-id ignore</code> command.
Defaults	Disabled
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced

Usage Information	Configuring this option retains the current best-path. When sessions are then reset, the oldest received path is chosen as the best-path.
--------------------------	---

bgp client-to-client reflection

Allows you to enable route reflection between clients in a cluster.

Syntax	<code>bgp client-to-client reflection</code> To disable client-to-client reflection, use the <code>no bgp client-to-client reflection</code> command.
Defaults	Enabled when a route reflector is configured.
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

Route reflection to clients is not necessary if all client routers are fully meshed.

Related Commands

- [bgp cluster-id](#) — assign an ID to a BGP cluster with two or more route reflectors.
- [neighbor route-reflector-client](#) — configure a route reflector and clients.

bgp cluster-id

Assign a cluster ID to a BGP cluster with more than one route reflector.

Syntax

`bgp cluster-id {ip-address | number}`

To delete a cluster ID, use the `no bgp cluster-id {ip-address | number}` command.

Parameters

- ip-address** Enter an IP address as the route reflector cluster ID.
- number** Enter a route reflector cluster ID as a number from 1 to 4294967295.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

When a BGP cluster contains only one route reflector, the cluster ID is the route reflector's router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Assign a cluster ID with the `bgp cluster-id` command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster.

The default format for displaying the cluster-id is dotted decimal, but if you enter the cluster-id as an integer, it is displayed as an integer.

This command automatically restarts the BGP instance for the configuration to take effect.

Related Commands

- [bgp client-to-client reflection](#) — enable route reflection between the route reflector and clients.
- [neighbor route-reflector-client](#) — configure a route reflector and clients.
- [show ip bgp cluster-list](#) — view paths with a cluster ID.

bgp confederation identifier

Configure an identifier for a BGP confederation.

Syntax

`bgp confederation identifier as-number`

To delete a BGP confederation identifier, use the `no bgp confederation identifier as-number` command.

Parameters

as-number Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added support for the 4-byte format

Usage Information

To accept 4-byte formats before entering a 4-byte AS number, configure your system. All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation.

Dell EMC Networking OS accepts confederation EBGP peers without a LOCAL_PREF attribute. The software sends AS_CONFED_SET and accepts AS_CONFED_SET and AS_CONF_SEQ.

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

If the neighbor is an eBGP neighbor, then BGP performs a check on the first AS number. In this scenario, it is mandatory that the first sequence in the AS path is of type AS_SEQUENCE or AS_CONFED_SEQUENCE (in the case of confederations). If the first entry appears as an AS_CONFED_SET and the neighbor is not in the local AS, then this is strictly a problem with the neighbor node.

This command automatically restarts the BGP instance for the configuration to take effect.

Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

bgp confederation peers

Specify the autonomous systems (ASs) that belong to the BGP confederation.

Syntax

```
bgp confederation peers as-number [...as-number]
```

To return to the default, use the `no bgp confederation peers` command.

Parameters

- as-number*** Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).
- ...as-number*** (OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

Defaults

Not configured.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added support for the 4-byte format.

Usage Information

All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems.

After specifying autonomous systems numbers for the BGP confederation, recycle the peers to update their configuration.

Related Commands

- [bgp confederation identifier](#) — configure a confederation ID.
- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

bgp dampening

Enable BGP route dampening and configure the dampening parameters.

Syntax

```
bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]
```

To disable route dampening, use the `no bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]` command.

Parameters

<i>half-life</i>	(OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is from 1 to 45. The default is 15 minutes .
<i>reuse</i>	(OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route's Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is from 1 to 20000. The default is 750 .
<i>suppress</i>	(OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route's Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is from 1 to 20000. The default is 2000 .
<i>max-suppress-time</i>	(OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is from 1 to 255. The default is 60 minutes .
<i>route-map map-name</i>	(OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map. Only <code>match</code> commands in the configured route map are supported.

Defaults

Disabled.

Command Modes

- ROUTER BGP
- ROUTER BGP-address-family

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

If you enter the `bgp dampening` command, the default values for *half-life*, *reuse*, *suppress*, and *max-suppress-time* are applied. The parameters are position-dependent; therefore, if you configure one parameter, configure the parameters in the order they appear in the CLI.

Route refresh is sent when you enable BGP dampening.

Related Commands

- [show ip bgp dampened-paths](#) — view the BGP paths.

bgp default local-preference

Change the default local preference value for routes exchanged between internal BGP peers.

Syntax

```
bgp default local-preference value
```

To return to the default value, use the `no bgp default local-preference` command.

Parameters

value

Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference value, the more the route is preferred. The range is from 0 to 4294967295. The default is **100**.

Defaults

100

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.
9.2(1.0)	Introduced on the Z9500.

Usage Information	<p>Configuring or un-configuring the command brings down and brings up the BGP Route Manager, this results in tear down and re-establishment of all active sessions.</p> <p>Link Bandwidth has to be configured on the router to tell it to associate Link Bandwidth with prefixes (paths) and/or to use Link Bandwidth in BGP Multipath route selection.</p> <p>This is done under BGP configuration and is supported per address family – for IPv4 and IPv6 address families.</p> <p>The configuration for a particular address family applies across all VRFs configured.</p> <p>This command must be performed on the router which is attaching link bandwidth to prefixes (typically a border router) as well as the router which is expected to load share traffic proportional to the bandwidth of the external links.</p>
--------------------------	---

bgp enforce-first-as

Disable (or enable) `enforce-first-as` check for updates received from EBGp peers.

Syntax	<code>bgp enforce-first-as</code> To turn off the default, use the <code>no bgp enforce-first-as</code> command.
Defaults	Enabled
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

Usage Information

This command is enabled by default, that is for all updates received from EBGP peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer. If not, the update is dropped and a counter is increments. Use the `show ip bgp neighbors` command to view the “failed enforce-first-as check” counter.

If you disable the `enforce-first-as` command, it can be viewed using the `show ip protocols` command.

In the event of an enforce-first-as check failure, the existing BGP session is flapped.

Related Commands

- [show ip bgp neighbors](#) — view the information the BGP neighbors exchange.
- [show ip protocols](#) — view information on routing protocols.

bgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

Syntax

`bgp fast-external-fallover`

To disable fast external fallover, use the `no bgp fast-external-fallover` command.

Defaults

Enabled

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The `bgp fast-external-fallover` command appears in the `show config` command output. The fast external fallover configuration is applied only after you manually reset all the existing BGP sessions. As a result, after you execute this command, you must also manually execute the `clear ip bgp` command in order for the configuration to take effect.

bgp four-octet-as-support

Enable 4-byte support for the BGP process.

Syntax `bgp four-octet-as-support`
 To disable fast external failover, use the `no bgp four-octet-as-support` command.

Defaults Disabled (supports 2-byte format)

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

Routers supporting 4-byte ASNs advertise that function in the OPEN message. The behavior of a 4-byte router is slightly different depending on whether it is speaking to a 2-byte router or a 4-byte router.

When creating Confederations, all the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

Where the 2-byte format is from 1 to 65535, the 4-byte format is from 1 to 4294967295. Both formats are accepted and the advertisements reflect the entered format.

For more information about using the 2 byte or 4-byte format, refer to the *Dell EMC Networking OS Configuration Guide*.

This command automatically restarts the BGP instance for the configuration to take effect.

bgp graceful-restart

To support graceful restart as a receiver only, enable graceful restart on a BGP neighbor, a BGP node, or designate a local router.

Syntax `bgp graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]`

To return to the default, use the `no bgp graceful-restart` command.

Parameters

restart-time seconds	Enter the keyword <code>restart-time</code> then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is 120 seconds .
stale-path-time seconds	Enter the keyword <code>stale-path-time</code> then the maximum number of seconds to wait before restarting a peer's stale paths. The default is 360 seconds .
role receiver-only	Enter the keyword <code>role receiver-only</code> to designate the local router to support graceful restart as a receiver only.

Defaults as above

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.

BGP graceful restart is active only when the neighbor becomes established. Otherwise it is disabled. Graceful-restart applies to all neighbors with established adjacency.

This command automatically restarts the BGP instance for the configuration to take effect.

bgp log-neighbor-changes

Enable logging of BGP neighbor resets.

Syntax	<code>bgp log-neighbor-changes</code> To disable logging, use the <code>no bgp log-neighbor-changes</code> command.
Defaults	Enabled
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information	To view BGP neighbor resets, use the <code>show logging</code> command in EXEC mode. The <code>bgp log-neighbor-changes</code> command appears in the <code>show config</code> command output.
Related Commands	show logging — views logging settings and system messages logged to the system.

bgp non-deterministic-med

Compare MEDs of paths from different autonomous systems.

Syntax	<code>bgp non-deterministic-med</code> To return to the default, use the <code>no bgp non-deterministic-med</code> command.
Defaults	Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

In Non-Deterministic mode, paths are compared in the order in which they arrive. This method can lead to Dell EMC Networking OS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (`no bgp non-deterministic-med`), Dell EMC Networking OS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.

When you change the path selection from Deterministic to Non-Deterministic, the path selection for the existing paths remains Deterministic until you enter the `clear ip bgp` command to clear existing paths.

bgp outbound-optimization

Enables outbound optimization for IBGP peer-group members.

Syntax `bgp outbound-optimization`
 To disable outbound optimization, enter the `no bgp outbound-optimization` command.

Defaults Enabled.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.4.(0.0)	Introduced on the S4810.
9.2(1.0)	Introduced on the Z9500.

Usage Information

The updates are sent to all the neighbors in the peer-group and all the neighbors have the same attributes including next-hop.

Enabling or disabling outbound optimization dynamically resets all neighbor sessions.

When you enable outbound optimization, all peers receive the same update packets. Also, the next-hop address, which is chosen as one of the addresses of the neighbor's reachable interface, is the same for all peers.

bgp recursive-bgp-next-hop

Enable next-hop resolution through other routes learned by BGP.

Syntax `bgp recursive-bgp-next-hop`
 To disable next-hop resolution, use the `no bgp recursive-bgp-next-hop` command.

Defaults Enabled

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced.

Usage Information This command is a *knob* to disable BGP next-hop resolution using BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.

The `clear ip bgp` command is required for this command to take effect and to keep the BGP database consistent. Execute the `clear ip bgp` command right after executing this command.

Related Commands

- [clear ip bgp](#) — clear the ip bgp.

bgp regex-eval-optz-disable

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

Syntax `bgp regex-eval-optz-disable`
To re-enable optimization engine, use the `no bgp regex-eval-optz-disable` command.

Defaults Enabled

Command Modes ROUTER BGP (conf-router_bgp)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced

Usage Information

BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is common. In a large-scale configuration, filtering millions of routes based on regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.

BGP policies, containing regular expressions to match as-path and communities, tend to use much CPU processing time, which in turn affects the BGP routing convergence. Additionally, the `show bgp` commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The Regex Engine Performance Enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expense of RP1 processor memory.

Examples

```
DellEMC(conf-router_bgp)# no bgp regex-eval-optz-disable
DellEMC(conf-router_bgp)# do show ip protocols
Routing Protocol is "ospf 22222"
  Router ID is 2.2.2.2
  Area
    51          Routing for Networks
                10.10.10.0/00

Routing Protocol is "bgp 1"
  Cluster Id is set to 10.10.10.0
  Router Id is set to 10.10.10.0
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE_REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200

DellEMC(conf-router_bgp)#
```

Related Commands

- [show ip protocols](#) — view information on all routing protocols enabled and active on the E-Series.

bgp router-id

Assign a user-given ID to a BGP router.

Syntax `bgp router-id ip-address`

To delete a user-assigned IP address, use the `no bgp router-id` command.

Parameters	<i>ip-address</i>	Enter an IP address in dotted decimal format to reset only that BGP neighbor.
Defaults		The router ID is the highest IP address of the Loopback interface or, if no Loopback interfaces are configured, the highest IP address of a physical interface on the router.
Command Modes		ROUTER BGP
Command History		This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .
	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S3148.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(2.0)	Introduced on the S3100 series.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.8(0.0P5)	Introduced on the S4048-ON.
	9.8(0.0P2)	Introduced on the S3048-ON.
	9.7(0.0)	Introduced on the S6000-ON.
	9.2(1.0)	Introduced on the Z9500.
	9.0.2.0	Introduced on the S6000.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.
	7.8.1.0	Introduced on the S-Series.
	7.7.1.0	Introduced on the C-Series.
Usage Information		Peering sessions are reset when you change the router ID of a BGP router. This command automatically restarts the BGP instance for the configuration to take effect.

bgp soft-reconfig-backup

To avoid the peer from resending messages, use this command *only* when route-refresh is *not* negotiated.

Syntax	<code>bgp soft-reconfig-backup</code>	To return to the default setting, use the <code>no bgp soft-reconfig-backup</code> command.
Defaults	Off	
Command Modes		ROUTER BGP
Command History		This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.
	Version 9.1(0.0)	Added support for IPv6.
	9.2(1.0)	Introduced on the Z9500.
	Version 9.0.2.0	Introduced on the S6000.
	Version 8.3.19.0	Introduced on the S4820T.
	Version 8.3.11.1	Introduced on the Z9000.

- Version 8.3.7.0** Introduced on the S4810.
- Version 7.8.1.0** Introduced on the S-Series.
- Version 7.7.1.0** Introduced on the C-Series.
- Version 7.2.1.0** Introduced.

Usage Information

When you enable soft-reconfiguration for a neighbor and you execute the `clear ip bgp soft in` command, the update database stored in the router is replayed and updates are re-evaluated. With this command, the replay and update process is triggered only if route-refresh request is not negotiated with the peer. If the request is indeed negotiated (after executing the `clear ip bgp soft in` command), BGP sends a route-refresh request to the neighbor and receives all of the peer's updates.

Related Commands

[clear ip bgp](#) — activates inbound policies without resetting the BGP TCP session.

capture bgp-pdu neighbor

Enable capture of an IPv4 BGP neighbor packet.

Syntax

`capture bgp-pdu neighbor ipv4-address direction {both | rx | tx}`

To disable capture of the IPv4 BGP neighbor packet, use the `no capture bgp-pdu neighbor ipv4-address` command.

Parameters

- ipv4-address** Enter the IPv4 address of the target BGP neighbor.
- direction {both | rx | tx}** Enter the keyword `direction` and a direction — either `rx` for inbound, `tx` for outbound, or `both`.

Defaults

Not configured.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

Related Commands

- [capture bgp-pdu max-buffer-size](#) — specifies a size for the capture buffer.
- [show capture bgp-pdu neighbor](#) — displays BGP packet capture information.

capture bgp-pdu max-buffer-size

Set the size of the BGP packet capture buffer. This buffer size pertains to both IPv4 and IPv6 addresses.

Syntax

`capture bgp-pdu max-buffer-size 100-102400000`

Parameters	100-102400000 Enter a size for the capture buffer.
Defaults	40960000 bytes.
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced

Related Commands	capture bgp-pdu neighbor — enables capture of an IPv4 BGP neighbor packet.
	show capture bgp-pdu neighbor — displays BGP packet capture information for an IPv6 address.

clear ip bgp

Reset BGP sessions. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

Z9500

Syntax

```
clear ip bgp [vrf vrf-name] [* | <1-4294967295> | <0.1-65535.65535> |
A.B.C.D {soft {in | out}} | X:X:X:X::X {soft {in | out}} | dampening |
flap-statistics | ipv4 | ipv6 | peer-group]
```

Parameters	vrf vrf-name Enter the keyword <code>vrf</code> and then the name of the VRF to clear all BGP sessions corresponding to that VRF.
	 NOTE: Use this attribute to clear a BGP instance corresponding to either a specific address family in a default VRF or an IPv4 address family in a non-default VRF.
	* Enter an asterisk (<code>*</code>) to reset all BGP sessions.
	<1-4294967295> Enter <code><1-4294967295></code> to clear peers with the AS number.
	<0.1-65535.65535 5> Enter <code><0.1-65535.65535 5></code> to clear peers with the AS number in dot format.
	A.B.C.D Enter the BGP neighbor address in the A.B.C.D format to clear.
	X:X:X:X::X Enter the BGP neighbor address in the X:X:X:X::X format to clear.
	soft (OPTIONAL) Enter the keyword <code>soft</code> to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.
	 NOTE: If you enter the <code>clear ip bgp ip-address soft</code> command, both inbound and outbound policies are reset.
	in (OPTIONAL) Enter the keyword <code>in</code> to activate only inbound policies.

out	(OPTIONAL) Enter the keyword <code>out</code> to activate only outbound policies. i NOTE: You must execute the <code>clear ip bgp soft out</code> command whenever there is a change in the local policy. If you do not run this command after a local policy change, then these policy changes are not reflected in the responses to the peer's route refresh messages.
dampening	Enter the keyword <code>dampening</code> to clear the flap dampening information.
flap-statistics	Enter the keywords <code>flap-statistics</code> to clear the flap statistics information.
ipv4	Enter the ipv4 address family to clear.
ipv6	Enter the ipv6 address family to clear.
peer-group	Enter the peer-group to clear all members of the peer-group.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
6.5.1.0	Expanded to include the <code>as-number</code> option.

Related Commands

- [bgp recursive-bgp-next-hop](#) — disable next-hop resolution through other routes learned by the BGP.

clear ip bgp dampening

Clear information on route dampening and return the suppressed route to the Active state.

Z9500

Syntax

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast]
[dampening [ipv4-address mask | ipv6-address mask]]
```

Parameters	vrf <i>vrf-name</i>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to clear information on route dampening corresponding to that VRF i NOTE: You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.
	ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to clear the ipv4 multicast routes.
	ipv4 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to clear the ipv4 unicast routes.
	ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to clear the ipv6 unicast routes.
	ipv4-address mask	(OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to clear dampening information only that BGP neighbor.
	ipv6-address mask	(OPTIONAL) Enter the IPv6 address and the network mask to clear information on IPv6 route dampening.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information After you enter this command, the software deletes the history routes and returns the suppressed routes to the Active state.

The `clear ip bgp dampening` command does not clear the history paths.

clear ip bgp flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

Z9500

Syntax `clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [flap-statistics [ipv4-address mask | ipv6-address mask] | filter-list as-path-name | regexp regular-expression]`

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear BGP flap statistics corresponding to that VRF.
NOTE: You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to clear information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to clear information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to clear information related only to ipv6 unicast routes.
- ipv4-address mask** (OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to reset only that prefix.
- ipv6-address mask** (OPTIONAL) Enter the IPv6 address followed by the network mask to reset only that prefix.
- filter-list as-path-name** (OPTIONAL) Enter the keywords `filter-list` then the name of a configured AS-PATH list.
- regexp regular-expression** (OPTIONAL) Enter the keyword `regexp` then regular expressions. Use one or a combination of the following:
 - `.` = (period) any single character (including a white space).
 - `*` = (asterisk) the sequences in a pattern (0 or more sequences).
 - `+` = (plus) the sequences in a pattern (1 or more sequences).
 - `?` = (question mark) sequences in a pattern (either 0 or 1 sequences).
NOTE: Enter an escape sequence (CTRL+v) prior to entering the `?` regular expression.
 - `[]` = (brackets) a range of single-character patterns.
 - `()` = (parenthesis) groups a series of pattern elements to a single element.
 - `{ }` = (braces) minimum and the maximum match count.
 - `^` = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
 - `$` = (dollar sign) the end of the output string.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

If you enter the `clear ip bgp flap-statistics` command without any parameters, all statistics are cleared.

Related Commands

- [show debugging](#) — view the enabled debugging operations.
- [show ip bgp flap-statistics](#) — view the BGP flap statistics.
- [undebug all](#) — disable all debugging operations.

clear ip bgp peer-group

Reset a peer-group's BGP sessions.

Z9500

Syntax

```
clear ip bgp [vrf vrf-name] peer-group peer-group-name [ipv4 [multicast | unicast] | ipv6 unicast] [soft {in | out}]
```

Parameters

vrf <i>vrf-name</i>	Enter the keyword <code>vrf</code> and then the name of the VRF to reset the peer group corresponding to that VRF.
	i NOTE: You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.
<i>peer-group-name</i>	Enter the peer group name to reset the BGP sessions within that peer group.
ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to reset ipv4 multicast routes.
ipv4 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to reset ipv4 unicast routes.
ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to reset ipv6 unicast routes.
soft	(OPTIONAL) Enter the keyword <code>soft</code> to reset soft configuration.
in	Enter the keyword <code>in</code> to re-configure soft inbound updates.
out	Enter the keyword <code>out</code> to re-configure soft outbound updates.

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

debug ip bgp

Display all information on BGP, including BGP events, keepalives, notifications, and updates.

Z9500

Syntax

```
debug ip bgp [ vrf vrf-name | A.B.C.D | X:X:X:X::X | peer-group peer-group-name] [in | out]
```

To disable all BGP debugging, use the `no debug ip bgp` command.

Parameters

vrf vrf-name	Enter the keyword <code>vrf</code> and then the name of the VRF to debug BGP information corresponding to that VRF.  NOTE: Use this attribute to debug BGP protocol operations corresponding to either a default or non-default VRF.
A.B.C.D	Enter the IPv4 address of the neighbor in dotted decimal format.
X:X:X:X::X	(OPTIONAL) Enter an IPv6 address.
peer-group peer-group-name	Enter the keywords <code>peer-group</code> then the name of the peer group to debug.
in	(OPTIONAL) Enter the keyword <code>in</code> to view only information on inbound BGP routes.
out	(OPTIONAL) Enter the keyword <code>out</code> to view only information on outbound BGP routes.
A.B.C.D	Enter the IP address of peer in the A.B.C.D format.
X:X:X:X::X	Enter the IPv6 IP address of peer in the X:X:X:X::X format.
dampening	Enter the keyword <code>dampening</code> to view BGP dampening.

events	Enter the keyword <code>events</code> to view BGP protocol events.
ipv4	Enter the <code>ipv4</code> IP address to view the IPV4 route information.
ipv6	Enter the <code>ipv6</code> IP address to view the IPV6 route information.
keepalives	Enter the keyword <code>keepalives</code> to view BGP keepalives.
notifications	Enter the keyword <code>notifications</code> to view BGP notifications.
soft-reconfiguration	Enter the keywords <code>soft-reconfiguration</code> to view only information on inbound BGP soft reconfiguration.
updates	Enter the keyword <code>updates</code> to view BGP updates.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.4.(0.0)	Added support for VRF.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information To view information on both incoming and outgoing routes, do not include the `in` and `out` parameters in the debugging command. The `in` and `out` parameters cancel each other; for example, if you enter the `debug ip bgp in` command and then enter the `debug ip bgp out` command, you do not see information on the incoming routes.

Entering a `no debug ip bgp` command removes all configured debug commands for BGP.

- Related Commands**
- [debug ip bgp events](#) — view information about BGP events.
 - [debug ip bgp keepalives](#) — view information about BGP keepalives.
 - [debug ip bgp notifications](#) — view information about BGP notifications.
 - [debug ip bgp updates](#) — view information about BGP updates.
 - [show debugging](#) — view enabled debugging operations.

debug ip bgp dampening

View information on routes being dampened.

Z9500

Syntax `debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening`

To disable debugging, use the `no debug ip bgp dampening` command.

Parameters	vrf vrf-name	Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
	ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 multicast routes.
	ipv4 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 unicast routes.
	ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv6 unicast routes.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced IPv6 MGBP support for the E-Series.

debug ip bgp events

Display information on local BGP state changes and other BGP events.

Z9500

Syntax `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]`

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]` command.

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display BGP state changes corresponding to that VRF.
- A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor.
- X:X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- peer-group peer-group-name** (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- in** (OPTIONAL) Enter the keyword `in` to view only events on inbound BGP messages.
- out** (OPTIONAL) Enter the keyword `out` to view only events on outbound BGP messages.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

debug ip bgp keepalives

Display information about BGP keepalive messages.

Z9500

Syntax `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]`

To disable debugging, use the `no debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]` command.

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display BGP keepalive information corresponding to that VRF.
- A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor.
- X:X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- peer-group peer-group-name** (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- in** (OPTIONAL) Enter the keyword `in` to view only inbound keepalive messages.
- out** (OPTIONAL) Enter the keyword `out` to view only outbound keepalive messages.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

debug ip bgp notifications

Allows you to view information about BGP notifications received from neighbors.

Syntax `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]`

To disable debugging, use the `no debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]` command.

Parameters	vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view neighbor BGP notification information corresponding to that VRF.
	A.B.C.D	(OPTIONAL) Enter the IPv4 address of the neighbor.
	X:X:X:X::X	(OPTIONAL) Enter an IPv6 address.
	peer-group peer-group-name	(OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.
	in	(OPTIONAL) Enter the keyword <code>in</code> to view BGP notifications received from neighbors.
	out	(OPTIONAL) Enter the keyword <code>out</code> to view BGP notifications sent to neighbors

7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

debug ip bgp soft-reconfiguration

Enable soft-reconfiguration debug.

Z9500

Syntax `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration`

To disable, use the `debug ip bgp [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration` command.

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable soft-reconfiguration debugging on that VRF.
- A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor in dotted decimal format.
- X:X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- peer-group-name** (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group..

Defaults Disabled

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced.

Usage Information This command turns on BGP soft-reconfiguration inbound debugging. If no neighbor is specified, debug turns on for all neighbors.

debug ip bgp updates

Allows you to view information about BGP updates.

Z9500

Syntax `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]`

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]` command.

Parameters	vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view BGP updates information corresponding to that VRF.
	A.B.C.D	(OPTIONAL) Enter an IPv4 address of the neighbor.
	X:X:X:X::X	(OPTIONAL) Enter an IPv6 address.
	peer-group peer-group-name	(OPTIONAL) Enter the keyword <code>peer-group</code> followed by the name of the peer group.
	in	(OPTIONAL) Enter the keyword <code>in</code> to view only BGP updates received from neighbors.
	out	(OPTIONAL) Enter the keyword <code>out</code> to view only BGP updates sent to neighbors.
	prefix-list prefix-list-name	(OPTIONAL) Enter the keyword <code>prefix-list</code> then the name of an established prefix list. If the prefix list is not configured, the default is permit (to allow all routes).
	ip-address	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
	peer-group-name	(OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.

7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

default-metric

Allows you to change the metric of redistributed routes to locally originated routes. Use this command with the `redistribute` command.

Syntax

`default-metric number`

To return to the default setting, use the `no default-metric` command.

Parameters

number Enter a number as the metric to be assigned to routes from other protocols. The range is from 1 to 4294967295.

Defaults 0

Command Modes ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The `default-metric` command in BGP sets the value of the BGP MULTI_EXIT_DISC (MED) attribute for redistributed routes only.

Related Commands

- [bgp always-compare-med](#) — enable comparison of all BGP MED attributes.
- [redistribute](#) — redistribute routes from other routing protocols into BGP.

deny bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

Syntax	<code>deny bandwidth</code> To disable this setting, enter the <code>no deny bandwidth</code> command.																		
Parameters	bandwidth Enter the keyword <code>bandwidth</code> to specify extended-community attribute as the matching criteria for denying traffic. The range is from 0 to 102400.																		
Defaults	N/A																		
Command Modes	EXTENDED COMMUNITY LIST																		
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

pre-7.7.1.0	Introduced.

Related Commands

- [router bgp](#) — enter ROUTER mode on the switch.

distance bgp

Define an administrative distance for routes.

Syntax `distance bgp external-distance internal-distance local-distance`
 To return to default values, use the `no distance bgp` command.

Parameters

- external-distance** Enter a number to assign to routes learned from a neighbor external to the AS. The range is from 1 to 255. The default is **20**.
- internal-distance** Enter a number to assign to routes learned from a router within the AS. The range is from 1 to 255. The default is **200**.
- local-distance** Enter a number to assign to routes learned from networks listed in the network command. The range is from 1 to 255. The default is **200**.

Defaults

- external-distance = **20**
- internal-distance = **200**
- local-distance = **200**

Command Modes ROUTER BGP (conf-router_bgp_af)

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Version	Description
7.6.1.0	Introduced IPv6 MGBP on the E-Series.

Usage Information

CAUTION: Dell EMC Networking recommends that you do not change the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.

The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as internal BGP routes.

maximum-paths

Configure the maximum number of parallel routes (multipath support) BGP supports.

Z9500

Syntax `maximum-paths {ebgp | ibgp} number`

To return to the default values, enter the `no maximum-paths` command.

Parameters

- ebgp** Enter the keyword `ebgp` to enable multipath support for External BGP routes.
- ibgp** Enter the keyword `ibgp` to enable multipath support for Internal BGP routes.
- number** Enter a number as the maximum number of parallel paths.

Defaults none

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Support from 2 to 64 paths on the S4810. Command syntax changed to <code>max-path</code> (was <code>maximum-paths</code>).
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

Usage Information

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

neighbor activate

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier).

Syntax `neighbor [ip-address | peer-group-name] activate`
 To disable, use the `no neighbor [ip-address | peer-group-name] activate` command.

Parameters

- ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** (OPTIONAL) Enter the name of the peer group.
- activate** Enter the keyword `activate` to enable the neighbor/peer group in the new AFI/SAFI.

Defaults Disabled

Command Modes CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

By default, when you create a neighbor/peer group configuration in the Router BGP context, this enables IPv4/Unicast AFI/SAFI. When you use `activate` in the new context, the neighbor/peer group enables for AFI/SAFI.

It is not possible to de-activate a peer from the IPv4 unicast address family.

neighbor add-path

This command allows the specified neighbor/peer group to send/receive multiple path advertisements.

Syntax	<code>neighbor [ip-address peer-group-name] add-path [send receive both] path-count</code>
Parameters	<p>ip-address (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.</p> <p>peer-group-name (OPTIONAL) Enter the name of the peer group.</p> <p>send Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.</p> <p>receive Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.</p> <p>both Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.</p> <p>path-count Enter the number paths supported. The range is from 2 to 64.</p>
Defaults	none
Command Modes	CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

Related Commands

- [bgp add-path](#) — allow the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previous ones.

neighbor advertisement-interval

Set the advertisement interval between BGP neighbors or within a BGP peer group.

Syntax	<code>neighbor {ip-address peer-group-name} advertisement-interval seconds</code> To return to the default value, use the <code>no neighbor {ip-address peer-group-name} advertisement-interval</code> command.
Parameters	ip-address (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.

peer-group-name Enter the name of the peer group to set the advertisement interval for all routers in the peer group.

seconds Enter a number as the time interval, in seconds, between BGP advertisements. The range is from 0 to 600 seconds. The default is **5 seconds** for internal BGP peers and **30 seconds** for external BGP peers.

- Defaults**
- seconds = **5 seconds** (internal peers)
 - seconds = **30 seconds** (external peers)

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

neighbor advertisement-start

To send BGP routing updates, set the minimum interval before starting.

Syntax `neighbor {ip-address} advertisement-start seconds`

To return to the default value, use the `no neighbor {ip-address} advertisement-start` command.

Parameters

ip-address (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.

seconds Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.

Defaults none

Command Modes ROUTER BGP

7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

neighbor allowas-in

Set the number of times an AS number can occur in the AS path.

Syntax `neighbor {ip-address | peer-group-name} allowas-in number`
 To return to the default value, use the `no neighbor {ip-address | peer-group-name} allowas-in` command.

Parameters

- ip-address*** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- number*** Enter a number of times to allow this neighbor ID to use the AS path. The range is from 1 to 10.

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

neighbor default-originate

Inject the default route to a BGP peer or neighbor.

Syntax `neighbor {ip-address | peer-group-name} default-originate [route-map map-name]`

To remove a default route, use the `no neighbor {ip-address | peer-group-name} default-originate` command.

Parameters

ip-address	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
peer-group-name	Enter the name of the peer group to set the default route of all routers in that peer group.
route-map map-name	(OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

Usage Information

If you apply a route map to a BGP peer or neighbor with the `neighbor default-originate` command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.

When you configure a route-map for a BGP peer or peer group with the `neighbor default-originate` command, the command checks for the existence of the route in BGP RIB.

Route-map configuration on a BGP peer or peer group works only when the LOC-RIB contains at least one route.

When you apply a default route to a BGP peer or peer group using the `neighbor default-originate` command, changes to the configured default route-map are applied to the BGP peer or peer group only after a delay of 15 seconds. As a result, you must wait for a period of 15 seconds before manually resetting BGP using the `clear ip bgp` command.

In case of eBGP, the `neighbor default-originate` command does not support *extended-community* as a non-transitive route-map attribute.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

In order that settings corresponding to the `neighbor default-originate` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor default-originate` command.

neighbor description

Assign a character string describing the neighbor or group of neighbors (peer group).

Syntax `neighbor {ip-address | peer-group-name} description text`

To delete a description, use the `no neighbor {ip-address | peer-group-name} description` command.

Parameters

- ip-address*** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group.
- text*** Enter a continuous text string up to 80 characters.

Defaults Not configured.

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

neighbor distribute-list

Distribute BGP information via an established prefix list.

Syntax `neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}`

To delete a neighbor distribution list, use the `no neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}` command.

Parameters

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group to apply the distribute list filter to all routers in the peer group.
- prefix-list-name** Enter the name of an established prefix list.
If the prefix list is not configured, the default is **permit** (to allow all routes).
- in** Enter the keyword `in` to distribute only inbound traffic.
- out** Enter the keyword `out` to distribute only outbound traffic.

Defaults Not configured.

9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

Usage Information

Other BGP filtering commands include: `neighbor filter-list`, `ip as-path access-list`, and `neighbor route-map`.

Related Commands

- [neighbor route-map](#) — assign a route map to a neighbor or peer group.

neighbor dmzlink-bw

Attaches a Link Bandwidth to received routes.

Z9500

Syntax

`neighbor {ip-address | peer-group} dmzlink-bw`

To disable BGP Link Bandwidth, enter the `no neighbor {ip-address | peer-group} dmzlink-bw` command.

Parameters

<i>ip-address</i>	Enter the IP address of the peer.
<i>peer-group</i>	Enter the name of the peer group.
<i>dmzlink-bw</i>	Enter the keyword <code>dmzlink-bw</code> to enable BGP Link Bandwidth in BGP multipath.

Defaults

N/A

Command Modes

ROUTER BGP

Command History

Version	Description
9.7(0.0)	Introduced on the S-Series and Z-Series.

Usage Information

Configuring or un-configuring the command will bring down and bring up the BGP Route Manager, this will result in tear down and re-establishment of all active sessions.

Link Bandwidth has to be configured on the router in order to tell it to associate Link Bandwidth with prefixes (paths) and/or to use Link Bandwidth in BGP Multipath route selection.

This is done under BGP configuration and is supported per address family – for IPv4 and IPv6 address families.

The configuration for a particular address family will apply across all VRFs configured.

This command must be performed on the router which is attaching link bandwidth to prefixes (typically a border router) as well as the router which is expected to load share traffic proportional to the bandwidth of the external links.

neighbor ebgp-multihop

Attempt and accept BGP connections to external peers on networks that are not directly connected.

Syntax

`neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]`

To disallow and disconnect connections, use the `no neighbor {ip-address | peer-group-name} ebgp-multihop` command.

Parameters

<i>ip-address</i>	Enter the IP address of the neighbor in dotted decimal format.
<i>peer-group-name</i>	Enter the name of the peer group.

ttl (OPTIONAL) Enter the number of hops as the Time to Live (ttl) value. The range is from 1 to 255. The default is **255**.

Defaults Disabled.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information To prevent loops, the `neighbor ebgp-multihop` command does not install the default routes of the multihop peer. Networks not directly connected are not considered valid for best-path selection.

neighbor fall-over

Enable or disable fast fall-over for BGP neighbors.

Syntax `neighbor {ipv4-address | peer-group-name} fall-over`
To disable, use the `no neighbor {ipv4-address | peer-group-name} fall-over` command.

Parameters ***ipv4-address*** Enter the IP address of the neighbor in dotted decimal format.
peer-group-name Enter the name of the peer group.

Defaults Disabled.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

Usage Information

When you enable failover, BGP keeps track of IP or IPv6 ability to reach the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for the peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

Related Commands

- [show ip bgp neighbors](#) — display information on the BGP neighbors.

neighbor filter-list

Configure a BGP filter based on the AS-PATH attribute.

Syntax

```
neighbor {ip-address | peer-group-name} filter-list as-path-name {in | out}
```

To delete a BGP filter, use the `no neighbor {ip-address | peer-group-name} filter-list as-path-name {in | out}` command.

Parameters

ip-address	Enter the IP address of the neighbor in dotted decimal format.
peer-group-name	Enter the name of the peer group to apply the filter to all routers in the peer group.
as-path-name	Enter the name of an established AS-PATH access list (up to 140 characters). If the AS-PATH access list is not configured, the default is permit (allow routes).
in	Enter the keyword <code>in</code> to filter inbound BGP routes.
out	Enter the keyword <code>out</code> to filter outbound BGP routes.

Defaults

Not configured.

Command Modes

- ROUTER BGP
- ROUTER BGP-address-family

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.

Version	Description
7.8.1.0	Introduced on the S-Series. Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, ACL names were up to 16 characters long.
7.7.1.0	Introduced on the C-Series.

Usage Information

To enter AS-PATH ACL mode and configure the AS-PATH filters to deny or permit BGP routes based on information in their AS-PATH attribute, use the `ip as-path access-list` command in CONFIGURATION mode.

Related Commands

[ip as-path access-list](#) — enter AS-PATH ACL mode and configure the AS-PATH filters.

neighbor graceful-restart

Enable graceful restart on a BGP neighbor.

Syntax

```
neighbor {ip-address | peer-group-name} graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]
```

To return to the default, enter the `no bgp graceful-restart` command.

Parameters

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group to apply the filter to all routers in the peer group.
- restart-time seconds** Enter the keyword `restart-time` then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is **120 seconds**.
- stale-path-time seconds** Enter the keyword `stale-path-time` then the maximum number of seconds to wait before restarting a peer's stale paths. The default is **360 seconds**.
- role receiver-only** Enter the keyword `role receiver-only` to designate the local router to support graceful restart as a receiver only.

Defaults

as above

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

This feature advertises to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.

neighbor local-as

To accept external routes from neighbors with a local AS number in the AS number path, configure Internal BGP (IBGP) routers.

Syntax `neighbor {ip-address | peer-group-name} local-as as-number [no-prepend]`

To return to the default value, use the `no neighbor {ip-address | peer-group-name} local-as` command.

Parameters	ip-address	Enter the IP address of the neighbor in dotted decimal format.
	peer-group-name	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
	as-number	Enter the AS number to reset all neighbors belonging to that AS. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte) or from 0.1 to 65535.65535 (dotted format).
	no prepend	Specifies that local AS values do not prepend to announcements from the neighbor.

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands

- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

neighbor maximum-prefix

Control the number of network prefixes received.

Syntax `neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold] [warning-only]`

To return to the default values, use the `no neighbor {ip-address | peer-group-name} maximum-prefix maximum` command.

Parameters

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group.
- maximum** Enter a number as the maximum number of prefixes allowed for this BGP router. The range is from 1 to 4294967295.
- threshold** (OPTIONAL) Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is from 1 to 100 percent. The default is **75**.
- warning-only** (OPTIONAL) Enter the keyword `warning-only` to set the router to send a log message when the maximum value is reached. If this parameter is not set, the router stops peering when the maximum number of prefixes is reached.
NOTE: When you set this option, the router accepts BGP prefixes only until the maximum configured value. After the maximum number is reached, the router drops any additional prefixes that it receives.

Defaults `threshold = 75`

Command Modes `ROUTER BGP`

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information If you configure the `neighbor maximum-prefix` command and the neighbor receives more prefixes than the `neighbor maximum-prefix` command configuration allows, the neighbor goes down and the `show ip bgp summary` command displays (prfxd) in the State/PfxRcd column for that neighbor. The neighbor remains down until you enter the `clear ip bgp` command for the neighbor or the peer group

to which the neighbor belongs or you enter the `neighbor shutdown` and `neighbor no shutdown` commands.

Related Commands

- [show ip bgp summary](#) — display the current BGP configuration.

neighbor next-hop-self

Allows you to configure the router as the next hop for a BGP neighbor. (This command is used for IBGP).

C-Series, E-Series

Syntax	<code>neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} next-hop-self</code> To return to the default setting, use the <code>no neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} next-hop-self</code> command.
Parameters	<p><i>ipv6-address</i> Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p><i>peer-group-name</i> (OPTIONAL) Enter the name of the peer group.</p>
Defaults	Disabled.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	If you configure the <code>set ipv6 next-hop</code> command in ROUTE-MAP mode, its configuration takes precedence over the <code>neighbor next-hop-self</code> (C-, E-, and S-Series) command.

neighbor password

Enable message digest 5 (MD5) authentication on the TCP connection between two neighbors.

Syntax	<code>neighbor {<i>ip-address</i> <i>peer-group-name</i>} password [<i>encryption-type</i>] password</code> To delete a password, use the <code>no neighbor {<i>ip-address</i> <i>peer-group-name</i>} password</code> command.
Parameters	<p><i>ip-address</i> Enter the IP address of the router to be included in the peer group.</p> <p><i>peer-group-name</i> Enter the name of a configured peer group.</p> <p><i>encryption-type</i> (OPTIONAL) Enter 7 as the encryption type for the password entered. 7 means that the password is encrypted and hidden.</p> <p><i>password</i> Enter a text string up to 80 characters long. The first character of the password must be a letter. You cannot use spaces in the password.</p>
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

This command automatically restarts the neighbor session for the configuration to take effect.

Configure the same password on both BGP peers or a connection does not occur. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection between them is verified and the MD5 digest is checked on every segment sent on the TCP connection.

Configuring a password for a neighbor causes an existing session to be torn down and a new one established.

If you specify a BGP peer group by using the `peer-group-name` parameter, all the members of the peer group inherit the characteristic configured with this command.

If you configure a password on one neighbor, but you have not configured a password for the neighboring router, the following message appears on the console while the routers attempt to establish a BGP session between them:

```
%RPM0-P:RP1 %KERN-6-INT: No BGP MD5 from [peer's IP address]
:179 to [local router's IP address]:65524
```

Also, if you configure different passwords on the two routers, the following message appears on the console:

```
%RPM0-P:RP1 %KERN-6-INT: BGP MD5 password mismatch from
[peer's IP address] : 11502 to [local router's IP address] :179
```

neighbor peer-group (assigning peers)

Allows you to assign one peer to an existing peer group.

Syntax

```
neighbor {ip-address | peer-group peer-group-name} dmzlink-bw
```

To delete a peer from a peer group, use the `no neighbor {ip-address | peer-group peer-group-name}` command.

To disable `dmzlink-dw` for the peer group, use the `no neighbor ip-address dmzlink-dw` command.

Parameters

ip-address Enter the IP address of the router to be included in the peer group.

peer-group-name Enter the name of a configured peer group.

dmzlink-bw Enter the keyword `dmzlink-bw` to attach a link bandwidth to received routes.

NOTE: If `dmzlink-bw` is configured for a peer, in order for the BGP peer to advertise the prefixes with `dmzlink-bw` attached to it, you must reset the peer or peer-group using the `clear ip bgp session` command.

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>dmzlink-bw</code> parameter.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information You can assign up to 256 peers to one peer group.

When you add a peer to a peer group, it inherits all the peer group's configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:

- [neighbor advertisement-interval](#)
- [neighbor distribute-list](#)
- [neighbor route-map](#)
- [neighbor route-reflector-client](#)

if a neighbor's configuration is more specific than its peer group's configuration, the neighbor may retain its configuration after it is added to the peer group. The neighbor's configuration does not affect outgoing updates.

A peer group must exist (be enabled) before you add a peer to it. If the peer group is disabled (shutdown), the peers within that group are also disabled (shutdown).

In BGP, you cannot associate a peer to a peer-group without configuring the `remote-as` for Internal BGP (IBGP) or External BGP (EBGP).

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands

- [clear ip bgp](#) — reset BGP sessions.
- [neighbor peer-group \(creating group\)](#) — create a peer group.
- [show ip bgp peer-group](#) — view BGP peers.
- [show ip bgp neighbors](#) — view BGP neighbors configurations.

neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

Syntax `neighbor peer-group-name peer-group`

To delete a peer group, use the `no neighbor peer-group-name peer-group` command.

Parameters **peer-group-name** Enter a text string up to 16 characters long as the name of the peer group.

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information When you create a peer group, it is disabled (Shut mode).

Related Commands

- [neighbor peer-group \(assigning peers\)](#) — assign routers to a peer group.
- [neighbor remote-as](#) — assign an indirectly connected AS to a neighbor or peer group.
- [neighbor shutdown](#) — disable a peer or peer group.

neighbor peer-group passive

Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

Syntax `neighbor peer-group-name peer-group passive [sessions]`

To delete a passive peer-group, use the `no neighbor peer-group-name peer-group passive` command.

Parameters **peer-group-name** Enter a text string up to 16 characters long as the name of the peer group.

Defaults Not configured.

Command Modes ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

After you configure a peer group as passive, assign it a subnet using the `neighbor soft-reconfiguration inbound` command.

For passive eBGP limits, the Remote AS must be different from the AS for this neighbor.

Related Commands

- [neighbor soft-reconfiguration inbound](#) — assign a subnet to a dynamically configured BGP neighbor.
- [neighbor remote-as](#) — assign an indirectly connected AS to a neighbor or peer group.

neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

Syntax

```
neighbor {ip-address | peer-group-name} remote-as number
```

To delete a remote AS entry, use the `no neighbor {ip-address | peer-group-name} remote-as number` command.

Parameters

<i>ip-address</i>	Enter the IP address of the neighbor to enter the remote AS in its routing table.
<i>peer-group-name</i>	Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group.
<i>number</i>	Enter a number of the AS. The range is from 0 to 65535 (2 byte) or from 1 to 4294967295 (4 byte).

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added 4-byte support.

Usage Information

To accept 4-byte formats before entering a 4 byte AS Number, configure your system. If the `number` parameter is the same as the AS number used in the `router bgp` command, the remote AS entry in the neighbor is considered an internal BGP peer entry.

This command creates a peer and the newly created peer is disabled (Shutdown).

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands

- [router bgp](#) — enter ROUTER BGP mode and configures routes in an AS.
- [bgp four-octet-as-support](#) — enable 4-byte support for the BGP process.

neighbor remove-private-as

Remove private AS numbers from the AS-PATH of outgoing updates.

Syntax

```
neighbor {ip-address | peer-group-name} remove-private-as
```

To return to the default, use the `no neighbor {ip-address | peer-group-name} remove-private-as` command.

Parameters

- ip-address*** Enter the IP address of the neighbor to remove the private AS numbers.
- peer-group-name*** Enter the name of the peer group to remove the private AS numbers.

Defaults

Disabled (that is, private AS number are not removed).

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added 4-byte support.

Usage Information

Applies to EBGp neighbors only.

Configure your system to accept 4-byte formats before entering a 4 byte AS Number.

If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGp neighbor, the private AS numbers are not removed.

If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path.

Private AS numbers are from 64512 to 65535 (2 byte).

neighbor route-map

Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

Syntax

```
neighbor {ip-address | peer-group-name} route-map map-name {in | out}
```

To remove the route map, use the `no neighbor {ip-address | peer-group-name} route-map map-name {in | out}` command.

Parameters

ip-address	Enter the IP address of the neighbor in dotted decimal format.
peer-group-name	Enter the name of the peer group.
map-name	Enter the name of an established route map. If the Route map is not configured, the default is deny (to drop all routes).
in	Enter the keyword <code>in</code> to filter inbound routes.
out	Enter the keyword <code>out</code> to filter outbound routes.

 **NOTE:** This command sends routes to peers only if an outbound policy is configured and if there is a change in the existing outbound policy.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

When you apply a route map to outbound routes, only routes that match at least one section of the route map are permitted.

If you identify a peer group by name, the peers in that peer group inherit the characteristics in the Route map used in this command. If you identify a peer by IP address, the Route map overwrites either the inbound or outbound policies on that peer.

neighbor route-reflector-client

Configure the router as a route reflector and the specified neighbors as members of the cluster.

Syntax

```
neighbor {ip-address | peer-group-name} route-reflector-client
```

To remove one or more neighbors from a cluster, use the `no neighbor {ip-address | peer-group-name} route-reflector-client` command. If you delete all members of a cluster, you also delete the route-reflector configuration on the router.

Parameters

- ip-address*** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group.
All routers in the peer group receive routes from a route reflector.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

A route reflector reflects routes to the neighbors assigned to the cluster. Neighbors in the cluster do not need to be fully meshed. By default, when you use `no route reflector`, the internal BGP (IBGP) speakers in the network must be fully meshed.

The first time you enter this command, the router configures as a route reflector and the specified BGP neighbors configure as clients in the route-reflector cluster.

When you remove all clients of a route reflector using the `no neighbor route-reflector-client` command, the router no longer functions as a route reflector.

If the clients of a route reflector are fully meshed, you can configure the route reflector to not reflect routes to specified clients by using the `no bgp client-to-client reflection` command.

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands

- [bgp client-to-client reflection](#) — enable route reflection between the route reflector and the clients.

neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

Syntax

```
neighbor {ip-address | peer-group-name} send-community [extended | standard]
```

To disable sending a COMMUNITY attribute, use the `no neighbor {ip-address | peer-group-name} send-community` command.

Parameters

<i>ip-address</i>	Enter the IP address of the peer router in dotted decimal format.
<i>peer-group-name</i>	Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group.
extended	(OPTIONAL) Enter the keyword <code>extended</code> to send extended community attribute.
standard	(OPTIONAL) Enter the keyword <code>standard</code> to send standard community attribute.

Defaults

Not configured and COMMUNITY attributes are not sent to neighbors.

Command Modes ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
Version 9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

To configure a COMMUNITY attribute, use the `set community` command in ROUTE-MAP mode.

In order that settings corresponding to the `neighbor send-community` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor send-community` command.

If you do not set any of the optional parameters (standard or extended), then both standard as well as extended attributes are sent. If you set either the standard or extended parameter, only the attribute that is specified is sent.

neighbor shutdown

Disable a BGP neighbor or peer group.

Syntax `neighbor {ip-address | peer-group-name} shutdown`

To enable a disabled neighbor or peer group, use the `neighbor {ip-address | peer-group-name}no shutdown` command.

Parameters

- ip-address*** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name*** Enter the name of the peer group to disable or enable all routers within the peer group.

Defaults Enabled (that is, BGP neighbors and peer groups are disabled.)

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

Peers that are enabled within a peer group are disabled when their peer group is disabled.

The `neighbor shutdown` command terminates all BGP sessions on the BGP neighbor or BGP peer group. Use this command with caution as it terminates the specified BGP sessions. When a neighbor or peer group is shut down, use the `show ip bgp summary` command to confirm its status.

Related Commands

- [show ip bgp summary](#) — display the current BGP configuration.
- [show ip bgp neighbors](#) — display the current BGP neighbors.

neighbor soft-reconfiguration inbound

Enable soft-reconfiguration for BGP.

Syntax

```
neighbor {ip-address | peer-group-name} soft-reconfiguration inbound
```

To disable, use the `no neighbor {ip-address | peer-group-name} soft-reconfiguration inbound` command.

Parameters

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group to disable or enable all routers within the peer group.

Defaults

Disabled

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

Usage Information

This command enables soft-reconfiguration for the BGP neighbor specified. BGP stores all the updates the neighbor receives but does not reset the peer-session.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.

NOTE: This command is supported in BGP Router Configuration mode for IPv4 Unicast address only.

Related Commands

- [show ip bgp neighbors](#) — display routes received by a neighbor.

neighbor subnet

Enable passive peering so that the members of the peer group are dynamic.

Syntax `neighbor peer-group-name subnet subnet-number mask`

To remove passive peering, use the `no neighbor peer-group-name subnet subnet-number mask` command.

Parameters

subnet-number Enter a subnet number in dotted decimal format (A.B.C.D.) as the allowable range of addresses included in the Peer group.
To allow all addresses, enter 0.0.0.0/0.

mask Enter a prefix mask in / prefix-length format (/x).

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

neighbor timers

Set keepalive and hold time timers for a BGP neighbor or a peer group.

Syntax `neighbor {ip-address | peer-group-name} timers keepalive holdtime`

To return to the default values, use the `no neighbor {ip-address | peer-group-name} timers` command.

Parameters	<i>ip-address</i>	Enter the IP address of the peer router in dotted decimal format.
	<i>peer-group-name</i>	Enter the name of the peer group to set the timers for all routers within the peer group.
	<i>keepalive</i>	Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is 60 seconds .
	<i>holdtime</i>	Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is 180 seconds .

- Defaults**
- keepalive = **60 seconds**
 - holdtime = **180 seconds**

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information Timer values configured with the `neighbor timers` command override the timer values configured with any other command.

When two neighbors, configured with different `keepalive` and `holdtime` values, negotiate for new values, the resulting values are as follows:

- the lower of the `holdtime` value is the new `holdtime` value, and
- whichever is the lower value; one-third of the new `holdtime` value, or the configured `keepalive` value, is the new `keepalive` value.

neighbor update-source

Enable the E-Series software to use Loopback interfaces for TCP connections for BGP sessions.

Syntax `neighbor {ip-address | peer-group-name} update-source interface`

To use the closest interface, use the `no neighbor {ip-address | peer-group-name} update-source interface` command.

Parameters	<i>ip-address</i> Enter the IP address of the peer router in dotted decimal format.
	<i>peer-group-name</i> Enter the name of the peer group to disable all routers within the peer group.
	<i>interface</i> Enter the keyword <code>loopback</code> then a number of the Loopback interface. The range is from 0 to 16383.
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information	Loopback interfaces are up constantly and the BGP session may need one interface constantly up to stabilize the session. The <code>neighbor update-source</code> command is not necessary for directly connected internal BGP sessions.
	Neighbors are sorted according to the source and destination ip addresses. If an update-source ip address exists, then the source ip address determines the order in which the neighbors are displayed.

neighbor weight

Assign a weight to the neighbor connection, which is used to determine the best path.

Syntax	<code>neighbor {ip-address peer-group-name} weight weight</code>
	To remove a weight value, use the <code>no neighbor {ip-address peer-group-name} weight</code> command.
Parameters	<i>ip-address</i> Enter the IP address of the peer router in dotted decimal format.
	<i>peer-group-name</i> Enter the name of the peer group to disable all routers within the peer group.
	<i>weight</i> Enter a number as the weight. The range is from 0 to 65535. The default is 0 .

Defaults 0

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information In the Dell EMC Networking OS best path selection process, the path with the highest weight value is preferred.

 **NOTE:** In the Dell EMC Networking OS best-path selection process, the path with the highest weight value is preferred.

If you configure the `set weight` command in a route map applied to this neighbor, the weight set in that command overrides the weight set in the `neighbor weight` command.

Related Commands

- `set weight` — assign a weight to all paths meeting the route map criteria.

network

Specify the networks for the BGP process and enter them in the BGP routing table.

Z9500

Syntax `network ip-address mask [route-map map-name]`

To remove a network, use the `no network ip-address mask [route-map map-name]` command.

Parameters

<i>ip-address</i>	Enter an IP address in dotted decimal format of the network.
<i>mask</i>	Enter the mask of the IP address in the slash prefix length format (for example, /24). The mask appears in command outputs in dotted decimal format (A.B.C.D).

route-map map-name (OPTIONAL) Enter the keyword `route-map` then the name of an established route map.

Only the following ROUTE-MAP mode commands are supported:

- [match ip address](#)
- [set community](#)
- [set local-preference](#)
- [set metric](#)
- [set next-hop](#)
- [set origin](#)
- [set weight](#)

If the route map is not configured, the default is **deny** (to drop all routes).

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information Dell EMC Networking OS software resolves the network address the `network` command configures with the routes in the main routing table to ensure that the networks are reachable using non-BGP routes and non-default routes.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

In BGP, the next-hop for the route is calculated from the information that is acquired through IGP or static routes.

Related Commands

- [redistribute](#) — redistribute routes into BGP.

network backdoor

Specify this IGP route as the preferred route.

Syntax `network ip-address mask backdoor`

To remove a network, use the `no network ip-address mask backdoor` command.

Parameters

<i>ip-address</i>	Enter an IP address in dotted decimal format of the network.
<i>mask</i>	Enter the mask of the IP address in the slash prefix length format (for example, /24). The mask appears in command outputs in dotted decimal format (A.B.C.D).

Defaults Not configured.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information Although Dell EMC Networking OS does not generate a route due to the backdoor config, there is an option for injecting/sourcing a local route in the presence of network backdoor config on a learned route.

permit bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to permit incoming or outgoing traffic.

Syntax `permit bandwidth`

To disable this setting, enter the `no permit bandwidth` command.

Parameters

bandwidth	Enter the keyword bandwidth to specify extended-community attribute as the matching criteria for permitting traffic. The range is from 0 to 102400.
------------------	---

Defaults N/A

Command Modes EXTENDED COMMUNITY LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.

Related Commands

- [deny bandwidth](#) – link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

redistribute

Redistribute routes into BGP.

Syntax `redistribute {connected | static} [route-map map-name]`
To disable redistribution, use the `no redistribution {connected | static}` command.

Parameters

connected Enter the keyword `connected` to redistribute routes from physically connected interfaces.

static Enter the keyword `static` to redistribute manually configured routes. These routes are treated as incomplete routes.

route-map map-name (OPTIONAL) Enter the keyword `route-map` then the name of an established route map.

Only the following ROUTE-MAP mode commands are supported:

- [match ip address](#)
- [set community](#)
- [set local-preference](#)
- [set metric](#)
- [set next-hop](#)
- [set origin](#)
- [set weight](#)

If the route map is not configured, the default is **deny** (to drop all routes).

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as internal .
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and applied outbound to an EBGp peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

If you do not configure the `default-metric` command, in addition to the `redistribute` command, or there is no route map to set the metric, the metric for redistributed static and connected is "0".

To redistribute the default route (0.0.0.0/0), configure the `neighbor default-originate` command.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

Related Commands

- [neighbor default-originate](#) — inject the default route.

redistribute ospf

Redistribute OSPF routes into BGP.

Syntax

```
redistribute ospf process-id [[match external {1 | 2}] [match internal]]
[route-map map-name]
```

To stop redistribution of OSPF routes, use the `no redistribute ospf process-id` command.

Parameters

<i>process-id</i>	Enter the number of the OSPF process. The range is from 1 to 65535.
match external {1 2}	(OPTIONAL) Enter the keywords <code>match external</code> to redistribute OSPF external routes. You can specify 1 or 2 to redistribute those routes only.
match internal	(OPTIONAL) Enter the keywords <code>match internal</code> to redistribute OSPF internal routes only.

route-map *map-name* (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.

Defaults Not configured.

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as internal .
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with `metric-type internal` and apply outbound to an EBGp peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

When you enter the `redistribute isis process-id` command without any other parameters, Dell EMC Networking OS redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes. RFC does not support this feature.

router bgp

To configure and enable BGP, enter ROUTER BGP mode.

Syntax `router bgp as-number`
To disable BGP, use the `no router bgp as-number` command.

Parameters ***as-number*** Enter the AS number. The range is from 1 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

Defaults Not enabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

At least one interface must be in Layer 3 mode for the `router bgp` command to be accepted. If all interfaces are configured under VRF, at least one interface should be in the default VRF for the `router bgp` command to be accepted. If no interfaces are enabled for Layer 3, an error message appears:

```
% Error: No router id
configured
```

BGP does not allow 23456 (AS-TRANS) as a configured AS number.

Example

```
DellEMC(conf)# router bgp 3
DellEMC(conf-router_bgp)#
```

shutdown all

Disables all the BGP neighbors.

Syntax

```
shutdown all
```

Use the `no shutdown all` command to enable all the configured BGP neighbors.

Command Modes ROUTER BGP

Command History

Version	Description
9.11.0.0	Introduced on the S-Series, Z-Series, MXL, and IOM.

Usage Information

You can use this command to disable all the configured BGP neighbors.

This command is global for all VRFs.

shutdown address-family-ipv4-multicast

Disables all the BGP neighbors corresponding to the multicast IPv4 address families.

Syntax

```
shutdown address-family-ipv4-unicast
```

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the multicast IPv4 address families.

Command Modes ROUTER BGP
CONFIGURATION

Command History	Version	Description
	9.11.0.0	Introduced on the S-Series, Z-Series, MXL, and IOM.

Usage Information You can use this command to disable all the configured BGP neighbors corresponding to the multicast IPv4 address families.

This command is global for all VRFs.

shutdown address-family-ipv4-unicast

Disables all the BGP neighbors corresponding to the unicast IPv4 address families.

Syntax `shutdown address-family-ipv4-unicast`

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the unicast IPv4 address families.

Command Modes ROUTER BGP
CONFIGURATION

Command History	Version	Description
	9.11.0.0	Introduced on the S-Series, Z-Series, MXL, and IOM.

Usage Information You can use this command to disable all the configured BGP neighbors corresponding to the unicast IPv4 address families.

This command is global for all VRFs.

shutdown address-family-ipv6-unicast

Disables all the BGP neighbors corresponding to the unicast IPv6 address families.

Syntax `shutdown address-family-ipv6-unicast`

Use the `no shutdown address-family-ipv6-unicast` command to enable all the configured BGP neighbors corresponding to the unicast IPv6 address families.

Command Modes ROUTER BGP
CONFIGURATION

Command History	Version	Description
	9.11.0.0	Introduced on the S-Series, Z-Series, MXL, and IOM.

Usage Information You can use this command to disable all the configured BGP neighbors corresponding to the unicast IPv6 address families.

This command is global for all VRFs.

set extcommunity bandwidth

Enables you to set extended community bandwidth.

Syntax `set extcommunity bandwidth`
To disable extended community bandwidth, enter the `no set extcommunity bandwidth` command.

Parameters **bandwidth** Enter the keyword `bandwidth` to enable extended community bandwidth. The range is from 0 to 102400.

Defaults N/A

Command Modes ROUTER MAP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series.

Usage Information A new policy command is introduced in order to attach the Link Bandwidth extended community only to the prefixes that are received from a neighbor that satisfy the desired conditions. This command is relevant for both inbound as well as outbound policy handling (for received prefixes). Also, there is no change to the set of supported conditions or filters.

During configuration, the bandwidth is specified in Mbps, not in bytes/second. While creating the actual LB extended community, the system will attach the AS number and encode the bandwidth in floating point format.

show capture bgp-pdu neighbor

Display BGP packet capture information for an IPv4 address on the system.

Syntax `show capture bgp-pdu neighbor ipv4-address`

Parameters **ipv4-address** Enter the IPv4 address (in dotted decimal format) of the BGP address to display packet information for that address.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

show config

View the current ROUTER BGP configuration.

Syntax show config

Command Modes ROUTER BGP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Example

```
DellEMC(conf-router_bgp)# show config
!
router bgp 100
 network 1.1.11.1/32
 network 1.1.12.1/32
 network 1.1.13.1/32
 neighbor 10.1.1.2 remote-as 200
 neighbor 10.1.1.2 no shutdown
DellEMC(conf-router_bgp)#
```

show ip bgp

View the current BGP IPv4 routing table for the system.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 unicast] [network [network-mask]] [longer-prefixes]
```

Parameters

vrf <i>vrf-name</i>	(OPTIONAL) Enter the keyword <i>vrf</i> and then the name of the VRF to view ipv4-unicast route information corresponding to that VRF.
ipv4 unicast	(OPTIONAL) Enter the keywords <i>ipv4 unicast</i> to view information only related to ipv4 unicast routes.
network	(OPTIONAL) Enter the network address (in dotted decimal format) of the BGP network to view information only on that network.
network-mask	(OPTIONAL) Enter the network mask (in slash prefix format) of the BGP network address.
longer-prefixes	(OPTIONAL) Enter the keywords <i>longer-prefixes</i> to view all routes with a common prefix.

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the ADDPATH parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

When you enable the `bgp non-deterministic-med` command, the `show ip bgp` command output for a BGP route does not list the INACTIVE reason.

In BGP, this command displays the exact reason why the route is discarded.

The following describes the `show ip bgp` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

The `show ip bgp` command displays the `dmzlink-dw` details only if `dmzlink-bw` is enabled using the `bgp dmzlink-dw` command.

Example

```
DelleMC# show ip bgp
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

	Network	Next Hop	Metric	LocPrf	Weight	Path
*>	55.0.0.0/24	172.16.0.2		0	200	i
*>	66.0.0.0/24	172.16.0.2		0	200	i

All the show and debugs commands display the link band width extended-community prefixed with DMZ-Link-bw along with other extended communities.

```
DelleMC# show ip bgp 3.3.3.0/24
BGP routing table entry for 3.3.3.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
  1.1.1.2 (3.3.3.1) Best
  AS_PATH :
  Next-Hop : 1.1.1.2, Cost : 0
  Origin IGP, Metric 0, LocalPref 100, Weight 0, internal
Extended Communities :
  DMZ-Link Bw: 2000 kbytes*
```

Related Commands

- [show ip bgp community](#) — view the BGP communities.
- [neighbor maximum-prefix](#) — control the number of network prefixes received.

show ip bgp cluster-list

View BGP neighbors in a specific cluster.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
cluster-list [cluster-id]
```

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view cluster information of BGP neighbors corresponding to that VRF.
- ipv4 multicast** (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related to only to the ipv6 unicast routes.
- cluster-id** (OPTIONAL) Enter the cluster id in dotted decimal format. The range is 1 — 4294967295.

show ip bgp community

View information on all routes with Community attributes or view specific BGP community groups.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
community [community-number] [local-as] [no-export] [no-advertise]
```

Parameters

vrf vrf-name	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view information either on all routes with community attributes or specific BGP community routes corresponding to that VRF.
ipv4 unicast	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
community-number	Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system. You can specify up to eight community numbers to view information on those community groups.
local-AS	Enter the keywords <code>local-as</code> to view all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED. All routes with the NO_EXPORT_SUBCONFED (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.
no-advertise	Enter the keywords <code>no-advertise</code> to view all routes containing the well-known community attribute of NO_ADVERTISE. All routes with the NO_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.
no-export	Enter the keywords <code>no-export</code> to view all routes containing the well-known community attribute of NO_EXPORT. All routes with the NO_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

Example

```
DellEMC# show ip bgp community ?
local-AS          Do not export outside local AS (well-known community)
no-advertise      Do not advertise to any peer (well-known community)
no-export         Do not export to next AS (well-known community)
aa:nn            Community number in aa:nn format
|               Pipe through a command

DellEMC# show ip bgp community
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf Weight Path

              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf Weight Path
*>  66.0.0.0/24       172.16.0.2              0 200 i
DellEMC#
```

show ip bgp community-list

View routes that a specific community list affects.

Z9500

Syntax `show ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] community-list community-list-name [exact-match]`

Parameters	vrf vrf-name	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view routes affected by a specific community list corresponding to that VRF.
	ipv4 unicast	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
	ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
	ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
	community-list-name	Enter the name of a configured IP community list (maximum 140 characters).
	exact-match	Enter the keyword for an exact match of the communities.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information The `show ip bgp community-list` command without any parameters lists BGP routes matching the Community List and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community-list pass` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

Example

```
DelleMC# conf t
DelleMC(conf)# ip community-list c11
DelleMC(config-community-list)# permit 1000:1
DelleMC(config-community-list)# end
DelleMC# show ip bgp community-list c11
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop           Metric      LocPrf Weight Path
*>  55.0.0.0/24       172.16.0.2         0           0    200 i
DelleMC# show ip bgp 55.0.0.0/24
BGP routing table entry for 55.0.0.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer

Received from :
172.16.0.2 (172.16.0.2)   Best
  AS_PATH : 200

Next-Hop : 172.16.0.2, Cost : 0
Origin IGP, Metric 4294967295 (Default), LocalPref 100, Weight 0, external

Communities :
200:1          1000:1          3000:1
DelleMC#
```

show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

Z9500

Syntax `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths`

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
Network	Displays the network ID to which the route is dampened.
From	Displays the IP address of the neighbor advertising the dampened route.
Reuse	Displays the hour:minutes:seconds until the dampened route is available.
Path	Lists all the ASs the dampened route passed through to reach the destination network.

Example

```
DellEMC# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From          Reuse          Path
d 55.0.0.0/24        172.16.0.2          00:36:23      200
DellEMC#
```

show ip bgp detail

Display BGP internal information for the IPv4 Unicast address family.

Syntax show ip bgp [ipv4 unicast] detail

Defaults none

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

```

show ip bgp extcommunity-list

View information on all routes with Extended Community attributes.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
extcommunity-list [list name]
```

Parameters

vrf vrf-name	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view information on all routes with extended community attributes corresponding to that VRF.
ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to <code>ipv4</code> multicast routes.
ipv4 unicast	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to <code>ipv4</code> unicast routes.
ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to <code>ipv6</code> unicast routes.
list name	Enter the extended community list name you wish to view. The range is 140 characters.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

Example

```
DelleMC# show run extcommunity-list
!
ip extcommunity-list ecl1
 permit rt 100:4
 permit soo 40:4
DelleMC#show ip bgp extcommunity-list ecl1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0

DelleMC#
```

show ip bgp filter-list

View the routes that match the filter lists.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
filter-list as-path-name
```

Parameters

vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view route information that matches the filter lists corresponding to that VRF.
ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
ipv4 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.

as-path-name Enter an AS-PATH access list name. The range is 140 characters.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information The following describes the `show ip bgp filter-list hello` command shown in the following example.

Field	Description
Path source codes	Lists the path sources shown to the right of the last AS number in the Path column: <ul style="list-style-type: none">• i = internal route entry• a = aggregate route entry• c = external confederation route entry• n = network route entry• r = redistributed route entry
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

Example

```
DelleMC# show run as-path a1
!
ip as-path access-list a1
 permit 500
DelleMC#

DelleMC# show ip bgp filter-list a1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
```

```

BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf Weight Path
*> 55.0.0.0/24        172.16.0.2
*> 66.0.0.0/24        172.16.0.2
DellEMC#

```

show ip bgp flap-statistics

View flap statistics on BGP routes.

Z9500

Syntax

```

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
flap-statistics [ip-address [mask]] [filter-list as-path-name] [regex
regular-expression]

```

Parameters

- | | |
|---------------------------------|---|
| vrf vrf-name | (OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view flap statistics on BGP routes corresponding to that VRF. |
| ipv4 multicast | (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes. |
| ipv4 unicast | (OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes. |
| ipv6 unicast | (OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes. |
| ip-address | (OPTIONAL) Enter the IP address (in dotted decimal format) of the BGP network to view information only on that network. |
| mask | (OPTIONAL) Enter the network mask (in slash prefix (/x) format) of the BGP network address. |
| filter-list as-path-name | (OPTIONAL) Enter the keyword <code>filter-list</code> then the name of a configured AS-PATH ACL. The range is 140 characters. |
| regex regular-expression | <p>Enter a regular expression then use one or a combination of the following characters to match. The range is 256 characters.</p> <ul style="list-style-type: none"> • <code>.</code> = (period) any single character (including a white space). • <code>*</code> = (asterisk) the sequences in a pattern (zero or more sequences). • <code>+</code> = (plus) the sequences in a pattern (one or more sequences). • <code>?</code> = (question mark) sequences in a pattern (either zero or one sequences). <p> NOTE: Enter an escape sequence (CTRL+v) prior to entering the <code>?</code> regular expression.</p> <ul style="list-style-type: none"> • <code>[]</code> = (brackets) a range of single-character patterns. • <code>()</code> = (parenthesis) groups a series of pattern elements to a single element. • <code>{ }</code> = (braces) minimum and the maximum match count. • <code>^</code> = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified. • <code>\$</code> = (dollar sign) the end of the output string. |

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The following describes the `show ip bgp flap` command shown in the following example.

Field	Description
Network	Displays the network ID to which the route is flapping.
From	Displays the IP address of the neighbor advertising the flapping route.
Flaps	Displays the number of times the route flapped.
Duration	Displays the hours:minutes:seconds since the route first flapped.
Reuse	Displays the hours:minutes:seconds until the flapped route is available.
Path	Lists all the ASs the flapping route passed through to reach the destination network.

Example

```
DellEMC# show ip bgp flap-statistics
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed

```

show ip bgp inconsistent-as

View routes with inconsistent originating autonomous system (AS) numbers; that is, prefixes that are announced from the same neighbor AS but with a different AS-Path.

Syntax `show ip bgp [vrf vrf-name] [ipv4 unicast] inconsistent-as`

Parameters

vrf vrf-name (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view routes corresponding to the VRF that contain inconsistent originating AS numbers.

ipv4 unicast (OPTIONAL) Enter the keywords `ipv4 unicast` to view information only related to ipv4 unicast routes.

DellEMC#

```

show ip bgp neighbors

Allows you to view the information BGP neighbors exchange.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
neighbors [ip-address [advertised-routes | dampened-routes | detail | flap-
statistics | routes | {received-routes [network [network-mask]]} | {denied-
routes [network [network-mask]]}]
```

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view information exchanged by BGP neighbors corresponding to that VRF.
-  **NOTE:** You can use this attribute to view information exchanged by BGP neighbors that correspond to either a default or a non-default VRF.
- ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.
- ip-address** (OPTIONAL) Enter the IP address of the neighbor to view only BGP information exchanged with that neighbor.

advertised-routes	(OPTIONAL) Enter the keywords <code>advertised-routes</code> to view only the routes the neighbor sent.
dampened-routes	(OPTIONAL) Enter the keywords <code>dampened-routes</code> to view information on dampened routes from the BGP neighbor.
detail	(OPTIONAL) Enter the keyword <code>detail</code> to view neighbor-specific internal information for the IPv4 Unicast address family.
flap-statistics	(OPTIONAL) Enter the keywords <code>flap-statistics</code> to view flap statistics on the neighbor's routes.
routes	(OPTIONAL) Enter the keyword <code>routes</code> to view only the neighbor's feasible routes.
received-routes [network] [network-mask]	(OPTIONAL) Enter the keywords <code>received-routes</code> then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information received from neighbors.  NOTE: Configure the <code>neighbor soft-reconfiguration inbound</code> command prior to viewing all the information received from the neighbors.
denied-routes [network] [network-mask]	(OPTIONAL) Enter the keywords <code>denied-routes</code> then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information on routes denied via neighbor inbound filters.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>ipv4 multicast</code> and <code>ipv6 unicast</code> parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the <code>ADDPATH</code> parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Added the <code>detail</code> option. Output now displays the default MED value.
7.2.1.0	Added the <code>received</code> and <code>denied route</code> options.
6.3.10	The output is changed to display the total number of advertised prefixes.

Usage Information

After a peer reset, the contents of the notification log messages is displayed in hex values for debugging.

The neighbor information that this command displays does not include counts corresponding to ignored prefixes and updates. However, the martian case is an exception where neighbor information corresponding to ignored updates is displayed.

BGP shows the exact information that is exchanged between the BGP peers. It also indicates whether or not this information is received by the BGP peer.

The following describes the `show ip bgp neighbors` command shown in the following examples.

The Lines Beginning with:	Description
BGP neighbor	Displays the BGP neighbor address and its AS number. The last phrase in the line indicates whether the link between the BGP router and its neighbor is an external or internal one. If they are located in the same AS, the link is internal; otherwise the link is external.
BGP version	Displays the BGP version (always version 4) and the remote router ID.
BGP state	Displays the neighbor's BGP state and the amount of time in hours:minutes:seconds it has been in that state.
Last read	This line displays the following information: <ul style="list-style-type: none">• last read is the time (hours:minutes:seconds) the router read a message from its neighbor• hold time is the number of seconds configured between messages from its neighbor• keepalive interval is the number of seconds between keepalive messages to help ensure that the TCP session is still alive.
Received messages	This line displays the number of BGP messages received, the number of notifications (error messages), and the number of messages waiting in a queue for processing.
Sent messages	The line displays the number of BGP messages sent, the number of notifications (error messages), and the number of messages waiting in a queue for processing.
Received updates	This line displays the number of BGP updates received and sent.
Soft reconfiguration	This line indicates that soft reconfiguration inbound is configured.
Minimum time (list of inbound and outbound policies)	Displays the minimum time, in seconds, between advertisements.
For address family:	Displays the policy commands configured and the names of the Route map, AS-PATH ACL, or Prefix list configured for the policy.
BGP table version	Displays the IPv4 Unicast as the address family.
accepted prefixes	Displays which version of the primary BGP routing table the router and the neighbor are using.
Prefix advertised	Displays the number of network prefixes the router accepts and the amount of memory used to process those prefixes.
Connections established	Displays the number of network prefixes advertised, the number rejected, and the number withdrawn from the BGP routing table.
Last reset	Displays the number of TCP connections established and dropped between the two peers to exchange BGP information.
Local host:	Displays the amount of time since the peering session was last reset. Also states if the peer resets the peering session. If the peering session was never reset, the word never is displayed.
	Displays the peering address of the local router and the TCP port number.

The Lines Beginning with:

Foreign host: Displays the peering address of the neighbor and the TCP port number.

Example

```
DelleMC# show ip bgp neighbors 172.16.0.2
BGP neighbor is 172.16.0.2, remote AS 200, external link
  Member of peer-group port0 for session parameters
  BGP remote router ID 172.16.0.2
  BGP state ESTABLISHED, in this state for 00:13:55
  Last read 00:00:03, Last write 00:00:55
  Hold time is 180, keepalive interval is 60 seconds
  Received 50 messages, 0 in queue
    1 opens, 0 notifications, 34 updates
    15 keepalives, 0 route refresh requests
  Sent 18 messages, 0 in queue
    1 opens, 0 notifications, 0 updates
    16 keepalives, 0 route refresh requests

Route refresh request: received 0, sent messages 1
Minimum time between advertisement runs is 30 seconds
Minimum time before advertisements start is 0 seconds

Capabilities received from neighbor for IPv4 Unicast :
  MULTIPROTO_EXT(1)
  ROUTE_REFRESH(2)

Capabilities advertised to neighbor for IPv4 Unicast :
  MULTIPROTO_EXT(1)
  ROUTE_REFRESH(2)
  ADD_PATH(69)
  CISCO_ROUTE_REFRESH(128)

For address family: IPv4 Unicast
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
InQ : Added 0, Replaced 0, Withdrawn 0
OutQ : Added 0, Withdrawn 0
Allow local AS number 0 times in AS-PATH attribute
Prefixes accepted 2, withdrawn 15 by peer, martian prefixes ignored 0
Prefixes advertised 0, denied 0, withdrawn 0 from peer

Connections established 1; dropped 0
Last reset never
Local host: 172.16.0.1, Local port: 58145
Foreign host: 172.16.0.2, Foreign port: 179

DelleMC#
```

Related Commands

- [show ip bgp](#) — view the current BGP routing table.

show ip bgp next-hop

View all next hops (using learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.

Z9500

Syntax `show ip bgp [vrf vrf-name] next-hop`

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information The following describes the `show ip bgp next-hop` command shown in the following example.

Field	Description
Next-hop	Displays the next-hop IP address.
Via	Displays the IP address and interface used to reach the next hop.
RefCount	Displays the number of BGP routes using this next hop.
Cost	Displays the cost associated with using this next hop.
Flaps	Displays the number of times the next hop has flapped.
Flaps	Displays the number of times the next hop has flapped.

Example

```
DellEMC# show ip bgp next-hop
      Next-hop          Resolved
      172.16.0.2        YES
DellEMC#
```

show ip bgp paths

View all the BGP path attributes in the BGP database.

Syntax `show ip bgp[vrf vrf-name] paths [regexp regular-expression]`

Parameters

regexp regular-expression Enter a regular expression then use one or a combination of the following characters to match:

- . = (period) any single character (including a white space).

- * = (asterisk) the sequences in a pattern (zero or more sequences).
 - + = (plus) the sequences in a pattern (one or more sequences).
 - ? = (question mark) sequences in a pattern (either zero or one sequences).
- i** **NOTE:** Enter an escape sequence (CTRL+v) prior to entering the ? regular expression.
- [] = (brackets) a range of single-character patterns.
 - () = (parenthesis) groups a series of pattern elements to a single element.
 - { } = (braces) minimum and the maximum match count.
 - ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
 - \$ = (dollar sign) the end of the output string.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF for the S4810, S4820T, and S6000.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The following describes the `show ip bgp path` command shown in the following example.

Field	Description
Total	Displays the total number of BGP path attributes.
Address	Displays the internal address where the path attribute is stored.
Hash	Displays the hash bucket where the path attribute is stored.
Refcount	Displays the number of BGP routes using this path attribute.
Metric	Displays the MED attribute for this path attribute.
Path	Displays the AS path for the route, with the origin code for the route listed last. Numbers listed between braces {} are AS_SET information.

Example

```
DellEMC# show ip bgp paths ?
community          Display community information
extcommunity       Display extended community information
regex              Display path information based on a regular
expression         |
                   Pipe through a command

DellEMC#show ip bgp paths
Total 2 Paths
Refcount Metric Path
1          0          200 i
1          0          200 i
DellEMC#
```

show ip bgp paths as-path

View all unique AS-PATHs in the BGP database.

Syntax `show ip bgp [vrf vrf-name] paths as-path`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The following describes the `show ip bgp paths as-path` command shown in the following example.

Field	Description
Address	Displays the internal address where the path attribute is stored.
Hash	Displays the hash bucket where the path attribute is stored.
Refcount	Displays the number of BGP routes using these AS-Paths.
AS-Path	Displays the AS paths for this route, with the origin code for the route listed last. Numbers listed between braces {} are AS_SET information.

Example

```
Dell#show ip bgp paths as-path
Total 13 AS-Paths
Address      Hash Refcount AS-Path
0x1ea3c1ec  251      1      42
0x1ea3c25c  251      1      22
0x1ea3c1b4  507      1      13
0x1ea3c304  507      1      33
0x1ea3c10c  763      1      {92 93}
0x1ea3c144  763      1      {102 103}
0x1ea3c17c  763      1      12
0x1ea3c2cc  763      1      32
0x1ea3c09c  764      1      {72 73}
```

```

0x1ea3c0d4 764 1 {82 83}
0x1ea3c224 1019 1 43
0x1ea3c294 1019 1 23
0x1ea3c02c 1021 4
Dell#

```

show ip bgp paths community

View all unique COMMUNITY numbers in the BGP database.

Z9500

Syntax `show ip bgp [vrf vrf-name] paths community`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information The following describes the `show ip bgp paths community` command shown in the following example.

Field	Description
Address	Displays the internal address where the path attribute is stored.
Hash	Displays the hash bucket where the path attribute is stored.
Refcount	Displays the number of BGP routes using these communities.
Community	Displays the community attributes in this BGP path.

