Dell Command Line Reference Guide for the S3100 Series
9.11(2.0P2)
Notes, cautions, and warnings

NOTE: A NOTE indicates important information that helps you make better use of your product.

CAUTION: A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

WARNING: A WARNING indicates a potential for property damage, personal injury, or death.

1 About this Guide
   - Objectives.............................................................. 41
   - Audience.............................................................. 41
   - Conventions.......................................................... 41

2 CLI Basics
   - Accessing the Command Line.................................. 43
   - Multiple Configuration Users.................................. 43
   - Obtaining Help....................................................... 44
   - Navigating the CLI.................................................. 45
   - Using the Keyword no Command............................. 46
   - Filtering show Commands........................................ 46
   - Enabling Software Features on Devices Using a Command Option
     - feature vrf......................................................... 47
     - show feature....................................................... 48
   - Command Modes.................................................... 49

3 File Management
   - boot system.......................................................... 59
   - cd.......................................................................... 61
   - copy...................................................................... 62
   - delete..................................................................... 64
   - dir........................................................................ 65
   - format.................................................................... 67
   - fsck flash............................................................... 67
   - mkdir..................................................................... 68
   - mount nfs................................................................ 69
   - rmdir..................................................................... 70
   - upgrade system..................................................... 70
   - rename.................................................................... 72
   - restore factory-defaults......................................... 72
   - show boot system.................................................... 75
   - show bootvar.......................................................... 76
   - show file-systems.................................................... 77
   - show os-version....................................................... 78
   - show running-config............................................... 80
   - show startup-config............................................... 83
   - show version.......................................................... 85
   - upgrade................................................................... 86

4 Control and Monitoring
   - banner exec........................................................... 89
banner login............................................................................................................................................................... 90
banner motd..................................................................................................................................................................... 92

6 Access Control Lists (ACL)

Commands Common to all ACL Types
remark
Contents

Extended MAC ACL Commands ................................................................. 195

Common IP ACL Commands ..................................................................... 195
access-class ......................................................................................... 195
clear counters ip access-group .............................................................. 196
ip access-group ................................................................................... 197
ip control-plane egress-filter ............................................................... 198
show ip accounting access-list .............................................................. 199
show ip access-list ............................................................................... 201

Standard IP ACL Commands ................................................................... 201
deny ....................................................................................................... 202
ip access-list standard ......................................................................... 203
permit .................................................................................................... 205
resequence access-list ......................................................................... 206
seq ......................................................................................................... 207

Extended IP ACL Commands .................................................................. 209
deny ....................................................................................................... 209
deny icmp .............................................................................................. 211
deny tcp ............................................................................................... 213
deny udp .............................................................................................. 216
ip access-list extended ....................................................................... 219
permit .................................................................................................... 220
permit tcp ............................................................................................ 221
permit udp ........................................................................................... 224
resequence access-list ....................................................................... 227
seq ......................................................................................................... 228

Common MAC Access List Commands ................................................. 231
clear counters mac access-group .......................................................... 231
mac access-group ............................................................................... 232
show mac access-list ......................................................................... 233
show mac accounting access-list ......................................................... 234

Standard MAC ACL Commands ............................................................ 235
deny ....................................................................................................... 235
mac access-list standard .................................................................... 237
permit .................................................................................................... 238
seq ......................................................................................................... 239

Extended MAC ACL Commands ........................................................... 241
deny ....................................................................................................... 241
mac access-list extended .................................................................... 243
permit .................................................................................................... 244

IP Prefix List Commands ....................................................................... 246
clear ip prefix-list ................................................................................ 246
deny ....................................................................................................... 247
ip prefix-list ......................................................................................... 248
seq ......................................................................................................... 249
show config ......................................................................................... 250
show ip prefix-list detail .................................................................................................................. 251
show ip prefix-list summary ............................................................................................................. 252
Route Map Commands ....................................................................................................................... 253
continue .................................................................................................................................................. 253
description ................................................................................................................................................. 254
match as-path ........................................................................................................................................ 255
match community .................................................................................................................................. 256
match interface ....................................................................................................................................... 257
match ip address .................................................................................................................................... 258
match ip next-hop .................................................................................................................................. 259
match ip route-source ............................................................................................................................. 260
match metric ........................................................................................................................................... 261
match origin ........................................................................................................................................... 262
match route-type ..................................................................................................................................... 263
match tag .................................................................................................................................................. 264
route-map ............................................................................................................................................... 265
set as-path ............................................................................................................................................... 266

About this Guide

This guide provides information about the Dell Networking operating system (OS) command line interface (CLI).
This book also includes information about the protocols and features supported in Dell Networking OS.