Example

```

DellEMC# show ip bgp paths community
Total 2 communities

```

```

Refcount      Community
1             NO-ADVERTISE
1             200:1          1000:1          3000:1
DellEMC#

```

show ip bgp peer-group

Allows you to view information on the BGP peers in a peer group.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast]
peer-group [peer-group-name [detail | summary]]
```

Parameters

vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> to view information on BGP peers in a peer group corresponding to that VRF.  NOTE: You can use this attribute to view information on BGP peers in a peer group that correspond to either a default or a non-default VRF.
ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
ipv4 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
peer-group-name	(OPTIONAL) Enter the name of a peer group to view information about that peer group only.
detail	(OPTIONAL) Enter the keyword <code>detail</code> to view detailed status information of the peers in that peer group.
summary	(OPTIONAL) Enter the keyword <code>summary</code> to view status information of the peers in that peer group. The output is the same as that found in the <code>show ip bgp summary</code> command.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>ipv4 multicast</code> and <code>ipv6 unicast</code> parameters. Introduced on S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the <code>ADDPATH</code> parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The following describes the `show ip bgp peer-group` command shown in the following example.

Line beginning with:

Line beginning with:	Description
----------------------	-------------

Peer-group	Displays the peer group's name.
Administratively shut	Displays the peer group's status if the peer group is not enabled. If you enable the peer group, this line is not displayed.
BGP version	Displays the BGP version supported.
Minimum time	Displays the time interval between BGP advertisements.
For address family	Displays IPv4 Unicast as the address family.
BGP neighbor	Displays the name of the BGP neighbor.
Number of peers	Displays the number of peers currently configured for this peer group.
Peer-group members:	Lists the IP addresses of the peers in the peer group. If the address is outbound optimized, an <code>*</code> is displayed next to the IP address.

Example

```
DellEMC# show ip bgp peer-group
Peer-group port0, remote AS 200
BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
BGP neighbor is port0, peer-group external
Update packing has 4_OCTET_AS support enabled

Number of peers in this group 1
Maximum limit on the accepted connections 256

Peer-group members (* - outbound optimized):
172.16.0.2
DellEMC#
```

Related Commands

- [neighbor peer-group \(assigning peers\)](#) — assign a peer to a peer-group.
- [neighbor peer-group \(creating group\)](#) — create a peer group.

show ip bgp regexp

Display the subset of the BGP routing tables matching the regular expressions specified.

Z9500

Syntax

```
show ip bgp [vrf vrf-name] regexp regular-expression [character]
```

Parameters

vrf *vrf-name* Enter the keyword `vrf` and then the name of the VRF to view the subset of BGP routing tables that match the regular expression specified on that VRF.

NOTE: You can use this attribute to view the subset of BGP routing tables that match the regular expression that is specified on either a default or a non-default VRF.

regular-expression
[character]

Enter a regular expression then use one or a combination of the following characters to match:

- . = (period) any single character (including a white space).
- * = (asterisk) the sequences in a pattern (zero or more sequences).
- + = (plus) the sequences in a pattern (one or more sequences).
- ? = (question mark) sequences in a pattern (either zero or one sequences).

NOTE: Enter an escape sequence (CTRL+v) prior to entering the ? regular expression.

- [] = (brackets) a range of single-character patterns.
- () = (parenthesis) groups a series of pattern elements to a single element.
- { } = (braces) minimum and the maximum match count.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- \$ = (dollar sign) the end of the output string.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

The following describes the `show ip bgp regexp` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then non-BGP routes exist in the router's routing table.

Field	Description
Metric	Displays the BGP router's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight
Path	Lists all the AS paths the route passed through to reach the destination network.

Example

```
DelleMC# show ip bgp regexp ^200
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf Weight Path
*>  55.0.0.0/24        172.16.0.2                0 200 i
*>  66.0.0.0/24        172.16.0.2                0 200 i
DelleMC#
```

show ip bgp summary

Allows you to view the status of all BGP connections.

Z9500

Syntax `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] summary`

Parameters	Parameter	Description
	vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view the status of all BGP connections corresponding to that VRF.
	ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
	ipv4 unicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
	ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

In BGP, route attributes are maintained at different locations. When attributes that correspond to multiple routes change, then attribute counts that the `show ip bgp summary` command displays are calculated as summations of attributes corresponding to all the associated routes. For example, if `cluster_id` is an attribute associated with thousand routes that contain exactly the same set of attributes, then the `cluster_id` count is 1. If these thousand routes are set with different attribute values with the same `cluster_id`, then the `cluster_id` count is 1000, since the same value is stored for thousand different attribute records.

The attribute `next-hop` is a part of the BGP attribute data structure.

If two peers send the same route that contains similar path attributes, then two entries are maintained in the back-end, as both these entries have different next-hops. If this same route is sent to a different peer, an entry for each peer is created, as the next-hop is different. As a result, the BGP attributes count in the summary output will differ accordingly.

The following describes the `show ip bgp summary` command shown in the following example.

Field	Description
BGP router identifier	Displays the local router ID and the AS number.
BGP table version	Displays the BGP table version and the main routing table version.
network entries	Displays the number of network entries, route paths, and the amount of memory used to process those entries.
paths	Displays the number of paths and the amount of memory used.
denied paths	Displays the number of denied paths and the amount of memory used.
BGP path attribute entries	Displays the number of BGP path attributes and the amount of memory used to process them.
BGP AS-PATH entries	Displays the number of BGP AS_PATH attributes processed and the amount of memory used to process them.
BGP community entries	Displays the number of BGP COMMUNITY attributes processed and the amount of memory used to process them. The <code>show ip bgp community</code> command provides more details on the COMMUNITY attributes.
Dampening enabled	Displayed only when you enable dampening. Displays the number of paths designated as history, dampened, or penalized.
Neighbor	Displays the BGP neighbor address.
AS	Displays the AS number of the neighbor.
MsgRcvd	Displays the number of BGP messages that neighbor received.
MsgSent	Displays the number of BGP messages that neighbor sent.
TblVer	Displays the version of the BGP table that was sent to that neighbor.
InQ	Displays the number of messages from that neighbor waiting to be processed.

Field	Description								
OutQ	Displays the number of messages waiting to be sent to that neighbor. If a number appears in parentheses, the number represents the number of messages waiting to be sent to the peer group.								
Up/Down	Displays the amount of time that the neighbor is in the Established stage. If the neighbor has never moved into the Established stage, the word never is displayed. The output format is: <table border="1" data-bbox="571 472 1173 683"> <thead> <tr> <th>Time Established</th> <th>Display Example</th> </tr> </thead> <tbody> <tr> <td>< 1 day</td> <td>00:12:23 (hours:minutes:seconds)</td> </tr> <tr> <td>< 1 week</td> <td>1d21h (DaysHours)</td> </tr> <tr> <td>> 1 week</td> <td>11w2d (WeeksDays)</td> </tr> </tbody> </table>	Time Established	Display Example	< 1 day	00:12:23 (hours:minutes:seconds)	< 1 week	1d21h (DaysHours)	> 1 week	11w2d (WeeksDays)
Time Established	Display Example								
< 1 day	00:12:23 (hours:minutes:seconds)								
< 1 week	1d21h (DaysHours)								
> 1 week	11w2d (WeeksDays)								
State/Pfxrcd	If the neighbor is in Established stage, the number of network prefixes received. If a maximum limit was configured with the <code>neighbor maximum-prefix</code> command, (prfxd) appears in this column. If the neighbor is not in Established stage, the current stage is displayed (Idle, Connect, Active, OpenSent, OpenConfirm). When the peer is transitioning between states and clearing the routes received, the phrase (Purging) may appear in this column. If the neighbor is disabled, the phrase (Admin shut) appears in this column.								

Example

```
DelleMC# show ip bgp summary
BGP router identifier 192.168.11.5, local AS number 100
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
2 network entrie(s) using 152 bytes of memory
2 paths using 208 bytes of memory
BGP-RIB over all using 210 bytes of memory
2 BGP path attribute entrie(s) using 144 bytes of memory
1 BGP AS-PATH entrie(s) using 10 bytes of memory
2 neighbor(s) using 16384 bytes of memory

Neighbor      AS           MsgRcvd  MsgSent   TblVer  InQ   OutQ  Up/Down  State/Pfx
172.16.0.2    200          10       8          0       0     0  00:05:34  2
192.168.10.2  100          0        22         0       0     0  00:00:00  (shut)
DelleMC#
```

show running-config bgp

To display the current BGP configuration, use this feature.

Syntax	<code>show running-config bgp</code>
Defaults	none
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Example

```
DellEMC# show running-config bgp
!
router bgp 100
 network 1.1.11.1/32
 network 1.1.12.1/32
 network 1.1.13.1/32
 neighbor 10.1.1.2 remote-as 200
 neighbor 10.1.1.2 no shutdown
DellEMC#
```

timers bgp

Adjust the BGP Keep Alive and Hold Time timers.

Syntax `timers bgp keepalive holdtime`
 To return to the default, use the `no timers bgp` command.

Parameters

- keepalive*** Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is **60 seconds**.
- holdtime*** Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is **180 seconds**.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

MBGP Commands

Multiprotocol BGP (MBGP) is an enhanced BGP that enables multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (ASs).

Dell EMC Networking OS MBGP is implemented as per IETF RFC 1858.

BGPv4 is supported in the following:

Dell EMC Networking OS Version	Platform Support
7.8.1.0, MBGP for IPv4 Multicast Only	S-Series

debug ip bgp dampening

View information on routes being dampened.

Z9500

Syntax	<pre>debug ip bgp [<i>vrf vrf-name</i>] [<i>ipv4 {unicast multicast}</i>] <i>ipv6 unicast</i>] dampening</pre> <p>To disable debugging, use the <code>no debug ip bgp dampening</code> command.</p>	
Parameters	vrf <i>vrf-name</i>	Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
	ipv4 <i>multicast</i>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 multicast routes.
	ipv4 <i>unicast</i>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 unicast routes.
	ipv6 <i>unicast</i>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv6 unicast routes.
Command Modes	EXEC Privilege	

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced IPv6 MGBP support for the E-Series.

distance bgp

Configure three administrative distances for routes.

Syntax

```
distance bgp external-distance internal-distance local-distance
```

To return to default values, use the `no distance bgp` command.

Parameters

- external-distance*** Enter a number to assign to routes learned from a neighbor external to the AS. The range is from 1 to 255. The default is **20**.
- internal-distance*** Enter a number to assign to routes learned from a router within the AS. The range is from 1 to 255. The default is **200**.
- local-distance*** Enter a number to assign to routes learned from networks listed in the network command. The range is from 1 to 255. The default is **200**.

Defaults

- external-distance = **20**
- internal-distance = **200**
- local-distance = **200**

Command Modes ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

CAUTION: Dell EMC Networking recommends not changing the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.

The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as internal BGP routes.

Related Commands

- `router bgp` — enter ROUTER mode on the switch.

show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

Z9500

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths
```

Parameters

vrf vrf-name	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
ipv4 multicast	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
ipv4 unicast	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
ipv6 unicast	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Usage Information

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
Network	Displays the network ID to which the route is dampened.
From	Displays the IP address of the neighbor advertising the dampened route.
Reuse	Displays the hour:minutes:seconds until the dampened route is available.
Path	Lists all the ASs the dampened route passed through to reach the destination network.

Example

```
DellEMC# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external, r -
redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From           Reuse          Path
d 55.0.0.0/24        172.16.0.2          00:36:23      200
DellEMC#
```

BGP Extended Communities (RFC 4360)

BGP Extended Communities, as defined in RFC 4360, is an optional transitive BGP attribute.

BGP Extended Communities provides two major advantages over Standard Communities:

- The range is extended from 4-octet (AA:NN) to 8-octet (Type:Value) to provide enough number communities.
- Communities are structured using a new "Type" field (1 or 2-octets), allowing you to provide granular control/filter routing information based on the type of extended communities.

deny

To reject (deny) from the two types of extended communities, route origin (rt) or site-of-origin (soo), use this feature.

Syntax	<code>deny {rt soo} {as4 ASN4:NN ASN:NNNN IPADDR:NN}</code> To remove (delete) the rule, use the <code>no deny {rt soo} {as4 ASN4:NN ASN:NNNN IPADDR:NN}</code> command.										
Parameters	<table><tr><td>rt</td><td>Enter the keyword <code>rt</code> to designate a Route Origin community.</td></tr><tr><td>soo</td><td>Enter the keyword <code>soo</code> to designate a Site-of-Origin community (also known as Route Origin).</td></tr><tr><td>as4 ASN4:NN</td><td>Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).</td></tr><tr><td>ASN:NNNN</td><td>Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).</td></tr><tr><td>IPADDR:NN</td><td>Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).</td></tr></table>	rt	Enter the keyword <code>rt</code> to designate a Route Origin community.	soo	Enter the keyword <code>soo</code> to designate a Site-of-Origin community (also known as Route Origin).	as4 ASN4:NN	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).	ASN:NNNN	Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).	IPADDR:NN	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).
rt	Enter the keyword <code>rt</code> to designate a Route Origin community.										
soo	Enter the keyword <code>soo</code> to designate a Site-of-Origin community (also known as Route Origin).										
as4 ASN4:NN	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).										
ASN:NNNN	Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).										
IPADDR:NN	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).										
Defaults	Not configured.										
Command Modes	CONFIGURATION (conf-ext-community-list)										
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command. <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>7.8.1.0</td><td>Introduced on the S-Series.</td></tr><tr><td>7.7.1.0</td><td>Introduced on the C-Series.</td></tr><tr><td>7.6.1.0</td><td>Introduced on the E-Series.</td></tr></tbody></table>	Version	Description	7.8.1.0	Introduced on the S-Series.	7.7.1.0	Introduced on the C-Series.	7.6.1.0	Introduced on the E-Series.		
Version	Description										
7.8.1.0	Introduced on the S-Series.										
7.7.1.0	Introduced on the C-Series.										
7.6.1.0	Introduced on the E-Series.										
Related Commands	permit — configures to add (permit) rules. show ip extcommunity-list — displays the extended community list.										

deny regex

This feature allows you to specify an extended community to reject (deny) using a regular expression (regex).

Syntax	<code>deny regex {regex}</code> To remove, use the <code>no deny regex {regex}</code> command.		
Parameters	<table><tr><td>regex</td><td>Enter a regular expression.</td></tr></table>	regex	Enter a regular expression.
regex	Enter a regular expression.		
Defaults	Not configured.		
Command Modes	CONFIGURATION (conf-ext-community-list)		
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.		

Version	Description
9.2(1.0)	Introduced on the Z9500.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Usage Information

Duplicate commands are silently accepted.

Example

```
Dell(conf-ext-community-list)#deny regexp 123
Dell(conf-ext-community-list)#
```

Related Commands

[permit regexp](#) — permits a community using a regular expression.

description

To designate a meaningful description to the extended community, use this feature.

Syntax

`description {line}`

To remove the description, use the `no description {line}` command.

Parameters

line Enter a description (maximum 80 characters).

Defaults

Not configured.

Command Modes

CONFIGURATION (conf-ext-community-list)

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

ip extcommunity-list

To enter the Extended Community-list mode, use this feature.

Syntax

`ip extcommunity-list word`

To exit from this mode, use the `exit` command.

Parameters

word Enter a community list name (maximum 16 characters).

Defaults

none

Command Modes

CONFIGURATION (conf-ext-community-list)

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Usage Information This mode changes the prompt.

Example

```
Dell(conf)#ip extcommunity-list test
Dell(conf-ext-community-list)#
```

match extcommunity

To match an extended community in the Route Map mode, use this feature.

Syntax `match extcommunity {extended community list name}`

To change the match, use the `no match extcommunity {extended community list name}` command.

Parameters *extended community list name* Enter the name of the extended community list.

Defaults none

Command Modes ROUTE MAP (config-route-map)

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Usage Information Like standard communities, you can use extended communities in the route-map to match the attribute.

Example

```
Dell(config-route-map)#match extcommunity Freedombird
Dell(config-route-map)#
```

permit

To add rules (permit) from the two types of extended communities, Route Origin (rt) or Site-of-Origin (soo), use this feature.

Syntax	<code>permit {rt soo} {as4 ASN4:NN ASN:NNNN IPADDR:NN}</code> To change the rules, use the <code>no permit {rt soo} {as4 ASN4:NN ASN:NNNN IPADDR:NN}</code> command.										
Parameters	<table><tr><td>rt</td><td>Enter the keyword <code>rt</code> to designate a Route Origin community.</td></tr><tr><td>soo</td><td>Enter the keyword <code>soo</code> to designate a Site-of-Origin community (also known as Route Origin).</td></tr><tr><td>as4 ASN4:NN</td><td>Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).</td></tr><tr><td>ASN:NNNN</td><td>Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).</td></tr><tr><td>IPADDR:NN</td><td>Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).</td></tr></table>	rt	Enter the keyword <code>rt</code> to designate a Route Origin community.	soo	Enter the keyword <code>soo</code> to designate a Site-of-Origin community (also known as Route Origin).	as4 ASN4:NN	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).	ASN:NNNN	Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).	IPADDR:NN	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).
rt	Enter the keyword <code>rt</code> to designate a Route Origin community.										
soo	Enter the keyword <code>soo</code> to designate a Site-of-Origin community (also known as Route Origin).										
as4 ASN4:NN	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).										
ASN:NNNN	Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).										
IPADDR:NN	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).										
Defaults	Not configured.										
Command Modes	CONFIGURATION (conf-ext-community-list)										
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command. <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>7.8.1.0</td><td>Introduced on the S-Series.</td></tr><tr><td>7.7.1.0</td><td>Introduced on the C-Series.</td></tr><tr><td>7.6.1.0</td><td>Introduced on the E-Series.</td></tr></tbody></table>	Version	Description	7.8.1.0	Introduced on the S-Series.	7.7.1.0	Introduced on the C-Series.	7.6.1.0	Introduced on the E-Series.		
Version	Description										
7.8.1.0	Introduced on the S-Series.										
7.7.1.0	Introduced on the C-Series.										
7.6.1.0	Introduced on the E-Series.										
Related Commands	deny — configures to delete (deny) rules. show ip bgp extcommunity-list — displays the extended community list.										

permit regex

This feature allows you specify an extended community to forward (permit) using a regular expression (regex).

Syntax	<code>permit regex {regex}</code> To remove, use the <code>no permit regex {regex}</code> command.		
Parameters	<table><tr><td>regex</td><td>Enter a regular expression.</td></tr></table>	regex	Enter a regular expression.
regex	Enter a regular expression.		
Defaults	Not configured.		
Command Modes	CONFIGURATION (conf-ext-community-list)		
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.		

Version	Description
9.2(1.0)	Introduced on the Z9500.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Usage Information

Duplicate commands are silently accepted.

Example

```
Dell(conf-ext-community-list)#permit regex 123
Dell(conf-ext-community-list)#
```

Related Commands

[deny regex](#) — denies a community using a regular expression.

set extcommunity rt

To set Route Origin community attributes in Route Map, use this feature.

Syntax

```
set extcommunity rt {as4 ASN4:NN [non-trans] | ASN:NNNN [non-trans] |
IPADDR:NN [non-trans]} [additive]
```

To delete the Route Origin community, use the `no set extcommunity` command.

Parameters

as4 ASN4:NN	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format ASN4:NN (4-byte AS number:2-byte community value).
ASN:NNNN	Enter the 2-octet AS specific extended community number in the format ASN:NNNN (2-byte AS number:4-byte community value).
IPADDR:NN	Enter the IP address specific extended community in the format IPADDR:NN (4-byte IPv4 Unicast Address:2-byte community value).
additive	(OPTIONAL) Enter the keyword <code>additive</code> to add to the existing extended community.
non-trans	(OPTIONAL) Enter the keywords <code>non-trans</code> to indicate a non-transitive BGP extended community.

Defaults

none

Command Modes

ROUTE MAP (config-route-map)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T
8.3.11.1	Introduced on the Z-9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Version	Description
7.6.1.0	Introduced on the E-Series.

Usage Information

If the set community `rt` and `soo` are in the same route-map entry, the behavior defines as:

- If the `rt` option comes before `soo`, with or without the `additive` option, `soo` overrides the communities `rt` sets.
- If the `rt` option comes after `soo`, without the `additive` option, `rt` overrides the communities `soo` sets.
- If the `rt` with the `additive` option comes after `soo`, `rt` adds the communities `soo` sets.

Related Commands

- [set extcommunity soo](#) — set the extended community site-of-origin in the route-map.

set extcommunity soo

To set extended community site-of-origin in Route Map, use this feature.

Syntax

```
set extcommunity soo {as4 ASN4:NN | ASN:NNNN | IPADDR:NN [non-trans]}
```

To delete the site-of-origin community, use the `no set extcommunity` command.

Parameters

as4 ASN4:NN	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).
ASN:NNNN	Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).
IPADDR:NN	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).
non-trans	(OPTIONAL) Enter the keywords <code>non-trans</code> to indicate a non-transitive BGP extended community.

Defaults

none

Usage Information

If there is a type or sub-type that is not well-known, it is displayed as:TTSS:XX:YYYY.

Where TT is type, SS is sub-type displayed in hexadecimal format, XX:YYYY is the value divided into 2-byte and 4-byte values in decimal format. This format is consistent with other vendors.

For example, if the extended community has type 0x04, sub-type 0x05, value 0x20 00 00 00 10 00, it displays as:0x0405:8192:4096.

Non-transitive extended communities are marked with an asterisk.

Example

```
Dell#show ip bgp ipv4 multicast extcommunity-list
BGP routing table entry for 192.168.1.0/24, version 2

Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
  100.100.1.2 (2.4.0.1) Best
    AS_PATH : 200
    Next-Hop : 100.100.1.2, Cost : 0
    Origin IGP, Metric 4294967295 (Default), LocalPref 100, Weight 0,
    external
    Communities :
```

```

300:400 500:600

Extended Communities :
RT:1111:4278080 SoO:35:4 SoO:36:50529043 SoO:37:50529044

Dell#

```

show ip bgp paths extcommunity

To display all BGP paths having extended community attributes, use this feature.

Syntax `show ip bgp paths extcommunity`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
Version 7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Usage Information The following describes the `show ip bgp paths extcommunity` command shown in the following example.

Field	Description
Address	Displays the internal address where the path attribute is stored.
Hash	Displays the hash bucket where the path attribute is stored.
Refcount	Displays the number of BGP routes using these extended communities.
Community	Displays the extended community attributes in this BGP path.

Example

```

DellEMC# show ip bgp paths extcommunity
Total 1 Extended Communities

Address      Hash  Refcount  Extended Community
0x41d57024  12272  1         RT:7:200 SoO:5:300 SoO:0.0.0.3:1285

DellEMC#

```

show ip extcommunity-list

Display the IP extended community list.

Syntax `show ip extcommunity-list [word]`

Parameters **word** Enter the name of the extended community list you want to view.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Example

```
DellEMC# show ip extcommunity-list test
ip extcommunity-list test
  deny RT:1234:12
  permit regexp 123
  deny regexp 234
  deny regexp 123
DellEMC#
```

show running-config extcommunity-list

To display the current configuration of the extended community lists, use this feature.

Syntax `show running-config extcommunity-list [word]`

Parameters **word** Enter the name of the extended community list you want to view.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

Example

```
Dell#show running-config extcommunity-list test

ip extcommunity-list test
  permit rt 65033:200
  deny soo 101.11.11.2:23
  permit rt as4 110212:340
  deny regex ^(65001_)$

Dell#
```

IPv6 BGP Commands

IPv6 border gateway protocol (IPv6 BGP) is supported on the platform.

BGP is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

address-family

Enable the IPv4 multicast or the IPv6 address family.

C-Series, E-Series, S-Series

Syntax	address-family [ipv4 multicast ipv6unicast]	
Parameters	ipv4multicast	Enter BGPv4 multicast mode.
	ipv6unicast	Enter BGPv6 mode.
Defaults	Not configured.	
Command Modes	ROUTER BGP	
Command History	Version 6.5.1.0	Introduced
Usage Information	Enter <code>ipv6unicast</code> to enter the BGP for IPv6 mode (CONF-ROUTER_BGPv6_AF).	

address family ipv6 unicast

This command changes the context to subsequent address family identifier (SAFI).

E-Series

Syntax	address family ipv6 unicast	
	To remove SAFI context, use the <code>no address family ipv6 unicast</code> command.	
Parameters	ipv6	Enter the keyword <code>ipv6</code> to specify the address family as IPv6.

	unicast	Enter the keyword <code>unicast</code> to specify multicast as SAFI.
Defaults	IPv6 Unicast	
Command Modes	ROUTER BGPV6-ADDRESS FAMILY	
Command History	Version 7.4.1.0	Introduced
Usage Information	All subsequent commands apply to this address family after you execute this command. You can exit from this AFI/SAFI to the IPv6 Unicast (the default) family by entering <code>exit</code> and returning to the Router BGP context.	

aggregate-address

Summarize a range of prefixes to minimize the number of entries in the routing table.

C-Series, E-Series

Syntax	<code>aggregate-address ipv6-address prefix-length [advertise-map map-name] [as-set] [attribute-map map-name] [summary-only] [suppress-map map-name]</code>	
Parameters	<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.
	<i>prefix-length</i>	 NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	<i>advertise-map map-name</i>	(OPTIONAL) Enter the keywords <code>advertise-map</code> followed by the name of a configured route map to set filters for advertising an aggregate route.
	<i>as-set</i>	(OPTIONAL) Enter the keywords <code>as-set</code> to generate path attribute information and include it in the aggregate. AS_SET includes AS_PATH and community information from the routes included in the aggregated route.
	<i>attribute-map map-name</i>	(OPTIONAL) Enter the keywords <code>attribute-map</code> followed by the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.
	<i>summary-only</i>	(OPTIONAL) Enter the keywords <code>summary-only</code> to advertise only the aggregate address. Specific routes will not be advertised.
	<i>suppress-map map-name</i>	(OPTIONAL) Enter the keywords <code>suppress-map</code> followed by the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.
Defaults	Not configured.	
Command Modes	CONFIGURATION-ROUTER-BGPV6-ADDRESS FAMILY	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active. Do not add the <code>as-set</code> parameter to the aggregate if routes within the aggregate are constantly changing as the aggregate will flap to keep track of the changes in the AS_PATH. In route maps used in the <code>suppress-map</code> parameter, routes meeting the <code>deny</code> clause are not suppress; in other words, they are allowed. The opposite is true: routes meeting the <code>permit</code> clause are suppressed. If the route is injected via the network command, that route still appears in the routing table if the <code>summary-only</code> parameter is configured in the <code>aggregate-address</code> command.	

The `summary-only` parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the `neighbor distribute-list` command.

In the `show ip bgp` command, aggregates contain an 'a' in the first column and routes suppressed by the aggregate contain an 's' in the first column.

bgp always-compare-med

Allows you to enable comparison of the MULTI_EXIT_DISC (MED) attributes in the paths from different external ASs.

C-Series, E-Series

Syntax	<code>bgp always-compare-med</code> To disable comparison of MED, use the <code>no bgp always-compare-med</code> command.
Defaults	Disabled (that is, the software only compares MEDs from neighbors within the same AS).
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	Any update without a MED attribute is the least preferred route. If you enable this command, use the <code>clear ip bgp *</code> command to recompute the best path.

bgp bestpath as-path ignore

Ignore the AS PATH in BGP best path calculations.

C-Series, E-Series

Syntax	<code>bgp bestpath as-path ignore</code> To return to the default, use the <code>no bgp bestpath as-path ignore</code> command.
Defaults	Disabled (that is, the software considers the AS_PATH when choosing a route as best).
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	If you enable this command, use the <code>clear ip bgp *</code> command to recompute the best path.

bgp bestpath med confed

Enable MULTI_EXIT_DISC (MED) attribute comparison on paths learned from BGP confederations.

C-Series, E-Series

Syntax	<code>bgp bestpath med confed</code>
---------------	--------------------------------------

To disable MED comparison on BGP confederation paths, use the `no bgp bestpath med confed` command.

Defaults Disabled

Command Modes ROUTER BGP

Command History **Version 8.2.1.0** Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the `clear ip bgp *` command to recompute the best path.

bgp bestpath med missing-as-best

During path selection, indicate preference to paths with missing MED (MULTI_EXIT_DISC) over those paths with an advertised MED attribute.

C-Series, E-Series

Syntax `bgp bestpath med missing-as-best`

To return to the default selection, use the `no bgp bestpath med missing-as-best` command.

Defaults Disabled

Command Modes ROUTER BGP

Command History **Version 8.2.1.0** Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During the path selection, paths with a lower MED are preferred over those with a higher MED.

bgp client-to-client reflection

Allows you to enable route reflection between clients in a cluster.

C-Series, E-Series

Syntax `bgp client-to-client reflection`

To disable client-to-client reflection, use the `no bgp client-to-client reflection` command.

Defaults Enabled when a route reflector is configured.

Command Modes ROUTER BGP

Command History **Version 8.2.1.0** Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information Route reflection to clients is not necessary if all client routers are fully meshed.

Related Commands

- [bgp cluster-id](#) – assigns an ID to a BGP cluster with two or more route reflectors.
- [neighbor route-reflector-client](#) – configures a route reflector and clients.

bgp cluster-id

Assign a cluster ID to a BGP cluster with more than one route reflector.

C-Series, E-Series

Syntax	<code>bgp cluster-id {ip-address number}</code> To delete a cluster ID, use the <code>no bgp cluster-id {ip-address number}</code> command.
Parameters	<i>ip-address</i> Enter an IP address as the route reflector cluster ID. <i>number</i> Enter a route reflector cluster ID as a number from 1 to 4294967295.
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	When a BGP cluster contains only one route reflector, the cluster ID is the route reflector's router ID. For redundancy, a BGP cluster may contain two or more route reflectors and you assign a cluster ID with the <code>bgp cluster-id</code> command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster. The default format for displaying the cluster-id is dotted decimal, but if you enter the <code>cluster-id</code> as an integer, it is displayed as an integer.
Related Commands	<ul style="list-style-type: none">• bgp client-to-client reflection – enables route reflection between route reflector and clients.• neighbor route-reflector-client – configures a route reflector and clients.• show ip bgp cluster-list – views paths with a cluster ID.

bgp confederation identifier

Configure an identifier for a BGP confederation.

C-Series, E-Series

Syntax	<code>bgp confederation identifier as-number</code> To delete a BGP confederation identifier, use the <code>no bgp confederation identifier as-number</code> command.
Parameters	<i>as-number</i> Enter the AS number. The range is 1 to 65535.
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	The autonomous systems configured in this command are visible to the EBGp neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation. FTOS accepts confederation EBGp peers without a LOCAL_PREF attribute. The software sends AS_CONFED_SET and accepts AS_CONFED_SET and AS_CONF_SEQ.

bgp dampening

Enable BGP route dampening and configure the dampening parameters.

C-Series, E-Series

Syntax	<code>bgp dampening [<i>half-life reuse suppress max-suppress-time</i>] [<i>route-map map-name</i>]</code> To disable route dampening, use the <code>no bgp dampening [<i>half-life reuse suppress max-suppress-time</i>] [<i>route-map map-name</i>]</code> command.
Parameters	<p><i>half-life</i> (OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is 1 to 45. The default is 15 minutes.</p> <p><i>reuse</i> (OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route's Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is 1 to 20000. The default is 750.</p> <p><i>suppress</i> (OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route's Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is 1 to 20000. The default is 2000.</p> <p><i>max-suppress-time</i> (OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is 1 to 255. The default is 60 minutes.</p> <p><i>route-map map-name</i> (OPTIONAL) Enter the keywords <code>route-map</code> followed by the name of a configured route map. Only match commands in the configured route map are supported.</p>
Defaults	Disabled.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	If you enter <code>bgp dampening</code> , the default values for <i>half-life</i> , <i>reuse</i> , <i>suppress</i> , and <i>max-suppress-time</i> are applied. The parameters are position-dependent; therefore, if you configure one parameter, you must configure the parameters in the order they appear in the command.
Related Commands	show ip bgp dampened-paths – views the BGP paths.

bgp default local-preference

Change the default local preference value for routes exchanged between internal BGP peers.

C-Series, E-Series

Syntax	<code>bgp default local-preference <i>value</i></code> To return to the default value, use the <code>no bgp default local-preference</code> command.
Parameters	<i>value</i> Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference

value, the more the route is preferred. The range is 0 to 4294967295. The default is **100**.

Defaults	100
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	The <code>bgp default local-preference</code> command setting is applied by all routers within the AS.

bgp enforce-first-as

Disable (or enable) enforce-first-as check for updates received from EBGP peers.

C-Series, E-Series

Syntax	<code>bgp enforce-first-as</code> To turn off the default, use the <code>no bgp enforce-first-as</code> command.
Defaults	Enabled.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	This is enabled by default, that is for all updates received from EBGP peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer. If not, the update is dropped and a counter is incremented. Use the <code>show ip bgp neighbors</code> command to view the “failed enforce-first-as check” counter. If you disable enforce-first-as, you can view it using the <code>show ip protocols</code> command.
Related Commands	<ul style="list-style-type: none">• show ip bgp neighbors – views the information exchanged by BGP neighbors.• show ip protocols – views information on routing protocols.

bgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

C-Series, E-Series

Syntax	<code>bgp fast-external-fallover</code> To disable fast external fallover, use the <code>no bgp fast-external-fallover</code> command.
Defaults	Enabled.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced

Usage Information The `bgp fast-external-fallover` command appears in the `show config` command output.

bgp four-octet-as-support

Enable 4-byte support for the BGP process.

C-Series, E-Series

Syntax `bgp four-octet-as-support`
To disable fast external fallover, use the `no bgp four-octet-as-support` command.

Defaults Disabled (supports 2-Byte format).

Command Modes ROUTER BGP

Command History

Version 8.2.1.0	Introduced on the E-Series ExaScale.
Version 7.7.1.0	Introduced

Usage Information Routers supporting 4-Byte ASNs advertise that function in the OPEN message. The behavior of a 4-Byte router is slightly different depending on whether it is speaking to a 2-Byte router or a 4-Byte router.

When creating Confederations, all the routers in the Confederation must be 4- or 2-byte identified routers. You cannot mix them.

Where the 2-Byte format is 1-65535, the 4-Byte format is 1-4294967295. Both formats are accepted, and the advertisements will reflect the entered format.

For more information about using the 2- or 4-Byte format, refer to the *FTOS Configuration Guide*.

bgp graceful-restart

Enable graceful restart on a BGP neighbor, a BGP node, or designate a local router to support graceful restart as a receiver only.

C-Series, E-Series

Syntax `bgp graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]`
To return to the default, use the `no bgp graceful-restart` command.

Parameters

neighbor ip-address peer-group-name	Enter the keyword <code>neighbor</code> followed by one of the options listed below: <ul style="list-style-type: none">• <code>ip-address</code> of the neighbor in IP address format of the neighbor.• <code>peer-group-name</code> of the neighbor peer group.
restart-time seconds	Enter the keywords <code>restart-time</code> followed by the maximum number of seconds needed to restart and bring up all peers. The range is 1 to 3600 seconds. The default is 120 seconds .
stale-path-time seconds	Enter the keywords <code>stale-path-time</code> followed by the maximum number of seconds to wait before restarting a peer's stale paths. The default is 360 seconds .
role receiver-only	Enter the keywords <code>role receiver-only</code> to designate the local router to support graceful restart as a receiver only.

Defaults As above.

Command Modes ROUTER BGP

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.	

bgp log-neighbor-changes

Enable logging of BGP neighbor resets.

C-Series, E-Series

Syntax	<code>bgp log-neighbor-changes</code>
	To disable logging, use the <code>no bgp log-neighbor-changes</code> command.
Defaults	Enabled.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale.
	Version 7.4.1.0 Introduced
Usage Information	The <code>bgp log-neighbor-changes</code> command appears in the <code>show config</code> command output.
Related Commands	show config – views the current configuration.

bgp non-deterministic-med

Compare MEDs of paths from different autonomous systems.

C-Series, E-Series

Syntax	<code>bgp non-deterministic-med</code>
	To return to the default, use the <code>no bgp non-deterministic-med</code> command.
Defaults	Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale.
	Version 7.4.1.0 Introduced
Usage Information	<p>In non-deterministic mode, paths are compared in the order in which they arrive. This method can lead to FTOS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (<code>no bgp non-deterministic-med</code>), FTOS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.</p> <p>When you change the path selection from deterministic to non-deterministic, the path selection for existing paths remains deterministic until you enter the <code>clear ip bgp</code> command to clear existing paths.</p>

bgp recursive-bgp-next-hop

Enable next-hop resolution through other routes learned by BGP.

C-Series, E-Series

Syntax	<code>bgp recursive-bgp-next-hop</code> To disable next-hop resolution, use the <code>no bgp recursive-bgp-next-hop</code> command.
Defaults	Enabled.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	<p>This command is a <i>knob</i> to disable BGP next-hop resolution via BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.</p> <p>The <code>clear ip bgp</code> command is required for this command to take effect and to keep the BGP database consistent. Execute the <code>clear ip bgp</code> command right after executing this command.</p>
Related Commands	clear ip bgp

bgp regex-eval-optz-disable

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

C-Series, E-Series

Syntax	<code>bgp regex-eval-optz-disable</code> To re-enable optimization engine, use the <code>no bgp regex-eval-optz-disable</code> command.
Defaults	Enabled.
Command Modes	ROUTER BGP (conf-router_bgp)
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.6.1.0 Introduced
Usage Information	<p>BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is quite common. In a large scale configuration, filtering millions of routes based on regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.</p> <p>BGP policies, containing regular expressions to match as-path and communities, tend to use a lot of CPU processing time, which in turn affects the BGP routing convergence. Additionally, the <code>show bgp</code> commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The regex engine performance enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expensive of RP1 processor memory.</p>
Related Commands	show ip protocols – views information on all routing protocols enabled and active on the E-Series.

bgp router-id

Assign a user-given ID to a BGP router.

C-Series, E-Series

Syntax	<code>bgp router-id ip-address</code> To delete a user-assigned IP address, use the <code>no bgp router-id</code> command.
Parameters	<i>ip-address</i> Enter an IP address in dotted decimal format to reset only that BGP neighbor.
Defaults	The router ID is the highest IP address of the Loopback interface or, if you do not configure Loopback interfaces, the highest IP address of a physical interface on the router.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	Peering sessions are reset when you change the router ID of a BGP router.

bgp soft-reconfig-backup

To avoid the peer from resending messages, use this command *only* when route-refresh is *not* negotiated.

Syntax	<code>bgp soft-reconfig-backup</code> To return to the default setting, use the <code>no bgp soft-reconfig-backup</code> command.
Defaults	Off
Command Modes	ROUTER BGP
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command. Version 9.1(0.0) Added support for IPv6. 9.2(1.0) Introduced on the Z9500. Version 9.0.2.0 Introduced on the S6000. Version 8.3.19.0 Introduced on the S4820T. Version 8.3.11.1 Introduced on the Z9000. Version 8.3.7.0 Introduced on the S4810. Version 7.8.1.0 Introduced on the S-Series. Version 7.7.1.0 Introduced on the C-Series. Version 7.2.1.0 Introduced.
Usage Information	When you enable soft-reconfiguration for a neighbor and you execute the <code>clear ip bgp soft in</code> command, the update database stored in the router is replayed and updates are re-evaluated. With this command, the replay and update process is triggered only if route-refresh request is not negotiated with the peer. If the request is indeed negotiated (after executing the <code>clear ip bgp soft in</code> command), BGP sends a route-refresh request to the neighbor and receives all of the peer's updates.
Related Commands	<code>clear ip bgp</code> — activates inbound policies without resetting the BGP TCP session.

capture bgp-pdu max-buffer-size

Set the size of the BGP packet capture buffer. This buffer size pertains to both IPv4 and IPv6 addresses.

C-Series, E-Series

Syntax	<code>capture bgp-pdu max-buffer-size 100-102400000</code>
Parameters	100-102400000 Enter a size for the capture buffer.
Defaults	40960000 bytes
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.5.1.0 Introduced
Related Commands	<ul style="list-style-type: none">show capture bgp-pdu neighbor – configures a route reflector and clients.capture bgp-pdu neighbor – enables capture of an IPv4 BGP neighbor packet.

capture bgp-pdu neighbor (ipv6)

Enable capture of an IPv6 BGP neighbor packet.

C-Series, E-Series

Syntax	<code>capture bgp-pdu neighbor ipv6-address direction {both rx tx}</code> To disable capture of the IPv6 BGP neighbor packet, use the <code>no capture bgp-pdu neighbor ipv6-address</code> command.
Parameters	ipv6-address Enter the IPv6 address of the target BGP neighbor. direction {both rx tx} Enter the keyword <code>direction</code> and a direction— either <code>rx</code> for inbound, <code>tx</code> for outbound, or <code>both</code> .
Defaults	Not configured.
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.5.1.0 Introduced
Related Commands	<ul style="list-style-type: none">clear ip bgp – enables route reflection between route reflector and clients.show capture bgp-pdu neighbor – configures a route reflector and clients.capture bgp-pdu neighbor – enables capture of an IPv4 BGP neighbor packet.

clear ip bgp ipv6-address

Reset BGP sessions specific to an IPv6 address on the E-Series. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

C-Series, E-Series

Syntax	<pre>clear ip bgp ipv6-address [flap-statistics ipv4 {multicast {flap-statistics soft {in out}} unicast {flap-statistics soft {in out}} ipv6 unicast {flap-statistics soft {in out}} soft [in out]</pre>
Parameters	<p>ipv6-address Enter an IPv6 address to reset neighbors belonging to that IP. Used without a qualifier, the keyword resets all neighbors belonging to that IP.</p> <p>flap-statistics (OPTIONAL) Enter the keywords <code>flap-statistics</code> to clear all flap statistics belonging to that AS or a specified address family within that IP.</p> <p>ipv4 (OPTIONAL) Enter the keyword <code>ipv4</code> to select options for that address family.</p> <p>ipv6 (OPTIONAL) Enter the keyword <code>ipv6</code> to select options for that address family.</p> <p>unicast (OPTIONAL) Enter the keyword <code>unicast</code> to select the unicast option within the selected address family.</p> <p>multicast (OPTIONAL) Enter the keyword <code>multicast</code> to select the multicast option within the selected address family. Multicast is supported on IPv4 only</p> <p>soft (OPTIONAL) Enter the keyword <code>soft</code> to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration. NOTE: If you enter <code>clear ip bgp ip6-address soft</code>, both inbound and outbound policies are reset.</p> <p>in (OPTIONAL) Enter the keyword <code>in</code> to activate only inbound policies.</p> <p>out (OPTIONAL) Enter the keyword <code>out</code> to activate only outbound policies.</p>
Command Modes	EXEC Privilege
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>

clear ip bgp * (asterisk)

Reset all BGP sessions in the specified category on the E-Series. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

C-Series, E-Series

Syntax	<pre>clear ip bgp * [ipv4 multicast soft [in out] ipv6 unicast soft [in out] soft [in out]]</pre>
Parameters	<p>* Enter an asterisk (<code>*</code>) to reset all BGP sessions.</p> <p>ipv4 multicast soft [in out] (OPTIONAL) This keyword sequence sets options within the a specified IPv4 address family.</p> <p>ipv6 unicast soft [in out] (OPTIONAL) This keyword sequence sets options within the a specified IPv6 address family.</p> <p>soft (OPTIONAL) Enter the keyword <code>soft</code> to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.</p>

NOTE: If you enter `clear ip bgp ip6-address soft`, both inbound and outbound policies are reset.

in (OPTIONAL) Enter the keyword `in` to activate only inbound policies.
out (OPTIONAL) Enter the keyword `out` to activate only outbound policies.

Command Modes EXEC Privilege

Command History
Version 8.2.1.0 Introduced on the E-Series ExaScale.
Version 7.4.1.0 Introduced

clear ip bgp as-number

Reset BGP sessions on the E-Series. The `soft` parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

C-Series, E-Series

Syntax `clear ip bgp as-number [flap-statistics | ipv4 {multicast {flap-statistics | soft {in | out}} | unicast {flap-statistics | soft {in | out}} | ipv6 unicast {flap-statistics | soft {in | out}} | soft [in | out]`

Parameters

- as-number** Enter an autonomous system (AS) number to reset neighbors belonging to that AS. If used without a qualifier, the keyword resets all neighbors belonging to that AS. The range is 1 to 65535.
- flap-statistics** (OPTIONAL) Enter the keywords `flap-statistics` to clear all flap statistics belonging to that AS or a specified address family within that AS.
- ipv4** (OPTIONAL) Enter the keyword `ipv4` to select options for that address family.
- ipv6** (OPTIONAL) Enter the keyword `ipv6` to select options for that address family.
- unicast** (OPTIONAL) Enter the keyword `unicast` to select the unicast option within the selected address family.
- multicast** (OPTIONAL) Enter the keyword `multicast` to select the multicast option within the selected address family. Multicast is supported on IPv4 only.
- soft** (OPTIONAL) Enter the keyword `soft` to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.
- in** (OPTIONAL) Enter the keyword `in` to activate only inbound policies.
- out** (OPTIONAL) Enter the keyword `out` to activate only outbound policies.

Command Modes EXEC Privilege

Command History
Version 8.2.1.0 Introduced on the E-Series ExaScale.
Version 7.4.1.0 Introduced

clear ip bgp ipv6 dampening

Clear information on route dampening and return suppressed route to active state.

Z9500

Syntax	<code>clear ip bgp ipv6 unicast dampening [ipv6-address]</code>
Parameters	<p>ipv6-address Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.</p> <p> NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p>
Command Modes	EXEC Privilege
Command History	<p>Version 9.2(1.0) Introduced on the Z9500.</p> <p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	After you enter this command, the software deletes history routes and returns suppressed routes to active state.

clear ip bgp ipv6 flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

C-Series, E-Series

Syntax	<code>clear ip bgp ipv6 unicast flap-statistics [ipv6-address filter-list as-path-name regexp regular-expression]</code>
Parameters	<p>ipv6-address (OPTIONAL) Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.</p> <p> NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p>filter-list as-path-name (OPTIONAL) Enter the keywords <code>filter-list</code> followed by the name of a configured AS-PATH list.</p> <p>regexp regular-expression (OPTIONAL) Enter the keyword <code>regexp</code> followed by regular expressions. Use one or a combination of the following:</p> <ul style="list-style-type: none">. (period) matches on any single character, including white space.* (asterisk) matches on sequences in a pattern (zero or more sequences).+ (plus sign) matches on sequences in a pattern (one or more sequences).? (question mark) matches sequences in a pattern (0 or 1 sequences).[] (brackets) matches a range of single-character patterns.^ (caret) matches the beginning of the input string. (If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.)\$ (dollar sign) matches the end of the output string.
Command Modes	EXEC Privilege
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p>

Version 7.4.1.0 Introduced

Usage Information

If you enter `clear ip bgp flap-statistics` without any parameters, all statistics are cleared.

Related Commands

`show ip bgp ipv6 unicast flap-statistics` – views BGP flap statistics.

clear ip bgp ipv6 unicast

Reset MBGP sessions.

E-Series

Syntax

```
clear ip bgp ipv6 unicast * ipv6-address prefix-length [dampening | flap-statistics] peer-group]
```

Parameters

- *** Enter the character * to clear all peers.
- ipv6-address prefix-length*** Enter the IPv6 address in the x:x:x::x format followed by the prefix length in the /x format. The range is /0 to /128.
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.
- dampening** (OPTIONAL) Enter the keyword `dampening` to clear route flap dampening information.
- flap-statistics** (OPTIONAL) Enter the keywords `flap-statistics` to reset the flap statistics on all prefixes from that neighbor.
- peer-group** (OPTIONAL) Enter the keywords `peer-group` to clear all members of a peer-group.

Command Modes EXEC Privilege

Command History **Version 7.4.1.0** Introduced

clear ip bgp ipv6 unicast dampening

Clear information on route dampening.

E-Series

Syntax

```
clear ip bgp dampening ipv6 unicast [network network-mask]
```

Parameters

- network*** (OPTIONAL) Enter the IPv6 network address in x:x:x::x format.
- network-mask*** If you enter the network address, then enter the network mask, from 0 to 128.

Command Modes EXEC Privilege

Command History **Version 7.4.1.0** Introduced

clear ip bgp ipv6 unicast flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

E-Series

Syntax	<code>clear ip bgp ipv6 unicast flap-statistics [<i>network</i> <i>filter-list list</i> <i>regexp regexp</i>]</code>	
Parameters	<i>network</i>	(OPTIONAL) Enter the IPv6 network address in x:x:x::x format to clear flap statistics.
	<i>filter-list list</i>	(OPTIONAL) Enter the keywords <code>filter-list</code> followed by the name of a configured AS-PATH list A maximum of 16 characters.
	<i>regexp regexp</i>	(OPTIONAL) Enter the keyword <code>regexp</code> followed by regular expressions. Use one or a combination of the following: <ul style="list-style-type: none">• <code>.</code> (period) matches on any single character, including white space.• <code>*</code> (asterisk) matches on sequences in a pattern (zero or more sequences).• <code>+</code> (plus sign) matches on sequences in a pattern (one or more sequences).• <code>?</code> (question mark) matches sequences in a pattern (0 or 1 sequences).• <code>[]</code> (brackets) matches a range of single-character patterns.• <code>^</code> (caret) matches the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.• <code>\$</code> (dollar sign) matches the end of the output string.
Command Modes	EXEC Privilege	
Command History	Version 7.4.1.0	Introduced

debug ip bgp keepalives

Allows you to view information about BGP keepalive messages.

C-Series, E-Series

Syntax	<code>debug ip bgp [<i>ipv6-address</i> <i>peer-group peer-group-name</i>] keepalives [<i>in</i> <i>out</i>]</code>	
	To disable debugging, use the <code>no debug ip bgp [<i>ip-address</i> <i>peer-group peer-group-name</i>] keepalives [<i>in</i> <i>out</i>]</code> command.	
Parameters	<i>ipv6-address</i>	(OPTIONAL) Enter the IPv6 address in the x:x:x::x format followed by the prefix length in the /x format. The range is /0 to /128.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	<i>peer-group peer-group-name</i>	(OPTIONAL) Enter the keywords <code>peer-group</code> followed by the name of the peer group.
	<i>in</i>	(OPTIONAL) Enter the keyword <code>in</code> to view only information on inbound keepalive routes.
	<i>out</i>	(OPTIONAL) Enter the keyword <code>out</code> to view only information on outbound keepalive routes.
Command Modes	EXEC Privilege	

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	Enter the <code>no debug ip bgp</code> command to remove all configured debug commands for BGP.	

debug ip bgp ipv6 dampening

View information on IPv6 routes being dampened.

C-Series, E-Series

Syntax	<code>debug ip bgp ipv6 unicast dampening [in out]</code> To disable debugging, use the <code>no debug ip bgp ipv6 unicast dampening</code> command.	
Parameters	in	(OPTIONAL) Enter the keyword <code>in</code> to view only information on inbound dampened routes.
	out	(OPTIONAL) Enter the keyword <code>out</code> to view only information on outbound dampened routes.
Command Modes	EXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	Enter the <code>no debug ip bgp</code> command to remove all configured debug commands for BGP.	
Related Commands	show ip bgp dampened-paths – View BGP dampened routes.	

debug ip bgp ipv6 unicast peer-group updates

View information about BGP peer-group updates.

E-Series

Syntax	<code>debug ip bgp ipv6 unicast peer-group <i>peer-group-name</i> updates [in out]</code> To disable debugging, use the <code>no debug ip bgp ipv6 unicast peer-group <i>peer-group-name</i> updates [in out]</code> command.	
Parameters	peer-group <i>peer-group-name</i>	Enter the keywords <code>peer-group</code> followed by the name of the peer-group.
	updates	Enter the keyword <code>updates</code> to view BGP update information.
	in	(OPTIONAL) Enter the keyword <code>in</code> to view only BGP updates received from neighbors.
	out	(OPTIONAL) Enter the keyword <code>out</code> to view only BGP updates sent to neighbors.
Command Modes	EXEC Privilege	
Command History	Version 7.4.1.0	Introduced

debug ip bgp ipv6 unicast dampening

View information on routes being dampened.

E-Series

Syntax	<code>debug ip bgp ipv6 unicast dampening</code> To disable debugging, use the <code>no debug ip bgp ipv6 unicast dampening</code> command.
Parameters	dampening Enter the keyword <code>dampening</code> to clear route flap dampening information.
Command Modes	EXEC Privilege
Command History	Version 7.4.1.0 Introduced

debug ip bgp ipv6 unicast updates

View information about BGP updates.

E-Series

Syntax	<code>debug ip bgp ipv6 unicast <i>ipv6-address prefix-length</i> updates [in out]</code> To disable debugging, use the <code>no debug ip bgp ipv6 unicast <i>ipv6-address prefix-length</i> updates [in out]</code> command.
Parameters	<i>ipv6-address</i> <i>prefix-length</i> Enter the IPv6 address in the <code>x:x:x:x</code> format followed by the prefix length in the <code>/x</code> format. The range is <code>/0</code> to <code>/128</code> .  NOTE: The <code>::</code> notation specifies successive hexadecimal fields of zeros.
	updates Enter the keyword <code>updates</code> to view BGP update information.
	in (OPTIONAL) Enter the keyword <code>in</code> to view only BGP updates received from neighbors.
	out (OPTIONAL) Enter the keyword <code>out</code> to view only BGP updates sent to neighbors.
Defaults	Disabled.
Command Modes	EXEC Privilege
Command History	Version 7.4.1.0 Introduced

debug ip bgp notifications

Allows you to view information about BGP notifications received from neighbors.

C-Series, E-Series

Syntax	<code>debug ip bgp [<i>ipv6-address</i> peer-group <i>peer-group-name</i>] notifications [in out]</code> To disable debugging, use the <code>no debug ip bgp [<i>ip-address</i> peer-group <i>peer-group-name</i>] notifications [in out]</code> command.
---------------	--

Parameters	ipv6-address	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	peer-group <i>peer-group-name</i>	(OPTIONAL) Enter the keywords <code>peer-group</code> followed by the name of the peer group.
	in	(OPTIONAL) Enter the keyword <code>in</code> to view BGP notifications received from neighbors.
	out	(OPTIONAL) Enter the keyword <code>out</code> to view BGP notifications sent to neighbors.
Command Modes	EXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	Enter the <code>no debug ip bgp</code> command to remove all configured debug commands for BGP.	

debug ip bgp updates

Allows you to view information about BGP updates.

C-Series, E-Series

Syntax	<code>debug ip bgp [<i>ipv6-address</i> peer-group <i>peer-group-name</i> ipv6 unicast [<i>ipv6-address</i>]] updates [in out prefix-list <i>prefix-list-name</i>]</code>	
	To disable debugging, use the <code>no debug ip bgp [<i>ip-address</i> peer-group <i>peer-group-name</i> ipv6 unicast [<i>ipv6-address</i>]] updates [in out]</code> command.	
Parameters	ipv6-address	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	peer-group <i>peer-group-name</i>	(OPTIONAL) Enter the keywords <code>peer-group</code> followed by the name of the peer group.
	in	(OPTIONAL) Enter the keyword <code>in</code> to view BGP updates received from neighbors.
	out	(OPTIONAL) Enter the keyword <code>out</code> to view BGP notifications updates sent to neighbors.
Command Modes	EXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	Enter the <code>no debug ip bgp</code> command to remove all configured debug commands for BGP.	

default-metric

Allows you to change the metrics of redistributed routes to locally originated routes. Use this command with the `redistribute` command.

C-Series, E-Series

Syntax	<code>default-metric number</code> To return to the default setting, use the <code>no default-metric</code> command.
Parameters	number Enter a number as the metric to be assigned to routes from other protocols. The range is 1 to 4294967295.
Defaults	0
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	The <code>default-metric</code> command in BGP sets the value of the BGP MULTI_EXIT_DISC (MED) attribute for redistributed routes only.
Related Commands	<ul style="list-style-type: none">• bgp always-compare-med – enables comparison of all BGP MED attributes.• redistribute – redistributes routes from other routing protocols into BGP.

description

Enter a description of the BGP routing protocol.

C-Series, E-Series

Syntax	<code>description {description}</code> To remove the description, use the <code>no description {description}</code> command.
Parameters	description Enter a description to identify the BGP protocol (80 characters maximum).
Defaults	none
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Related Commands	router bgp – Enter ROUTER mode on the switch.

distance bgp

Configure three administrative distances for routes.

C-Series, E-Series

Syntax	<code>distance bgp external-distance internal-distance local-distance</code>
---------------	--

To return to default values, use the `no distance bgp` command.

Parameters	<p><i>external-distance</i> Enter a number to assign to routes learned from a neighbor external to the AS. The range is 1 to 255. The default is 20.</p> <p><i>internal-distance</i> Enter a number to assign to routes learned from a router within the AS. The range is 1 to 255. The default is 200.</p> <p><i>local-distance</i> Enter a number to assign to routes learned from networks listed in the <code>network</code> command. The range is 1 to 255. The default is 200.</p>
Defaults	<ul style="list-style-type: none">• <code>external-distance = 20</code>• <code>internal-distance = 200</code>• <code>local-distance = 200</code>
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	<p> CAUTION: Dell Force10 recommends that you do not change the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.</p> <p>The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table.</p> <p>Routes from confederations are treated as internal BGP routes.</p>

ipv6 prefix-list

Configure an IPv6 prefix list.

Syntax	<code>ipv6 prefix-list prefix-list name</code>												
Parameters	<p><i>prefix-list name</i> Enter the name of the prefix list.</p> <p> NOTE: There is a 140-character limit for prefix list names.</p>												
Defaults	none												
Command Modes	CONFIGURATION												
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .												
	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.8(0.0P5)</td><td>Introduced on the S4048-ON.</td></tr><tr><td>9.8(0.0P2)</td><td>Introduced on the S3048-ON.</td></tr><tr><td>9.0.0.0</td><td>Introduced on the Z9000.</td></tr><tr><td>8.3.19.0</td><td>Introduced on the S4820T.</td></tr><tr><td>8.3.10.0</td><td>Introduced on the S4810.</td></tr></tbody></table>	Version	Description	9.8(0.0P5)	Introduced on the S4048-ON.	9.8(0.0P2)	Introduced on the S3048-ON.	9.0.0.0	Introduced on the Z9000.	8.3.19.0	Introduced on the S4820T.	8.3.10.0	Introduced on the S4810.

maximum-paths

Configure the maximum number of parallel routes (multipath support) BGP supports.

C-Series, E-Series

Syntax	<code>maximum-paths {ebgp ibgp} number</code> To return to the default values, use the <code>no maximum-paths</code> command.						
Parameters	<table><tr><td>ebgp</td><td>Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes.</td></tr><tr><td>ibgp</td><td>Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes</td></tr><tr><td>number</td><td>Enter a number as the maximum number of parallel paths. The range is 1 to 16. The default is 1.</td></tr></table>	ebgp	Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes.	ibgp	Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes	number	Enter a number as the maximum number of parallel paths. The range is 1 to 16. The default is 1 .
ebgp	Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes.						
ibgp	Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes						
number	Enter a number as the maximum number of parallel paths. The range is 1 to 16. The default is 1 .						
Defaults	1						
Command Modes	ROUTER BGPV6-ADDRESS FAMILY						
Command History	<table><tr><td>Version 8.2.1.0</td><td>Introduced on the E-Series ExaScale.</td></tr><tr><td>Version 7.4.1.0</td><td>Introduced</td></tr></table>	Version 8.2.1.0	Introduced on the E-Series ExaScale.	Version 7.4.1.0	Introduced		
Version 8.2.1.0	Introduced on the E-Series ExaScale.						
Version 7.4.1.0	Introduced						
Usage Information	If you enable this command, use the <code>clear ip bgp</code> command to recompute the best path.						

neighbor activate

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} activate</code> To disable, use the <code>no neighbor {ipv6-address peer-group-name} activate</code> command.						
Parameters	<table><tr><td>ipv6-address</td><td>Enter the IPv6 address in the x:x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</td></tr><tr><td>peer-group-name</td><td>Identify a peer group by name.</td></tr><tr><td>activate</td><td>Enter the keyword <code>activate</code> to enable the identified neighbor or peer group in the new AFI/SAFI.</td></tr></table>	ipv6-address	Enter the IPv6 address in the x:x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.	peer-group-name	Identify a peer group by name.	activate	Enter the keyword <code>activate</code> to enable the identified neighbor or peer group in the new AFI/SAFI.
ipv6-address	Enter the IPv6 address in the x:x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.						
peer-group-name	Identify a peer group by name.						
activate	Enter the keyword <code>activate</code> to enable the identified neighbor or peer group in the new AFI/SAFI.						
Defaults	Disabled.						
Command Modes	ROUTER BGPV6-ADDRESS FAMILY						
Command History	<table><tr><td>Version 8.2.1.0</td><td>Introduced on the E-Series ExaScale.</td></tr><tr><td>Version 7.4.1.0</td><td>Introduced</td></tr></table>	Version 8.2.1.0	Introduced on the E-Series ExaScale.	Version 7.4.1.0	Introduced		
Version 8.2.1.0	Introduced on the E-Series ExaScale.						
Version 7.4.1.0	Introduced						
Usage Information	By default, when you create a neighbor/peer group configuration in the Router BGP context, it is enabled for the IPv6/Unicast AFI/SAFI. By using <code>activate</code> in the new context, the neighbor/peer group is enabled for AFI/SAFI.						

neighbor advertisement-interval

Set the advertisement interval between BGP neighbors or within a BGP peer group.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} advertisement-interval seconds</code> To return to the default value, use the <code>no neighbor {ipv6-address peer-group-name} advertisement-interval</code> command.
Parameters	<p>ipv6-address Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p>peer-group-name Enter the name of the peer group to set the advertisement interval for all routers in the peer group.</p> <p>seconds Enter a number as the time interval, in seconds, between BGP advertisements. The range is 0 to 600 seconds. The default is 5 seconds for internal BGP peers and 30 seconds for external BGP peers.</p>
Defaults	<ul style="list-style-type: none">• <code>seconds = 5 seconds</code> (internal peers)• <code>seconds = 30 seconds</code> (external peers)
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>

neighbor allows-in

Set the number of times an AS number can occur in the AS path.

C-Series, E-Series

Syntax	<code>neighbor {ip-address peer-group-name} allows-in number</code> To return to the default value, use the <code>no neighbor {ip-address peer-group-name} allows-in</code> command.
Parameters	<p>ipv6-address Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p>peer-group-name Enter the name of the peer group to set the advertisement interval for all routers in the peer group.</p> <p>number Enter a number of times to allow this neighbor ID to use the AS path. The range is 1 to 10.</p>
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Related Commands	bgp four-octet-as-support – enables 4-Byte support for the BGP process.

neighbor default-originate

Inject the default route to a BGP peer or neighbor.

C-Series, E-Series

Syntax	<code>neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} default-originate [<i>route-map map-name</i>]</code> To remove a default route, use the <code>no neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} default-originate [<i>route-map map-name</i>]</code> command.						
Parameters	<table><tr><td><i>ipv6-address</i></td><td>Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</td></tr><tr><td><i>peer-group-name</i></td><td>Enter the name of the peer group to set the advertisement interval for all routers in the peer group.</td></tr><tr><td><i>route-map map-name</i></td><td>(OPTIONAL) Enter the keywords <code>route-map</code> followed by the name of a configured route map.</td></tr></table>	<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.	<i>peer-group-name</i>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.	<i>route-map map-name</i>	(OPTIONAL) Enter the keywords <code>route-map</code> followed by the name of a configured route map.
<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.						
<i>peer-group-name</i>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.						
<i>route-map map-name</i>	(OPTIONAL) Enter the keywords <code>route-map</code> followed by the name of a configured route map.						
Defaults	Not configured.						
Command Modes	ROUTER BGPV6-ADDRESS FAMILY						
Command History	<table><tr><td>Version 8.2.1.0</td><td>Introduced on the E-Series ExaScale.</td></tr><tr><td>Version 7.4.1.0</td><td>Introduced</td></tr></table>	Version 8.2.1.0	Introduced on the E-Series ExaScale.	Version 7.4.1.0	Introduced		
Version 8.2.1.0	Introduced on the E-Series ExaScale.						
Version 7.4.1.0	Introduced						
Usage Information	If you apply a route map to a BGP peer or neighbor with the <code>neighbor default-originate</code> command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.						

neighbor description

Assign a character string describing the neighbor or group of neighbors (peer group).

C-Series, E-Series

Syntax	<code>neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} description <i>text</i></code> To delete a description, use the <code>no neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} description <i>text</i></code> command.						
Parameters	<table><tr><td><i>ipv6-address</i></td><td>Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</td></tr><tr><td><i>peer-group-name</i></td><td>Enter the name of the peer group to set the advertisement interval for all routers in the peer group.</td></tr><tr><td><i>text</i></td><td>Enter a continuous text string up to 80 characters.</td></tr></table>	<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.	<i>peer-group-name</i>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.	<i>text</i>	Enter a continuous text string up to 80 characters.
<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.						
<i>peer-group-name</i>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.						
<i>text</i>	Enter a continuous text string up to 80 characters.						
Defaults	Not configured.						
Command Modes	ROUTER BGP						
Command History	<table><tr><td>Version 8.2.1.0</td><td>Introduced on the E-Series ExaScale.</td></tr><tr><td>Version 7.4.1.0</td><td>Introduced</td></tr></table>	Version 8.2.1.0	Introduced on the E-Series ExaScale.	Version 7.4.1.0	Introduced		
Version 8.2.1.0	Introduced on the E-Series ExaScale.						
Version 7.4.1.0	Introduced						

neighbor distribute-list

Distribute BGP information via an established prefix list.

C-Series, E-Series

Syntax	<code>neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} distribute-list <i>prefix-list-name</i> {in out}</code> To delete a neighbor distribution list, use the <code>no neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} distribute-list <i>prefix-list-name</i> {in out}</code> command.
Parameters	<p><i>ipv6-address</i> Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p><i>peer-group-name</i> Enter the name of the peer group.</p> <p><i>prefix-list-name</i> Enter the name of an established prefix list. If you do not configure the prefix list, the default is <code>permit</code> (to allow all routes).</p> <p>in Enter the keyword <code>in</code> to distribute only inbound traffic.</p> <p>out Enter the keyword <code>out</code> to distribute only outbound traffic.</p>
Defaults	Not configured.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	Other BGP filtering commands include the <code>neighbor filter-list</code> and <code>neighbor route-map</code> commands.
Related Commands	<ul style="list-style-type: none">• neighbor filter-list – assigns a AS-PATH list to a neighbor or peer group.• neighbor route-map – assigns a route map to a neighbor or peer group.

neighbor ebgp-multihop

Attempt and accept BGP connections to external peers on networks that are not directly connected.

C-Series, E-Series

Syntax	<code>neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} ebgp-multihop [<i>ttl</i>]</code> To disallow and disconnect connections, use the <code>no neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} ebgp-multihop [<i>ttl</i>]</code> command.
Parameters	<p><i>ipv6-address</i> Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p><i>peer-group-name</i> Enter the name of the peer group.</p> <p><i>ttl</i> (OPTIONAL) Enter the number of hops as the time to live (ttl) value. The range is 1 to 255. The default is 255.</p>
Defaults	Disabled.
Command Modes	ROUTER BGP

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

Usage Information To prevent loops, the `neighbor ebgp-multihop` command does not install default routes of the multihop peer. Networks not directly connected are not considered valid for best path selection.

neighbor fall-over

Enable or disable fast fall-over for BGP neighbors.

C-Series, E-Series

Syntax `neighbor {ipv6-address | peer-group-name} fall-over`
 To disable, use the `no neighbor {ipv6-address | peer-group-name} fall-over` command.

Parameters

ipv6-address Enter the IPv6 address in the x:x:x::x format.
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

peer-group-name Enter the name of the peer group.

Defaults Disabled.

Command Modes ROUTER BGP

Command History

Version 8.2.1.0	Introduced on the E-Series ExaScale.
Version 7.4.1.0	Introduced

Usage Information When you enable fall-over, BGP keeps track of IP or IPv6 reachability to the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

Related Commands [show ip bgp neighbors](#) – displays information on the BGP neighbors.

neighbor filter-list

Configure a BGP filter based on the AS-PATH attribute.

C-Series, E-Series

Syntax `neighbor {ipv6-address | peer-group-name} filter-list as-path-name {in | out}`
 To delete a BGP filter, use the `no neighbor {ipv6-address | peer-group-name} filter-list as-path-name {in | out}` command.

Parameters

ipv6-address Enter the IPv6 address in the x:x:x::x format.
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

peer-group-name Enter the name of the peer group to apply the filter to all routers in the peer group.

as-path-name Enter the name of an established AS-PATH access list. If you do not configure the AS-PATH access list, the default is `permit` (to allow routes). The maximum is 16 characters.

in Enter the keyword `in` to filter inbound BGP routes.
out Enter the keyword `out` to filter outbound BGP routes.

Defaults Not configured.

Command Modes ROUTER BGPV6-ADDRESS FAMILY

Command History
Version 8.2.1.0 Introduced on the E-Series ExaScale.
Version 7.4.1.0 Introduced

neighbor maximum-prefix

Control the number of network prefixes received.

C-Series, E-Series

Syntax `neighbor {ipv6-address | peer-group-name} maximum-prefix maximum [threshold] [warning-only]`

To return to the default values, use the `no neighbor {ipv6-address | peer-group-name} maximum-prefix maximum [threshold] [warning-only]` command.

Parameters

- ipv6-address** Enter the IPv6 address in the x:x:x:x format.
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.
- peer-group-name** Enter the name of the peer group.
- maximum** Enter a number as the maximum number of prefixes allowed for this BGP router. The range is 1 to 4294967295.
- threshold** (OPTIONAL) Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is 1 to 100 percent. The default is **75**.
- warning-only** (OPTIONAL) Enter the keywords `warning-only` to set the router to send a log message when the maximum value is reached. If you do not set this parameter, the router stops peering when the maximum number of prefixes is reached.

Defaults `threshold = 75`

Command Modes ROUTER BGPV6-ADDRESS FAMILY

Command History
Version 8.2.1.0 Introduced on the E-Series ExaScale.
Version 7.4.1.0 Introduced

Usage Information If you configure the `neighbor maximum-prefix` command and the neighbor receives more prefixes than allowed by the `neighbor maximum-prefix` command configuration, the neighbor goes down and the `show ip bgp summary` command displays (*prfxd*) in the State/PfxRcd column for that neighbor. The neighbor remains down until you enter the `clear ip bgp` command for the neighbor or the peer group to which the neighbor belongs or you enter the `neighbor shutdown` and `neighbor no shutdown` commands.

Related Commands [show ip bgp summary](#) – displays the current BGP configuration.

neighbor next-hop-self

Allows you to configure the router as the next hop for a BGP neighbor. (This command is used for IBGP).

C-Series, E-Series

Syntax	<code>neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} next-hop-self</code> To return to the default setting, use the <code>no neighbor {<i>ipv6-address</i> <i>peer-group-name</i>} next-hop-self</code> command.
Parameters	<p><i>ipv6-address</i> Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p><i>peer-group-name</i> (OPTIONAL) Enter the name of the peer group.</p>
Defaults	Disabled.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	If you configure the <code>set ipv6 next-hop</code> command in ROUTE-MAP mode, its configuration takes precedence over the <code>neighbor next-hop-self</code> (C-, E-, and S-Series) command.

neighbor peer-group (assigning peers)

Allows you to assign one peer to a existing peer group.

C-Series, E-Series

Syntax	<code>neighbor <i>ipv6-address</i> peer-group <i>peer-group-name</i></code> To delete a peer from a peer group, use the <code>no neighbor <i>ipv6-address</i> peer-group <i>peer-group-name</i></code> command.
Parameters	<p><i>ipv6-address</i> Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p><i>peer-group peer-group-name</i> Enter the keywords <code>peer-group</code> followed by the name of a configured peer group. The maximum is 16 characters.</p>
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	<p>You can assign up to 64 peers to one peer group.</p> <p>When you add a peer to a peer group, it inherits all the peer group's configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:</p> <ul style="list-style-type: none">• neighbor advertisement-interval• neighbor distribute-list• neighbor route-map

- [neighbor route-reflector-client](#)
- [neighbor send-community](#)

A neighbor may keep its configuration after it was added to a peer group if the neighbor's configuration is more specific than the peer group's, and the neighbor's configuration does not affect outgoing updates.

A peer group must exist before you add a peer to it. If the peer group is disabled (shutdown), the peers within the group are also disabled (shutdown).

Related Commands

- [clear ip bgp](#) – resets BGP sessions.
- [neighbor peer-group \(creating group\)](#) – creates a peer group.
- [show ip bgp peer-group](#) – view BGP peers.
- [show ip bgp neighbors](#) show ip bgp neighbors View BGP neighbors configurations.

neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

C-Series, E-Series

Syntax	<code>neighbor peer-group-name peer-group</code> To delete a peer group, use the <code>no neighbor peer-group-name peer-group</code> command.
Parameters	peer-group-name Enter a text string up to 16 characters long as the name of the peer group.
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	When a peer group is created, it is disabled (shut mode).
Related Commands	<ul style="list-style-type: none"> • neighbor peer-group (assigning peers) – assigns routers to a peer group. • neighbor remote-as – assigns an indirectly connected AS to a neighbor or peer group. • neighbor shutdown – disables a peer or peer group.

neighbor peer-group passive

Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

C-Series, E-Series

Syntax	<code>neighbor peer-group-name peer-group passive</code> To delete a passive peer-group, use the <code>no neighbor peer-group-name peer-group passive</code> command.
Parameters	peer-group-name Enter a text string up to 16 characters long as the name of the peer group.
Defaults	Not configured.
Command Modes	ROUTER BGP
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information

After you configure a peer group as passive, you must assign it a subnet using the `neighbor subnet` command.

Related Commands

`neighbor subnet` – assigns a subnet to a dynamically-configured BGP neighbor.

neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

C-Series, E-Series

Syntax

`neighbor {ipv6-address | peer-group-name} remote-as number`

To delete a remote AS entry, use the `no neighbor {ipv6-address | peer-group-name} remote-as number` command.

Parameters

ipv6-address Enter the IPv6 address in the x:x:x:x::x format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

peer-group-name Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group.

number Enter a number of the AS. The range is 1 to 65535.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information

If the number parameter is the same as the AS number used in the `router bgp` command, the remote AS entry in the neighbor is considered an internal BGP peer entry.

This command creates a peer and the newly created peer is disabled (shutdown).

Related Commands

`router bgp` – Enter ROUTER BGP mode and configure routes in an AS.

neighbor remove-private-as

Remove private AS numbers from the AS-PATH of outgoing updates.

C-Series, E-Series

Syntax

`neighbor {ipv6-address | peer-group-name} remove-private-as`

To return to the default, use the `no neighbor {ipv6-address | peer-group-name} remove-private-as` command.

Parameters

ipv6-address Enter the IPv6 address in the x:x:x:x::x format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

peer-group-name Enter the name of the peer group to remove the private AS numbers.

Defaults	Disabled (that is, private AS number are not removed).
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale.
	Version 7.4.1.0 Introduced
Usage Information	Applies to EBGp neighbors only.
	If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGp neighbor, the private AS numbers are not removed.
	If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path. Private AS numbers are 64512 to 65535.

neighbor route-map

Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} route-map map-name {in out}</code> To remove the route map, use the <code>no neighbor {ipv6-address peer-group-name} route-map map-name {in out}</code> command.
Parameters	ipv6-address Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	peer-group-name Enter the name of the peer group.
	map-name Enter the name of an established route map. If you do not configure the Route map, the default is <code>deny</code> (to drop all routes).
	in Enter the keyword <code>in</code> to filter inbound routes.
	out Enter the keyword <code>out</code> to filter outbound routes.
Defaults	Not configured.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale.
	Version 7.4.1.0 Introduced
Usage Information	When you apply a route map to outbound routes, only routes that match at least one section of the route map are permitted.
	If you identify a peer group by name, the peers in that peer group inherit the characteristics in the Route map used in this command. If you identify a peer by IP address, the Route map overwrites either the inbound or outbound policies on that peer.

neighbor route-reflector-client

Configure a neighbor as a member of a route reflector cluster.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} route-reflector-client</code> To indicate that the neighbor is not a route reflector client or to delete a route reflector configuration, use the <code>no neighbor {ipv6-address peer-group-name} route-reflector-client</code> command.
Parameters	<p>ipv6-address Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p>peer-group-name Enter the name of the peer group. All routers in the peer group receive routes from a route reflector.</p>
Defaults	Not configured.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	<p>The first time you enter this command it configures the neighbor as a route reflector and members of the route-reflector cluster. Internal BGP (IBGP) speakers do not need to be fully meshed if you configure a route reflector.</p> <p>When all clients of a route reflector are disabled, the neighbor is no longer a route reflector.</p>

neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} send-community</code> To disable sending a COMMUNITY attribute, use the <code>no neighbor {ipv6-address peer-group-name} send-community</code> command.
Parameters	<p>ipv6-address Enter the IPv6 address in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p>peer-group-name Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group.</p>
Defaults	Not configured and COMMUNITY attributes are not sent to neighbors.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>

neighbor soft-reconfiguration inbound

Enable a BGP soft-reconfiguration and start storing updates for inbound IPv6 unicast routes.

Syntax	<code>neighbor {ipv4-address ipv6-address peer-group-name} soft-reconfiguration inbound</code>
Parameters	<p>ipv4-address ipv6-address Enter the IP address of the neighbor for which you want to start storing inbound routing updates.</p> <p>peer-group-name Enter the name of the peer group for which you want to start storing inbound routing updates.</p>
Defaults	Disabled.
Command Modes	ROUTER BGPv6 ADDRESS FAMILY (conf-router_bgpv6_af)
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
8.4.1.0	Added support for IPv4 multicast and IPv4 unicast address families.
8.3.19.0	Introduced on the S4820T.
7.8.1.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

Usage Information	<p>This command enables soft-reconfiguration for the specified BGP neighbor. BGP stores all updates for inbound IPv6 unicast routes the neighbor receives but does not reset the peer-session.</p> <p> CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.</p>
--------------------------	--

neighbor subnet

Enable passive peering so that the members of the peer group are dynamic.

C-Series, E-Series

Syntax	<code>neighbor peer-group-name subnet subnet-number mask</code> To remove passive peering, use the <code>no neighbor peer-group-name subnet subnet-number mask</code> command.
Parameters	<p>subnet-number Enter a subnet number in dotted decimal format (A.B.C.D.) as the allowable range of addresses included in the peer group. To allow all addresses, enter 0::0/0.</p> <p>mask Enter a prefix mask in / prefix-length format (/x).</p>
Defaults	Not configured.
Command Modes	ROUTER BGP

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

neighbor shutdown

Disable a BGP neighbor or peer group.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} shutdown</code>	
	To enable a disabled neighbor or peer group, use the <code>no neighbor {ipv6-address peer-group-name} shutdown</code> command.	
Parameters	<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	<i>peer-group-name</i>	Enter the name of the peer group to disable or enable all routers within the peer group.
Defaults	Enabled (that is, BGP neighbors and peer groups are disabled.)	
Command Modes	ROUTER BGP	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	Peers that are enabled within a peer group are disabled when their peer group is disabled. The <code>neighbor shutdown</code> command terminates all BGP sessions on the BGP neighbor or BGP peer group. Use this command with caution as it terminates the specified BGP sessions. When a neighbor or peer group is shutdown, use the <code>show ip bgp summary</code> command to confirm its status.	
Related Commands	<ul style="list-style-type: none"> • show ip bgp summary – displays the current BGP configuration. • show ip bgp neighbors – displays the current BGP neighbors. 	

neighbor timers

Set keepalive and hold time timers for a BGP neighbor or a peer group.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} timers keepalive holdtime</code>	
	To return to the default values, use the <code>no neighbor {ipv6-address peer-group-name} timers</code> command.	
Parameters	<i>ipv6-address</i>	Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	<i>peer-group-name</i>	Enter the name of the peer group to set the timers for all routers within the peer group.
	<i>keepalive</i>	Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is 1 to 65535. The default is 60 seconds .

holdtime Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is 3 to 65535. The default is **180 seconds**.

- Defaults**
- *keepalive* = **60 seconds**
 - *holdtime* = **180 seconds**

Command Modes ROUTER BGP

Command History

Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information

Timer values configured with the `neighbor timers` command override the timer values configured with the `timers bgp` command.

When two neighbors, configured with different *keepalive* and *holdtime* values, negotiate for new values, the resulting values are as follows:

- the lower of the *holdtime* values is the new *holdtime* value, and
- whichever is the lower value; one-third of the new *holdtime* value, or the configured *keepalive* value is the new *keepalive* value.

neighbor update-source

Enable the E-Series software to use Loopback interfaces for TCP connections for BGP sessions.

C-Series, E-Series

Syntax `neighbor {ipv6-address | peer-group-name} update-source loopback interface`

To use the closest interface, use the `no neighbor {ipv6-address | peer-group-name} update-source loopback interface` command.

Parameters

ipv6-address Enter the IPv6 address in the x:x:x:x format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

peer-group-name Enter the name of the peer group to disable all routers within the peer group.

loopback interface Enter the keyword `loopback` followed by a number of the loopback interface. The range is 0 to 16383.

Defaults Not configured.

Command Modes ROUTER BGP

Command History

Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information

Loopback interfaces are up constantly and the BGP session may need one interface constantly up to stabilize the session. The `neighbor update-source` command is not necessary for directly connected internal BGP sessions.

neighbor weight

Assign a weight to the neighbor connection, which is used to determine the best path.

C-Series, E-Series

Syntax	<code>neighbor {ipv6-address peer-group-name} weight weight</code> To remove a weight value, use the <code>no neighbor {ipv6-address peer-group-name} weight weight</code> command.
Parameters	<p>ipv6-address Enter the IPv6 address in the x:x:x::x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p> <p>peer-group-name Enter the name of the peer group to disable all routers within the peer group.</p> <p>weight Enter a number as the weight. The range is 0 to 65535. The default is 0.</p>
Defaults	0
Command Modes	ROUTER BGP
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	<p>In the FTOS best path selection process, the path with the highest weight value is preferred.</p> <p> NOTE: Reset the neighbor connection (the <code>clear ip bgp *</code> command) to apply the weight to the connection and recompute the best path.</p>

neighbor X:X:X::X password

Enable TCP MD5 Authentication for an IPv6 BGP peer session.

C-Series, E-Series

Syntax	<code>neighbor x:x:x::x password {7 <encrypt-pass> <clear-pass>}</code> To return to the default setting, use the <code>no neighbor x:x:x::x password</code> command.
Parameters	<p>encrypt-pass Enter the encrypted password.</p> <p>clear-pass Enter the clear text password.</p>
Defaults	Disabled.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced</p>
Usage Information	The TCP session is authentication and hence prevents the data from being compromised.

network

Specify the networks for the BGP process and enter them in the BGP routing table.

C-Series, E-Series

Syntax	<code>network ipv6-address prefix-length [route-map map-name]</code> To remove a network, use the <code>no network ip-address mask [route-map map-name]</code> command.
Parameters	<p><i>ipv6-address</i> <i>prefix-length</i> Enter the IPv6 address in the x:x:x::x format followed by the prefix length in the /x format. The range is /0 to /128.</p> <p><i>mask</i> Enter the mask of the IP address in the slash prefix length format (for example, /24). The mask appears in command outputs in dotted decimal format (A.B.C.D).</p> <p><i>route-map map-name</i> (OPTIONAL) Enter the keywords <i>route-map</i> followed by the name of an established route map. Only the following ROUTE-MAP mode commands are supported:</p> <ul style="list-style-type: none">• match ipv6 address• match ipv6 next-hop• match ipv6 route-source• set ipv6 next-hop <p>If the route map is not configured, the default is <code>deny</code> (to drop all routes).</p>
Defaults	Not configured.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	Version 8.2.1.0 Introduced on the E-Series ExaScale. Version 7.4.1.0 Introduced
Usage Information	The E-Series software resolves the network address configured by the <code>network</code> command with the routes in the main routing table to ensure that the networks are reachable via non-BGP routes and non-default routes.
Related Commands	redistribute – redistributes routes into BGP.

network backdoor

Specify this IGP route as the preferred route.

C-Series, E-Series

Syntax	<code>network ipv6-address prefix-length backdoor</code> To remove a network, use the <code>no network ipv6-address prefix-length backdoor</code> command.
Parameters	<p><i>ipv6-address</i> <i>prefix-length</i> Enter the IPv6 address in the x:x:x::x format followed by the prefix length in the /x format. The r range is /0 to /128.</p> <p>NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p>
Defaults	Not configured.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

Usage Information Though FTOS does not generate a route due to backdoor config, there is an option for injecting/ sourcing a local route in presence of network backdoor config on a learned route.

redistribute

Redistribute routes into BGP.

E-Series

Syntax `redistribute {connected | static} [route-map map-name]`
 To disable redistribution, use the `no redistribute [connected | static] [route-map map-name]` command.

Parameters

connected Enter the keyword `connected` to redistribute routes from physically connected interfaces.

static Enter the keyword `static` to redistribute manually configured routes. These routes are treated as incomplete routes.

route-map map-name (OPTIONAL) Enter the keywords `route-map` followed by the name of an established route map. Only the following ROUTE-MAP mode commands are supported:

- `match ipv6 address`
- `match ipv6 next-hop`
- `match ipv6 route-source`
- `set ipv6 next-hop`

If the route map is not configured, the default is `deny` (to drop all routes).

Defaults Not configured.

Command Modes ROUTER BGPV6-ADDRESS FAMILY

Command History **Version 7.4.1.0** Introduced

Usage Information If you do not configure the `default-metric` command in addition to the `redistribute` command, or there is no route map to set the metric, the metric for redistributed static and connected is "0".

To redistribute the default route (0::0/0), configure the `neighbor default-originate` command.

Related Commands [neighbor default-originate](#) – injects the default route.

redistribute ospf

Redistribute OSPFv3 routes into BGP.

E-Series

Syntax `redistribute ospf process-id [[match external {1 | 2}] [match internal]] [route-map map-name]`

To stop redistribution of OSPF routes, use the `no redistribute ospf process-id` command.

Parameters	<p><i>process-id</i> Enter the number of the OSPFv3 process. The range is 1 to 65535.</p> <p>match external {1 2} (OPTIONAL) Enter the keywords <code>match external</code> to redistribute OSPF external routes. You can specify 1 or 2 to redistribute those routes only.</p> <p>match internal (OPTIONAL) Enter the keywords <code>match internal</code> to redistribute OSPFv3 internal routes only.</p> <p>route-map <i>map-name</i> (OPTIONAL) Enter the keywords <code>route-map</code> followed by the name of an established route map. Only the following ROUTE-MAP mode commands are supported:</p> <ul style="list-style-type: none"> • <code>match ipv6 address</code> • <code>match ipv6 next-hop</code> • <code>match ipv6 route-source</code> • <code>set ipv6 next-hop</code> <p>If you do not configure the route map, the default is <code>deny</code> (to drop all routes).</p>
Defaults	Not configured.
Command Modes	ROUTER BGPV6-ADDRESS FAMILY
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Usage Information	When you enter the <code>redistribute ospf process-id</code> command without any other parameters, FTOS redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes.

router bgp

Enter ROUTER BGP mode to configure and enable BGP.

E-Series

Syntax	<code>router bgp <i>as-number</i></code>
	To disable BGP, use the <code>no router bgp <i>as-number</i></code> command.
Parameters	<p><i>process-id</i> Enter the number of the OSPFv3 process. The range is 1 to 65535.</p>
Defaults	Not configured.
Command Modes	CONFIGURATION
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>

show capture bgp-pdu neighbor

Display BGP packet capture information for an IPv6 address on the E-Series.

C-Series, E-Series

Syntax	<code>show capture bgp-pdu neighbor <i>ipv6-address</i></code>
Parameters	<p><i>ipv6-address</i> Enter the IPv6 address (X:X:X::X) of a BGP neighbor.</p>

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.5.1.0 Introduced

- Related Commands**
- [capture bgp-pdu neighbor](#) – enables capture of an IPv6 BGP neighbor packet.
 - [clear ip bgp](#) – specifies a size for the capture buffer.

show config

View the current ROUTER BGP configuration.

C-Series, E-Series

Syntax show config

Command Modes ROUTER BGPV6-ADDRESS FAMILY

Example

```
FTOS(conf-router_bgp)#show conf
!
router bgp 18508
 neighbor RR-CLIENT peer-group
 neighbor RR-CLIENT remote-as 18508
 neighbor RR-CLIENT no shutdown
 neighbor RR-CLIENT-PASSIV peer-group passive
 neighbor RR-CLIENT-PASSIV remote-as 18508
 neighbor RR-CLIENT-PASSIV subnet 9000::9:0/120
 neighbor RR-CLIENT-PASSIV no shutdown
 neighbor 1109::33 remote-as 18508
 neighbor 1109::33 update-source Loopback 101
 neighbor 1109::33 no shutdown
 neighbor 2222::220 remote-as 18508
 neighbor 2222::220 route-reflector-client
 neighbor 2222::220 update-source Loopback 100
 neighbor 2222::220 no shutdown
 neighbor 4000::33 remote-as 18508
 neighbor 4000::33 no shutdown
 neighbor 4000::60 remote-as 18508
 neighbor 4000::60 no shutdown
 neighbor 9000::1:2 remote-as 640
 no neighbor 9000::1:2 activate
 neighbor 9000::1:2 no shutdown
!
FTOS#
```

show ip bgp next-hop

View all next hops (via learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.

C-Series, E-Series

Syntax show ip bgp next-hop [local-routes]

Parameters

local-routes (OPTIONAL) Show next-hop information for local routes.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

Example

```
FTOS#show ip bgp next-hop
  Next-hop      Via                               RefCount  Cost  Flaps  Time Elapsed
  9000::5:2     9000::5:2, Gi 8/38             2          0    0      00:23:22
  9000::6:2     9000::6:2, Gi 8/38             2          0    0      00:23:22
  9000::7:2     9000::7:2, Gi 8/38             2          0    0      00:23:22
  9000::8:2     9000::8:2, Gi 8/38             2          0    0      00:23:22
  9000::9:2     9000::9:2, Gi 8/38            6000       0    0      00:23:16
  9000::a:2     9000::a:2, Gi 8/38             2          0    0      00:23:22
FTOS#
```

show ip bgp paths

View all the BGP path attributes in the BGP database.

C-Series, E-Series

Syntax `show ip bgp paths [regexp regular-expression]`

Parameters

regexp *regular-expression*

Enter a regular expression then use one or a combination of the following characters to match:

- `.` = (period) any single character (including a white space).
- `*` = (asterisk) the sequences in a pattern (0 or more sequences).
- `+` = (plus) the sequences in a pattern (1 or more sequences).
- `?` = (question mark) sequences in a pattern (either 0 or 1 sequences). You must enter an escape sequence (CTRL+v) prior to entering the `?` regular expression.
- `[]` = (brackets) a range of single-character patterns.
- `^` = (caret) the beginning of the input string. If the caret is used at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- `$` = (dollar sign) the end of the output string.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp paths as-path

View all unique AS-PATHs in the BGP database.

C-Series, E-Series

Syntax `show ip bgp paths as-path`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp paths community

View all unique COMMUNITY numbers in the BGP database.

C-Series, E-Series

Syntax	<code>show ip bgp paths community</code>	
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp paths extcommunity

View all unique Extended community information in the BGP database.

C-Series, E-Series

Syntax	<code>show ip bgp paths extcommunity</code>	
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp regexp

Allows you to view the subset of BGP routing table matching the regular expressions specified.

C-Series, E-Series

Syntax	<code>show ip bgp regexp <i>regular-expression</i> [<i>character</i>]</code>	
Parameters	<p><i>regular-expression</i> [<i>character</i>]</p>	<p>Enter a regular expression then use one or a combination of the following characters to match:</p> <ul style="list-style-type: none">. = (period) any single character (including a white space).* = (asterisk) the sequences in a pattern (0 or more sequences).+ = (plus) the sequences in a pattern (1 or more sequences).? = (question mark) sequences in a pattern (either 0 or 1 sequences). <p> NOTE: You must enter an escape sequence (CTRL+v) prior to entering the ? regular expression.</p> <ul style="list-style-type: none">[] = (brackets) a range of single-character patterns.^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.\$ = (dollar sign) the end of the output string.
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege	

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ipv6 prefix-list

Displays the specified IPv6 prefix list.

Syntax `show ipv6 prefix-list detail {prefix-list name} | summary`

Parameters	detail	Display a detailed description of the selected IPv6 prefix list.
	<i>prefix-list name</i>	Enter the name of the prefix list.  NOTE: There is a 140-character limit for prefix list names.
	summary	Display a summary of RPF routes.

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.0.0.0	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.

Related Commands

- [ipv6 prefix-list](#) — configure an IPv6 prefix-list.

show ip bgp ipv6 unicast

View the current BGP routing table for the E-Series.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast [network [network-mask] [longer-prefixes]]`

Parameters	<i>network</i>	(OPTIONAL) Enter the network address (in dotted decimal format) of the BGP network to view information only on that network.
	<i>network-mask</i>	(OPTIONAL) Enter the network mask (in slash prefix format) of the BGP network address.
	<i>longer-prefixes</i>	(OPTIONAL) Enter the keywords <i>longer-prefixes</i> to view all routes with a common prefix.

Command Modes

- EXEC
- EXEC Privilege

Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

Usage Information When you enable the `bgp non-deterministic-med` command, the `show ip bgp` command output for a BGP route does not list the INACTIVE reason.

show ip bgp ipv6 unicast cluster-list

View BGP neighbors in a specific cluster.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast cluster-list [cluster-id]`

Parameters *cluster-id* (OPTIONAL) Enter the cluster id in dotted decimal format.

Command Modes

- EXEC
- EXEC Privilege

Command History

Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

show ip bgp ipv6 unicast community

View information on all routes with Community attributes or view specific BGP community groups.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast community [community-number] [local-as] [no-export] [no-advertise]`

Parameters

community-number Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system. You can specify up to eight community numbers to view information on those community groups.

local-AS Enter the keywords `local-as` to view all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED. All routes with the NO_EXPORT_SUBCONFED (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.

no-advertise Enter the keywords `no-advertise` to view all routes containing the well-known community attribute of NO_ADVERTISE. All routes with the NO_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.

no-export Enter the keywords `no-export` to view all routes containing the well-known community attribute of NO_EXPORT. All routes with the NO_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

Command Modes

- EXEC
- EXEC Privilege

Command History

Version 8.2.1.0 Introduced on the E-Series ExaScale.

Version 7.4.1.0 Introduced

Usage Information To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

show ip bgp ipv6 unicast community-list

View routes that are affected by a specific community list.

C-Series, E-Series

Syntax	<code>show ip bgp ipv6 unicast community-list <i>community-list-name</i> [exact-match]</code>	
Parameters	<i>community-list-name</i>	Enter the name of a configured IP community list.
	exact-match	(OPTIONAL) Enter exact-match to display only for an exact match of the communities.
Command Modes	<ul style="list-style-type: none">• EXEC• EXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp ipv6 unicast dampened-paths

View BGP routes that are dampened (non-active).

C-Series, E-Series

Syntax	<code>show ip bgp ipv6 unicast dampened-paths</code>	
Command Modes	<ul style="list-style-type: none">• EXEC• EXEC Privilege	
Command History	Version 7.4.1.0	Introduced

show ip bgp ipv6 unicast detail

Display BGP internal information for IPv6 Unicast address family.

C-Series, E-Series

Syntax	<code>show ip bgp ipv6 unicast detail</code>	
Defaults	none	
Command Modes	<ul style="list-style-type: none">• EXEC• EXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp ipv6 unicast extcommunity-list

View information on all routes with Extended Community attributes.

C-Series, E-Series, S-Series

Syntax	<code>show ip bgp ipv6 unicast extcommunity-list [list name]</code>	
Parameters	<i>list name</i>	Enter the extended community list name you wish to view.
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced
Usage Information	To view the total number of COMMUNITY attributes found, use the <code>show ip bgp summary</code> command. The text line above the route table states the number of COMMUNITY attributes found. The <code>show ip bgp community</code> command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the <code>show ip bgp</code> command output.	

show ip bgp ipv6 unicast filter-list

View the routes that match the filter lists.

C-Series, E-Series

Syntax	<code>show ip bgp ipv6 unicast filter-list as-path-name</code>	
Parameters	<i>as-path-name</i>	Enter the name of an AS-PATH.
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege	
Command History	Version 8.2.1.0	Introduced on the E-Series ExaScale.
	Version 7.4.1.0	Introduced

show ip bgp ipv6 unicast flap-statistics

View flap statistics on BGP routes.

C-Series, E-Series

Syntax	<code>show ip bgp ipv6 unicast flap-statistics [ipv6-address prefix-length] [filter-list as-path-name] [regexp regular-expression]</code>	
Parameters	<i>ipv6-address prefix-length</i>	Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	<i>filter-list as-path-name</i>	(OPTIONAL) Enter the keywords <code>filter-list</code> followed by the name of a configured AS-PATH ACL.

regex *regular-expression*

Enter a regular expression then use one or a combination of the following characters to match:

- . = (period) any single character (including a white space).
- * = (asterisk) the sequences in a pattern (0 or more sequences).
- + = (plus) the sequences in a pattern (1 or more sequences).
- ? = (question mark) sequences in a pattern (either 0 or 1 sequences).
- [] = (brackets) a range of single-character patterns.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- \$ = (dollar sign) the end of the output string.

NOTE: You must enter an escape sequence (CTRL+v) prior to entering the ? regular expression.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

Version 8.2.1.0	Introduced on the E-Series ExaScale.
Version 7.4.1.0	Introduced

show ip bgp ipv6 unicast inconsistent-as

View routes with inconsistent originating autonomous system (AS) numbers; that is, prefixes that are announced from the same neighbor AS but with a different AS-Path.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast inconsistent-as`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

Version 8.2.1.0	Introduced on the E-Series ExaScale.
Version 7.4.1.0	Introduced

show ip bgp ipv6 unicast neighbors

Allows you to view the information exchanged by BGP neighbors.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast neighbors [ipv6-address prefix-length | ip-address] [advertised-routes | dampened-routes | detail | flap-statistics | routes]`

Parameters

ipv6-address prefix-length* / *ip-address

Enter the IPv6 address in the x:x:x:x:x format followed by the prefix length in the /x format. The range is /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros or enter an IP address in dotted decimal format to reset all prefixes from that neighbor.

advertised-routes

(OPTIONAL) Enter the keywords *advertised-routes* to view only the routes the neighbor sent.

- dampened-routes** (OPTIONAL) Enter the keywords `dampened-routes` to view information on dampened routes from the BGP neighbor.
- detail** (OPTIONAL) Enter the keyword `detail` to view neighbor-specific internal information for the IPv6 address family.
- flap-statistics** (OPTIONAL) Enter the keywords `flap-statistics` to view flap statistics on the neighbor's routes.
- routes** (OPTIONAL) Enter the keyword `routes` to view only the neighbor's feasible routes.

- Command Modes**
- EXEC
 - EXEC Privilege

- Command History**
- Version 8.2.1.0** Introduced on the E-Series ExaScale.
 - Version 7.4.1.0** Introduced

Related Commands [show ip bgp](#) – view the current BGP routing table.

show ip bgp ipv6 unicast peer-group

Allows you to view information on the BGP peers in a peer group.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast peer-group [peer-group-name [summary]]`

- Parameters**
- peer-group-name** (OPTIONAL) Enter the name of a peer group to view information about that peer group only.
 - detail** (OPTIONAL) Enter the keyword `detail` to view peer-group-specific information for the IPv6 address family.
 - summary** (OPTIONAL) Enter the keyword `summary` to view status information of the peers in that peer group. The output is the same as that found in `show ip bgp summary` command

- Command Modes**
- EXEC
 - EXEC Privilege

- Command History**
- Version 8.2.1.0** Introduced on the E-Series ExaScale.
 - Version 7.4.1.0** Introduced

Example

```
FTOS#show ip bgp peer-group

Peer-group RR-CLIENT, remote AS 18508
  BGP version 4
  Minimum time between advertisement runs is 5 seconds

  For address family: IPv4 Unicast
  BGP neighbor is RR-CLIENT, peer-group internal,
  Number of peers in this group 1
  Peer-group members (* - outbound optimized):
    9000::4:

Peer-group RR-CLIENT-PASSIV, remote AS 18508
  BGP version 4
  Minimum time between advertisement runs is 5 seconds
```

```

For address family: IPv4 Unicast
BGP neighbor is RR-CLIENT-PASSIV, peer-group internal,
Number of peers in this group 1
Peer-group members (* - outbound optimized):
 9000::9:2*
FTOS#

```

show ip bgp ipv6 unicast summary

Allows you to view the status of all BGP connections.

C-Series, E-Series

Syntax `show ip bgp ipv6 unicast summary`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History **Version 8.2.1.0** Introduced on the E-Series ExaScale.

Example

```

FTOS# show ip bgp summary
BGP router identifier 55.55.55.55, local AS number 18508
BGP table version is 0, main routing table version 0
6 BGP path attribute entrie(s) using 392 bytes of memory
6 BGP AS-PATH entrie(s) using 294 bytes of memory
6 BGP community entrie(s) using 234 bytes of memory

Neighbor      AS      MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/Pfx
1109::33      18508   0        0        0        0    0  never   Active
2222::220     18508   0        0        0        0    0  never   Active
4000::33      18508   0        0        0        0    0  never   Active

9000::b:14    18508   29       29       0        0    0  00:13:01 0
FTOS#

```

timers bgp

Allows you to adjust the BGP network timers for all neighbors.

C-Series, E-Series

Syntax `timers bgp keepalive holdtimer`

To return to the default values, use the `no timers bgp` command.

- Parameters**
- keepalive*** Enter the time interval in seconds between which the E-Series sends keepalive messages. The range is 1 to 65535. The default is **60 seconds**.
 - holdtimer*** Enter the time interval in seconds which the E-Series waits since the last keepalive message before declaring a BGP peer dead. The range is 3 to 65535. The default is **180 seconds**.

Defaults	<ul style="list-style-type: none"> • <i>keepalive</i> = 60 seconds • <i>holdtimer</i> = 180 seconds
Command Modes	ROUTER BGP
Command History	<p>Version 8.2.1.0 Introduced on the E-Series ExaScale.</p> <p>Version 7.4.1.0 Introduced</p>
Related Commands	neighbor timers – adjusts BGP timers for a specific peer or peer group.

IPv6 MBGP Commands

Multiprotocol BGP (MBGP) is an enhanced BGP that enables the multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (AS). FTOS MBGP is implemented as per IETF RFC 1858.

show ipv6 mbgproutes

Display the selected IPv6 MBGP route or a summary of all MBGP routes in the table.

Syntax	<code>show ipv6 mbgproutes <i>ipv6-address prefix-length</i> summary</code>	
Parameters	<i>ipv6-address</i>	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.
	<i>prefix-length</i>	 NOTE: The :: notation specifies successive hexadecimal fields of zeros.
	summary	Display a summary of RPF routes.
Command Modes	EXEC	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.8(0.0P5)	Introduced on the S4048-ON.
	9.8(0.0P2)	Introduced on the S3048-ON.
	9.0.0.0	Introduced on the Z9000.
	8.3.19.0	Introduced on the S4820T.
	8.3.10.0	Introduced on the S4810.

Content Addressable Memory (CAM)

You can use content addressable memory (CAM) commands to configure the amount of memory allocated to CAM memory partitions.

NOTE: Not all CAM commands are supported on all platforms. Be sure to note the platform when looking for a command.

NOTE: If you are using these features for the first time, contact Dell EMC Networking Technical Assistance Center (TAC) for guidance.

Topics:

- [CAM Profile Commands](#)
- [Unified Forwarding Table Modes](#)

CAM Profile Commands

The CAM profiling feature allows you to partition the CAM to best suit your application. For example:

- Configure more Layer 2 forwarding information base (FIB) entries when the system is deployed as a switch.
- Configure more Layer 3 FIB entries when the system is deployed as a router.
- Configure more access control lists (ACLs) (when IPv6 is not employed).
- Hash multi-protocol label switching (MPLS) packets based on source and destination IP addresses for link aggregation groups (LAGs).
- Hash based on bidirectional flow for LAGs.
- Optimize the virtual local area network (VLAN) ACL Group feature, which permits group VLANs for IP egress ACLs.

Important Points to Remember

- Dell EMC Networking OS supports CAM allocations on the C-Series and S-Series.
- All line cards within a single system must have the same CAM profile (including CAM sub-region configurations); this profile must match the system CAM profile (the profile on the primary route processor module [RPM]).
- Dell EMC Networking OS automatically reconfigures the CAM profile on line cards and the secondary RPM to match the system CAM profile by saving the correct profile on the card and then rebooting it.
- The CAM configuration is applied to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- When budgeting your CAM allocations for ACLs and quality of service (QoS) configurations, remember that ACL and QoS rules might consume more than one CAM entry depending on complexity. For example, transmission control protocol (TCP) and user datagram protocol (UDP) rules with `port range` options might require more than one CAM entry.
- After you install a secondary RPM, copy the running-configuration to the startup-configuration so that the new RPM has the correct CAM profile.
- You MUST save your changes and reboot the system for CAM profiling or allocations to take effect.

cam-acl (Configuration)

Select the default CAM allocation settings or reconfigure a new CAM allocation for Layer 2, IPv4, and IPv6 ACLs, Layer 2 and Layer 3 (IPv4) QoS, Layer 2 Protocol Tunneling (L2PT), IP and MAC source address validation for DHCP, Ethernet Connectivity Fault Management (CFM) ACLs, OpenFlow, and Policy-based Routing (PBR).

Syntax

```
cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos
number l2qos number l2pt number ipmacacl number [vman-qos | vman-dual-
qos number] ecfmacacl number [nlbclusteracl number] ipv4pbr number }openflow
```

number | *fcoe number*} [*iscsiptacl number*] [*ipv4udfmirracl number*]
 [*ipv4mirracl number*]][*vrfv4acl number*]

Parameters

default	Use the default CAM profile settings and set the CAM as follows: <ul style="list-style-type: none"> ● L2Acl : 6 ● IPV4Acl : 4 ● IPV6Acl : 0 ● IPV4Qos : 2 ● L2Qos : 1 ● L2PT : 0 ● IpMacAcl : 0 ● VmanQos : 0 ● VmanDualQos : 0 ● EcfmAcl : 0 ● nlbclusteracl: 0 ● FcoeAcl : 0 ● iscsiOptAcl : 0 ● ipv4pbr : 0 ● ipv4udfmirracl: 0 ● Openflow : 0 ● fedgovacl : 0
l2acl number	Enter the keyword <i>l2acl</i> and then the number of l2acl blocks. The range is from 1 to 8.
ipv4acl number	Enter the keyword <i>ipv4acl</i> and then the number of FP blocks for IPv4. The range is from 0 to 8.
ipv6acl number	Enter the keyword <i>ipv6acl</i> and then the number of FP blocks for IPv6. The range is from 0 to 4.
ipv4qos number	Enter the keyword <i>ipv4qos</i> and then the number of FP blocks for IPv4. The range is from 0 to 8.
l2qos number	Enter the keyword <i>l2qos</i> and then the number of FP blocks for l2 qos. The range is from 1 to 8.
l2pt number	Enter the keyword <i>l2pt</i> and then the number of FP blocks for l2 protocol tunnelling. The range is from 0 to 1.
ipmacacl number	Enter the keyword <i>ipmacacl</i> and then the number of FP blocks for IP and MAC ACL. The range is from 0 to 6.
ecfmacl number	Enter the keyword <i>ecfmacacl</i> and then the number of FP blocks for ECFM ACL. The range is from 0 to 5.
nlbclusteracl number	Enter the keyword <i>nlbclusteracl</i> and then the number of FP blocks for nlbcluster ACL. The range is from 0 to 2. By default, the value is 0 and it supports 8 NLB arp entries reserved for internal functionality. <div style="border-left: 1px solid blue; padding-left: 10px; margin-left: 20px;"> <p>NOTE: When you reconfigure CAM allocation, use the <i>nlbclusteracl number</i> command to change the number of NLB ARP entries. The range is from 0 to 2. The default value is 0. At the default value of 0, eight NLB ARP entries are available for use. This platform supports up to 512 CAM entries. Select 1 to configure 256 entries. Select 2 to configure 512 entries. Even though you can perform CAM carving to allocate the maximum number of NLB entries, Dell EMC Networking recommends that you use a maximum of 64 NLB ARP entries.</p> </div>
vman-qos	Enter the keyword <i>vman-qos</i> and then the number of FP blocks for VMAN QoS. The range is from 0 to 6.
vman-dual-qos number	Enter the keyword <i>vman-dual-qos</i> and then the number of FP blocks for VMAN dual QoS. The range is from 0 to 4.

ipv4pbr number	Enter the keyword <code>ipv4pbr</code> and then the number of FP blocks for ipv4pbr ACL. The range is from 0 to 8.
Openflow number	Enter the keyword <code>openflow</code> and then the number of FP blocks for open flow (multiples of 4). The range is from 0 to 8.
fcoeacl number	Enter the keyword <code>fcoeacl</code> and then the number of FP blocks for FCOE ACL. The range is from 0 to 6.
iscsiptacl number	Enter the keyword <code>iscsiptacl</code> and then the number of FP blocks for iSCSI optimization ACL. The range is from 0 to 2.
l2acl number	Allocate space to each CAM region.
ipv4acl number	Enter 4 or 8 for the number of OpenFlow FP blocks.
ipv6acl number,	<ul style="list-style-type: none"> • 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality) • 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)
ipv4qos number	
l2qos number	The fcoe range is 0–6 groups. Each group has 128 entries; the value given must be an even number. This information is stored in the NVRAM and is effective after rebooting the switch.
l2pt number	
ipmacacl number	
ecfmacl number	
{nlbclusteracl}	
[vman-qos 	
vman-dual-qos	
number] ipv4pbr	
numberopenflow	
{4 8} 	
fcoe number	
[iscsiptacl	
number]	
[vrfv4acl	
number]	
ipv4udfmirracl	Enter the keyword <code>ipv4udfmirracl</code> and then the number of FP blocks for IPv4 UDF mirror ACL. The range is from 0 to 8.
[ipv4mirracl	Enter the <code>ipv4mirracl</code> keyword and then the number of FP blocks for IPv4 mirror ACL. The range is from 0 to 8. You cannot use the <code>ipv4mirracl</code> and <code>ipv4udfmirracl</code> commands at the same time.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Added the keyword <code>ipv4mirracl</code> .
9.11(0.0)	Added the keyword <code>ipv4udfmirracl</code> .
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added the <code>nlbcluster</code> ACL keyword. Introduced on the S6000-ON.
9.4.(0.0)	Added support for PBR and VRF.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.2(0.2)	Added support for fcoe.
9.1.(0.0)	Added support for OpenFlow.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.2	Clarified block information for the S4810.
8.3.10.0	Introduced on the S4810.
8.3.1.0	Added the keywords <code>ecfmac1</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

Usage Information

Save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system for the new settings to take effect.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks; these blocks cannot be reallocated. Only number of blocks can be configured by the user .

The `ipv6acl` allocation must be a factor of 2.

If allocation values are not entered for the CAM regions, the value is 0.

If you enable BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the command `reload conditional nvram-cfg-change`.

cam-acl-egress

Allocate CAM for egress ACLs.

Syntax `cam-acl-egress default | l2acl number ipv4acl number ipv6acl number`

Parameters

- default*** Reset egress CAM ACL entries to default settings.
- l2acl number*** Allocate space to each CAM region. The total space allocated must equal 4. The `ipv6acl` range must be a factor of 2.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

cam-optimization

Optimize CAM utilization for QoS Entries by minimizing require policy-map CAM space.

Syntax `cam-optimization [qos]`

Parameters `qos` Optimize CAM usage for QoS.

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0.	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

Usage Information When you enable this command, if a Policy Map containing classification rules (ACL and/or dscp/ ip-precedence rules) is applied to more than one physical interface on the same port pipe, only a single copy of the policy is written (only one FP entry is used).

 **NOTE:** An ACL itself may still require more than a single FP entry, regardless of the number of interfaces. For more information, refer to the “IP Access Control Lists”, “Prefix Lists”, and “Route-map” sections in the *Dell EMC Networking OS Configuration Guide*.

cam-threshold

Configure CAM threshold value for sending the syslog message on CAM usage. Configure silence period for stop receiving syslog message on CAM usage.

Syntax	<code>cam-threshold threshold {default <i>threshold-percent</i>} silence-period {default <i>silence-period-value</i>}</code>	
Defaults	Enabled	
Parameters	threshold default	Enter the keyword <code>default</code> for CAM usage threshold for notification of the CAM usage through syslog message. The default threshold value is 90 percent.
	threshold <i>threshold-percent</i>	Enter the threshold percent for notification of the CAM usage through syslog message. The range is from 1 to 100 percent.
	silence-period default	Enter the keyword <code>default</code> to set the silence period for receiving syslog message regarding CAM usage for CAM region, slot/portpipe. The default silence period is 0 seconds.
	silence-period <i>silence-period-value</i>	Enter the silence period for stop receiving syslog message for the respective CAM region, slot/portpipe. The range is from 0 to 65535 seconds.
Command Modes	CONFIGURATION	
Supported Modes		
Command History	Version	Description
	9.13.0.0	Introduced on the MXL, FN IOM, S5000, S4048-ON, S6000, S6000-ON, S3048-ON, S3100 Series, C9010, S4048T-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON.
Usage Information	The <code>no cam-threshold</code> command will set the CAM threshold to 90 percent and silence period to 0. The CAM threshold and silence period configuration is applicable only for Ingress L2, IPv4, IPv6 and Egress L2, IPv4, and IPv6 ACL CAM groups. For other ACL CAM regions, the CAM threshold and silence period is not configurable and the values are fixed to 90 percent and 0 respectively.	

Example

```
DellEMC(conf)#cam-threshold threshold 2 silence-period 2
DellEMC(conf)#do show running-config | g cam-threshold
cam-threshold threshold 2 silence-period 2
```

show cam-acl

Display the details of the CAM profiles on the chassis and all stack units.

Syntax	<code>show cam-acl</code>	
Defaults	none	
Command Modes	EXEC Privilege	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series.

Usage Information

The display reflects the settings implemented with the `cam-acl` command.

Example

```
DellEMC# show cam-acl

-- Chassis Cam ACL --
      Current Settings(in block sizes)
      1 block = 256 entries
L2Acl      :      2
Ipv4Acl    :      4

DellEMC#

```

show cam-usage

Display the amount of memory space used and available in each CAM partition (including Layer 2 ACL, Layer 3 ACL, and IPv4Flow)

Syntax `show cam-usage [acl | router | switch]`

Parameters

- acl** (OPTIONAL) Enter the keyword `acl` to display Layer 2 and Layer 3 ACL CAM usage.
- router** (OPTIONAL) Enter the keyword `router` to display Layer 3 CAM usage.
- switch** (OPTIONAL) Enter the keyword `switch` to display Layer 2 CAM usage.

Defaults none

Command Modes EXEC Privilege

Command History

Version	Description
9.11(2.0P1)	Optimized the ACL filters to support more than 200 egress ACL rules on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.11.0.0	The <code>show cam-usage</code> command is updated to display ECMP count information.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z9000.

Usage Information

The following regions must be provided in the `show cam-usage` output:

- L3AclCam
- L2AclCam
- V6AclCam

The following table describes the output fields of the `show cam-usage` command.

Table 3. Output fields of the show cam-usage command

Field	Description
Stackunit	Number of the stack unit that contains information on ACL VLAN groups
Portpipe	The hardware path that packets follow through a system for ACL optimization

Table 3. Output fields of the show cam-usage command (continued)

Field	Description
CAM-Region	Type of area in the CAM block that is used for ACL VLAN groups
Total CAM space	Total amount of space in the CAM block
Used CAM	Amount of CAM space that is currently in use
Available CAM	Amount of CAM space that is free and remaining to be allocated for ACLs

Example

```
DelleMC#show cam-usage
Stackunit|Portpipe| CAM Partition      | Total CAM | Used CAM | Available
CAM
=====|=====|=====|=====|=====|=====
0        |    0    | IN-L2 ACL          |    1024   |     0    |    1024
          |         | IN-L3 ACL          |    1024   |     1    |    1023
          |         | IN-L3 FIB          |   163840  |    16    |   163824
          |         | IN-L3 ECMP GRP    |   262144  |     0    |   262144
          |         | IN-V6 ACL          |         0  |     0    |         0
          |         | IN-NLB ACL        |         0  |     0    |         0
          |         | IPMAC ACL         |         0  |     0    |         0
          |         | OUT-L2 ACL        |        206 |     9    |        197
          |         | OUT-L3 ACL        |         102 |     9    |         93
          |         | OUT-V6 ACL        |         102 |     4    |         98
```

Example (show cam-usage router)

```
DelleMC#show cam-usage router
Stackunit|Portpipe| CAM Partition      | Total CAM | Used CAM | Available
CAM
=====|=====|=====|=====|=====|=====
0        |    0    | IN-L3 ACL          |    1024   |     1    |    1023
          |         | IN-L3 ECMP GRP    |   262144  |     0    |   262144
          |         | IN-V6 ACL          |         0  |     0    |         0
          |         | IN-L3-MIRR ACL    |         0  |     0    |         0
          |         | IN-L3 FIB         |   163840  |    15    |   163825
```

test cam-usage

Verify that enough CAM space is available for the IPv6 ACLs you have created.

Syntax test cam-usage service-policy input *input* policy name *linecard* {*number* | all}

Parameters

- policy-map name** Enter the name of the policy-map to verify. Maximum is 32 characters.
- number** Enter all to get information for all the linecards or enter the linecard number to get information for a specific linecard.

Defaults none

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced.

Usage Information

This command applies to both IPv4 and IPv6 CAM Profiles, but is best used when verifying QoS optimization for IPv6 ACLs.

QoS Optimization for IPv6 ACLs does not impact the CAM usage for applying a policy on a single (or the first of several) interfaces. It is most useful when a policy is applied across multiple interfaces; it can reduce the impact to CAM usage across subsequent interfaces.

The following describes the `test cam-usage` command shown in the following example.

Term	Explanation
Stack-Unit	Lists the stack unit or units that are checked. Entering all shows the status for all stacks.
Portpipe	Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering <code>a11</code> shows the status for linecards and port-pipes in the chassis. . The port set value is from 0 to 3.
CAM Partition	Shows the CAM profile of the CAM.
Available CAM	Identifies the amount of CAM space remaining for that profile.
Estimated CAM per Port	Estimates the amount of CAM space the listed policy will require.
Status	Indicates whether or not the policy will be allowed in the CAM.

Example

Example

Unified Forwarding Table Modes

Unified Forwarding Table (UFT) consolidates the resources of several search tables (Layer 2, Layer 3 Hosts, and Layer 3 Route [Longest Prefix Match — LPM]) into a single flexible resource. The system supports several UFT modes to extract the forwarding tables, as required. By default, Dell EMC Networking OS initializes the table sizes to UFT mode 2 profile, as it provides a reasonable shared memory for all the tables. The other supported UFT modes are scaled-I3-hosts (UFT mode 3) and scaled-I3-routes (UFT mode 4).

Important Points to Remember

- All line cards/Stack Members within a single system must have the same UFT mode profiles. This profile must match the system UFT mode profile (the profile on the primary route processor module [RPM]/ Master Unit of the Stack).
- Apply the UFT mode configuration to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- Save the changes and reboot the system for UFT mode profiling to take effect.

hardware forwarding-table mode

Select a mode to initialize the maximum scalability size for L2 MAC table or L3 Host table or L3 Route table.

Syntax `hardware forwarding-table mode {scaled-l3- hosts | scaled-l3-routes}`

Parameters

scaled-l3-hosts	Enter the keywords <code>scaled-l3-hosts</code> to select the forwarding table mode for scaling l3 host entries.
scaled-l3-routes	Enter the keywords <code>scaled-l3-routes</code> to select the forwarding table mode for scaling l3 route entries.

Defaults UFT mode 2

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.7(0.0)	Introduced on the S6000, S6000-ON, and Z9500 switch..

Usage Information This command takes effect only after reboot.

Related Commands [show hardware forwarding-table mode](#) — displays the hardware forwarding table mode in the current boot and in the next boot.

show hardware forwarding-table mode

Display the hardware forwarding table mode in the current boot and in the next boot.

Syntax `show hardware forwarding-table mode`

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000, S6000-ON, and Z9500 switch.

Example

```
DellEMC#show hardware forwarding-table mode

Mode                : Current Settings           Next Boot Settings
L2 MAC Entries      : 160K                       scaled-l3-hosts
L3 Host Entries     : 144K                       96K
L3 Route Entries    : 16K                         208K
                   :                               16K

Control Plane Policing (CoPP)

Control plane policing (CoPP) uses access control list (ACL) rules and quality of service (QoS) policies to create filters for a system's control plane. The CoPP filters prevent traffic that is not identified as legitimate from reaching the control plane, and rate-limit traffic to an acceptable level.

On the Z9500 switch, the control plane has 24 queues (0 to 23) divided into groups of eight queues for the Route Processor, Control Processor, and line-card CPUs as follows:

- Queues 0 to 7 process packets destined to the Control Processor CPU .
- Queues 8 to 15 process packets destined to the Route Processor CPU.
- Queues 16 to 23 process packets destined to the line card CPU.

clear control-traffic protocol

Clear all per-protocol counters of rate-limited control-plane traffic.

Z9500

Syntax	<code>clear control-traffic protocol [cp-switch linecard slot-id portset port-pipe] counters</code>
Parameters	<p>cp-switch Enter the keyword <code>cp-switch</code> to display counters for rate-limited traffic on the central switch (aggregated CoPP).</p> <p>linecard slot-id portset port-pipe Enter the slot ID and port pipe to display counters for rate-limited traffic on a specified Z9500 line card and port set. The range of Z9500 slot IDs is from 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0; 0 to 3 on line cards 1 and 2.</p>
Defaults	Clear per-protocol rate-limiting counters for all control-plane and port-set (port-pipe) traffic.
Command Modes	EXEC Privilege
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <p>Version 9.2(1.0) Introduced on the Z9500.</p>

- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.8.0** Introduced on the S4810.

Usage Information

There are three line cards (0-2) with fixed ports on the Z9500. Line card 0 uses three sets of ports (port pipes): 0 to 2; line cards 1 and 2 use four sets of ports: 0 to 3.

- On line card 0, port set 0 consists of ports 0–44; port set 1 consists of ports 48–92; port set 2 consists of ports 96–140.
- On line cards 1 and 2, port set 0 consists of ports 0–44; port set 1 consists of ports 48–92; port set 2 consists of ports 96–140; port set 3 consists of ports 144–188.

To display the per-protocol counters of rate-limited control-plane traffic at the aggregated (switch) or line card and port set level, use the `show control-traffic protocol` command.

Example

```
Dell#clear control-traffic protocol cp-switch counters
Dell#
```

clear control-traffic queue

Clear per-queue counters of rate-limited control-plane traffic.

Z9500

Syntax

```
clear control-traffic queue {all | queue-number} counters
```

Parameters

- all** Enter the keyword `all` to clear counters for rate-limited traffic on all CPU queues, including Route Processor, Control Processor, and line-card CPUs.
- queue-number** Enter the queue number to clear counters for rate-limited traffic on a specified CPU queue. The range of queue-number values is from 0 to 23. The twenty-four control-plane queues are divided into groups of eight queues for the Route Processor, Control Processor, and line-card CPUs as follows:
 - Queues 0 to 7 process packets destined to the Control Processor CPU .
 - Queues 8 to 15 process packets destined to the Route Processor CPU.
 - Queues 16 to 23 process packets destined to the line card CPU.

Defaults

Clear per-queue rate-limiting counters for all control-plane and port traffic.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.8.0** Introduced on the S4810.

Usage Information

To display the per-queue counters of rate-limited control-plane traffic at the aggregated (switch) or line card and port set level, use the `show control-traffic queue` command.

Example

```
Dell#clear control-traffic queue 2 counters
Dell#
```

control-plane-cpuqos

To manage control-plane traffic, enter control-plane mode and configure the switch.

Syntax	<code>control-plane-cpuqos</code>
Defaults	Not configured.
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

Usage Information

Create a policy-map by associating a queue number with the qos-policy.
 Create QoS policies prior to enabling this command.
 For CoPP, use the keyword `cpu-qos` when creating qos-policy-input.

Related Commands

- [qos-policy-input](#) — create a QoS input policy map.
- [policy-map-input](#) — create an input policy map.

service-policy rate-limit-protocols

Apply a policy for the system to rate limit control protocols on a per-protocol basis.

Syntax

`service-policy rate-limit-protocols policy-name`

Parameters

policy-name Enter the service-policy name, using a string up to 32 characters.

Defaults

Not configured.

Command Modes

CONTROL-PLANE-CPUQOS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

- [class-map](#) — creates a QoS class map.
- [policy-map-input](#) — creates an input policy map.

show control-traffic protocol

Display per-protocol counters of rate-limited control-plane traffic.

Z9500

Syntax `show control-traffic protocol [cp-switch | linecard slot-id portset port-pipe] counters`

Parameters

cp-switch Enter the keyword `cp-switch` to display counters for rate-limited traffic on the central switch (aggregated CoPP).

linecard slot-id portset port-pipe Enter the slot ID and port pipe to display counters for rate-limited traffic on a specified Z9500 line card and port set. The range of Z9500 slot IDs is from 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0; 0 to 3 on line cards 1 and 2.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.

Usage Information There are three line cards (0-2) with fixed ports on the Z9500. Line card 0 uses three sets of ports (port pipes): 0 to 2; line cards 1 and 2 use four sets of ports: 0 to 3.

In the `show` output, Tx Counters displays the number of bytes of control-plane traffic received on which protocol-based rate limiting is applied. Rx Counters displays the number of bytes transmitted to a control-plane CPU after protocol-based rate limiting is applied. Drops displays the number of bytes of control-plane traffic that have been dropped as a result of protocol-based rate limiting.

To clear the per-protocol counters of rate-limited control-plane traffic at the aggregated (switch) or line card and port set level, use the `clear control-traffic protocol` command.

Example

```
Dell#show control-traffic protocol linecard 2 portset 0 counters

show control-traffic queue

Display per-queue counters of rate-limited control-plane traffic.

Z9500

Syntax `show control-traffic queue {all | queue-id queue-number} counters`

Parameters

all Enter the keyword `all` to display counters for rate-limited traffic on all CPU queues, including Route Processor, Control Processor, and line-card CPUs.

queue-id *queue-number* Enter the queue number to display counters for rate-limited traffic on a specified CPU queue. The range of `queue-number` values is from 0 to 23. The twenty-four control-plane queues are divided into groups of eight queues for the Route Processor, Control Processor, and line-card CPUs as follows:

- Queues 0 to 7 process packets destined to the Control Processor CPU .
- Queues 8 to 15 process packets destined to the Route Processor CPU.
- Queues 16 to 23 process packets destined to the line card CPU.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

Usage Information

In the `show` output, Rx Bytes displays the number of bytes of control-plane traffic received, on which queue-based rate limiting is applied. Tx Counters displays the number of bytes transmitted to a control-plane CPU after queue-based rate limiting is applied. Drop Counters displays the number of bytes of control-plane traffic that have been dropped as a result of queue-based rate limiting.

To clear the per-queue counters of rate-limited control-plane traffic at the aggregated (switch) or line card and port set level, use the `clear control-traffic queue` command.

Example

```
Dell#show control-traffic queue queue-id 0 counters
Queue      Rx Counter  Tx Counter  Drop counter
-----
Q0         5000        5000        0
Dell#
```

show cpu-queue rate cp

Display the rates for each CPU queue.

Syntax `show cpu-queue rate cp`

Defaults Not configured.

Command Modes EXEC Privilege

DellEMC#						

show ipv6 protocol-queue-mapping

Display the queue mapping for each configured IPv6 protocol.

Syntax `show ipv6 protocol-queue-mapping`

Defaults Not configured.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.

Example

```
DellEMC# show ipv6 protocol-queue-mapping
  Protocol  Src-Port  Dst-Port  TcpFlag  Queue  EgPort  Rate (kbps)
  -----
TCP (BGP)   any/179   179/any   —        Q9     —        —
ICMPV6 NA   any       any       —        Q6     —        —

  ISIS      01:80:c2:00:00:14/15 any       Q9     CP    -
           09:00:2b:00:00:04/05 any       Q9     CP    -
DellEMC#
```

show protocol-queue-mapping

Display the Z9500 protocol-queue mapping for each configured protocol.

Z9500

Syntax	<code>show protocol-queue-mapping [queue-id queue-number]</code>
Parameters	queue-id queue-number (Optional) Display the protocol-queue mapping for a specified control-plane queue. The range of CPU queue numbers is from 0 to 23.

Defaults Not configured.

Command Modes EXEC Privilege

Usage Information The `show` output displays information on CPU traffic flows for all protocols, including the ingress queue at which the traffic is queued and the CPU to which protocol traffic is sent with the applied rate limits (configured or default) in kilobits per second (kbps). The egress port queues on CPUs are abbreviated as: RP (Route Processor), CP (Control Processor), and LC (line card).

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

Example

```
Dell# show protocol-queue-mapping

Data Center Bridging (DCB)

Data center bridging (DCB) refers to a set of IEEE Ethernet enhancements that provide data centers with a single, robust, converged network to support multiple traffic types, including local area network (LAN), server, and storage traffic.

The Dell Networking operating software commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

This chapter includes the following sections:

- [DCB Command](#)
- [PFC Commands](#)
- [ETS Commands](#)
- [DCBX Commands](#)

Topics:

- [DCB Command](#)
- [PFC Commands](#)
- [ETS Commands](#)
- [DCBX Commands](#)
- [dcb-map](#)
- [dcb-map sfm all backplane all](#)
- [priority-pgid](#)
- [priority-group bandwidth pfc](#)
- [dcb-map linecard all backplane all](#)
- [dcb-policy buffer-threshold sfm all port-set all backplane all](#)
- [dcb pfc-shared-buffer-size](#)
- [dcb pfc-shared-buffer-size sfm all](#)
- [dcb-buffer-threshold](#)
- [priority](#)
- [show linecard port-set backplane all](#)
- [show sfm backplane all pfc buffer-threshold](#)
- [qos-policy-buffer](#)
- [dcb-policy buffer-threshold \(Interface Configuration\)](#)
- [dcb-policy buffer-threshold linecard all backplane all](#)
- [service-class buffer shared-threshold-weight](#)
- [show qos dcb-buffer-threshold](#)
- [show running-config dcb-buffer-threshold](#)
- [dcb pfc-total-buffer-size](#)
- [dcb pfc-queues](#)
- [dcb <ets | pfc> enable](#)

DCB Command

The following DCB command is supported on the Z9500 platform.

dcb-enable

Enable data center bridging.

Syntax `dcb enable [pfc-queues 1|4]`
 To disable DCB, use the `no dcb enable` command.

Parameters	<i>pfc-queues</i>	Enter the pfc-queue range. To disable DCB, use the <code>no dcb enable</code> command. The range is from 1 to 4.				
Defaults	The default is 2					
Command Modes	CONFIGURATION					
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>		Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description					
9.7(0.0)	Introduced on the Z9500.					
Usage Information	<p>By default, iSCSI is enabled on the unit and the flow control is enabled on all of the interfaces. It is also acts as defaults when the link-level flow control is enabled on one or more interfaces. To enable DCB, do one of the following:</p> <ul style="list-style-type: none"> • Apply the <code>dcb-map</code> command with the <code>no pfc-mode</code> command on to all the interfaces. • Disable flow-control on all of the interfaces. 					

PFC Commands

The following PFC commands are supported on the Z9500 platform.

clear pfc counters

Clear the PFC TLV counters and PFC statistics on an interface or linecard.

Syntax	<code>clear pfc counters [port-type slot/port linecard {unit number all } all backplane all}}</code>					
Parameters	port-type	Enter the keywords <code>port-type</code> then the slot/port information.				
	linecard unit number	Enter the keyword <code>linecard</code> to clear the linecard number.				
	all backplane all	Enter the keywords <code>all backplane all</code> to clear the counters on all interfaces.				
Defaults	none					
Command Modes	EXEC Privilege					
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>		Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description					
9.7(0.0)	Introduced on the Z9500.					
Usage Information	If you do not use the <code>statistics</code> parameter, both hardware and DCBx counters clear.					

clear pfc counters sfm backplane all

Clear the PFC counters on sfm and backplane ports.

Syntax `clear pfc counters sfm <0-5/all> backplane all`

Parameters *backplane all* Enter the keywords all backplane all to clear the counters on all interfaces.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information If you do not use the statistics parameter, both hardware and DCBx counters clear.

pfc no-drop queues

Configure the port queues that still function as no-drop queues for lossless traffic.

Syntax `pfc no-drop queues queue-range`

To remove the no-drop port queues, use the `no pfc no-drop queues` command.

Parameters *queue-range* Enter the queue range. Separate the queue values with a comma; specify a priority range with a dash; for example, `pfc no-drop queues 1,3` or `pfc no-drop queues 7` or `pfc no-drop queues 0,7`. The range is from 0 to 3.

Defaults No lossless queues are configured.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information

- When you configure lossless queues on an interface, PFC priority configuration is not allowed on the dcb-input profile applied on the interface.
- The maximum number of lossless queues globally supported on the switch is two.

The following lists the dot1p priority-queue assignments.

dot1p Value in the Incoming Frame	Description heading
0	0
1	0
2	0
3	1

dot1p Value in the Incoming Frame	Description heading
4	2
5	3
6	3
7	3

show dcb

Displays the data center bridging status, the number of PFC-enabled ports, and the number of PFC-enabled queues.

Syntax `show dcb linecard <0-2> port-set <0-3>`

Parameters

- unit number** Enter the linecard number. The range is from 0 to 2.
- port-set number** Enter the port-set number. The range is from 0 to 3.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500

Usage Information Specify a linecard number on the Master switch in a stack.

NOTE: `show dcb` command without options displays DCB buffer details for all linecards, SFMs, and for all port-pipes.

Example

```
Dell#sh dcb linecard 2 port-set 0
DCB Status: Enabled, PFC Queue Count: 2
linecard Total Buffer PFC Total Buffer PFC Shared Buffer PFC Available Buffer
PP (KB) (KB) (KB) (KB)
-----
2 0 11210 7488 496 4992
Dell#
```

show interface pfc

Displays the PFC configuration applied to ingress traffic on an interface, including priorities and link delay.

Syntax `show interface port-type slot/port pfc {summary | detail}`

Parameters

- port-type slot/port pfc** Enter the port-type slot and port PFC information.
- {summary | detail}** Enter the keyword `summary` for a summary list of results or enter the keyword `detail` for a full list of results.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information

To clear the PFC TLV counters, use the `clear pfc counters interface port-type slot/port` command.

The following describes the `show interface pfc summary` command shown in the following example.

Field	Description
Interface	Interface type with linecard and port number.
Admin mode is on Admin is enabled	PFC admin mode is on or off with a list of the configured PFC priorities. When the PFC admin mode is on, PFC advertisements are enabled to be sent and received from peers; received PFC configuration take effect. The admin operational status for a DCBX exchange of PFC configuration is enabled or disabled.
Remote is enabled, Priority list Remote Willing Status is enabled	Operational status (enabled or disabled) of peer device for DCBX exchange of PFC configuration with a list of the configured PFC priorities. Willing status of peer device for DCBX exchange (Willing bit received in PFC TLV): enabled or disable.
Local is enabled	DCBX operational status (enabled or disabled) with a list of the configured PFC priorities.
Operational status (local port)	Port state for current operational PFC configuration: <ul style="list-style-type: none"> • <code>Init</code>: Local PFC configuration parameters were exchanged with the peer. • <code>Recommend</code>: Remote PFC configuration parameters were received from the peer. • <code>Internally propagated</code>: PFC configuration parameters were received from the configuration source.
PFC DCBX Oper status	Operational status for the exchange of the PFC configuration on the local port: match (up) or mismatch (down).
State Machine Type	Type of state machine used for DCBX exchanges of the PFC parameters: Feature — for legacy DCBX versions; Symmetric — for an IEEE version.
TLV Tx Status	Status of the PFC TLV advertisements: enabled or disabled.
PFC Link Delay	Link delay (in quanta) used to pause specified priority traffic.
Application Priority TLV: FCOE TLV Tx Status	Status of FCoE advertisements in application priority TLVs from the local DCBX port: enabled or disabled.
Application Priority TLV: SCSI TLV Tx Status	Status of iSCSI advertisements in application priority TLVs from the local DCBX port: enabled or disabled.
Application Priority TLV: Local FCOE Priority Map	Priority bitmap the local DCBX port uses in FCoE advertisements in application priority TLVs.
Application Priority TLV: Local iSCSI Priority Map	Priority bitmap the local DCBX port uses in iSCSI advertisements in application priority TLVs.
Application Priority TLV: Remote FCOE Priority Map	Status of FCoE advertisements in application priority TLVs from the remote peer port: enabled or disabled.

Field	Description
Application Priority TLV: Remote ISCSI Priority Map	Status of iSCSI advertisements in application priority TLVs from the remote peer port: enabled or disabled.
PFC TLV Statistics: Input TLV pkts	Number of PFC TLVs received.
PFC TLV Statistics: Output TLV pkts	Number of PFC TLVs transmitted.
PFC TLV Statistics: Error pkts	Number of PFC error packets received.
PFC TLV Statistics: Pause Tx pkts	Number of PFC pause frames transmitted.
PFC TLV Statistics: Pause Rx pkts	Number of PFC pause frames received.

Example (Summary)

```
Dell# show interfaces tengigabitethernet 0/49 pfc summary
Interface TenGigabitEthernet 0/49
  Admin mode is on
  Admin is enabled
  Remote is enabled, Priority list is 4
  Remote Willing Status is enabled
  Local is enabled
  Oper status is Recommended
  PFC DCBX Oper status is Up
  State Machine Type is Feature
  TLV Tx Status is enabled
  PFC Link Delay 45556 pause quantams
  Application Priority TLV Parameters :
  -----
  FCOE TLV Tx Status is disabled
  ISCSI TLV Tx Status is disabled
  Local FCOE PriorityMap is 0x8
  Local ISCSI PriorityMap is 0x10
  Remote FCOE PriorityMap is 0x8
  Remote ISCSI PriorityMap is 0x8

Dell# show interfaces tengigabitethernet 0/49 pfc detail
Interface TenGigabitEthernet 0/49
  Admin mode is on
  Admin is enabled
  Remote is enabled
  Remote Willing Status is enabled
  Local is enabled
  Oper status is recommended
  PFC DCBX Oper status is Up
  State Machine Type is Feature
  TLV Tx Status is enabled
  PFC Link Delay 45556 pause quanta
  Application Priority TLV Parameters :
  -----
  FCOE TLV Tx Status is disabled
  ISCSI TLV Tx Status is disabled
  Local FCOE PriorityMap is 0x8
  Local ISCSI PriorityMap is 0x10
  Remote FCOE PriorityMap is 0x8
  Remote ISCSI PriorityMap is 0x8
```

```
0 Input TLV pkts, 1 Output TLV pkts, 0 Error pkts,  
0 Pause Tx pkts, 0 Pause Rx pkts
```

show interface pfc statistics

Displays counters for the PFC frames received and transmitted (by dot1p priority class) on an interface.

Syntax `show interface port-type slot/port pfc statistics`

Parameters

<i>port-type</i>	Enter the port type.
<i>slot/port</i>	Enter the slot/port number.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information You can use this command even without enabling DCB on the system.

Example (Summary)

```
Dell (conf-if-te-0/1)#show int te 0/1 pfc statistics  
Interface TenGigabitEthernet 0/1  
Priority      Rx XOFF Frames      Rx Total Frames      Tx Total Frames  
-----  
-  
1             0                   0                   0  
2             0                   0                   0  
3             0                   0                   0

```

ETS Commands

dcb-enable

Enable data center bridging.

Syntax `dcb enable [pfc-queues 1|4]`
To disable DCB, use the `no dcb enable` command.

Parameters

<i>pfc-queues</i>	Enter the pfc-queue range. To disable DCB, use the <code>no dcb enable</code> command. The range is from 1 to 4.
--------------------------	--

Defaults The default is **2**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information

By default, iSCSI is enabled on the unit and the flow control is enabled on all of the interfaces. It is also acts as defaults when the link-level flow control is enabled on one or more interfaces. To enable DCB, do one of the following:

- Apply the `dcb-map` command with the `no pfc-mode` command on to all the interfaces.
- Disable flow-control on all of the interfaces.

clear ets counters

Clear all ETS TLV counters on an interface.

Syntax `clear ets counters port-type slot/port`

Parameters *port-type* Enter the keywords `port-type` then the slot/port information.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

show interface ets

Displays the ETS configuration applied to egress traffic on an interface, including priority groups with priorities and bandwidth allocation.

Syntax `show interface port-type fortyGigE/tenGigE X/x ets detail`

Parameters *interface* Enter the port-type which can be ten GigE or forty GigE and port ETS information.
detail Enter key details for a full list of results.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information

 **NOTE:** Please note that the `show interface ets details` are updated with Minimum and Maximum bandwidth details.

Example (Summary)

Example (Detail)

```
Dell#show interface fortyGigE 0/36 ets detail
Interface fortyGigE 0/36
Max Supported PG is 4
```

```

DCBX Commands

advertise dcbx-tlv

On a DCBX port with a manual role, configure the PFC and ETS TLVs advertised to DCBX peers.

Syntax `advertise dcbx-tlv {ets-conf | ets-reco | pfc} [ets-conf | ets-reco | pfc] [ets-conf | ets-reco | pfc]`

To remove the advertised ETS TLVs, use the `no advertise dcbx-tlv` command.

Parameters

{ets-conf | ets-reco | pfc} Enter the PFC and ETS TLVs advertised, where:

- `ets-conf`: enables the advertisement of ETS configuration TLVs.
- `ets-reco`: enables the advertisement of ETS recommend TLVs.
- `pfc`: enables the advertisement of PFC TLVs.

Defaults All PFC and ETS TLVs are advertised.

Command Modes PROTOCOL LLDP

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information You can configure the transmission of more than one TLV type at a time; for example: `advertise dcbx-tlv ets-conf ets-reco`.

You can enable ETS recommend TLVs (`ets-reco`) only if you enable ETS configuration TLVs (`ets-conf`). To disable TLV transmission, use the `no` form of the command; for example, `no advertise dcbx-tlv pfc ets-reco`.

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

dcbx port-role

Configure the DCBX port role the interface uses to exchange DCB information.

Syntax `dcbx port-role {config-source | auto-downstream | auto-upstream | manual}`
To remove DCBX port role, use the `no dcbx port-role {config-source | auto-downstream | auto-upstream | manual}` command.

Parameters

<code>config-source</code> <code>auto-downstream</code> <code>auto-upstream</code> <code>manual</code>	Enter the DCBX port role, where: <ul style="list-style-type: none">• <code>config-source</code>: configures the port to serve as the configuration source on the switch.• <code>auto-upstream</code>: configures the port to receive a peer configuration. The configuration source is elected from auto-upstream ports.• <code>auto-downstream</code>: configures the port to accept the internally propagated DCB configuration from a configuration source.• <code>manual</code>: configures the port to operate only on administer-configured DCB parameters. The port does not accept a DCB configuration received from a peer or a local configuration source.
---	---

Defaults **Manual**

Command Modes INTERFACE PROTOCOL LLDP

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

dcbx version

Configure the DCBX version used on the interface.

Syntax `dcbx version {auto | cee | cin | ieee-v2.5}`
To remove the DCBX version, use the `dcbx version {auto | cee | cin | ieee-v2.5}` command.

Parameters

<code>auto</code> <code>cee</code> <code>cin</code> <code>ieee-v2.5</code>	Enter the DCBX version type used on the interface, where: <ul style="list-style-type: none">• <code>auto</code>: configures the port to operate using the DCBX version received from a peer.• <code>cee</code>: configures the port to use CDD (Intel 1.01).• <code>cin</code>: configures the port to use Cisco-Intel-Nuova (DCBX 1.0).
---	--

- `ieee-v2`: configures the port to use IEEE 802.1az (Draft 2.5).

Defaults Auto

Command Modes INTERFACE PROTOCOL LLDP

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

debug dcbx

Enable DCBX debugging.

Syntax `debug dcbx {all | auto-detect-timer | config-exchng | fail | mgmt | resource | sem | tlv}`

To disable DCBX debugging, use the `no debug dcbx` command.

Parameters

<i>{all auto-detect-timer config-exchng fail mgmt resource sem tlv}</i>	Enter the type of debugging, where: <ul style="list-style-type: none"> • <code>all</code>: enables all DCBX debugging operations. • <code>auto-detect-timer</code>: enables traces for DCBX auto-detect timers. • <code>config-exchng</code>: enables traces for DCBX configuration exchanges. • <code>fail</code>: enables traces for DCBX failures. • <code>mgmt</code>: enables traces for DCBX management frames. • <code>resource</code>: enables traces for DCBX system resource frames. • <code>sem</code>: enables traces for the DCBX state machine. • <code>tlv</code>: enables traces for DCBX TLVs.
--	---

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

fcoe priority-bits

Configure the FCoE priority advertised for the FCoE protocol in application priority TLVs.

Syntax `fcoe priority-bits priority-bitmap`

To remove the configured FCoE priority, use the `no fcoe priority-bits` command.

Parameters ***priority-bitmap*** Enter the priority-bitmap range. The range is from 1 to FF.

Defaults	0x8				
Command Modes	PROTOCOL LLDP				
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.				
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description				
9.7(0.0)	Introduced on the Z9500.				
Usage Information	This command is available at the global level only.				

iscsi priority-bits

Configure the iSCSI priority advertised for the iSCSI protocol in application priority TLVs.

Syntax	<code>iscsi priority-bits <i>priority-bitmap</i></code> To remove the configured iSCSI priority, use the <code>no iscsi priority-bits</code> command.				
Parameters	<i>priority-bitmap</i> Enter the priority-bitmap range. The range is from 1 to FF.				
Defaults	0x10				
Command Modes	PROTOCOL LLDP				
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.				
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description				
9.7(0.0)	Introduced on the Z9500.				
Usage Information	This command is available at the global level only.				

show interface dcbx detail

Displays the DCBX configuration on an interface.

Syntax	<code>show interface <i>port-type</i> <i>slot/port</i> dcbx detail</code>				
Parameters	<i>port-type</i> Enter the port type. <i>slot/port</i> Enter the slot/port number.				
Command Modes	EXEC Privilege				
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.				
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description				
9.7(0.0)	Introduced on the Z9500.				
Usage Information	To clear DCBX frame counters, use the <code>clear dcbx counters interface <i>stack-unit/port</i></code> command.				

The following describes the `show interface dcbx detail` command shown in the following example.

Field	Description
Interface	Interface type with chassis slot and port number.
Port-Role	Configured the DCBX port role: auto-upstream, auto-downstream, config-source, or manual.
DCBX Operational Status	Operational status (enabled or disabled) used to elect a configuration source and internally propagate a DCB configuration. The DCBX operational status is the combination of PFC and ETS operational status.
Configuration Source	Specifies whether the port serves as the DCBX configuration source on the switch: true (yes) or false (no).
Local DCBX Compatibility mode	DCBX version accepted in a DCB configuration as compatible. In auto-upstream mode, a port can only receive a DCBX version supported on the remote peer.
Local DCBX Configured mode	DCBX version configured on the port: CEE, CIN, IEEE v2.5, or Auto (port auto-configures to use the DCBX version received from a peer).
Peer Operating version	DCBX version that the peer uses to exchange DCB parameters.
Local DCBX TLVs Transmitted	Transmission status (enabled or disabled) of advertised DCB TLVs (see TLV code at the top of the show command output).
Local DCBX Status: DCBX Operational Version	DCBX version advertised in Control TLVs.
Local DCBX Status: DCBX Max Version Supported	Highest DCBX version supported in Control TLVs.
Local DCBX Status: Sequence Number	Sequence number transmitted in Control TLVs.
Local DCBX Status: Acknowledgment Number	Acknowledgement number transmitted in Control TLVs.
Local DCBX Status: Protocol State	Current operational state of the DCBX protocol: ACK or IN-SYNC.
Peer DCBX Status: DCBX Operational Version	DCBX version advertised in Control TLVs received from the peer device.
Peer DCBX Status: DCBX Max Version Supported	Highest DCBX version supported in Control TLVs received from the peer device.
Peer DCBX Status: Sequence Number	Sequence number transmitted in Control TLVs received from the peer device.
Peer DCBX Status: Acknowledgment Number	Acknowledgement number transmitted in Control TLVs received from the peer device.

Field	Description
Total DCBX Frames transmitted	Number of DCBX frames sent from the local port.
Total DCBX Frames received	Number of DCBX frames received from the remote peer port.
Total DCBX Frame errors	Number of DCBX frames with errors received.
Total DCBX Frames unrecognized	Number of unrecognizable DCBX frames received.

Example

```
Dell(conf)# show interface tengigabitethernet 0/49 dcbx detail
Dell#show interface te 0/49 dcbx detail

```

dcb-map

Create a DCB map to configure priority flow control (PFC) and enhanced transmission selection (ETS) on Ethernet ports that support converged Ethernet traffic. Apply the DCB map to an Ethernet interface.

Syntax `dcb-map map-name`

Parameters	<i>map-name</i>	Enter a DCB map name. The maximum number of alphanumeric characters is 32.
Defaults		None. There are no pre-configured PFC and ETS settings on S5000 Ethernet interfaces.
Command Modes		CONFIGURATION INTERFACE
Command History	Version	Description
	9.7(0.0)	Introduced on the Z9500.
Usage Information	<p>A DCB map is a template used to configure DCB parameters and apply them on converged Ethernet interfaces. DCB parameters include priority-based flow control (PFC) and enhanced traffic selection (ETS).</p> <p>To display the PFC and ETS settings in DCB maps, enter the <code>show qos dcb-map</code> command.</p> <p>Use the <code>dcb-map</code> command to create a DCB map to specify PFC and ETS settings and apply it on Ethernet ports. After you apply a DCB map to an interface, the PFC and ETS settings in the map are applied when the Ethernet port is enabled. DCBx is enabled on Ethernet ports by default.</p> <p>The <code>dcb-map</code> command is supported only on physical Ethernet interfaces.</p> <p>To remove a DCB map from an interface, enter the <code>no dcb-map map-name</code> command in Interface configuration mode.</p>	

dcb-map sfm all backplane all

Assign the specified DCB Map on all backplane ports of the switch linecard.

Syntax	<code>dcb-map sfm all backplane all <dcb-map-name></code>					
Parameters	<i>map-name</i>	Enter a DCB map name. The maximum number of alphanumeric characters is 32.				
Defaults		none				
Command Modes		GLOBAL CONFIGURATION				
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <tr> <td>Version</td> <td>Description</td> </tr> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </table>		Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description					
9.7(0.0)	Introduced on the Z9500.					
Usage Information	<p>You can configure DCB-MAP on backplane ports in both leaf and spine. To remove a DCB Map from all backplane ports, enter the <code>[no] dcb-map sfm all backplane all <dcb-map-name></code> command in Interface configuration mode.</p>					

priority-pgid

Assign 802.1p priority traffic to a priority group in a DCB map.

Syntax	<code>priority-pgid dot1p0_group-num dot1p1_group-num dot1p2_group-num dot1p3_group-num dot1p4_group-num dot1p5_group-num dot1p6_group-num dot1p7_group-num</code>	
Parameters	<i>dot1p0_group-num</i>	Enter the priority group number for each 802.1p class of traffic in a DCB map.

dot1p1_group-num
dot1p2_group-num
dot1p3_group-num
dot1p4_group-num
dot1p5_group-num
dot1p6_group-num
dot1p7_group-num

Defaults None

Command Modes DCB MAP

Command History	Version	Description
	9.6(0.0)	Introduced on the Z9500.

Usage Information PFC and ETS settings are not pre-configured on Ethernet ports. You must use the `dcb-map` command to configure different groups of 802.1p priorities with PFC and ETS settings.

Using the `priority-pgid` command, you assign each 802.1p priority to one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group. For example, the `priority-pgid 0 0 0 1 2 4 4 4` command creates the following groups of 802.1p priority traffic:

- Priority group 0 contains traffic with dot1p priorities 0, 1, and 2.
- Priority group 1 contains traffic with dot1p priority 3.
- Priority group 2 contains traffic with dot1p priority 4.
- Priority group 4 contains traffic with dot1p priority 5, 6, and 7.

To remove a `priority-pgid` configuration from a DCB map, enter the `no priority-pgid` command.

priority-group bandwidth pfc

Configure the ETS bandwidth allocation and PFC mode used to manage port traffic in an 802.1p priority group.

Syntax `priority-group group-num {bandwidth percentage| strict-priority} pfc {on | off}[no] priority-group <x> {bandwidth <0-100> | strict-priority } [[committed | peak] | [peak | committed] {<0-40000>} [<0-4000>]} pfc {on | off}`

Parameters

priority-group group-num Enter the keyword `priority-group` followed by the number of an 802.1p priority group. Use the `priority-pgid` command to create the priority groups in a DCB map.

bandwidth percentage Enter the keyword `bandwidth` followed by a bandwidth percentage allocated to the priority group. The range of valid values is 1 to 100. The sum of all allocated bandwidth percentages in priority groups in a DCB map must be 100%.

strict-priority	Configure the priority-group traffic to be handled with strict priority scheduling. Strict-priority traffic is serviced first, before bandwidth allocated to other priority groups is made available.
pfcc {on off}	Configure whether priority-based flow control is enabled (on) or disabled (off) for port traffic in the priority group.
Committed/Peak	Enter the bandwidth percentage for the priority group.

Defaults None

Command Modes DCB MAP

Command History	Version	Description
	9.7(0.0)	Introduced on the Z9500.

Usage Information Use the `dcb-map` command to configure priority groups with PFC and/or ETS settings and apply them to Ethernet interfaces.

Use the `priority-pgid` command to map 802.1p priorities to a priority group. You can assign each 802.1p priority to only one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group.

Repeat the `priority-group bandwidth pfc` command to configure PFC and ETS traffic handling for each priority group in a DCB map.

You can enable PFC on a maximum of two priority queues.

If you configure more than one priority group as strict priority, the higher numbered priority queue is given preference when scheduling data traffic.

If a priority group does not use its allocated bandwidth, the unused bandwidth is made available to other priority groups.

To remove a priority-group configuration in a DCB map, enter the `no priority-group bandwidth pfc` command.

By default, equal bandwidth is assigned to each dot1p priority in a priority group. Use the `bandwidth` parameter to configure the bandwidth percentage assigned to a priority group. The sum of the bandwidth allocated to all priority groups in a DCB map must be 100% of the bandwidth on the link. You must allocate at least 1% of the total port bandwidth to each priority group.

dcb-map linecard all backplane all

Apply the specified DCB map on all ports of the switch linecard.

Syntax `dcb-map linecard <0-2/all> port-set <0-3/all> backplane all <dcb-map-name>`
 To remove the PFC and ETS settings in a DCB map from all linecard units, use the `no dcb-map linecard <0-2/all> port-set <0-3/all>backplane all <dcb-map-name>` command.

Parameters **dcb-map-name** Enter the name of the DCB map.

Defaults None

Command Modes CONFIGURATION

Command History	Version	Description
	9.7(0.0)	Introduced on the Z9500.

Usage Information The `dcb-map linecard all backplane all` command overwrites any previous DCB maps applied to backplane

dcb-policy buffer-threshold sfm all port-set all backplane all

Assign the DCB policy to all sfm and backplane ports interfaces. This setting takes precedence over the global buffer-threshold interface configuration.

Syntax `dcb-policy buffer-threshold sfm all port-set all backplane all <dcb-policy-name>`

Parameters **buffer-threshold** Configure the profile name for the DCB buffer threshold

Defaults None.

Command Modes GLOBAL CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information You can configure dcb-policy on all sfm and backplane ports and assign dcb-policy to the backplane ports.

Example `dcb-policy buffer-threshold sfm all backplane all test`

dcb pfc-shared-buffer-size

Configure the maximum amount of shared buffer size for PFC packets in kilobytes.

Syntax `dcb pfc-shared-buffer-size <value> linecard <0-2/all> port-set <0-3/all>`

Parameters **KB** Enter a number in the range from 0 to 11210.

Default 2496KB

Command Modes CONFIGURATION mode

Command History

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information Configure the maximum shared buffer available for PFC traffic. You can choose to increase or decrease the shared buffer that is allocated in the system by default. Configure the shared buffer size less than the total PFC buffer size. If the buffer size and DCB buffer threshold settings are applied on one or more ports, a validation is performed to determine whether following condition is satisfied: If the shared buffer size is more than the total PFC buffer size value, the configuration is not saved and a system logging message is generated as follows:

Shared-pfc-buffer-size <= (Total-pfc-buffer-size — Σpfc priority <> buffer-size on each port, priority).

```
Dell(conf)#dcb pfc-shared-buffer-size 2000 %ERROR: pfc shared buffer size configured cannot accommodate existing buffer requirement in the system.
```

Enter a smaller value for the shared buffer size or increase the total buffer size appropriately by using the `dcb pfc-total- buffer-size` command.

Example `Dell(conf)#dcb pfc-shared-buffer-size 5000`

dcb pfc-shared-buffer-size sfm all

Configure the maximum amount of shared buffer size for PFC packets on all sfm ports in kilobytes.

Syntax	<code>dcb pfc-shared-buffer-size <value> sfm all</code>
Parameters	KB Enter a number in the range from 0 to 11210.
Defaults	The default is 3328KB for Z9500 platform.
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information  **NOTE:** Please note that the existing "dcb pfc-shared-total-size / pfc-shared-buffer-size <value>" without any options is still applicable for Z9500. When executed, it configures the value to both backplane and sfm units.

Example `dcb pfc-shared-buffer-size 3000 sfm all`

dcb-buffer-threshold

Configure the profile name for the DCB buffer threshold.

Syntax	<code>dcb buffer-threshold</code>				
Parameters	profile-name Enter the name of the profile, which can be a string of up to 32 characters in length.				
Default	None				
Command Modes	CONFIGURATION mode				
Command History	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the Z9500.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description				
9.7(0.0)	Introduced on the Z9500.				
Usage Information	When you enter the profile name, you enter the DCB buffer threshold configuration mode. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets.				

Example `S4810-YU-MR-Dell(conf)#dcb buffer-threshold test`

Example of commands in dcb buffer-threshold mode

```
qos-policy-buffer queue queue-num pause no-drop queue buffer-size
size pause-threshold threshold-value resume-offset threshold-value shared-
threshold-weight size
```

```
Dell(conf)# qos-policy-buffer test
Dell(conf-qos-policy-buffer)#queue 0 pause no-drop buffer-size
128000 pause-threshold 103360 resume-threshold 83520
Dell(conf-qos-policy-buffer)# queue 4 pause no-drop buffer-size
128000 pause-threshold 103360 resume-threshold 83520
```

```
priority value buffer-size size pause-threshold threshold-value resume-  
offset threshold-value shared-threshold-weight size
```

```
Dell(conf-dcb-buffer-thr)#priority 0 buffer-size 52 pause-threshold 16  
resume-offset 10 shared-threshold-weight 7
```

priority

Syntax

```
priority value buffer-size size pause-threshold threshold-value resume-  
offset threshold-value shared-threshold-weight size
```

Parameters

priority	Specify the priority of the queue for which the buffer space settings apply
value	Enter a number in the range of 0 to 7 to denote the priority that is allocated to the dynamic buffer control mechanism
buffer-size	Ingress buffer size
size	Size of the ingress buffer in KB. Enter a number in the range from 0 to 7787. The default is 45 KB.
pause-threshold	Buffer limit for pause frames to be sent
threshold-value	Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range from 0 to 7787. The default is 10 KB.
resume-offset	Buffer offset limit for resuming in KB
threshold-value	Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range from 1 to 7787. The default is 10 KB.
shared-threshold-weight	Buffer shared threshold weight
size	Weightage of the priorities on the shared buffer size in the system. Enter a number in the range from 0 to 9. The default shared threshold weight is 10.

Default

The default size of the ingress buffer is 45 KB. The default buffer limit at which the port sends the pause to peer and recommences the sending of packets to the peer is 10 KB. The default threshold weight of the shared buffer space is 10.

Command Modes DCB-BUFFER-THRESHOLD mode

Command History

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information

For each priority, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use the `priority` command to set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all eight priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities are configured within the DCB input policy is applied, then the configuration for those priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

Example

```
Dell(conf-dcb-buffer-thr)#priority 0 buffer-size 52 pause-threshold 16  
resume-offset 10 shared-threshold-weight 7
```

show linecard port-set backplane all

Displays the PFC buffer threshold assigned to a QoS policy.

Syntax `show linecard <0-2/all> port-set <0-3/all> backplane all [pf buffer-threshold | details | statistics] | [ets details]`

Parameters *detail* Enter the keyword detail for a full list of results.

Command Modes EXEC

```

qos-policy-buffer

Create a QoS policy buffer and enter the configuration mode to configure the no-drop queues, ingress buffer size, buffer limit for pausing, and buffer offset limit for resuming

Syntax `qos-policy-buffer queue queue-num pause no-drop queue buffer-size size pause-threshold threshold-value resume-offset threshold-value shared-threshold-weight size`

Parameters

policy-name	Name of the QoS policy buffer that is applied to an interface for this setting to be effective with the DCB input policy. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. This method of configuration enables different peer-provided and administrative priorities to be set up because the intended queue is directly configured instead of determining the priority to queue mapping for local and remote parameters.
queue 0 to queue 7	Specify the queue number to which the QoS policy buffer parameters apply
pause	Pause frames to be sent at the specified buffer limit levels and pause packet settings
no-drop	The packets for this queue must not be dropped
value	Enter a number in the range of 0 to 7 to denote the priority to be allocated to the dynamic buffer control mechanism
buffer-size	Ingress buffer size

size	Size of the ingress buffer in KB. Enter a number in the range from 0 to 7787. The default is 45KB.
pause-threshold	Buffer limit for pause frames to be sent
threshold-value	Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range from 0 to 7787. The default is 10KB.
resume-offset	Buffer offset limit for resuming in KB
threshold-value	Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range from 1 to 7787. The default is 10KB.
shared-threshold-weight	Buffer shared threshold weight
size	Weightage of the priorities on the shared buffer size in the system. Enter a number in the range from 0 to 9. The default shared threshold weight is 10.

Default The default size of the ingress buffer is 45KB. The default buffer limit at which the port sends the pause to peer and recommences the sending of packets to the peer is 10KB. The default threshold weight of the shared buffer space is 10.

Command Modes DCB-BUFFER-THRESHOLD mode

Command History	Version	Description
	9.7(0.0)	Introduced on the Z9500.

Usage Information You must apply this buffer policy at the interface level for the attributes to be applicable with the DCB input policy.

For each QoS policy buffer, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all 8 priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

Example

```
S4810-YU-MR-Dell(conf)# qos-policy-buffer test
S4810-YU-MR-Dell (conf-qos-policy-buffer)#queue 0 pause no-drop buffer-size 128000 pause-threshold 103360 resume-threshold 83520
S4810-YU-MR-Dell (conf-qos-policy-buffer)# queue 4 pause no-drop buffer-size 128000 pause-threshold 103360 resume-threshold 83520
```

dcb-policy buffer-threshold (Interface Configuration)

Assign the DCB policy to the DCB buffer threshold profile on interfaces. This setting takes precedence over the global buffer-threshold setting.

Syntax `dcb-policy buffer-threshold linecard <0-2/all> port-set <0-3/all> backplane all <dcb-policy-name>`

Parameters **buffer-threshold** Configure the profile name for the DCB buffer threshold

Default None

Command Modes INTERFACE mode

Command History	Version	Description
	9.7(0.0)	Introduced on the Z9500.

Usage Information

You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.

Example

```
dcb-policy buffer-threshold linecard all portset all backplane all test
```

dcb-policy buffer-threshold linecard all backplane all

Assign the DCB buffer configuration on the backplane ports. This setting takes precedence over the global buffer-threshold setting.

Syntax `[no] dcb-policy buffer-threshold linecard <0-2>|all [port-set <0-3/all>] backplane all <dcb-policy-name>`

- Parameters**
- buffer-threshold** Configure the profile name for the DCB buffer threshold
 - linecard** Enter the keyword **linecard** unit identification.
 - backplane all** Enter the keywords **backplane** all to assign DCB policy to the backplane ports.

Defaults None.

Command Modes GLOBAL CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information You can configure the DCB buffer configuration on the backplane ports.

service-class buffer shared-threshold-weight

Create a service class and associate the threshold weight of the shared buffer with each of the queues per port in the egress direction.

Syntax `[No] Service-class buffer shared-threshold-weight {[queue0 number] || [queue1 number] || [queue2 number] || [queue3 number] || [queue4 number] || [queue5 number] || [queue6 number] || [queue7 number]}`

- Parameters**
- buffer** Define the shared buffer settings
 - shared-threshold-weight** Specify the weight of a queue for the shared buffer space
 - queue 0 to queue 7** To apply the shared-threshold weight, specify the queue number

number Enter a weight for the queue on the shared buffer as a number in the range of 1 to 11.

Default The default threshold weight on the shared buffer for each queue is 9. Therefore, each queue can consume up to 66.67 percent of available shared buffer by default.

Command Modes INTERFACE mode

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.9(0.0)	Introduced on the Z9500, S4810, S4820T, S5000, and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S6000.

Usage Information You can configure all the data queues. You can configure queues 0-7.

The following table describes the mapping between the threshold weight of the shared buffer on the queue. It also shows the percentage of the available shared buffer used by the queues for each of the corresponding threshold weights of the shared buffer:

shared-threshold-weight on the queue	% of available shared buffer that can be consumed by the queue
0	No dynamic sharing; shared buffer = 0.
1	0.77%
2	1.54%
3	3.03%

Example

show qos dcb-buffer-threshold

Displays the DCB buffer threshold assigned to a QoS policy.

Syntax `show qos dcb buffer-threshold {name}`

Parameters *name* Enter the name of the profile, which can be a string of up to 32 characters in length.

Command Modes EXEC
EXEC Privilege

Command History

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information The following table describes the output fields displayed for the `show` command:

Table 4. Output Description for `show qos dcb buffer-threshold` command

Field	Description
Name	Name of the DCB buffer threshold profile
Buffer threshold parameters	Buffer size allocated for the PFC priority queue and the priority of the queue

Example

```
Dell#show qos dcb buffer-threshold
Name      :      test1
Buffer threshold parameters:
pfc priority 0 buffer-size 40
pfc priority 3 buffer-size 50
```

show running-config dcb-buffer-threshold

Displays the DCB buffer threshold details in the running configuration.

Syntax `show running-config buffer-threshold`

Command Modes EXEC
EXEC Privilege

Command History

Version	Description
9.7(0.0)	Introduced on the Z9500.

Usage Information The following table describes the output fields displayed for the `show running-config dcb-buffer-threshold` command:

Table 5. Output Description for `show running-config buffer-threshold` command

Field	Description
Profile name	Name of the DCB buffer threshold profile
Priority	The priority of the queue for which the buffer space settings apply
buffer-size	Ingress buffer size
pause-threshold-value	Buffer limit at which the port sends the pause to peer in KB.

Table 5. Output Description for show running-config buffer-threshold command (continued)

Field	Description
resume-threshold-value	Buffer offset limit at which the port resumes the peer in KB.

Example

```
Dell#show run buffer-threshold
!
dcb-buffer-threshold test1
pfc priority 0 buffer-size 40
pfc priority 3 buffer-size 50
!
dcb-buffer-threshold test2
pfc priority 0 buffer-size 80 pause-threshold 50
!
dcb-buffer-threshold test3
pfc priority 0 buffer-size 80 pause-threshold 60 resume-threshold 30
```

```
On interface in which PFC is not enabled:

Dell#show interface tengigabitethernet 0/20 pfc buffer-threshold
```

The following table describes the output fields displayed for the show interface pfc buffer-threshold command:

Table 6. Output Description for show interface pfc buffer-threshold command

Field	Description
queue	Number of the queue
lossless	Whether the queue is a lossy or lossless queue for which buffer threshold is configured
buffer-size	Ingress buffer size
pause-threshold-value	Buffer limit at which the port sends the pause to peer in KB.
resume-threshold-value	Buffer offset limit at which the port resumes the peer in KB.
shared threshold weight	Weightage of the priorities on the shared buffer size in the system.

dcb pfc-total-buffer-size

Configure the total buffer size for PFC in kilobytes.

Syntax `dcb pfc-total-buffer-size <value> linecard <0-2/all> port-set <0-3/all>[no]`
`dcb pfc-total-buffer-size <value> linecard <0-2/all> port-set <0-3/all>`

Parameters *all* Configure on all linecards.

Default **7488**

Command Modes CONFIGURATION mode

Command History	<table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description				
9.7(0.0)	Introduced on the Z9500.				
Usage Information	<p>Configure the maximum buffer available for PFC traffic. You can choose to increase or decrease the buffer size that is allocated in the system by default. However, if you modify the PFC buffer size to be lower than the previously configured PFC buffer size, the system determines whether this reduction in size is valid without disrupting the existing configuration. In such a scenario, disable and re-enable DCB. For example, if you modify the total buffer size to be 4000 KB from the previous size of 5000 KB, an error message is displayed that this reduction cannot be performed owing to existing system configuration because of queues that are being currently processed.</p> <p>The lossless queue limit per port is validated based on the <code>dcb pfc-queues</code> command. PFC queue configuration identifies the maximum number of queues a port can support. Although the queue limit per port is a baseline when dynamic buffering is enabled, the limit per port for queues depends on the availability of the buffer.</p>				
Example	<pre>Dell(conf)#dcb pfc-total-buffer-size 5000 Dell(conf)#dcb pfc-total-buffer-size 4000 %ERROR: Total pfc buffer size configured cannot accommodate existing buffer requirement in the system.</pre>				

dcb pfc-queues

Configure the number of PFC queues.

Syntax	<code>dcb pfc-queues value</code>				
Parameters	<p>value Enter the number of PFC queues in the range of 0 through 4. The number of ports supported based on lossless queues configured will depend on the buffer.</p>				
Default	The default number of PFC queues in the system is 2 for S4810 and 1 for S6000 platforms.				
Command Modes	CONFIGURATION mode				
Command History	<table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the Z9500.
Version	Description				
9.7(0.0)	Introduced on the Z9500.				
Usage Information	<p>You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.</p>				
Example	<pre>Dell(conf)#dcb pfc-queues 4</pre>				

dcb <ets | pfc> enable

Enable priority flow control or enhanced transmission selection on interface.

Syntax	<pre>dcb <ets pfc> enable pfc >enable</pre> <ul style="list-style-type: none"> • To disable ETS on interface, use “no dcb ets enable” command. • To disable PFC on interface, use “no dcb pfc enable” command.
Defaults	Enable
Command Modes	INTERFACE

Command History**Version****Description****9.7(0.0)**

Introduced on the Z9500.

Usage Information

PFC and ETS are enabled by default on the interfaces when DCB is globally enabled (refer to `dcb enable`). In some network topology, you may want to disable PFC on an interface and apply link level flow control; Similarly you may want to disable ETS on an interface and apply QoS bandwidth configurations.

Limitations

- “`dcb-map`” CLI on interface is mutually exclusive to “`no dcb ets enable`” and “`no dcb pfc enable`”.
- “`pfc priority`” CLI is mutually exclusive to “`no dcb pfc enable`” command.

Related Commands

[dcb-map](#) — applies dcb-map profile on interface.

Debugging and Diagnostics

Use the debugging and diagnostics commands described in this chapter to troubleshoot switch operation.

This chapter contains the following sections:

- [Diagnostics and Monitoring Commands](#)
- [Offline Diagnostic Commands](#)
- [Buffer Tuning Commands](#)
- [Hardware Commands](#)

Topics:

- [Diagnostics and Monitoring Commands](#)
- [Offline Diagnostic Commands](#)
- [Buffer Tuning Commands](#)
- [Hardware Commands](#)

Diagnostics and Monitoring Commands

The following section describes the diagnostics and monitoring commands.

For similar commands, refer to the [Control and Monitoring](#) chapter.

logging coredump

Enable a core dump.

Syntax `logging coredump {cp | linecard {slot-number |all} } rps`

Parameters

cp	Enter a core dump for the Control Processor.
linecard	Enter a core dump for a line card.
rps	Enter a core dump for Route Processor 1 or 2.

Defaults The kernel core dump is enabled by default for the Route Processor (RP 1 and 2 on the E-Series). The kernel core dump for the Control Processor and application core dump are disabled on all systems by default.

Command Modes CONFIGURATION

Command History

Version 9.7(0.0)	Introduced on the Z9500.
Version 8.3.19.0	Introduced on the S4820T.
Version 8.3.11.1	Introduced on the Z9000.
Version 8.3.7.0	Introduced on the S4810.
Version 7.7.1.0	Restructured the command to accommodate core dumps for CP. Introduced on the C-Series and S-Series.
Version 6.5.1.0	Application coredump naming convention enhanced to include application.
Version 6.1.1.0	Introduced

Usage Information The kernel core dump can be large and may take up to five to 30 minutes to upload. The system does not overwrite application core dumps so you should delete them as necessary to conserve space on the flash. If the flash is out of memory, the core dump is aborted. The system completes the core dump process and waits until the upload is complete before rebooting the system.

Related Commands

[logging coredump server](#) – designates a server to upload kernel core-dumps.

logging coredump server

Enable the platform to send application core dumps to an FTP server.

Syntax `logging coredump server {ftp-server | ip-address | ipv6-address} username {ftp-username | name} password [type] {ftp-password | password}`

Parameters

ftp-server	Enter the hostname or IP address of the FTP server where Dell Networking OS sends application core dumps.
ip-address	Enter the IP address of the target server in dotted decimal format.
ipv6-address	Enter an IPv6 address of the target server, in the x:x:x:x format.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.
name	Enter a username to access the target server.
ftp-username	Enter the user name to access the target ftp server.
type	Enter the password type: <ul style="list-style-type: none">• Enter 0 to enter an un-encrypted password.• Enter 7 to enter a password that has already been encrypted using a Type 7 hashing algorithm.
password	Enter a password to access the target server.
ftp-password	Enter the password of the target ftp server where the application core dump files will be uploaded. The password can be up to 15 alphanumeric characters; no special characters are allowed.

Defaults Crash kernel files are uploaded to flash by default.

Command Modes CONFIGURATION

Command History

Version 9.7(0.0)	Introduced on the Z9500.
Version 9.0.2.0	Introduced on the S6000.
Version 9.0.0.0	Added information about ftp password and URL to <i>Usage Information</i> .
Version 8.3.19.0	Introduced on the S4820T.
Version 8.3.11.1	Introduced on the Z9000.
Version 8.3.7.0	Introduced on the S4810.
Version 8.4.1.0	Added support for IPv6.
Version 7.7.1.0	Restructured the command to accommodate core dumps for CP. Introduced on the C-Series and S-Series.
Version 6.1.1.0	Introduced

Usage Information

You must use this command to enable core dump logging before a software exception occurs. If the FTP server is unreachable, Dell Networking OS aborts the application core dump.

When you enable this command to allow the system to automatically upload application core dumps to an FTP server, you are requested to enter a username and password. Use the username and password of the FTP server where the core files are being moved. The password can be up to 15 alphanumeric characters only; no special characters are allowed. After you enter the password, an FTP URL is created with the credentials in the operating system. The CLI monitors application core dumps in the unit. Any application core dumps that occur are automatically uploaded to the FTP server.

Because flash space may be limited, using this command ensures your entire crash kernel files are uploaded successfully and completely. You can only configure a single coredump server. Configuration of a new coredump server over-writes any previously configured server.

 **NOTE:** You must disable logging coredump before you designate a new server destination for your core dumps.

Offline Diagnostic Commands

The offline diagnostics test suite is useful for isolating faults and debugging hardware. While tests are running, Dell EMC Networking OS results are saved as a text file (TestReport-SU-X.txt) in the flash directory. This `show file` command is available only on master and standby.

Important Points to Remember

- Offline diagnostics can only be run when the unit is offline.
- You can only run offline diagnostics on a unit to which you are connected via the console. In other words, you cannot run diagnostics on a unit to which you are connected to via a stacking link.
- Diagnostic results are printed to the screen. Dell EMC Networking OS does not write them to memory.
- Diagnostics only test connectivity, not the entire data path.

diag

Run offline diagnostics on all CPUs or on a specified CPU in the switch.

Syntax `diag {all | {{cp | rp | linecard} unit-id} [alllevels | level0 | level1 | level2] [interactive] [testname name] [terminate]`

Parameters		
all		Enter the keyword <code>all</code> to run offline diagnostic tests on all Z9500 CPUs, including the Control Processor, Route Processor, and line cards.
cp unit-id		Enter the <code>cp unit-id</code> parameters to run offline diagnostic tests only on the Control Processor CPU. The Control Processor CPU ID is 0.
rp unit-id		Enter the keyword <code>rp unit-id</code> parameters to run offline diagnostic tests only on the Route Processor CPU. The Route Processor CPU ID is 0.
linecard unit-id		Enter the <code>linecard unit-id</code> parameters to run offline diagnostic tests only on a specified line card. The range of line-card CPU IDs is from 0 to 2. Each line-card CPU processes packets on the corresponding Z9500 line card; for example, line-card CPU 1 processes packets on line card 1.
alllevels		Enter the keyword <code>alllevels</code> to run the complete set of offline diagnostic tests.
level0		Enter the keyword <code>level0</code> to run Level 0 diagnostics. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.
level1		Enter the keyword <code>level1</code> to run Level 1 diagnostics. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, EEPROM, and CPLD) wherever possible. There are no tests on 10G links. At this level, ports are shut down automatically.
level2		Enter the keyword <code>level2</code> to run Level 2 diagnostics. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations.
interactive		Enter the keyword <code>interactive</code> to run offline diagnostics in interactive mode.

testname *name* Enter the `testname name` parameters to run a specified offline diagnostic test. Enclose the test-case name in double quotes (" "). For example: `diag level1 testname "first"`.

terminate Enter the keyword `terminate` to stop the offline diagnostic tests that are running.

Defaults All offline diagnostic tests are run on all Z9500 CPUs (Control Processor, Route Processor, and line cards).

Command Modes EXEC Privilege

Usage Information Before you use this command to run diagnostic test, make sure the switch is offline (`offline system` command).

You are prompted to reboot when the off-line diagnostics complete.

Use the `show diag` command to view a summary of diagnostic information presented for each Z9500 CPU.

At the end of offline diagnostic tests, a test report is generated. The filename of the report is `TestReport-{CP/LP/RP}-N.txt`, where `{CP/LP/RP}-N` identifies the CPU and CPU ID on which the diagnostics were run: Route Processor 0, Control Processor 0 or a line-card CPU {0-2}. The report is stored at `flash://` and `ramdisk:/diagnostic`. To view the test report, use the `show file flash://filename` command. A sample `filename` is `TestReport-LP-2`.

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version 9.2(1.0) Introduced on the Z9500.

Version 8.3.19.0 Introduced on the S4820T.

Version 8.3.11.1 Introduced on the Z9000.

Version 8.3.7.0 Introduced on the S4810.

Version 8.3.1.0 Introduced the `verbose` option.

Version 7.7.1.0 Introduced on the S-Series.

Related Commands [offline stack-unit](#) — bring a switch offline to run diagnostic tests.
[online stack-unit](#) — reload the system after running offline diagnostic tests.

offline stack-unit

Place a stack unit in the offline state.

Syntax `offline stack-unit number`

Parameters *number* Enter the stack-unit id.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added a warning message to the off-line diagnostic.
7.7.1.0	Introduced on the S-Series.

Usage Information

You cannot enter this command on a Master or Standby unit.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

Warning - Diagnostic execution will cause stack-unit to reboot after completion of diags.

Proceed with Offline-Diags [confirm yes/no]:y

online stack-unit

Place a stack unit in the online state.

Syntax `online stack-unit number`

Parameters *number* Enter the stack-unit number.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

Warning - Diagnostic execution will cause stack-unit to reboot after completion of diags.

Proceed with Offline-Diags [confirm yes/no]:y

show diag

Display results of offline diagnostic tests on a switch.

Syntax `show diag {all | {{cp | rp | linecard} unit-id} [summary | detail]`

Parameters

all	Enter the keyword <code>all</code> to display the results of offline diagnostic tests on all Z9500 CPUs, including the Control Processor, Route Processor, and line cards.
cp unit-id	Enter the <code>cp unit-id</code> parameters to display the results only of the offline diagnostic tests run on the Control Processor CPU. The Control Processor CPU ID is 0.
rp unit-id	Enter the <code>rp unit-id</code> parameters to display the results only of the offline diagnostic test srun on the Route Processor CPU. The Route Processor CPU ID is 0.
linecard unit-id	Enter the <code>linecard unit-id</code> parameters to display the results only of the offline diagnostic test run on a specified line card. he range of line-card CPU IDs is from 0 to 2. Each line-card CPU processes packets on the corresponding Z9500 line card; for example, line-card CPU 1 processes packets on line card 1.
summary	Enter the keyword <code>summary</code> to display a summary of the offline diagnostic test results.
detail	Enter the keyword <code>detail</code> to display detailed information about the offline diagnostic test results.

Defaults

A summary of the results of offline diagnostic tests run on all Z9500 CPUs (Control Processor, Route Processor, and line cards) is displayed.

Command Modes EXEC Privilege

Usage Information

Use the `show diag` command to view a summary of diagnostic information presented for each Z9500 CPU. CPU diagnostic results are presented in the following order: Control Processor (CP), line-card processor 0 (LP0), line-card processor 1 (LP1), line-card processor 2 (LP2), and Route Processor (RP).

Example: While offline diagnostics are running on a line card

```
Dell# show diag linecard 0 detail
Diag status of linecard member 0:
-----
linecard is currently offline.