References

For more information about your system, go to the Dell Networking Support page and refer to the following documents:

- Dell Networking OS Configuration Guide
- Dell Networking OS Installation Guide
- Dell Networking OS Quick Start Guide
- Dell Networking OS Release Notes

Topics:

- Objectives
- Audience
- Conventions

Objectives

This information is intended as a reference guide for the Dell Networking OS CLI commands, with detailed syntax statements, along with usage information and sample output.

NOTE: For more information about when to use the CLI commands, see the Dell Networking OS Configuration Guide for your specific system.

Audience

The Dell Networking OS CLI Guide is intended for system administrators with an understanding of Layer 2 and Layer 3 networking technologies, who are responsible for configuring or maintaining networks.

Conventions

This guide uses the following conventions to describe command syntax:

Keyword

Keywords are in Courier font and must be entered in the CLI as listed.

parameter

Parameters are in italics and require a number or word to be entered in the CLI.

(X)

Keywords and parameters within braces must be entered in the CLI.

[X]

Keywords and parameters within brackets are optional.
Keywords and parameters separated by a bar require you to choose one option.

Keywords and parameters separated by a double bar allow you to choose any or all of the options.
This chapter describes the command line interface (CLI) structure and command modes. The Dell Networking operating software commands are in a text-based interface that allows you to use the launch commands, change command modes, and configure interfaces and protocols.

Topics:
- Accessing the Command Line
- Multiple Configuration Users
- Obtaining Help
- Navigating the CLI
- Using the Keyword no Command
- Filtering show Commands
- Enabling Software Features on Devices Using a Command Option
- Command Modes

Accessing the Command Line

Access the CLI through a serial console port or a Telnet session.
When the system successfully boots, enter the command line in EXEC mode.

NOTE: You must have a password configured on a virtual terminal line before you can Telnet into the system. Therefore, you must use a console connection when connecting to the system for the first time.

Example

```
telnet 172.31.1.53
Trying 172.31.1.53...
Connected to 172.31.1.53.
Escape character is '^]'.
Login: username
Password: Dell>
```

After you log in to the switch, the prompt provides you with the current command-level information. For example:

<table>
<thead>
<tr>
<th>Prompt</th>
<th>CLI Command Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell&gt;</td>
<td>EXEC</td>
</tr>
<tr>
<td>Dell#</td>
<td>EXEC Privilege</td>
</tr>
<tr>
<td>Dell(conf)#</td>
<td>CONFIGURATION</td>
</tr>
</tbody>
</table>

NOTE: For a list of all the command mode prompts, refer to the Command Modes section.

Multiple Configuration Users

When a user enters CONFIGURATION mode and another user is already in CONFIGURATION mode, the Dell Networking operating software generates an alert warning message similar to the following:

```
Dell#conf
```
% Warning: The following users are currently configuring the system:

User "" on line console0
User "admin" on line vty0 (123.12.1.123)
User "admin" on line vty1 (123.12.1.123)
User "Irene" on line vty3 (123.12.1.321)

Dell#conf

When another user enters CONFIGURATION mode, Dell Networking OS sends a message similar to the following:

% Warning: User "admin" on line vty2 "172.16.1.210" is in configuration

In this case, the user is "admin" on vty2.

Obtaining Help

As soon as you are in a Command mode, there are several ways to access help:

To obtain a list of keywords at any command mode:
Type a ? at the prompt or after a keyword. There must always be a space before the ?.

To obtain a list of keywords with a brief functional description:
Type help at the prompt.