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.7.0** Introduced on the S4810.
- Version 8.3.1.0** Introduced the `verbose` option.
- Version 7.7.1.0** Introduced on the S-Series.

show diag information

Display the status of offline diagnostic tests on a switch.

Syntax `show diag information`

Defaults None.

Command Modes EXEC Privilege

Usage Information Use the `show diag information` command to view the progress of offline diagnostics on Z9500 CPUs: line-card processors (Linecard slots 0 to 2), Control Processor (Linecard slot 3), and Route Processor (Linecard slot 4).

Example: Before offline diagnostics are run on a switch

```

Dell# show diag information
Diag information:
Diag software image version:
9-2(1-509)
-----
Linecard slot 0:      No card diags executed yet (Card Offline).

```

```

Linecard slot 1:      No card diags executed yet (Card Offline).
Linecard slot 2:      No card diags executed yet (Card Offline).
Linecard slot 3:      No card diags executed yet (Card Offline).
-----

```

Example:
After offline
diagnostics are
run on a switch

```

Dell# show diag information
Diag information:
Diag software image version:
9-2(1-509)
-----
Linecard slot 0:      Card diags are done (Card Offline).
Linecard slot 1:      Card diags are done (Card Offline).
Linecard slot 2:      Card diags are done (Card Offline).
Linecard slot 3:      Card diags are done (Card Offline).
-----

```

Command
History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.7.0** Introduced on the S4810.
- Version 8.3.1.0** Introduced the `verbose` option.
- Version 7.7.1.0** Introduced on the S-Series.

show diag testcase

Display the offline diagnostic tests available for the Z9500 CPUs at each level.

Syntax `show diag testcase {all | {{cp | rp | linecard} unit-id} [alllevels | level0 | level1 | level2]`

Parameters

- all** Enter the keyword `all` to display the complete suite of offline diagnostic tests available on the Z9500.
- cp unit-id** Enter the `cp unit-id` parameters to display only the offline diagnostic tests available on the Control Processor CPU. The Control Processor CPU ID is 0.
- rp unit-id** Enter the `rp unit-id` parameters to display only the offline diagnostic tests available on the Route Processor CPU. The Route Processor CPU ID is 0.
- linecard unit-id** Enter the `linecard unit-id` parameters to display only the offline diagnostic tests available for a specified line card. The range of line-card CPU IDs is from 0 to 2. Each line-card CPU processes packets on the corresponding Z9500 line card; for example, line-card CPU 1 processes packets on line card 1.
- alllevels** Enter the keyword `alllevels` to display the the complete set of offline diagnostic tests.
- level0** Enter the keyword `level0` to display only the Level 0 diagnostic tests. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.
- level1** Enter the keyword `level1` to display only the Level 1 diagnostic tests. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, EEPROM, and CPLD)

wherever possible. There are no tests on 10G links. At this level, ports are shut down automatically.

level2 Enter the keyword `level2` to display only the Level 2 diagnostic tests. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations.

Defaults Display the complete set of offline diagnostic tests available at all levels.

Command Modes EXEC Privilege

Usage Information Offline diagnostics tests are grouped into three levels:

- Level 0 — Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.
- Level 1 — A smaller set of diagnostic tests. Level 1 diagnostics perform status/self-test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, or EEPROM) wherever possible.
- Level 2 — The full set of diagnostic tests. Level 2 diagnostics are used primarily for on-board Loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations.

Example

```
Dell# show diag testcase linecard 0
-----
                eepromTest: ALL  RUN  YES  YES  NO  NO  NO
                  i2cTest: ALL  RUN  YES  YES  NO  NO  NO
    lcFullIxiaSnakeTest: ALL  RUN  NO   NO  NO  NO  YES
      macPhyRegTest: ALL  RUN  YES  YES  NO  NO  NO
    partyLinkStatusTest: ALL  RUN  NO   YES  NO  NO  NO
      pcieScanTest: ALL  RUN  YES  NO   NO  NO  NO
    portcardBcmIdTest: ALL  RUN  YES  NO   NO  NO  NO
    portcardBoardRevisionTest: ALL  RUN  YES  NO   NO  NO  NO
    portcardHiGigLinkStatusTest: ALL  RUN  NO   YES  NO  NO  NO
    portcardIxiaTrafficCmd: ALL  RUN  NO   NO   NO  NO  YES
    portcardPortStats: ALL  RUN  NO   NO   NO  NO  YES
    portcardXELinkStatusTest: ALL  RUN  NO   YES  NO  NO  NO
      qsfopOpticsTest: ALL  RUN  YES  YES  NO  NO  NO
      qsfopPhyTest: ALL  RUN  YES  YES  NO  NO  NO
      qsfopPresenceTest: ALL  RUN  NO   YES  NO  NO  NO
    qsfopReadInterruptTest: ALL  RUN  NO   NO   NO  NO  YES
      qsfopReadModeTest: ALL  RUN  NO   NO   NO  NO  YES
          rtcTest: ALL  RUN  YES  YES  NO  NO  NO
      sataSsdTest: ALL  RUN  YES  YES  NO  NO  NO
      temperatureTest: ALL  RUN  YES  NO   NO  NO  NO
```

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.7.0** Introduced on the S4810.
- Version 8.3.1.0** Introduced the `verbose` option.
- Version 7.7.1.0** Introduced on the S-Series.

Buffer Tuning Commands

The following sections detail the buffer tuning commands.

NOTE: Altering the buffer allocations is a sensitive operation. Do not use any buffer tuning commands without first contacting the Dell Networking Technical Assistance Center (TAC).

buffer-profile (Configuration)

Create a buffer profile that can be applied to an interface.

Syntax	<code>buffer-profile {fp csf} profile-name {global {1Q 4q}}</code>	
Parameters	fp	Enter the keyword <code>fp</code> to create a buffer profile for the Field Processor.
	csf	Enter the keyword <code>csf</code> to create a buffer profile for the Switch Fabric Processor.
	profile-name	Create a name for the buffer profile.
	global	Apply one of two pre-defined buffer profiles to all of the port-pipes in the system.
	1Q	Enter the keyword <code>1Q</code> to choose a pre-defined buffer profile for single queue (for example, non-QoS) applications.
	4Q	Enter the keyword <code>4q</code> to choose a pre-defined buffer profile for four queue (for example, QoS) applications.

Defaults Dynamic

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(0.2)	Changed the default value from <code>global 4q</code> to <code>Dynamic</code> .
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
7.8.1.0	Added the <code>global</code> keyword.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.
7.6.1.0	Introduced on the C-Series.

Usage Information The `buffer-profile global` command fails if you have already applied a custom buffer-profile on an interface. Similarly, when you configure `buffer-profile global`, you cannot not apply `buffer-profile` on any interface.

If the default buffer-profile is active, Dell Networking OS displays an error message instructing you to remove the default configuration using the `no buffer-profile global` command.

Reload the system for the global buffer-profile to take effect.

Hardware Commands

These commands display information from a hardware sub-component or ASIC.

clear control-traffic

Clear control-traffic statistics from a Z9500 CPU.

Syntax	<code>clear control-traffic {all cp-switch linecard slot-id portset port-pipe} counters</code>						
Parameters	<table><tr><td>cp-switch</td><td>Enter the keyword <code>cp-switch</code> to clear the counters for control traffic on the control plane.</td></tr><tr><td>linecard slot-id portset port-pipe</td><td>Enter the slot ID and port pipe to clear the counters for control traffic on a specified Z9500 line card and port set. The range of Z9500 slot IDs is from 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0 and 0 to 3 on line cards 1 and 2.</td></tr><tr><td>all</td><td>Enter the keyword <code>all</code> to clear control-traffic statistics on the control plane and all line cards.</td></tr></table>	cp-switch	Enter the keyword <code>cp-switch</code> to clear the counters for control traffic on the control plane.	linecard slot-id portset port-pipe	Enter the slot ID and port pipe to clear the counters for control traffic on a specified Z9500 line card and port set. The range of Z9500 slot IDs is from 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0 and 0 to 3 on line cards 1 and 2.	all	Enter the keyword <code>all</code> to clear control-traffic statistics on the control plane and all line cards.
cp-switch	Enter the keyword <code>cp-switch</code> to clear the counters for control traffic on the control plane.						
linecard slot-id portset port-pipe	Enter the slot ID and port pipe to clear the counters for control traffic on a specified Z9500 line card and port set. The range of Z9500 slot IDs is from 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0 and 0 to 3 on line cards 1 and 2.						
all	Enter the keyword <code>all</code> to clear control-traffic statistics on the control plane and all line cards.						

Defaults None.

Command Modes EXEC Privilege

Example

```
Dell# clear control-traffic cp-switch counters
```

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- | | |
|-------------------------|------------------------------|
| Version 9.2(1.0) | Introduced on the Z9500. |
| Version 8.3.11.1 | Introduced on the Z9000. |
| Version 8.1.1.0 | Introduced on the ES-Series. |

clear hardware

Clear statistics from a specified hardware component.

Syntax `clear hardware {cp {cpu {data-plane | i2c | sata-interface} statistics} | cp-switch {counters} | linecard slot-id {counters | cpu {data-plane | i2c | sata-interface} statistics} | unit unit-num {counters} | party-bus {port port-num statistics | all} | rp {cpu {data-plane | i2c | sata-interface} statistics} | sfm sfm-unit-no {counters}}`

Parameters	<table><tr><td>cp</td><td>Enter the keywords <code>cp</code> with a command option to clear the hardware statistics for the Control Processor. The command options are:<ul style="list-style-type: none"><code>cpu data-plane statistics</code>: Clears data-plane statistics, including the high-Gigabit Ethernet (HiGig) port statistics with input/output counters to which the stacking module is connected.<code>cpu i2c statistics</code>: Clears active i2c-address statistics.<code>cpu sata-interface statistics</code>: Clears sata-interface error counter statistics.</td></tr><tr><td>cp-switch</td><td>Enter the keyword <code>cp-switch</code> with a command option to clear the hardware statistics for control-plane and protocol control traffic. The command options are:</td></tr></table>	cp	Enter the keywords <code>cp</code> with a command option to clear the hardware statistics for the Control Processor. The command options are: <ul style="list-style-type: none"><code>cpu data-plane statistics</code>: Clears data-plane statistics, including the high-Gigabit Ethernet (HiGig) port statistics with input/output counters to which the stacking module is connected.<code>cpu i2c statistics</code>: Clears active i2c-address statistics.<code>cpu sata-interface statistics</code>: Clears sata-interface error counter statistics.	cp-switch	Enter the keyword <code>cp-switch</code> with a command option to clear the hardware statistics for control-plane and protocol control traffic. The command options are:
cp	Enter the keywords <code>cp</code> with a command option to clear the hardware statistics for the Control Processor. The command options are: <ul style="list-style-type: none"><code>cpu data-plane statistics</code>: Clears data-plane statistics, including the high-Gigabit Ethernet (HiGig) port statistics with input/output counters to which the stacking module is connected.<code>cpu i2c statistics</code>: Clears active i2c-address statistics.<code>cpu sata-interface statistics</code>: Clears sata-interface error counter statistics.				
cp-switch	Enter the keyword <code>cp-switch</code> with a command option to clear the hardware statistics for control-plane and protocol control traffic. The command options are:				

	<ul style="list-style-type: none"> • <code>counters</code>: Clears the counters for control-plane and protocol control packets to troubleshoot an error condition.
linecard <i>slot-id</i>	<p>Enter the <code>linecard <i>slot-id</i></code> parameters with a command option to clear the hardware statistics for a specified Z9500 line card. The range of slot IDs is from 0 to 2. The command options are:</p> <ul style="list-style-type: none"> • <code>counters</code>: Clears traffic counters on line-card ports. • <code>cpu data-plane statistics</code>: Clears data-plane statistics, including the HiGig port statistics with input/output counters to which the stacking module is connected. • <code>cpu i2c statistics</code>: Clears active i2c-address statistics. • <code>cpu sata-interface statistics</code>: Clears sata-interface error counter statistics.
unit <i>unit-num</i>	<p>Enter the <code>unit <i>unit-num</i></code> parameters with a command option to clear hardware statistics for a specified port pipe. The range of port-pipe unit numbers is 0 to 3. The command options are:</p> <ul style="list-style-type: none"> • <code>counters</code>: Clears the packets counters on a port pipe.
party-bus	<p>Enter the keyword <code>party-bus</code> with a command option to clear hardware statistics for the party bus that links Z9500 CPUs. The command options are:</p> <ul style="list-style-type: none"> • <code>port <i>port-num</i> statistics</code>: Clears statistics on a specified party-bus internal port. • <code>port all</code>: Clear statistics on all party-bus internal ports.
rp	<p>Enter the keyword <code>rp</code> with a command option to clear hardware statistics for the Route Processor. The command options are:</p> <ul style="list-style-type: none"> • <code>cpu data-plane statistics</code>: Clears data-plane statistics, including the HiGig port statistics with input/output counters. • <code>cpu i2c statistics</code>: Clears active i2c-address statistics. • <code>cpu sata-interface statistics</code>: Clears sata-interface error counter statistics.
sfm <i>sfm-unit-num</i>	<p>Enter the keyword <code>sfm</code> with an Switch Fabric Module (SFM) unit number and a command option to clear hardware statistics from the specified SFM on the Z9500. The range of SFM unit numbers is from 0 to 5. The command options are:</p> <ul style="list-style-type: none"> • <code>counters</code>: Clears the traffic counters for an SFM unit.

Defaults	none
Command Modes	EXEC Privilege
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <p>Version 9.2(1.0) Introduced on the Z9500.</p> <p>Version 8.3.19.0 Introduced on the S4820T.</p> <p>Version 8.3.11.0 Introduced on the Z9000.</p> <p>Version 8.3.7.0 Introduced on the S4810.</p> <p>Version 7.8.1.0 Introduced on the S-Series.</p>
Related Commands	<code>show hardware</code> — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.

clear hardware system-flow

Clear system-flow statistics from selected hardware components.

Syntax `clear hardware system-flow layer2 stack-unit number port-set 0-0 counters`

Parameters	<p>stack-unit number Enter the keywords <code>stack-unit</code> then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data.</p> <p>port-set 0-0 counters Enter the keywords <code>port-set</code> along with a port-pipe number, then the keyword <code>counters</code> to clear the system-flow counters on the selected port-pipe.</p>
Defaults	None
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

clear hardware vlan-counters

Clear VLAN statistics.

Syntax	<code>clear hardware vlan-counters vlan-id</code>
Parameters	<p>vlan-id Enter the interface VLAN number. The range is from 1 to 4094.</p>
Defaults	None
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced this command.

remote-exec

Debug and troubleshoot switch hardware using remote commands.

NOTE: Use the `remote-exec` command only with the guidance of an engineer from Dell Networking Technical Support.

Syntax	<code>remote-exec {cp rp linecard slot-id} hw-command</code>
Parameters	<p>cp Enter the keyword <code>cp</code> to troubleshoot Control Processor CPU operation.</p> <p>rp Enter the keyword <code>rp</code> to troubleshoot Route Processor CPU operation.</p> <p>linecard slot-id Enter the <code>linecard slot-id</code> to troubleshoot line-card CPU operation. The range of line-card slot IDs is from 0 to 2. Each line-card CPU processes packets on the corresponding Z9500 line card.</p> <p>hw-command Enter the debug command that Dell Networking Tech Support gives you.</p>
Defaults	none
Command Modes	<ul style="list-style-type: none"> EXEC EXEC Privilege
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <p>Version 9.2(1.0) Introduced on the Z9500.</p> <p>Version 9.2(0.0) Modified the <code>drops</code> keyword range, unit keyword <code>range</code> and added the <code>buffer</code> and <code>cpu management statistics</code> options.</p> <p>Version 8.3.19.0 Introduced on the S4820T.</p> <p>Version 8.3.11.5 Added i2c statistics and sata-interfaces statistics.</p> <p>Version 8.3.11.4 Added user port information.</p> <p>Version 8.3.11.1 Introduced on the Z9000.</p> <p>Version 8.3.7.0 Introduced on the S4810.</p> <p>Version 7.7.1.0 Introduced on the S-Series.</p>
Usage Information	Use the <code>remote-exec</code> command to remotely execute a command on the Route Processor and line-card (LP) processor from the Control Processor.
Related Commands	show hardware — displays information on hardware components.

show control-traffic

Display information about the control traffic transmitted on a Z9500 CPU: Route Processor, Control Processor, or line card.

Syntax	<code>show control-traffic {cp rp linecard slot-id} counters</code>
Parameters	<p>cp Enter the keyword <code>cp</code> to display control-traffic information from the Control Processor CPU.</p>

- rp** Enter the keyword `rp` to display control-traffic information from the Route Processor CPU.
- linecard *slot-id*** Enter the `linecard slot-id` parameters to display control-traffic information from the specified line-card processor. The range of Z9500 slot IDs is from 0 to 2.

Defaults None.

Command Modes EXEC Privilege

Example

```
Dell# show control-traffic counters
```

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.1.1.0** Introduced on the ES-Series.

show hardware

Display input and output traffic statistics and other operational information about a specified hardware component.

Syntax

```
show hardware {cp {cpu {data-plane | i2c | management | sata-interface}
statistics} |
cp-switch {counters | details | drops | port-stats | register | table-dump} |
linecard slot-id {buffer {total-buffer | unit unit-num [port port-num
[queue queue-num]]} |
cpu {data-plane | i2c | management | sata-interface} statistics |
drops {unit unit-num {port {port-num | port-range}} |
user-port {user-port-num | port-range}} |
unit unit-num {counters | details | ipmc-replication | port-stats |
register | table-dump} |
bp-link-map | bp-link-state | higid unit unit-num [port port-num]}
party-bus {port port-num statistics | all}
rp {cpu {data-plane | i2c | management | sata-interface} statistics} |
sfm sfm-unit-num {buffer {total-buffer | unit unit-num {port | total-
buffer}} | counters | details | drops | port-stats | register | table-dump}}
```

Parameters

- cp** Enter the keywords `cp` with a command option to display hardware statistics from the Control Processor. The command options are:
 - `cpu data-plane statistics`: Displays data-plane statistics, including the HiGig port statistics with input/output counters to which the stacking module is connected.
 - `cpu i2c statistics`: Displays active i2c-address statistics.
 - `cpu management statistics`: Displays management port counters.
 - `cpu sata-interface statistics`: Displays sata-interface error counter statistics.
- cp-switch** Enter the keyword `cp-switch` with a command option to display hardware statistics for control-plane and protocol control traffic. The command options are:

- `counters`: Displays the counters for control-plane and protocol control packets to troubleshoot an error condition.
- `details`: Displays more detailed information on control-plane and protocol control packet statistics.
- `drops`: Displays the number of internal drops of control-plane and protocol control packets.
- `port-stats`: Displays status about why a control-plane internal port is not brought up to register level.
- `register`: Displays internal control-plane registers.
- `table-dump`: Displays the tables from the bShell.

linecard *slot-id*

Enter the `linecard slot-id` parameters with a command option to display hardware statistics from the specified line-card ports. The range of line-card slot IDs is from 0 to 2. The command options are:

- `buffer total-buffer statistics`: Displays the total number of buffers allocated for a specified line card.
- `buffer unit unit-num port statistics`: Displays the number of buffers allocated for a specified port-pipe. The range of port-pipe unit numbers is 0 to 3.
- `buffer unit unit-num total-buffer statistics`: Displays the number of buffers allocated for a specified port-pipe. The range of port-pipe unit numbers is 0 to 3.
- `cpu data-plane statistics`: Displays data-plane statistics, including the HiGig port statistics with input/output counters to which the stacking module is connected.
- `cpu i2c statistics`: Displays active i2c-address statistics.
- `cpu management statistics`: Displays management port counters for a specified line card.
- `cpu sata-interface statistics`: Displays sata-interface error counter statistics.
- `drops unit unit-num {port {port-num | range}}`: Displays the number of dropped packets on the ports of a specified port pipe on a line card. The range of port-pipe unit numbers is 0 to 3.
- `user-port {user-port-num | port-range}`: Displays statistics on a specified line-card port or range of ports.
- `unit unit-num {counters | details | ipmc-replication | port-stats | register | table-dump}`: Displays statistics on a specified line-card port pipe unit. The range of port-pipe unit numbers is 0 to 3. The command options are:
 - `counters`: Displays the traffic counters for a specified port pipe.
 - `details`: Displays more detailed hardware information for a specified port pipe.
 - `ipmc-replication`: Displays the multicast IPMC replication table from the bShell.
 - `port-stats`: Displays the internal statistics for each port pipe (unit) on a per-port basis.
 - `register`: Displays the line-card internal registers for each port pipe.
 - `table-dump`: Displays the tables from the bShell.
- `bp-link-map`: Displays the backplane links (between leaf/port and spine/fabric) on a specified line card.
- `bp-link-state`: Displays the status of the backplane links on a specified line card.
- `hg-stats unit unit-num port port-num`: Displays input and output statistics for a HiGig port on a specified line card.

party-bus

Enter the keyword `party-bus` with a command option to display hardware statistics from the party bus that links Z9500 CPUs. The command options are:

- `port port-num statistics`: Displays statistics on a specified party-bus internal port.

- `port all`: Displays statistics on all party-bus internal ports.

rp

Enter the keyword `rp` with a command option to display hardware statistics from the Route Processor. The command options are:

- `cpu data-plane statistics`: Displays data-plane statistics, including the HiGig port statistics with input/output counters to which the stacking module is connected.
- `cpu i2c statistics`: Displays active i2c-address statistics.
- `cpu management statistics`: Displays management port counters.
- `cpu sata-interface statistics`: Displays sata-interface error counter statistics.

sfm sfm-unit-num

Enter the keyword `sfm` with an Switch Fabric Module (SFM) unit number and a command option to display hardware statistics from the specified SFM on the Z9500. The range of SFM unit numbers is from 0 to 5. The command options are:

- `buffer {total-buffer | unit unit-num {port port-num | total-buffer}`: Displays buffer statistics from the total SFM buffer or from a specified SFM unit. The range of SFM unit ID numbers is from 0 to 5. The range of SFM unit ports is from 1 to 128.
- `counters`: Displays the counters for SFM traffic to troubleshoot an error condition.
- `details`: Displays more detailed information on control-plane and protocol control packet statistics.
- `drops`: Displays the number of internal drops on the specified SFM unit.
- `port-stats`: Displays status about why an SFM port is not brought up to register level.
- `register`: Displays the internal registers for each switch fabric.
- `table-dump`: Displays the tables from the bShell.

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 9.2(0.0)** Modified the `drops` keyword range, unit keyword `range` and added the `buffer` and `cpu management statistics` options.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.5** Added i2c statistics and sata-interfaces statistics.
- Version 8.3.11.4** Added user port information.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.7.0** Introduced on the S4810.
- Version 7.8.1.0** Modified the `stack-port` keyword range expanded from 49-52 to 0-52; output modified for the `cpu data-plane statistics` option; the following options were added: `drops [unit 0-1 [port 0-27]]` and `unit 0-1 {counters | details | port-stats [detail] | register}`
- Version 7.7.1.0** Introduced on the S-Series.

Example (Linecard CPU Dataplane: Statistics)

```

Rate info (interval 15 seconds):
  Input 00.00 Mbits/sec,          0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec,         0 packets/sec, 0.00% of line-rate

```

**Related
Commands**

[clear hardware system-flow](#) — clears the statistics from selected hardware components.

[show system \(S-Series and Z-Series\)](#) — displays the current status of all the stack members or a specific member.

show hardware counters interface

Display the counter information for a specific interface.

Syntax `show hardware counters interface interface`

Parameters

counters Enter the keywords `counters` to display counter value for the specified linecard the port pipe.

interface
interface Enter any of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Defaults None

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.

Example

```

RX - Debug Counter 2                0
<output truncated for brevity>

```

show hardware buffer interface

Display buffer statistics for a specific interface.

Syntax

```
show hardware buffer interface interface{priority-group { id | all } |
queue { id| all} ] buffer-info
```

Parameters

interface <i>interface</i>	Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.
priority-group	Enter the keyword <code>priority-group</code> followed by <i>id</i> for specific priority-group or keyword <i>all</i> .
queue	Enter the keyword <code>queue</code> followed by <i>id</i> for specific queue or keyword <i>all</i> .
buffer-info	To display total buffer information for the interface, enter the keywords <code>buffer-info</code> .

Command Modes

EXEC
EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.

Example displaying total-buffer information for the interface

Example displaying priority-group range

Example displaying queue range

show hardware buffer-stats-snapshot

Displays buffer statistics tracking resource information for a specific interface.

Syntax `show hardware buffer-stats-snapshot resource {headroom-pool [detail] | service-pool [detail] interface interface {{priority-group {id | all} | queue ucast {id | all} mcast {id | all} | all} [detail]}`

Parameters	headroom-pool detail	Enter the keyword <code>headroom-pool</code> followed by the keyword <code>detail</code> to view detailed information about the headroom pool usage.
	service-pool detail	Enter the keyword <code>service-pool</code> followed by the keyword <code>detail</code> to view detailed information about the service pool usage.
	interface <i>interface</i>	Enter any of the following keywords and the interface information: <ul style="list-style-type: none">For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
	queue	Enter the keyword <code>queue</code> followed by <code>all</code> for displaying details of all queues, <code>ucast queue-id</code> or <code>all</code> for displaying Unicast queue details, and <code>mcast queue-id</code> or <code>all</code> for displaying Multicast queue details.
	priority-group	Enter the keyword <code>priority-group</code> followed by <code>id</code> for specific priority-group or keyword <code>all</code> .

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, Z9500.

Usage Information `<Interface><slot/port>-Queue ucast/mcast` — Displays the total unicast/multicast buffer usage on per-port per-queue basis. For CPU port, counters for queues 0 to 11 displays and there is no differentiation between unicast and multicast queues.

Example displaying egress queue-level snapshot for both unicast and multicast

```
DellEMC# show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue all
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
-----
Q#  TYPE      Q#      TOTAL BUFFERED CELLS
-----
```

packets for the specific interface

```
UCAST 0 0
UCAST 1 0
UCAST 2 0
UCAST 3 0
UCAST 4 0
UCAST 5 0
UCAST 6 0
UCAST 7 0
UCAST 8 0
UCAST 9 0
UCAST 10 0
UCAST 11 0
MCAST 0 0
MCAST 1 0
MCAST 2 0
MCAST 3 0
MCAST 4 0
MCAST 5 0
MCAST 6 0
MCAST 7 0
MCAST 8 0
```

Example displaying egress queue-level snapshot for unicast packets for the specific interface

```
DelleMC# show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue ucast 10
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
```

```
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      10      0
```

```
DelleMC# show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue ucast all
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
```

```
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      0      0
UCAST      1      0
UCAST      2      0
UCAST      3      0
UCAST      4      0
UCAST      5      0
UCAST      6      0
UCAST      7      0
UCAST      8      0
UCAST      9      0
UCAST     10      0
UCAST     11      0
```

Example displaying egress queue-level snapshot for multicast packets for the specific interface

```
DelleMC# show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue mcast 3
Unit 1 unit: 0 port: 1 (interface Fo 0/0)
```

```
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      3      0
```

```
DelleMC# show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue mcast all
```

```
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
```

```
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      0      0
MCAST      1      0
MCAST      2      0
```

```
MCAST      3      0
MCAST      4      0
MCAST      5      0
MCAST      6      0
MCAST      7      0
MCAST      8      0
```

Example displaying ingress priority-group level snapshot for the specific interface

```
DellEMC# show hardware buffer-stats-snapshot resource interface fortyGigE 0/0 priority-group 7
```

```
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
```

```
-----
PG#      SHARED CELLS      HEADROOM CELLS
-----
7         0              0
```

```
DellEMC# show hardware buffer-stats-snapshot resource interface fortyGigE 0/0 priority-group all
```

```
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
```

```
-----
PG#      SHARED CELLS      HEADROOM CELLS
-----
0         0              0
1         0              0
2         0              0
3         0              0
4         0              0
5         0              0
6         0              0
7         0              0
```

show hardware ipv6

Display information about IPv6 ACLs used on a Z9500 line card and port pipe.

Syntax `show hardware ipv6 {eg-acl | in-acl} linecard slot-id port-set port-pipe`

Parameters

- eg-acl | in-acl** Enter either the keyword `eg-acl` or the keyword `in-acl` to display ingress or egress ACL data.
- linecard slot-id** Enter the `linecard slot-id` parameters to specify a Z9500 line card. The range of slot IDs is from 0 to 2.
- port-set port-pipe** Enter the keywords `port-set port-pipe` parameters to specify a port pipe (set of ports) on a line card. The range of port-pipe numbers is: 0 to 2 on line card 0 and 0 to 3 on line cards 1 and 2.

Defaults none

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

- Version 9.2(1.0)** Introduced on the Z9500.
- Version 8.3.19.0** Introduced on the S4820T.
- Version 8.3.11.1** Introduced on the Z9000.
- Version 8.3.7.0** Introduced on the S4810.
- Version 7.8.1.0** Introduced on the S-Series.

Example

```
Dell#show hardware ipv6 eg-acl linecard 0 port-set 0

param3=0(0)}
        policer=
        statistics={stat id 110 slice = 0 idx=4 entries=1}{Packets}
```

Usage Information

The port-set values are internal port numbers. For a cross reference of the internal and port numbers, refer to the *Debugging and Diagnostics* chapter in the *Dell Networking OS Configuration Guide for the Z9500 System*.

show hardware mac

Display MAC ACL entries for the specified stack-unit, port-pipe and pipeline ID.

Syntax

```
show hardware mac {eg-acl | in-acl} stack-unit id port-set 0-0
```

Parameters

- | | |
|------------------------|---|
| eg-acl in-acl | Enter either the keyword <code>eg-acl</code> or the keyword <code>in-acl</code> to select between ingress or egress ACL data. |
| stack-unit id | Enter the keyword <code>stack-unit</code> to select the stack unit ID. |

port-set 0-0 Enter the keywords `port-set` with a port-pipe number to display the MAC ACL entries for the specified port-pipe number. .

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Usage Information The unit numbers given are internal port numbers.

show hardware ip

Display ACL or QoS data for the selected stack member and stack member port-pipe.

Syntax `show hardware layer3 {acl | qos} stack-unit number port-set 0-0`

Parameters

acl qos	Enter either the keyword <code>acl</code> or the keyword <code>qos</code> to select between ACL or QoS data.
stack-unit <i>number</i>	Enter the keywords <code>stack-unit</code> then a number to select a stack ID.
port-set 0-0	Enter the keyword <code>port-set</code> with a port-pipe number.

Defaults None

8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

show hardware system-flow

Display Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

Syntax `show hardware system-flow stack-unit id port-set number [counters]`

Parameters

- stack-unit *id*** Enter the keywords `stack-unit` to select a stack member ID.
- port-set *number* [counters]** Enter the keywords `port-set` with a port-pipe number.
(OPTIONAL) Enter the keyword `counters` for the specified port-pipe.

Defaults None

Total number of inbytes: 0
Total number of outpackets: 0
Total number of outbytes: 0
DellEMC#

```

Related Commands

- [clear hardware system-flow](#) — clear the statistics from selected hardware components.

show hardware drops

Displays internal drops on the specified interface or for a range of interface.

Syntax `show hardware drops interface interface`

Parameters	drops	Enter the keyword <code>drops</code> to display internal drops.
	interface	Enter any of the following keywords and the interface or interface range information: <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.

Command Modes EXEC
EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Included the FEC BER details in the output for 100G interfaces of S6100-ON and Z9100-ON . Included FCS Error Ratio in the output for all interfaces of S6000, S6000-ON, S6100-ON, and Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Removed the keywords <code>stack-unit</code> . Introduced on the Z9500.
9.7(0.0)	Introduced on the S6000-ON.
9.2(0.2)	Modified the <code>drops</code> keyword range, unit keyword <code>range</code> and added the <code>buffer</code> and <code>cpu management statistics</code> options.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.5	Added i2c statistics and sata-interfaces statistics.
8.3.11.4	Added user port information.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

```

tcpdump

Enable a TCP dump for CPU bound traffic.

Syntax `tcpdump cp [capture-duration time | filter expression value | packet-count value | snap-length value | write-to path]`

To disable the TCP dump, use the `no tcpdump` command.

Parameters

- capture-duration*** Enter the time for packet capturing. The timer begins as soon as the command is enabled. The range is 20 to 9000 seconds.
- filter*** Specify the packet that will be dumped. If no filter is entered, all packets are dumped. Filter expressions usually consist of an id (name or number) preceded by one or more qualifiers. There are three different kinds of qualifier: type, direction, or protocol.

Enclose the filter option with double quotes: "port 20." The range is 1 to 100 characters.
- packet-count*** Enter the number of packets to capture. The counter begins as soon as the command is enabled. The range is 10 to 150000.

snap-length Enter the number of bytes per packet to capture. Use this option to reduce the size of the captured packets, to capture only the needed headers and avoid rest of the data portion of the packet. The range is 0 to 1200.

write-to Enter the location to save the captured packets. Files can be saved to flash, to FTP, SCP, or TFTP:

- `flash://filepath`
- `ftp://userid:password@hostip/filepath`
- `scp://userid:password@hostip/filepath`
- `tftp://hostip/filepath`

Defaults Disable

Command Modes EXEC Privilege

Command History
Version 9.0.2.0 Introduced on the S6000.
Version 8.3.11.1 Introduced on the Z9000.

Usage Information You can use the capture-duration timer and the packet-count counter at the same time. The TCP dump stops when the first of the thresholds is met. That means that even if the duration timer is 9000 seconds, if the maximum file count parameter is met first, the dumps stop.

Entering `no tcpdump stops` the file dump immediately, without waiting for a threshold to be met.

The files saved on the flash are located in the `flash://TCP_DUMP_DIR/Tcpdump_<time_stamp_dir>/` directory. The file name is `tcpdump_*.pcap`. There can be up to 20 `Tcpdump_<time_stamp_dir>` directories. If more than 20 files are created, the oldest is overwritten.

Dynamic Host Configuration Protocol (DHCP)

Dynamic host configuration protocol (DHCP) is an application layer protocol that dynamically assigns IP addresses and other configuration parameters to network end-stations (hosts) based on the configuration policies the network administrators determine.

Topics:

- [Configure a DHCP Server and DHCP Clients](#)
- [Configure Secure DHCP and DHCP Relay](#)

Configure a DHCP Server and DHCP Clients

To configure the system to be a DHCP server and to manually configure DHCP clients, use the following commands.

clear ip dhcp

Reset the DHCP counters.

Syntax `clear ip dhcp [binding {address} | client statistics {all | interface type slot/port}] | conflict | server statistics]`

Parameters		
binding		Enter the keyword <code>binding</code> to delete all entries in the binding table.
address		Enter the IP address to clear the binding entry for a single IP address.
client statistics {all interface type slot/port}		Enter the keywords <code>server statistics all</code> to clear all counter information on all DHCP client interfaces on the switch. Enter an interface type and slot/port information to clear DHCP counters on a specified interface. The valid interface types are: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
conflicts		Enter the keyword <code>conflicts</code> to delete all of the log entries created for IP address conflicts.
server statistics		Enter the keywords <code>server statistics</code> to clear all the server counter information.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

Usage Information

Press Enter after the `clear ip dhcp binding` command clears all the IPs from the binding table.

clear ip dhcp snooping

Clear the DHCP binding table.

Syntax `clear ip dhcp snooping {binding | source-address-validation discard-counters [interface interface]}`

Parameters

binding	Clears the binding table.
source-address-validation discard-counters	Clears discard counters from all the interfaces configured with IP Source Guard.
interface <i>interface</i>	(OPTIONAL) Specifies an interface to clear the discard counters. Enter any of the following keywords and the interface information: <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. For a port channel interface, enter the keywords <code>port-channel</code> then a number.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Added the keywords <code>discard-counters</code> , <code>interface</code> , and the variable <code>interface</code> on the S4810, S4820T, S5000, S6000, Z9000, Z9500.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

Example

The following example shows how to clear the discard counters globally:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters
```

The following example shows how to clear the discard counters on an interface:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters interface TenGigE 1/10
```

The following example shows how to clear the discard counters on a port channel interface:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters interface portchannel 1
```

Related Commands

- [show ip dhcp snooping](#) — display the contents of the DHCP binding table.

debug ipv6 dhcp

To enable debug logs for DHCPv6 relay agent transactions.

Syntax

```
debug ipv6 dhcp
```

To disable the debug logs for dhcpv6 relay agent transactions, use the `debug ipv6 dhcp` command.

Defaults

None

```

default-router

Assign a default gateway to clients based on the address pool.

Syntax	default-router <i>address</i> [<i>address2</i> ... <i>address8</i>]	
Parameters	<i>address</i>	Enter a list of routers that may be the default gateway for clients on the subnet. You may specify up to eight routers. List them in order of preference.
Defaults	None	
Command Modes	DHCP <POOL>	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

disable

Disable the DHCP server.

Syntax	disable
---------------	---------

DHCP Server is disabled by default. To enable the system to be a DHCP server, use the `no disable` command.

Defaults Disabled

Command Modes CONFIGURATION
DHCP <POOL>

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
8.2.1.0	Introduced on the C-Series and S-Series.

ip address dhcp

Configure an interface to receive its IP address from the configured DHCP server.

Z9500

Syntax	<pre>ip address dhcp</pre> <p>To release the IP address acquired from a DHCP server, enter the <code>no ip address dhcp</code> command.</p>
Defaults	Not configured.
Command Modes	INTERFACE
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <ul style="list-style-type: none"> Version 9.2(1.0) Introduced on the Z9500. Version 8.3.19.0 Introduced on the S4820T. Version 8.3.11.1 Introduced on the Z9000. Version 8.3.7.0 Introduced on the S4810. Version 8.1.1.0 Introduced on the E-Series ExaScale. Version 7.6.1.0 Introduced on the S-Series. Version 7.5.1.0 Introduced on the C-Series.
Usage Information	<p>You must be in INTERFACE mode in order to configure an interface to dynamically acquire an IP address from a DHCP server.</p> <p>Use the <code>no ip address dhcp</code> in INTERFACE mode to:</p> <ul style="list-style-type: none"> • Release the IP address that was dynamically acquired from a DHCP server from the interface. • Disable the DHCP client on the interface so it cannot acquire a dynamic IP address from a DHCP server. • Stop DHCP packet transactions on the interface. <p>To release the IP address dynamically acquired from a DHCP server and allow an interface to acquire a new DHCP server-assigned address, enter the <code>release dhcp interface type slot/port</code> command in EXEC Privilege mode. To acquire a new server-assigned IP address, enter the <code>renew dhcp interface type slot/port</code> command in EXEC Privilege mode or the <code>ip address dhcp</code> command in INTERFACE Configuration mode.</p> <p> NOTE: If the management port is associated with any non-default VRF, then the <code>ip address dhcp</code> command does not work.</p>

ip address dhcp relay information-option

Include the relay-information option (option 81) in DHCP packets sent by the client. Some DHCP servers can be configured to allocate IP addresses based on option 81.

Z9500

Syntax	<code>ip address dhcp relay information-option [remote-id [hostname mac remote-id]</code>						
Parameters	<table><tr><td>remote-id hostname</td><td>Set the hostname as the remote ID in Option 82.</td></tr><tr><td>remote-id remote-id</td><td>Enter the name to be used as the remote ID in Option 82; maximum: 64 characters.</td></tr><tr><td>remote-id mac</td><td>Use the chassis MAC address as the remote ID in Option 82.</td></tr></table>	remote-id hostname	Set the hostname as the remote ID in Option 82.	remote-id remote-id	Enter the name to be used as the remote ID in Option 82; maximum: 64 characters.	remote-id mac	Use the chassis MAC address as the remote ID in Option 82.
remote-id hostname	Set the hostname as the remote ID in Option 82.						
remote-id remote-id	Enter the name to be used as the remote ID in Option 82; maximum: 64 characters.						
remote-id mac	Use the chassis MAC address as the remote ID in Option 82.						
Default	Option 82 uses the chassis MAC address as the remote ID.						
Command Modes	CONFIGURATION						
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <p>Version 9.2(1.0) Introduced on the Z9500.</p>						
Usage Information	<p>You can enter the <code>ip address dhcp relay information-option</code> and <code>ip address dhcp relay vendor-class-identifier</code> commands in the same <code>ip address dhcp</code> command line; for example:</p> <pre>ip address dhcp vendor-class-identifier dell9500 relay information-option mac ip address dhcp relay information-option mac vendor-class-identifier dell9500</pre>						
Related Commands	ip address dhcp — configures an interface to receive its IP address from the configured DHCP server.						

ip address dhcp vendor-class-identifier

Include the vendor-class identifier option (option 60) in DHCP packets sent by the client.

Z9500

Syntax	<code>ip address dhcp vendor-class-identifier text</code>		
Parameters	<table><tr><td>vendor-class-identifier text</td><td>Include a user-configurable text string with the hardware-related information (option 60) in DHCP packets sent by the client (32 characters maximum).</td></tr></table>	vendor-class-identifier text	Include a user-configurable text string with the hardware-related information (option 60) in DHCP packets sent by the client (32 characters maximum).
vendor-class-identifier text	Include a user-configurable text string with the hardware-related information (option 60) in DHCP packets sent by the client (32 characters maximum).		
Default	None.		
Command Modes	CONFIGURATION		
Command History	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <p>Version 9.2(1.0) Introduced on the Z9500.</p>		

Usage Information

Use this command to include the vendor-class identifier (option 60) in DHCP packets sent by the client. This option is used by DHCP clients to identify the vendor type and configuration of a DHCP client. The vendor-class identifier includes hardware-related information that identifies the switch and includes a user-configurable text string .

You can enter the `ip address dhcp relay information-option` and `ip address dhcp relay vendor-class-identfier` commands in the same `ip address dhcp` command line; for example:

```
ip address dhcp vendor-class-identifier dell9500 relay information-option mac
```

```
ip address dhcp relay information-option mac vendor-class-identifier dell9500
```

Related Commands

[ip address dhcp](#) — configures an interface to receive its IP address from the configured DHCP server.

lease

Specify a lease time for the addresses in a pool.

Syntax

```
lease {days [hours] [minutes] | infinite}
```

Parameters

<i>days</i>	Enter the number of days of the lease. The range is from 0 to 31.
<i>hours</i>	Enter the number of hours of the lease. The range is from 0 to 23.
<i>minutes</i>	Enter the number of minutes of the lease. The range is from 0 to 59.
<i>infinite</i>	Specify that the lease never expires.

Defaults

24 hours

Command Modes

DHCP <POOL>

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

netbios-name-server

Specify the NetBIOS Windows Internet Naming Service (WINS) name servers, in order of preference, that are available to Microsoft Dynamic Host Configuration Protocol (DHCP) clients.

Syntax	<code>netbios-name-server address [address2...address8]</code>	
Parameters	address	Enter the address of the NETBIOS name server. You may enter up to eight, in order of preference.
Defaults	None	
Command Modes	DHCP <POOL>	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

netbios-node-type

Specify the NetBIOS node type for a Microsoft DHCP client. Dell EMC Networking recommends specifying clients as `hybrid`.

Syntax	<code>netbios-node-type type</code>	
Parameters	type	Enter the NETBIOS node type: <ul style="list-style-type: none">• Broadcast: Enter the keyword <code>b-node</code>.• Hybrid: Enter the keyword <code>h-node</code>.• Mixed: Enter the keyword <code>m-node</code>.• Peer-to-peer: Enter the keyword <code>p-node</code>.
Defaults	Hybrid	
Command Modes	DHCP <POOL>	

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

network

Specify the range of addresses in an address pool.

Syntax

```
network network /prefix-length
```

Parameters

network/ prefix-length Specify a range of addresses. Prefix-length range is from 17 to 31.

Defaults

None

Command Modes

DHCP <POOL>

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

pool

Create an address pool.

Syntax	<code>pool name</code>
Parameters	name Enter the address pool's identifying name.
Defaults	None
Command Modes	DHCP
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

show ip dhcp client statistics

Display statistical information about DHCP client interfaces.

Z9500

Syntax	<code>show ip dhcp client statistics [interface type slot/port]</code>
---------------	--

Parameters **interface** Enter the keyword `interface` with the interface type and slot/port information to display DHCP client information for a specified interface. The valid interface types are:

typeslot/port

- For a 10-Gigabit Ethernet interface, enter the keyword `tengigabitethernet`.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE`.

Defaults none

Command Modes EXEC Privilege

Command History

Version 9.2(1.0)	Introduced on the Z9500.
Version 8.3.19.0	Introduced on the S4820T.
Version 8.3.11.1	Introduced on the Z9000.
Version 8.3.7.0	Introduced on the S4810.
Version 8.2.1.0	Introduced on the C-Series and S-Series.

Example

```
Dell# show ip dhcp client statistics interface fortyGigE 2/0
Interface Name           Fo 2/0
Message                  Received
DHCPPOFFER              9
DHCPACK                  9
DHCPNAK                  0
Message                  Sent
DHCPDISCOVER            53
DHCPREQUEST             9
DHCPDECLINE              0
DHCPRELEASE             6
DHCPREBIND              0
DHCPRENEW                0
DHCPINFORM              0
```

show ip dhcp configuration

Display the DHCP configuration.

Syntax `show ip dhcp configuration [global | pool name]`

Parameters

pool *name* Display the configuration for a DHCP pool.

global Display the DHCP configuration for the entire system.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

Example

```
DellEMC# show ip dhcp configuration global

Protocol status          : Enabled
Number of ping packets  : 1
DellEMC#

DellEMC# show ip dhcp configuration pool p1

Pool Name                : p1
Pool Type                : Dynamic
Domain Name              : dell.com
Lease Time               : 2Days 0Hrs 0Mins
DNS Servers              : 10.11.0.1
Default Routers         : 1.1.1.1
Network                 : 1.1.1.0 255.255.255.0
```

show ip dhcp conflict

Display the address conflict log.

Syntax `show ip dhcp conflict address`

Parameters **address** Display a particular conflict log entry.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

show ip dhcp lease

Display lease information about the dynamic IP address currently assigned to a DHCP client interface.

Z9500

Syntax	<code>show ip dhcp dhcp lease [interface type slot/port]</code>	
Parameters	<p>interface type slot/port</p> <p>Enter the keyword <code>interface</code> with the interface type and slot/port information to display DHCP lease information for a specified interface. The valid interface types are:</p> <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>tengigabitethernet</code>. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code>. 	
Defaults	none	
Command Modes	EXEC Privilege	
Command History	<p>Version 9.2(1.0) Introduced on the Z9500.</p> <p>Version 8.3.19.0 Introduced on the S4820T.</p> <p>Version 8.3.11.1 Introduced on the Z9000.</p> <p>Version 8.3.7.0 Introduced on the S4810.</p> <p>Version 8.2.1.0 Introduced on the C-Series and S-Series.</p>	

Example

show ip dhcp snooping

Display the contents of the DHCP binding table or display the interfaces configured with IP Source Guard.

Syntax	<code>show ip dhcp snooping [binding source-address-validation [discard-counters [interface interface]]]</code>										
Parameters	<table border="1"> <thead> <tr> <th>Parameters</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>binding</td> <td>Display the binding table.</td> </tr> <tr> <td>source-address-validation</td> <td>Display the interfaces configured with IP Source Guard.</td> </tr> <tr> <td>discard-counters</td> <td>(OPTIONAL) Display the number of dropped packets.</td> </tr> <tr> <td>interface interface</td> <td>(OPTIONAL) Specifies an interface to show the discard counters.</td> </tr> </tbody> </table>	Parameters	Description	binding	Display the binding table.	source-address-validation	Display the interfaces configured with IP Source Guard.	discard-counters	(OPTIONAL) Display the number of dropped packets.	interface interface	(OPTIONAL) Specifies an interface to show the discard counters.
Parameters	Description										
binding	Display the binding table.										
source-address-validation	Display the interfaces configured with IP Source Guard.										
discard-counters	(OPTIONAL) Display the number of dropped packets.										
interface interface	(OPTIONAL) Specifies an interface to show the discard counters.										

Parameters Description

Enter any of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

Defaults None

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version Description

9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Added the <code>discard-counters</code> , <code>interface</code> keywords, and the <code>interface</code> variable.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

Example The following example displays the interfaces configured with IP Source Guard:

```
DelleMC> show ip dhcp snooping source-address-validation
ip sav access-list on TenGigabitEthernet 1/1
Total cam count 3
permit host 0.0.0.0 count (0 packets)
permit host 10.1.1.252 count (0 packets)
permit host 10.1.1.253 count (0 packets)
ipmac-vlan sav access-list on TenGigabitEthernet 1/2
Total cam count 4
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 10.1.1.1 host 00:00:00:aa:00:01 count (0 packets)
permit vlan 10 host 10.1.1.2 host 00:00:00:aa:00:02 count (0 packets)
permit vlan 20 host 10.2.2.1 host 00:00:00:aa:00:03 count (0 packets)
permit vlan 20 host 10.2.2.2 host 00:00:00:aa:00:04 count (0 packets)
```

The following example displays the port channel interfaces configured with IP Source Guard:

```
DelleMC> show ip dhcp snooping source-address-validation interface
portchannel 10
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 0
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 1
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 2
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
```

NOTE: The output for port-channel interfaces does not display the physical interface.

The following example displays the SAV discard counters on all interfaces:

```
DelleMC> show ip dhcp snooping source-address-validation discard-
counters
deny access-list on TenGigabitEthernet 1/1
Total cam count 1
deny count (0 packets)
deny access-list on TenGigabitEthernet 1/2
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)
```

The following example displays the SAV discard counters on a particular interface:

```
DelleMC> show ip dhcp snooping source-address-validation discard-
counters interface TenGigabitEthernet 1/1
deny access-list on TenGigabitEthernet 1/1
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)
```

The following example displays the SAV discard counters on a port channel interface:

```
DelleMC> show ip dhcp snooping source-address-validation discard-
counters interface portchannel 10
deny access-list on Port-channel 10 on stack-unit 0
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 1
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 2
Total cam count 1
deny vlan 10 count (0 packets)
```

NOTE: The output for port-channel interfaces does not display the physical interface. If the LAG member interfaces belong to different stack-units, the counters are displayed per stack-unit for that port channel.

show ip dhcp server statistics

Display statistical information about a DHCP server.

Z9500

Syntax	show ip dhcp server statistics
Defaults	none
Command Modes	EXEC Privilege
Command History	Version 9.2(1.0) Introduced on the Z9500. Version 8.3.19.0 Introduced on the S4820T. Version 8.3.11.1 Introduced on the Z9000. Version 8.3.7.0 Introduced on the S4810. Version 8.2.1.0 Introduced on the C-Series and S-Series.

Example

```
Dell# show ip dhcp server statistics
Address pools          1
Database agents       0
Automatic bindings   10
Manual bindings       0
Expired bindings      1
Malformed messages   0

Message               Received
BOOTREQUEST           0
DHCPDISCOVER          10
DHCPREQUEST           16
DHCPDECLINE           0
DHCPRELEASE           8
DHCPIFORM              0

Message               Sent
BOOTREPLY              0
DHCPPOFFER            10
DHCPACK                16
DHCPCNAK               0
```

Configure Secure DHCP and DHCP Relay

DHCP, as defined by RFC 2131, provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks, including using the switch as a DHCP relay agent.

arp inspection

Enable dynamic arp inspection (DAI) on a VLAN.

Syntax	arp inspection
Defaults	Disabled
Command Modes	INTERFACE VLAN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

Related Commands

- [arp inspection-trust](#) — specify a port as trusted so that ARP frames are not validated against the binding table.

arp inspection-trust

Specify a port as trusted so that ARP frames are not validated against the binding table.

Syntax

```
arp inspection-trust
```

Defaults

Disabled

Command Modes

- INTERFACE
- INTERFACE PORT-CHANNEL

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

Related Commands

- [arp inspection](#) — enable dynamic ARP inspection on a VLAN.

clear ip dhcp snooping

Clear the DHCP binding table.

Syntax `clear ip dhcp snooping {binding | source-address-validation discard-counters [interface interface]}`

Parameters

binding	Clears the binding table.
source-address-validation discard-counters	Clears discard counters from all the interfaces configured with IP Source Guard.
interface <i>interface</i>	(OPTIONAL) Specifies an interface to clear the discard counters. Enter any of the following keywords and the interface information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For a port channel interface, enter the keywords <code>port-channel</code> then a number.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Added the keywords <code>discard-counters</code> , <code>interface</code> , and the variable <code>interface</code> on the S4810, S4820T, S5000, S6000, Z9000, Z9500.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

Example

The following example shows how to clear the discard counters globally:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters
```

The following example shows how to clear the discard counters on an interface:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters interface TenGigE 1/10
```

The following example shows how to clear the discard counters on a port channel interface:

```
DellEMC> clear ip dhcp snooping source-address-validation discard-counters interface portchannel 1
```

Related Commands

- [show ip dhcp snooping](#) — display the contents of the DHCP binding table.

clear ipv6 dhcp snooping binding

Clear all the DHCPv6 snooping binding database entries.

Syntax `clear ipv6 dhcp snooping binding`

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

Example

```
DellEMC# clear ipv6 dhcp snooping?
binding Clear the snooping binding database
```

ip dhcp snooping

Enable DHCP snooping globally.

Syntax [no] ip dhcp snooping

Defaults Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the S4810 and S4820T.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series on Layer 2 interfaces.
7.8.1.0	Introduced on the C-Series and S-Series on Layer 3 interfaces.

Usage Information When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP snooping, the binding table deletes and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

Introduced in Dell EMC Networking OS version 7.8.1.0, DHCP snooping was available for Layer 3 only and dependent on DHCP Relay Agent (`ip helper-address`). Dell EMC Networking OS version 8.2.1.0 extends DHCP Snooping to Layer 2. You do not have to enable relay agent to snoop on Layer 2 interfaces.

ipv6 dhcp snooping

Enable DHCPv6 snooping globally for ipv6.

Syntax [no] ipv6 dhcp snooping

To disable the snooping globally, use the `no ipv6 dhcp snooping` command.

Defaults Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

ip dhcp snooping binding

Create a static entry in the DHCP binding table.

Syntax `[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address interface interface-type lease number`

Parameters	Parameter	Description
	mac address	Enter the keyword <code>mac</code> then the MAC address of the host to which the server is leasing the IP address.
	vlan-id vlan-id	Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.
	ip ip-address	Enter the keyword <code>ip</code> then the IP address that the server is leasing.
	interface type	Enter the keyword <code>interface</code> then the type of interface to which the host is connected: <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
	lease time	Enter the keyword <code>lease</code> then the amount of time the IP address are leased. The range is from 1 to 4294967295.

Defaults None

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Enhanced the command to map multiple IP addresses to one MAC address. Enhanced to support DHCP snooping in a VLT setup.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

Usage Instructions

You can map multiple IP addresses to the same MAC address.

Related Commands

- [show ip dhcp snooping](#) — display the contents of the DHCP binding table.

IPv6 DHCP Snooping Binding

Create a static DHCP snooping binding entry in the snooping database.

Syntax

```
[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value
```

To delete the DHCP snooping binding entry from DHCP snooping database, use the `[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value` command.

Parameters

mac address	Enter the keyword <code>mac</code> then the MAC address of the host to which the server is leasing the IPv6 address.
vlan-id	Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.
ipv6 ipv6-address	Enter the keyword <code>ipv6</code> then the IPv6 address that is leased to the client.
interface type	Enter the keyword <code>interface</code> then the type of interface to which the host is connected: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
interface number	Enter the number of the interface.
lease value	Enter the keyword <code>lease</code> then the amount of time the IPv6 address are leased. The range is from 1 to 4294967295.

Defaults

None

8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

ipv6 dhcp snooping database write-delay

To set time interval for storing the snooping binding entries in a file.

Syntax `[no] ipv6 dhcp snooping database write-delay value`

To disable the storing of snooping binding entries in a file, use the `no ipv6 dhcp snooping write-delay` command.

Parameters	value	The range is from 5 to 21600. The value of the minutes range is from 5 min. to 15 days.
Defaults	None

8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.2.1.0	Introduced on the C-Series and S-Series.

ipv6 dhcp snooping verify mac-address

Syntax	<code>[no] ipv6 dhcp snooping verify mac-address</code> To disable verify source mac-address against IPv6 DHCP packet MAC address, use the <code>no ipv6 dhcp snooping verify mac-address</code> command.
Defaults	Disabled
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

ip dhcp snooping vlan

Enable DHCP Snooping on one or more VLANs.

Syntax	<code>[no] ip dhcp snooping vlan <i>name</i></code>
Parameters	<i>name</i> Enter the name of a VLAN on which to enable DHCP Snooping.
Defaults	Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

Usage Information When enabled, the system begins creating entries in the binding table for the specified VLANs.

 **NOTE:** Learning only happens if there is a trusted port in the VLAN.

Related Commands [ip dhcp snooping trust](#) — configures an interface as trusted.

ipv6 dhcp snooping vlan

Enable ipv6 DHCP Snooping on VLAN or range of VLANs.

Syntax `[no] ip dhcp snooping vlan vlan-id`

To disable the ipv6 dhcp snooping on VLAN basis or range of VLAN, use the `no ip dhcp snooping vlan <vlan-id>` command.

Parameters *vlan-id* Enter the name of a VLAN id or list of the VLANs to enable DHCP Snooping.

Defaults Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

ip dhcp source-address-validation

Enable the IP Source Guard.

Syntax `[no] ip dhcp source-address-validation [ipmac] [vlan vlan-id]`

Parameters	<p>ipmac Enable IP+MAC Source Address Validation.</p> <p>vlan <i>vlan-id</i> (OPTIONAL) SAV validates the source IP address along with the source VLAN ID against the DHCP snooping binding table.</p>																																				
Defaults	Disabled																																				
Command Modes	INTERFACE INTERFACE PORTCHANNEL																																				
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Usage Information	<p>Allocate at least one FP block to <code>ipmacacl</code> before you can enable IP+MAC Source Address Validation and SAV with VLAN option.</p> <ol style="list-style-type: none"> 1. Use the <code>cam-acl 12acl</code> command from CONFIGURATION mode. 2. Save the running-config to the startup-config. 3. Reload the system. 																																				

ipv6 helper-address

Configures the ipv6 DHCP helper addresses without VRF.

Syntax	<pre>[no] ipv6 helper-address ipv6-address</pre> <p>To delete the ipv6 helper address, use the <code>[no] ipv6 helper-address ipv6-address</code> command.</p>
Parameters	<p><i>ipv6-address</i> Enter the keyword <code>ipv6-address</code> through which the server address can be reached.</p>
Default	Disabled.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, Z9000, and Z9500.

Usage Information Use this command on the interfaces where the DHCP clients are connected to forward the packets from clients to DHCP server and vice-versa.

Example

```
DellEMC(conf-if-te-1/1)# ipv6 helper-address
X:X:X:X::X      IPv6 helper address
VRF             VRF name.
Global         Global address space
```

ip dhcp relay secondary-subnet

Enable DHCP relay secondary- subnet on all the interfaces.

Syntax [no] ip dhcp relay secondary-subnet
To disable the dhcp relay secondary- subnet, use the `no ip dhcp relay secondary-subnet` command.

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

Example

```
Dell(conf)# ip dhcp relay secondary-subnet
```

show ip dhcp binding

Display the DHCP binding table.

Syntax show ip dhcp binding

Defaults None

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

show ip dhcp snooping

Display the contents of the DHCP binding table or display the interfaces configured with IP Source Guard.

Syntax

```
show ip dhcp snooping [binding | source-address-validation [discard-counters [interface interface]]]
```

Parameters

Parameters	Description
binding	Display the binding table.
source-address-validation	Display the interfaces configured with IP Source Guard.
discard-counters	(OPTIONAL) Display the number of dropped packets.
interface <i>interface</i>	(OPTIONAL) Specifies an interface to show the discard counters. Enter any of the following keywords and the interface information: <ul style="list-style-type: none">For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.For a port channel interface, enter the keywords <code>port-channel</code> then a number.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Added the <code>discard-counters</code> , <code>interface</code> keywords, and the <code>interface</code> variable.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

Example

The following example displays the interfaces configured with IP Source Guard:

```
DelleMC> show ip dhcp snooping source-address-validation
ip sav access-list on TenGigabitEthernet 1/1
Total cam count 3
permit host 0.0.0.0 count (0 packets)
permit host 10.1.1.252 count (0 packets)
permit host 10.1.1.253 count (0 packets)
ipmac-vlan sav access-list on TenGigabitEthernet 1/2
Total cam count 4
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 10.1.1.1 host 00:00:00:aa:00:01 count (0 packets)
permit vlan 10 host 10.1.1.2 host 00:00:00:aa:00:02 count (0 packets)
permit vlan 20 host 10.2.2.1 host 00:00:00:aa:00:03 count (0 packets)
permit vlan 20 host 10.2.2.2 host 00:00:00:aa:00:04 count (0 packets)
```

The following example displays the port channel interfaces configured with IP Source Guard:

```
DelleMC> show ip dhcp snooping source-address-validation interface
portchannel 10
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 0
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 1
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 2
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
```

i **NOTE:** The output for port-channel interfaces does not display the physical interface.

The following example displays the SAV discard counters on all interfaces:

```
DelleMC> show ip dhcp snooping source-address-validation discard-
counters
deny access-list on TenGigabitEthernet 1/1
Total cam count 1
deny count (0 packets)
deny access-list on TenGigabitEthernet 1/2
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)
```

The following example displays the SAV discard counters on a particular interface:

```
DelleMC> show ip dhcp snooping source-address-validation discard-
counters interface TenGigabitEthernet 1/1
deny access-list on TenGigabitEthernet 1/1
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)
```

The following example displays the SAV discard counters on a port channel interface:

```
DelleMC> show ip dhcp snooping source-address-validation discard-
counters interface portchannel 10
deny access-list on Port-channel 10 on stack-unit 0
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 1
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 2
Total cam count 1
deny vlan 10 count (0 packets)
```

i **NOTE:** The output for port-channel interfaces does not display the physical interface. If the LAG member interfaces belong to different stack-units, the counters are displayed per stack-unit for that port channel.

show ipv6 dhcp snooping

Display the DHCPv6 snooping binding database.

Syntax show ipv6 dhcp snooping

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

Example

```

DellEMC# show ipv6 dhcp snooping
IPv6 DHCP Snooping                : Enabled.
IPv6 DHCP Snooping Mac Verification : Disabled.

Database write-delay (In minutes)  : 5

DHCP packets information
Snooping packets                   : 0
Snooping packets processed on L2 vlans : 0

DHCP Binding File Details
Invalid File                        : 0
Invalid Binding Entry               : 0
Binding Entry lease expired         : 0

DellEMC#

```

Equal Cost Multi-Path (ECMP)

Equal cost multi-path (ECMP) supports multiple "best paths" in next-hop packet forwarding to a destination device.

Topics:

- [ecmp-group](#)
- [hash-algorithm](#)
- [hash-algorithm ecmp](#)
- [hash-algorithm hg](#)
- [hash-algorithm hg-seed](#)
- [hash-algorithm seed](#)
- [ip ecmp-group](#)
- [link-bundle-distribution trigger-threshold](#)
- [link-bundle-monitor enable](#)
- [show config](#)
- [show link-bundle distribution](#)

ecmp-group

Provides a mechanism to monitor traffic distribution on an ECMP link bundle. A system log is generated when the standard deviation of traffic distribution on a member link exceeds a defined threshold.

Z9500

Syntax

```
ecmp-group {ecmp-group-id interface interface | link-bundle-monitor}
```

To remove the selected interface, use the `ecmp-group no interface` command.

To disable link bundle monitoring, use the `ecmp-group no link-bundle-monitor` command.

Parameters

- | | |
|-----------------------------|---|
| <i>ecmp-group ID</i> | Enter the identifier number for the ECMP group. The range is from 2 to 64. |
| <i>interface</i> | Enter the following keywords and the interface information to add the interface to the ECMP group: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For a LAG interface, enter the keywords <code>port-channel</code> then the slot/port information. |

Defaults

Off

Command Modes

- CONFIGURATION
- CONFIGURATION ECMP-GROUP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

Usage Information

Using CONFIGURATION mode, create an ECMP group ID. You can then assign interfaces to the ECMP group using CONFIGURATION ECMP-GROUP mode. You can also enable on the port-channel configuration using the CONFIGURATION ECMP-GROUP command mode.

hash-algorithm

Changes the hash algorithm used to distribute traffic flows across a Port Channel and ECMP. The ECMP and LAG options are supported on the S-Series and Z-Series.

Syntax

```
hash-algorithm {ecmp {crc16 | crc16cc | crc32MSB | crc32LSB | crc-upper
| dest-ip | flow-based-hashing {crc16|crc16cc|crc32MSB|crc32LSB|xor1|xor2|
xor4|xor8|xor16}|lsb | xor1 | xor2 | xor4 | xor8 | xor16}[[hg {crc16 |
crc16cc | crc32MSB | crc32LSB | xor1 | xor2 | xor4 | xor8 | xor16}]] [lag
{crc16 | crc16cc | crc32MSB | crc32LSB | xor1 | xor2 | xor4 | xor8 |
xor16 }][stack-unit|linecard number | port-set number] | [hg-seed value] |
[seedvalue]
```

To return to the default hash algorithm, use the `no hash-algorithm` command.

To return to the default ECMP hash algorithm, use the `no hash-algorithm ecmp algorithm-value` command.

To remove the hash algorithm on a particular stack-unit/ line-card, use the `no hash-algorithm linecard number` command.

Parameters

<p>ecmp <i>crc16</i> <i>crc16cc</i> <i>crc32MSB</i> <i>crc32LSB</i> <i>dest-ip</i> <i>flow-</i> <i>based-hashing</i> <i>crc16</i> <i>crc16cc</i> <i>crc32MSB</i> <i>crc32LSB</i> <i>xor1</i> <i>xor2</i> <i>xor4</i> <i>xor8</i> <i>xor16</i>] <i>lsb</i> <i>xor1</i> <i>xor2</i> <i>xor4</i> <i>xor8</i> <i>xor16</i></p>	<p>Enter the keyword <code>ecmp</code> then one of the following options:</p> <ul style="list-style-type: none"> • <i>crc16</i>: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default) • <i>crc16cc</i>: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial • <i>crc32MSB</i>: Use CRC32_UPPER — MSB 16 bits of computed CRC32 • <i>crc32LSB</i>: Use CRC32_LOWER — LSB 16 bits of computed CRC32 • <i>crc-upper</i>: Uses the upper 32 bits of the key for the hash computation • <i>dest-ip</i>: Uses the destination IP for ECMP hashing • <i>flow-based-hashing</i>: Enter the keywords <code>flow-based-hashing</code> followed by the algorithm <i>crc16</i> <i>crc16cc</i> <i>crc32MSB</i> <i>crc32LSB</i> <i>xor1</i> <i>xor2</i> <i>xor4</i> <i>xor8</i> <i>xor16</i> • <i>lsb</i>: Returns the LSB of the key as the hash
---	--

- *xor1*: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- *xor2*: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- *xor4*: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- *xor8*: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- *xor16*: Use CR16 — 16 bit XOR

hg { *crc16*
| *crc16cc* |
crc32MSB |
crc32LSB | *xor1* |
xor2 | *xor4* | *xor8*
| *xor16*}

Enter the keyword **hg** then one of the following options available in the stack-unit and linecard provisioned devices:

- *crc16*: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
- *crc16cc*: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- *crc32MSB*: Use CRC32_UPPER — MSB 16 bits of computed CRC32
- *crc32LSB*: Use CRC32_LOWER — LSB 16 bits of computed CRC32
- *xor1*: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- *xor2*: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- *xor4*: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- *xor8*: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- *xor16*: Use CR16 — 16 bit XOR

lag { *crc16*
| *crc16cc* |
crc32MSB |
crc32LSB | *xor1* |
xor2 | *xor4* | *xor8*
| *xor16*}

Enter the keyword **hg** then one of the following options available in the stack-unit and linecard provisioned devices::

- *crc16*: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
- *crc16cc*: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- *crc32MSB*: Use CRC32_UPPER — MSB 16 bits of computed CRC32
- *crc32LSB*: Use CRC32_LOWER — LSB 16 bits of computed CRC32
- *xor1*: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- *xor2*: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- *xor4*: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- *xor8*: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- *xor16*: Use CR16 — 16 bit XOR

hg-seed *seed-value*

(This option is available in stack-unit and linecard provisioned devices): Enter the keywords **hg-seed** then the hash algorithm seed value. The range is from 0 to 2147483646.

stack-unit
number

(OPTIONAL) : Enter the keyword **stack-unit** then the stack-unit slot number.

linecard *number*

(OPTIONAL) : Enter the keyword **linecard** then the linecard slot number.

port-set *number*

(OPTIONAL) Enter the keyword **port-set** then the port-set slot number.

Defaults

IPSA and IPDA mask value is **FF** for the stack-unit.

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added <code>flow-based-hashing</code> support for hashing on ECMP for S4820T, S6000, S4048 and Z9500.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Added the <code>nh-ecmp</code> option.
7.7.1.1	Added the <code>nh-ecmp</code> option.

Usage Information

To ensure that CRC is not used for LAG, set the default hash-algorithm method on E-Series systems. For example, `hash-algorithm ecmp xor lag checksum nh-ecmp checksum`.

The hash value calculated with the `hash-algorithm` command is unique to the entire unit. The hash algorithm command with the `stack-unit` option changes the hash for a particular stack-unit by applying the mask specified in the `IPSA` and `IPDA` fields.

The `stack-unit` option is applicable with the `lag-hash-align` microcode only. Any other microcode returns an error message as follows:

- `DellEMC(conf)#hash-algorithm linecard 5 ip-sa-mask ff ip-da-mask ff`
- `% Error: This command is not supported in the current microcode configuration`

In addition, the `linecard number ip-sa-mask value ip-da-mask value` option has the following behavior to maintain bi-directionality:

- When hashing is done on both `IPSA` and `IPDA`, the `ip-sa-mask` and `ip-da-mask` values must be equal. (Single Linecard).
- When hashing is done only on `IPSA` or `IPDA`, Dell EMC Networking OS maintains bi-directionality with masks set to `XX 00` for stack-unit 1 and `00 XX` for stack-unit 2 (`ip-sa-mask` and `ip-da-mask`). The mask value must be the same for both stack-units when using multiple stack-units as ingress (where `XX` is any value from `00` to `FF` for both stack-units). For example, assume that traffic is flowing between linecard 1 and linecard 2:
 - `hash-algorithm linecard 1 ip-sa-mask aa ip-da-mask 00`
 - `hash-algorithm linecard 2 ip-sa-mask 00 ip-da-mask aa`

The different hash algorithms are based on the number of Port Channel members and packet values. The default hash algorithm (number 0) yields the most balanced results in various test scenarios, but if the default algorithm does not provide a satisfactory distribution of traffic, use the `hash-algorithm` command to designate another algorithm.

When a Port Channel member leaves or is added to the Port Channel, the hash algorithm is recalculated to balance traffic across the members.

hash-algorithm ecmp

Change the hash algorithm used to distribute traffic flows across an ECMP (equal-cost multipath routing) group.

Term heading Description heading

Syntax hash-algorithm ecmp {crc-upper} | {dest-ip} | {lsb}
To return to the default hash algorithm, use the no hash-algorithm ecmp command.

Parameters

crc-upper	Uses the upper 32 bits of the key for the hash computation. The default is crc-lower .
dest-ip	Uses the destination IP for ECMP hashing. The default is enabled .
lsb	Returns the LSB of the key as the hash. The default is crc-lower .

Defaults

- **crc-lower**
- **dest-ip enabled**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information The hash value calculated with the hash-algorithm command is unique to the entire chassis. The default ECMP hash configuration is **crc-lower**. This command takes the lower 32 bits of the hash key to compute the egress port and is the “fall-back” configuration if you have not configured anything else.

The different hash algorithms are based on the number of ECMP group members and packet values. The default hash algorithm yields the most balanced results in various test scenarios, but if the default algorithm does not provide satisfactory distribution of traffic, use this command to designate another algorithm.

When a member leaves or is added to the ECMP group, the hash algorithm is recalculated to balance traffic across the members.

hash-algorithm hg

To distribute traffic flows across different internal HiGig links, change the hash algorithm.

Syntax hash-algorithm hg {crc16 | xor1 | xor2 | xor4 | xor8 | xor16 | crc16cc | crc32MSB | crc32LSB} linecard slot-id port-set port-pipe

Parameters **crc16** Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default).

<i>xor1</i>	Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1.
<i>xor2</i>	Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2.
<i>xor4</i>	Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4.
<i>xor8</i>	Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8.
<i>xor16</i>	Use CR16 — 16 bit XOR.
<i>crc16cc</i>	Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial.
<i>crc32MSB</i>	Use CRC32_UPPER — MSB 16 bits of computed CRC32.
<i>crc32LSB</i>	Use CRC32_LOWER — LSB 16 bits of computed CRC32.
<i>linecard slot-id port-set port-pipe</i>	Enter the line-card slot ID and port-pipe number for the set of ports for which you want to redistribute traffic flows. The range of Z9500 slot IDs is 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0; 0 to 3 on line cards 1 and 2.

Defaults **crc16 algorithm**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.11.4	Introduced on the Z9000.

hash-algorithm hg-seed

Select the seed value used in HiGig hashing.

Syntax [no] hash-algorithm hg-seed *number* [*linecard slot-id port-set port-pipe*]

Parameters

hg-seed <i>number</i>	Enter the keywords <i>hg-seed</i> then the hash algorithm seed value. The range is from 0 to 2147483646.
linecard <i>slot-id port-set port-pipe</i>	(Optional) Enter the line-card slot ID and port-pipe number for the set of ports for which you configure HiGig hashing. The range of Z9500 slot IDs is 0 to 2. The range of port-pipe numbers is: 0 to 2 on line card 0; 0 to 3 on line cards 1 and 2.
port-set <i>port-pipe</i>	Enter the keywords <i>port-set</i> then the line card's port-pipe number. The range is from 0 to 5.

Defaults **32-bit chassis MAC and system time**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.

Version	Description
8.3.11.4	Introduced on the Z9000.

hash-algorithm seed

Select the seed value for the ECMP, LAG, and NH hashing algorithm.