To obtain a list of available options:
Type a keyword, and then enter a space and a ?.

To obtain a list of partial keywords using a partial keyword:
Type a partial keyword, and then enter a ?.

Example

The following is an example of entering ip ? at the prompt:

Dell(conf)#ip ?
access-list     Named access-list
as-path         BGP autonomous system path filter
community-list  Add a community list entry
control-plane   Control plane configuration
dhcp            DHCP configuration commands
domain-list     Domain name to complete unqualified host name
domain-list     Enable IP Domain Name System hostname translation
domain-name    Define the default domain name
ecmp            Weighted Ecmp Configuration
ecmp-group      ECMP Group Configuration
extcommunity-list Add a Extended community list entry
ftp             FTP configuration commands
helper-address  DHCP relay agent configuration
host            Add an entry to the ip hostname table
http            HTTP configuration commands
icmp            ICMP configuration commands
igmp            Internet Group Management Protocol
max-frag-count  Max. fragmented packets allowed in IP re-assembly
mroute          Multicast routes and counters
msdp            Multicast source discovery protocol
multicast-limit Max entries in Multicast TIB
multicast-mdp   Enable IP multicast MSDP protocol
multicast-routing Enable IP multicast forwarding
name-server     Specify address of name server to use
pim             Protocol Independent Multicast
prefix-list     Build a prefix list
redirect-list   Named redirect-list
route           Establish static routes
route-export    Export routes
route-import    Import routes
scp             SCP configuration commands
source-route    Process packets with source routing header options
ssh             SSH configuration commands
tacacs          Interface configuration for TACACS+
When entering commands, you can take advantage of the following timesaving features:

- Commands are not case-sensitive.
- Enter partial (truncated) command keywords. For example, you can enter `int teng 1/1/1` for the `interface tengigabitethernet 1/1/1` command.
- Use the TAB key to complete keywords in commands.
- Use the up Arrow key to display the last enabled command.
- Use either the Backspace key or Delete key to erase the previous character.
- Use the left and right Arrow keys to navigate left or right in the Dell Networking OS command line.

The shortcut key combinations at the Dell Networking OS command line are as follows:

<table>
<thead>
<tr>
<th>Key Combination</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTL-A</td>
<td>Moves the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>CNTL-B</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>CNTL-D</td>
<td>Deletes the character at the cursor.</td>
</tr>
<tr>
<td>CNTL-E</td>
<td>Moves the cursor to the end of the line.</td>
</tr>
<tr>
<td>CNTL-F</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>CNTL-I</td>
<td>Completes a keyword.</td>
</tr>
<tr>
<td>CNTL-K</td>
<td>Deletes all the characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td>CNTL-L</td>
<td>Re-enters the previous command.</td>
</tr>
<tr>
<td>CNTL-N</td>
<td>Returns to the more recent commands in the history buffer after recalling commands with Ctrl-P or the up Arrow key.</td>
</tr>
<tr>
<td>CNTL-P</td>
<td>Recalls commands, beginning with the last command.</td>
</tr>
<tr>
<td>CNTL-R</td>
<td>Re-enters the previous command.</td>
</tr>
<tr>
<td>CNTL-U</td>
<td>Deletes the line.</td>
</tr>
<tr>
<td>CNTL-W</td>
<td>Deletes the previous word.</td>
</tr>
<tr>
<td>CNTL-X</td>
<td>Deletes the line.</td>
</tr>
<tr>
<td>CNTL-Z</td>
<td>Ends continuous scrolling of the command outputs.</td>
</tr>
<tr>
<td>Esc B</td>
<td>Moves the cursor back one word.</td>
</tr>
<tr>
<td>Esc F</td>
<td>Moves the cursor forward one word.</td>
</tr>
<tr>
<td>Esc D</td>
<td>Deletes all the characters from the cursor to the end of the word.</td>
</tr>
</tbody>
</table>

Navigating the CLI

The Dell Networking OS displays a CLI prompt comprised of the host name and CLI mode.

- Host name is the initial part of the prompt and is “Dell” by default. You can change the host name with the `hostname` command.
- CLI mode is the second part of the prompt and reflects the current CLI mode. For a list of the Dell Networking OS command modes, see the command mode list in Accessing the Command Line.
The CLI prompt changes as you move up and down the levels of the command structure. Starting with CONFIGURATION mode, the command prompt adds modifiers to further identify the mode. For more information about command modes, see Command Modes.

Using the Keyword no Command

To disable, delete or return to default values, use the no form of the commands.

For most commands, if you type the keyword no in front of the command, you disable that command or delete it from the running configuration. In this guide, the no form of the command is described in the Syntax portion of the command description.

Filtering show Commands

You can filter commands using the show command to find specific information, display certain information only, or begin the command output at the first instance of a regular expression or phrase.

Execute a show command and a pipe ( | ), and one of the following parameters and a regular expression to show output that either excludes or includes the specified parameters.

NOTE: The Dell Networking OS accepts a space before or after the pipe, no space before or after the pipe, or any combination. For example: command | grep gigabit | except regular-expression | find regular-expression.

- **except**
  - Displays only the text that does not match the pattern (or regular expression).

- **find**
  - Searches for the first occurrence of a pattern.

- **grep**
  - Displays text that matches a pattern.
  
  The grep command option has an ignore-case suboption that makes the search case-insensitive. For example, the commands:

  ```
  show run | grep Ethernet
  ```
  
  Returns a search result with instances containing a capitalized Ethernet, such as interface TenGigabitEthernet 1/1.

  ```
  show run | grep ethernet
  ```
  
  Does not return the previous search result because it only searches for instances containing a noncapitalized ethernet.

  ```
  show run | grep Ethernet ignore-case
  ```
  
  Returns instances containing both Ethernet and ethernet.

- **no-more**
  - Does not paginate the display output.

- **save**
  - Copies the output to a file for future use.

Displaying All Output

Use the no-more option after the pipe to display all output at once — not one screen at a time. This operation is similar to terminal length screen-length except that the no-more option affects the output of just the specified command. For example: show running-config|no-more.
Filtering the Command Output Multiple Times

You can filter a single command output multiple times. To filter a command output multiple times, place the save option as the last filter. For example: command | grep regular-expression | except regular-expression | grep other-regular-expression | find regular-expression | no-more | save.

Enabling Software Features on Devices Using a Command Option

The capability to activate software applications or components on a device using a command is supported on this platform. Starting with Release 9.4(0.0), you can enable or disable specific software features or applications that need to run on a device by using a command attribute in the CLI interface. This enables effective, streamlined management and administration of applications and utilities that run on a device. You can employ this capability to perform an on-demand activation, or turn-off a software component or protocol. A feature configuration file generated for each image contains feature names, and denotes if this enabling or disabling method is available. You can enable or disable the VRF application globally across the system by using this capability.

Activate the VRF application on a device by using the feature vrf command in CONFIGURATION mode.

**NOTE:** The no feature vrf command is not supported on any of the platforms.

To enable the VRF feature and cause all VRF-related commands to be available or viewable in the CLI interface, use the following command. You must enable the VRF feature before you can configure its related attributes.

Dell(conf)# feature vrf

Based on if the VRF feature is identified as supported in the Feature Configuration file, configuration command feature vrf becomes available for usage. This command is stored in the running-configuration and precedes all other VRF-related configurations.

To display the state of Dell Networking OS features:

Dell# show feature

**Example of show feature output**

For a particular target where VRF is enabled, the show output is similar to the following:

<table>
<thead>
<tr>
<th>Feature</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**feature vrf**

Enable the VRF application on a switch. Once enabled, you cannot deactivate the VRF application.

**Syntax**

`feature vrf`

**Defaults**

Disabled

**Command Modes**

CONFIGURATION
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048–ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048–ON.</td>
</tr>
<tr>
<td>9.5(0.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S5000, and S6000.</td>
</tr>
</tbody>
</table>

Usage Information

Activate the VRF application on a device using the `feature vrf` command in CONFIGURATION mode. The `no feature vrf` command is not supported on any platform.