Syntax `hash-algorithm seed value [linecard slot] [port-set number]`

Parameters

- seed value** Enter the keyword `seed` then the seed value. The range is from 0 to 2,147,483,646.
- linecard slot** Enter the keyword `linecard` then the linecard slot number.
- port-set number** Enter the keyword `port-set` then the port-pipe number. The value is 0.

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.

Usage Information Deterministic ECMP sorts ECMPs in order even though RTM provides them in a random order. However, the hash algorithm uses as a seed the lower 12 bits of the chassis MAC, which yields a different hash result for every chassis. This behavior means that for a given flow, even though the prefixes are sorted, two unrelated chassis select different hops.

Dell provides a CLI-based solution for modifying the hash seed to ensure that on each configured system, the ECMP selection is same. When configured, the same seed is set for ECMP, LAG, and NH, and is used for incoming traffic only.

NOTE: While the seed is stored separately on each port-pipe, the same seed is used across all CAMs.

You cannot separate LAG and ECMP but you can use different algorithms across the chassis with the same seed. If LAG member ports span multiple port-pipes and line cards, set the seed to the same value on each port-pipe to achieve deterministic behavior.

If the hash algorithm configuration is removed, the hash seed does not go to the original factory default setting.

ip ecmp-group

Enable and specify the maximum number of ecmp that the L3 CAM hold for a route, By default, when maximum paths are not configured, the CAM can hold a maximum of 16 ecmp per route.

Syntax `ip ecmp-group {maximum-paths | {number} {path-fallback}}`
To negate a command, use the `no ip ecmp-group maximum-paths {number}` command.

Parameters

- maximum-paths** Specify the maximum number of ECMP for a route. The range is 2 to 64.
- path-fallback** Use the keywords `path-fallback` to enable this feature. If you enable the feature, re-enter this keyword to disable the feature.

Defaults 16

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.

Usage Information You must save the new ECMP settings to the startup-config (`write mem`) then reload the system for the new settings to take effect.

link-bundle-distribution trigger-threshold

Provides a mechanism to set the threshold to trigger when traffic distribution begins being monitored on an ECMP link bundle.

Syntax `link-bundle-distribution trigger-threshold [percent]`
To exit from ecmp group mode, use the `exit` command.

Parameters

- percent** Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is **60%**.

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.10.0	Introduced on the S4810.

show config

Display the ECMP configuration.

Syntax `show config`

Command Modes CONFIGURATION-ECMP-GROUP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Related Commands

- [show running-config ecmp-group](#) — display interfaces, LAG, or LAG link bundles being monitored for uneven traffic distribution.

show link-bundle distribution

Display the link-bundle distribution for the interfaces in the bundle, type of bundle (LAG or ECMP), and the most recently calculated interface utilization (either bytes per second rate or maximum rate) for each interface.

Syntax `show link-bundle-distribution`

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

DellEMC#

Flex Hash

This chapter describes the Flex Hash enhancements.

Topics:

- [load-balance ingress-port enable](#)
- [load-balance flexhash](#)
- [lACP fast-switchover](#)
- [encapsulation dot1q](#)

load-balance ingress-port enable

Enable the Flex hash functionality. This utility is supported on the platform.

Syntax `load-balance ingress-port enable`
To disable the Flex hash capability, use the **no** version of this command.

Default None

Command Modes CONFIGURATION mode

Command History	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.3(0.0)	Introduced on the S6000 platform.
	9.2(1.0)	Introduced on the Z9500.

Usage Information

Flex hash uses the RTAG7 bins 2 and 3 (overlay bins). These bins must be enabled for Flex hash to be configured. These bins contain the source module and source port information. These bins are disabled by default in releases of Dell EMC Networking OS earlier than Release 9.3.0.0. The default behavior of disabling of these bins occurs because of incorrect egress port information that would otherwise be displayed in the output of the diagnostic show command of `show ip flow`.

As a result, when load balancing of RRoCE packets using Flex hash is enabled, the `show ip flow` command is not functional. Similarly, when `show ip flow` command operates (ingress port based load balancing is disabled) the hashing of RRoCE packets is not operational.

Flex hash APIs do not mask out unwanted byte values after extraction of the data from the Layer 4 headers for the offset value.

Example `DellEMC#load-balance ingress-port enable`

load-balance flexhash

Specify the parameters for the Flex Hash mechanism, such as whether IPv4 or IPv6 packets must be subject to Flex Hash functionality, a unique protocol number, the offset of hash fields from the start of the L4 header to be used for hash calculation, and a meaningful description to associate the protocol number with the name.

Syntax `load-balance flexhash ipv4/ipv6 ip-proto <protocol number> <description string> offset1 <offset1 value> [offset2 <offset2 value>]`

To disable the Flex hash settings, use the `no load-balance flexhash ipv4/ipv6 ip-protocol number` command.

Parameters

ipv4	Denotes whether Flex Hash needs to be enabled for IPv4 packets.
ipv6	Denotes whether Flex Hash needs to be enabled for IPv6 packets.
protocol number	Represents the Outer IPv4 protocol field in case of IPv4 packets, and the Outer IPv6 next header field in case of IPv6 packets. The <code>ipv4/ipv6</code> keyword and the IP protocol value are used as keys to identify if a duplicate flex hash configuration is already present. Duplicate flex hash configuration is not possible. To change an existing flex hash configuration, you must delete the existing flex hash attribute and configure the flex attribute afresh.
description string	A description string is followed by the protocol number to enable you to associate the protocol number with the protocol name in an easily-identifiable way. For example, for a protocol number of 254, you can specify the description as RRoCE.
offset1 value	Specify the byte offset from the start of the L4 header from which the 2-byte data is extracted and be used in hash computation. You must enter the offset as an even number. The offset range is 0 – 30 bytes from start of L4 header.
offset2 value	(Optional) Specify the additional 2 bytes that must be extracted from the start of the L4 header to be used for hash computation. You must enter the offset as an even number. The offset range is 0 – 30 bytes from start of L4 header.

Default None

Command Modes CONFIGURATION mode

Command History

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.3(0.0)	Introduced on the S6000 platform.
9.2(1.0)	Introduced on the Z9500.

Usage Information

With the introduction of various overlay technologies such as network virtualization using generic routing encapsulation (NVGRE) segments and Routable Remote Direct Memory Access (RRDMA) over Converged Ethernet (RRoCE), information related to a traffic flow is contained in the L4 header. The fields in the L2 and L3 headers are not sufficient to distinguish the flows. Therefore, the fields in the L4 header are processed when hashing is performed for packets over LAG and ECMP links. The Flex Hash functionality enables you to configure a packet search key and matches packets based on the search key. When a packet matches the search key, two 16-bit hash fields are extracted from the start of the L4 header and provided as inputs (bins 2 and 3) for RTAG7 hash computation. You must specify the offset of hash fields from the start of the L4 header, which contains a flow identification field.

You can cause the system to include the fields present at the offsets that you define (from the start of the L4 header) as a part of LAG and ECMP computation. Also, you can specify whether the IPv4 or IPv6 packets must be operated with the Flex Hash mechanism.

Example

```
DellEMC(conf)# load-balance flexhash ipv4 ip-protocol 1 desc offset1 1 offset2 2
```

lACP fast-switchover

Cause the physical ports to be aggregated faster by configuring this capability in a port-channel on both the nodes that are members of a port-channel.

Syntax `lACP fast-switchover`

To disable the capability of faster aggregation of the member ports of a LAG or a port-channel bundle, use the no version of this command.

Defaults Not configured

Command Modes INTERFACE (conf-if-po-number)

Command History	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.3(0.0)	Introduced on the S6000.
	9.2(1.0)	Introduced on the Z9500.

Usage Information You can configure the optimal switchover functionality for LACP even if you do not enable the fast boot mode on the system. You must configure the long timeout mechanism for the LACP session to enable the fast boot capability to operate properly. This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect

If you configure the optimized booting-time capability and perform a reload of the system, the LACP application sends PDUs across all the active LACP links immediately.

Related Commands [show lacp](#) — displays the LACP configuration.

encapsulation dot1q

Configures lite-subinterfaces.

Syntax `encapsulation dot1q vlan-id`

To remove a previously configured lite-subinterface, use the `no encapsulation dot1q vlan-id` command.

Parameters **dot1q *vlan-id*** Enter the keyword `dot1q` followed by the VLAN ID to which the host belongs. The range is from 1 to 4094. A lite subinterface is considered as a Layer 3 port property and is synchronous with the existing rules of applying Layer 2 or Layer 3 properties to an interface.

Command Modes INTERFACE

Command History	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.3.0.0	Introduced on the S6000.
	9.2(1.0)	Introduced on the Z9500.

Usage Information To enable routing of RRoCE packets, the VLAN ID is mapped to the default VLAN ID of 4095 and this mapping is performed using VLAN translation. After VLAN translation, the RRoCE packets are considered in the same manner as normal IP packets that received on L3 interface and routed in the egress direction. At the egress interface, the VLAN ID is appended to the packet and transmitted out of the interface as a tagged packet with the dot1Q value preserved. The dot1Q value is preserved only for egress interfaces that are associated with a VLAN or a lite-subinterface . If a Layer 3 interface is configured without the encapsulation 802.1Q VLAN ID or is an untagged interface in a VLAN , the dot1Q value is not preserved .

FIPS Cryptography

To configure federal information processing standards (FIPS) cryptography, use the following commands:

Topics:

- [fips mode enable](#)
- [show fips status](#)
- [show ip ssh](#)
- [ssh](#)

fips mode enable

Enable the FIPS cryptography mode on the platform.

Syntax	<code>[no] fips mode enable</code> To disable the FIPS cryptography mode, use the <code>no fips mode enable</code> command.
Default	Disabled
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Introduced on the Z9500.
9.1(0.0)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Example

```
Dell (conf)# fips mode enable
WARNING: Enabling FIPS mode will close all SSH/Telnet connection,
restart those servers, and destroy all configured host keys.
proceed (y/n) ? y
Dell (conf)#
```

show fips status

Displays the status of the FIPS mode.

Syntax	<code>show fips status</code>
Defaults	None
Command Modes	EXEC
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Introduced on the Z9500.
9.1(0.0)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Example

```
DellEMC# show fips status
FIPS Mode      : Disabled
DellEMC#

DellEMC#show fips status
FIPS Mode      : Enabled
DellEMC#
```

show ip ssh

Display information about established SSH sessions

Syntax show ip ssh

Defaults None

Command Modes EXEC
EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Removed the support for hmac-sha2-256-96 algorithm.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Introduced on the Z9500.
9.1(0.0)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on S4810.

Example

```
DellEMC# show ip ssh
SSH server          : enabled.
SSH server version  : v2.
SSH server vrf      : default.
SSH server ciphers  : aes256-ctr, aes256-cbc, aes192-ctr, aes192-
cbc, aes128-ctr, aes128-cbc, 3des-cbc.
SSH server macs     : hmac-sha2-256, hmac-sha1, hmac-sha1-96,
hmac-md5, hmac-md5-96.
SSH server kex algorithms : diffie-hellman-group14-sha1.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication    : disabled.
Vty Encryption HMAC Remote IP
```

With FIPS Mode enabled:

```
Dell EMC# show ip ssh
SSH server : enabled.
SSH server version : v2.
SSH server vrf : default.
SSH server ciphers : 3des-cbc, aes128-cbc, aes192-cbc, aes256-
cbc, aes128-ctr, aes192-ctr, aes256-ctr.
SSH server macs : hmac-sha1-96.
SSH server kex algorithms : diffie-hellman-group14-sha1.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication : disabled.
  Vty          Encryption          HMAC          Remote IP
0 3des-cbc hmac-sha1-96 10.1.20.48
1 3des-cbc hmac-sha1-96 10.1.20.48
```

With FIPS Mode disabled:

```
Dell EMC# show ip ssh
SSH server : enabled.
SSH server version : v1 and v2.
SSH server vrf : default.
SSH server ciphers : 3des-cbc, aes128-cbc, aes192-cbc, aes256-
cbc, aes128-ctr, aes192-ctr, aes256-ctr.
SSH server macs : hmac-md5, hmac-md5-96, hmac-sha1, hmac-
sha1-96, hmac-sha2-256.

  Vty          Encryption          HMAC          Remote IP
0 3des-cbc hmac-sha1-96 10.1.20.48
1 3des-cbc hmac-sha1-96 10.1.20.48
```

ssh

Open an SSH connection specifying the hostname, username, port number, and version of the SSH client.

Syntax `ssh {hostname|ipv4 address|ipv6 address} [-c encryption cipher|-l username|-m HMAC algorithm|-p port-number|-v {1|2}]`

Parameters

- | | |
|-----------------------------|--|
| hostname | (OPTIONAL) Enter the IP address or the hostname of the remote device. |
| ipv4 address | (OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D. |
| ipv6 addressprefix | (OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128 |
| |  NOTE: The :: notation specifies successive hexadecimal fields of zeros. |
| -c encryption cipher | Enter the following encryption cipher to use. (For v2 clients only.) <ul style="list-style-type: none">• 3des-cbc: Force ssh to use 3des-cbc encryption cipher. FIPS mode is enabled or disabled: <ul style="list-style-type: none">• aes256-ctr: Force ssh to use the aes256-ctr encryption cipher.• aes256-cbc: Force ssh to use the aes128-cbc encryption cipher.• aes192-ctr: Force ssh to use the aes128-cbc encryption cipher.• aes192-cbc: Force ssh to use the aes256-cbc encryption cipher.• aes128-ctr: Force ssh to use the aes256-cbc encryption cipher.• aes128-cbc: Force ssh to use the aes128-cbc encryption cipher.• 3des-cbc: Force ssh to use 3des-cbc encryption cipher. |

- l username** (OPTIONAL) Enter the keyword `-l` then the user name used in this SSH session. The default is the user name of the user associated with the terminal.
- m HMAC algorithm** Enter one of the following HMAC algorithms to use. (For v2 clients only.):
Without the FIPS mode enabled:
- `hmac-sha1-96`: Force ssh to use the hmac-sha1-96 HMAC algorithm.
 - `hmac-sha1`: Force ssh to use the hmac-sha1 HMAC algorithm.
 - `hmac-md5-96`: Force ssh to use the hmac-md5-96 HMAC algorithm.
 - `hmac-md5`: Force ssh to use the hmac-md5 HMAC algorithm.
- With the FIPS mode enabled:
- `hmac-sha2-256`: Force ssh to use the hmac-sha2-256 HMAC algorithm.
 - `hmac-sha1-96`: Force ssh to use the hmac-sha1-96 HMAC algorithm.
 - `hmac-sha1`: Force ssh to use the hmac-sha1 HMAC algorithm.
 - `hmac-md5-96`: Force ssh to use the hmac-md5-96 HMAC algorithm.
 - `hmac-md5`: Force ssh to use the hmac-md5 HMAC algorithm.
- p port-number** (OPTIONAL) Enter the keyword `-p` then the port number. The range is 1 to 65535.
- v {1|2}** (OPTIONAL) Enter the keyword `-v` then the SSH version 1 or 2. The default: The version from the protocol negotiation.
-  **NOTE:** If the FIPS mode is enabled, this option does not display in the output.

Defaults See *Parameters*.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Removed the support for hmac-sha2-256-96 algorithm.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Introduced on the Z9500.
9.1(0.0)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Related Commands

- ip ssh server** Configure an SSH server.
- show ip ssh client-pub-keys** Display the client-public keys.

Usage Information Dell EMC Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

 **NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

Example **If FIPS mode is not enabled:**

```
DellEMC# ssh 10.10.10.10 ?
-c Encryption cipher to use (for v2 clients only)
```

```

-l    User name option
-m    HMAC algorithm to use (for v2 clients only)
-p    SSH server port option (default 22)
-v    SSH protocol version
<cr>
DellEMC# ssh 10.10.10.10 -c ?
3des-cbc          Force ssh to use 3des-cbc encryption cipher
aes128-cbc        Force ssh to use aes128-cbc encryption cipher
aes192-cbc        Force ssh to use aes192-cbc encryption cipher
aes256-cbc        Force ssh to use aes256-cbc encryption cipher
aes128-ctr        Force ssh to use aes128-ctr encryption cipher
aes192-ctr        Force ssh to use aes192-ctr encryption cipher
aes256-ctr        Force ssh to use aes256-ctr encryption cipher
DellEMC# ssh 10.10.10.10 -m ?
hmac-md5          Force ssh to use hmac-md5 HMAC algorithm
hmac-md5-96       Force ssh to use hmac-md5-96 HMAC algorithm
hmac-sha1         Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96     Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-sha2-256    Force ssh to use hmac-sha2-256 HMAC algorithm

```

With FIPS mode enabled:

```

DellEMC# ssh 10.10.10.10 ?
-c    Encryption cipher to use (for v2 clients only)
-l    User name option
-m    HMAC algorithm to use (for v2 clients only)
-p    SSH server port option (default 22)
<cr>
DellEMC# ssh 10.10.10.10 -c ?
3des-cbc          Force ssh to use 3des-cbc encryption cipher
aes128-cbc        Force ssh to use aes128-cbc encryption cipher
aes192-cbc        Force ssh to use aes192-cbc encryption cipher
aes256-cbc        Force ssh to use aes256-cbc encryption cipher
aes128-ctr        Force ssh to use aes128-ctr encryption cipher
aes192-ctr        Force ssh to use aes192-ctr encryption cipher
aes256-ctr        Force ssh to use aes256-ctr encryption cipher
DellEMC#ssh 10.10.10.10 -m ?
hmac-sha1         Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96     Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-sha2-256    Force ssh to use hmac-sha2-256 HMAC algorithm

```

FIP Snooping

In a converged Ethernet network, a switch can operate as an intermediate Ethernet bridge to snoop on FIP packets during the login process on Fibre Channel over Ethernet (FCoE) forwarders (FCFs). Acting as a transit FIP snooping bridge, the switch uses dynamically created access control lists (ACLs) to permit only authorized FCoE traffic to transmit between an FCoE end-device and an FCF.

clear fip-snooping database interface vlan

Clear FIP snooping information on a VLAN for a specified FCoE MAC address, ENode MAC address, or FCF MAC address, and remove the corresponding ACLs FIP snooping generates.

Z9500

Syntax `clear fip-snooping database interface vlan {vlan-id} enode {enode-mac-address} | fcf {fcf-mac-address} | session {session-mac-address}`

Parameters

<i>enode-mac-address</i>	Enter the ENode MAC address of the session which has to be cleared.
<i>fcf-mac-address</i>	Enter the FCF MAC address of the session which has to be cleared.
<i>session-mac-address</i>	Enter the MAC address of the session which has to be cleared.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

clear fip-snooping statistics

Clears the statistics on the FIP packets snooped on all VLANs, a specified VLAN, or a specified port interface.

Z9500

Syntax	<code>clear fip-snooping statistics [interface vlan <i>vlan-id</i> interface <i>port-type slot/port</i> interface port-channel <i>port-channel-number</i>]</code>
Parameters	<p><i>vlan-id</i> Enter the VLAN ID of the FIP packet statistics to be cleared.</p> <p><i>port-type slot/port</i> Enter the slot number and port-type of the FIP packet statistics to be cleared.</p> <p><i>port-channelnumber</i> Enter the port channel number of the FIP packet statistics to be cleared.</p>
Command Modes	EXEC Privilege
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100–ON.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

debug fip snooping

Enable debugging on FIP snooping.

Z9500

Syntax	<code>debug fip-snooping [all acl error ifm info ipc ns rscn rx tx]</code>
Parameters	<p>all Enter the keyword <code>all</code> to enable debugging on all the options.</p>

acl	Enter the keyword <code>acl</code> for ACL-specific debugging.
error	Enter the keyword <code>error</code> for error-specific debugging.
ifm	Enter the keyword <code>ifm</code> for IFM-specific debugging.
info	Enter the keyword <code>info</code> for information-specific debugging.
ipc	Enter the keyword <code>ipc</code> for IPC-specific debugging.
ns	Enter the keyword <code>ns</code> for name-server-specific debugging.
rscn	Enter the keyword <code>rscn</code> for RSCN-specific debugging.
rx	Enter the keyword <code>rx</code> for packet receive-specific debugging.
tx	Enter the keyword <code>tx</code> for packet transmit-specific debugging.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

debug fip snooping rx

Enable debugging for FIP snooping receive-specific packets.

Z9500

Syntax `debug fip-snooping rx packet-type [all | discovery | ns | virtual-link-instantiation | virtual-link-maintenance | vlan-discovery] [interface]`

Parameters

packet-type Enter the keyword `packet-type` and then the option type on which to enable debugging. The options are:

- `all` — Enter the keyword `all` to enable debugging on all the options.
- `discovery` — Enter the keyword `discovery` to enable debugging on FCF advertisements and ENode solicitation.
- `ns` — Enter the keyword `ns` to enable debugging of the name-server packets.
- `virtual-link-instantiation` — Enter the keywords `virtual-link-instantiation` to enable debugging on FLOGI, FDISC, and FLOGO packets.
- `virtual-link-maintenance` — Enter the keywords `virtual-link-maintenance` to enable debugging on FIP clear virtual link frames and keepalives.
- `vlan-discovery` — Enter the keywords `vlan-discovery` to enable debugging on VLAN requests and notifications.

interface Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
9.2(0.2)	Introduced on the S4810 and S4820T. Added the receive parameters <code>packet-type</code> and <code>interfaces</code> and their options.

feature fip-snooping

Enable FCoE transit and FIP snooping on a switch.

Z9500

Syntax `feature fip-snooping`
To disable the FCoE transit feature, use the `no feature fip-snooping` command.

Defaults Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information Before enabling FIP snooping, assign the `fcoeacl` space using the `cam-acl` command. If not assigned, the following error message is displayed:

```
DellEMC(conf)#feature fip-snooping
% Error: Cannot enable fip snooping. CAM Region not allocated for Fcoe.
```

```
DellEMC(conf)#cam-acl l2acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 l2qos 0 l2pt
0 ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2
DellEMC(conf)#feature fip-snooping
```

fip-snooping enable

Enable FIP snooping on all VLANs or on a specified VLAN.

Z9500

Syntax `fip-snooping enable`

To disable the FIP snooping feature on all or a specified VLAN, use the `no fip-snooping enable` command.

Defaults FIP snooping is disabled on all VLANs.

Command Modes

- CONFIGURATION
- VLAN INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information The maximum number of FCFs supported per FIP snooping-enabled VLAN is 12. The default number of FIP snooping sessions supported per ENode server is 32. The maximum number of FIP snooping sessions supported per ENode server is 64.

fip-snooping fc-map

Configure the FC-MAP value FIP snooping uses on all VLANs.

Z9500

Syntax `fip-snooping fc-map fc-map-value`

To return the configured FM-MAP value to the default value, use the `no fip-snooping fc-map` command.

Parameters `fc-map-value` Enter the FC-MAP value FIP snooping uses. The range is from 0EFC00 to 0EFCFF.

Defaults `0x0EFC00`

Command Modes

- VLAN INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

fip-snooping port-mode fcf

Configure the port for bridge-to-FCF links.

Z9500

Syntax

```
fip-snooping port-mode fcf
```

To disable the bridge-to-FCF link on a port, use the `no fip-snooping port-mode fcf` command.

Command Modes INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information

The maximum number of FCFs supported per FIP snooping-enabled VLAN is four.

fip-snooping max-sessions-per-enodemac

Configure the maximum session limit per ENode MAC address.

Z9500

Syntax

```
fip-snooping max-sessions-per-enode-mac max-sessions-value
```

To return the configured maximum sessions to the default value, use the `no fip-snooping max-sessions-per-enode-mac` command.

Parameters	<i>max-sessions-value</i>	Enter the maximum number of sessions allowed per ENode MAC address. The range is from 1 to 64.
Defaults	32	
Command Modes	CONFIGURATION	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
	9.7(0.0)	Introduced on the Z9500 and S6000-ON.
	9.2(0.2)	Introduced on the S4810 and S4820T.

show fip-snooping config

Display the FIP snooping status and configured FC-MAP values.

Z9500

Syntax	show fip-snooping config	
Command Modes	<ul style="list-style-type: none"> • EXEC • EXEC Privilege 	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.

	9.7(0.0)	Introduced on the Z9500 and S6000-ON.
	8.3.19.0	Introduced on the S4820T.
	8.3.12.0	Introduced on the S4810.

Example

```
DelleMC# show fip-snooping config
FIP Snooping Feature enabled Status: Enabled
FIP Snooping Global enabled Status: Enabled
Global FC-MAP Value: 0X0EFC00

FIP Snooping enabled VLANs
VLAN   Enabled   FC-MAP
----   -
100    TRUE      0X0EFC00
```

show fip-snooping enode

Display information on the ENodes in FIP-snooped sessions, including the ENode interface and MAC address, FCF MAC address, VLAN ID and FC-ID.

Z9500

Syntax `show fip-snooping enode [enode-mac-address]`

Parameters **enode-mac-address** Enter the MAC address of the ENodes to display.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information The following describes the `show fip-snooping enode` command shown in the following example.

Field	Description
ENode MAC	MAC address of the ENode.
ENode Interface	Slot/ port number of the interface connected to the ENode.
FCF MAC	MAC address of the FCF.
VLAN	VLAN ID number the session uses.
FC-ID	Fibre Channel session ID the FCF assigns.

Example

```
DellEMC# show fip-snooping enode
Enode MAC           Enode Interface  FCF MAC           VLAN FC-ID
-----
d4:ae:52:1b:e3:cd Te 1/11           54:7f:ee:37:34:40 100 62:00:11
```

show fip-snooping fcf

Display information on the FCFs in FIP-snooped sessions, including the FCF interface and MAC address, FCF interface, VLAN ID, FC-MAP value, FKA advertisement period, and number of ENodes connected.

Z9500

Syntax `show fip-snooping fcf [fcf-mac-address]`

Parameters ***fcf-mac-address*** Enter the MAC address of the FCF to display.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information The following describes the `show fip-snooping fcf` command shown in the following example.

Field	Description
FCF MAC	MAC address of the FCF.
FCF Interface	Slot/port number of the interface to which the FCF is connected.
VLAN	VLAN ID number the session uses.
FC-MAP	FC-Map value the FCF advertises.
ENode Interface	Slot/ number of the interface connected to the ENode.
FKA_ADV_PERIOD	Time (in milliseconds) during which FIP keep-alive advertisements transmit.
D	
No of ENodes	Number of ENodes connected to the FCF.
FC-ID	Fibre Channel session ID the FCF assigns.

Example

```
DellEMC# show fip-snooping fcf
FCF MAC          FCF Interface  VLAN  FC-MAP  FKA_ADV_PERIOD  No. of Enodes
-----
54:7f:ee:37:34:40 Po 22          100  0e:fc:00  4000                               2
```

show fip-snooping sessions

Display information on FIP-snooped sessions on all VLANs or a specified VLAN, including the ENode interface and MAC address, the FCF interface and MAC address, VLAN ID, FCoE MAC address and FCoE session ID number (FC-ID), worldwide node name (WWNN) and the worldwide port name (WWPN).

Z9500

C9000 Series

Syntax `show fip-snooping sessions [interface vlan vlan-id]`

Parameters ***vlan-id*** Enter the *vlan-id* of the specified VLAN to display.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information

The following describes the `show fip-snooping sessions` command shown in the following example.

Field	Description
ENode MAC	MAC address of the ENode.
ENode Interface	Slot/ port number of the interface connected to the ENode.
FCF MAC	MAC address of the FCF.
FCF Interface	Slot/ port number of the interface to which the FCF is connected.
VLAN	VLAN ID number the session uses.
FCoE MAC	MAC address of the FCoE session the FCF assigns.
FC-ID	Fibre Channel ID the FCF assigns.
Port WWPN	Worldwide port name of the CNA port.
Port WWNN	Worldwide node name of the CNA port.

Example

```

Dell# show fip-snooping sessions
Enode MAC          Enode Intf  FCF MAC          FCF Intf  VLAN  FCoE MAC
   FC-ID          Port WWPN          Port WWNN
-----

```

show fip-snooping statistics

Display statistics on the FIP packets snooped on all interfaces, including VLANs, physical ports, and port channels.

Z9500

Syntax

```
show fip-snooping statistics [interface vlan vlan-id | interface interface-
type | interface port-channel port-channel-number]
```

Parameters

vlan-id Enter the VLAN ID of the FIP packet statistics displays.

port-channel-number Enter the port channel number of the FIP packet statistics displays.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information

The following describes the `show fip-snooping statistics` command shown in the following example.

Field	Description
Number of VLAN Requests	Number of FIP-snoop VLAN request frames received on the interface.
Number of VLAN Notifications	Number of FIP-snoop VLAN notification frames received on the interface.
Number of Multicast	Number of FIP-snoop multicast discovery solicit frames received on the interface.

Field	Description
Discovery Solicits	
Number of Unicast Discovery Solicits	Number of FIP-snoop unicast discovery solicit frames received on the interface.
Number of FLOGI	Number of FIP-snoop FLOGI request frames received on the interface.
Number of FDISC	Number of FIP-snoop FDISC request frames received on the interface.
Number of FLOGO	Number of FIP-snoop FLOGO frames received on the interface.
Number of ENode Keep Alives	Number of FIP-snoop ENode keep-alive frames received on the interface.
Number of VN Port Keep Alives	Number of FIP-snoop VN port (Virtual N-port) keep-alive frames received on the interface.
Number of Multicast Discovery Advertisements	Number of FIP-snoop multicast discovery advertisements received on the interface.
Number of Unicast Discovery Advertisements	Number of FIP-snoop unicast discovery advertisements received on the interface.
Number of FLOGI Accepts	Number of FIP FLOGI accept frames received on the interface.
Number of FLOGI Rejects	Number of FIP FLOGI reject frames received on the interface.
Number of FDISC Accepts	Number of FIP FDISC accept frames received on the interface.
Number of FDISC Rejects	Number of FIP FDISC reject frames received on the interface.
Number of FLOGO Accepts	Number of FIP FLOGO accept frames received on the interface.
Number of FLOGO Rejects	Number of FIP FLOGO reject frames received on the interface.
Number of CVLs	Number of FIP clear virtual link frames received on the interface.
Number of FCF Discovery Timeouts	Number of FCF discovery timeouts that occurred on the interface.
Number of VN Port Session Timeouts	Number of VN port session timeouts that occurred on the interface.
Number of Session failures due to Hardware Config	Number of session failures due to hardware configuration that occurred on the interface.

Example

```
DellEMC# show fip-snooping statistics interface vlan 100
Number of Vlan Requests           :0
Number of Vlan Notifications      :0
Number of Multicast Discovery Solicits :2
Number of Unicast Discovery Solicits :0
```

```

Number of FLOGI :2
Number of FDISC :16
Number of FLOGO :0
Number of Enode Keep Alive :9021
Number of VN Port Keep Alive :3349
Number of Multicast Discovery Advertisement :4437
Number of Unicast Discovery Advertisement :2
Number of FLOGI Accepts :2
Number of FLOGI Rejects :0
Number of FDISC Accepts :16
Number of FDISC Rejects :0
Number of FLOGO Accepts :0
Number of FLOGO Rejects :0
Number of CVL :0
Number of FCF Discovery Timeouts :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0
DellEMC(conf)#

```

```

DellEMC# show fip-snooping statistics int tengigabitethernet 1/11
Number of Vlan Requests :1
Number of Vlan Notifications :0
Number of Multicast Discovery Solicits :1
Number of Unicast Discovery Solicits :0
Number of FLOGI :1
Number of FDISC :16
Number of FLOGO :0
Number of Enode Keep Alive :4416
Number of VN Port Keep Alive :3136
Number of Multicast Discovery Advertisement :0
Number of Unicast Discovery Advertisement :0
Number of FLOGI Accepts :0
Number of FLOGI Rejects :0
Number of FDISC Accepts :0
Number of FDISC Rejects :0
Number of FLOGO Accepts :0
Number of FLOGO Rejects :0
Number of CVL :0
Number of FCF Discovery Timeouts :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0

```

Example (Port Channel)

```

DellEMC# show fip-snooping statistics interface port-channel 22
Number of Vlan Requests :0
Number of Vlan Notifications :2
Number of Multicast Discovery Solicits :0
Number of Unicast Discovery Solicits :0
Number of FLOGI :0
Number of FDISC :0
Number of FLOGO :0
Number of Enode Keep Alive :0
Number of VN Port Keep Alive :0
Number of Multicast Discovery Advertisement :4451
Number of Unicast Discovery Advertisement :2
Number of FLOGI Accepts :2
Number of FLOGI Rejects :0
Number of FDISC Accepts :16
Number of FDISC Rejects :0
Number of FLOGO Accepts :0
Number of FLOGO Rejects :0
Number of CVL :0
Number of FCF Discovery Timeouts :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0

```

show fip-snooping system

Display information on the status of FIP snooping on the switch (enabled or disabled), including the number of FCoE VLANs, FCFs, ENodes, and currently active sessions.

Z9500

Syntax `show fip-snooping system`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Example

```
DellEMC# show fip-snooping system
Global Mode : Enabled
FCOE VLAN List (Operational) : 1, 100
FCFs : 1
Enodes : 2
Sessions : 17
```

show fip-snooping vlan

Display information on the FCoE VLANs on which FIP snooping is enabled.

Z9500

Syntax `show fip-snooping vlan`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the Z9500 and S6000-ON.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Example

```

DellEMC# show fip-snooping vlan
* = Default VLAN
VLAN FC-MAP      FCFs Enodes Sessions
---- -
*1    -          -     -      -
100   0X0EFC00  1     2     17

```

Force10 Resilient Ring Protocol (FRRP)

FRRP is a proprietary protocol for that offers fast convergence in a Layer 2 network without having to run the spanning tree protocol (STP). The resilient ring protocol is an efficient protocol that transmits a high-speed token across a ring to verify the link status. All the intelligence is contained in the master node with practically no intelligence required of the transit mode.

Important Points to Remember

- FRRP is media- and speed-independent.
- FRRP is a Dell EMC Networking proprietary protocol that does not interoperate with any other vendor.
- Spanning Tree must be disabled on both primary and secondary interfaces before Resilient Ring protocol is enabled.
- A VLAN configured as the control VLAN for a ring cannot be configured as a control or member VLAN for any other ring.
- Member VLANs across multiple rings are not supported in Master nodes.
- If multiple rings share one or more member VLANs, they cannot share any links between them.
- Each ring can have only one Master node; all others are Transit nodes.

Topics:

- [clear frrp](#)
- [debug frrp](#)
- [description](#)
- [disable](#)
- [interface](#)
- [member-vlan](#)
- [mode](#)
- [protocol frrp](#)
- [show frrp](#)
- [timer](#)

clear frrp

Clear the FRRP statistics counters.

Syntax	<code>clear frrp [ring-id]</code>
Parameters	ring-id (Optional) Enter the ring identification number. The range is from 1 to 255.
Defaults	None
Command Modes	EXEC
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Example

```
DellEMC# clear frrp
Clear frrp statistics counter on all ring [confirm] yes
DellEMC#clear frrp 4
Clear frrp statistics counter for ring 4 [confirm] yes
DellEMC#
```

Related Commands

- [show frrp](#) — display the Resilient Ring Protocol configuration.

debug frrp

Clear the FRRP statistics counters.

Syntax

```
debug frrp {event | packet | detail} [ring-id] [count number]
```

To disable debugging, use the `no debug frrp {event | packet | detail} {ring-id} [countnumber]` command.

Parameters

event	Enter the keyword <code>event</code> to display debug information related to ring protocol transitions.
packet	Enter the keyword <code>packet</code> to display brief debug information related to control packets.
detail	Enter the keyword <code>detail</code> to display detailed debug information related to the entire ring protocol packets.
ring-id	(Optional) Enter the ring identification number. The range is from 1 to 255.

count *number* Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534.

Defaults Disabled.

Command Modes CONFIGURATION (conf-frpp)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

Usage Information Because the resilient ring protocol can potentially transmit 20 packets per interface, restrict debug information.

description

Enter an identifying description of the ring.

Syntax `description Word`
To remove the ring description, use the `no description [Word]` command.

Parameters **Word** Enter a description of the ring. Maximum: 255 characters.

Defaults None

Command Modes CONFIGURATION (conf-frpp)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

disable

Disable the resilient ring protocol.

Syntax `disable`
 To enable the Resilient Ring Protocol, use the `no disable` command.

Defaults **Disabled**

Command Modes CONFIGURATION (conf-frpp)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

interface

Configure the primary, secondary, and control-vlan interfaces.

Z9500

Syntax `interface {primary interface secondary interface control-vlan vlan-id}`
To return to the default, use the `no interface {primary interface secondary interface control-vlan vlan-id}` command.

Parameters

primary *interface* Enter the keyword `primary` to configure the primary interface then one of the following interfaces and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

secondary *interface* Enter the keyword `secondary` to configure the secondary interface then one of the following interfaces and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

control-vlan *vlan-id* Enter the keyword `control-vlan` then the VLAN ID. The range is from 1 to 4094.

Defaults None

Command Modes CONFIGURATION (conf-frpp)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.

Version	Description
---------	-------------

7.4.1.0	Introduced.
---------	-------------

Usage Information

This command causes the Ring Manager to take ownership of the two ports after IFM validates the configuration. Ownership is relinquished for a port only when the interface does not play a part in any control VLAN, that is, the interface does not belong to any ring.

Related Commands

- [show frrp](#) — display the Resilient Ring Protocol configuration information.

member-vlan

Specify the member VLAN identification numbers.

Syntax

```
member-vlan {vlan-range}
```

To return to the default, use the `no member-vlan [vlan-range]` command.

Parameters

<i>vlan-range</i>	Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10. Combination: 3, 4, 5-10, 8.

mode

Set the Master or Transit mode of the ring.

Syntax	<code>mode {master transit}</code> To reset the mode, use the <code>no mode {master transit}</code> command.
Parameters	master Enter the keyword <code>master</code> to set the Ring node to Master mode. transit Enter the keyword <code>transit</code> to set the Ring node to Transit mode.
Defaults	Mode None
Command Modes	CONFIGURATION (conf-frrp)
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

protocol frrp

Enter the Resilient Ring Protocol and designate a ring identification.

Syntax	<code>protocol frrp {ring-id}</code> To exit the ring protocol, use the <code>no protocol frrp {ring-id}</code> command.
Parameters	ring-id Enter the ring identification number. The range is from 1 to 255.
Defaults	None
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

Usage Information

This command places you into the resilient ring protocol. After executing this command, the command line prompt changes to `conf-frrp`.

show frrp

Display the resilient ring protocol configuration.

Syntax	<code>show frrp [ring-id [summary]] [summary]</code>	
Parameters	ring-id	Enter the ring identification number. The range is from 1 to 255
	summary	(OPTIONAL) Enter the keyword <code>summary</code> to view just a summarized version of the Ring configuration.
Defaults	None	
Command Modes	EXEC	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command is executed. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Example (Summary)

```
DellEMC# show frrp summary
```

```
Ring-ID State Mode Ctrl_Vlan Member_Vlans
-----
2       UP   Master  2       11-20, 25,27-30
31      UP   Transit 31      40-41
50      Down Transit 50      32
DellEMC#
```

Related Commands

- [protocol frrp](#) — enter the resilient ring protocol and designate a ring identification.

timer

Set the hello interval or dead interval for the Ring control packets.

Syntax

```
timer {hello-interval milliseconds}| {dead-interval milliseconds}
```

To remove the timer, use the `no timer {hello-interval [milliseconds]}| {dead-interval milliseconds}` command.

Parameters

hello-interval ***milliseconds***

Enter the keyword `hello-interval` then the time, in milliseconds, to set the hello interval of the control packets. The milliseconds must be entered in increments of 50 millisecond; for example, 50, 100, 150, and so on. If an invalid value is entered, an error message is generated. The range is from 50 to 2000 ms. Default: **500 ms**.

dead-interval ***milliseconds***

Enter the keyword `dead-interval` then the time, in milliseconds, to set the dead interval of the control packets. The range is from 50 to 6000 ms. Default: **1500 ms**.

 **NOTE:** The configured dead interval must be at least three times the hello interval.

Defaults

- **500 ms** for `hello-interval milliseconds`
- **1500 ms** for `dead-intervalmilliseconds`

Command Modes CONFIGURATION (conf-frpp)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

Usage Information The `hello interval` command is the interval at which ring frames are generated from the primary interface of the master node. The `dead interval` command is the time that elapses before a time-out occurs.

GARP VLAN Registration (GVRP)

The Dell EMC Networking operating system supports the basic GVRP commands on the Dell EMC Networking OS.

The generic attribute registration protocol (GARP) mechanism allows the configuration of a GARP participant to propagate through a network quickly. A GARP participant registers or de-registers its attributes with other participants by making or withdrawing declarations of attributes. At the same time, based on received declarations or withdrawals, GARP handles attributes of other participants.

GVRP enables a device to propagate local VLAN registration information to other participant devices and dynamically update the VLAN registration information from other devices. The registration information updates local databases regarding active VLAN members and through which port the VLANs can be reached.

GVRP ensures that all participants on a bridged LAN maintain the same VLAN registration information. The VLAN registration information propagated by GVRP includes both manually configured local static entries and dynamic entries from other devices.

GVRP participants have the following components:

- The GVRP application
- GARP information propagation (GIP)
- GARP information declaration (GID)

Important Points to Remember

- GVRP is supported on Layer 2 ports only.
- All VLAN ports added by GVRP are tagged.
- GVRP is supported on untagged ports belonging to a default VLAN and tagged ports.
- GVRP cannot be enabled on untagged ports belonging to a non-default VLAN *unless* native VLAN is turned on.
- GVRP requires end stations with dynamic access NICs.
- Based on updates from GVRP-enabled devices, GVRP allows the system to dynamically create a port-based VLAN (unspecified) with a specific VLAN ID and a specific port.
- On a port-by-port basis, GVRP allows the system to learn about GVRP updates to an existing port-based VLAN with that VLAN ID and IEEE 802.1Q tagging.
- GVRP allows the system to send dynamic GVRP updates about your existing port-based VLAN.
- GVRP updates are not sent to any blocked spanning tree protocol (STP) ports. GVRP operates only on ports that are in the forwarding state.
- GVRP operates only on ports that are in the STP forwarding state. If you enable GVRP, a port that changes to the STP Forwarding state automatically begin to participate in GVRP. A port that changes to an STP state other than forwarding no longer participates in GVRP.
- VLANs created dynamically with GVRP exist only as long as a GVRP-enabled device is sending updates. If the devices no longer send updates, or GVRP is disabled, or the system is rebooted, all dynamic VLANs are removed.
- GVRP manages the active topology, not non-topological data such as VLAN protocols. If a local bridge must classify and analyze packets by VLAN protocols, manually configure protocol-based VLANs, and simply rely on GVRP for VLAN updates. But if the local bridge must know only how to reach a given VLAN, then GVRP provides all necessary information.
- The VLAN topologies that GVRP learns are treated differently from VLANs that are statically configured. The GVRP dynamic updates are not saved in NVRAM, while static updates are saved in NVRAM. When GVRP is disabled, the system deletes all VLAN interfaces that were learned through GVRP and leaves unchanged all VLANs that were manually configured.

Related Commands	<ul style="list-style-type: none">• gvrp enable — enable GVRP on physical interfaces and LAGs.• protocol gvrp — access GVRP protocol.
-------------------------	--

garp timers

Set the intervals (in milliseconds) for sending GARP messages.

Syntax	<code>garp timers {join leave leave-all}</code> To return to the previous setting, use the <code>no garp timers {join leave leave-all}</code> command.
---------------	---

Parameters	join Enter the keyword <code>join</code> then the number of milliseconds to configure the join time. The range is from 100 to 147483647 milliseconds. The default is 200 milliseconds .
-------------------	---

 **NOTE:** Designate the milliseconds in multiples of 100.

- leave** Enter the keyword `leave` then the number of milliseconds to configure the leave time. The range is from 100 to 2147483647 milliseconds. The default is **600 milliseconds**.
 **NOTE:** Designate the milliseconds in multiples of 100.
- leave-all** Enter the keywords `leave-all` then the number of milliseconds to configure the leave-all time. The range is from 100 to 2147483647 milliseconds. The default is 1000 milliseconds.
 **NOTE:** Designate the milliseconds in multiples of 100.

Defaults As above.

Command Modes CONFIGURATION-GVRP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

Usage Information

- **Join Timer** — `Join` messages announce the willingness to register some attributes with other participants. For reliability, each GARP application entity sends a `Join` message twice and uses a join timer to set the sending interval.
- **Leave Timer** — `Leave` announces the willingness to de-register with other participants. Together with `Join`, `Leave` messages help GARP participants complete attribute reregistration and de-registration. The leave timer starts after receipt of a leave message sent for de-registering some attribute information. If a `Join` message is *not* received before the `Leave` time expires, the GARP application entity removes the attribute information as requested.
- **Leave All Timer** — The `Leave All` timer starts when a GARP application entity starts. When this timer expires, the entity sends a `Leave-all` message so that other entities can reregister their attribute information. Then the `Leave-all` time begins again.

Related Commands

- [show garp timers](#) — display the current GARP times.

gvrp enable

Enable GVRP on physical interfaces and LAGs.

Syntax	<code>gvrp enable</code> To disable GVRP on the interface, use the <code>no gvrp enable</code> command.
Defaults	Disabled.
Command Modes	CONFIGURATION-INTERFACE

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

Usage Information Fixed registration prevents an interface, configured using the command line, to belong to a VLAN (static configuration) from being unconfigured when it receives a `Leave` message. Therefore, Registration mode on that interface is fixed.

Normal registration is the default registration. The port's membership in the VLAN depends on GVRP. The interface becomes a member of a VLAN after learning about the VLAN through GVRP. If the VLAN is removed from the port that sends GVRP advertisements to this device, the port stops being a member of the VLAN.

To advertise or learn about VLANs through GVRP, use the `forbidden` command when you do not want the interface.

Related Commands

- `show gvrp` — display the GVRP configuration including the registration.

protocol gvrp

Access GVRP protocol — (config-gvrp)#.

Syntax `protocol gvrp`

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000–ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

Related Commands

- [disable](#) — globally disable GVRP.

show config

Display the global GVRP configuration.

Syntax `show config`

Command Modes CONFIGURATION-GVRP

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100–ON.
9.8(2.0)	Introduced on the S3100 series.

8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

Example

```
DellEMC# show garp timers
GARP Timers          Value (milliseconds)
-----
Join Timer           200
Leave Timer           600
LeaveAll Timer        10000
DellEMC#
```

Related Commands • [garp timers](#) — set the intervals (in milliseconds) for sending GARP messages.

show gvrp

Display the GVRP configuration.

Z9500

Syntax `show gvrp [brief | interface]`

Parameters

brief (OPTIONAL) Enter the keyword `brief` to display a brief summary of the GVRP configuration.

interface (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

Defaults None

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Usage Information	<p>Invalid messages/attributes skipped can occur in the following cases:</p> <ul style="list-style-type: none">The incoming GVRP PDU has an incorrect length."End of PDU" was reached before the complete attribute could be parsed.The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01).The attribute that was being parsed had an invalid attribute length.The attribute that was being parsed had an invalid GARP event.The attribute that was being parsed had an invalid VLAN ID. The valid range is from 1 to 4095. <p>A failed registration can occur for the following reasons:</p> <ul style="list-style-type: none"><code>Join</code> requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state).An entry for a new GVRP VLAN could not be created in the GVRP database.
--------------------------	---

Example

**Related
Commands**

- `show gvrp` — display the GVRP configuration.

Internet Group Management Protocol (IGMP)

The IGMP commands are supported on the Dell EMC Networking OS.

Topics:

- [IGMP Commands](#)
- [IGMP Snooping Commands](#)

IGMP Commands

Dell EMC Networking OS supports IGMPv1/v2/v3 and is compliant with RFC-3376.

Important Points to Remember

- Dell EMC Networking OS supports protocol-independent multicast-sparse (PIM-SM) and protocol-independent source-specific multicast (PIM-SSM) include and exclude modes.
- IGMPv2 is the default version of IGMP on interfaces. You can configure IGMPv3 on interfaces. It is backward compatible with IGMPv2.
- The maximum number of interfaces supported 95.
- There is no hard limit on the maximum number of groups supported.
- IGMPv3 router interoperability with IGMPv2 and IGMPv1 routers on the same subnet is not supported.
- An administrative command (`ip igmp version`) is added to manually set the IGMP version.
- All commands previously used for IGMPv2 are compatible with IGMPv3.

clear ip igmp groups

Clear entries from the group cache table.

Z9500

Syntax	<code>clear ip igmp [vrf vrf-name] groups [group-address interface]</code>	
Parameters	vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.  NOTE: Applies to specific VRF if input is provided, else applies to default VRF.
	group-address	(OPTIONAL) Enter the IP multicast group address in dotted decimal format.
	interface interface	Enter the following keywords and the interface information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For a port channel interface, enter the keywords <code>port-channel</code> then a number. • For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series legacy command	

debug ip igmp

Enable debugging of IGMP packets.

Z9500

Syntax `debug ip igmp [group address | interface]`

- To disable IGMP debugging, use the `no debug ip igmp [vrf vrf-name] [group address | interface]` command.
- To disable all debugging, use the `undebug all` command.

Parameters

vrf *vrf-name* (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable debugging of IGMP packets corresponding to that VRF.

 **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

group-address (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

interface
interface Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

Defaults Disabled.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command

Usage Information IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.

ip igmp access-group

To specify access control for packets, use this feature.

Syntax `ip igmp access-group access-list`

To remove the feature, use the `no ip igmp access-group access-list` command.

Parameters ***access-list*** Enter the name of the extended ACL (16 characters maximum).

Defaults Not configured

Command Modes INTERFACE (*conf-if-interface-slot/port*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.6.1.0	Introduced on E-Series.

Usage Information The access list accepted is an extended ACL. To block IGMP reports from hosts, on a per-interface basis based on the group address and source address that you specify in the access list, use this feature.

ip igmp group-join-limit

To limit the number of IGMP groups that can be joined in a second, use this feature.

Z9500

Syntax	<code>ip igmp group-join-limit <i>number</i></code>	
Parameters	<i>number</i>	Enter the number of IGMP groups permitted to join in a second. The range is from 1 to 10000.
Defaults	none	
Command Modes	CONFIGURATION (<i>conf-if-interface-slot/port</i>)	
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.	

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.6.1.0	Introduced on the E-Series.

ip igmp immediate-leave

Enable IGMP immediate leave.

Syntax `ip igmp immediate-leave [group-list prefix-list-name]`

To disable `ip igmp immediate leave`, use the `no ip igmp immediate-leave` command.

Parameters **group-list *prefix-list-name*** Enter the keywords `group-list` then a string up to 16 characters long of the `prefix-list-name`.

Defaults Not configured.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

E-Series legacy command

Usage Information Querier normally sends some group-specific queries when a `leave` message is received for a group prior to deleting a group from the membership database. There may be situations when you require immediate deletion of a group from the membership database. This command provides a way to achieve the immediate deletion. In addition, this command provides a way to enable `immediate-leave processing` for specified groups.

ip igmp last-member-query-interval

Change the last member query interval, which is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages. This interval is also the interval between Group-Specific Query messages.

Z9500

Syntax `ip igmp last-member-query-interval milliseconds`
To return to the default value, use the `no ip igmp last-member-query-interval` command.

Parameters *milliseconds* Enter the number of milliseconds as the interval. For IGMP version 2, the range is from 100 to 25599. For IGMP version 3, the range is from 100 to 65535. The default value is **1000 milliseconds**.

Defaults **1000 milliseconds**

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	For IGMP version 2, the Interval range is from 100 to 25599. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
E-Series legacy command	

ip igmp querier-timeout

Change the interval that must pass before a multicast router decides that there is no longer another multicast router that should be the querier.

Syntax `ip igmp querier-timeout seconds`
To return to the default value, use the `no ip igmp querier-timeout` command.

Parameters **seconds** Enter the number of seconds the router must wait to become the new querier. The range is from 60 to 300. The default is **125 seconds**.

Defaults **125 seconds**

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.

E-Series legacy command.

ip igmp query-interval

Change the transmission frequency of IGMP general queries the Querier sends.

Z9500

Syntax `ip igmp query-interval seconds`

To return to the default values, use the `no ip igmp query-interval` command.

Parameters **seconds** Enter the number of seconds between queries sent out. The range is from 1 to 18000. The default is **60 seconds**.

Defaults **60 seconds**

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100–ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100–ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Maximum range of the Hello interval value is changed to 18000. Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.

E-Series legacy command.

Usage Information

If you have configured the hello interval value to be greater than 18000, you must first reset that value to be less than or equal to 18000 before upload. Otherwise, the command execution fails during bootup and the hello interval value is set to the default value.

ip igmp query-max-resp-time

Set the maximum query response time advertised in general queries.

 **NOTE:** The IGMP query-max-resp-time value must be less than the IGMP query-interval value.

Syntax `ip igmp query-max-resp-time seconds`

To return to the default values, use the `no ip igmp query-max-resp-time` command.

Parameters *seconds* Enter the number of seconds for the maximum response time. The range is from 1 to 25. The default is **10 seconds**.

Defaults **10 seconds**

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.

E-Series legacy command.

ip igmp ssm-map

To translate (*,G) memberships to (S,G) memberships, use a statically configured list.

Z9500

Syntax

```
ip igmp [vrf vrf-name] ssm-map std-access-list source-address
```

Undo this configuration, that is, remove SSM map (S,G) states and replace them with (*,G) state, use the `ip igmp [vrf vrf-name] ssm-map std-access-list source-address` command.

Parameters

vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.  NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.
std-access-list	Specify the standard IP access list that contains the mapping rules for multicast groups.
source-address	Specify the multicast source address to which the groups are mapped.

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF and Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.

Usage Information

Mapping applies to both v1 and v2 IGMP joins; any updates to the ACL are reflected in the IGMP groups. You may not use extended access lists with this command. When you configure a static SSM map and the router cannot find any matching access lists, the router continues to accept (*,G) groups.

Related Commands

- [ip access-list standard](#) — create a standard access list to filter based on IP address.

ip igmp static-group

Configure an IGMP static group.

Syntax

```
ip igmp static-group {group address [exclude [source address]] | [include {source address}]}
```

To delete a static address, use the `no ip igmp static-group {group address [exclude [source address]] | [include {source address}]}` command.

Parameters

group address	Enter the group address in dotted decimal format (A.B.C.D).
exclude source address	(OPTIONAL) Enter the keyword <code>exclude</code> then the source address, in dotted decimal format (A.B.C.D), for which a static entry is added.
include source address	(OPTIONAL) Enter the keyword <code>include</code> then the source address, in dotted decimal format (A.B.C.D), for which a static entry is added.

Defaults

none

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Expanded to support the <code>exclude</code> and <code>include</code> options.

E-Series legacy command

Usage Information

A group in `include` mode must have at least one source address defined. In `exclude` mode, if you do not specify a source address, Dell Networking OS implicitly assumes all sources are included. If you do not specify either `include` or `exclude`, Dell Networking OS implicitly assumes a IGMPv2 static join.

Command Limitations

- Only one mode (`include` or `exclude`) is permitted per multicast group per interface. To configure another mode, all sources belonging to the original mode must be unconfigured.
- If a static configuration is present and a packet for the same group arrives on an interface, the dynamic entry completely overwrites all the static configuration for the group.

Related Commands

[show ip igmp groups](#) — displays IGMP group information.

ip igmp version

Manually set the version of the router to IGMPv2 or IGMPv3.

Z9500

Syntax `ip igmp version {2 | 3}`

Parameters

2	Enter the number 2 to set the IGMP version number to IGMPv2.
3	Enter the number 3 to set the IGMP version number to IGMPv3.

Defaults 2 (IGMPv2)

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Changed the default IGMP from version 2 to version 3. Introduced on the S6000-ON
9.5(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.

7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

show ip igmp groups

View the IGMP groups.

Z9500

Syntax `show ip igmp [vrf vrf-name] groups [group-address [detail] | detail | interface [group-address [detail]]]`

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
- group-address** (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
- interface** (OPTIONAL) Enter the interface type and the interface information:
 - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- detail** (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

Version	Description
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series and C-Series.
7.5.1.0	Expanded to support the detail option.

E-Series legacy command.

Usage Information

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

Field	Description
Group Address	Lists the multicast address for the IGMP group.
Interface	Lists the interface type, slot and port number.
Mode	Displays the IGMP version used.
Uptime	Displays the amount of time the group has been operational.
Expires	Displays the amount of time until the entry expires.
Last Reporter	Displays the IP address of the last host to be a member of the IGMP group.

Example

```
DellEMC# show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Uptime Expires
225.0.0.0      Vlan 100    00:00:05 00:02:04
225.0.0.1      Vlan 100    00:00:05 00:02:04
225.0.0.2      Vlan 100    00:00:05 00:02:04
225.0.0.3      Vlan 100    00:00:05 00:02:04
225.0.0.4      Vlan 100    00:00:05 00:02:04
```

Example (VLT)

NOTE: The asterisk (*) after the port channel number (Po 2) highlighted in the following example indicates the port channel is VLT, that the local VLT port channel is down and the remote VLT port is up.

```
DellEMC# show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
```

Group Address	Interface	Mode	Uptime	Expires	Last Reporter
225.0.0.0	Vlan 100	IGMPv2	00:00:05	00:02:04	3.0.0.51
225.0.0.1	Vlan 100	IGMPv2	00:00:05	00:02:04	3.0.0.51
225.0.0.2	Vlan 100	IGMPv2	00:00:05	00:02:04	3.0.0.51
225.0.0.3	Vlan 100	IGMPv2	00:00:05	00:02:04	3.0.0.51
225.0.0.4	Vlan 100	IGMPv2	00:00:05	00:02:04	3.0.0.51

Example (Details)

```
DelleMC# show ip igmp group details
Interface                Vlan 20
Group                    232.1.1.5
Uptime                   00:11:22
Expires                  Never
Router mode              INCLUDE
Last reporter            35.0.0.2
Group source list
Source address           Expires
65.0.0.1                 00:01:22
65.0.0.2                 00:01:22
65.0.0.3                 00:01:22
65.0.0.4                 00:01:22
65.0.0.5                 00:01:22
```

show ip igmp interface

View information on the interfaces participating in IGMP.

Z9500

Syntax `show ip igmp [vrf vrf-name] interface [interface]`

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IGMP interfaces associated with that VRF.
- interface** (OPTIONAL) Enter the interface type and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command.

Usage Information

IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results.

The `show ip igmp interface` command does not display information corresponding to the loop-back interfaces.

Example

```
DelleMC# show ip igmp interface
TenGigabitEthernet 1/1 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/5 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/6 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/7 is up, line protocol is down
  Internet protocol processing disabled
Vlan 20
  Inbound IGMP access group is not set
  Internet address is 35.0.0.1/24
  IGMP is enabled on interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 125 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is enabled for all groups
  IGMP activity: 0 joins
  IGMP querying router is 35.0.0.1 (this system)
  IGMP version is 2
```

Example (VRF)

```
DelleMC# show ip igmp vrf BLUE interface
TenGigabitEthernet 1/20
  Inbound IGMP access group is not set
  Internet address is 50.10.4.1/24
  IGMP is up on the interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 0 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is disabled
  IGMP activity: 0 joins
  IGMP querying router is 50.10.4.1 (this system)
  IGMP version is 3
Vlan 4007
  Inbound IGMP access group is not set
  Internet address is 50.30.124.4/24
```

```

DellEMC#
IGMP is up on the interface
IGMP query interval is 60 seconds
IGMP querier timeout is 83 seconds
IGMP max query response time is 10 seconds
IGMP last member query response interval is 1000 ms
IGMP immediate-leave is disabled
IGMP activity: 0 joins
IGMP querying router is 50.30.124.1
IGMP version is 3
DellEMC#

```

show ip igmp ssm-map

Display is a list of groups that are currently in the IGMP group table and contain SSM mapped sources.

Z9500

Syntax

```
show ip igmp [vrf vrf-name] ssm-map [group]
```

Parameters

- vrf *vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
-  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.
- group** (OPTIONAL) Enter the multicast group address in the form A.B.C.D to display the list of sources to which this group is mapped.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.

Example

```

DellEMC# show ip igmp ssm-map
Interface                Vlan 20

```

```

Group                232.1.1.5
Uptime              00:11:22
Expires             Never
Router mode         INCLUDE
Last reporter       35.0.0.2
Group source list
Source address      Expires
65.0.0.1            00:01:22
65.0.0.2            00:01:22
65.0.0.3            00:01:22
65.0.0.4            00:01:22
65.0.0.5            00:01:22

```

**Related
Commands**

- `ip igmp ssm-map` — use a statically configured list to translate (*,G) memberships to (S,G) memberships.

IGMP Snooping Commands

Dell EMC Networking OS supports IGMP Snooping version 2 and 3 on all Dell EMC Networking systems.

Important Points to Remember for IGMP Snooping

- Dell EMC Networking OS supports version 1, version 2, and version 3 hosts.
- Dell EMC Networking OS IGMP snooping implementation is based on IP multicast address (not based on Layer 2 multicast mac address) and the IGMP snooping entries are in Layer 3 flow table not in Layer 2 forwarding information base (FIB).
- Dell EMC Networking OS IGMP snooping implementation is based on draft-ietf-magma-snoop-10.
- Dell EMC Networking OS supports IGMP snooping on JUMBO-enabled cards.
- IGMP snooping is not enabled by default on the switch.
- A maximum of 1800 groups and 600 VLAN are supported.
- IGMP snooping is not supported on a default VLAN interface.
- IGMP snooping is not supported over VLAN-Stack-enabled VLAN interfaces (you must disable IGMP snooping on a VLAN interface before configuring VLAN-Stack-related commands).
- IGMP snooping does not react to Layer 2 topology changes triggered by spanning tree protocol (STP).
- IGMP snooping reacts to Layer 2 topology changes multiple spanning tree protocol (MSTP) triggers by sending a general query on the interface that comes in the FWD state.

Important Points to Remember for IGMP Querier

- The IGMP snooping Querier supports version 2.
- You must configure an IP address to the VLAN interface for IGMP snooping Querier to begin. The IGMP snooping Querier disables itself when a VLAN IP address is cleared, and then it restarts itself when an IP address is reassigned to the VLAN interface.
- When enabled, IGMP snooping Querier does not start if there is a statically configured multicast router interface in the VLAN.
- When enabled, IGMP snooping Querier starts after one query interval in case no IGMP general query (with IP SA lower than its VLAN IP address) is received on any of its VLAN members.
- When enabled, IGMP snooping Querier periodically sends general queries with an IP source address of the VLAN interface. If it receives a general query on any of its VLAN member, it checks the IP source address of the incoming frame.

If the IP SA in the incoming IGMP general query frame is lower than the IP address of the VLAN interface, the switch disables its IGMP snooping Querier functionality.

If the IP SA of the incoming IGMP general query is higher than the VLAN IP address, the switch continues to work as an IGMP snooping Querier.

clear ip igmp snooping groups

Clear snooping entries from the group cache table.

Z9500

Syntax	<code>clear ip igmp snooping groups [group-address interface interface]</code>
Parameters	<p>group-address (OPTIONAL) Enter the IP multicast group address in dotted decimal format.</p> <p>interface interface Enter the following keywords and the interface information:</p> <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on S-Series and Z-Series.

Usage Information IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.

debug ip igmp snooping

Enable debugging of IGMP snooping packets on interfaces and groups.

Z9500

Syntax	<code>debug ip igmp snooping [group address interface]</code> <ul style="list-style-type: none">• To disable debugging of IGMP snooping, use the <code>no debug ip igmp snooping [group address interface]</code> command.• To disable all debugging, use the <code>undebug all</code> command.
---------------	--

Parameters	<p>snooping Enter the keyword <code>snooping</code> to enable debugging of IGMP snooping.</p> <p>group-address (OPTIONAL) Enter the IP multicast group address in dotted decimal format.</p> <p>interface interface Enter the following keywords and the interface information:</p> <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.
-------------------	--

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

Defaults Disabled.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.

Usage Information IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.

ip igmp snooping enable

Enable IGMP snooping on all or a single VLAN. This command is the master on/off switch to enable IGMP snooping.

Syntax `ip igmp snooping enable`
 To disable IGMP snooping, use the `no ip igmp snooping enable` command.

Defaults Disabled.

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information

To enable IGMP snooping, enter this command. When you enable this command from CONFIGURATION mode, IGMP snooping enables on all VLAN interfaces (except the default VLAN).

 **NOTE:** Execute the `no shutdown` command on the VLAN interface for IGMP Snooping to function.

ip igmp snooping fast-leave

Enable IGMP snooping fast-leave for this VLAN.

Z9500

Syntax

`ip igmp snooping fast-leave`

To disable IGMP snooping fast leave, use the `no igmp snooping fast-leave` command.

Defaults

Not configured.

Command Modes

INTERFACE VLAN — (conf-if-vl-n)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
---------	-------------

E-Series legacy command.	
---------------------------------	--

Usage Information

Queriers normally send some queries when a leave message is received prior to deleting a group from the membership database. There may be situations when you require a fast deletion of a group. When you enable IGMP fast leave processing, the switch removes an interface from the multicast group as soon as it detects an IGMP version 2 leave message on the interface.

ip igmp snooping flood

This command controls the flooding behavior of unregistered multicast data packets.

Syntax

```
ip igmp snooping flood
```

To undo this configuration, use the `no ip igmp snooping flood` command.

Defaults

Enabled.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
---------	-------------

9.8(0.0P5)	Introduced on the S4048-ON.
-------------------	-----------------------------

9.8(0.0P2)	Introduced on the S3048-ON.
-------------------	-----------------------------

9.7(0.0)	Introduced on the S6000-ON.
-----------------	-----------------------------

9.5(0.1)	Introduced on the Z9500.
-----------------	--------------------------

----------------	--------------------------

8.3.19.0	Introduced on the S4820T.
-----------------	---------------------------

8.3.11.1	Introduced on the Z9000.
-----------------	--------------------------

8.3.7.0	Introduced on the S4810.
----------------	--------------------------

8.2.1.0	Introduced on the C-Series and S-Series.
----------------	--

7.7.1.0	Introduced on the E-Series.
----------------	-----------------------------

E-Series legacy command	
--------------------------------	--

Usage Information

On the C-Series and S-Series, unregistered multicast data traffic drops when you disable flooding; they do not forward the packets to multicast router ports. On the C-Series and S-Series, in order to disable Layer 2 multicast flooding, disable Layer 3 multicast (`no ip multicast-routing`).

ip igmp snooping last-member-query-interval

The last member query interval is the maximum response time inserted into Group-Specific queries sent in response to Group-Leave messages.

Z9500

Syntax

```
ip igmp snooping last-member-query-interval milliseconds
```

To return to the default value, use the `no ip igmp snooping last-member-query-interval` command.

Parameters	<i>milliseconds</i>	Enter the interval in milliseconds. The range is from 100 to 65535. The default is 1000 milliseconds .
Defaults	1000 milliseconds	
Command Modes	INTERFACE VLAN	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S3148.
	9.10(0.0)	Introduced on the S6100-ON.

	8.3.7.0	Introduced on the S4810.
	7.6.1.0	Introduced on the S-Series.
	7.5.1.0	Introduced on the C-Series.
	E-Series legacy command	
Usage Information	This last-member-query-interval is also the interval between successive Group-Specific Query messages. To change the last-member-query interval, use this command.	

ip igmp snooping mrouter

Statically configure a VLAN member port as a multicast router interface.

Z9500

Syntax	<code>ip igmp snooping mrouter interface <i>interface</i></code>	
	To delete a specific multicast router interface, use the <code>no igmp snooping mrouter interface <i>interface</i></code> command.	
Parameters	interface <i>interface</i>	Enter the following keywords and the interface information: <ul style="list-style-type: none"> For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.

- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 512.

Defaults Not configured.

Command Modes INTERFACE VLAN — (conf-if-vl-n)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command.

Usage Information The Dell EMC Networking OS provides the capability of statically configuring the interface to which a multicast router is attached. To configure a static connection to the multicast router, enter the `ip igmp snooping mrouter interface` command in the VLAN context. The interface to the router must be a part of the VLAN where you are entering the command.

ip igmp snooping querier

Enable IGMP querier processing for the VLAN interface.

Z9500

Syntax `ip igmp snooping querier`

To disable IGMP querier processing for the VLAN interface, use the `no ip igmp snooping querier` command.

Defaults Not configured.

Command Modes INTERFACE VLAN — (conf-if-vl-n)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series legacy command	

Usage Information

This command enables the IGMP switch to send General Queries periodically. This behavior is useful when there is no multicast router present in the VLAN because the multicast traffic is not routed. Assign an IP address to the VLAN interface for the switch to act as a querier for this VLAN.

show ip igmp snooping groups

Display snooping related information for all the IGMP groups, interface or one group of one interface.

Z9500

Syntax

```
show ip igmp snooping groups [group-address [detail] | detail | interface
[group-address [detail]]]
```

Parameters

- group-address** (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
- interface** (OPTIONAL) Enter the interface type and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- detail** (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500.

Usage Information This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

Field	Description
Group Address	Lists the multicast address for the IGMP group.
Interface	Lists the interface type, slot and port number.
Mode	Displays the IGMP version used.
Uptime	Displays the amount of time the group has been operational.
Expires	Displays the amount of time until the entry expires.
Last Reporter	Displays the IP address of the last host to be a member of the IGMP group.
Member Ports	Indicates the port channel. If the port channel is VLT, an asterisk (*) after the port channel number indicates the port channel is locally down and that a remote VLT port is up.

Example

```
DelleMC# show ip igmp snooping groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address      Interface      Mode           Uptime      Expires      Last
Reporter
225.1.1.1         Vlan 10       IGMPv2-Compat 00:00:07    00:02:09    1.1.1.2
Member Ports: Te 1/17
DelleMC#
```

show ip igmp snooping mrouter

Display multicast router interfaces.

Z9500

Syntax `show ip igmp snooping mrouter [vlan number]`

Parameters **vlan number** Enter the keyword `vlan` then the vlan number. The range is from 1 to 4094.

- Command Modes**
- EXEC

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command.

Usage Information

If the port channel is a VLT port channel, an asterisk (*) after the port channel number (Po 100*) indicates the port channel is locally down and that a remote VLT port is up.

Example

```
DellEMC# show ip igmp snooping mrouter
Interface Router Ports
Vlan 2 Te 1/3, Po 1
DellEMC#
```

Related Commands

- [ip igmp snooping mrouter](#) — configure a static connection to the multicast router.
- [show ip igmp groups](#) — view groups.

Interfaces

To configure egress, port channel, time domain, and UDP, use these interface commands.

Topics:

- [Basic Interface Commands](#)
- [Egress Interface Selection \(EIS\) Commands](#)
- [Port Channel Commands](#)
- [HiGig Port Channel Commands](#)
- [UDP Broadcast Commands](#)

Basic Interface Commands

The following commands are for Physical, Loopback, and Null interfaces.

clear counters

Clear the counters displayed in the show interfaces commands for all virtual router redundancy protocol (VRRP) groups, virtual local area networks (VLANs), and physical interfaces, or selected ones.

Syntax `clear counters [interface | vrrp {vr-id | ipv6 vr-id} | learning-limit | vlan vlan-id]`

Parameters *interface* (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:

- For IPv4 access-group counters, enter the keyword `ip`.
- For IPv6 access-group counters, enter the keyword `ipv6`.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For MAC access-group counters, enter the keyword `mac`.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For the management interface, enter the keyword `ManagementEthernet` then slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a tunnel interface, enter the keyword `tunnel`. The range is from 1 to 16383.

NOTE: This command also enables you to clear the port configurations corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.

- For ON platforms, you can specify multiple ports as `slot/port/[subport]` - `slot/port/[subport]`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

vrrp [ipv6 {vr-id} vr-id]	(OPTIONAL) Enter the keyword <code>vrrp</code> to clear the counters of all VRRP groups. To clear the counters of VRRP groups on all IPv6 interfaces, enter <code>ipv6</code> . To clear the counters of a specified group, enter a VRID number from 1 to 255.
learning-limit	(OPTIONAL) Enter the keywords <code>learning-limit</code> to clear unknown source address (SA) drop counters when MAC learning limit is configured on the interface.
vlan vlan-id	Enter the keyword <code>vlan</code> followed by the interface VLAN number. The range is from 1 to 4094.

Defaults Without an interface specified, the command clears all interface counters.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to clear the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Added the VLAN parameter.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.4.1.0	Added support (E-Series only) for VRRP groups in a VRF instance.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4093 VLANs on the E-Series. Prior to the release, 2094 was supported.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	Updated the definition of the <code>learning-limit</code> option for clarity.

Example

```
DellEMC# clear counters
Clear counters on all interfaces [confirm]
DellEMC#
```

**Related
Commands**

- [mac learning-limit](#) — allow aging of MACs even though a learning-limit is configured or disallow station move on learned MACs.

clear dampening

Clear the dampening counters on all the interfaces or just the specified interface.

Syntax `clear dampening [interface]`

Parameters *interface* (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Defaults Without an interface specified, the command clears all interface dampening counters.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

DellEMC#clear dampening tegigabitethernet 1/10
Clear dampening counters on TeGi 1/10 [confirm] y
DellEMC#
```

**Related
Commands**

- [show interfaces dampening](#) — display interface dampening information.
- [dampening](#) — configure dampening on an interface.

dampening

Configure dampening on an interface.

Syntax dampening [[[*half-life*] [*reuse-threshold*]] [*suppress-threshold*]] [*max-suppress-time*]]

Parameters

- half-life*** Enter the number of seconds after which the penalty is decreased. The penalty decreases half after the half-life period expires. The range is from 1 to 30 seconds. The default is **5 seconds**.
- reuse-threshold*** Enter a number as the reuse threshold, the penalty value below which the interface state is changed to “up”. The range is from 1 to 20000. The default is **750**.
- suppress-threshold*** Enter a number as the suppress threshold, the penalty value above which the interface state is changed to “error disabled”. The range is from 1 to 20000. The default is **2500**.
- max-suppress-time*** Enter the maximum number for which a route can be suppressed. The default is four times the half-life value. The range is from 1 to 86400. The default is **20 seconds**.

Defaults Disabled.

8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information With each flap, Dell EMC Networking OS penalizes the interface by assigning a penalty (1024) that decays exponentially depending on the configured half-life. After the accumulated penalty exceeds the suppress threshold value, the interface moves to the Error-Disabled state. This interface state is deemed as “down” by all static/dynamic Layer 2 and Layer 3 protocols. The penalty is exponentially decayed based on the half-life timer. After the penalty decays below the reuse threshold, the interface enables. The configured parameters are as follows:

- `suppress-threshold` should be greater than `reuse-threshold`
- `max-suppress-time` should be at least 4 times `half-life`

i | **NOTE:** You cannot apply dampening on an interface that is monitoring traffic for other interfaces.

Example

```
DellEMC(conf-if-te-1/10)# dampening 20 800 4500 120
DellEMC(conf-if-te-1/10)#
```

Related Commands

- [clear dampening](#) — clear the dampening counters on all the interfaces or just the specified interface.
- [show interfaces dampening](#) — display interface dampening information.

default interface

Reset a physical interface to its factory default settings.

Syntax

```
default interface interface-type slot/port - range
```

Parameters

- | | |
|------------------------------|---|
| <i>interface-type</i> | Enter the interface type and slot/port information: |
| <i>slot/port</i> | <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. |
| <i>range</i> | <ul style="list-style-type: none">• For non-ON platforms, you can specify multiple ports as <code>slot/port-range</code>. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as <code>show interfaces interface-type 1/1 - 4</code>.• For ON platforms, you can specify multiple ports as <code>slot/port/[subport] - slot/port/[subport]</code>. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as <code>show interfaces interface-type 1/1/1 - 1/1/4</code>. |

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3100 series.
9.9(0.0)	Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, and Z9500.

Usage Information

Use the `default interface` command to set a Gigabit Ethernet, 10-Gigabit Ethernet, or 40-Gigabit Ethernet interface to its factory-default state. By default, a physical interface is disabled (shutdown) with no assigned IP address or switchport (no ip address). This command removes all software settings and all L3, VLAN, VXLAN, and port-channel configurations on a physical interface.

Example

```
DellEMC(conf-if-te-1/5)# show config
!
interface TenGigabitEthernet 1/5
description testconfig
no ip address
portmode hybrid
switchport
rate-interval 8
mac learning-limit 10 no-station-move
no shutdown
DellEMC(conf-if-te-1/5)#
```

```
DelleMC(conf)# default interface tengigabitethernet 1/5

DelleMC(conf-if-te-1/5)# show config
!
interface TenGigabitEthernet 1/5
 no ip address
 shutdown
```

Related Commands

- [show running-config](#) – display the current configuration.

description

Assign a descriptive text string to the interface.

Syntax `description desc_text`
 To delete a description, use the `no description` command.

Parameters *desc_text* Enter a text string up to 240 characters long.

Defaults None

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Modified for E-Series: Revised from 78 to 240 characters.

Usage Information

Important Points to Remember:

- To use special characters as a part of the description string, you must enclose the whole string in double quotes.
- Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks ("*desc_text*").

- Entering a text string after the `description` command overwrites any previous text string that you previously configured as the description.
- The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port-channel.
- Use the `show interfaces description` command to display descriptions configured for each interface.

duplex (Management)

Set the mode of the Management interface.

Syntax `duplex {half | full}`
 To return to the default setting, use the `no duplex` command.

Parameters

half	Enter the keyword <code>half</code> to set the Management interface to transmit only in one direction.
full	Enter the keyword <code>full</code> to set the Management interface to transmit in both directions.

Defaults Not configured.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Documentation modified—added <i>Management</i> to distinguish from <code>duplex (10/100 Interfaces)</code> .

Usage Information This command applies only to the Management interface on the route processor modules (RPMs).

Related Commands

- [interface ManagementEthernet](#) — configures the Management port on the system (either the Primary or Standby RPM).
- [duplex \(Management\)](#) — sets the mode of the Management interface.
- [management route](#) — configures a static route that points to the Management interface or a forwarding router.
- [speed \(Management interface\)](#) — sets the speed on the Management interface.

flowcontrol

Control how the system responds to and generates 802.3x pause flow control frames.

Syntax `flowcontrol {rx {off | on} tx {off | on} [negotiate | pause-threshold value | resume-offset value] | [monitor session-ID]}`
 To return to the default, use the `no` form of this command.

Parameters

rx on	Enter the keywords <code>rx on</code> to process the received flow control frames on this port.  NOTE: Flow-control packets are mirrored only when flow-control <code>rx</code> is enabled on an interface.
rx off	Enter the keywords <code>rx off</code> to ignore the received flow control frames on this port.
tx on	Enter the keywords <code>tx on</code> to send control frames from this port to the connected device when a higher rate of traffic is received.
tx off	Enter the keywords <code>tx off</code> so that flow control frames are not sent from this port to the connected device when a higher rate of traffic is received.
pause-threshold	Enter the buffer threshold limit for generating <code>PAUSE</code> frames.
resume-offset	Enter the offset value for generating <code>PAUSE</code> frames to resume traffic.
negotiate	(Optional) Enter the keyword <code>negotiate</code> to enable the pause-negotiation with the egress port of the peer device. If the <code>negotiate</code> command is not used, pause-negotiation is disabled. 40-gigabit Ethernet interfaces do not support pause-negotiation
monitor	Enter the keyword <code>monitor</code> then the session-ID to enable mirror flow control frames on the interface. The range is from 0 to 65535.

Defaults

An interface ignores flow-control frames received from other network devices (`rx off`) and does not transmit pause frames (`tx off`).

Command Modes INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Added support for monitor session.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.6.0.0	Added support for the negotiate feature on the S4810 and S4820T.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
6.5.1.9 and 7.4.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series with the <code>thresholds</code> option.

Usage Information

The globally assigned 48-bit multicast address 01-80-C2-00-00-01 is used to send and receive pause frames. To allow full-duplex flow control, stations implementing the pause operation instruct the MAC to enable the reception of frames with a destination address equal to this multicast address.

When a port receives traffic at a higher rate than it can process, the frames are stored in the port buffer. As a result, buffer usage increases. When the buffer usage reaches the value specified in the “pause-threshold” argument, the port sends PAUSE frame to the connected link partner to stop sending the traffic. Eventually this reduces the buffer usage. When the buffer usage drops by the value specified in the “resume-threshold”, the port again sends a PAUSE frame with 0 as wait-time. This results in resume of the paused traffic flow.

Important Points to Remember

- Do not enable `tx pause` when buffer carving is enabled. For information and assistance, consult Dell EMC Networking TAC.
- The only configuration applicable to half duplex ports is `rx off tx off`. The following error is returned:

```
Can't configure flowcontrol when half duplex is configure, config ignored
```
- Half duplex cannot be configured when the flow control configuration is on (default is `rx on tx on`). The following error is returned:

```
Can't configure half duplex when flowcontrol is on, config ignored
```

i **NOTE:** The flow control must be off (`rx off tx off`) before configuring the half duplex.

- Speeds less than one Gig cannot be configured when the asymmetric flow control configuration is on. The following error is returned:

```
Can't configure speed <1G when Asymmetric flowcontrol is on, config ignored
```
- Dell EMC Networking OS only supports `rx on tx on` and `rx off tx off` for speeds less than one Gig (Symmetric).

i **NOTE:** If you use the `disable rx flow control` command, Dell EMC Networking recommends rebooting the system.

i **NOTE:** Dell EMC Networking OS does not support mirroring of `tx pause` frames.

Example

```
DellEMC(conf-if-Te-1/1)# show config
!
interface TenGigabitEthernet 1/1
no ip address
switchport
no negotiation auto
flowcontrol rx off tx on
no shutdown
...
```

Example (Monitor Session)

```
DellEMC(conf-if-te-1/5)#show config
!
interface TenGigabitEthernet 1/5
no ip address
shutdown
flowcontrol monitor 5
```

Example (Values) This Example shows how Dell EMC Networking OS negotiates the flow control values between two Dell EMC Networking chassis connected back-to-back using 1G copper ports.

```
Configured
LocRxConf  LocTxConf  RemoteRxConf  RemoteTxConf
off         off         off           off
           off         on            off
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added the support for interfaces.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

Usage Information

You cannot delete a physical interface.

By default, physical interfaces are disabled (`shutdown`) and are not assigned to an IP address or switchport. To place an interface in Layer 2 mode, ensure that the interface's configuration does not contain an IP address and enter the `switchport` command.

You can create up to 64 tunnel interfaces. The tunnel is added as a logical interface with no default configuration. To delete a tunnel interface, use the `no interface tunnel tunnel-id` command.

The tunnel interface operates as an ECMP (equal cost multi path) only when the next hop to the tunnel destination is over a physical interface. If you select any other interface as the next hop to the tunnel destination, the tunnel interface does not operate as an ECMP.

Example

```
DellEMC(conf)# int tengigabitethernet 1/10
DellEMC(conf-if-te-1/10)# exit
DellEMC(conf)#
```

Related Commands

- [interface loopback](#) — configure a Loopback interface.
- [interface null](#) — configure a Null interface.
- [interface port-channel](#) — configure a port channel.
- [interface vlan](#) — configure a VLAN.

interface loopback

Configure a Loopback interface.

Syntax `interface loopback number`

To remove a loopback interface, use the `no interface loopback number` command.

Parameters	number	Enter a number as the interface number. The range is from 0 to 16383.
Defaults	Not configured.	
Command Modes	CONFIGURATION	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

Example

```
DellEMC(conf)# interface loopback 1655
DellEMC(conf-if-lo-1655)#
```

Related Commands

- [interface](#) — configure a physical interface.
- [interface null](#) — configure a Null interface.
- [interface port-channel](#) — configure a port channel.
- [interface vlan](#) — configure a VLAN.

interface managementEthernet

Configure the Management port on the system (either the Primary or Standby RPM).

Syntax	<code>interface managementEthernet slot/port</code>
Parameters	slot/port
Defaults	Not configured.
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S55, S60, and S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

Usage Information

You cannot delete a Management port.

The Management port is enabled by default (`no shutdown`). To assign an IP address to the Management port, use the `ip address` command.

Example

```
DellEMC(conf)# interface managementethernet 1/1
DellEMC(conf-if-ma-1/1)#
```

Related Commands

- [management route](#) — configure a static route that points to the Management interface or a forwarding router.
- [speed \(Management interface\)](#) — Set the speed for the Management interface.

interface null

Configure a Null interface on the switch.

Syntax `interface null number`

Parameters *number* Enter zero (0) as the Null interface number.

Defaults Not configured; number = 0

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

Usage Information

You cannot delete the Null interface. The only configuration command possible in a Null interface is `ip unreachable`.