**show feature**

Verify the status of software applications, such as VRF, that are activated and running on a device.

Syntax

```
show feature
```

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Usage Information

You can activate VRF application on a device by using the `feature vrf` command in CONFIGURATION mode. The `no feature vrf` command is not supported on any of the platforms.

Example

```
Dell# show feature
Feature       State
-------------
VRF           Enabled
Dell#
```
Command Modes

To navigate and launch various CLI modes, use specific commands. Navigation to these modes is described in the following sections.

BGP ADDRESS-FAMILY Mode

To enable or configure IPv4 for BGP, use BGP ADDRESS-FAMILY mode. For more information, see Border Gateway Protocol IPv4 (BGPv4).

To enter BGP ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER BGP mode.
2. Enter the address-family command.
3. Enter the protocol type:
   - For IPv4, enter the ipv4 multicast command. The prompt changes to include conf-router_bgp_af for IPv4.

CLASS-MAP Mode

To create or configure a class map, use CLASS-MAP mode. For more information, see Policy-Based QoS Commands.

To enter CLASS-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the class-map command, and then enter the class map name. The prompt changes to include config-class-map.

You can return to CONFIGURATION mode by using the exit command.

CONFIGURATION Mode

In EXEC Privilege mode, use the configure command to enter CONFIGURATION mode and configure routing protocols and access interfaces.

To enter CONFIGURATION mode:

1. Verify that you are logged in to EXEC Privilege mode.
2. Enter the configure command. The prompt changes to include conf.

From this mode, you can enter INTERFACE mode by using the interface command.

CONTROL-PLANE Mode

To manage control-plane traffic, use CONTROL-PLANE mode. For more information, see Control Plane Policing (CoPP).

To enter CONTROL-PLANE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the control-plane-cpuqos command. The prompt changes to include conf-control-cpuqos.

You can return to CONFIGURATION mode by using the exit command.
**DHCP Mode**

To enable and configure Dynamic Host Configuration Protocol (DHCP), use DHCP mode. For more information, see *Dynamic Host Configuration Protocol (DHCP)*.

To enter DHCP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip dhcp server` command. The prompt changes to include `config-dhcp`.

You can return to CONFIGURATION mode by using the `exit` command.

**DHCP POOL Mode**

To create an address pool, use DHCP POOL mode. For more information, see *Dynamic Host Configuration Protocol (DHCP)*.

To enter DHCP POOL mode:

1. Verify that you are logged in to DHCP mode.
2. Enter the `pool` command then the pool name. The prompt changes to include `config-dhcp-pool-name`.

You can return to DHCP mode by using the `exit` command.

**ECMP GROUP Mode**

To enable or configure traffic distribution monitoring on an ECMP link bundle, use ECMP GROUP mode. For more information, see *ecmp_overview*.

To enter ECMP GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ecmp-group` command then enter the ECMP group ID. The prompt changes to include `conf-ecmp-group-ecmp-group-id`.

You can return to CONFIGURATION mode by using the `exit` command.

**EIS Mode**

To enable or configure Egress Interface Selection (EIS), use EIS mode.

To enter EIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `management egress-interface-selection` command. The prompt changes to include `conf-mgmt-eis`.

You can return to CONFIGURATION mode by using the `exit` command.

**EXEC Mode**

When you initially log in to the switch, by default, you are logged in to EXEC mode. This mode allows you to view settings and enter EXEC Privilege mode, which is used to configure the device.
When you are in EXEC mode, the > prompt is displayed following the host name prompt, which is “Dell” by default. You can change the host name prompt using the `hostname` command.

**NOTE:** Each mode prompt is preceded by the host name.

### EXEC Privilege Mode

The `enable` command accesses EXEC Privilege mode. If an administrator has configured an “Enable” password, you are prompted to enter it.

EXEC Privilege mode allows you to access all the commands accessible in EXEC mode, plus other commands, such as to clear address resolution protocol (ARP) entries and IP addresses. In addition, you can access CONFIGURATION mode to configure interfaces, routes and protocols on the switch. While you are logged in to EXEC Privilege mode, the # prompt is displayed.