Example

```
DelleMC(conf)# interface null 0
DelleMC(conf-if-nu-0)#
```

Related Commands

- [interface](#) — configure a physical interface.
- [interface loopback](#) — configure a Loopback interface.
- [interface port-channel](#) — configure a port channel.
- [interface vlan](#) — configure a VLAN.
- [ip unreachable](#) — enable generation of internet control message protocol (ICMP) unreachable messages.

interface range

This command permits configuration of a range of interfaces to which subsequent commands are applied (bulk configuration). Using the `interface range` command, you can enter identical commands for a range of interface.

Syntax

```
interface range interface {slot/port | port} - port}, interface {slot/port | port} - port},...
```

Parameters

***interface* {slot/port | port} — port}, *interface* {slot/port | port} — port},...** Enter `interface range` and one of the interfaces and then the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. The ranges can include VLANs, port-channels, and physical interfaces.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a Tunnel interface, enter the keyword `Tunnel` then a number from 1 to 16383.

Defaults

None

Command Modes CONFIGURATION

CONFIGURATION TERMINAL BATCH

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.13(0.0)	Introduced the Configuration Terminal Batch mode on C9010.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P2)	Introduced on the S4038-ON.
9.8(0.0P5)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.2.1.0	Added support for 4093 VLANs on E-Series. Prior releases supported 2094.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information

When creating an interface range, interfaces appear in the order they are entered; they are not sorted. The command verifies that interfaces are present (physical) or configured (logical).

Important Points to Remember:

- Bulk configuration is created if at least one interface is valid.
- Non-existing interfaces are excluded from the bulk configuration with a warning message.
- The `interface range` prompt includes interface types with slot/port information for valid interfaces. The prompt allows for a maximum of 32 characters. If the bulk configuration exceeds 32 characters, it is represented by an ellipsis (...).
- When the `interface range` prompt has multiple port ranges, the smaller port range is excluded from the prompt.
- If overlapping port ranges are specified, the port range is extended to the smallest start port and the biggest end port.

Example (Bulk)

```
DellEMC(conf)# interface range tengigbitethernet 2/1 - 11, fortyGigE
3/3, tengigbitethernet 3/10
% Warning: Non-existing ports (not configured) are ignored by
interface-range
```

Example (Configuration Terminal Batch Mode)

```
DellEMC(conf-b)#interface range te 1/1-4
DellEMC(conf-if-range-te-1/1-4)#
```

**Example
(Multiple Ports)**

```
DelleMC(conf)# interface range tengigabitethernet 2/10 - 23,  
tengigabitethernet 2/12 - 17  
DelleMC(conf-if-range-te-2/10-23)#
```

**Example
(Overlapping
Ports)**

```
DelleMC(conf)# interface range tengigabitethernet 2/3 - 11,  
tengigabitethernet 2/3 - 23  
DelleMC(conf-if-range-te-2/3-23)#
```

**Usage
Information**

Only VLAN and port-channel interfaces created using the `interface vlan` and `interface port-channel` commands can be used in the `interface range` command.

Use the `show running-config` command to display the VLAN and port-channel interfaces. VLAN or port-channel interfaces that are not displayed in the `show running-config` command cannot be used with the bulk configuration feature of the `interface range` command. You cannot create virtual interfaces (VLAN, Port-channel) using the `interface range` command.

NOTE: If a range has VLAN, physical and port-channel interfaces, only commands related to physical interfaces can be bulk configured. To configure commands specific to VLAN and port-channel only those respective interfaces should be configured in a particular range.

**Example (Single
Range)**

This example shows a single range bulk configuration.

```
DelleMC(config)# interface range tengigabitethernet 5/3 - 23  
DelleMC(config-if-range-te-5/3-23)# no shutdown  
DelleMC(config-if-range-te-5/3-23)#
```

**Example
(Multiple Range)**

This example shows how to use commas to add different interface types to a range of interfaces.

```
DelleMC(config-if)# interface range tengigabitethernet 5/1 - 5/23,  
tengigabitethernet 1/1 - 1/2  
DelleMC(config-if-range-te-1/1-2,te-5/1-23)# no shutdown  
DelleMC(config-if-range-te-1/1-2,te-5/1-23)#
```

**Example
(Multiple Range)**

This example shows how to use commas to add VLAN and port-channel interfaces to the range.

```
DelleMC(config-if)# interface range tengigabitethernet 5/1 - 23,  
tengigabitethernet 1/1 - 2,

**Related
Commands**

- [interface port-channel](#) — configure a port channel group.
- [interface vlan](#) — configure a VLAN interface.
- [show config \(from INTERFACE RANGE mode\)](#) — display the bulk configuration interfaces.
- [show range](#) — display the bulk configuration ranges.
- [interface range macro \(define\)](#) — define a macro for an interface-range.

interface range macro (define)

Defines a macro for an interface range and then saves the macro in the running configuration.

Syntax `define interface range macro name interface , interface , ...`

Parameters

- | | |
|--|--|
| <i>name</i> | Enter up to 16 characters for the macro name. |
| <i>interface,
interface,...</i> | Enter the keywords <code>interface range</code> and the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. Comma-separated ranges can include VLANs, port-channels, and physical interfaces. <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a Tunnel interface, enter the keyword <code>tunnel</code> then the tunnel ID. The range is from 1 to 16383.• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094. |

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.2.1.0	Added support for 4093 VLANs on E-Series. Prior releases supported 2094.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

Example (Single Range)

This example shows how to define an interface range macro named test. Execute the `show running-config` command to display the macro definition.

```
DelleMC(config)# define interface-range test tengigabitethernet 1/1 - 3,
tengigabitethernet 5/1 - 47, tengigabitethernet 3/1 - 12

DelleMC# show running-config | grep define
define interface-range test tengigabitethernet 1/1 - 3,
tengigabitethernet 5/1 - 47,
tengigabitethernet 3/1 - 12
DelleMC(config)#interface range macro test
DelleMC(config-if-range-te-1/1-3,te-5/1-47,te-3/1-12)#
```

Related Commands

- [interface range](#) – configure a range of command (bulk configuration).
- [interface range macro name](#) – run an interface range macro.

interface range macro name

Run the interface-range macro to automatically configure the pre-defined range of interfaces.

Syntax `interface range macro name`

Parameters *name* Enter the name of an existing macro.

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
6.2.1.0	Introduced

Example (Single Range)

This example shows the macro named *test* that was defined earlier.

```
DellEMC(config)# interface range macro test
DellEMC(config-if-range-te-1/1-3,te-5/1-47,te-2/1-89) #
Dell
```

Related Commands

- [interface range](#) — configure a range of command (bulk configuration).
- [interface range macro \(define\)](#) — define a macro for an interface range (bulk configuration).

interface vlan

Configure a VLAN. You can configure up to 4094 VLANs.

Syntax

```
interface vlan vlan-id [of-instance{of-id}]
```

Parameters

- vlan-id*** Enter a number as the VLAN Identifier. The range is from 1 to 4094.
- of-instance*{*of-id*}** Enter the keyword **of-instance** then the OpenFlow instance ID to add the VLAN to the specified OpenFlow instance. The range is from 1 to 8.
-  **NOTE:** Associate the OpenFlow instance with the VLAN when the VLAN is created. An existing VLAN cannot be associated with an OpenFlow instance.

Defaults

Not configured, except for the Default VLAN, which is configured as VLAN 1.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.1.(0.0)	Introduced on the S4810; added support for OpenFlow.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Usage Information

For more information about VLANs and the commands to configure them, see [Virtual LAN \(VLAN\) Commands](#).

FTP, TFTP, and SNMP operations are not supported on a VLAN. MAC ACLs and IP ACLs are supported. For more information, see [Access Control Lists \(ACL\)](#).

The following features are not supported on VLANs associated with an OpenFlow instance:

- IPv4
- IPv6
- MTU

If OpenFlow VLANs are configured on the switch, spanning-tree protocols cannot be enabled simultaneously.

Example (Single Range)

```
DellEMC(conf)# int vlan 3
DellEMC(conf-if-vl-3)#
```

Related Commands

- [interface](#) — configure a physical interface.
- [interface loopback](#) — configure a loopback interface.
- [interface null](#) — configure a null interface.
- [interface port-channel](#) — configure a port channel group.
- [show vlan](#) — display the current VLAN configuration on the switch.
- [shutdown](#) — disable/enable the VLAN.
- [tagged](#) — add a Layer 2 interface to a VLAN as a tagged interface.
- [untagged](#) — add a Layer 2 interface to a VLAN as an untagged interface.

keepalive

Send keepalive packets periodically to keep an interface alive when it is not transmitting data.

Syntax

`keepalive`

To stop sending keepalive packets, use the `no keepalive` command.

Defaults

Enabled.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.2	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

Usage Information When you configure `keepalive`, the system sends a self-addressed packet out of the configured interface to verify that the far end of a WAN link is up. When you configure `no keepalive`, the system does not send keepalive packets and so the local end of a WAN link remains up even if the remote end is down.

linecard portmode

Split a single 40G port into four 10G ports on the switch.

Syntax `linecard slot-id port number portmode quad`

Parameters

linecard slot-id	Enter the slot ID of a Z9500 line card to reset. The range of slot IDs is from 0 to 2.
number	Enter the port number of the 40G port to be split. A 40G port number is a multiple of 4; for example, 0, 4, 8, 12, ... 120, 124, 128).

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.

Usage Information Enabling quad mode on a port removes the interface configurations (if any) on the port after a save and reload. Be sure that the port is removed from other L2 and L3 feature configurations.

You must save and reload the system for the 40G to 4x10G port change to take effect.

This command cannot be used if LR4 optics are inserted in the 40G port.

monitor interface

Monitor counters on a single interface or all interfaces. The screen is refreshed every five seconds and the CLI prompt disappears.

Syntax `monitor interface [interface] [linecard slot-id]`

To disable monitoring and return to the CLI prompt, press the `q` key.

Parameters

interface	(OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none">For the Management interface on the stack-unit, enter the keyword <code>managementEthernet</code> then the slot/port information.For a port channel interface, enter the keyword <code>port-channel</code> and then a number.For a Tunnel interface, enter the keyword <code>tunnel</code> then the slot/port. The range is from 1 to 16383.For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.
linecard slot-id	Enter the <code>linecard slot-id</code> parameters to specify the Z9500 ports on a line card. The range of slot IDs is from 0 to 2.

Command Modes

- EXEC
- EXEC Privilege

Command History

7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Usage Information

In the Example, the delta column displays changes since the last screen refresh.

The following are the `monitor` command menu options.

Key	Description
systest-3	Displays the host name assigned to the system.
monitor time	Displays the amount of time since the <code>monitor interface</code> command was entered.
time	Displays the amount of time the chassis is up (since last reboot).
m	Change the view from a single interface to all interfaces on the line card or visa-versa.
c	Refresh the view.
b	Change the counters displayed from Packets on the interface to Bytes.
r	Change the [delta] column from change in the number of packets/bytes in the last interval to rate per second.
l	Change the view to the next interface on the line card, or if in line card mode, the next line card in the chassis.
a	Change the view to the previous interface on the line card, or if in line card mode, the previous line card in the chassis.
T	Increase the screen refresh rate.
t	Decrease the screen refresh rate.
q	Return to the CLI prompt.

Example (Single Interface)

```
systest-3 Monitor time: 00:00:06 Refresh Intvl.: 2s Time: 03:26:26

mtu

Set the link maximum transmission unit (MTU) (frame size) for an Ethernet interface.

Syntax	<code>mtu value</code>	
	To return to the default MTU value, use the <code>no mtu</code> command.	
Parameters	value	Enter a maximum frame size in bytes. The range is from 592 to 9216. The default is 9216.
Defaults	9216	
Command Modes	INTERFACE	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Reduced the maximum size of the maximum transmission unit (MTU) to 9216 bytes on S6000, S6000-ON, S4048-ON, Z9500, and C9010. Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Usage Information

If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (`ip mtu` command) must be enough bytes to include the Layer 2 header.

When you enter the `no mtu` command, Dell EMC Networking OS reduces the IP MTU value to 1536 bytes.

Link MTU and IP MTU considerations for port channels and VLANs are as follows.

port channels:

- All members must have the same link MTU value and the same IP MTU value.
- The port channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the port channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

VLANs:

- All members of a VLAN must have same IP MTU value.

- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following shows the difference between Link MTU and IP MTU.

Layer 2 Overhead	Link MTU and IP MTU Delta
Ethernet (untagged)	18 bytes
VLAN Tag	22 bytes
Untagged Packet with VLAN-Stack Header	22 bytes
Tagged Packet with VLAN-Stack Header	26 bytes

portmode hybrid

To accept both tagged and untagged frames, set a physical port or port-channel. A port configured this way is identified as a hybrid port in report displays.

Syntax `portmode hybrid`

To return a port to accept either tagged or untagged frames (non-hybrid), use the `no portmode hybrid` command.

Defaults non-hybrid

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information

The following describes the `interface` command shown in the following example. This example sets a port as hybrid, makes the port a tagged member of VLAN 20, and an untagged member of VLAN 10, which becomes the native VLAN of the port. The port now accepts:

- untagged frames and classify them as VLAN 10 frames
- VLAN 20 tagged frames

The following describes the `do show interfaces` command shown in the following example. This example shows output with “Hybrid” as the newly added value for 802.1QTagged. The options for this field are:

- True — port is tagged
- False — port is untagged
- Hybrid — port accepts both tagged and untagged frames

The following describes the `interface vlan` command shown in the following example. This example shows unconfiguration of the hybrid port using the `no portmode hybrid` command.

NOTE: Remove all other configurations on the port before you can remove the hybrid configuration from the port.

Example

```
DelleMC(conf)# interface tengigabitethernet 1/1
DelleMC(conf-if-te-1/1)# portmode hybrid
DelleMC(conf-if-te-1/1)# interface vlan 10
DelleMC(conf-if-vl-10)# untagged tengigabitethernet 1/1
DelleMC(conf-if-vl-10)# interface vlan 20
DelleMC(conf-if-vl-20)# tagged tengigabitethernet 1/1
DelleMC(conf-if-vl-20)#
```

Example

```
DelleMC(conf-if-vl-20)# do show interfaces switchport
Name: TenGigabitEthernet 1/1
802.1QTagged: Hybrid
Vlan membership:
Vlan 10, Vlan 20
Native VlanId: 10
DelleMC(conf-if-vl-20)#
```

Example (Vlan)

```
DelleMC(conf-if-vl-20)# interface vlan 10
DelleMC(conf-if-vl-10)# no untagged tengigabitethernet 1/1
DelleMC(conf-if-vl-10)# interface vlan 20
DelleMC(conf-if-vl-20)# no tagged tengigabitethernet 1/1
DelleMC(conf-if-vl-20)# interface tengigabitethernet 1/1
DelleMC(conf-if-te-1/1)# no portmode hybrid
DelleMC(conf-if-vl-20)#
```

rate-interval

Configure the traffic sampling interval on the selected interface.

Syntax `rate-interval seconds`

Parameters

seconds

Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

NOTE: Because polling occurs every 15 seconds, the number of seconds designated here rounds to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45.

Defaults **299 seconds**

Command Modes INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced

Usage Information

The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

rate-interval (Configuration Mode)

Configure the traffic sampling interval for all physical and logical port-channel interfaces globally. The support to configure rate-interval globally enables you to modify the default interval rate for all physical and logical interfaces at one time.

Syntax `rate-interval seconds`

Use the `no rate-interval` command to remove the sampling interval configuration.

Parameters

seconds Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

NOTE: Because polling occurs every 15 seconds, the number of seconds designated here round to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45. If you configure this value to be less than 5, then the entire buffer is cleared; the `show int stats` command shows the rate information to be 0 as the polling interval is less than 5.

Defaults **299 seconds**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11.0.0	Introduced on all Dell EMC Networking OS platforms.

Usage Information

The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

When `rate-interval` is not configured in the global configuration mode or interface mode, the default value of 299 seconds is applied.

When `rate-interval` is configured only in the global configuration mode and not in the interface mode, the global `rate-interval` value is applied at the interface level also.

When `rate-interval` is configured at the interface level and not in the global configuration mode, the interface level `rate-interval` value is applied for an interface.

When `rate-interval` is configured in both global configuration mode as well as interface mode, then the `rate-interval` value configured at interface level is applied as it takes precedence over the global value.

reset linecard

Reset the ports on a Z9500 line card.

Z9500

Syntax	<code>reset linecard slot-id</code>
Parameters	linecard slot-id Enter the slot ID number to specify the set of line-card ports to be reset. The range of Z9500 line-card slot IDs is 0 to 2.
Defaults	none
Command Modes	EXEC
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell NetworkingOS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Added the <code>hard reset</code> option.
7.8.1.0	Augmented to run on the standby unit in order to reset the standby unit directly.
7.7.1.0	Introduced on the S-Series.

Usage Information

Resetting is a soft reboot, including flushing the forwarding tables.

Example

```
Stack MAC : 00:01:e8:8b:1a:36

Related Commands

- [reload](#) – reboots the Dell Networking OS.

show config

Display the interface configuration.

Syntax `show config`

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Example

```

DellEMC(conf-if-fo-1/4)# show config
!
interface fortyGigE 1/4
 no ip address
 mtu 9216
 switchport
 no shutdown
DellEMC(conf-if-fo-1/4)#

```

show config (from INTERFACE RANGE mode)

Display the bulk configured interfaces (`interface range`).

Syntax `show config`

Command Modes CONFIGURATION INTERFACE (`conf-if-range`)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC(conf)# interface range tengigabitethernet 1/1 - 2
DellEMC(conf-if-range-gi-1/1-2)# show config
!
interface TenGigabitEthernet 1/1
  no ip address
  switchport
  no shutdown
!
interface TenGigabitEthernet 1/2
  no ip address
  switchport
  no shutdown
DellEMC(conf-if-range-gi-1/1-2)#
```

show interfaces

Display information on a specific physical interface or virtual interface.

Syntax `show interfaces interface-type[-range]`

Parameters *interface* Enter one of the following keywords and the interface information:

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For stack-units, enter the keywords `stack-unit` then the slot/port information.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.

NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

-range (Optional) Enter the range of interfaces for which you want to view the information. The format is *interface-type slot/port-port-slot/port*

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Added the OUI value in the command output for the Z9100-ON.
9.11(0.0)	Included the FEC BER details in the output for 100G interfaces of S6100-ON and Z9100-ON. Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100. Included display information about EEE on the S3048-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON. Included display information about EEE on the S3100 series, S4820T, and S5000.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.2(0.2)	Added support for the tunnel interface type.
9.1(0.0)	Updated Management Ethernet output to include two global IPv6 addresses on S4810 and Z9000 and added output example showing OpenFlow instance ID.
8.3.12.1	Updated command output to support multiple IPv6 addresses on S4810.

Version	Description
8.3.11.4	Output expanded to support eSR4 optics in Z9000.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.2	Included SFP and SFP+ optics power detail in the E-Series and C-Series output.
8.2.1.0	Added support for 4093 VLANs on the E-Series. Prior releases supported 2094.
8.1.1.0	Introduced on the E-Series.
7.8.1.0	Output expanded to include SFP+ media on the C-Series.
7.6.1.0	Introduced on the S Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Changed the organization of the display output.
6.3.1.0	Added the Pluggable Media Type field in the E-Series output.

Usage Information

Use the `show interfaces` command for details on a specific interface.

NOTE: In the CLI output, the power value is rounded to a 3-digit value. For receive/transmit power that is less than 0.000, an `snmp query` returns the corresponding dbm value even though the CLI displays as 0.000.

NOTE: After the counters are cleared, the line-rate continues to increase until it reaches the maximum line rate. When the maximum line rate is reached, there is no change in the line-rate.

User Information

The following table describes the `show interfaces` command shown in the 10G example.

Line	Description
TenGigabitEthernet 1/1...	Interface type and administrative and line protocol status.
Hardware is...	Interface hardware information, assigned MAC address, and current address.
Pluggable media present...	Present pluggable media wavelength, type, and rate. The error scenarios are: <ul style="list-style-type: none"> Wavelength, unknown — Unable to determine the optics type Unknown — If the wavelength is reading an error Dell EMC Networking allows unsupported SFP and XFP transceivers to be used, but Dell EMC Networking OS might not be able to retrieve some data about them. In that case, typically when the output of this field is "Pluggable media present, Media type is unknown", the Medium and the XFP/SFP receive power reading data might not be present in the output.
Interface index...	Displays the interface index number the SNMP uses to identify the interface.
Internet address...	States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.
MTU 1554...	Displays link and IP MTU information.
LineSpeed	Displays the interface's line speed, duplex mode, and negotiation mode.
Energy Efficient Ethernet	Displays whether Energy Efficient Ethernet has been enabled or not.
ARP type:...	Displays the ARP type and the ARP timeout value for the interface.
Last clearing...	Displays the time when the <code>show interfaces</code> counters were cleared.
Queuing strategy...	States the packet queuing strategy. FIFO means first in first out.

Line	Description
Input Statistics:	<p>Displays all the input statistics including:</p> <ul style="list-style-type: none"> ● Number of packets and bytes into the interface ● Number of packets with VLAN tagged headers ● Packet size and the number of those packets inbound to the interface ● Number of Multicast and Broadcast packets: <ul style="list-style-type: none"> ○ Multicasts = number of MAC multicast packets ○ Broadcasts = number of MAC broadcast packets ● Number of runts, giants, and throttles packets: <ul style="list-style-type: none"> ○ runts = number of packets that are less than 64B ○ giants = packets that are greater than the MTU size ○ throttles = packets containing PAUSE frames ● Number of CRC, overrun, and discarded packets: <ul style="list-style-type: none"> ○ CRC = packets with CRC/FCS errors ○ overrun = number of packets discarded due to FIFO overrun conditions ○ discarded = the sum of runts, giants, CRC, and overrun packets discarded without any processing
Output Statistics:	<p>Displays output statistics sent out of the interface including:</p> <ul style="list-style-type: none"> ● Number of packets, bytes, and underruns out of the interface ● Packet size and the number of the packets outbound to the interface ● Number of Multicast, Broadcast, and Unicast packets: <ul style="list-style-type: none"> ○ Multicasts = number of MAC multicast packets ○ Broadcasts = number of MAC broadcast packets ○ Unicasts = number of MAC unicast packets ● Number of VLANs, throttles, discards, and collisions: <ul style="list-style-type: none"> ○ Vlans = number of VLAN tagged packets ○ throttles = packets containing PAUSE frames ○ discarded = number of packets discarded without any processing ○ collisions = number of packet collisions ○ wred=count both packets discarded in the MAC and in the hardware-based queues
Rate information...	Estimate of the input and output traffic rate over a designated interval (30 to 299 seconds). Traffic rate is displayed in bits, packets per second, and percent of line rate.
Time since...	Elapsed time since the last interface status change (hh:mm:ss format).

Example

```

DelleMC# show interfaces
TenGigabitEthernet 2/1 is down, line protocol is down
Hardware is DellForce10Eth, address is 00:01:e8:8b:3d:e7
Current address is 00:01:e8:8b:3d:e7
Pluggable media present, Media type is unknown
Wavelength unknown
Interface index is 100992002
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
Flowcontrol rx on tx off
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 3d17h53m
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns

```

```

0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
0 Multicasts, 0 Broadcasts, 0 Unicasts
0 throttles, 0 discarded, 0 collisions, 0 wredrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 3d17h51m

```

Example

Usage Information

The Management port is enabled by default (no shutdown). If necessary, use the `ip address` command to assign an IP address to the Management port. If two RPMs are installed in your system, use the `show redundancy` command to display which RPM is the Primary RPM.

Example

```

DellEMC# show interfaces tengigabitethernet 1/1
TenGigabitEthernet 1/1 is up, line protocol is down
Hardware is DellEMCEth, address is 00:01:e8:41:77:95
  Current address is 00:01:e8:41:77:95
Pluggable media present, SFP type is 1000BASE-SX
  Wavelength is 850nm
Interface index is 100974648
Port will not be disabled on partial SFM failure
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit
Flowcontrol rx on tx on
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 1w0d5h
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions, 0 wredrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 1w0d5h
DellEMC#

```

Example (Management Ethernet)

Example (Management Ethernet, two IPv6 addresses)

```

ManagementEthernet 0/0 is up, line protocol is up
Hardware is DellForce10Eth, address is 00:01:e8:a0:bf:f3
Current address is 00:01:e8:a0:bf:f3
Pluggable media not present
Interface index is 302006472
Internet address is 10.16.130.5/16
Link local IPv6 address: fe80::201:e8ff:fea0:bff3/64
Global IPv6 address: 1::1/
Global IPv6 address: 2::1/64

```

```

Virtual-IP is not set
Virtual-IP IPv6 address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 00:06:14
Queueing strategy: fifo
Input 791 packets, 62913 bytes, 775 multicast
Received 0 errors, 0 discarded
Output 21 packets, 3300 bytes, 20 multicast
Output 0 errors, 0 invalid protocol
Time since last interface status change: 00:06:03

```

**Example
(OpenFlow
instance)**

```

DellEMC# show interfaces vlan 6
Vlan 6 is down, line protocol is down
Address is 00:01:e8:8a:e1:8c, Current address is 00:01:e8:8a:e1:8c
Interface index is 1107525638
of-instance: 2
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 00:05:12
Queueing strategy: fifo
Time since last interface status change: 00:05:12

```

**Related
Commands**

- [show interfaces configured](#) – display any interface with a non-default configuration.
- [show ip interface](#) – display Layer 3 information about the interfaces.
- [show range](#) – display all interfaces configured using the interface range command.

show interfaces configured

Display any interface with a non-default configuration.

Syntax `show interfaces configured`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Changed the organization of the display output.

Example

```
DellEMC# show interfaces configured
TenGigabitEthernet 1/18 is up, line protocol is up
Hardware is DelleMCeth, address is 00:01:e8:05:f7:fc
Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interfaces" counters 00:12:42
Queueing strategy: fifo
Input Statistics:
  10 packets, 10000 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 10 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  1 packets, 64 bytes, 0 underruns
  1 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 1 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 00:04:59
DellEMC#
```

show interfaces dampening

Display interface dampening information.

Syntax `show interfaces dampening [[interface] [summary] [detail]]`

Parameters *interface* (Optional) Enter one of the following keywords and the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

summary (OPTIONAL) Enter the keyword `summary` to display the current summary of dampening data, including the number of interfaces configured and the number of interfaces suppressed, if any.

detail (OPTIONAL) Enter the keyword `detail` to display detailed interface dampening data.

Defaults None

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

Example

```
DellEMC# show interfaces dampening
Interface Supp   Flaps Penalty Half-Life Reuse Suppress Max-Sup
  State
Te 1/2   Up      0      0          20      800   4500   120
```

```
Te 1/10 Up 0 0 5 750 2500 20
DellEMC#
```

Related Commands

- [dampening](#) — configure dampening on an interface.
- [show interfaces configured](#) — display any interface with a non-default configuration.

show interfaces phy

Display auto-negotiation and link partner information.

Syntax

```
show interfaces gigabitethernet slot/port phy
```

Parameters

tengigabitethernet

- Enter the keyword `tengigabitethernet` then the slot or port information.
- NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.
- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
 - For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the C-Series and S-Series.
6.5.4.0	Introduced on the E-Series.

Usage Information

The following describes the `show interfaces gigabitethernet` command following example.

Mode Control Indicates if `auto negotiation` is enabled. If so, indicates the selected speed and duplex.

Mode Status	Displays auto negotiation fault information. When the interface completes auto negotiation successfully, the <code>autoNegComplete</code> field and the <code>linkstatus</code> field read "True."
AutoNegotiation Advertise	Displays the control words the local interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the local interface supports.
AutoNegotiation Remote Partner's Ability	Displays the control words the remote interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the remote interface supports.
AutoNegotiation Expansion	<code>ParallelDetectionFault</code> is the handshaking scheme in which the link partner continuously transmit an "idle" data packet using the Fast Ethernet MLT-3 waveform. Equipment that does not support auto-negotiation must be configured to exactly match the mode of operation as the link partner or else no link can be established.
1000Base-T Control	1000Base-T requires auto-negotiation. The IEEE Ethernet standard does not support setting a speed to 1000 Mbps with the <code>speed</code> command without auto-negotiation. E-Series line cards support both full-duplex and half-duplex 1000BaseT.
Phy Specific Control	<p>Values are:</p> <ul style="list-style-type: none"> ● 0 - Manual MDI ● 1 - Manual MDIX ● 2 - N/A ● 3 - Auto MDI/MDIX
Phy Specific Status	<p>Displays PHY-specific status information. Cable length represents a rough estimate in meters:</p> <ul style="list-style-type: none"> ● 0 - < 50 meters ● 1 - 50 - 80 meters ● 2 - 80 - 110 meters ● 3 - 110 - 140 meters ● 4 - 140 meters <p>Link Status: Up or Down</p> <p>Speed:</p> <ul style="list-style-type: none"> ● Auto ● 1000MB ● 100MB ● 10MB

Example

```
DellEMC# show interfaces tengigabitethernet 1/0 phy
Mode Control:
  SpeedSelection:      10b
  AutoNeg:             ON
  Loopback:           False
  PowerDown:          False
  Isolate:            False
  DuplexMode:         Full
Mode Status:
  AutoNegComplete:    False
  RemoteFault:        False
  LinkStatus:         False
  JabberDetect:       False
AutoNegotiation Advertise:
  100MegFullDplx:     True
  100MegHalfDplx:     True
  10MegFullDplx:      False
  10MegHalfDplx:      True
  Asym Pause:         False
  Sym Pause:          False
AutoNegotiation Remote Partner's Ability:
```

```

100MegFullDplx:      False
100MegHalfDplx:     False
10MegFullDplx:      False
10MegHalfDplx:      False
Asym Pause:         False
Sym Pause:          False
AutoNegotiation Expansion:
ParallelDetectionFault: False
...

```

show interfaces status

To display status information on a specific interface only, display a summary of interface information or specify a stack-unit slot and interface.

Syntax `show interfaces [interface | linecard slot-number] status`

Parameters

interface (OPTIONAL) Enter one of the following keywords the interface information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

i NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

linecard slot-number (OPTIONAL) Enter the keyword `linecard` then the slot number.

Defaults None

7.5.1.0	Introduced on the E-Series.

Example

show interfaces vlan

Display VLAN statistics.

Syntax `show interfaces vlan {vlan-id} [LINE] {description}`

Parameters

vlan-id	Enter the interface VLAN number. The range is from 1 to 4094.
LINE	(OPTIONAL) Enter the name of the VLAN.
description	Displays the VLAN interface information with description.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S-Series and Z-Series.

Usage Information

NOTE: This command also enables you to view information corresponding to a range of ports.

- You can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1 - 4`.

Example

```
DellEMC# show interfaces vlan 10
Vlan 10 is up, line protocol is down
Address is 90:b1:1c:f4:99:ce, Current address is 90:b1:1c:f4:99:ce
Interface index is 1107787786
Internet address is not set
Mode of IPv4 Address Assignment: NONE
DHCP Client-ID: 90b11cf499ce
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 2d17h26m
Queueing strategy: fifo
Time since last interface status change: 2d17h26m
Input Statistics:
    0 packets, 0 bytes
Output Statistics:
    0 packets, 0 bytes, 0 underruns
```

show range

Display all interfaces configured using the `interface range` command.

Syntax `show range`

Command Modes INTERFACE RANGE (config-if-range)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4093 VLANs on E-Series.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced.

Example

```
DellEMC(conf-if-range-te-2/2,fo-2/56)# show range
2/2 - 0
2/56 - 0
DellEMC(conf-if-range-te-2/2,fo-2/56)#
```

- Related Commands**
- [interface](#) — configure a physical interface on the switch.
 - [show ip interface](#) — display Layer 3 information about the interfaces.

show running-config ecmp-group

Display interfaces, LAG, or LAG link bundles being monitored for uneven traffic distribution using the `ecmp-group monitoring enable` command. The ECMP group could have a LAG or a list of interfaces (not just LAG link-bundles).

Syntax `show running-config ecmp-group`

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.

- Related Commands**
- [ecmp-group](#) — configure a mechanism to monitor traffic distribution.

shutdown

Disable an interface.

Syntax `shutdown`

To activate an interface, use the `no shutdown` command.

Defaults The interface is disabled.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.

9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command

Usage Information

The `shutdown` command marks a physical interface as unavailable for traffic. To discover if an interface is disabled, use the `show ip interface brief` command. Disabled interfaces are listed as down.

Disabling a VLAN or a port channel causes different behavior. When a VLAN is disabled, the Layer 3 functions within that VLAN are disabled. Layer 2 traffic continues to flow. Entering the `shutdown` command on a port channel disables all traffic on the port channel and the individual interfaces within the port channel. To enable a port channel, enter `no shutdown` on the port channel interface and at least one interface within that port channel.

The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port channel.

Related Commands

- [interface port-channel](#) — create a port channel interface.
- [interface vlan](#) — create a VLAN.
- [show ip interface](#) — display the interface routing status. Add the keyword `brief` to display a table of interfaces and their status.

speed (for 10/100/1000/10000 interfaces)

Set the speed for 10/100/1000/10000 interfaces. Set both sides of a link to the same speed (10/100/1000/10000) or to auto or the link may not come up.

Syntax `speed {10 | 100 | 1000 | 10000 | auto}`

To return to the default setting, use the `no speed {10 | 100 | 1000 | 10000}` command.

Parameters

10	Enter the keyword <code>10</code> to set the interface's speed to 10 Mb/s. i NOTE: This interface speed is not supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card. If the command is entered for these interfaces, an error message appears.
100	Enter the keyword <code>100</code> to set the interface's speed to 10/100 Mb/s. i NOTE: When this setting is enabled, only 100Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.
1000	Enter the keyword <code>1000</code> to set the interface's speed to 1000 Mb/s. Auto-negotiation is enabled. For more information, refer to <code>negotiation auto</code> . i NOTE: When this setting is enabled, only 1000Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.
10000	Enter the keyword <code>10000</code> to set the interface's speed to 10000 Mb/s. Auto-negotiation is enabled. For more information, refer to <code>negotiation auto</code> .
auto	Enter the keyword <code>auto</code> to set the interface to auto-negotiate its speed. Auto-negotiation is enabled. For more information, refer to <code>negotiation auto</code> .

Defaults `auto`

Command Modes INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Added support for fanned-out 1 Gigabit SFP port.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Supported on LC-EH-GE-50P or the LC-EJ-GE-50P cards.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command

Usage Information

This command is found on the /1000/10000 Base-T Ethernet interfaces.

When you enable `auto`, the system performs an automatic discovery to determine the optics installed and configure the appropriate speed.

When you configure a speed for the 10/100/1000/10000 interface, confirm the negotiation `auto` command setting. Both sides of the link must have auto-negotiation either enabled or disabled. For speed settings of 1000 or `auto`, the software sets the link to auto-negotiation and you cannot change that setting.

NOTE: Starting with Dell EMC Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the `speed` command. When you set the speed to **10** or **100 Mbps**, you can also use the `duplex` command.

If you use an active optical cable (AOC), you can convert the QSFP+ port to a 10 Gigabit SFP+ port or 1 Gigabit SFP port. Use the `speed` command to enable the required speed.

speed (Management interface)

Set the speed for the Management interface.

Syntax `speed {10 | 100 | 1000 | auto}`

To return to the default setting, use the `no speed` command.

Parameters	
10	Enter the keyword <code>10</code> to set the interface's speed to 10 Mb/s.
100	Enter the keyword <code>100</code> to set the interface's speed to 100 Mb/s.
1000	Enter the keyword <code>1000</code> to set the interface's speed to 1000 Mb/s.
auto	Enter the keyword <code>auto</code> to set the interface to auto-negotiate its speed.

Defaults `auto`

9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S55, S60, and S4810
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Usage Information This command is found on the Management interface only.

Related Commands

- [interface ManagementEthernet](#) — configure the Management port on the system (either the Primary or Standby RPM).
- [management route](#) — configure a static route that points to the Management interface or a forwarding router.

switchport

Place an interface in Layer 2 mode.

Syntax `switchport [[backup interface {interface | port-channel number}] | mode private-vlan {host | promiscuous | trunk}]`

To remove an interface from Layer 2 mode and place it in Layer 3 mode, enter the `no switchport` command. If a `switchport backup interface` is configured, first remove the backup configuration. To remove a `switchport backup interface`, enter the `no switchport backup interface` command.

Parameters

backup	(OPTIONAL) Use this option to configure a redundant Layer 2 link without using Spanning Tree. The keyword <code>backup</code> configures a backup port so that if the primary port fails, the backup port changes to the up state. If the primary later comes up, it becomes the backup.
interface interface	(OPTIONAL) Enter any of the following keywords and the interface information: <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
port-channel	(OPTIONAL) Enter the keywords <code>port-channel</code> if the backup port is a static or dynamic port channel.

mode	(OPTIONAL) Enter the keyword <code>mode</code> to set the interface mode.
private-vlan	(OPTIONAL) Enter the keywords <code>private-vlan</code> to set the interface mode to private VLAN mode.
host	(OPTIONAL) Enter the keyword <code>host</code> to set the private VLAN interface to host mode.
promiscuous	(OPTIONAL) Enter the keyword <code>promiscuous</code> to set the private VLAN interface to promiscuous mode.
trunk	(OPTIONAL) Enter the keyword <code>trunk</code> to set the private VLAN interface to trunk mode.

Defaults Disabled — interface is in Layer 3 mode.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.4.1.0	Added support for port-channel interfaces (the <code>port-channel number</code> option).
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.7.1.0	Added the <code>backup interface</code> option.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Usage Information

If an IP address or VRRP group is assigned to the interface, you cannot use the `switchport` command on the interface. To use the `switchport` command on an interface, only the `no ip address` and `no shutdown` statements must be listed in the `show config` output.

When you enter the `switchport` command, the interface is automatically added to the default VLAN.

To use the `switchport backup interface` command on a port, first enter the `switchport` command. For more information, see “Configuring Redundant Links” in the Layer 2 section in the *Dell EMC Networking OS Configuration Guide*.

wavelength

Set the wavelength for tunable 10-Gigabit SFP+ optics.

Syntax	<code>wavelength</code> To retain the existing wavelength, use the <code>no wavelength</code> command.
Defaults	none
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, M I/O Aggregator, FN I/O Module, MXL, C9010, S3100 series, and Z9100-ON.

Usage Information	The wavelength can be configured only on a tunable 10-Gigabit SFP+ optic. The wavelength range is from 1528.3 nm to 1568.77nm. If you configure the wavelength on a non-tunable optic, there is no change to the existing wavelength. The configured wavelength is saved in the running configuration and is applicable, when a tunable optic is used. If you do not configure the wavelength on an inserted tunable optic, the existing wavelength is used.
--------------------------	--

Example The following example shows the wavelength set for a tunable 10-Gigabit SFP+ optic:

```
DellEMC(conf-if-te-1/1)# wavelength 1528.30
```

Related Commands	<ul style="list-style-type: none">• show config — displays the interface configuration.
-------------------------	---

Egress Interface Selection (EIS) Commands

The following commands are Egress Interface Selection (EIS) commands.

application

Configure the management egress interface selection.

Syntax	<code>application {all <i>application-type</i>}</code> To remove a management application configuration, use the <code>no application {all <i>application-type</i>}</code> command.
---------------	--

Parameters	<p><i>application-type</i> Enter any of the following keywords:</p> <ul style="list-style-type: none">• For DNS, enter the keyword <code>dns</code>.• For FTP, enter the keyword <code>ftp</code>.• For NTP, enter the keyword <code>ntp</code>.• For Radius, enter the keyword <code>radius</code>.• For sFlow collectors, enter the keyword <code>sflow-collector</code>.• For SNMP (traps and MIB responses), enter the keywords <code>snmp</code>.• For SSH, enter the keyword <code>ssh</code>.• For Syslog, enter the keyword <code>syslog</code>.
-------------------	--

- For TACACS, enter the keyword `tacacs`.
- For Telnet, enter the keyword `telnet`.
- For TFTP, enter the keyword `tftp`.

all Configure all applications.

Defaults None.

Command Modes EIS Mode (`conf-mgmt-eis`)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the Z9000, S4810, and S4820T.

clear management application pkt-cntr

Clear management application packet counters for all management application types.

Syntax `clear management application pkt-cntr`

Defaults None.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the Z9000, S4810, and S4820T.

clear management application pkt-fallback-cntr

Clear management application packet fallback counters for all management application types.

Syntax `clear management application pkt-fallback-cntr`

Defaults None.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.2.(0.0)	Introduced on the Z9000, S4810, and S4820T.

management egress-interface-selection

To make configured application traffic egress through the management port instead of the front-end (FE) port, enable and configure a management egress interface.

Syntax `management egress-interface-selection`

To disable and remove management egress interface selection (EIS) configurations, use the `no management egress-interface-selection` command.

Defaults None.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.

show ip management-eis-route

Display the management routes used by EIS.

Syntax `show ip management-eis-route`

Defaults None.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the Z9000, S4810, and S4820T.

Example

```
DellEMC# show ip management-eis-route
Destination      Gateway          State           Route Source
-----
10.11.0.0/16     ManagementEthernet 0/0   Connected     Connected
172.16.1.0/24   10.11.192.4     Active         Static
```

show management application pkt-cntr

Display the number of packets for each application type that have taken the management route.

Syntax `show management application pkt-cntr`

Defaults None.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the Z9000, S4810, and S4820T.

Example

```
Dell EMC# show management application pkt-cntr
dns                : 2
ftp                : 0
ntp                : 0
radius             : 0
sflow-collector   : 0
snmp               : 0
ssh                : 0
syslog             : 0
tacacs             : 0
telnet             : 0
tftp               : 0
```

show management application pkt-fallback-cntr

Display the number of packets for each application type that have been rerouted to the default routing table due to management port or route lookup failure.

Syntax `show management application pkt-fallback-cntr`

Defaults None.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Introduced on the Z9000, S4810, and S4820T.

Example

```
Dell EMC# show management application pkt-fallback-cntr
dns                : 0
ftp                : 0
ntp                : 0
radius             : 0
sflow-collector   : 0
snmp               : 0
```

```
ssh          : 2
syslog      : 0
tacacs      : 0
telnet      : 0
tftp        : 0
```

Port Channel Commands

A Link Aggregation Group (LAG) is a group of links that appear to a MAC client as if they were a single link according to IEEE 802.3ad. In Dell EMC Networking OS, a LAG is referred to as a Port Channel.

- The platform supports 512 port channels and 16 members per port channel.

As each port can be assigned to only one Port Channel, and each Port Channel must have at least one port, some of those nominally available Port Channels might have no function because they could have no members if there are not enough ports installed.

NOTE: The Dell EMC Networking OS implementation of LAG or Port Channel requires that you configure a LAG on both switches manually. For information about Dell EMC Networking OS link aggregation control protocol (LACP) for dynamic LAGs, refer to the [Link Aggregation Control Protocol \(LACP\)](#) chapter. For more information about configuring and using Port Channels, refer to the *Dell EMC Networking OS Configuration Guide*.

channel-member

Add an interface to the Port Channel, while in INTERFACE PORTCHANNEL mode.

Syntax `channel-member interface`

To delete an interface from a Port Channel, use the `no channel-member interface` command.

Parameters *interface* (OPTIONAL) Enter any of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Defaults Not configured.

Command Modes INTERFACE PORTCHANNEL

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Usage Information

Use the `interface port-channel` command to access this command.

You cannot add an interface to a Port Channel if the interface contains an IP address in its configuration. Only the `shutdown`, `description`, `mtu`, and `ip mtu` commands can be configured on an interface if it is added to a Port Channel. The `mtu` and `ip mtu` commands are only available when the chassis is in Jumbo mode.

Link MTU and IP MTU considerations for Port Channels are:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

When an interface is removed from a Port Channel with the `no channel-member` command, the interface reverts to its configuration prior to joining the Port Channel.

An interface can belong to only one Port Channel.

You can have 16 interfaces per Port Channel. The interfaces can be located on different line cards but must be the same physical type and speed (for example, all 10-Gigabit Ethernet interfaces).

For more information about Port Channels, refer to the *Dell EMC Networking OS Configuration Guide*.

Related Commands

- [description](#) — assign a descriptive text string to the interface.
- [interface port-channel](#) — create a Port Channel interface.
- [shutdown](#) — disable/enable the port channel.

group

Group two LAGs in a supergroup ("fate-sharing group" or "failover group").

Syntax

```
group group_number port-channel number port-channel number
```

To remove an existing LAG supergroup, use the `no group group_number` command.

Parameters

- | | |
|----------------------------|---|
| group_number | Enter an integer from 1 to 32 that uniquely identifies this LAG fate-sharing group. |
| port-channel number | Enter the keywords <code>port-channel</code> then an existing LAG number. Enter this keyword/variable combination twice, identifying the two paired LAGs. |

Defaults

None

Command Modes

PORT-CHANNEL FAILOVER-GROUP (conf-po-failover-grp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

- [port-channel failover-group](#) — access PORT-CHANNEL FAILOVER-GROUP mode to configure a LAG failover group.
- [show interfaces port-channel](#) — display information on configured Port Channel groups.

interface port-channel

Create a Port Channel interface, which is a link aggregation group (LAG) containing 16 physical interfaces on the S-Series.

Syntax

```
interface port-channel channel-number
```

To delete a Port Channel, use the `no interface port-channel channel-number` command.

Parameters

channel-number For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 512.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Increased the number of port channels to 4096.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on S4810.
8.3.11.1	Introduced on Z9000.
8.1.1.0	Introduced on E-Series.
7.6.1.0	Introduced on S-Series.
7.5.1.0	Introduced on C-Series.
pre-Version 6.2.1.0	Introduced on E-Series.

Usage Information

Port Channel interfaces are logical interfaces and can be either in Layer 2 mode (by using the `switchport` command) or Layer 3 mode (by configuring an IP address). You can add a Port Channel in Layer 2 mode to a VLAN.

The `shutdown`, `description`, and `name` commands are the only commands that you can configure on an interface while it is a member of a Port Channel. To add a physical interface to a Port Channel, the interface can only have the `shutdown`, `description`, and `name` commands configured. The Port Channel's configuration is applied to the interfaces within the Port Channel.

A Port Channel can contain any physical interface. Based on the first interface configured in the Port Channel and enabled, Dell EMC Networking OS determines the common speed. For more information, refer to [channel-member](#).

If the line card is in a Jumbo mode chassis, you can also configure the `mtu` and `ip mtu` commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

 **NOTE:** In a Jumbo-enabled system, all members of a Port Channel must be configured with the same link MTU values and the same IP MTU values.

Example

```
DellEMC(conf)# int port-channel 2
DellEMC(conf-if-po-2)#
```

Related Commands

- [channel-member](#) — add a physical interface to the LAG.
- [interface](#) — configure a physical interface.
- [interface loopback](#) — configure a Loopback interface.
- [interface null](#) — configure a null interface.
- [interface vlan](#) — configure a VLAN.
- [shutdown](#) — disable/enable the port channel.

minimum-links

Configure the minimum number of links in a LAG (Port Channel) that must be in “oper up” status for the LAG to be also in “oper up” status.

Syntax `minimum-links number`

Parameters `number` Enter the number of links in a LAG that must be in “oper up” status. The range is from 1 to 16. The default is **1**.

Defaults **1**

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Usage Information

If you use this command to configure the minimum number of links in a LAG that must be in “oper up” status, the LAG must have at least that number of “oper up” links before it can be declared as up. For example, if the required minimum is four, and only three are up, the LAG is considered down.

port-channel failover-group

To configure a LAG failover group, access PORT-CHANNEL FAILOVER-GROUP mode.

Syntax `port-channel failover-group`
To remove all LAG failover groups, use the `no port-channel failover-group` command.

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.

Usage Information

This feature groups two LAGs to work in tandem as a supergroup. For example, if one LAG goes down, the other LAG is taken down automatically, providing an alternate path to reroute traffic, avoiding oversubscription on the other LAG. You can use both static and dynamic (LACP) LAGs to configure failover groups. For more information, see the “Port Channel” section in the *Dell EMC Networking OS Configuration Guide*.

Related Command

- [group](#) — group two LAGs in a supergroup (“fate-sharing group”).
- [show interfaces port-channel](#) — display information on configured Port Channel groups.

show config

Display the current configuration of the selected LAG.

Syntax `show config`

Command Modes INTERFACE PORTCHANNEL

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.0	Introduced on the E-Series.

Example

```
DellEMC(conf-if-po-1)# show config
!
interface Port-channel 1
  no ip address
  shutdown
DellEMC(conf-if-po-1)#
```

show interfaces port-channel

Display information on configured Port Channel groups.

Syntax `show interfaces port-channel [channel-number] [brief] [description]`

Parameters

channel-number For a Port Channel interface, enter the keyword `port-channel` then a number. The range is from 1 to 512.

NOTE: This command also enables you to view information corresponding to a range of ports.

- For port-channel interfaces, you can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces port-channel 1 - 4`.

brief (OPTIONAL) Enter the keyword `brief` to display only the port channel number, the state of the port channel, and the number of interfaces in the port channel.

description (OPTIONAL) Displays the port-channel information with description.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Increased the number of port channels to 4096.
9.9(0.0)	Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series. Modified to display the LAG failover group status.
7.5.1.0	Introduced on the C-Series.

E-Series legacy command

Usage Information The following describes the `show interfaces port-channel` command shown in the following example.

Field	Description
Port-Channel 1...	Displays the LAG's status. In the Example, the status of the LAG's LAG fate-sharing group ("Failover-group") is listed.
Hardware is...	Displays the interface's hardware information and its assigned MAC address.
Port-channel is part...	Indicates whether the LAG is part of a LAG fate-sharing group ("Failover-group").
Internet address...	States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.
MTU 1554...	Displays link and IP MTU.
LineSpeed	Displays the interface's line speed. For a port channel interface, it is the line speed of the interfaces in the port channel.
Members in this...	Displays the interfaces belonging to this port channel.
ARP type:...	Displays the ARP type and the ARP timeout value for the interface.
Last clearing...	Displays the time when the <code>show interfaces</code> counters were cleared.
Queueing strategy.	States the packet queuing strategy. FIFO means first in first out.
packets input...	Displays the number of packets and bytes into the interface.
Input 0 IP packets...	Displays the number of packets with IP headers, VLAN tagged headers, and MPLS headers. The number of packets may not add correctly because a VLAN tagged IP packet counts as both a VLAN packet and an IP packet.
0 64-byte...	Displays the size of packets and the number of those packets entering that interface. This information is displayed over two lines.
Received 0...	Displays the type and number of errors or other specific packets received. This information is displayed over three lines.
Output 0...	Displays the type and number of packets sent out the interface. This information is displayed over three lines.
Rate information...	Displays the traffic rate information into and out of the interface. Traffic rate is displayed in bits and packets per second.
Time since...	Displays the time since the last change in the configuration of this interface.

Example

```
DelleMC# show interfaces port-channel 20
Port-channel 20 is up, line protocol is up (Failover-group 1 is down)
Hardware address is 00:01:e8:01:46:fa
Port-channel is part of failover-group 1
Internet address is 1.1.120.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 2000 Mbit
Members in this channel: Te 2/5 Te 2/18
ARP type: ARPA, ARP timeout 04:00:00
Last clearing of "show interfaces" counters 00:00:00
Queueing strategy: fifo
  44507301 packets input, 3563070343 bytes
  Input 44506754 IP Packets, 0 Vlans 0 MPLS
  41 64-byte pkts, 44502871 over 64-byte pkts, 249 over 127-byte pkts
  407 over 255-byte pkts, 3127 over 511-byte pkts, 606 over 1023-byte
  pkts
  Received 0 input symbol errors, 0 runts, 0 giants, 0 throttles
  0 CRC, 0 IP Checksum, 0 overrun, 0 discarded
  1218120 packets output, 100745130 bytes, 0 underruns
  Output 5428 Multicasts, 4 Broadcasts, 1212688 Unicasts
  1216142 IP Packets, 0 Vlans, 0 MPLS
  0 throttles, 0 discarded
Rate info (interval 299 sec):
  Input 01.50Mbits/sec, 2433 packets/sec
```

```
Output 00.02Mbps/sec,4 packets/sec
Time since last interface status change: 00:22:34

DellEMC#
```

User Information The following describes the `show interfaces port-channel brief` command shown in the following example.

Field	Description
LAG	Lists the port channel number.
Mode	Lists the mode: <ul style="list-style-type: none"> • L3 — for Layer 3 • L2 — for Layer 2
Status	Displays the status of the port channel. <ul style="list-style-type: none"> • down — if the port channel is disabled (<code>shutdown</code>) • up — if the port channel is enabled (<code>no shutdown</code>)
Uptime	Displays the age of the port channel in hours:minutes:seconds.
Ports	Lists the interfaces assigned to this port channel.
(untitled)	Displays the status of the physical interfaces (up or down). <ul style="list-style-type: none"> • In Layer 2 port channels, an * (asterisk) indicates which interface is the primary port of the port channel. The primary port sends out interface PDU. • In Layer 3 port channels, the primary port is not indicated.

Example

```
DellEMC# show interfaces port-channel 1 brief

LAG Mode Status Uptime Ports
1 L2 up 00:00:08 Te 3/1 (Up) *
Te 3/2 (Down)
Te 3/3 (Up)

DellEMC#
```

Related Commands

- `show lacp` — display the LACP matrix.

show port-channel-flow

Display an egress port in a given port-channel flow.

Syntax

```
show port-channel-flow outgoing-port-channel number incoming-interface
interface {source-ip address destination-ip address} | {source-port number
destination-port number} | {source-mac address destination-mac address
{vlan vlanid | ether-type}}
```

Parameters

outgoing-port-channel <i>number</i>	Enter the keywords <code>outgoing-port-channel</code> then the number of the port channel to display flow information. <ul style="list-style-type: none"> • For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 512.
incoming-interface <i>interface</i>	Enter the keywords <code>incoming-interface</code> then the interface type and the interface information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
source-ip <i>address</i>	Enter the keywords <code>source-ip</code> then the IP source address in IP address format.

destination-ip address	Enter the keywords <code>destination-ip</code> then the IP destination address in IP address format.
source-port number	Enter the keywords <code>source-port</code> then the source port number. The range is from 1 to 65536. The default is None .
destination-port number	Enter the keywords <code>destination-port</code> then the destination port number. The range is from 1 to 65536. The default is None .
source-mac address	Enter the keywords <code>source-mac</code> then the MAC source address in the nn:nn:nn:nn:nn:nn format.
destination-mac address	Enter the keywords <code>destination-mac</code> then the MAC destination address in the nn:nn:nn:nn:nn:nn format.
vlan vlan-id	Enter the keywords <code>vlan</code> then the VLAN-id. The range is from 0 to 4094.
ether-type	Enter the keywords <code>ether-type</code> in the XX:XX format.

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Increased the number of port channels to 4096.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.

Usage Information

Because this command calculates based on a Layer 2 hash algorithm, use this command to display flows for switched Layer 2 packets, not for routed packets (use the `show ip flow` command to display routed packets).

The `show port-channel-flow` command returns the egress port identification in a given port-channel if a valid flow is entered. A mismatched flow error occurs if MAC-based hashing is configured for a Layer 2 interface and you are trying to display a Layer 3 flow.

The output displays three entries:

- Egress port for unfragmented packets.
- In the event of fragmented packets, the egress port of the first fragment.
- In the event of fragmented packets, the egress port of the subsequent fragments.

 **NOTE:** In the `show port channel flow` command output, the egress port for an unknown unicast, multicast, or broadcast traffic is not displayed.

The following example shows the `show port-channel-flow outgoing-port-channel number incoming-interface interface source-mac address destination-mac address`

- Load-balance is configured for MAC
- Load-balance is configured for IP 4-tuple/2-tuple
- A non-IP payload is going out of Layer 2 LAG interface that is a member of VLAN with an IP address

Example

```
DellEMC# show port-channel-flow outgoing-port-channel 1 incoming-  
interface te 3/3  
source-mac 00:00:50:00:00:00 destination-mac 00:00:a0:00:00:00
```

Egress Port for port-channel 1, for the given flow, is Te 13/2

HiGig Port Channel Commands

High-Gigabit Ethernet (HiGig) port channels are used to transmit data between internal backplane ports on line-card (leaf) and switch fabric module (SFM - spine) network processing units (NPUs). You can configure an SNMP trap to be generated when traffic distribution in a HiGig port channel is uneven.

NOTE: HiGig port channels on the backplane are also referred to as *HiGig link bundles* in C9000 documentation and CLI.

On the C9000, backplane port channels operate as HiGig link bundles to transmit data traffic between line-card and SFM NPUs. There are 11 line-card and 6 SFM (spine) NPUs. The 6 SFM (spine) NPUs comprise the switch fabric module; the 11 line-card (leaf) NPUs are used across three C9000 line cards.

Line-card NPUs are numbered as follows:

- Line-card slot 0 uses three NPUs numbered 0 to 2.
- Line-card slot 1 uses four NPUs numbered 0 to 3.
- Line-card slot 2 uses four NPUs numbered 0 to 3.

SFM NPUs are numbered 0 to 5.

Line-card and SFM NPUs use HiGig port channels to transmit data.

- An SFM NPU uses 11 HiGig port channels, one port channel to transmit data to each line-card NPU. Each HiGig port channel in an SFM NPU consists of two HiGig links.
- A line-card NPU supports 12 front-end I/O ports and 12 backplane HiGig ports. The 12 backplane links are members of a single HiGig port channel that connects the line-card NPU to each SFM NPU. Two HiGig links in the port channel are used to connect to each SFM NPU.

clear hardware hg-stats

Clear traffic statistics from a HiGig port in a HiGig link bundle/port channel on a line-card or switch fabric module (SFM) NPU.

Syntax `clear hardware {sfm npu-id | linecard slot} hg-stats {port hg-port-number | npuUnit npu-id port hg-port-number}`

Parameters

sfm npu-id	Specify a Z9500 SFM (spine) NPU by entering the keyword <code>sfm</code> and SFM NPU ID. Valid SFM NPU IDs are 0 to 5.
linecard slot	Specify a Z9500 line-card (leaf) NPU by entering the keyword <code>linecard</code> and line-card slot. Valid slot numbers are 0 to 2.
hg-stats {port hg-port-number npuUnit npu-id port hg-port-number}	Enter the keyword <code>hg-stats</code> to clear HiGig port statistics. For an SFM NPU HiGig link bundle, specify only a HiGig port number. Valid SFM <code>hg-port-number</code> values are 1 to 22. For a line-card NPU HiGig link bundle, specify an NPU ID and a HiGig port number. Line-card NPUs range from 0 to 3. Line-card HiGig port numbers range from 50 to 61.

Defaults none

Command Modes EXEC Privilege

Command History

Version	Description
9.2.1.0	Introduced on the Z9500 switch.

Version	Description
9.3.0.0	Added support for the <code>hg-stats</code> option on the Z9000 platform.

Example

```
Dell# clear hardware linecard 0 hg-stats npuUnit 0 port 59

Dell# show hardware linecard 0 hg-stats npuUnit 0 port 59
HiGig Port Statistics:
HiGigabitEthernet 0/0/59,
Input Statistics:
    0 packets, 0 bytes
    0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
    0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
    0 Multicasts, 0 Broadcasts
    0 runts, 0 giants, 0 throttles
    0 CRC, 0 overrun, 0 discarded
Output Statistics:
    0 packets, 0 bytes 0 underruns
    0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
    0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
    0 Multicasts, 0 Broadcasts 0 Unicasts
    0 throttles, 0 discarded, 8247266722598448750 collisions
7236269947061497449 wredDrops
Rate info (interval 15 seconds):
    Input 00.00 Mbits/sec,          0 packets/sec, 0.00% of line-rate
    Output 00.00 Mbits/sec,        0 packets/sec, 0.00% of line-rate
```

Related Commands [show hardware hg-stats](#) — displays traffic statistics from internal ports in a HiGig link bundle.

hg-link-bundle-monitor enable

Enable the monitoring of link utilization and traffic distribution in backplane HiGig link bundles/port channels on a line-card or switch fabric module (SFM) NPU.

Syntax `hg-link-bundle-monitor {sfm npu-id hg-port-channel hg-port-channel-id | slot slot npuUnit npu-id hg-port-channel 0} enable`

To disable HiGig link-bundle monitoring, use the `no` version of this command.

Parameters	
sfm <i>npu-id</i> hg-port-channel <i>hg-port-channel-id</i>	Specify a HiGig port channel on a Z9500 SFM (spine) NPU by entering the keyword <code>sfm</code> and SFM NPU ID, then <code>hg-port-channel</code> and a HiGig port channel ID. SFM NPU IDs are 0 to 5; SFM HiGig port-channel IDs are 0 to 10.
slot <i>slot-id</i> npuUnit <i>npu-id</i> hg-port-channel 0	Specify a HiGig port channel on a Z9500 line-card (leaf) NPU by entering the keyword <code>slot</code> and slot number, then <code>npuUnit</code> and line-card NPU ID, then <code>hg-port-channel 0</code> . Line-card slot numbers are 0 to 2; line-card NPU IDs are 0 to 3. The HiGig port-channel ID is always 0 because there is only one HiGig link bundle on a line-card NPU.
enable	Enable HiGig link-bundle monitoring.

Command Modes CONFIGURATION

Command History	Version	Description
	9.2(1.0)	Introduced on the Z9500 switch.
	9.3(0.0)	Introduced on the Z9000 switch.

Usage Information You can configure HiGig link bundle monitoring so that a system log message or an SNMP trap is generated when traffic distribution in a bundle is uneven. The formula that determines uneven traffic distribution is predefined.

hg-link-bundle-monitor rate-interval

Specify the interval (in seconds) for polling traffic distribution in the member links of a HiGig link bundle.

Syntax	<code>hg-link-bundle-monitor rate-interval <i>seconds</i></code> To restore the default value, use the <code>no</code> version of this command.						
Parameters	<i>seconds</i> Polling interval in seconds. Valid values are 10 to 299.						
Command Modes	CONFIGURATION						
Command History	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.2(1.0)</td><td>Introduced on the Z9500 switch.</td></tr><tr><td>9.3.0.0</td><td>Introduced on the Z9000 switch.</td></tr></tbody></table>	Version	Description	9.2(1.0)	Introduced on the Z9500 switch.	9.3.0.0	Introduced on the Z9000 switch.
Version	Description						
9.2(1.0)	Introduced on the Z9500 switch.						
9.3.0.0	Introduced on the Z9000 switch.						
Defaults	The default polling interval for HiGig link bundles is 15 seconds.						
Usage Information	The rate interval used to poll member links is globally configured and applied to all HiGig link bundles in the system.						

hg-link-bundle-monitor trigger-threshold

Specify the bandwidth-percentage threshold used in HiGig link-bundle monitoring to determine uneven traffic distribution and when an alarm is generated.

Syntax	<code>hg-link-bundle-monitor trigger-threshold <i>percentage</i></code> To restore the default value, use the <code>no hg-link-bundle-monitor trigger-threshold <i>percentage</i></code> command.						
Parameters	<i>percentage</i> Trigger threshold (in percentage of link-bundle bandwidth) at which an SNMP trap is generated. Valid values are 1 to 90.						
Command Modes	CONFIGURATION						
Command History	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.2.1.0</td><td>Introduced on the Z9500 switch.</td></tr><tr><td>9.3.0.0</td><td>Introduced on the Z9000 platform.</td></tr></tbody></table>	Version	Description	9.2.1.0	Introduced on the Z9500 switch.	9.3.0.0	Introduced on the Z9000 platform.
Version	Description						
9.2.1.0	Introduced on the Z9500 switch.						
9.3.0.0	Introduced on the Z9000 platform.						
Defaults	The default trigger-threshold value is 60.						
Usage Information	The trigger-threshold of bandwidth usage, which determines when the calculation of link-bundle utilization is performed, is set at 60 percent of the link-bundle bandwidth. When the total traffic use (mean) is below the trigger-threshold percentage, unevenness in link-bundle traffic distribution is not reported. If traffic unevenness is detected in three consecutive measurements, an alarm is issued. The time interval between measurements is defined by the rate interval for HiGig link polling (default 15 seconds).						

show hardware hg-stats

Display the traffic statistics from internal ports in a HiGig link bundle/port channel on a line-card or switch fabric module (SFM) NPU.

Syntax	<code>show hardware {sfm npu-id linecard slot} hg-stats {port hg-port-number npuUnit npu-id port hg-port-number}</code>	
Parameters	sfm npu-id	Specify a Z9500 SFM (spine) NPU by entering the keyword <code>sfm</code> and SFM NPU ID. Valid SFM NPU IDs are 0 to 5.
	linecard slot	Specify a Z9500 line-card (leaf) NPU by entering the keyword <code>linecard</code> and line-card slot. Valid slot numbers are 0 to 2.
	hg-stats {port hg-port-number npuUnit npu-id port hg-port-number}	Enter the keyword <code>hg-stats</code> to display HiGig port statistics. For an SFM NPU HiGig link bundle, specify only a HiGig port number. Valid SFM <code>hg-port-number</code> values are 1 to 22. For a line-card NPU HiGig link bundle, specify an NPU ID and a HiGig port number. Line-card NPUs range from 0 to 3. Line-card HiGig port numbers range from 50 to 61.
Defaults	none	
Command Modes	<ul style="list-style-type: none">EXECEXEC Privilege	
Command History	Version	Description
	9.2.1.0	Introduced on the Z9500 switch.
	9.3.0.0	Added support for the <code>hg-stats</code> option on the Z9000 platform.

Example (Line-card HiGig Port)

```
Dell# show hardware linecard 0 hg-stats npuUnit 0 port 59
Higig Port Statistics:
HiGigabitEthernet 0/0/59,
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  1566541600 packets, 125323328000 bytes 0 underruns
  0 64-byte pkts, 1566541600 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts 1566541600 Unicasts
  0 throttles, 0 discarded, 0 collisions 0 wredDrops
Rate info (interval 15 seconds):
  Input 00.00 Mbits/sec,          0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec,        0 packets/sec, 0.00% of line-rate
```

Example (SFM HiGig Port)

```
Dell# show hardware sfm 5 hg-stats port 19
Higig Port Statistics:
HiGigabitEthernet 3/5/19,
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  63970532045 packets, 5117642582960 bytes 0 underruns
  0 64-byte pkts, 63970531981 over 64-byte pkts, 0 over 127-byte pkts
```

```

0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
0 Multicasts, 0 Broadcasts 63970532058 Unicasts
0 throttles, 0 discarded, 0 collisions 0 wredDrops
Rate info (interval 15 seconds):
Input 00.00 Mbits/sec,          0 packets/sec, 0.00% of line-rate
Output 37096.40 Mbits/sec,    57963128 packets/sec, 94.88% of line-
rate

```

Example (SFM HiGig Port)

```

Dell# show hardware sfm 5 hg-stats port 19
HiGig Port Statistics:
HiGigabitEthernet 3/5/19,
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  63970532045 packets, 5117642582960 bytes 0 underruns
  0 64-byte pkts, 63970531981 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts 63970532058 Unicasts
  0 throttles, 0 discarded, 0 collisions 0 wredDrops
Rate info (interval 15 seconds):
Input 00.00 Mbits/sec,          0 packets/sec, 0.00% of line-rate
Output 37096.40 Mbits/sec,    57963128 packets/sec, 94.88% of line-
rate

```

Related Commands

[clear hardware hg-stats](#) — clears traffic statistics from internal ports in a HiGig link bundle.

show hg-link-bundle-distribution

Display the operational status and link utilization in a HiGig link bundle.

Syntax

```
show hg-link-bundle-distribution {sfm npunit hg-port-channel hg-port-channel-id | slot slot npunit npunit hg-port-channel 0} enable
```

Parameters

sfm <i>npunit</i> hg-port-channel <i>hg-port-channel-id</i>	Specify a HiGig port channel on a Z9500 SFM (spine) NPU by entering the keyword <code>sfm</code> and SFM NPU ID, then <code>hg-port-channel</code> and a HiGig port channel ID. SFM NPU IDs are 0 to 5; SFM HiGig port-channel IDs are 0 to 10.
slot <i>slot-id</i> npunit <i>npunit</i> hg-port-channel 0	Specify a HiGig port channel on a Z9500 line-card (leaf) NPU by entering the keyword <code>slot</code> and slot number, then <code>npunit</code> and NPU ID, then <code>hg-port-channel 0</code> . Line-card slot numbers are 0 to 2; line-card NPU IDs are 0 to 3. The HiGig port-channel ID is always 0 because there is only one HiGig link bundle used on a line-card NPU to connect to SFM NPUs.

Command Modes EXEC, EXEC Privilege

Command History

Version	Description
9.2.(1.0)	Introduced on the Z9500 switch.
9.3.0.0	Introduced on the Z9000 switch.

Usage Information

The following table illustrates the fields displayed in the output of this command:

Table 7. Output Description for show hg-link-bundle-distribution command

Field	Description
Link-bundle trigger threshold	Percentage value of link-bundle bandwidth that serves as the threshold for marking a link bundle as being overutilized, triggering link-bundle monitoring, and generating an SNMP alarm.
Slot	Slot number of a Z9500 line card.
npuUnit	Network processing unit (NPU) ID number of a HiGig link bundle/port-channel.
hg-port-channel	Port-channel number of a HiGig link bundle.
Utilization (In Percent)	Percentage of total bandwidth usage by the traffic transmitted on the HiGig link bundle.
Alarm State	Indicates whether an alarm has been generated if uneven traffic distribution occurs in a HiGig link bundle. Possible values are Active and Inactive.
Interface	Member interface of the specified HiGig link bundle/port channel in the format: <i>slot-id/npu-id:hghigig-port-number</i>
Utilization (In Percent)	Percentage of total link-bundle bandwidth used on each member link.

Example

```
Dell# show hg-link-bundle-distribution slot 0 npuUnit 2 hg-port-channel 0

hg-link-bundle trigger threshold - 60
Slot 0 npuUnit 2 hg-port-channel-0 Utilization [In Percent] - 0 Alarm
State - Inactive
Interface Utilization [In Percent]
0/2:hg0          10
0/2:hg1          10
0/2:hg2          10
0/2:hg3          10
```

snmp-server enable traps hg-lbm

Enable the generation of SNMP traps and notifications when HiGig link-bundle monitoring is enabled.

Syntax `snmp-server enable traps hg-lbm`

Parameters **hg-lbm** Enter the keyword `hg-lbm` to enable traps for HiGig link-bundle monitoring.

Command Modes CONFIGURATION mode

Command History	Version	Description
	9.2.1.0	Introduced on the Z9500 switch.
	9.3.0.0	Introduced on the Z9000 platform.

UDP Broadcast Commands

The user datagram protocol (UDP) broadcast feature is a software-based method to forward low throughput (not to exceed 200 pps) IP/UDP broadcast traffic arriving on a physical or VLAN interface.

Important Points to Remember

- This feature is available only on the S4810, S4820T, S3048-ON, S4048-ON, Z9000 platforms.
- Routing information protocol (RIP) is not supported with the UDP Broadcast feature.
- If you configure this feature on an interface using the `ip udp-helper udp-port` command, the `ip directed-broadcast` command becomes ineffective on that interface.
- The existing `show interface` command has been modified to display the configured broadcast address.

debug ip udp-helper

Enable UDP debug and display the debug information on a console.

Syntax `debug ip udp-helper`
To disable debug information, use the `no debug ip udp-helper` command.

Defaults Debug disabled.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
Pre-version 8.3.7.0	Introduced on the E-Series.

Example

```
DellEMC# debug ip udp-helper
UDP helper debugging is on

01:20:22: Pkt rcvd on Gi 3/0 with IP DA (0xffffffff) will be sent on Gi
5/1 Gi 5/2
Vlan 3

01:44:54: Pkt rcvd on Gi 4/0 is handed over for DHCP processing.
```

Related Commands

- [ip udp-helper udp-port](#) — enable the UDP broadcast feature on an interface.
- [show ip udp-helper](#) — display the configured UDP helper(s) on all interfaces.

ip udp-helper udp-port

Enable the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.

Syntax	<code>ip udp-helper udp-port [udp-port-list]</code> To disable the UDP broadcast on a port, use the <code>no ip udp-helper udp-port [udp-port-list]</code> command.
Parameters	udp-port-list (OPTIONAL) Enter up to 16 comma-separated UDP port numbers.  NOTE: If you do not use this option, all UDP ports are considered by default.
Defaults	None
Command Modes	INTERFACE (config-if)
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
Pre-version 8.3.7.0	Introduced on the E-Series.

Usage Information	<p>If you configure the <code>ip helper-address</code> command and <code>ip udp-helper udp-port</code> command, the behavior is that the UDP broadcast traffic with port numbers 67/68 is unicast relayed to the DHCP server per the <code>ip helper-address</code> configuration. This occurs regardless if the <code>ip udp-helper udp-port</code> command contains port numbers 67/68 or not.</p> <p>If you only configure the <code>ip udp-helper udp-port</code> command, all the UDP broadcast traffic is flooded, including ports 67/68 traffic if those ports are part of the <code>udp-port-list</code>.</p>
Related Commands	<ul style="list-style-type: none">• ip helper-address — configure the destination broadcast or host address for the DHCP server.• debug ip udp-helper — enable debug and displays the debug information on a console.• show ip udp-helper — display the configured UDP helpers on all interfaces.

show ip udp-helper

Display the configured UDP helpers on all interfaces.

Syntax	<code>show ip udp-helper</code>
Defaults	None
Command Modes	EXEC
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .
Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
Pre-version 8.3.7.0	Introduced on the E-Series.

Example

```
DelleMC# show ip udp-helper
-----
Port      UDP  port  list
-----
Te 10/2   656, 658
Te 10/3   All
```

Related Commands

- [debug ip udp-helper](#) — enable debug and displays the debug information on a console.
- [ip udp-helper udp-port](#) — enable the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.

Internet Protocol Security (IPSec)

Internet protocol security (IPSec) is an end-to-end security scheme for securing IP communications by authenticating and encrypting all packets in a session. Use IPSec between hosts, gateways, or hosts and gateways.

IPSec uses a series of protocol functions to achieve information security:

- **Authentication Headers (AH)** — Connectionless integrity and origin authentication for IP packets.
- **Encapsulating Security Payloads (ESP)** — Confidentiality, authentication, and data integrity for IP packets.
- **Security Associations (SA)** — Algorithm-provided parameters required for AH and ESP protocols.

IPSec capability is available on control (protocol) and management traffic; end-node support is required.

IPSec supports two operational modes: Transport and Tunnel.

- Transport is the default mode for IPSec and encrypts only the payload of the packet. Routing information is unchanged.
- Tunnel mode is used to encrypt the entire packet, including the routing information in the IP header. Tunnel mode is typically used in creating virtual private networks (VPNs).

Transport mode provides IP packet payload protection using ESP. You can use ESP alone or in combination with AH to provide additional authentication. AH protects data from modification but does not provide confidentiality.

SA is the configuration information that specifies the type of security provided to the IPSec flow. The SA is a set of algorithms and keys used to authenticate and encrypt the traffic flow. The AH and ESP use SA to provide traffic protection for the IPSec flow.

NOTE:

The Dell EMC Networking OS supports IPSec only for FTP and telnet protocols (ports 20, 21, and 23). The system rejects if you configure IPSec for other protocols.

Topics:

- [crypto ipsec transform-set](#)
- [crypto ipsec policy](#)
- [management crypto-policy](#)
- [match](#)
- [session-key](#)
- [show crypto ipsec transform-set](#)
- [show crypto ipsec policy](#)
- [transform-set](#)

crypto ipsec transform-set

Create a transform set, or combination of security algorithms and protocols, of cryptos.

Syntax

```
crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-
authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}
```

To delete a transform set, use the `no crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}` command.

Parameters

<i>name</i>	Enter the name for the transform set.
ah-authentication	Enter the keywords <code>ah-authentication</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.

- md5 — Use Message Digest 5 (MD5) authentication.
- sha1 — Use Secure Hash Algorithm 1 (SHA-1) authentication.
- null — Causes an encryption policy configured for the area to not be inherited on the interface.

esp-authentication

Enter the keywords `esp-authentication` then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.

- md5 — Use Message Digest 5 (MD5) authentication.
- sha1 — Use Secure Hash Algorithm 1 (SHA-1) authentication.
- null — Causes an encryption policy configured for the area to not be inherited on the interface.

esp-encryption

Enter the keywords `esp-encryption` then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.

- 3des — Use 3DES encryption.
- cbc — Use CDC encryption.
- des — Use DES encryption.
- null — Causes an encryption policy configured for the area to not be inherited on the interface.

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.
9.2(1.0)	Introduced on the Z9500.

- Usage Information**
- Both sides of the link must specify the same transform set.
 - You can create up to 64 transform sets.

Example

```
Dell(conf)# do show crypto ipsec transform-set

Transform-Set Name      : ts1
Transform-Set refCnt    : 0
AH Transform            : md5
ESP Auth Transform     :
ESP Encry Transform    :

Dell(conf)#
```

crypto ipsec policy

Create a crypto policy used by ipsec.

Syntax `crypto ipsec policy name seq-num ipsec-manual`

To delete a crypto policy entry, use the `no crypto ipsec policy name seq-num ipsec-manual` command.

Parameters	<p><i>name</i> Enter the name for the crypto policy set.</p> <p><i>seq-num</i> Enter the sequence number assigned to the crypto policy entry.</p>										
Defaults	None										
Command Modes	CONFIGURATION										
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .										
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.8(0.0P5)</td> <td>Introduced on the S4048-ON.</td> </tr> <tr> <td>9.8(0.0P2)</td> <td>Introduced on the S3048-ON.</td> </tr> <tr> <td>9.2(0.2)</td> <td>Introduced on the Z9000, S4810, and S4820T.</td> </tr> <tr> <td>9.2(1.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.8(0.0P5)	Introduced on the S4048-ON.	9.8(0.0P2)	Introduced on the S3048-ON.	9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.	9.2(1.0)	Introduced on the Z9500.

9.2(1.0)	Introduced on the Z9500.										

match

Apply an match filter to the crypto policy.

Syntax `match seq-num tcp [sourceip address | ipv6 address {mask} {source-port number}] [destination ip address | ipv6 address {mask} {destination-port number}]`

To remove the match filter for the crypto map, use the `no match seq-num tcp [source ip address | ipv6 address {mask} {source-port number}] [destination ip address | ipv6 address {mask} {destination-port number}]` command.

Parameters

- seq-num** Enter the match command sequence number.
- sourceip-address / ipv6 address** Enter the keyword `source` then the IPv4 or IPv6 address for the source.
- mask** Enter the mask prefix length in /nn format.
- source-port number** Enter the source port number.
- destination-port number** Enter the destination port number.

Defaults None

Command Modes CONFIG-CRYPTO-POLICY

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.
9.2(1.0)	Introduced on the Z9500.

Usage Information

- IPv4 addresses support only -/32 mask types.
- IPv6 addresses support only -/128 mask types.
- Configure match for bi-directional traffic for optimal routing.
- Only TCP is supported.

Example

```
match 0 tcp a::1 /128 0 a::2 /128 23
match 1 tcp a::1 /128 23 a::2 /128 0
match 2 tcp a::1 /128 0 a::2 /128 21
match 3 tcp a::1 /128 21 a::2 /128 0
match 4 tcp 1.1.1.1 /32 0 1.1.1.2 /32 23
match 5 tcp 1.1.1.1 /32 23 1.1.1.2 /32 0
match 6 tcp 1.1.1.1 /32 0 1.1.1.2 /32 21
match 7 tcp 1.1.1.1 /32 21 1.1.1.2 /32 0
```

session-key

Specify the session keys used in the crypto policy entry.

Syntax	<code>session-key {inbound outbound} {ah spi hex-key-string esp spi encrypt hex-key-string auth hex-key-string}</code> To delete the session key information from the crypto policy, use the <code>no session-key {inbound outbound} {ah esp}</code> command.																		
Parameters	<table><tr><td>name</td><td>Enter the name for the transform set.</td></tr><tr><td>inbound</td><td>Specify the inbound session key for IPSec.</td></tr><tr><td>outbound</td><td>Specify the outbound session key for IPSec.</td></tr><tr><td>ah</td><td>Use the AH protocol when you select the AH transform set in the crypto policy.</td></tr><tr><td>esp</td><td>Use the ESP protocol when you select the ESP transform set in the crypto policy.</td></tr><tr><td>spi</td><td>Enter the security parameter index number.</td></tr><tr><td>hex-key-string</td><td>Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key.</td></tr><tr><td>encrypt</td><td>Indicates the ESP encryption transform set key string.</td></tr><tr><td>auth</td><td>Indicates the ESP authentication transform set key string.</td></tr></table>	name	Enter the name for the transform set.	inbound	Specify the inbound session key for IPSec.	outbound	Specify the outbound session key for IPSec.	ah	Use the AH protocol when you select the AH transform set in the crypto policy.	esp	Use the ESP protocol when you select the ESP transform set in the crypto policy.	spi	Enter the security parameter index number.	hex-key-string	Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key.	encrypt	Indicates the ESP encryption transform set key string.	auth	Indicates the ESP authentication transform set key string.
name	Enter the name for the transform set.																		
inbound	Specify the inbound session key for IPSec.																		
outbound	Specify the outbound session key for IPSec.																		
ah	Use the AH protocol when you select the AH transform set in the crypto policy.																		
esp	Use the ESP protocol when you select the ESP transform set in the crypto policy.																		
spi	Enter the security parameter index number.																		
hex-key-string	Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key.																		
encrypt	Indicates the ESP encryption transform set key string.																		
auth	Indicates the ESP authentication transform set key string.																		
Defaults	None																		
Command Modes	CONF-CRYPTO-POLICY																		
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .																		
	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.8(0.0P5)</td><td>Introduced on the S4048-ON.</td></tr><tr><td>9.8(0.0P2)</td><td>Introduced on the S3048-ON.</td></tr><tr><td>9.2(0.2)</td><td>Introduced on the Z9000, S4810, and S4820T.</td></tr><tr><td>9.2(1.0)</td><td>Introduced on the Z9500.</td></tr></tbody></table>	Version	Description	9.8(0.0P5)	Introduced on the S4048-ON.	9.8(0.0P2)	Introduced on the S3048-ON.	9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.	9.2(1.0)	Introduced on the Z9500.

Usage Information	<ul style="list-style-type: none">• This command is only available in the ipsec-manual model.• The key information entry is associated with the global method for enabling clear text or encrypted display in the running config.																		

show crypto ipsec transform-set

Display the transform set configuration.

Syntax	<code>show crypto ipsec transform-set name</code>		
Parameters	<table><tr><td>name</td><td>Enter the name of the transform set.</td></tr></table>	name	Enter the name of the transform set.
name	Enter the name of the transform set.		
Command Modes	EXEC		
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .		

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.
9.2(1.0)	Introduced on the Z9500.

Example

```
DellEMC# show crypto ipsec transform-set

Transform-Set Name      : dallas
Transform-Set refCnt   : 0
AH Transform           :
ESP Auth Transform     :
ESP Encry Transform   : 3des
DellEMC#
```

show crypto ipsec policy

Display the crypto policy configuration.

Syntax `show crypto ipsec policy`

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.
9.2(1.0)	Introduced on the Z9500.

Example

```
DellEMC(conf-crypto-policy)# do show crypto ipsec policy

Policy name           : poll
Policy refcount      : 0
Sequence Num         : 1

Inbound AH Key       : [0]::
Inbound ESP Auth Key : [0]::
Inbound ESP Encry Key : [0]::
Outbound AH SPI      : 0
Outbound ESP Auth SPI : 0
Outbound ESP Encry SPI : 0
Outbound AH Key      : [0]::
Outbound ESP Auth Key : [0]::
Outbound ESP Encry Key : [0]::

Match sequence Num   : 2
Protocol type        : tcp
IP or IPv6           : IP
```

```

Source address      : 1.1.1.1
Source mask        : /32
Source port        : 0
Destination address : 1.1.1.2
Destination mask    : /32
Destination port    : 23
source-interface name :
source-interface num :

DellEMC(conf-crypto-policy) #

```

transform-set

Specify the transform set the crypto policy uses.

Syntax	<code>transform-set <i>transform-set-name</i></code> To delete a transform set from the crypto policy, use the <code>no transform-set <i>transform-set-name</i></code> command.
Parameters	<i>transform-set-name</i> Enter the name for the crypto policy transform set.
Defaults	None
Command Modes	CONFIG-CRYPTO-POLICY
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(0.2)	Introduced on the Z9000, S4810, and S4820T.
9.2(1.0)	Introduced on the Z9500.

IPv4 Routing

The basic IPv4 commands are supported by Dell EMC Networking OS on the platform.

Topics:

- arp
- arp backoff-time
- arp learn-enable
- arp retries
- arp timeout
- clear arp-cache
- clear host
- clear ip fib linecard
- clear ip route
- clear ip traffic
- clear tcp statistics
- debug arp
- debug ip dhcp
- debug ip icmp
- debug ip packet
- ip address
- ip directed-broadcast
- ip domain-list
- ip domain-lookup
- ip domain-name
- ip helper-address
- ip helper-address hop-count disable
- ip host
- ip max-frag-count
- ip mtu
- ip name-server
- ip proxy-arp
- ip route
- ip source-route
- ip unreachable
- ipv4 unicast-host-route
- load-balance
- management route
- show arp
- show arp retries
- show hosts
- show ip cam linecard
- show ip fib linecard
- show ip flow
- show ip interface
- show ip management-route
- show ip protocols
- show ip route
- show ip route list
- show ip route summary
- show ip traffic

- [show tcp statistics](#)

arp

To associate an IP address with a MAC address in the switch, use address resolution protocol (ARP).

Syntax `arp [vrf vrf-name] ip-address mac-address interface`

To remove an ARP address, use the `no arp ip-address` command.

Parameters	vrf vrf-name	Enter a VRF name to configure an ARP entry for that VRF. Use the VRF option after the keyword <code>arp</code> to configure a static arp on that particular VRF.
	ip-address	Enter an IP address in dotted decimal format.
	mac-address	Enter a MAC address in nnnn.nnnn.nnnn format.
	interface	(OPTIONAL) Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information. • For a port channel interface, enter the keywords <code>port-channel</code> then a number.

Defaults Not configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
pre-6.2.1.0	Introduced on the E-Series.

Usage Information

You cannot use Class D or Class E IP addresses or zero IP address (0.0.0.0) when creating a static ARP. Zero MAC addresses (00:00:00:00:00:00) are also invalid.

You can use the `vrf` attribute of this command to create a static ARP entry on either a default or a non-default VRF. You cannot use this parameter to create any static ARPs corresponding to management VRFs. When a VRF is deleted using the `no ip vrf` command, all the static ARP configurations that belong to that VRF are removed automatically.

Although static ARP entries take precedence over dynamically-learned ARP entries, a static ARP entry that points to a wrong port is not included in the FIB or ARP entries.

Related Commands

- [clear arp-cache](#) — clear dynamic ARP entries from the ARP table.
- [show arp](#) — display the ARP table.

arp backoff-time

Set the exponential timer for resending unresolved ARPs.

Syntax `arp backoff-time seconds`

Parameters **seconds** Enter the number of seconds an ARP entry is black-holed. The range is from 1 to 3600. The default is **30**.

Defaults **30**

Command Mode CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

Usage Information

This timer is an exponential backoff timer. Over the specified period, the time between ARP requests increases. This behavior reduces the potential for the system to slow down while waiting for a multitude of ARP responses.

Related Commands

- [show arp retries](#) — display the configured number of ARP retries.

arp learn-enable

Enable ARP learning using gratuitous ARP.

Syntax `arp learn-enable`

Defaults Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced.

Usage Information In Dell EMC Networking OS versions prior to 8.3.1.0, if a gratuitous ARP is received some time after an ARP request is sent, only RP2 installs the ARP information. For example:

1. At time $t=0$, Dell EMC Networking OS sends an ARP request for IP *A.B.C.D*.
2. At time $t=1$, Dell EMC Networking OS receives an ARP request for IP *A.B.C.D*.
3. At time $t=2$, Dell EMC Networking OS installs an ARP entry for *A.B.C.D* only on RP2.

Beginning with Dell EMC Networking OS version 8.3.1.0, when a gratuitous ARP is received, Dell EMC Networking OS installs an ARP entry on all three CPUs.

arp retries

Set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

Syntax `arp retries number`

Parameters *number* Enter the number of retries. The range is from 1 to 20. The default is **5**.

Defaults	5
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced.

Usage Information	Retries are 20 seconds apart.
Related Commands	<ul style="list-style-type: none"> • show arp retries — display the configured number of ARP retries.

arp timeout

Set the time interval for an ARP entry to remain in the ARP cache.

Syntax	<code>arp timeout <i>minutes</i></code>	
Parameters	<i>minutes</i>	Enter the number of minutes. The range is from 0 to 35790. The default is 240 minutes .
Defaults	240 minutes (4 hours)	
Command Modes	INTERFACE	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

clear arp-cache

Clear the dynamic ARP entries from a specific interface or optionally delete (`no-refresh`) ARP entries from the content addressable memory (CAM).

Z9500

Syntax	<code>clear arp-cache [vrf vrf-name interface ip ip-address] [no-refresh]</code>
Parameters	
vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to clear the ARP cache corresponding to that VRF.
interface	(OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information. • For a port channel interface, enter the keywords <code>port-channel</code> then a number. • For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.
ip ip-address	(OPTIONAL) Enter the keyword <code>ip</code> then the IP address of the ARP entry you wish to clear.
no-refresh	(OPTIONAL) Enter the keywords <code>no-refresh</code> to delete the ARP entry from CAM. Or use this option with <code>interface</code> or <code>ip ip-address</code> to specify which dynamic ARP entries you want to delete.
	NOTE: Transit traffic may not be forwarded during the period when deleted ARP entries are resolved again and re-installed in CAM. Use this option with extreme caution.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

clear host

Remove one or all dynamically learned host table entries.

Syntax `clear host name`

Parameters *name* Enter the name of the host to delete. Enter * to delete all host table entries.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

clear ip fib linecard

Clear all FIB entries on a Z9500 line card (use this command with caution; refer to *Usage Information*.)

Z9500

Syntax	<code>clear ip fib linecard <i>slot-id</i></code>
Parameters	linecard <i>slot-id</i> Enter the slot ID of a Z9500 line card. Valid slot IDs are from 0 to 2.
Command Modes	EXEC
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.
	Version 9.2(1.0) Introduced on the Z9500.
	Version 9.0.0.0 Introduced on the Z9000.
	Version 8.3.7.0 Introduced on the S4810.
	Version 8.3.19.0 Introduced on the S4820T.
Usage Information	To clear Layer 3 CAM inconsistencies, use this command.  CAUTION: Executing this command causes traffic disruption.
Related Commands	show ip fib linecard — shows FIB entries on a specified stack-unit.

clear ip route

Clear one or all routes in the routing table.

Syntax	<code>clear ip route [<i>vrf vrf-name</i>] [* <i>ip-address mask</i>]</code>
Parameters	vrf <i>vrf-name</i> (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to clear the routes corresponding to that VRF.

- * Enter an asterisk (*) to clear all learned IP routes.
- ip-address mask*** Enter a specific IP address and mask in dotted decimal format to clear that IP address from the routing table.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

Usage Information Use the `vrf vrf-name` attribute of this command to clear routes corresponding to either a specific VRF or the default VRF.

You cannot use this attribute to clear routes corresponding to a management VRF.

- Related Commands**
- [ip route](#) — assign an IP route to the switch.
 - [show ip route](#) — view the routing table.
 - [show ip route summary](#) — view a summary of the routing table.

clear ip traffic

Clear IP traffic statistics on Z9500 CPUs.

Z9500

Syntax `clear ip traffic {cp | rp}`

Parameters **cp** Clear ip traffic statistics on the Control Processor CPU.

rp Clear ip traffic statistics on the Route Processor CPU.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version 9.2(1.0)	Introduced on the Z9500.
Version 8.3.19.0	Introduced on the S4820T.
Version 8.3.11.1	Introduced on the Z9000.
Version 8.3.7.0	Introduced on the S4810.
Version 8.1.1.0	Introduced on the E-Series ExaScale.
Version 7.6.1.0	Introduced on the S-Series.
Version 7.5.1.0	Introduced on the C-Series.
pre-Version 6.2.1.1	Introduced on the E-Series.

Related Commands [show ip traffic](#) — displays IP traffic statistics.

clear tcp statistics

Clear TCP counters.

Syntax `clear tcp statistics [all | cp | rp]`

Parameters

all	Enter the keyword <code>all</code> to clear all TCP statistics maintained on all switch processors.
cp	(OPTIONAL) Enter the <code>cp</code> to clear only statistics from the Control Processor.
rp	(OPTIONAL) Enter the keyword <code>rp</code> to clear only the statistics from Route Processor.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

debug arp

View information on ARP transactions.

Z9500

Syntax `debug arp [interface] [count value]`
 To stop debugging ARP transactions, use the `no debug arp` command.

Parameters

interface (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

count value (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534.

Defaults None

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series(the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Added the <code>count</code> option.

Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

debug ip dhcp

Enable debug information for dynamic host configuration protocol (DHCP) relay transactions and display the information on the console.

Syntax

`debug ip dhcp`

To disable debug, use the `no debug ip dhcp` command.

Defaults

Debug disabled

Related Commands

- [ip helper-address](#) – specify the destination broadcast or host address for the DHCP server request.
- [ip helper-address hop-count disable](#) – disable the hop-count increment for the DHCP relay agent.

debug ip icmp

View information on the internal control message protocol (ICMP).

Z9500

Syntax

```
debug ip icmp [interface] [count value]
```

To disable debugging, use the `no debug ip icmp` command.

Parameters

- interface*** (OPTIONAL) Enter the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

count value (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is **Infinity**.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Added the <code>count</code> option.

Example

```
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
```

Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

debug ip packet

View a log of IP packets sent and received.

Z9500

Syntax `debug ip packet [access-group name] [count value] [interface]`
To disable debugging, use the `no debug ip packet [access-group name] [count value] [interface]` command.

Parameters

access-group name	Enter the keyword <code>access-group</code> then the access list name (maximum 16 characters) to limit the debug output based on the defined rules in the ACL.
count value	(OPTIONAL) Enter the keyword <code>count</code> then the count value. The range is from 1 to 65534. The default is <code>Infinity</code> .
interface	(OPTIONAL) Enter the following keywords and the interface information: <ul style="list-style-type: none">•• For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Added the <code>access-group</code> option.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
6.3.1.0	Added the <code>count</code> option.

Usage Information

The following describes the `debug ip packet` command in the following example.

Field	Description
s=	Lists the source address of the packet and the name of the interface (in parentheses) that received the packet.
d=	Lists the destination address of the packet and the name of the interface (in parentheses) through which the packet is being sent out on the network.
len	Displays the packet's length.
sending, rcvd, fragment, sending broad/multicast proto, unroutable	The last part of each line lists the status of the packet.
TCP src=	Displays the source and destination ports, the sequence number, the acknowledgement number, and the window size of the packets in that TCP packets.
UDP src=	Displays the source and destination ports for the UDP packets.
ICMP type=	Displays the ICMP type and code.
IP Fragment	States that it is a fragment and displays the unique number identifying the fragment (Ident) and the offset (in 8-byte units) of this fragment (fragment offset) from the beginning of the original datagram.

Example

```
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 0/0), len 54, sending
    TCP src=23, dst=40869, seq=2112994894, ack=606901739, win=8191 ACK
    PUSH
IP: s=10.1.2.206 (Ma 0/0), d=10.1.2.62, len 40, rcvd
    TCP src=0, dst=0, seq=0, ack=0, win=0
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 0/0), len 226, sending
    TCP src=23, dst=40869, seq=2112994896, ack=606901739, win=8192 ACK
    PUSH
IP: s=10.1.2.216 (Ma 0/0), d=10.1.2.255, len 78, rcvd
    UDP src=0, dst=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 0/0), len 1500, sending fragment
    IP Fragment, Ident = 4741, fragment offset = 0
    ICMP type=0, code=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 0/0), len 1500, sending fragment
    IP Fragment, Ident = 4741, fragment offset = 1480
IP: s=40.40.40.40 (local), d=224.0.0.5 (Gi 4/11), len 64, sending broad/
multicast
proto=89
IP: s=40.40.40.40 (local), d=224.0.0.6 (Gi 4/11), len 28, sending broad/
multicast
proto=2
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
    ICMP type=8, code=0
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
    ICMP type=8, code=0
```

Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

The `access-group` option supports only the equal to (`eq`) operator in TCP ACL rules. Port operators not equal to (`neq`), greater than (`gt`), less than (`lt`), or range are not supported in `access-group` option (refer to the following example). ARP packets (`arp`) and Ether-type (`ether-type`) are also not supported in the `access-group` option. The entire rule is skipped to compose the filter.

The `access-group` option pertains to:

- IP protocol number: from 0 to 255

- Internet control message protocol (`icmp`) but not the ICMP message type (from 0 to 255)
- Any internet protocol (`ip`)
- Transmission Control Protocol (`tcp`) but not on the `rst`, `syn`, or `urg` bits
- User Datagram Protocol (`udp`)

In the case of ambiguous access control list rules, the `debug ip packet access-control` command is disabled. A message appears identifying the error (refer to the Example below).

Example (Error Messages)

```
DelleMC# debug ip packet access-group test
%Error: port operator GT not supported in access-list debug
%Error: port operator LT not supported in access-list debug
%Error: port operator RANGE not supported in access-list debug
%Error: port operator NEQ not supported in access-list debug

DelleMC#00:10:45: %RPM0-P:CP
%IPMGR-3-DEBUG_IP_PACKET_ACL_AMBIGUOUS_EXP: Ambiguous rules not
supported in access-list debug, access-list debugging is turned off
DelleMC#
```

ip address

Assign a primary and secondary IP address to the interface.

Syntax

```
ip address ip-address mask [secondary]
```

To delete an IP address from an interface, use the `no ip address [ip-address]` command.

Parameters

<i>ip-address</i>	Enter an IP address in dotted decimal format.
<i>mask</i>	Enter the mask of the IP address in slash prefix format (for example, /24).
<i>secondary</i>	(OPTIONAL) Enter the keyword <code>secondary</code> to designate the IP address as the secondary address.

Defaults

Not configured.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information

You must be in INTERFACE mode before you add an IP address to an interface. Assign an IP address to an interface prior to entering ROUTER OSPF mode.

ip directed-broadcast

Enables the interface to receive directed broadcast packets.

Syntax

`ip directed-broadcast`

To disable the interface from receiving directed broadcast packets, use the `no ip directed-broadcast` command.

Defaults

Disabled (that is, the interface does not receive directed broadcast packets)

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information

To configure a list of possible domain names, configure the `ip domain-list` command up to six times.

If you configure both the `ip domain-name` and `ip domain-list` commands, the software tries to resolve the name using the `ip domain-name` command. If the name is not resolved, the software goes through the list of names configured with the `ip domain-list` command to find a match.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command. To view a DNS-related configuration, use the `show running-config resolve` command.

Related Commands

- [ip domain-name](#) — specify a DNS server.

ip domain-lookup

To address resolution (that is, DNS), enable dynamic host-name.

Syntax `ip domain-lookup`

To disable DNS lookup, use the `no ip domain-lookup` command.

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information To fully enable DNS, also specify one or more domain name servers with the `ip name-server` command.

Dell EMC Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out all other interfaces, including the Management port.

To view current bindings, use the `show hosts` command.

Related Commands

- [ip name-server](#) — specify a DNS server.
- [show hosts](#) — view the current bindings.

ip domain-name

Configure one domain name for the switch.

Syntax `ip domain-name name`

To remove the domain name, use the `no ip domain-name` command.

Parameters

name Enter one domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information

You can only configure one domain name with the `ip domain-name` command. To configure more than one domain name, configure the `ip domain-list` command up to six times.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command.

Related Commands

- [ip domain-list](#) — configure additional names.

ip helper-address

Specify the address of a DHCP server so that DHCP broadcast messages can be forwarded when the DHCP server is not on the same subnet as the client.

Syntax

```
ip helper-address ip-address
```

To remove a DHCP server address, use the `no ip helper-address` command.

Parameters	<i>ip-address</i>	Enter an IP address in dotted decimal format (A.B.C.D).
Defaults	Not configured.	
Command Modes	INTERFACE	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Added support for IPv6.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.2.1.1	Introduced on the E-Series.

Usage Information You can add multiple DHCP servers by entering the `ip helper-address` command multiple times. If multiple servers are defined, an incoming request is sent simultaneously to all configured servers and the reply is forwarded to the DHCP client.

Dell EMC Networking OS uses standard DHCP ports, that is UDP ports 67 (server) and 68 (client) for DHCP relay services. It listens on port 67 and if it receives a broadcast, the software converts it to unicast, and forwards to it to the DHCP-server with source port=68 and destination port=67.

The server replies with source port=67, destination port=67 and Dell EMC Networking OS forwards to the client with source port=67, destination port=68.

ip helper-address hop-count disable

Disable the hop-count increment for the DHCP relay agent.

Syntax	<code>ip helper-address hop-count disable</code>
	To re-enable the hop-count increment, use the <code>no ip helper-address hop-count disable</code> command.
Defaults	Enabled; the hops field in the DHCP message header is incremented by default.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.3.1.0	Introduced for the E-Series.

Usage Information This command disables the incrementing of the hops field when boot requests are relayed to a DHCP server through Dell EMC Networking OS. If the incoming boot request already has a non-zero hops field, the message is relayed with the same value for hops. However, the message is discarded if the hops field exceeds 16, to comply with the relay agent behavior specified in RFC 1542.

Related Commands

- [ip helper-address](#) — specify the destination broadcast or host address for DHCP server requests.
- [show running-config](#) — display the current configuration and changes from the default values.

ip host

Assign a name and an IP address to the host-to-IP address mapping table.

Syntax `ip host name ip-address`

To remove an IP host, use the `no ip host name [ip-address]` command.

Parameters

<i>name</i>	Enter a text string to associate with one IP address.
<i>ip address</i>	Enter an IP address, in dotted decimal format, to be mapped to the name.

Defaults Not configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced for the E-Series.

ip max-frag-count

Set the maximum number of fragments allowed in one packet for packet re-assembly.

Syntax	<code>ip max-frag-count <i>count</i></code>
	To place no limit on the number of fragments allowed, use the <code>no ip max-frag-count</code> command.
Parameters	<i>count</i> Enter a number for the number of fragments allowed for re-assembly. The range is from 2 to 256.
Defaults	No limit is set on number of fragments allowed.
Command Modes	CONFIGURATION

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced for the E-Series.

Usage Information

To avoid denial of service (DOS) attacks, keep the number of fragments allowed for re-assembly low.

ip mtu

Set the IP MTU (frame size) of the packet the RPM transmits for the line card interface. If the packet must be fragmented, Dell EMC Networking OS sets the size of the fragmented packets to the size specified in this command.

Syntax

`ip mtu value`

To return to the default IP MTU value, use the `no ip mtu` command.

Parameters

value

Enter the maximum MTU size if the IP packet is fragmented. The range is from 576 to 9234. The default is **1500 bytes**.

Defaults

1500 bytes

Command Modes

INTERFACE (Gigabit Ethernet and 10-Gigabit Ethernet interfaces)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
6.1.1.0	Introduced on the E-Series.

Usage Information

When you enter the `no mtu` command, Dell EMC Networking OS reduces the `ip mtu` value to 1536 bytes. To return the IP MTU value to the default, use the `no ip mtu` command.

Starting with Dell EMC Networking OS Release 9.2(0.2), the `ip mtu` command is not supported to configure the IP MTU value that is used when the IP packet is fragmented. Instead of having to configure the IP MTU value, this value is automatically computed by the software when you configure an interface. As a result, the `ip mtu` command is not available for configuration. However, you can continue to specify the link MTU value by using the `mtu` command.

Compensate for Layer 2 header when configuring link MTU on an Ethernet interface or Dell EMC Networking OS may not fragment packets. If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (the `ip mtu` command) must be enough bytes to include for the Layer 2 header.

Link MTU and IP MTU considerations for Port Channels and VLANs are as follows

Port Channels:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

VLANs:

- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following describes the difference between Link MTU and IP MTU.

Layer 2 Overhead	Difference between Link MTU and IP MTU
Ethernet (untagged)	18 bytes
VLAN Tag	Tag 22 bytes
Untagged Packet with VLAN-Stack Header	22 bytes
Tagged Packet with VLAN-Stack Header	26 bytes

Related Commands

- [mtu](#) — set the link MTU for an Ethernet interface.

ip name-server

Enter up to six IPv4 addresses of name servers. The order you enter the addresses determines the order of their use.

Syntax `ip name-server ipv4-address [ipv4-address2...ipv4-address6]`

To remove a name server, use the `no ip name-server ip-address` command.

Parameters

- ipv4-address*** Enter the IPv4 address, in dotted decimal format, of the name server to be used.
- ipv4-address2...ipv4-address6*** (OPTIONAL) Enter up five more IPv4 addresses, in dotted decimal format, of name servers to be used. Separate the addresses with a space.

Defaults No name servers are configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

Dell EMC Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out on all other interfaces, including the Management port.

You can separately configure both IPv4 and IPv6 domain name servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the ip name-server command is configured.

ip proxy-arp

Enable proxy ARP on an interface.

Syntax

```
ip proxy-arp
```

To disable proxy ARP, use the `no ip proxy-arp` command.

Defaults

Enabled.

Command Modes

INTERFACE

pre-6.1.1.0	Introduced on the E-Series.

Related Commands

- [show ip interface](#) — display the interface routing status and configuration.

ip route

Assign a static route to the switch.

Syntax

```
ip route [vrf vrf-name] ip-address mask {ip-address | interface [ip-address]} [distance] [permanent] [tag tag-value] [vrf vrf-name] [weight weight-value]
```

To delete a specific static route, use the `no ip route destination mask` command.

To delete all routes matching a certain route, use the `no ip route destination mask` command.

Parameters

vrf vrf-name	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to configure a static route corresponding to that VRF. Use this VRF option after the <code>ip route</code> keyword to configure a static route on that particular VRF.
destination	Enter the IP address in dotted decimal format of the destination device.
mask	Enter the mask in the slash prefix format (/x) of the destination IP address.
ip-address	Enter the IP address of the forwarding router in dotted decimal format.
interface	Enter one of the following keyword followed by the interface information <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383. • For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information. • For a port channel interface, enter the keywords <code>port-channel</code> then a number. • For a Null interface, enter the keyword <code>null</code> then the Null interface number. • For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.

- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

If you configure a static IPv6 route using an egress interface and enter the ping command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the ping command to detect the destination address.

interface <i>ip-address</i>	Enter the keyword <code>interface</code> then the IP address.
distance	(OPTIONAL) Enter the value of the distance metric assigned to the route. The range is from 1 to 255.
permanent	(OPTIONAL) Enter the keyword <code>permanent</code> to specify that the route must not be removed even if the interface assigned to that route goes down. The route must be currently active to be installed in the routing table. If you disable the interface, the route is removed from the routing table.
tag <i>tag-value</i>	(OPTIONAL) Enter the keyword <code>tag</code> then a number to assign to the route. The range is from 1 to 4294967295.
vrf <i>vrf-name</i>	Enter the keyword <code>vrf</code> followed by the name of the VRF. Use this VRF option after the next hop to specify which VRF the next hop belongs to. This setting is used in route leaking cases. See “Route Leaking VRFs” in the Virtual Routing and Forwarding (VRF) section of the Configuration guide.
weight <i>weight-value</i>	Enter the keyword <code>weight</code> followed by a weight value. The range is from 0 to 255.  NOTE: Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

Defaults Not configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Included the <code>weighted</code> parameter to support weighted ECMP feature.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Added support for tunnel interface type.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.

Version	Description
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

Using the following example of a static route: `ip route 33.33.33.0 /24 tengigabitethernet 1/1 172.31.5.43`

- The software installs a next hop that is not on the directly connected subnet but which recursively resolves to a next hop on the interface's configured subnet. In the example, if `tengigabitethernet 1/1` has an ip address on subnet 2.2.2.0 and if 172.31.5.43 recursively resolves to 2.2.2.0, Dell EMC Networking OS installs the static route.
- When the interface goes down, Dell EMC Networking OS withdraws the route.
- When the interface comes up, Dell EMC Networking OS re-installs the route.
- When recursive resolution is "broken," Dell EMC Networking OS withdraws the route.
- When recursive resolution is satisfied, Dell EMC Networking OS re-installs the route.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

You cannot use the VRF attribute of this command to configure routes in a management VRF. When a specific VRF is deleted, all the configured static routes corresponding to that VRF are automatically removed.

Example

```
DellEMC(conf)# ip route 1.1.1.0/24 4.4.4.2 weight 100
DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# do show running-config | grep route ip route 1.1.1.0/24
4.4.4.2 weight 100 ip route 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100
DellEMC(conf)# ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)#
DellEMC(conf)# do show running-config | grep route ip route vrf test
1.1.1.0/24 4.4.4.2 weight 100 ip route vrf test 1.1.1.0/24 6.6.6.2
weight 200
```

Related Commands

- [show ip route](#) — view the switch routing table.

ip source-route

Enable Dell EMC Networking OS to forward IP packets with source route information in the header.

Syntax `ip source-route`

To drop packets with source route information, use the `no ip route-source` command.

Defaults Enabled.

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

ipv4 unicast-host-route

Enable programming of IPv4 /32 route prefixes in L3 host table.

Syntax [no] ipv4 unicast-host-route

Defaults Disabled by default. By default, all the IPv4 route prefixes are installed only in the LPM table.

Command Modes CONFIGURATION

Command History

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0)	Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.1)	Introduced on the S6000.
9.2(1.0)	Introduced on the Z9500.

Usage Information

A warning message is displayed when you enter this command stating that this setting takes effect for existing routes only when IPv4 route prefixes are cleared from the routing table (RTM). To disable this functionality, use no ipv4 unicast-host-route command.

Example

```
DellEMC(conf)#ip unicast-host-route
Warning: Command will take effect for existing routes only when IPv4
route prefixes are cleared from RTM
DellEMC(conf)#no ip unicast-host-route
```

load-balance

By default, for C-Series and S-Series, Dell EMC Networking OS uses an IP 4-tuple (IP SA, IP DA, Source Port, and Destination Port) to distribute IP traffic over members of a Port Channel as well as equal-cost paths. To designate another method to balance traffic over Port Channel members, use the `load-balance` command.

Syntax

```
load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}
```

To return to the default setting (IP 4-tuple), use the `no load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}` command.

Parameters

ip-selection {dest-ip source-ip}	Enter the keywords to distribute IP traffic based on the following criteria: <ul style="list-style-type: none">• <code>dest-ip</code> — Uses destination IP address and destination port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.• <code>source-ip</code> — Uses source IP address and source port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
mac {dest-mac source-dest-mac source-mac}	Enter the keywords to distribute MAC traffic based on the following criteria: <ul style="list-style-type: none">• <code>dest-mac</code> — Uses the destination MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.• <code>source-dest-mac</code> — Uses the destination and source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.• <code>source-mac</code> — Uses the source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
tcp-udp enable	Enter the keywords to distribute traffic based on the following: <ul style="list-style-type: none">• <code>enable</code> — Takes the TCP/UDP source and destination ports into consideration when doing hash computations. This option is enabled by default.
ingress-port enable	Enter the keywords to distribute traffic based on the following: <ul style="list-style-type: none">• <code>enable</code> — Takes the source port into consideration when doing hash computations. This option is disabled by default.

Defaults

IP 4-tuple (IP SA, IP DA, Source Port, Destination Port)

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Added the <code>ingress-port</code> parameter for the S4810.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Usage Information

By default, Dell EMC Networking OS distributes incoming traffic based on a hash algorithm using the following criteria:

- IP source address
- IP destination address
- TCP/UDP source port
- TCP/UDP destination port

management route

Configure a static route that points to the Management interface or a forwarding router.

Z9500

Syntax

```
management route {ip-address mask | ipv6-address 1.1.1.1prefix-length}
{forwarding-router-address | managementethernet | fortyGigE | vlan |
tengigabitethernet }
```

To remove a static route, use the `no management route` command.

Parameters

<i>ip-address mask</i>	Enter an IP address (dotted decimal format) and mask (/prefix format) of the destination subnet.
<i>ipv6-address prefix-length</i>	Enter an IPv6 address (x:x:x:x format) and mask (/prefix format) of the destination subnet. Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is from /0 to /128.
	 NOTE: The :: notation specifies successive hexadecimal fields of zeros.
<i>forwarding-router-address</i>	Enter an IP address (dotted decimal format) or an IPv6 address (x:x:x:x format) of a forwarding router.
<i>managementethernet</i>	Enter the keyword <code>managementethernet</code> for the Management interface on the Primary RPM.
<i>fortyGigE</i>	Enter the keyword <code>fortyGigE</code> to specify a forty Gigabit Ethernet interface.
<i>vlan</i>	Enter the keyword <code>vlan</code> to specify a vlan interface.
<i>tengigabitethernet</i>	Enter the keyword <code>tengigabitethernet</code> to specify a ten Gigabit Ethernet interface.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for forty gigabit, vlan, and tengigabit ethernet interfaces. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000 and added support for IPv6.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

When a static route (or a protocol route) overlaps with Management static route, the static route (or a protocol route) is preferred over the Management Static route. Also, Management static routes and the Management Connected prefix are not reflected in the hardware routing tables. Separate routing tables are maintained for IPv4 and IPv6 management routes. This command manages both tables.

Related Commands

- [interface ManagementEthernet](#) — configure the Management port on the system (either the Primary or Standby RPM).
- [speed \(Management interface\)](#) — set the speed for the Management interface.

show arp

Display the ARP table.

Z9500

Syntax

```
show arp [vrf vrf-name] [interface interface | ip ip-address [mask] |  
macaddress mac-address [mac-address mask]] [retries] [static | dynamic]  
[inspection {database | statistics}][summary]
```

Parameters

- vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF.
-  **NOTE:** Use this attribute to start a BGP instance for either a specific address family corresponding to the default VRF or an IPv4 address family corresponding to a non-default VRF.
- interface interface** (OPTIONAL) Enter the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

ip <i>ip-address mask</i>	(OPTIONAL) Enter the keyword <code>ip</code> then an IP address in the dotted decimal format. Enter the optional IP address mask in the slash prefix format (<code>/ x</code>).
inspection	Enter the keyword <code>inspection</code> with one of the following keywords to view ARP entries: <ul style="list-style-type: none"> • <code>database</code> — view a list of ARP entries learned using DAI • <code>statistics</code> — view DAI statistics
macaddress <i>mac-address mask</i>	(OPTIONAL) Enter the keyword <code>macaddress</code> then a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format. Enter the optional MAC address mask in <code>nn:nn:nn:nn:nn</code> format also.
static	(OPTIONAL) Enter the keyword <code>static</code> to view entries entered manually.
retries	(OPTIONAL) Enter the keyword <code>retries</code> to show the number of ARP retries before a 20-second back off.
dynamic	(OPTIONAL) Enter the keyword <code>dynamic</code> to view dynamic entries.
summary	(OPTIONAL) Enter the keyword <code>summary</code> to view a summary of ARP entries.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF and added usage information for the <code>clear arp-cache</code> command.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.8.1.0	Augmented to display local ARP entries learned from private VLANs (PVLANS).
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

The following example shows two VLANs that are associated with a private VLAN (PVLAN) (refer to [Private VLAN \(PVLAN\)](#)).

If you have entered the `clear arp-cache` command to remove a large number of ARP entries and the command is still being processed in the background, an error message display if you attempt to enter the `show arp` command:

```
Clear arp in-progress. Please try after sometime!
```

The following describes the `show arp` command shown in the following example.

Description

Protocol	Displays the protocol type.
Address	Displays the IP address of the ARP entry.
Age(min)	Displays the age (in minutes) of the ARP entry.
Hardware Address	Displays the MAC address associated with the ARP entry.
Interface	Displays the first two letters of the interfaces type and the slot/port associated with the ARP entry.
VLAN	Displays the VLAN ID, if any, associated with the ARP entry.
CPU	Lists which CPU the entries are stored on.

Example

```
DellEMC> show arp
Protocol Address Age(min) Hardware Address Interface VLAN CPU
-----
Internet 192.2.1.254 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.253 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.252 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.251 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.250 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.251 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.250 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.249 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.248 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.247 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.246 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.245 1 00:00:c0:02:01:02 Te 2/13 - CP
```

Example (Private VLAN)

NOTE: In this example, Line 1 shows community VLAN 200 (in primary VLAN 10) in a PVLAN. Line 2 shows primary VLAN 10.

```
DellEMC# show arp
Protocol Address Age(min) Hardware Address Interface VLAN CPU
-----
Internet 5.5.5.1 - 00:01:e8:43:96:5e - V1 10 pv 200 CP
Internet 5.5.5.10 - 00:01:e8:44:99:55 - V1 10 CP
Internet 10.1.2.4 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 10.10.10.4 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 10.16.127.53 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 10.16.134.254 20 00:01:e8:d5:9e:e2 Ma 0/0 - CP
Internet 133.33.33.4 1 00:01:e8:d5:9e:e2 Ma 0/0 - CP
```

Usage Information

The following describes the `show arp summary` command shown in the following example.

Description

Total Entries	Lists the total number of ARP entries in the ARP table.
Static Entries	Lists the total number of configured or static ARP entries.
Dynamic Entries	Lists the total number of learned or dynamic ARP entries.
CPU	Lists which CPU the entries are stored on.

Example (Summary)

```
DellEMC# show arp summary

TotalEntries Static Entries Dynamic Entries CPU
-----
83              0              83              CP
DellEMC#
```

Related Commands

- [ip local-proxy-arp](#) — enable/disable Layer 3 communication in secondary VLANs.
- [switchport mode private-vlan](#) — set PVLAN mode of the selected port.

show arp retries

Display the configured number of ARP retries.

Syntax `show arp retries`

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.

9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced.

Related Commands

- [arp retries](#) — set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

show hosts

View the host table and DNS configuration.

Syntax `show hosts`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Added support for IPv6 addresses.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information The following describes the `show hosts` command in the following example.

Field	Description
Default domain...	Displays the domain name (if configured).
Name/address lookup...	States if DNS is enabled on the system. <ul style="list-style-type: none">• If DNS is enabled, the Name/Address lookup is domain service.• If DNS is not enabled, the Name/Address lookup is static mapping
Name servers are...	Lists the name servers, if configured.
Host	Displays the host name assigned to the IP address.
Flags	Classifies the entry as one of the following: <ul style="list-style-type: none">• perm — the entry was manually configured and will not time out• temp — the entry was learned and will time out after 72 hours of inactivity. Also included in the flag is an indication of the validity of the route: <ul style="list-style-type: none">• ok — the entry is valid.• ex — the entry expired.

Field	Description
	<ul style="list-style-type: none"> • ?? — the entry is suspect.
TTL	Displays the amount of time until the entry ages out of the cache. For dynamically learned entries only.
Type	Displays IP as the type of entry.
Address	Displays the IP addresses assigned to the host.

Example

```
DellEMC# show hosts
Default domain is not set
Name/address lookup uses static mappings
Name servers are not set
Host      Flags      TTL      Type      Address
-----
ks        (perm, OK) -      IP        2.2.2.2
4200-1    (perm, OK) -      IP        192.68.69.2
1230-3    (perm, OK) -      IP        192.68.99.2
ZZr       (perm, OK) -      IP        192.71.18.2
Z10-3     (perm, OK) -      IP        192.71.23.1
DellEMC#
```

Related Commands

- [traceroute](#) — view the DNS resolution.
- [ip host](#) — configure a host.

show ip cam linecard

View CAM entries for a port pipe on a line card.

Syntax

```
show ip cam linecard number port-set pipe-number [ip-address mask [longer-prefixes] | index index-number | summary | vrf vrf instance]
```

Parameters

<i>number</i>	Enter the number of the line card.
<i>pipe-number</i>	Enter the number of the line card's port-pipe. The range is from 0 to 1.
<i>ip-address mask</i> [<i>longer-prefix</i>]	(OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only. Enter the keyword <i>longer-prefixes</i> to view routes with a common prefix.
index <i>index-number</i>	(OPTIONAL) Enter the keyword <i>index</i> then the CAM index number. The range depends on CAM size.
summary	(OPTIONAL) Enter the keyword <i>summary</i> to view a table listing route prefixes and the total number of routes that can be entered into the CAM.
<i>vrf instance</i>	(OPTIONAL) E-Series Only: Enter the keyword <i>vrf</i> then the VRF instance name to show CAM information as it applies to that VRF instance.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.

Version	Description
8.1.1.2	Introduced on the E-Series E600i.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

Usage Information

The following describes the `show ip cam` command shown in the following example.

Field	Description
Index	Displays the CAM index number of the entry.
Destination	Displays the destination route of the index.
EC	Displays the number of equal cost multipaths (ECMP) available for the default route for non-Jumbo line cards. For Jumbo line cards, displays 0,1 when ECMP is more than eight.
CG	Displays 0.
V	Displays a 1 if the entry is valid and a 0 if the entry is for a line card with Catalog number beginning with LC-EF.
C	Displays the CPU bit. 1 indicates that a packet hitting this entry is forwarded to the CP or RP2, depending on Egress port.
Next-Hop	Displays the next hop IP address of the entry.
VId	Displays the VLAN ID. If the entry is 0, the entry is not part of a VLAN.
Mac Addr	Displays the next-hop router's MAC address.
Port	Displays the egress interface. Use the second half of the entry to determine the interface. For example, in the entry 17c1 CP, the CP is the pertinent portion. <ul style="list-style-type: none"> • CP = control processor • RP2 = route processor 2 • Gi = Gigabit Ethernet interface • So = SONET interface • Te = 10-Gigabit Ethernet interface

Example

```
Dell# show ip cam linecard 13 port-set 0
Index Destination EC CG V C Next-Hop VId Mac-Addr Port

Dell#
```

Usage Information

The following describes the `show ip cam summary` command shown in the following example.

Field	Description
Prefix Length	Displays the prefix-length or mask for the IP address configured on the linecard 0 port pipe 0.

Field	Description
Current Use	Displays the number of routes currently configured for the corresponding prefix or mask on the linecard 0 port pipe 0.
Initial Size	Displays the CAM size Dell Networking OS allocates for the corresponding mask. Dell Networking OS adjusts the CAM size if the number of routes for the mask exceeds the initial allocation.

**Example
(Summary)**

```
Dell# show ip cam linecard 4 port-set 0 summary
Total Number of Routes in the CAM is 13
Total Number of Routes which can be entered in CAM is 131072

Prefix Len Current Use Initial Sz

show ip fib linecard

View all forwarding information base (FIB) entries.

Syntax `show ip fib linecard slot-number [vrf vrf instance | ip-address/prefix-list | summary]`

Parameters

- vrf instance** (OPTIONAL) E-Series Only: Enter the keyword `vrf` then the VRF instance name to show the FIB cache entries tied to that VRF instance.

- slot-number** Enter the number of the line card slot.

- ip-address mask*** (OPTIONAL) Enter the IP address of the network destination to view only information on that destination. Enter the IP address in dotted decimal format (A.B.C.D). Enter the mask in slash prefix format (/X).
- longer-prefixes** (OPTIONAL) Enter the keywords `longer-prefixes` to view all routes with a common prefix.
- summary** (OPTIONAL) Enter the keyword `summary` to view the total number of prefixes in the FIB.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

Version	Description
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

Usage Information The following describes the `show ip fib` command shown in the following example.

Field	Description
Destination	Lists the destination IP address.
Gateway	Displays either the word "direct" and an interface for a directly connected route or the remote IP address used to forward the traffic.
First-Hop	Displays the first hop IP address.
Mac-Addr	Displays the MAC address.
Port	Displays the egress-port information.
Vid	Displays the VLAN ID. If no VLAN is assigned, zero (0) is listed.
Index	Displays the internal interface number.
EC	Displays the number of ECMP paths.

Example

```
Dell> show ip fib linecard 12

Destination      Gateway          First-Hop      Mac-Addr      Port      VId Index EC
-----
3.0.0.0/8        via 100.10.10.10, So 2/8 100.10.10.10 00:01:e8:00:03:ff So 2/8 0 60260 0
3.0.0.0/8        via 101.10.10.10, So 2/9
00.10.10.0/24    Direct, So 2/8 0.0.0.0          00:01:e8:00:03:ff So 2/8 0 11144 0
100.10.10.1/32   via 127.0.0.1 127.0.0.1          00:00:00:00:00:00 CP          0 3276 0
100.10.10.10/32  via 100.10.10.10, So 2/8 100.10.10.10 00:01:e8:00:03:ff So 2/8 0 0 0
101.10.10.0/24   Direct, So 2/9 0.0.0.0          00:00:00:00:00:00 RP2          0 11145 0

Dell>
```

show ip flow

Show how a Layer 3 packet is forwarded when it arrives at a particular interface.

Syntax `show ip flow interface interface {source-ip address destination-ip address} {protocol number [tcp | udp]} {src-port number destination-port number}`

Parameters	interface <i>interface</i>	Enter the keyword <i>interface</i> then one of the following interface keywords. <ul style="list-style-type: none">For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.
	source-ip <i>address</i>	Enter the keywords <code>source-ip</code> then the IP source address in IP address format.
	destination-ip <i>address</i>	Enter the keywords <code>destination-ip</code> then the IP destination address in IP address format.
	protocol number [tcp udp]	Enter the keyword <code>protocol</code> then one of the protocol type keywords: <code>tcp</code> , <code>udp</code> , or <code>protocol number</code> . The protocol number range is from 0 to 255. .
	src-port <i>number</i>	Enter the keywords <code>src-port</code> then the source port number.
	destination-port <i>number</i>	Enter the keywords <code>destination-port</code> then the destination port number.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

This command provides egress port information for a given IP flow. This information is useful in identifying which interface the packet follows in the case of Port-channel and Equal Cost Multi Paths. Use this command for routed packets only. For switched packets, use the `show port-channel-flow` command.

The `show ip flow` command does not compute the egress port information when `load-balance mac hashing` is also configured due to insufficient information (the egress MAC is not available).

S-Series produces the following error message: `%Error: Unable to read IP route table.`

Example

```
DellEMC# show ip flow interface te 2/42 20.1.1.1 100.1.1.2 protocol tcp
Flow: 20.1.1.1 100.1.1.2 6
Ingress interface: Te 2/42
Egress Interface: Te 2/43
DellEMC#
```

show ip interface

View IP-related information on all interfaces.

Z9500

Syntax

```
show ip interface [interface | brief] [configured]
```

Parameters

interface

(OPTIONAL)

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a stack-unit interface, enter the keyword `stack-unit` then the stack unit number.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

brief

(OPTIONAL) Enter the keyword `brief` to view a brief summary of the interfaces and whether an IP address is assigned.

configured

(OPTIONAL) Enter the keyword `configured` to display the physical interfaces with non-default configurations only.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Updated the command output to include the unicast reverse path forwarding (uRPF) status.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.3.7.0	Introduced on the S4810.
8.1.1.2	Supported on the E-Series E600i.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Example

```
DelleMC# show ip interface tengigabitethernet 1/1
TenGigabitEthernet 1/1 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
DelleMC#
```

```
DelleMC# show ip interface port-channel 128
Port-channel 128 is down, line protocol is down
Internet address is 10.1.1.1/16
Broadcast address is 10.1.255.255
Address determined by user input
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
DelleMC#
```

```
DelleMC#show ip interface vlan 1
Vlan 1 is down, line protocol is down
```

```

Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachable are not sent
IP unicast RPF check is not supported
DelleMC#

```

Usage Information

The following describes the `show ip interface brief` command shown in the following example.

Fields	Description
Interface	Displays type of interface and the associated slot and port number.
IP-Address	Displays the IP address for the interface, if configured.
Ok?	Indicates if the hardware is functioning properly.
Method	Displays "Manual" if the configuration is read from the saved configuration.
Status	States whether the interface is enabled (up) or disabled (administratively down).
Protocol	States whether IP is enabled (up) or disabled (down) on the interface.

Example (Brief)

```

DelleMC# show ip interface brief
Interface                IP-Address  OK? Method  Status
Protocol
TenGigabitEthernet 1/0  unassigned NO  Manual  administratively down
down
TenGigabitEthernet 1/1  unassigned NO  Manual  administratively down
down
TenGigabitEthernet 1/2  unassigned YES Manual  up
TenGigabitEthernet 1/3  unassigned YES Manual  up
TenGigabitEthernet 1/4  unassigned YES Manual  up
TenGigabitEthernet 1/5  10.10.10.1 YES Manual  up
TenGigabitEthernet 1/6  unassigned NO  Manual  administratively down
down

```

show ip management-route

View the IP addresses assigned to the Management interface.

Syntax

```
show ip management-route [all | connected | summary | static]
```

Parameters

- all** (OPTIONAL) Enter the keyword `all` to view all IP addresses assigned to all Management interfaces on the switch.
- connected** (OPTIONAL) Enter the keyword `connected` to view only routes directly connected to the Management interface.
- summary** (OPTIONAL) Enter the keyword `summary` to view a table listing the number of active and non-active routes and their sources.
- static** (OPTIONAL) Enter the keyword `static` to view non-active routes also.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC# show ip management-route

Destination      Gateway                State
-----
10.1.2.0/24      ManagementEthernet 1/1  Connected
172.16.1.0/24    10.1.2.4               Active
DellEMC#
```

show ip protocols

View information on all routing protocols enabled and active on the switch.

Syntax `show ip protocols`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Regular evaluation optimization enabled/disabled added to display output.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Example

```
DelleMC# show ip protocols
Routing Protocol is "bgp 1"
  Cluster Id is set to 20.20.20.3
  Router Id is set to 20.20.20.3
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200
  Neighbor(s):
    Address : 20.20.20.2
    Filter-list in : foo
    Route-map in : foo
    Weight : 0
    Address : 5::6
    Weight : 0
DelleMC#
```

show ip route

View information, including how they were learned, about the IP routes on the switch.

Syntax

```
show ip route [vrf vrf-name] hostname | ip-address [mask] [longer-prefixes]
| list prefix-list | protocol [process-id | routing-tag] | all | connected
| static | summary]
```

Parameters

vrf vrf-name	(OPTIONAL) Enter the keyword <code>vrf</code> and then the VRF name to list the routes in the route table of a specific VRF.
ip-address	(OPTIONAL) Specify a name of a device or the IP address of the device to view more detailed information about the route.
mask	(OPTIONAL) Specify the network mask of the route. Use this parameter with the IP address parameter.
longer-prefixes	(OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.
list prefix-list	(OPTIONAL) Enter the keyword <code>list</code> and the name of a configured prefix list. For more information, refer to the show ip route list command.

<i>protocol</i>	(OPTIONAL) Enter the name of a routing protocol (<i>bgp</i> , <i>isis</i> , <i>ospf</i> , <i>rip</i>) or the keywords <i>connected</i> or <i>static</i> .  NOTE: <i>bgp</i> , <i>isis</i> , <i>ospf</i> , and <i>rip</i> . <ul style="list-style-type: none"> • If you enter <i>bgp</i>, you can include the BGP <i>as-number</i>. • If you enter <i>isis</i>, you can include the ISIS <i>routing-tag</i>. • If you enter <i>ospf</i>, you can include the OSPF <i>process-id</i>.
<i>process-id</i>	(OPTIONAL) Specify that only OSPF routes with a certain process ID must be displayed.
<i>routing-tag</i>	(OPTIONAL) Specify that only ISIS routes with a certain routing tag must be displayed.
<i>connected</i>	(OPTIONAL) Enter the keyword <i>connected</i> to view only the directly connected routes.
<i>all</i>	(OPTIONAL) Enter the keyword <i>all</i> to view both active and non-active routes.
<i>static</i>	(OPTIONAL) Enter the keyword <i>static</i> to view only routes the <i>ip route</i> command configures.
<i>summary</i>	(OPTIONAL) Enter the keyword <i>summary</i> . For more information, refer to the show ip route summary command.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.9.1.0	Introduced VRF on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

The following describes the `show ip route all` command in the following example.

Field	Description
(undefined)	<p>Identifies the type of route:</p> <ul style="list-style-type: none"> ● C = connected ● S = static ● R = RIP ● B = BGP ● IN = internal BGP ● EX = external BGP ● LO = Locally Originated ● O = OSPF ● IA = OSPF inter area ● N1 = OSPF NSSA external type 1 ● N2 = OSPF NSSA external type 2 ● E1 = OSPF external type 1 ● E2 = OSPF external type 2 ● i = IS-IS ● L1 = IS-IS level-1 ● L2 = IS-IS level-2 ● IA = IS-IS inter-area ● * = candidate default ● > = non-active route ● + = summary routes <p>The weight for weighted ECMP route calculations is displayed for each path in the route in <code>show ip route</code> command. The ECMP weight is displayed only if weighted ECMP is enabled using the <code>ip ecmp weighted</code> command is enabled.</p> <p>If weighted ECMP is disabled, the <code>show ip route</code> command does not show the weighted ECMP route information.</p>
Destination	Identifies the route's destination IP address
Gateway	Identifies whether the route is directly connected and on which interface the route is configured.
Dist/Metric	Identifies if the route has a specified distance or metric.
Last Change	Identifies when the route was last changed or configured.

Example

```
DelleMC# show ip route all

Codes:C- connected, S - static, R - RIP
      B- BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated
      O- OSPF, IA -OSPF inter area N1 - OSPF NSSA external type 1
      N2- OSPF NSSA external type 2, E1 - OSPF external type 1
      E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1
      L2- IS-IS level-2, IA - IS-IS inter area, * - candidate default
      >- non-active route + - summary route

Gateway of last resort is not set

      Destination          Gateway                    Dist/Metric  Last Change
-----
R    3.0.0.0/8             via 100.10.10.10, Te 2/8  120/1       00:07:12
                               via 101.10.10.10, Te 2/9

```

show ip route list

Display IP routes in an IP prefix list.

Syntax `show ip route [vrf vrf-name] list prefix-list`

Parameters

- prefix-list** Enter the name of a configured prefix list.
- vrf vrf-name** Enter the keyword `vrf` followed by the name of the VRF to display IP routes in an IP prefix list corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Example

```
DellEMC# show ip route list test

Codes:C- connected, S - static, R - RIP,
      B- BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated,
      O- OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
      N2- OSPF NSSA external type 2, E1 - OSPF external type 1,
      E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
      L2- IS-IS level-2, IA - IS-IS inter area, * - candidate default,
      >- non-active route, + - summary route

Gateway of last resort is not set

      Destination      Gateway                Dist/Metric  Last Change
      -----
R    2.1.0.0/24        via 2.1.4.1, Te 4/43   120/2       3d0h
R    2.1.1.0/24        via 2.1.4.1, Te 4/43   120/2       3d1h
R    2.1.2.0/24        via 2.1.4.1, Te 4/43   120/1       3d0h
R    2.1.3.0/24        via 2.1.4.1, Te 4/43   120/1       3d1h
C    2.1.4.0/24        Direct, Te 4/43        0/0         3d1h
```

Related Commands

- [ip prefix-list](#) — enter CONFIGURATION-IP PREFIX-LIST mode and configures a prefix list.
- [show ip prefix-list summary](#) — display a summary of the configured prefix lists.

show ip route summary

View a table summarizing the IP routes in the switch.

Syntax `show ip route [vrf vrf-name] [summary]`

Parameters `vrf vrf-name` Enter the keyword `vrf` followed by the name of the VRF to view information on the IP routes corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information

The following describes the `show ip route summary` shown in the following example.

Column Heading	Description
Route Source	Identifies how the route is configured in Dell EMC Networking OS.
Active Routes	Identifies the best route if a route is learned from two protocol sources.
Non-active Routes	Identifies the back-up routes when a route is learned by two different protocols. If the best route or active route goes down, the non-active route becomes the best route.
ospf 100	If routing protocols (OSPF, RIP) are configured and routes are advertised, then information on those routes is displayed.
Total 1388 active...	Displays the number of active and non-active routes and the memory usage of those routes. If there are no routes configured in the Dell EMC Networking OS, this line does not appear.

Example

```
DellEMC> show ip route summary

Route Source    Active Routes    Non-active Routes
connected       17                0
static          3                 0
ospf 100        1368              2
Intra-area: 762 Inter-area: 1 External-1: 600 External-2: 5
Total           1388              2
Total 1388 active route(s) using 222440 bytes
Total 2 non-active route(s) using 128 bytes
DellEMC>
```

Related Commands

- [show ip route](#) — display information about the routes found in the switch.

show ip traffic

View IP, ICMP, UDP, TCP and ARP traffic statistics.

Syntax

```
show ip traffic [all | cp | rp1 | rp2]
```

 **NOTE:** These options are supported only on the E-Series.

Parameters

all	(OPTIONAL) Enter the keyword <code>all</code> to view statistics from all processors. If you do not enter a keyword, you also view all statistics from all processors.
cp	(OPTIONAL) Enter the keyword <code>cp</code> to view only statistics from the Control Processor.
rp1	(OPTIONAL) Enter the keyword <code>rp1</code> to view only the statistics from Route Processor 1.

rp2 (OPTIONAL) Enter the keyword `rp2` to view only the statistics from Route Processor 2.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	F10 Monitoring MIB available for the <code>ip traffic statistics</code> command.
pre-6.1.1.0	Introduced on the E-Series.

Usage Information The following describes the `show ip traffic` summary shown in the following example.

Keyword	Definition
unknown protocol...	No receiver for these packets. Counts packets whose protocol type field is not recognized by Dell EMC Networking OS.
not a gateway...	Packets can not be routed; the host/network is unreachable.
security failures...	Counts the number of received unicast/multicast packets that could not be forwarded due to: <ul style="list-style-type: none">● route not found for unicast/multicast; ingress interfaces do not belong to the destination multicast group● destination IP address belongs to reserved prefixes; the host/network is unreachable
bad options...	Unrecognized IP option on a received packet.
Fragments:	IP fragments received.
... reassembled	Number of IP fragments that were reassembled.
... timeouts	Number of times a timer expired on a reassembled queue.
... too big	Number of invalid IP fragments received.
... couldn't fragment	Number of packets that could not be fragmented and forwarded.

Keyword	Definition
...encapsulation failed	Counts packets which could not be forwarded due to ARP resolution failure. Dell EMC Networking OS sends an arp request prior to forwarding an IP packet. If a reply is not received, Dell EMC Networking OS repeats the request three times. These packets are counted in encapsulation failed.
Rcvd:	
...short packets	The number of bytes in the packet are too small.
...bad length	The length of the packet was not correct.
...no port broadcasts	The incoming broadcast/multicast packet did not have any listener.
...socket full	The applications buffer is full and the incoming packet are dropped.

The Dell Monitoring MIB provides access to the following statistics.

- **IP Statistics: Bcast: Received:** Object = f10BcastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.1
- **IP Statistics: Bcast: Sent:** Object = f10BcastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.2
- **IP Statistics: Mcast: Received:** Object = f10McastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.3
- **IP Statistics: Mcast: Sent:** Object = f10McastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.4
- **ARP Statistics: Rcvd: Request:** Object = f10ArpReqRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.1
- **ARP Statistics: Rcvd: Replies:** Object = f10ArpReplyRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.3
- **ARP Statistics: Sent: Request:** Object = f10ArpReqSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.2
- **ARP Statistics: Sent: Replies:** Object = f10ArpReplySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.4
- **ARP Statistics: Sent: Proxy:** Object = f10ArpProxySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.5

Example

```
DellEMC# show ip traffic
Control Processor IP Traffic:

IP statistics:
  Rcvd: 23857 total, 23829 local destination
        0 format errors, 0 checksum errors, 0 bad hop count
        0 unknown protocol, 0 not a gateway
        0 security failures, 0 bad options
  Frags: 0 reassembled, 0 timeouts, 0 too big
        0 fragmented, 0 couldn't fragment
  Bcast: 28 received, 0 sent; Mcast: 0 received, 0 sent
  Sent: 16048 generated, 0 forwarded
        21 encapsulation failed, 0 no route
ICMP statistics:
  Rcvd: 0 format errors, 0 checksum errors, 0 redirects, 0 unreachable
        0 echo, 0 echo reply, 0 mask requests, 0 mask replies, 0 quench
        0 parameter, 0 timestamp, 0 info request, 0 other
  Sent: 0 redirects, 0 unreachable, 0 echo, 0 echo reply
        0 mask requests, 0 mask replies, 0 quench, 0 timestamp
        0 info reply, 0 time exceeded, 0 parameter problem
UDP statistics:
  Rcvd: 0 total, 0 checksum errors, 0 no port
        0 short packets, 0 bad length, 0 no port broadcasts, 0 socket full
  Sent: 0 total, 0 forwarded broadcasts
TCP statistics:
  Rcvd: 23829 total, 0 checksum errors, 0 no port
  Sent: 16048 total
ARP statistics:
  Rcvd: 156 requests, 11 replies
  Sent: 21 requests, 10 replies (0 proxy)
Routing Processor1 IP Traffic:
```

show tcp statistics

View information on TCP traffic through the switch.

Syntax `show tcp statistics {all | cp | rp}`

Parameters

all	Enter the keyword <code>all</code> to view all TCP information.
cp	Enter the keyword <code>cp</code> to view only TCP information from the Control Processor.
rp	Enter the keyword <code>rp1</code> to view only TCP statistics from Route Processor 1.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S3148.

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series.
6.4.1.0	Introduced

Usage Information The following describes the `show tcp statistics cp` command shown in the following example.

Field	Description
Rcvd:	Displays the number and types of TCP packets received by the switch. <ul style="list-style-type: none">• Total = total packets received• no port = number of packets received with no designated port
0 checksum error...	Displays the number of packets received with the following: <ul style="list-style-type: none">• checksum errors• bad offset to data• too short
329 packets...	Displays the number of packets and bytes received in sequence.
17 dup...	Displays the number of duplicate packets and bytes received.
0 partially...	Displays the number of partially duplicated packets and bytes received.
7 out-of-order...	Displays the number of packets and bytes received out of order.

Field	Description
0 packets with data after window	Displays the number of packets and bytes received that exceed the switch's window size.
0 packets after close	Displays the number of packet received after the TCP connection was closed.
0 window probe packets...	Displays the number of window probe and update packets received.
41 dup ack...	Displays the number of duplicate acknowledgement packets and acknowledgement packets with data received.
10184 ack...	Displays the number of acknowledgement packets and bytes received.
Sent:	Displays the total number of TCP packets sent and the number of urgent packets sent.
25 control packets...	Displays the number of control packets sent and the number retransmitted.
11603 data packets...	Displays the number of data packets sent.
24 data packets retransmitted	Displays the number of data packets resent.
355 ack..	Displays the number of acknowledgement packets sent and the number of packet delayed.
0 window probe...	Displays the number of window probe and update packets sent.
7 Connections initiated...	Displays the number of TCP connections initiated, accepted, and established.
14 Connections closed...	Displays the number of TCP connections closed, dropped.
20 Total rxmt...	Displays the number of times the switch tried to re-send data and the number of connections dropped during the TCP retransmit timeout period.
0 Keepalive....	Lists the number of keepalive packets in timeout, the number keepalive probes and the number of TCP connections dropped during keepalive.

Example

```
DellEMC# show tcp stat cp

Control Processor TCP:
Rcvd: 10585 Total, 0 no port
    0 checksum error, 0 bad offset, 0 too short
    329 packets (1263 bytes) in sequence
    17 dup packets (6 bytes)
    0 partially dup packets (0 bytes)
    7 out-of-order packets (0 bytes)
    0 packets ( 0 bytes) with data after window
    0 packets after close
    0 window probe packets, 41 window update packets
    41 dup ack packets, 0 ack packets with unsend data
    10184 ack packets (12439508 bytes)
Sent: 12007 Total, 0 urgent packets
    25 control packets (including 24 retransmitted)
    11603 data packets (12439677 bytes)
    24 data packets (7638 bytes) retransmitted
    355 ack only packets (41 delayed)
    0 window probe packets, 0 window update packets
    7 Connections initiated, 8 connections accepted, 15 connections established
    14 Connections closed (including 0 dropped, 0 embryonic dropped)
    20 Total rxmt timeout, 0 connections dropped in rxmt timeout
    0 Keepalive timeout, 0 keepalive probe, 0 Connections dropped in keepalive
```

IPv6 Access Control Lists (IPv6 ACLs)

IPv6 ACLs and IPv6 Route Map commands are supported on Dell EMC Networking OS.

NOTE: For IPv4 ACL commands, see [Access Control Lists \(ACL\)](#).

Important Points to Remember

- Certain platforms require manual CAM usage space allotment. For more information, see [cam-acl](#).
- Egress IPv6 ACL and IPv6 ACL on the Loopback interface is not supported.
- Reference to an empty ACL permits any traffic.
- ACLs are not applied to self-originated traffic (for example, Control Protocol traffic not affected by IPv6 ACL because the routed bit is not set for Control Protocol traffic and for egress ACLs the routed bit must be set).
- You can use the same access list name for both IPv4 and IPv6 ACLs.
- You can apply both IPv4 and IPv6 ACLs on an interface at the same time.
- You can apply IPv6 ACLs on physical interfaces and a logical interfaces (Port-channel/VLAN).
- Non-contiguous masks are not supported in source or destination addresses in IPv6 ACL entries.
- Because the prefix mask is specified in /x format in IPv6 ACLs, inverse mask is not supported.

Topics:

- [cam-acl](#)
- [cam-acl-egress](#)
- [deny \(for IPv6 ACLs\)](#)
- [deny arp \(for Extended MAC ACLs\)](#)
- [deny icmp \(for Extended IPv6 ACLs\)](#)
- [deny tcp \(for IPv6 ACLs\)](#)
- [deny udp \(for IPv6 ACLs\)](#)
- [ipv6 access-list](#)
- [ipv6 control-plane egress-filter](#)
- [permit \(for IPv6 ACLs\)](#)
- [permit icmp \(for IPv6 ACLs\)](#)
- [permit tcp \(for IPv6 ACLs\)](#)
- [permit udp \(for IPv6 ACLs\)](#)
- [seq \(for IPv6 ACLs\)](#)
- [test cam-usage](#)

cam-acl

Allocate space for IPv6 ACLs.

Syntax `cam-acl {default | l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 l2qos 1-10}`

Parameters

default

Use the default CAM profile settings, and set the CAM as follows:

- L3 ACL (ipv4acl): **6**
- L2 ACL(l2acl): **5**
- IPv6 L3 ACL (ipv6acl): **0**
- L3 QoS (ipv4qos): **1**

- L2 QoS (l2qos): **1**

l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 l2qos 1-10 Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 13. The `ipv6acl` range must be a factor of 2 (2, 4, 6, 8, 10).

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.4.2.0	Introduced on the E-Series.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

Usage Information For the new settings to take effect, save the new CAM settings to the startup-config (`write mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from 1 to 4.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the `ipv6acl` profile which is from 0 to 10. The `ipv6acl` allocation must be a factor of 2 (2, 4, 6, 8, 10).

cam-acl-egress

Allocate space for IPv6 egress ACLs.

Syntax `cam-acl-egress {default | l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4}`

Parameters **default** Use the default CAM profile settings, and set the CAM as follows:

- L2 ACL(l2acl): **1**
- L3 ACL (ipv4acl): **1**
- IPv6 L3 ACL (ipv6acl): **2**

l2acl 1-4 ipv4acl 1- 4 ipv6acl 0-4 Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The `ipv6acl` range must be a factor of 2.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.4.2.0	Introduced on the E-Series.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

Usage Information For the new settings to take effect, save the new CAM settings to the startup-config (`write mem` or `copy run start`), then reload the system.

The total amount of space allowed is 4 FP Blocks.

Example

```
DellEMC# configure
DellEMC(conf)# cam-acl-egress ?
default      Reset Egress CAM ACL entries to default setting
l2acl        Set L2-ACL entries
DellEMC(conf)# cam-acl-egress l2acl ?
<1-4>        Number of FP blocks for l2acl
DellEMC(conf)# cam-acl-egress l2acl 1 ?
ipv4acl      Set IPV4-ACL entries
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ?
ipv6acl      Set IPV6-ACL entries
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl ?
<0-4>        Number of FP blocks for IPV6 (multiples of 2)
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl 2
DellEMC(conf)#
```

deny (for IPv6 ACLs)

Configure a filter that drops IPv6 packets that match the filter criteria.

Syntax `deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

Parameters	log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
	threshold-in-msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
	interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
	monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
	no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny arp (for Extended MAC ACLs)

Configure an egress filter that drops ARP packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

Syntax `deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes]] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number}` command.

Parameters	log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
	threshold-in-msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
	interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
	monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.5(0.1)	Introduced on the Z9500.

Version	Description
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

NOTE: Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

Syntax

```
deny icmp {source address mask | any | host ipv6-address} {destination
address | any | host ipv6-address} [message-type] [ttl operator] [count
[byte]] | [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

Parameters

source address mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ipv6-address	Enter the keyword <code>host</code> then the IPv6 address to specify a host IP address.
destination	Enter the IP address of the network or host to which the packets are sent.
ttl	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.

- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

Command Modes ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>t11</code> parameter.
9.11(2.0P0)	Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.5(0.1)	Introduced on the Z9500.
9.3.0.0	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by

monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

Syntax

```
deny tcp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [bit] [operator
port [port]] [ttl operator] [count [byte]] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

Parameters

source address mask	Enter a network mask in /prefix format (/x).
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ipv6-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
destination address	Enter the IPv6 address of the network or host to which the packets are sent.
bit	Enter a flag or combination of bits: <ul style="list-style-type: none"> • <code>ack</code>: acknowledgement field • <code>fin</code>: finish (no more data from the user) • <code>psh</code>: push function • <code>rst</code>: reset the connection • <code>syn</code>: synchronize sequence numbers • <code>urg</code>: urgent field
operator	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code> = equal to • <code>neq</code> = not equal to • <code>gt</code> = greater than • <code>lt</code> = less than • <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)
port port	Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none"> • 23 = Telnet • 20 and 21 = FTP • 25 = SMTP • 169 = SNMP
ttl	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.

- `neq`(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- `gt`(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- `range`(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

count	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny udp (for IPv6 ACLs)

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

Syntax

```
deny udp {source address mask | any | host ipv6-address} [operator port  
[port]] {destination address | any | host ipv6-address} [operator port  
[port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-  
in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

Parameters

ttl	Enter the keyword <code>ttl</code> to deny a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none">• <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.• <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.• <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.• <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value.• <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes ACCESS-LIST

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.

9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs.

You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

Syntax `ipv6 access-list access-list-name cpu-qos`

To delete an access list, use the `no ipv6 access-list access-list-name` command.

Parameters

access-list-name Enter the access list name as a string, up to 140 characters.

cpu-qos Enter the keyword `cpu-qos` to assign this ACL to control plane traffic only (CoPP).

permit	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition.
deny	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
ospfv3	Specify that this ACL is for OSPFv3 control plane traffic

Defaults All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for CoPP for OSPFv3 on the S4810, S4820T, S6000, and Z9000 platforms.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000
8.3.11.1	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series. Increased the name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long.
7.4.1.0	Introduced on the E-Series.

Usage Information The number of entries allowed per ACL is hardware-dependent. For detailed specification on entries allowed per ACL, refer to your line card documentation. You can create an IPv6 ACL for control-plane traffic policing for OSPFv3, in addition to the CoPP support for VRRP, BGP, and ICMP.

ipv6 control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv6 CPU traffic.

Syntax `ipv6 control-plane egress-filter`

Defaults Not enabled.

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.

9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

permit (for IPv6 ACLs)

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

Syntax

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]]  
[dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs  
[count]]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

Parameters

log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in-msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
no-drop	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

permit icmp (for IPv6 ACLs)

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

Syntax

```
permit icmp {source address mask | any | host ipv6-address} {destination
address | any | host ipv6-address} [message-type] [ttl operator] [count
[byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

Parameters

source address mask	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ip-v6address	Enter the keyword <code>host</code> then the IPv6 address to specify a host IP address.

destination	Enter the IP address of the network or host to which the packets are sent.
ttl	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value. • <code>gt</code>(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value. • <code>lt</code> (less than) — matches packets that contain a ttl value that is less than the specified ttl value. • <code>range</code>(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
count	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
byte	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(0.0)	Introduced the <code>ttl</code> parameter.
9.11(2.0P1)	Added the <code>type</code> parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.

Version	Description
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

permit tcp (for IPv6 ACLs)

Configure a filter to pass TCP packets that match the filter criteria.

Syntax

```
permit tcp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [bit] [operator
port [port]] [ttl operator] [count [byte]] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

Parameters

source address mask	Enter a network mask in /prefix format (/x).
any	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
host ipv6-address	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
destination address	Enter the IPv6 address of the network or host to which the packets are sent.
bit	Enter a flag or combination of bits: <ul style="list-style-type: none"> • <code>ack</code>: acknowledgement field • <code>fin</code>: finish (no more data from the user) • <code>psh</code>: push function • <code>rst</code>: reset the connection • <code>syn</code>: synchronize sequence numbers • <code>urg</code>: urgent field
operator	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code> = equal to • <code>neq</code> = not equal to

- `gt` = greater than
- `lt` = less than
- `range` = inclusive range of ports (you must specify two ports for the port parameter)

port port Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

- 23 = Telnet
- 20 and 21 = FTP
- 25 = SMTP
- 169 = SNMP

ttl Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.

operator Enter one of the following logical operand:

- `eq`(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- `neq`(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- `gt`(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- `range`(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

count (OPTIONAL) Enter the keyword `count` to count packets the filter processes.

byte (OPTIONAL) Enter the keyword `byte` to count bytes the filter processes.

log (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

threshold-in msgs count (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

interval minutes (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

- `permit` – assign a permit filter for IP packets.

permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

Syntax

```
permit udp {source address mask | any | host ipv6-address} [operator port
[port]] {destination address | any | host ipv6-address} [operator port
[port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-
in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

Parameters

ttl	Enter the keyword <code>ttl</code> to permit a packet based on the time to live value. The range is from 1 to 255.
operator	Enter one of the following logical operand: <ul style="list-style-type: none"> • <code>eq</code>(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value. • <code>neq</code>(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.

- `gt`(greater than) — matches packets that contain a `ttl` value that is greater than the specified `ttl` value.
- `lt` (less than) — matches packets that contain a `ttl` value that is less than the specified `ttl` value.
- `range`(inclusive range of values) — matches packets that contain a `ttl` value that falls between the specified range of `ttl` values.

log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in-msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3.0.0	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can

be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

seq (for IPv6 ACLs)

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

Syntax `seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp | udp} {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [operator port [portnumber]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To delete a filter, use the `no seq sequence-number` command.

Parameters

<i>sequence-number</i>	Enter a number from 0 to 4294967290.
<i>deny</i>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
<i>permit</i>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
<i>ipv6-protocol-number</i>	Enter a number to filter based on the protocol identified in the IPv6 protocol header.
<i>icmp</i>	Enter the keyword <code>icmp</code> to configure an ICMP access list filter.
<i>ip</i>	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols.
<i>tcp</i>	Enter the keyword <code>tcp</code> to configure a TCP access list filter.
<i>udp</i>	Enter the keyword <code>udp</code> to configure a UDP access list filter.
<i>source</i>	Enter an IP address in dotted decimal format of the network from which the packet was received.
<i>mask</i>	(OPTIONAL) Enter a network mask in /prefix format (/x).
<i>any</i>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<i>host ipv6-address</i>	Enter the keyword <code>host</code> and then enter the IPv6 address to specify a host IP address or hostname.
<i>operator</i>	(OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> • <code>eq</code> = equal to • <code>neq</code> = not equal to • <code>gt</code> = greater than • <code>lt</code> = less than • <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter.)
<i>portnumber</i>	(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none"> • 23 = Telnet • 20 and 21 = FTP-DATA and FTP • 25 = SMTP • 169 = SNMP

destination	Enter the IP address of the network or host to which the packets are sent.
count	(OPTIONAL) Enter the keyword <code>count</code> to count the packets.
bytes	(OPTIONAL) Enter the keyword <code>bytes</code> to count the bytes.
log	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
threshold-in msgs count	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminate with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
interval minutes	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
monitor	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(2.0P0)	Included support for using logical names of a protocol to configure an IP access list in both TCP and UDP on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100.
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

- [permit](#) – configure a filter to forward packets.

test cam-usage

Verify that enough ACL CAM space is available for the IPv6 ACLs you have created.

Syntax `test cam-usage service-policy input input policy name linecard {number | all}`

Parameters

- policy-map name*** Enter the name of the policy-map to verify.
- number*** Enter `all` to get information for all the linecards, or enter the linecard number to get information for a specific card. The range is 0-6 for E-Series and 0-7 for C-Series.

Defaults none

Command Modes EXEC Privilege

Command History

Version	Description
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Introduced on the C-Series and E-Series TeraScale.

Usage Information

This command applies to both IPv4 and IPv6 CAM Profiles, but is best used when verifying QoS optimization for IPv6 ACLs.

QoS Optimization for IPv6 ACLs does not impact the CAM usage for applying a policy on a single (or the first of several) interfaces. It is most useful when a policy is applied across multiple interfaces; it can reduce the impact to CAM usage across subsequent interfaces.

The following describes the `test cam-usage` command shown in the Example below.

Term	Explanation
Linecard	Lists the line card or linecards that are checked. Entering <code>all</code> shows the status for linecards in the chassis.
Portpipe	Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering <code>all</code> shows the status for linecards and port-pipes in the chassis.
CAM Partition	Shows the CAM profile of the CAM.
Available CAM	Identifies the amount of CAM space remaining for that profile.
Estimated CAM per Port	Estimates the amount of CAM space the listed policy requires.
Status	Indicates whether or not the policy is allowed in the CAM

Example (C-Series)

```
Dell#test cam-usage service-policy input LauraMapTest linecard all

Linecard|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port|
Status
-----
 2| 1| IPv4Flow| 232| 0| Allowed
 2| 1| IPv6Flow| 0| 0| Allowed
 4| 0| IPv4Flow| 232| 0| Allowed
 4| 0| IPv6Flow| 0| 0| Allowed

```

IPv6 Basics

IPv6 basic commands are supported on the Dell EMC Networking OS.

NOTE: For information about the Dell EMC Networking OS version and platform that supports IPv6 in each software feature, see the *IPv6 Addressing* section in the *Dell EMC Networking OS Configuration Guide*.

Topics:

- `cam-ipv6 extended-prefix`
- `clear ipv6 fib`
- `clear ipv6 route`
- `clear ipv6 mld_host`
- `ipv6 address`
- `ipv6 address autoconfig`
- `ipv6 address eui64`
- `ipv6 control-plane icmp error-rate-limit`
- `ipv6 flowlabel-zero`
- `ipv6 host`
- `ipv6 name-server`
- `ipv6 nd dad attempts`
- `ipv6 nd disable-reachable-timer`
- `ipv6 nd dns-server`
- `ipv6 nd prefix`
- `ipv6 nd reachable-time`
- `ipv6 neighbor`
- `ipv6 route`
- `ipv6 unicast-host-route`
- `ipv6 unicast-routing`
- `show cam-ipv6 extended-prefix`
- `show ipv6 cam linecard`
- `show ipv6 management-route`
- `show ipv6 control-plane icmp`
- `show ipv6 fib linecard`
- `show ipv6 flowlabel-zero`
- `show ipv6 interface`
- `show ipv6 mld_host`
- `show ipv6 neighbors`
- `show ipv6 route`

cam-ipv6 extended-prefix

Enable LPM partitioning to support IPv6 /65 to /128 route prefixes to be stored in Partition 1.

Syntax `cam-ipv6 extended-prefix <Max-IPv6-prefixes>`

To remove LPM partitioning configuration, use no `cam-ipv6 extended-prefix`.

Parameters ***Max-IPv6-Prefix*** Maximum number of IPv6 prefixes in the mask length of /65 to /128. The possible values are 1024, 2048, and 3072.

Defaults LPM is not partitioned with Partition 1 and therefore /65 to /128 prefixes are not converted to /64 prefixes and are installed and saved in LPM. All the packets for those routes traverse through the default route path.

Command Modes CONFIGURATION

Command History	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.8(0.0P5)	Introduced on the S4048-ON.
	9.8(0.0P2)	Introduced on the S3048-ON.
	9.7(0.0)	Introduced on the S6000-ON.
	9.5(0.1)	Introduced on the Z9500.
	9.3(0.1)	Introduced on the S6000.

Usage Information You can partition the LPM table to store IPv6 prefixes greater than /64 mask length. Requires reboot of the switch to take effect as the SDK handles this only during its initialization.

clear ipv6 fib

Clear (refresh) all forwarding information base (FIB) entries on a linecard or stack unit.

Z9500

Syntax `clear ipv6 fib linecard slot-id`

Parameters

slot	Enter the slot number to clear the FIB.
linecard slot-id	Enter the slot ID of a Z9500 line card. Valid slot IDs are from 0 to 2.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

clear ipv6 route

Clear (refresh) all or a specific route from the IPv6 routing table.

Z9500

Syntax `clear ipv6 route [vrf vrf-name] { * | ipv6-address prefix-length }`

Parameters

- vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to clear the IPv6 routes corresponding to that VRF.
- *** Enter the * to clear (refresh) all routes from the IPv6 routing table.
- ipv6-address prefix-length** Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.
 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

clear ipv6 mld_host

Clear the IPv6 MLD host counters and reset the elapsed time.

Syntax `clear ipv6 mld_host`

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

ipv6 address

Configure an IPv6 address to an interface.

Syntax `ipv6 address {ipv6-address prefix-length}`
 To remove the IPv6 address, use the `no ipv6 address {ipv6-address prefix-length}` command.

Parameters

ipv6-address Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

prefix-length

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

Defaults None

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.8(2.0)	Introduced on the S3100 series.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.1(0.0)	Updated Usage Information.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.1.0	Added support on the management Ethernet port.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information

- If two addresses are configured, delete an existing address before configuring a new address.
- If the last manually-configured global IPv6 address is removed using the “no” form of the command, the link-local IPv6 address is removed automatically.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across platform must be members of the same subnet.

- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

NOTE: Do not use the /128 prefix length on physical or port channel interfaces. You can use the /128 prefix length on loopback interfaces.

Example

```
DellEMC(conf)# interface tengigabitethernet 1/2
DellEMC(conf-if-te-1/2)# ipv6 address ?
X:X:X:X::X IPv6 address
DellEMC(conf-if-te-1/2)# ipv6 address 2002:1:2::3 ?
<0-128> Prefix length in bits
DellEMC(conf-if-te-1/2)# ipv6 address 2002:1:2::3 /96 ?
<cr>
DellEMC(conf-if-te-1/2)# ipv6 address 2002:1:2::3 /96
DellEMC(conf-if-te-1/2)# show config
!
interface TenGigabitEthernet 1/2
  no ip address
  ipv6 address 2002:1:2::3 /96
  no shutdown
```

ipv6 address autoconfig

Configure IPv6 address auto-configuration for the management interface.

Syntax	<code>ipv6 address autoconfig</code> To disable the address autoconfig operation on the management interface, use the <code>no ipv6 address autoconfig</code> command.
Default	Disabled
Command Modes	INTERFACE (management interface only)
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.1.(0.0)	Updated Usage Information section.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

- Usage Information**
- SAA can configure up to two addresses. If any preferred prefix or valid timers time out, the corresponding address are deprecated or removed. If an address is removed due to a time-out, an address from the current unused prefix is used to create a new address. If there are no remaining prefixes, the software waits to receive a new prefix from the RA.
 - If auto-configuration is enabled, all IPv6 addresses on that management interface are auto-configured. Manual and auto-configurations are not supported on a single management interface.
 - Removing auto-configuration removes all auto-configured IPv6 addresses and the link-local IPv6 address from that management interface.
 - IPv6 addresses on a single management interface cannot be members of the same subnet.
 - IPv6 secondary addresses on management interfaces across a platform must be members of the same subnet.

- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

ipv6 address eui64

Configure IPv6 EUI64 address configuration on the interface.

Syntax	<code>ipv6 address {ipv6-address prefix-length} eui64</code> To disable IPv6 EUI64 address autoconfiguration, use the <code>no ipv6 address {ipv6-address prefix-length} eui64</code> command.												
Parameters	<p>ipv6-address Enter the IPv6 prefix in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.</p> <p>prefix-length</p> <p> NOTE: The :: notation specifies successive hexadecimal fields of zeros.</p>												
Defaults	None												
Command Modes	CONFIGURATION												
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .												
	<table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.8(0.0P5)</td> <td>Introduced on the S4048-ON.</td> </tr> <tr> <td>9.8(0.0P2)</td> <td>Introduced on the S3048-ON.</td> </tr> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.2(1.0)</td> <td>Introduced on the Z9500.</td> </tr> <tr> <td>9.2(0.2)</td> <td>Introduced.</td> </tr> </tbody> </table>	Version	Description	9.8(0.0P5)	Introduced on the S4048-ON.	9.8(0.0P2)	Introduced on the S3048-ON.	9.7(0.0)	Introduced on the S6000-ON.	9.2(1.0)	Introduced on the Z9500.	9.2(0.2)	Introduced.
Version	Description												
9.8(0.0P5)	Introduced on the S4048-ON.												
9.8(0.0P2)	Introduced on the S3048-ON.												
9.7(0.0)	Introduced on the S6000-ON.												
9.2(1.0)	Introduced on the Z9500.												
9.2(0.2)	Introduced.												
Usage Information	This command allows you to create an EUI64 address based on the specified prefix and MAC address only. Prefixes may be configured on the interface using the <code>ipv6 nd prefix</code> command without creating an EUI64 address.												

Example

ipv6 control-plane icmp error-rate-limit

Configure the maximum number of ICMP error packets per second that can be sent per second.

Syntax	<code>ipv6 control-plane icmp error-rate-limit {1-200}</code> To restore the default value, use the <code>no ipv6 control-plane icmp error-rate-limit</code> command.
Parameters	<p>pps Enter the maximum number of error packets generated per second. The range is from 1 to 200, where 0 disables the rate-limiting.</p>
Default	100 pps
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

ipv6 flowlabel-zero

Configure system to set the flow label field in the packets to zero.

Syntax	<code>ipv6 flowlabel-zero</code> To disable the 0 from being set in the field and allow the protocol operations to fill the field, use the <code>no ipv6 flowlabel-zero</code> command.
Default	Disabled
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>DellEMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Usage Information	If the flowlabel value is already set for BGP or SSH, the system defaults to the already configured value. All packets on the same connection are considered part of the same flow by the system. For new connections, set the new flowlabel to zero.
--------------------------	---

ipv6 host

Assign a name and IPv6 address the host-to-IPv6 address mapping table uses.

Syntax	<code>ipv6 host name ipv6-address</code> To remove an IP host, use the <code>no ipv6 host name {ipv6-address}</code> .
Parameters	<p>name Enter a text string to associate with one IP address.</p> <p>ipv6-address Enter the IPv6 address (X:X:X::X) to be mapped to the name.</p>
Defaults	Not configured.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the C-Series and S-Series.
8.4.1.0	Introduced on the E-Series.

ipv6 name-server

Enter up to six IPv6 addresses of name servers. The order you enter the addresses determines the order of their use.

Syntax `ipv6 name-server ipv6-address [ipv6-address2... ipv6-address6]`
To remove a name server, use the `no ipv6 name-server ipv6-address` command.

Parameters

<i>ipv6-address</i>	Enter the IPv6 address (X:X:X:X::X) of the name server to be used. Note: The :: notation specifies successive hexadecimal fields of zeros.
<i>ipv6-address2... ipv6-address6</i>	(OPTIONAL) Enter up to five more IPv6 addresses, in the x:x:x:x::x format, of name servers to be used. Separate the IPv6 addresses with a space.

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the C-Series and S-Series.
8.4.1.0	Introduced on the E-Series.

Usage Information You can separately configure both IPv4 and IPv6 domain name servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the `ip name-server` command is configured.

ipv6 nd dad attempts

To perform duplicate address detection (DAD) on an interface, configure the number of neighbor solicitation messages that are sent.

Syntax	<code>ipv6 nd dad attempts {number of attempts}</code> To restore the default value, use the <code>no ipv6 nd dad attempts</code> command.
Parameters	number of attempts Enter the number of attempts to be made to detect a duplicate address. The range is from 0 to 15. Setting the value to 0 disables DAD on the interface.
Default	3 attempts
Command Modes	INTERFACE (management interface only)
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

ipv6 nd disable-reachable-timer

Keep the learnt neighbor discovery entries stateless so that the entries do not time out.

Syntax	<code>ipv6 nd disable-reachable-timer</code> To restore to default, use the <code>no ipv6 nd disable-reachable-timer</code> command.
Default	Disabled
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.11.0.1	Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S4810, S4820, S5000, S6000, S6010-ON, S6000-ON, S6100-ON, Z9100-ON, C9010, Z9500, MXL, and FN IOM.

ipv6 nd dns-server

Configures Recursive DNS Server (RDNSS) addresses to be distributed via IPv6 router advertisements to an IPv6 device.

Syntax	<code>ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime infinite}</code> To remove the IPv6 RDSS configuration, use <code>no ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime infinite}</code>
---------------	--

Parameters	<i>ipv6-RDNSS-address</i>	Enter the IPv6 Recursive DNS Server's (RDNSS) address. You can specify up to 4 IPv6 RDNSS server addresses.
	<i>lifetime</i>	Enter the lifetime in seconds. The amount of time the IPv6 host can use the IPv6 RDNSS address for name resolution. The range is 0 to 4294967295 seconds. When you specify the maximum lifetime value of 4294967295 or <i>infinite</i> , the lifetime does not expire. A value of 0 indicates to the host that the RDNSS address should not be used. You must specify a lifetime using the <i>lifetime</i> or <i>infinite</i> parameter.
	<i>infinite</i>	Enter the keyword <i>infinite</i> to specify that the RDNSS lifetime does not expire.