### EXTENDED COMMUNITY LIST Mode

To enable and configure a BGP extended community, use EXTENDED COMMUNITY LIST mode.

To enter EXTENDED COMMUNITY LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip extcommunity-list` command then a community list name. The prompt changes to include `conf-ext-community-list`.

You can return to CONFIGURATION mode by using the `exit` command.

### FRRP Mode

To enable or configure Force10 Resilient Ring Protocol (FRRP), use FRRP mode. For more information, see Force10 Resilient Ring Protocol (FRRP).

To enter FRRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol frrp` command then the ring ID. The prompt changes to include `conf-frrp-ring-id`.

You can return to CONFIGURATION mode by using the `exit` command.

### INTERFACE Mode

Use INTERFACE mode to configure interfaces or IP services on those interfaces. An interface can be physical (for example, a Gigabit Ethernet port) or virtual (for example, the Null interface).

To enter INTERFACE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `interface` command and then enter an interface type and interface number that is available on the switch.

**NOTE:** In Dell Networking OS, the stack unit number and interfaces start from 0. But in Dell Networking OS Open Networking platforms, the stack unit number and interfaces start from 1.

The prompt changes to include the designated interface and slot/port number. For example:
<table>
<thead>
<tr>
<th>Prompt</th>
<th>Interface Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell(conf-if)#</td>
<td>INTERFACE mode</td>
</tr>
<tr>
<td>Dell(conf-if-gi-1/1)#</td>
<td>Gigabit Ethernet interface then the slot/port information</td>
</tr>
<tr>
<td>Dell(conf-if-te-1/1)#</td>
<td>Ten-Gigabit Ethernet interface then slot/port information</td>
</tr>
<tr>
<td>Dell(conf-if-lo-0)#</td>
<td>Loopback interface number</td>
</tr>
<tr>
<td>Dell(conf-if-nu-0)#</td>
<td>Null Interface then zero</td>
</tr>
<tr>
<td>Dell(conf-if-po-0)#</td>
<td>Port-channel interface number The range is from 1 to 128.</td>
</tr>
<tr>
<td>Dell(conf-if-vl-0)#</td>
<td>VLAN Interface then VLAN number (range 1–4094)</td>
</tr>
<tr>
<td>Dell(conf-if-ma-1/1)#</td>
<td>Management Ethernet interface then slot/port information</td>
</tr>
<tr>
<td>Dell(conf-if-tu-0)#</td>
<td>Tunnel interface then tunnel ID.</td>
</tr>
<tr>
<td>Dell(conf-if-range)#</td>
<td>Designated interface range (used for bulk configuration).</td>
</tr>
</tbody>
</table>

**IP ACCESS LIST Mode**

To enter IP ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `ip access-list standard` command or the `ip access-list extended` command.

To enter IP ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter either the `ip access-list standard` command or the `ip access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-nacl` or `conf-ext-nacl`.

You can return to CONFIGURATION mode by using the `exit` command.

**ISIS ADDRESS-FAMILY Mode**

To enable or configure IPv6 for ISIS, use ISIS ADDRESS-FAMILY mode. For more information, see Intermediate System to Intermediate System (IS-IS).

To enter ISIS ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER ISIS mode.
2. Enter the `address-family ipv6 unicast` command. The prompt changes to include `conf-router_isis-af_ipv6`.
**LLDP Mode**

To enable and configure Link Layer Discovery Protocol (LLDP), use LLDP mode. For more information, see [Link Layer Discovery Protocol (LLDP)](Link Layer Discovery Protocol (LLDP)).

To enter LLDP mode:

1. To enable LLDP globally, verify that you are logged in to CONFIGURATION mode. To enable LLDP on an interface, verify that you are logged in to INTERFACE mode.
2. Enter the `protocol lldp` command. The prompt changes to include `conf-lldp` or `conf-if-interface-lldp`.

**LLDP MANAGEMENT INTERFACE Mode**

To enable and configure Link Layer Discovery Protocol (LLDP) on management interfaces, use LLDP MANAGEMENT INTERFACE mode.