Defaults Not Configured

Command Modes INTERFACE CONFIG

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9000, S6000, S4810, S4820T, and MXL..

Usage Information Use this command to add, edit, or delete an IPv6 RDNSS address and lifetime value. You can configure up to four IPv6 RDNSS addresses. You must specify a lifetime using the *lifetime* or *infinite* parameter.

Example

ipv6 nd prefix

Specify which IPv6 prefixes are included in Neighbor Advertisements.

Syntax `ipv6 nd prefix {ipv6-prefix | prefix-length | default} [no-advertise] | [no-autoconfig] [no-rtr-address] [off-link] [lifetime {valid | infinite} {preferred | infinite}]`

Parameters	<i>ipv6-prefix</i>	Enter an IPv6 prefix.
	<i>prefix-length</i>	Enter the prefix then the prefix length. The length range is from 0 to 128.
	default	Enter the keyword <i>default</i> to set default parameters for all prefixes.
	no-advertise	Enter the keyword <i>no-advertise</i> to prevent the specified prefix from being advertised.
	no-autoconfig	Enter the keywords <i>no-autoconfig</i> to disable Stateless Address Autoconfiguration.
	no-rtr-address	Enter the keyword <i>no-rtr-address</i> to exclude the full router address from router advertisements (the R bit is not set).

off-link	Enter the keywords <code>off-link</code> to advertise the prefix without stating to recipients that the prefix is either on-link or off-link.
valid-lifetime infinite	Enter the amount of time that the prefix is advertised, or enter <code>infinite</code> for an unlimited amount of time. The range is from 0 to 4294967295. The default is 2592000 . The maximum value means that the preferred lifetime does not expire for the valid-life time parameter.
preferred-lifetime infinite	Enter the amount of time that the prefix is preferred, or enter <code>infinite</code> for an unlimited amount of time. The range is from 0 to 4294967295. The default is 604800 . The maximum value means that the preferred lifetime and does not expire.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.2.0	Introduced on the E-Series, C-Series, and S-Series.

Usage Information By default, all prefixes configured as addresses on the interface are advertised. This command allows control over the individual parameters per prefix; you can use the `default` keyword to use the default parameters for all prefixes. If a prefix has been configured with lifetime parameter values, the default values cannot be applied using the `ipv6 nd prefix default no-autoconfig` command.

ipv6 nd reachable-time

Configure the amount of time before an IPv6 neighbor is considered unreachable.

Syntax `ipv6 nd reachable-time reachable-time`
To restore to default, use the `no ipv6 nd reachable-time` command.

Parameters **reachable-time** Enter the reachable time in milliseconds. The value is from 0 to 3600000. The default value is 0.

Default Disabled

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.12(1.0)	Introduced on the S5048F-ON.
Legacy version	Introduced on the S series and Z series.

ipv6 neighbor

Configure a static entry in the IPv6 neighbor discovery.

Syntax	<pre>ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface} {hardware_address}</pre> <p>To remove a static IPv6 entry from the IPv6 neighbor discovery, use the <code>no ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface}</code> command.</p>								
Parameters	<table><tr><td>vrf vrf-name</td><td>(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF.</td></tr><tr><td>ipv6-address</td><td>Enter the IPv6 address of the neighbor in the <code>x:x:x:x</code> format.  NOTE: The <code>::</code> notation specifies successive hexadecimal fields of zero.</td></tr><tr><td>interface interface</td><td>Enter the keyword <code>interface</code> then the interface type and slot/port or number information:<ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.• For a Null interface, enter the keyword <code>null</code> then the Null interface number.• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.• For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel interface number. The range is from 1 to 16383.</td></tr><tr><td>hardware_addresses</td><td>Enter a 48-bit hardware MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.</td></tr></table>	vrf vrf-name	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF.	ipv6-address	Enter the IPv6 address of the neighbor in the <code>x:x:x:x</code> format.  NOTE: The <code>::</code> notation specifies successive hexadecimal fields of zero.	interface interface	Enter the keyword <code>interface</code> then the interface type and slot/port or number information: <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.• For a Null interface, enter the keyword <code>null</code> then the Null interface number.• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.• For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel interface number. The range is from 1 to 16383.	hardware_addresses	Enter a 48-bit hardware MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
vrf vrf-name	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF.								
ipv6-address	Enter the IPv6 address of the neighbor in the <code>x:x:x:x</code> format.  NOTE: The <code>::</code> notation specifies successive hexadecimal fields of zero.								
interface interface	Enter the keyword <code>interface</code> then the interface type and slot/port or number information: <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.• For a Null interface, enter the keyword <code>null</code> then the Null interface number.• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.• For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel interface number. The range is from 1 to 16383.								
hardware_addresses	Enter a 48-bit hardware MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.								
Defaults	None								
Command Modes	CONFIGURATION								
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .								

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.1	Introduced on the S4810.

Usage Information

Neighbor Discovery Protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. It defines mechanisms for solving problems, such as:

- Router discovery: Hosts can locate routers residing on a link.
- Prefix discovery: Hosts can discover address prefixes for the link.
- Parameter discovery .
- Address autoconfiguration — configuration of addresses for an interface .
- Address resolution — mapping from IP address to link-layer address.
- Next-hop determination.
- Neighbor Unreachability Detection (NUD): Determine that a neighbor is no longer reachable on the link.
- Duplicate Address Detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

Use the `ipv6 neighbor` command to manually configure the IPv6 address of a neighbor to be discovered by the switch.

ipv6 route

Establish a static IPv6 route.

Z9500

Syntax

```
ipv6 route [vrf vrf-name] ipv6-address prefix-length {ipv6-address |  
interface | interface ipv6-address} [distance] [tag value] [permanent]  
[weight weight-value]
```

To remove the IPv6 route, use the `no ipv6 route` command.

Parameters

vrf <i>vrf-name</i>	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF.
<i>ipv6-address</i> <i>prefix-length</i>	Enter the IPv6 address in the <code>x:x:x:x</code> format then the prefix length in the <code>/x</code> format. The range is from <code>/0</code> to <code>/128</code> .  NOTE: The <code>::</code> notation specifies successive hexadecimal fields of zeros.
<i>interface</i>	(OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.• For a Null interface, enter the keyword <code>null</code> then the Null interface number.• For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel interface number. The range is from 1 to 16383.• For a VLAN interface, enter the keyword <code>VLAN</code> then the vlan number. The range is from 1 to 4094. <p>If you configure a static IPv6 route using an egress interface and enter the <code>ping</code> command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the <code>ping</code> command to detect the destination address.</p>
<i>ipv6-address</i>	(OPTIONAL) Enter the forwarding router IPv6 address in the <code>x:x:x:x</code> format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- distance** (OPTIONAL) Enter a number as the metric distance assigned to the route. The range is from 1 to 255.
- tag value** (OPTIONAL) Enter the keyword `tag` then a tag value number. The range is from 1 to 4294967295.
- permanent** (OPTIONAL) Enter the keyword `permanent` to specify that the route is not to be removed, even if the interface assigned to that route goes down.
 **NOTE:** If you disable the interface with an IPv6 address associated with the keyword `permanent`, the route disappears from the routing table.
- weight weight-value** Enter the keyword `weight` followed by a weight value. The range is from 0 to 255.
 **NOTE:** Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

Defaults None

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Also included the <code>weight</code> parameter to support weighted ECMP feature. Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information When the interface goes down, Dell EMC Networking OS withdraws the route. The route is re-installed, by Dell EMC Networking OS, when the interface comes back up. When a recursive resolution is “broken,” Dell EMC Networking OS withdraws the route. The route is re-installed, by Dell EMC Networking OS, when the recursive resolution is satisfied.

After an IPv6 static route interface is created, if an IP address is not assigned to a peer interface, the peer must be manually pinged to resolve the neighbor information.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

Example

```
DellEMC(conf)# ipv6 route 44::/64 33::1 weight 100
DellEMC(conf)# ipv6 route 44::/64 33::2 weight 200
DellEMC(conf)# do show running-config | grep ipv6 route
DellEMC(conf)# ipv6 route vrf vrf_test 44::/64 33::1 weight 100
DellEMC(conf)# ipv6 route vrf vrf_test 44::/64 33::2 weight 200
DellEMC(conf)# do show running-config | grep ipv6 route vrf
```

Related Commands

- [show ipv6 route](#) — view the IPv6 configured routes.

ipv6 unicast-host-route

Enable programming of IPv6 /128 route prefixes in L3 host table.

Syntax [no] ipv6 unicast-host-route

Defaults Enabled by default. By default, all the IPv6/128 route prefixes are installed only in L3 host table.

Command Modes CONFIGURATION

Command History

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.3(0.1)	Introduced on the S6000.

Usage Information

You can use this command to enable programming of /128 route prefixes in L3 host table or in LPM table. A warning message is displayed when you enter this command stating that this setting takes effect for existing routes only when IPv6 route prefixes are cleared from the routing table (RTM). To enable programming of /128 route prefixes in LPM table, use no ipv6 unicast-host-route command.

Example

```
DellEMC(conf)# ipv6 unicast-host-route
Warning: Command will take effect for existing routes only when IPv6
route prefixes are cleared from RTM
DellEMC(conf)#no ipv6 unicast-host-route
Warning: Command will take effect for existing routes only when IPv6
route prefixes are cleared from RTM
DellEMC(conf)#
```

ipv6 unicast-routing

Enable IPv6 unicast routing on the device.

Syntax ipv6 unicast-routing

To disable unicast routing, use the no ipv6 unicast-routing command.

Defaults	Enabled
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>DellEMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information Because this command is enabled by default, it does not appear in the running configuration. When you disable unicast routing, the `no ipv6 unicast-routing` command is included in the running configuration. Whenever unicast routing is disabled or re-enabled, DellEMC Networking OS generates a syslog message indicating the action.

Disabling unicast routing on an E-Series chassis causes the following behavior:

- static and protocol learned routes are removed from RTM and from the CAM; packet forwarding to these routes is terminated
- connected routes and resolved neighbors remain in the CAM and new IPv6 neighbors are still discoverable
- additional protocol adjacencies (OSPFv3 and BGP4) are brought down and no new adjacencies are formed
- the IPv6 address family configuration (under router bgp) is deleted
- IPv6 Multicast traffic continues to flow unhindered

show cam-ipv6 extended-prefix

Display the current settings and next-boot settings for cam-ipv6 extended-prefix configuration. Display the cam-ipv6 extended-prefix configuration.

Syntax `show cam-ipv6 extended-prefix`

Defaults None

Command Modes EXEC
EXEC **Privilege**

Command History	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.5(0.1)	Introduced on the Z9500.
9.3(0.1)	Introduced on the S6000.

Usage Information

You can use this command to view the number of supported extended prefix entries in LPM configured. The output also displays the current applied value and the new value that is applicable after the reboot of the device.

Example

```
DellEMC# show cam-ipv6 extended-prefix
Cam-Ipv6-LPM Extended Prefix
-----
Current Settings
cam-ipv6-max-/65-to-/128-Prefix : 2048
DellEMC(conf)#
```

show ipv6 cam linecard

Displays the IPv6 CAM entries for the specified line card and port pipe.

Z9500

Syntax

```
show ipv6 cam linecard slot-id port-set {0-3} [summary | ipv6-address]
```

Parameters

line card slot-id	Enter the slot ID of the line card. The range of Z9500 slot IDs is from 0 to 2.
port-set	Enter the keyword <code>port-set</code> followed by the port-pipe number. The range of Z9500 port-pipe numbers is: 0 to 2 on line card 0; 0 to 3 on line cards 1 and 2.
summary	(OPTIONAL) Enter the keyword <code>summary</code> to display a table listing network prefixes and the total number prefixes which can be entered into the IPv6 CAM.
ipv6-address	Enter the IPv6 address in the x:x:x:x/n format to display networks that have more specific prefixes. The range is from /0 to /128.  NOTE: The :: notation specifies successive hexadecimal fields of zeros.

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version 9.2(1.0)	Introduced on the Z9500.
Version 9.0.0.0	Introduced on the Z9000.
Version 8.3.19.0	Introduced on the S4820T.
Version 8.3.7.1	Introduced on the S4810.
Version 8.4.2.1	Introduced on the S-Series.

Usage Information

 **NOTE:** If a route has a mask greater than 64, no output is displayed but an equivalent /64 entry is listed in the `show ipv6 cam linecard {0-2} port-set {0-3}` output. Similarly, if there is more than one ECMP object with a destination route that has a mask greater than 64, if the first 64 bits in the destination routes of the ECMP objects are the same, only one route is installed in CAM even though multiple ECMP path entries exist.

Example

```
Dell# show ipv6 interface linecard 0
TenGigabitEthernet 0/2 is down, line protocol is down
  IPV6 is enabled
  Link Local address: fe80::7686:7aff:feff:6f08

show ipv6 management-route

Display the IPv6 static routes configured for the management interface.

Syntax `show ipv6 management-route [all | connected | summary | static]`

Parameters

- all** (OPTIONAL) Enter the keyword `all` to view all IP addresses assigned to all Management interfaces on the switch.
- connected** (OPTIONAL) Enter the keyword `connected` to view only routes directly connected to the Management interface.
- summary** (OPTIONAL) Enter the keyword `summary` to view a table listing the number of active and non-active routes and their sources.
- static** (OPTIONAL) Enter the keyword `static` to view non-active routes also.

Command Modes EXEC Privilege

Related Commands

- [ipv6 nd dad attempts](#) — configure system to set the flow label field in the packets to zero.

show ipv6 interface

Display the status of interfaces configured for IPv6.

Syntax `show ipv6 interface interface {slot | slot/port} [brief] [configured] [linecard slot-id]`

Parameters	<i>interface</i>	(OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none">• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.• For a port channel interface, enter the keywords <code>port-channel</code> then a number.• For a Null interface, enter the keyword <code>null</code> then the Null interface number.• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.• For stacking, enter the keywords <code>stack-unit</code> then the stack-unit ID.• For a tunnel interface, enter the keyword <code>tunnel</code> then the tunnel ID.
	brief	(OPTIONAL) View a summary of IPv6 interfaces.
	configured	(OPTIONAL) View information on all IPv6 configured interfaces.
	managementethernet <i>slot/port</i>	(OPTIONAL) View information on an IPv6 Management port. Enter the slot number (0-1) and port number zero (0).
	loopback	(OPTIONAL) View information for IPv6 Loopback interfaces.
	port-channel	(OPTIONAL) View information for IPv6 port channels.
	tengigabitethernet	(OPTIONAL) View information for an IPv6 tengigabitethernet interface.
	linecard <i>slot-id</i>	Enter the <code>linecard slot-id</code> parameters to specify the Z9500 ports on a line card. The range of slot IDs is from 0 to 2.
	tunnel <i>tunnel-id</i>	(OPTIONAL) View information for a tunnel interface.
	vlan	(OPTIONAL) View information for IPv6 VLANs.

Defaults None

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.11(0.0)	Updated the command output to include the unicast reverse path forwarding (uRPF) status.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.5(0.1)	Added support for IPv6 recursive DNS addresses on the Z9500.
9.2(1.0)	Introduced on the Z9500.
9.2.(0.0)	Added support for tunnel interface.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on the E-Series.
8.4.2.1	Introduced on the S-Series.
8.2.1.0	Introduced on the E-Series. Added support for the managementethernet slot/port parameter.
7.8.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information

The Management port is enabled by default (no shutdown). If necessary, use the `ipv6 address` command to assign an IPv6 address to the Management port.

Example

```
DelleMC# show ipv6 interface linecard 0
TenGigabitEthernet 0/2 is down, line protocol is down
  IPV6 is enabled
  Link Local address: fe80::7686:7aff:feff:6f08
  Global Unicast address(es):
    10:10:10:1::8, subnet is 10:10:10::/48 (MANUAL)
    Remaining lifetime: infinite
  Global Anycast address(es):
  Joined Group address(es):
    ff02::1
    ff02::2
    ff02::1:ff00:8
    ff02::1:ffff:6f08
  ND MTU is 0
  ICMP redirects are not sent
  DAD is enabled, number of DAD attempts: 3
  ND reachable time is 27000 milliseconds
  ND base reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds

IPv6 unicast RPF check is not supported
DellEMC#

```

show ipv6 mld_host

Display the IPv6 MLD host counters.

Syntax `show ipv6 mld_host`

Command Modes EXEC

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.2(1.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Usage Information The following describes the `show ipv6 mld-host` command shown in the following example.

Field	Description
Valid MLD Packets	The total number of packets received and sent from the last time the elapsed time was cleared.
Reports	The total number of reports (queries and unsolicited reports generated from joins or leaves) that have been received or sent.
Leaves	The number of Multicast leaves that have been sent.
MLDv1 queries	The number of MLDv1 queries that have been received.
MLDv2 queries	The number of MLDv2 queries that have been received.

Field	Description
Malformed Packets	The number of MLDv1 and MLDv2 packets that do not match the requirement for a valid MLD packet.

Example

```
MLD Host Traffic Counters
Elapsed time since counters cleared: 0028:33:52
      Received      Sent
Valid MLD Packets  97962      18036
Reports            79962      18034
Leaves             -----      0
MLDv2 Queries     18000      -----
MLDv1 Queries     0          -----
Errors:
Malformed Packets: 4510
```

show ipv6 neighbors

Display IPv6 discovery information. Entering the command without options shows all IPv6 neighbor addresses stored on the control processor (CP).

Z9500

Syntax

```
show ipv6 neighbors [vrf vrf-name] [cpu rp [ipv6-address] [ipv6-address]
interface interface]
```

Parameters

- | | |
|----------------------------|---|
| vrf vrf-name | (OPTIONAL) Enter the keyword <code>vrf</code> and the name of the VRF to display the neighbors corresponding to that VRF.
NOTE: If you do not specify this option, neighbors corresponding to the default VRF are displayed. |
| cpu rp | Enter the keywords <code>cpu rp</code> to display information about IPv6 neighbors learned only on the Route Processor. |
| ipv6-address | Enter the IPv6 address of a neighbor to display information about the specified device. |
| ipv6-address | Enter the IPv6 address of the neighbor in the <code>x:x:x:x</code> format.
NOTE: The <code>::</code> notation specifies successive hexadecimal fields of zero. |
| interface interface | Enter the keyword <code>interface</code> then the interface type and slot/port or number information: <ul style="list-style-type: none"> • For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. • For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information. • For a Management interface, enter the keyword <code>managementethernet</code> followed by slot/port numbers. • For a Port Channel interface, enter the keywords <code>port-channel</code> followed by a number. • For a port channel interface, enter the keywords <code>port-channel</code> then a number. • For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094. |

Defaults

None

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.1	Introduced on the S4810.

Example

```
DelleMC# show ipv6 neighbors

*      - Active session role
Ad Dn - Admin Down
B      - BGP
C      - CLI
I      - ISIS
O      - OSPF
R      - Static Route (RTM)

  LocalAddr  RemoteAddr  Interface  State  Rx-int  Tx-int  Mult  Clients
* 10.1.3.2   10.1.3.1    Te 1/3     Up     300     250    3     C
```

```
DelleMC# show ipv6 neighbors detail

Session Discriminator: 1
Neighbor Discriminator: 1
Local Addr: 10.1.3.2

Client Registered: CLI
Uptime: 00:02:04
Statistics:
  Number of packets received from neighbor: 376
  Number of packets sent to neighbor: 314
  Number of state changes: 2
  Number of messages from IFA about port state change: 0
  Number of messages communicated b/w Manager and Agent: 6
DelleMC#
```

show ipv6 route

Displays the IPv6 routes.

Z9500

Syntax

```
show ipv6 route [ipv6-address prefix-length] [vrf vrf-name] [hostname]
[all] [bgp as number] [connected] [isis tag] [list prefix-list name] [ospf
process-id] [rip] [static] [summary]
```

Parameters

ipv6-address	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.
prefix-length	 NOTE: The :: notation specifies successive hexadecimal fields of zeros.
vrf vrf-name	(Optional) Enter the keyword vrf followed by the name of the VRF to display IPv6 routes corresponding to that VRF.  NOTE: If you do not specify this option, routes corresponding to the default VRF are displayed.
hostname	(OPTIONAL) View information for this IPv6 routes with Host Name.
all	(OPTIONAL) View information for all IPv6 routes.
bgp	(OPTIONAL) View information for all IPv6 BGP routes.
connected	(OPTIONAL) View only the directly connected IPv6 routes.
isis	(OPTIONAL) View information for all IPv6 IS-IS routes.
list	(OPTIONAL) View the IPv6 prefix list.
ospf	(OPTIONAL) View information for all IPv6 OSPF routes.
rip	(OPTIONAL for E-Series only) View information for all IPv6 RIP routes.
static	(OPTIONAL) View only routes configured by the <code>ipv6 route</code> command.
summary	(OPTIONAL) View a brief list of the configured IPv6 routes.

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

Usage Information

The following describes the `show ipv6 route` command shown in the following examples.

Field	Description
(undefined)	Identifies the type of route: <ul style="list-style-type: none"> • L = Local • C = connected • S = static • R = RIP • B = BGP • IN = internal BGP • EX = external BGP • LO = Locally Originated • O = OSPF • IA = OSPF inter-area • N1 = OSPF NSSA external type 1 • N2 = OSPF NSSA external type 2 • E1 = OSPF external type 1 • E2 = OSPF external type 2 • i = IS-IS • L1 = IS-IS level-1 • L2 = IS-IS level-2 • IA = IS-IS inter-area • * = candidate default • > = non-active route • + = summary routes
Destination	Identifies the route's destination IPv6 address.
Gateway	Identifies whether the route is directly connected and on which interface the route is configured.
Dist/Metric	Identifies if the route has a specified distance or metric.
Last Change	Identifies when the route was last changed or configured.

Example (S-Series)

```
DellEMC# show ipv6 route

Codes: C - connected, L - local, S - static, R - RIP,
       B - BGP, IN - internal BGP, EX - external BGP, LO - Locally
Originated,
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
       L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default,
Gateway of last resort is not set

  Destination  Dist/Metric,      Gateway,    Last Change
  -----
C    100::/64 [0/0]
      Direct, Te 1/12/1, 20:00:18
C    400::/64 [0/0]
      Direct, Tu 1, 00:09:02
S    800::/64 [1/0]
      via 100::1, Te 1/12/1, 00:00:50
```

```
L fe80::/10 [0/0]
   Direct, Nu 0, 20:00:18
DelleMC#
```

**Example
(Summary)**

```
show ipv6 route summary:
=====
DelleMC# show ipv6 route summary

Route Source           Active Routes   Non-active Routes
connected              3                0
static                 1                0
Total                  4                0
Total 4 active route(s) using 928 bytes
DelleMC#
```

iSCSI Optimization

Internet small computer system interface (iSCSI) optimization enables quality-of-service (QoS) treatment for iSCSI storage traffic on a switch.

To configure and verify the iSCSI optimization feature, use the following Dell Networking OS commands.

Topics:

- [advertise dcbx-app-tlv](#)
- [iscsi aging time](#)
- [iscsi cos](#)
- [iscsi enable](#)
- [iscsi priority-bits](#)
- [iscsi profile-compellant](#)
- [iscsi target port](#)
- [show iscsi](#)
- [show iscsi session](#)
- [show iscsi session detailed](#)
- [show run iscsi](#)

advertise dcbx-app-tlv

Configure DCBX to send iSCSI TLV advertisements.

C9000 Series

Syntax	<code>advertise dcbx-app-tlv iscsi</code> To disable DCBX iSCSI TLV advertisements, use the <code>no advertise dcbx-app-tlv iscsi</code> command.						
Defaults	Disabled.						
Command Modes	PROTOCOL LLDP						
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is the Dell Networking OS version history for this command.						
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.9(0.0)</td> <td>Introduced on the C9010.</td> </tr> <tr> <td>9.6(0.0)</td> <td>Introduced on the Z9500.</td> </tr> </tbody> </table>	Version	Description	9.9(0.0)	Introduced on the C9010.	9.6(0.0)	Introduced on the Z9500.
Version	Description						
9.9(0.0)	Introduced on the C9010.						
9.6(0.0)	Introduced on the Z9500.						
Usage Information	You can configure iSCSI TLVs to send either globally or on a specified interface. The interface configuration takes priority over global configuration.						

iscsi aging time

Set the aging time for iSCSI sessions.

Syntax `iscsi aging time time`

To remove the iSCSI session aging time, use the `no iscsi aging time` command.

Parameters **time** Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes.

Defaults **10 minutes**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

iscsi cos

Set the QoS policy that is applied to the iSCSI flows.

Syntax `iscsi cos {enable | disable | dot1p vlan-priority-value [remark] | dscp dscp-value [remark]}`

To disable the QoS policy, use the `no iscsi cos` command.

Parameters

enable	Enter the keyword <code>enable</code> to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default is: the iSCSI packets are handled with dotp1 priority 4 without remark.
disable	Enter the keyword <code>disable</code> to disable the application of preferential QoS treatment to iSCSI frames.
dot1p vlan-priority-value	Enter the dot1p value of the VLAN priority tag assigned to the incoming packets in an iSCSI session. The range is from 0 to 7. The default is the dot1p value in ingress iSCSI frames is not changed and is the same priority is used in iSCSI TLV advertisements if you did not enter the <code>iscsi priority-bits</code> command.
dscp dscp-value	Enter the DSCP value assigned to the incoming packets in an iSCSI session. The valid range is from 0 to 63. The default is: the DSCP value in ingress packets is not changed.
remark	Marks the incoming iSCSI packets with the configured dot1p or DSCP value when they egress to the switch. The default is: the dot1p and DSCP values in egress packets are not changed.

Defaults Disabled.

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

Usage Information By default, iSCSI flows are assigned to dot1p priority 4.

iscsi enable

Globally enable iSCSI optimization.

Syntax	<code>iscsi enable</code> To disable iSCSI optimization, use the <code>no iscsi enable</code> command.
Parameters	enable Enter the keyword <code>enable</code> to enable the iSCSI optimization feature.
Defaults	Disabled.
Command Modes	CONFIGURATION
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

iscsi priority-bits

Configure the priority bitmap that advertises in the iSCSI application TLVs.

Syntax	<code>iscsi priority-bits</code> To remove the configured priority bitmap, use the <code>no iscsi priority-bits</code> command.
Defaults	4 (0x10 in the bitmap)
Command Modes	PROTOCOL LLDP (only on the global, not on the interface)
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

iscsi profile-compellent

Configure the auto-detection of Dell Compellent arrays on a port.

Syntax	<code>iscsi profile-compellent</code>
Defaults	Dell Compellent disk arrays are not detected.
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6.(0.0)	Introduced on the Z9500.

iscsi target port

Configure the iSCSI target ports and optionally, the IP addresses on which iSCSI communication is monitored.

Syntax `iscsi target port [tcp-port-2...tcp-port-16]ip-address [ip-address]`
To remove the configured iSCSI target ports or IP addresses, use the `no iscsi target port` command.

Parameters

tcp-port-2...tcpport-16	Enter the tcp-port number of the iSCSI target ports. The <code>tcp-port-n</code> is the TCP port number or a list of TCP port numbers on which the iSCSI target listens to requests. Separate port numbers with a comma. The default is 860, 3260 .
ip-address (Optional)	Enter the ip-address that the iSCSI monitors. The ip-address specifies the IP address of the iSCSI target.

Defaults **860, 3260**

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

Usage Information You can configure up to 16 target TCP ports on the switch in one command or multiple commands. When you use the `no iscsi target port` command and the TCP port you wish to delete is one bound to a specific IP address, the IP address value must be included in the command.

show iscsi

Display the currently configured iSCSI settings.

Syntax `show iscsi`

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

Example

```
Dell#show iscsi
iSCSI is enabled
iSCSI session monitoring is disabled
iSCSI COS : dot1p is 4 no-remark
Session aging time: 10
Maximum number of connections is 256
-----
iSCSI Targets and TCP Ports:
-----
TCP Port Target IP Address
3260
860
```

- Related Commands**
- [show iscsi session](#)— displays information about active iSCSI sessions on the switch.
 - [show iscsi session detailed](#)— displays detailed information about active iSCSI sessions on the switch.
 - [show run iscsi](#)— shows `run iscsi`.

show iscsi session

Display information about active iSCSI sessions on the switch.

Syntax `show iscsi session`

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

Example

```
Dell# show iscsi session
Session 0:
-----
Target: iqn.2001-05.com.equallogic:0-8a0906-0e70c2002-10a0018426a48c94-
iom010
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg
ISID: 400001370000

Session 1:
-----
Target: iqn.2001-05.com.equallogic:0-8a0906-0f60c2002-0360018428d48c94-
iom011
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg
ISID: 400001370000.
```

Usage Information

Only sessions the switch observes are learned; sessions flowing through an adjacent switch are not learned.

After the switch is reloaded, any information exchanged during the initial handshake is not available. If the switch picks up the communication after reloading, it would detect a session was in progress but could not obtain complete information for it. Any incomplete information of this type would not be available in the `show` commands.

- Related Commands**
- [show iscsi](#) — displays the currently configured iSCSI settings.
 - [show iscsi session detailed](#)— displays detailed information about active iSCSI sessions on the switch.
 - [show run iscsi](#)— shows `run iscsi`.

show iscsi session detailed

Display detailed information on active iSCSI sessions on the switch.

Syntax `show iscsi session detailed [session isid]`

Parameters

isid Enter the session's iSCSi ID to display detailed information about the specified iSCSi session.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Introduced on the Z9500.

Example

```
Dell# show iscsi session detailed
Session 0 :
-----
Target:iqn.2010-11.com.ixia:ixload:iscsi-TG1
Initiator:iqn.2010-11.com.ixia.ixload:initiator-iscsi-2c
Up Time:00:00:01:28 (DD:HH:MM:SS)
Time for aging out:00:00:09:34 (DD:HH:MM:SS)
ISID:806978696102
Initiator   Initiator Target      Target  Connection
IP Address TCP Port  IP Address TCPPort ID

Initiator   Initiator Target      Target  Connection
IP Address TCP Port  IP Address TCPPort ID
10.10.0.53  33432    10.10.0.101 3260   0
```

Related Commands

- [show iscsi](#)— displays the currently configured iSCSI settings.
- [show iscsi session](#)— displays information about active iSCSI sessions on the switch.
- [show run iscsi](#) — shows run `iscsi`.

show run iscsi

Display all globally configured non-default iSCSI settings in the current Dell Networking OS session.

Syntax `show run iscsi`

Command Modes EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version 9.6(0.0)	Introduced on the Z9500.
-------------------------	--------------------------

Related Commands

- [show iscsi](#)— displays the currently configured iSCSI settings.
- [show iscsi session](#)— displays detailed information about active iSCSI sessions on the switch.
- [show iscsi session detailed](#)— displays detailed information on active iSCSI sessions on the switch.

Intermediate System to Intermediate System (IS-IS)

IS-IS is an interior gateway protocol that uses shortest-path-first algorithm. IS-IS facilitates the communication between open systems, supporting routers passing through both IP and OSI traffic.

A router is considered as an intermediate system. Networks are partitioned into manageable routing domains called areas. Intermediate systems send, receive, and forward packets to other routers within their area (Level 1 and Level 1-2 devices). Only Level 1-2 and Level 2 devices communicate with other areas.

IS-IS protocol standards are listed in the Standard Compliance chapter in the *Dell EMC Networking OS Configuration Guide*.

i **NOTE:** The fundamental mechanisms of IS-IS are the same for IPv4 and IPv6. However some command modes might vary when applied to IPV4 and IPV6. These variations have been explicitly explained for such commands. If the variation is not mentioned, then the information applies to both the protocol versions.

- show isis protocol
- show isis traffic
- spf-interval

adjacency-check

Verify that the “protocols supported” field of the IS-IS neighbor contains matching values to this router.

Syntax adjacency-check

To disable adjacency check, use the `no adjacency-check` command.

Defaults Enabled.

Command Modes • ROUTER ISIS (*for IPv4*)
 • CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Introduced on the E-Series.

Usage Information

To perform protocol-support consistency checks on hello packets, use this command. The adjacency-check is enabled by default.

If a BFD session goes down indicating that IPv4 or IPv6 connectivity to its neighbor is lost, it does not imply that the adjacency is lost altogether. The hello adjacency runs over Layer 2, and does not require IP connectivity. However, if IPv4 connectivity is lost to a neighbor, then when the next SPF calculation is performed, the system ensures that it does not calculate any IPv4 or IPv6 routes through that neighbor.

advertise

Leak routes between levels (distribute IP prefixes between Level 1 and Level 2 and vice versa).

Syntax

```
advertise {level1-into-level2 | level2-into-level1} prefix-list-name
```

To return to the default, use the `no advertise {level1-into-level2 | level2-into-level1} [prefix-list-name]` command.

Parameters

- level1-into-level2** Enter the keywords `level1-into-level2` to advertise Level 1 routes into Level 2 LSPs. This setting is the default.
- level2-into-level1** Enter the keywords `level2-into-level1` to advertise Level 2 inter-area routes into Level 1 LSPs. This behavior is described in RFC 2966.
- prefix-list-name** Enter the name of a configured IP prefix list. Routes meeting the criteria of the IP Prefix list are leaked.

Defaults

- level1-into-level2** (Level 1 to Level 2 leaking is enabled.)
- level2-into-level1** (Level 2 to Level 1) leaking is disabled.

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Version 6.3.1.0 Introduced

Usage Information

You cannot disable leaking from Level 1 to Level 2. Also, you cannot enable leaking from Level 2 to Level 1. However, you can regulate the rate flow from one level to another using an IP Prefix list. If you do not configure the IP Prefix list, all Level 1 routes are leaked.

You can find more information in IETF RFC 2966, *Domain-wide Prefix Distribution with Two-Level IS-IS*.

area-password

Configure a hash message authentication code (HMAC) password for an area.

Syntax `area-password [hmac-md5 | encryption-type] password`

To delete a password, use the `no area-password` command.

Parameters

- hmac-md5** (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password.
- encryption-type** (OPTIONAL) Enter 7 to encrypt the password using DES.
- password** Enter a 1 to 16-character length alphanumeric string to prevent unauthorized access or incorrect routing information corrupting the link state database. The password is processed as plain text, which only provides limited security.

Defaults Not configured.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.

Usage Information

To prevent the link state database from receiving incorrect routing information from unauthorized routers, use the `area-password` command on routers within an area.

The configured password injects into Level 1 LSPs, CSNPs, and PSNPs.

Related Commands

- [domain-password](#) — set the authentication password for a routing domain.
- [isis password](#) — configure an authentication password for an interface.

clear config

Clear IS-IS configurations that display under the *router isis* heading of the `show running-config` command output.

Syntax `clear config`

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

The following is a list of the Dell EMC Networking OS version history for this command.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.1	Introduced on the S4810.

Usage Information

 **CAUTION: Use caution when you enter this command. Back up your configuration prior to using this command or your IS-IS configuration will be erased.**

clear isis

Restart the IS-IS process. All IS-IS data is cleared.

Z9500

Syntax `clear isis [vrf vrf-name] [tag] {* | database | traffic}`

Parameters	vrf <i>vrf-name</i>	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to restart the IS-IS process corresponding to that VRF.
	tag	(Optional) Enter an alphanumeric string to specify the IS-IS routing tag area.
	*	Enter the keyword <code>*</code> to clear all IS-IS information and restart the IS-IS process. This command removes IS-IS neighbor information and IS-IS LSP database information and the full SPF calculation is done.
	database	Clears IS-IS LSP database information.
	traffic	Clears IS-IS counters.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

clns host

Define a name-to-network service mapping point (NSAP) that you use with commands that require NSAPs and system IDs.

Syntax `clns host name nsap`

Parameters	<i>name</i>	Enter an alphanumeric string to identify the name-to-NSAP mapping.
	<i>nsap</i>	Enter a specific NSAP address that is associated with the name parameter.

Defaults Not configured.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

To configure a shortcut name that you can use instead of entering a long string of numbers associated with an NSAP address, use this command.

Related Commands

- [hostname dynamic](#) — enable dynamic learning of host names from routers in the domain and allows the routers to advertise the host names in LSPs.

debug isis

Enable debugging for all IS-IS operations.

Syntax

`debug isis`

To disable debugging of IS-IS, use the `no debug isis` command.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

Entering `debug isis` enables all debugging parameters.

To display all debugging information in one output, use this command. To turn off debugging, you normally enter separate `no` forms of each command. To disable all debug messages for IS-IS at once, enter the `no debug isis` command.

debug isis adj-packets

Enable debugging on adjacency-related activity such as hello packets that are sent and received on IS-IS adjacencies.

Z9500

Syntax `debug isis [vrf vrf-name] adj-packets [interface]`
To turn off debugging, use the `no debug isis [vrf vrf-name]adj-packets [interface]` command.

Parameters

vrf vrf-name (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable the debug information on IS-IS for an adjacency tied to that VRF. This command displays the IIH related debug details.

interface (OPTIONAL) Identifies the interface type and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

debug isis graceful-restart

Enables debugging information on IS-IS; this information contains graceful-restart details that are tied to a VRF. It displays GR hello, internal state, and event debugs.

Z9500

Syntax `debug isis [vrf vrf-name] graceful-retart [all | events | hello | states]`
To turn off debugging, use the `no debug isis [vrf vrf-name] spf-triggers` command.

Parameters

vrf vrf-name	(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains graceful-restart details tied to the VRF that you specify. This information includes GR Hello, Internal State, and Event Debug details.
all	Enter the keyword all to enable debugging information that includes all the logs that are related to graceful-restart.
events	Enter the keyword events to enable debugging information that includes logs that are related to generated events.
hello	Enter the keyword hello to enable debugging information that includes restart TLV related information.
states	Enter the keyword states to enable debugging information that includes state machine related information.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.

debug isis local-updates

To debug IS-IS local update packets, enable debugging on a specific interface and provides diagnostic information.

Z9500

Syntax `debug isis [vrf vrf-name] local-updates [interface]`
To turn off debugging, use the `no debug isis [vrf vrf-name] updates [interface]` command.

Parameters

vrf vrf-name	(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable the debugging information on IS-IS corresponding to that VRF. This information contains local updates tied to the VRF that you specify. This command displays the local LSP debugging details of the current unit.
interface	(OPTIONAL) Identifies the interface type as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
6.3.1.0	Introduced.

debug isis snp-packets

To debug IS-IS complete sequence number PDU (CSNP) and partial sequence number PDU (PSNP) packets, enable debugging on a specific interface and provides diagnostic information.

Z9500

Syntax `debug isis [vrf vrf-name] snp-packets [interface]`
 To turn off debugging, use the `no debug isis [vrf vrf-name] snp-packets [interface]` command.

Parameters

vrf vrf-name (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable debugging information on ISIS for CSNP/PSNP packets tied to that VRF. The command displays the SNP (CSNP/PSNP) related debugging information.

interface (OPTIONAL) Identifies the interface type as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
6.3.1.0	Introduced.

debug isis spf-triggers

Enable debugging on the events that triggered IS-IS shortest path first (SPF) events for debugging purposes.

Z9500

Syntax `debug isis [vrf vrf-name] spf-triggers`

To turn off debugging, use the `no debug isis [vrf vrf-name] spf-triggers` command.

Parameters **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains SPF trigger detail tied to the VRF that you specify. When SPF is triggered, this debugging information is displayed.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

Version	Description
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced.

debug isis update-packets

Enable debugging on link state PDUs (LSPs) that a router detects.

Z9500

Syntax

```
debug isis [vrf vrf-name] update-packets [interface]
```

To turn off debugging, use the `no debug isis update-packets [interface]` command.

Parameters

- vrf *vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable the debugging information on IS-IS. This information contains updates from neighbors tied to the VRF that you specify. This command displays the debugging details of the received LSPs from the neighbors.
- interface*** (OPTIONAL) Identifies the interface type and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
6.3.1.0	Introduced.

default-information originate

Generates a default route into an IS-IS routing domain and controls the distribution of default information.

Syntax `default-information originate [always] [metric metric] [route-map map-name]`

To disable the generation of a default route into the specified IS-IS routing domain, use the `no default-information originate [always] [metric metric] [route-map map-name]` command.

Parameters

- always** (OPTIONAL) Enter the keyword `always` to have the default route always advertised.
- metric *metric*** (OPTIONAL) Enter the keyword `metric` then a number to assign to the route. The range is from 0 to 16777215.
- route-map *map-name*** (OPTIONAL) A default route the routing process generates if the route map is satisfied.

Defaults Not configured.

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Version	Description
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

Usage Information

When you use this command to redistribute routes into a routing domain, the router becomes an autonomous system (AS) boundary router. An AS boundary router does not always generate a default route into a routing domain. The router still requires its own default route before it can generate one.

How a metric value assigned to a default route advertises depends on the `metric-style` command configuration. If the `metric-style` command is set for Narrow mode and the metric value in the `default-information originate` command is set to a number higher than 63, the metric value advertised in the LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `default-information originate` command is advertised.

Related Commands

- [redistribute](#) — redistribute routes from one routing domain to another routing domain.

description

Enter a description of the IS-IS routing protocol.

Syntax

```
description {description}
```

To remove the description, use the `no description {description}` command.

Parameters

description Enter a description to identify the IS-IS protocol (80 characters maximum).

Defaults

None

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
pre-7.7.1.0	Introduced.

Related Commands

- [router isis](#) — enter ROUTER mode on the switch.

distance

Define the administrative distance for learned routes.

Syntax `distance weight [ip-address mask [prefix-list]]`
To return to the default values, use the `no distance weight` command.

Parameters

- weight** The administrative distance value indicates the reliability of a routing information source. The range is from 1 to 255. (A higher relative value indicates lower reliability. Routes with smaller values are given preference.) The default is **115**.
- ip-address mask** (OPTIONAL) Enter the next-hop address in dotted decimal format and enter a mask in either dotted decimal or /prefix format.
- prefix-list** (OPTIONAL) Enter the name of a prefix list name.

Defaults weight = **115**

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced.

Usage Information The administrative distance indicates the trust value of incoming packets. A low administrative distance indicates a high trust rate. A high value indicates a lower trust rate. For example, a weight of 255 is interpreted that the routing information source is not trustworthy and should be ignored.

distribute-list in

Filter network prefixes received in updates.

Z9500

Syntax `distribute-list prefix-list-name in [interface]`

To return to the default values, use the `no distribute-list prefix-list-name in [interface]` command.

Parameters

- prefix-list-name*** Specify the prefix list to filter prefixes in routing updates.
- interface*** (OPTIONAL) Identifies the interface type and the interface following:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults

Not configured.

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

Related Commands

- [distribute-list out](#) — suppress networks from being advertised in updates.
- [redistribute](#) — redistribute routes from one routing domain to another routing domain.

distribute-list out

Suppress network prefixes from being advertised in outbound updates.

Syntax

```
distribute-list prefix-list-name out [connected | bgp as number | ospf process-id | rip | static]
```

To return to the default values, use the `no distribute-list prefix-list-name out [bgp as number connected | ospf process-id | rip | static]` command.

Parameters

- prefix-list-name*** Specify the prefix list to filter prefixes in routing updates.

connected	(OPTIONAL) Enter the keyword <code>connected</code> for directly connected routing process.
ospf <i>process-id</i>	(OPTIONAL) Enter the keyword <code>ospf</code> then the OSPF process-ID number. The range is from 1 to 65535.
bgp <i>as number</i>	(OPTIONAL) Enter the BGP then the AS Number. The range is from 1 to 65535.
rip	(OPTIONAL) Enter the keyword <code>rip</code> for RIP routes.
static	(OPTIONAL) Enter the keyword <code>static</code> for user-configured routing process.

Defaults Not configured.

- Command Modes**
- ROUTER ISIS (*for IPv4*)
 - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

Usage Information You can assign a name to a routing process so a prefix list IS applied to only the routes derived from the specified routing process.

- Related Commands**
- [distribute-list in](#) — filter the networks received in updates.
 - [redistribute](#) — redistribute routes from one routing domain to another routing domain.

distribute-list redistributed-override

Suppress flapping of routes when the same route is redistributed into IS-IS from multiple routers in the network.

Syntax `distribute-list redistributed-override in`
To return to the default, use the `no distribute-list redistributed-override in` command.

Defaults none

- Command Modes**
- ROUTER ISIS (*for IPv4*)
 - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Added IPv6 ISIS support.
6.3.1.0	Introduced.

Usage Information

When you execute this command, IS-IS does not download the route to the routing table if the same route was redistributed into IS-IS routing protocol on the same router.

domain-password

Set the authentication password for a routing domain.

Syntax `domain-password [hmac-md5 | encryption-type] password`

To disable the password, use the `no domain-password` command.

Parameters

- hmac-md5** (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- encryption-type** (OPTIONAL) Enter 7 to encrypt the password using DES.
- password** Enter an alphanumeric string up to 16 characters long. If you do not specify an `encryption-type` or `hmac-md5` keywords, the password is processed as plain text which provides limited security.

Defaults No default password.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced.

Usage Information

The domain password is inserted in Level 2 link state PDUs (LSPs), complete sequence number PDUs (CSNPs), and partial sequence number PDUs (PSNPs).

Related Commands

- [area-password](#) — configure an IS-IS area authentication password.
- [isis priority](#) — configure the authentication password for an interface.

graceful-restart ietf

Enable graceful restart on an IS-IS router.

Syntax

`graceful-restart ietf`

To return to the default, use the `no graceful-restart ietf` command.

Parameters

ietf Enter `ietf` to enable graceful restart on the IS-IS router.

Defaults

Graceful restart disabled.

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
6.3.1.0	Introduced on the E-Series.

Usage Information

Every graceful restart enabled router's HELLO PDUs includes a restart TLV. This restart enables (re)starting as well as the existing ISIS peers to detect the GR capability of the routers on the connected

network. A flag in the Restart TLV contains restart request (RR), restart acknowledge (RA) and suppress adjacency advertisement (SA) bit flags.

The ISIS graceful restart-enabled router can co-exist in mixed topologies where some routers are graceful restart-enabled and others are not. For neighbors that are not graceful restart-enabled, the restarting router brings up the adjacency per the usual methods.

graceful-restart interval

Set the graceful restart grace period, the time during that all graceful restart attempts are prevented.

Syntax	<code>graceful-restart interval minutes</code> To return to the default, use the <code>no graceful-restart interval</code> command.
Parameters	minutes Enter the graceful-restart interval minutes. The range is from 1 to 20 minutes. The default is 5 minutes .
Defaults	5 minutes
Command Modes	ROUTER ISIS
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

graceful-restart restart-wait

Enable the graceful restart maximum wait time before a restarting peer comes up.

Syntax	 NOTE: Set the t3 timer to <code>adjacency</code> on the restarting router when implementing this command. <code>graceful-restart restart-wait seconds</code> To return to the default, use the <code>no graceful-restart restart-wait</code> command.
---------------	--

Parameters **seconds** Enter the graceful restart time in seconds. The range is from 5 to 300 seconds. The default is **30 seconds**.

Defaults **30 seconds**

Command Modes ROUTER ISIS

8.3.1.0	Introduced on the E-Series.

Related Commands

- [graceful-restart t3](#) — configure the overall wait time before graceful restart completes.

graceful-restart t1

Set the graceful restart wait time before unacknowledged restart requests are generated. This wait time is the interval before the system sends a restart request (an IIH with RR bit set in Restart TLV) until the CSNP is received from the helping router.

Syntax `graceful-restart t1 {interval seconds | retry-times value}`

To return to the default, use the `no graceful-restart t1` command.

Parameters **interval** Enter the keyword `interval` to set the wait time. The range is from 5 to 120 seconds. The default is **5 seconds**.

retry-times Enter the keywords `retry-times` to set the number of times the request interval is extended until a CSNP is received from the helping router. The range is from 1 to 10 attempts. The default is **1**.

Defaults See *Parameters*.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

Version	Description
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

graceful-restart t3

Configure the overall wait time before graceful restart completes.

Syntax `graceful-restart t3 {adjacency | manual} seconds`
 To return to the default, use the `no graceful-restart t3` command.

Parameters

- adjacency** Enter the keyword `adjacency` so that the restarting router receives the remaining time value from its peer and adjusts its T3 value so if you have configured this option.
- manual** Enter the keyword `manual` to specify a time value that the restarting router uses. The range is from 50 to 120 seconds. The default is **30 seconds**.

Defaults manual, **30 seconds**

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

Usage Information The running router sets the remaining time value to the current adjacency hold time. You can override this setting by implementing this command.

Override the default restart-wait time by entering the `no graceful-restart restart-wait` command. When you disable `restart-wait`, the current adjacency hold time is used.

Set the `t3` timer to `adjacency` on the restarting router when implementing this command. The restarting router gets the remaining time value from its peer and adjusts its T3 value so only when you have configured `graceful-restart t3 adjacency`.

Related Commands

- [graceful-restart restart-wait](#) — enable the graceful restart maximum wait time before a restarting peer comes up.

hello padding

Use to turn ON or OFF padding for LAN and point-to-point hello PDUs or to selectively turn padding ON or OFF for LAN or point-to-point hello PDUs.

Syntax

```
hello padding [multi-point | point-to-point]
```

To return to the default, use the `no hello padding [multi-point | point-to-point]` command.

Parameters

- multi-point** (OPTIONAL) Enter the keywords `multi-point` to pad only LAN hello PDUs.
- point-to-point** (OPTIONAL) Enter the keywords `point-to-point` to pad only point-to-point PDUs.

Defaults

Both LAN and point-to-point hello PDUs are padded.

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS Hellos (IHHS) to the full MTU provides early error detection of large frame transmission problems or mismatched MTUs on adjacent interfaces.

Related Commands

- [isis hello padding](#) — turn ON or OFF hello padding on an interface basis.

hostname dynamic

Enables dynamic learning of hostnames from routers in the domain and allows the routers to advertise the hostname in LSPs.

Syntax

```
hostname dynamic
```

To disable this command, use the `no hostname dynamic` command.

Defaults	Enabled.

9.8(0.0P2)	Introduced on the S3048-ON.																		
9.7(0.0)	Introduced on the S6000-ON.																		

Version	Description
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

IS-IS normally purges LSPs with an incorrect data link checksum causing the LSP source to regenerate the message. A cycle of purging and regenerating LSPs can occur when a network link continues to deliver accurate LSPs even though there is a link causing data corruption. This process could cause disruption to your system operation.

ip router isis

Configure IS-IS routing processes on an interface and attach an area tag name to the routing process.

Syntax

`ip router isis [tag]`

To disable IS-IS on an interface, use the `no ip router isis [tag]` command.

Parameters

tag (OPTIONAL) The tag you specify identifies a specific area routing process. If you do not specify a tag, a null tag is assigned.

Defaults

No processes are configured.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Introduced.

Usage Information

To assign a network entity title to enable IS-IS, use the `net` command.

This command accepts even if an IP address is not configured. This command is cached in the L3 Manager till the IP address is configured. When the IP address configuration reaches the L3Manager, the circuit add message is sent to IS-IS.

 **NOTE:** IP address is not mandatory for forming IS-IS adjacency.

**Related
Commands**

- [net](#) — configure an IS-IS network entity title (NET) for the routing process.
- [router isis](#) — enable the IS-IS routing protocol.

ipv6 router isis

Enable the IPv6 IS-IS routing protocol and specify an IPv6 IS-IS process.

Syntax

```
ipv6 router isis [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

Parameters

tag

(OPTIONAL) This parameter is a unique name for a routing process. A null tag is assumed if the tag option is not specified. The tag name must be unique for all IP router processes for a given router.

Defaults

Not configured.

Command Modes

ROUTER ISIS

Version

Description

9.10(0.1)

Introduced on the S6010-ON and S4048T-ON.

9.10(0.0)

Introduced on the S3148.

9.10(0.0)

Introduced on the S6100-ON.

9.8(2.0)

Introduced on the S3100 series.

9.8(1.0)

Introduced on the Z9100-ON.

9.8(0.0P5)

Introduced on the S4048-ON.

9.8(0.0P2)

Introduced on the S3048-ON.

9.7(0.0)

Introduced on the S6000-ON.

9.5(0.1)

Introduced on the Z9500.

9.0.2.0

Introduced on the S6000.

8.3.19.0

Introduced on the S4820T.

8.3.12.0

Introduced on the S4810.

8.3.11.1

Introduced on the Z9000.

7.5.1.0

Introduced on the E-Series.

**Usage
Information**

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

To establish adjacencies and establish dynamic routing, enable routing on one or more interfaces.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

**Related
Commands**

- [net](#) — configure an IS-IS network entity title (NET) for the routing process.
- [is-type](#) — assign a type for a given area.

isis circuit-type

Configure the adjacency type on interfaces.

Syntax `isis circuit-type {level-1 | level-1-2 | level-2-only}`

To return to the default values, use the `no isis circuit-type` command.

Parameters	level-1	You can form a Level 1 adjacency if there is at least one common area address between this system and neighbors. You cannot form Level 2 adjacencies on this interface.
	level-1-2	You can form a Level 1 and Level 2 adjacencies when the neighbor is also configured as Level-1-2 and there is at least one common area, if not, a Level 2 adjacency is established. This setting is the default.
	level-2-only	You can form a Level 2 adjacencies when other Level 2 or Level 1-2 routers and their interfaces are configured for Level 1-2 or Level 2. Level 1 adjacencies cannot be established on this interface.

Defaults **level-1-2**

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information Because the default establishes Level 1 and Level 2 adjacencies, you do not need to configure this command. Routers in an IS-IS system must be configured as a Level 1-only, Level 1-2, or Level 2-only system.

Only configure interfaces as Level 1 or Level 2 on routers that are between areas (for example, a Level 1-2 router) to prevent the software from sending unused hello packets and wasting bandwidth.

isis csnp-interval

Configure the IS-IS complete sequence number PDU (CSNP) interval on an interface.

Syntax `isis csnp-interval seconds [level-1 | level-2]`

To return to the default values, use the `no isis csnp-interval [seconds] [level-1 | level-2]` command.

Parameters	seconds	Interval of transmission time between CSNPs on multi-access networks for the designated intermediate system. The range is from 0 to 65535. The default is 10 .
	level-1	(OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 1.
	level-2	(OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 2.

Defaults seconds = **10**; **level-1** (if not otherwise specified)

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information The default values of this command are typically satisfactory transmission times for a specific interface on a designated intermediate system. To maintain database synchronization, the designated routers send CSNPs.

You can configure Level 1 and Level 2 CSNP intervals independently.

isis hello-interval

Specify the length of time between hello packets sent.

Syntax `isis hello-interval seconds [level-1 | level-2]`

To return to the default values, use the `no isis hello-interval [seconds] [level-1 | level-2]` command.

Parameters	seconds	Allows you to set the length of time between hello packet transmissions. The range is from 1 to 65535. The default is 10 .
	level-1	(OPTIONAL) Select this value to configure the hello interval for Level 1. This value is the default.
	level-2	(OPTIONAL) Select this value to configure the hello interval for Level 2.

Defaults	seconds = 10 ; level-1 (if not otherwise specified)
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information Hello packets are held for a length of three times the value of the hello interval. To conserve bandwidth and CPU usage, use a high hello interval seconds. Use a low hello interval seconds for faster convergence (but uses more bandwidth and CPU resources).

Related Commands

- [isis hello-multiplier](#) — specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency as down.

isis hello-multiplier

Specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency down.

Syntax

```
isis hello-multiplier multiplier [level-1 | level-2]
```

To return to the default values, use the `no isis hello-multiplier [multiplier] [level-1 | level-2]` command.

Parameters

multiplier	Specifies an integer that sets the multiplier for the hello holding time. Never configure a hello-multiplier lower than the default (3). The range is from 3 to 1000. The default is 3 .
level-1	(OPTIONAL) Select this value to configure the hello multiplier independently for Level 1 adjacencies. This value is the default.
level-2	(OPTIONAL) Select this value to configure the hello multiplier independently for Level 2 adjacencies.

Defaults	multiplier = 3 ; level-1 (if not otherwise specified)
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

The holdtime (the product of the hello-multiplier multiplied by the hello-interval) determines how long a neighbor waits for a hello packet before declaring the neighbor is down so routes can be recalculated.

Related Commands

- [isis hello-interval](#) — specify the length of time between hello packets.

isis hello padding

Turn ON or OFF padding of hello PDUs from INTERFACE mode.

Syntax

```
isis hello padding
```

To return to the default, use the `no isis hello padding` command.

Defaults

Padding of hello PDUs is enabled (ON).

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.

Usage Information

Hello PDUs are “padded” only when both the global and interface padding options are ON. Turning either one OFF disables padding for the corresponding interface.

Related Commands

- [hello padding](#) — turn ON or OFF padding for LAN and point-to-point hello PDUs.

isis ipv6 metric

Assign metric to an interface for use with IPv6 information.

Syntax

```
isis ipv6 metric default-metric [level-1 | level-2]
```

To return to the default values, use the `no ipv6 isis metric [default-metric] [level-1 | level-2]` command.

Parameters

default-metric	Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215. The default is 10 .
level-1	(OPTIONAL) Enter the keywords <code>level-1</code> to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This value is the default.
level-2	(OPTIONAL) Enter the keywords <code>level-2</code> to configure the SPF calculation for Level 2 (inter-area) routing.

Defaults

default-metric = **10**; **level-1** (if not otherwise specified)

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Introduced on the E-Series.

Usage Information

Dell EMC Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

isis metric

Assign a metric to an interface.

Syntax `isis metric default-metric [level-1 | level-2]`
To return to the default values, use the `no isis metric [default-metric] [level-1 | level-2]` command.

Parameters

default-metric Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215 irrespective of the metric style. The default is **10**.

If metric value is configured to more than 63, system throughs the following warning:Warning: for metrics greater than 63, 'metric-style wide' should be configured on level-1-2, or it will be capped at 63.

If the metric style is WIDE, the metric values that are greater than 63 are only effective.

level-1 (OPTIONAL) Enter the keywords `level-1` to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This setting is the default.

level-2 (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

Defaults default-metric = **10**; level-1 (if not otherwise specified)

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information Dell EMC Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

isis network point-to-point

Enable the software to treat a broadcast interface as a point-to-point interface.

Syntax	<code>isis network point-to-point</code> To disable the feature, use the <code>no isis network point-to-point</code> command.
Defaults	Not enabled.
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.

9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

isis password

Configure an authentication password for an interface.

Syntax	<code>isis password [hmac-md5] password [level-1 level-2]</code> To delete a password, use the <code>no isis password [password] [level-1 level-2]</code> command.
Parameters	<p><i>encryption-type</i> (OPTIONAL) Enter 7 to encrypt the password using DES.</p> <p><i>hmac-md5</i> (OPTIONAL) Enter the keywords <code>hmac-md5</code> to encrypt the password using MD5.</p> <p><i>password</i> Assign the interface authentication password.</p> <p><i>level-1</i> (OPTIONAL) Independently configures the authentication password for Level 1. The router acts as a station router for Level 1 routing. This setting is the default.</p> <p><i>level-2</i> (OPTIONAL) Independently configures the authentication password for Level 2. The router acts as an area router for Level 2 routing.</p>
Defaults	No default password. level-1 (if not otherwise specified).
Command Modes	INTERFACE
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

To protect your network from unauthorized access, use this command to prevent unauthorized routers from forming adjacencies.

You can assign different passwords for different routing levels by using the keywords `level-1` and `level-2`.

The `no` form of this command disables the password for Level 1 or Level 2 routing, using the respective keywords `level-1` or `level-2`.

This password provides limited security as it is processed as plain text.

isis priority

Set the priority of the designated router you select.

Syntax

```
isis priority value [level-1 | level-2]
```

To return to the default values, use the `no isis priority [value] [level-1 | level-2]` command.

Parameters

value	This value sets the router priority. The higher the value, the higher the priority. The range is from 0 to 127. The default is 64 .
level-1	(OPTIONAL) Specify the priority for Level 1. This setting is the default.
level-2	(OPTIONAL) Specify the priority for Level 2.

Defaults

value = **64**; **level-1** (if not otherwise specified).

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.

Version	Description
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

You can configure priorities independently for Level 1 and Level 2. Priorities determine which router on a LAN is the designated router. Priorities are advertised within hellos. The router with the highest priority becomes the designated intermediate system (DIS).

 **NOTE:** Routers with a priority of 0 cannot be a designated router.

Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If all the routers have priority 0, one with highest MAC address becomes DIS even though its priority is 0.

is-type

Configure IS-IS operating level for a router.

Syntax `is-type {level-1 | level-1-2 | level-2-only}`
To return to the default values, use the `no is-type` command.

Parameters

level-1	Allows a router to act as a Level 1 router.
level-1-2	Allows a router to act as both a Level 1 and Level 2 router. This setting is the default.
level-2-only	Allows a router to act as a Level 2 router.

Defaults **level-1-2**

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

The IS-IS protocol automatically determines area boundaries and are able to keep Level 1 and Level 2 routing separate. Poorly planned use of this feature may cause configuration errors, such as accidental area partitioning.

If you are configuring only one area in your network, you do not need to run both Level 1 and Level 2 routing algorithms. You can configure the IS type as Level 1.

log-adjacency-changes

Generate a log messages for adjacency state changes.

Syntax `log-adjacency-changes`
 To disable this function, use the `no log-adjacency-changes` command.

Defaults Adjacency changes are not logged.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

This command allows you to monitor adjacency state changes, which are useful when you monitor large networks. Messages are logged in the system's error message facility.

lsp-gen-interval

Set the minimum interval between successive generations of link-state packets (LSPs).

Syntax `lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]`

To restore default values, use the `no lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

Parameters

- level-1** (OPTIONAL) Enter the keywords `level-1` to apply the configuration to generation of Level-1 LSPs.
- level-2** (OPTIONAL) Enter the keywords `level-2` to apply the configuration to generation of Level-2 LSPs.
- interval seconds** Enter the maximum number of seconds between LSP generations. The range is from 0 to 120 seconds. The default is **5 seconds**.
- initial_wait_interval seconds** (OPTIONAL) Enter the initial wait time, in seconds, before running the first LSP generation. The range is from 0 to 120 seconds. The default is **1 second**.
- second_wait_interval seconds** (OPTIONAL) Enter the wait interval, in seconds, between the first and second LSP generation. The range is from 0 to 120 seconds. The default is **5 seconds**.

Defaults See *Parameters*.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

Usage Information LSP throttling slows down the frequency at which LSPs are generated during network instability. Even though throttling LSP generations slows down network convergence, no throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of LSP generations until the topology regains its stability.

The first generation is controlled by the initial wait interval and the second generation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down

and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

lsp-mtu

Set the maximum transmission unit (MTU) of IS-IS link-state packets (LSPs). This command only limits the size of LSPs this router generates.

Syntax `lsp-mtu size`

To return to the default values, use the `no lsp-mtu` command.

Parameters **size** The maximum LSP size, in bytes. The range is from 512 to 16000 for Non-Jumbo mode and from 128 to 9195 for Jumbo mode. The default is **1497**.

 **NOTE:** The appropriate interface circuit is brought down and removed.

Defaults **1497** bytes.

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

Usage Information The link MTU and the LSP MTU size must be the same.

Because each device can generate a maximum of 255 LSPs, consider carefully whether you use the `lsp-mtu` command.

lsp-refresh-interval

Set the link state PDU (LSP) refresh interval. LSPs must be refreshed before they expire. When the LSPs are not refreshed after a refresh interval, they are kept in a database until their `max-lsp-lifetime` reaches zero and then LSPs is purged.

Syntax `lsp-refresh-interval seconds`

To restore the default refresh interval, use the `no lsp-refresh-interval` command.

Parameters	<i>seconds</i>	The LSP refresh interval, in seconds. This value must be 300 seconds less than the value specified in the <code>max-lsp-lifetime</code> command. The range is from 1 to 65535 seconds. The default is 900 .
Defaults	900 seconds	
Command Modes	ROUTER ISIS	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	
	Version	Description
	9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
	9.10(0.0)	Introduced on the S3148.
	9.10(0.0)	Introduced on the S6100-ON.
	9.8(2.0)	Introduced on the S3100 series.
	9.8(1.0)	Introduced on the Z9100-ON.
	9.8(0.0P5)	Introduced on the S4048-ON.
	9.8(0.0P2)	Introduced on the S3048-ON.
	9.7(0.0)	Introduced on the S6000-ON.
	9.5(0.1)	Introduced on the Z9500.
	9.0.2.0	Introduced on the S6000.
	8.3.19.0	Introduced on the S4820T.
	8.3.12.0	Introduced on the S4810.
	8.3.11.1	Introduced on the Z9000.
	7.5.1.0	Added support for LSP Throttling Enhancement.
Usage Information	<p>The refresh interval determines the rate at which route topology information is transmitted preventing the information from becoming obsolete.</p> <p>The refresh interval must be less than the LSP lifetime specified with the <code>max-lsp-lifetime</code> command. A low value reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. A higher value reduces the link utilization the flooding of refreshed packets causes.</p>	
Related Commands	<ul style="list-style-type: none"> • max-lsp-lifetime — set the maximum interval that LSPs persist without being refreshed. 	

max-area-addresses

Configure manual area addresses.

Syntax	<code>max-area-addresses number</code>	To return to the default values, use the <code>no max-area-addresses</code> command.
Parameters	<i>number</i>	Set the maximum number of manual area addresses. The range is from 3 to 6. The default is 3 .
Defaults	3 addresses	
Command Modes	ROUTER ISIS	
Command History	This guide is platform-specific. For command information about other platforms, see the relevant <i>Dell EMC Networking OS Command Line Reference Guide</i> .	

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.5.1.0	Added support for LSP Throttling Enhancement.

Usage Information

To configure the number of area addresses on router, use this command. This value must be consistent with routers in the same area, otherwise the router forms only Level 2 adjacencies. The value must be same among all the routers to form Level 1 adjacencies.

max-lsp-lifetime

Set the maximum time that link-state packets (LSPs) exist without being refreshed.

Syntax `max-lsp-lifetime seconds`

To restore the default time, use the `no max-lsp-lifetime` command.

Parameters **seconds** The maximum lifetime of LSP in seconds. This value must be greater than the `lsp-refresh-interval` command. The higher the value the longer the LSPs are kept. The range is from 1 to 65535. The default is **1200**.

Defaults **1200** seconds

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than the LSP refresh interval.

The `seconds` parameter enables the router to keep LSPs for the specified length of time. If the value is higher, the overhead is reduced on slower-speed links.

Related Commands

- [lsp-refresh-interval](#) — set the link-state packet (LSP) refresh interval.

maximum-paths

Allows you to configure the maximum number of equal cost paths allowed in a routing table.

 **NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

Syntax

`maximum-paths number`

To return to the default values, use the `no maximum-paths` command.

Parameters

number Enter a number as the maximum number of parallel paths an IP routing installs in a routing table. The range is from 1 to 64. The default is **4**.

Defaults

4

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

6.3.1.0	Introduced.

metric-style

To generate and accept old-style, new-style, or both styles of type, length, and values (TLV), configure a router.

Syntax `metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]`

To return to the default values, use the `no metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]` command.

Parameters		
narrow		Allows you to generate and accept old-style TLVs. The metric range is from 0 to 63.
transition		Allows you to generate both old-style and new-style TLVs. The metric range is from 0 to 63.
wide		Allows you to generate and accept only new-style TLVs. The metric range is from 0 to 16777215.
level-1		Enables the metric style on Level 1.
level-2		Enables the metric style on Level 2.

Defaults **narrow**; if no Level is specified, Level-1 and Level-2 are configured.

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.

Usage Information

If you enter the `metric-style wide` command, the Dell EMC Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.

The new-style TLVs have wider metric fields than old-style TLVs.

When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that is requires.

Related Commands

- [isis metric](#) — configure a metric for an interface.

multi-topology

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

Syntax `multi-topology [transition]`
To return to a single topology configuration, use the `no multi-topology [transition]` command.

Parameters **transition**

Defaults Disabled

Command Modes CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.
7.8.1.0	Introduced.

net

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

Syntax `net network-entity-title`
To remove a net, use the `no net network-entity-title` command.

Parameters **network-entity-title** Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

Defaults Not configured.

Command Modes ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

passive-interface

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

Syntax

`passive-interface interface`

To delete a passive interface configuration, use the `no passive-interface interface` command.

Parameters**interface**

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults

Not configured.

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.

Version	Description
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.

redistribute

Redistribute routes from one routing domain to another routing domain.

Syntax

```
redistribute {static | connected | rip} [level-1 | level-1-2 | level-2]
[metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

To end redistribution or disable any of the specified keywords, use the `no redistribute {static | connected | rip} [metric metric-value] [metric-type {external | internal}] [level-1 | level-1-2 | level-2] [route-map map-name]` command.

Parameters

connected	Enter the keyword <code>connected</code> to redistribute active routes into IS-IS.
rip	Enter the keyword <code>rip</code> to redistribute RIP routes into IS-IS.
static	Enter the keyword <code>static</code> to redistribute user-configured routes into IS-IS.
metric <i>metric-value</i>	(OPTIONAL) Assign a value to the redistributed route. The range is from 0 to 16777215. The default is 0 . Use a value that is consistent with the destination protocol.
metric-type {external internal}	(OPTIONAL) The external link type associated with the default route advertised into a routing domain. Specify one of the following: <ul style="list-style-type: none"> external internal
level-1	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.
level-1-2	(OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.
level-2	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.
route-map <i>map-name</i>	(OPTIONAL) If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.

Defaults

- metric `metric-value` = **0**
- metric-type = `internal`; **level-2**

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added support for IPv6 ISIS.
6.3.1.0	Introduced.

Usage Information

To redistribute a default route (0.0.0.0/0), configure the `default-information originate` command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.

When an LSP with an internal metric is received, the Dell EMC Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the `distribute-list out` command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow or Transition mode and the metric value in the `redistribute` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `redistribute` command is advertised.

Related Commands

- [default-information originate](#) — generate a default route for the IS-IS domain.
- [distribute-list out](#) — suppress networks from being advertised in updates. This command filters redistributed routing information.

redistribute bgp

Redistribute routing information from a BGP process.

Syntax

```
redistribute bgp AS number [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute bgp` command with the appropriate parameters.

Parameters

AS number	Enter a number that corresponds to the autonomous system number. The range is from 1 to 65355.
level-1	(OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.

level-1-2	(OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.
level-2	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.
metric <i>metric-value</i>	(OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is 0 .
metric-type {external internal}	(OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"> • external • internal
route-map <i>map-name</i>	map-name is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol. If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

Defaults IS-IS Level 2 routes only

- Command Modes**
- ROUTER ISIS (*for IPv4*)
 - CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added support for IPv6 ISIS.
6.3.1.0	Introduced.

Usage Information BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

Example

```
DellEMC(conf)# router is
DellEMC(conf-router_isis)# redistribute bgp 1 level-1 metric 32 metric-
type
external route-map rmap-isis-to-bgp
DellEMC(conf-router_bgp)#show running-config isis
!
router isis
```

```
redistribute bgp 1 level-1 metric 32 metric-type external route-map
rmap-isis-to-bgp
```

redistribute ospf

Redistribute routing information from an OSPF process.

Syntax

```
redistribute ospf process-id [level-1 | level-1-2 | level-2] [match
{internal | external}] [metric metric-value] [metric-type {external |
internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]` command.

Parameters

<i>process-id</i>	Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65355.
<i>metric metric-value</i>	(OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is 0 .
<i>metric-type {external internal}</i>	(OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none">externalinternal
<i>level-1</i>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.
<i>level-1-2</i>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.
<i>level-2</i>	(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.
<i>match {external internal}</i>	(OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are <ul style="list-style-type: none">internalexternal
<i>route-map map-name</i>	<i>map-name</i> is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol. If you do not specify a <i>map-name</i> , all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

Defaults

See *Parameters*.

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.

Version	Description
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Added support for IPv6 ISIS.
6.3.1.0	Introduced.

Usage Information

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

router isis

Allows you to enable the IS-IS routing protocol and to specify an IP IS-IS process.

Syntax

```
router isis [vrf vrf-name] [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

Parameters

vrf vrf-name	Enter the keyword <code>vrf</code> followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.
tag	(OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the <code>tag</code> option is not specified. The tag name must be unique for all IP router processes for a given router.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

Related Commands

- `ip router isis` — configure IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.
- `net` — configure an IS-IS network entity title (NET) for a routing process.
- `is-type` — assign a type for a given area.

set-overload-bit

To set the overload bit in zeroth fragment of non-pseudonode LSPs on the router, configure the router. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

Syntax

`set-overload-bit`

To return to the default values, use the `no set-overload-bit` command.

Defaults

Not set.

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	Added support for multi-topology ISIS.
6.3.1.0	Introduced.

Usage Information

Set the overload bit when a router experiences problems, such as a memory shortage due to an incomplete link state database which can result in an incomplete or inaccurate routing table. If you set the

overload bit in its LSPs, other routers ignore the unreliable router in their SPF calculations until the router has recovered.

NOTE: Enables you to configure a single system wide value that is common for both IPv4 and IPv6 address.

show config

Display the changes you made to the IS-IS configuration. Default values are not shown.

Syntax show config

spf-interval level-2 120 20 25
exit-address-family
```

show isis database

Display the IS-IS link state database.

Z9500

Syntax `show isis [vrf vrf-name] database [level-1 | level-2] [local] [detail | summary] [system-id] [lspid]`

Parameters	vrf <i>vrf-name</i>	(Optional) Enter the keyword vrf followed by the name of the VRF to display IS-IS link state database corresponding to that VRF.  NOTE: If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed.
	level-1	(OPTIONAL) Displays the Level 1 IS-IS link-state database.
	level-2	(OPTIONAL) Displays the Level 2 IS-IS link-state database.
	local	(OPTIONAL) Displays local link-state database information.
	detail	(OPTIONAL) Displays the detailed link-state database information of each LSP when specified. If not specified, a summary displays.
	summary	(OPTIONAL) Displays the summary of link-state database information when specified.
	<i>lspid</i>	(OPTIONAL) Display only the specified LSP.
	<i>system-id</i>	(OPTIONAL) Displays the link-state database for system-id.

8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.7.1	Introduced on the S4810.

Usage Information

The following describes the `show isis database` command shown in the following example.

Field	Description
IS-IS Level-1/Level-2 Link State Database	Displays the IS-IS link state database for Level 1 or Level 2.
LSPID	<p>Displays the LSP identifier.</p> <p>The first six octets are the System ID of the originating router.</p> <p>The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router.</p> <p>The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems.</p> <p>The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number.</p> <p>An * after the LSPID indicates that the system originates an LSP where this command was issued.</p>
LSP Seq Num	This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.
LSP Checksum	This is the checksum of the entire LSP packet.
LSP Holdtime	This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.
ATT	This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router.
P	This value represents the P bit. This bit is always set to zero as Dell EMC Networking does not support area partition repair.
OL	This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.

Example

The bold sections identify that MultiTopology IS-IS is enabled.

```
DelleMC# show isis database

show isis graceful-restart detail

Display detailed IS-IS graceful restart related settings.

Z9500

- Syntax** `show isis [vrf vrf-name] graceful-restart detail`
- Command Modes**
- EXEC
 - EXEC Privilege
- Parameters**
- vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to display IS-IS graceful restart details corresponding to that VRF.
-  **NOTE:** If you do not specify this option, the IS-IS graceful restart details corresponding to the default VRF are displayed.
- Command History**
- This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.

Example

```
DellEMC# show isis graceful-restart detail
Configured Timer Value
=====
Graceful Restart      : Enabled
T3 Timer              : Manual
T3 Timeout Value     : 30
T2 Timeout Value     : 30 (level-1), 30 (level-2)
T1 Timeout Value     : 5, retry count: 1
Adjacency wait time  : 30

Operational Timer Value
=====
Current Mode/State   : Normal/RUNNING
T3 Time left         : 0
T2 Time left         : 0 (level-1), 0 (level-2)
Restart ACK rcv count : 0 (level-1), 0 (level-2)
Restart Req rcv count : 0 (level-1), 0 (level-2)
Suppress Adj rcv count : 0 (level-1), 0 (level-2)
Restart CSNP rcv count : 0 (level-1), 0 (level-2)
Database Sync count  : 0 (level-1), 0 (level-2)
```

show isis hostname

Display IS-IS host names configured or learned on the switch.

Z9500

Syntax `show isis [vrf vrf-name] hostname`

Parameters `vrf vrf-name` Enter the keyword `vrf` followed by the name of the VRF to display IS-IS host names corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Example

```
DellEMC# show isis hostname
System Id      Dynamic Name  Static Name
*F100.E120.0013 Force10      ISIS
DellEMC#
```

show isis interface

Display detailed IS-IS interface status and configuration information.

Z9500

Syntax

```
show isis [vrf vrf-name] interface [interface]
```

Parameters

- vrf *vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display IS-IS interface status information corresponding to that VRF.
- interface*** (OPTIONAL) Enter the following keywords and the interface information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.

  Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
--More--
```

show isis neighbors

Display information about neighboring (adjacent) routers.

Z9500

Syntax

```
show isis [vrf vrf-name] neighbors [level-1 | level-2] [detail] [interface]
```

Parameters

- vrf *vrf-name*** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display adjacent router information corresponding to that VRF.
- level-1** (OPTIONAL) Displays information about Level 1 IS-IS neighbors.
- level-2** (OPTIONAL) Displays information about Level 2 IS-IS neighbors.

- detail** (OPTIONAL) Displays detailed information about neighbors.
- interface** (OPTIONAL) Enter the following keywords and the interface information:
 - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- Command Modes**
- EXEC
 - EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Usage Information Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

Field	Description
System Id	The value that identifies a system in an area.
Interface	The interface, slot, and port in which the router was discovered.
State	The value providing status about the adjacency state. The range is Up and Init.
Type	This value displays the adjacency type (Layer 2, Layer 2 or both).
Priority	IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface.
Uptime	Displays the interfaces uptime.
Circuit Id	The neighbor's interpretation of the designated router for the interface.

Example

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

```
DellEMC# show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2(M) 127 09:28:01 TEST.02
!
DellEMC#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2(M) 127 09:28:04 TEST.02 Area Address(es):
49.0000.0001
  IP Address(es): 25.1.1.3*
  MAC Address: 0000.0000.0000
  Hold Time: 28
  Link Local Address: fe80::201:e8ff:fe00:492c
Topology: IPv4 IPv6 , Common (IPv4 IPv6 )
Adjacency being used for MTs: IPv4 IPv6
DellEMC#
```

show isis protocol

Display IS-IS routing information.

Z9500

Syntax `show isis [vrf vrf-name] protocol`

Parameters `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS routing information corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Example

The bold section identifies that Multi-Topology IS-IS is enabled.

```
DellEMC# show isis protocol
IS-IS Router: <Null Tag>
System Id: F100.E120.0013 IS-Type: level-1-2
Manual area address(es):
  49.0000.0001
Routing for area address(es):
  49.0000.0001
Interfaces supported by IS-IS:
TenGigabitEthernet 1/1 - IP - IPv6
TenGigabitEthernet 1/2 - IP - IPv6
TenGigabitEthernet 1/10 - IP - IPv6
Loopback 0 - IP - IPv6
Redistributing:
Distance: 115
Generate narrow metrics: level-1-2
Accept narrow metrics:   level-1-2
Generate wide metrics:   none
Accept wide metrics:     none
Multi Topology Routing is enabled in transition mode.
DellEMC#
```

show isis traffic

This command allows you to display IS-IS traffic interface information.

Z9500

Syntax

```
show isis [vrf vrf-name] traffic [interface]
```

Parameters

- vrf *vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display IS-IS traffic interface information corresponding to that VRF.
- interface*** (OPTIONAL) Identifies the interface type and the interface following:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
 - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
 - For a port channel interface, enter the keywords `port-channel` then a number.
 - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.

Version	Description
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.2(0.2)	Introduced on the Z9000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Usage Information

The following describes the `show isis traffic` command shown in the following example.

Item	Description
Level-1/Level-2 Hellos (sent/rcvd)	Displays the number of Hello packets sent and received.
PTP Hellos (sent/rcvd)	Displays the number of point-to-point Hellos sent and received.
Level-1/Level-2 LSPs sourced (new/refresh)	Displays the number of new and refreshed LSPs.
Level-1/Level-2 LSPs flooded (sent/rcvd)	Displays the number of flooded LSPs sent and received.
Level-1/Level-2 LSPs CSNPs (sent/rcvd)	Displays the number of CSNP LSPs sent and received.
Level-1/Level-2 LSPs PSNPs (sent/rcvd)	Displays the number of PSNP LSPs sent and received.
Level-1/Level-2 DR Elections	Displays the number of times designated router elections ran.
Level-1/Level-2 SPF Calculations	Displays the number of shortest path first calculations.
LSP checksum errors received	Displays the number of checksum errors LSPs received.
LSP authentication failures	Displays the number of LSP authentication failures.

Example

```
DellEMC# show is traffic
IS-IS: Level-1 Hellos (sent/rcvd) : 0/721
IS-IS: Level-2 Hellos (sent/rcvd) : 900/943
IS-IS: PTP Hellos (sent/rcvd) : 0/0
IS-IS: Level-1 LSPs sourced (new/refresh) : 0/0
IS-IS: Level-2 LSPs sourced (new/refresh) : 1/3
IS-IS: Level-1 LSPs flooded (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs flooded (sent/rcvd) : 5934/5217
IS-IS: Level-1 LSPs CSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs CSNPs (sent/rcvd) : 472/238
IS-IS: Level-1 LSPs PSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs PSNPs (sent/rcvd) : 10/337
IS-IS: Level-1 DR Elections : 4
IS-IS: Level-2 DR Elections : 4
IS-IS: Level-1 SPF Calculations : 0
IS-IS: Level-2 SPF Calculations : 389
IS-IS: LSP checksum errors received : 0
```

```
IS-IS: LSP authentication failures : 0
DellEMC#
```

spf-interval

Specify the minimum interval between shortest path first (SPF) calculations.

Syntax `spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]`

To restore default values, use the `no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

Parameters

- level-1** (OPTIONAL) Enter the keyword `level-1` to apply the configuration to Level-1 SPF calculations.
- level-2** (OPTIONAL) Enter the keyword `level-2` to apply the configuration to Level-2 SPF calculations.
- interval seconds** Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is **10 seconds**.
- initial_wait_interval seconds** (OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is **5 seconds**.
- second_wait_interval seconds** (OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is **5 seconds**.

Defaults See *Parameters*.

Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.1)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.12.0	Introduced on the S4810.
7.8.1.0	Added support for multi-topology ISIS.
7.5.1.0	Added support for SPF Throttling Enhancement.

Usage Information

This command `spf-interval` in CONFIG-ROUTER-ISIS-AF-IPV6 mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in CONFIG-ROUTER-ISIS mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

Link Aggregation Control Protocol (LACP)

This section contains commands for Dell EMC Networks' implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as “port-channels” in the Dell EMC Networking OS.

NOTE: For static LAG commands based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications, see [Port Channel Commands](#) .

Topics:

- [clear lacp counters](#)
- [debug lacp](#)
- [lacp long-timeout](#)
- [lacp port-priority](#)
- [lacp system-priority](#)
- [port-channel mode](#)
- [port-channel-protocol lacp](#)
- [show lacp](#)

clear lacp counters

Clear port channel counters.

Z9500

Syntax `clear lacp port-channel-number counters`

Parameters *port-channel-number* Enter a port-channel number. The range is from 1 to 512.

Defaults Without a Port Channel specified, the command clears all Port Channel counters.

Command Modes

- EXEC
- EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

Version	Description
9.10(0.1)	Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)	Introduced on the S3148.
9.10(0.0)	Introduced on the S6100-ON.
9.8(2.0)	Introduced on the S3100 series.
9.8(1.0)	Introduced on the Z9100-ON.
9.8(0.0P5)	Introduced on the S4048-ON.
9.8(0.0P2)	Introduced on the S3048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

Related Commands

- [show lacp](#) — display the LACP configuration.

debug lacp

Debug LACP (configuration, events, and so on).

Syntax

```
debug lacp [config | events | pdu [interface-type [in | out]]]
```

To disable LACP debugging, use the `no [config | events | pdu [interface-type [in | out]]]` command.

Parameters

config	(OPTIONAL) Enter the keyword <code>config</code> to debug the LACP configuration.
events	(OPTIONAL) Enter the keyword <code>events</code> to debug the LACP event information.
pdu	(OPTIONAL) Enter the keyword <code>pdu</code> to debug the LACP Protocol Data Unit information.