To enter LLDP MANAGEMENT INTERFACE mode:

1. Verify that you are logged in to LLDP mode.
2. Enter the `management-interface` command. The prompt changes to include `conf-lldp-mgmtIf`.

**LINE Mode**

To configure the console or virtual terminal parameters, use LINE mode.

To enter LINE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `line` command. Include the keywords `console` or `vty` and their line number available on the switch. The prompt changes to include `config-line-console` or `config-line-vty`.

You can exit this mode by using the `exit` command.

**MAC ACCESS LIST Mode**

To enter MAC ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `mac access-list standard` or `mac access-list extended` command.

To enter MAC ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `mac access-list standard` command or the `mac access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-macl` or `conf-ext-macl`.

You can return to CONFIGURATION mode by using the `exit` command.

**MONITOR SESSION Mode**

To enable and configure a traffic monitoring session using port monitoring, use MONITOR SESSION mode. For more information, see [Port Monitoring](Port Monitoring).

To enter MONITOR SESSION mode:
1 Verify that you are logged in to CONFIGURATION mode.
2 Enter the monitor session command, and then the session ID. The prompt changes to include conf-mon-sess-sessionID.

MULTIPLE SPANNING TREE (MSTP) Mode
To enable and configure MSTP, use MULTIPLE SPANNING TREE mode. For more information, see Multiple Spanning Tree Protocol (MSTP).

To enter MULTIPLE SPANNING TREE mode:
1 Verify that you are logged in to CONFIGURATION mode.
2 Enter the protocol spanning-tree mstp command. The prompt changes to include conf-mstp.

You can return to CONFIGURATION mode by using the exit command.

OPENFLOW INSTANCE Mode
To enable and configure OpenFlow instances, use OPENFLOW INSTANCE mode.

To enter OPENFLOW INSTANCE mode:
1 Verify that you are logged in to CONFIGURATION mode.
2 Enter the openflow of-instance command, and then the OpenFlow ID number of the instance you want to create or configure. The prompt changes to include conf-of-instance of-id.

You can return to the CONFIGURATION mode by entering the exit command.

Per-VLAN SPANNING TREE (PVST+) Plus Mode
To enable and configure the Per-VLAN Spanning Tree (PVST+) protocol, use PVST+ mode. For more information, see Per-VLAN Spanning Tree Plus (PVST+).

**NOTE:** The protocol name is PVST+, but the plus sign is dropped at the CLI prompt.

To enter PVST+ mode:
1 Verify that you are logged in to CONFIGURATION mode.
2 Enter the protocol spanning-tree pvst command. The prompt changes to include conf-pvst.

You can return to CONFIGURATION mode by using the exit command.

PORT-CHANNEL FAILOVER-GROUP Mode
To configure shared LAG state tracking, use PORT-CHANNEL FAILOVER-GROUP mode. For more information, see Port Channel Commands.

To enter PORT-CHANNEL FAILOVER-GROUP mode:
1 Verify that you are logged in to CONFIGURATION mode.
2 Enter the port-channel failover-group command. The prompt changes to include conf-po-failover-grp.

You can return to CONFIGURATION mode by using the exit command.
PREFIX-LIST Mode

To configure a prefix list, use PREFIX-LIST mode.

To enter PREFIX-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip prefix-list` command and the name for the prefix list. The prompt changes to include `conf-nprefixl`.

You can return to CONFIGURATION mode by using the `exit` command.

PROTOCOL GVRP Mode

To enable and configure GARP VLAN Registration Protocol (GVRP), use PROTOCOL GVRP mode. For more information, see GARP VLAN Registration (GVRP).

To enter PROTOCOL GVRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol gvrp` command. The prompt changes to include `config-gvrp`.

You can return to CONFIGURATION mode by using the `exit` command.

RAPID SPANNING TREE (RSTP) Mode

To enable and configure RSTP, use RSTP mode. For more information, see Rapid Spanning Tree Protocol (RSTP).

To enter RSTP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree rstp` command. The prompt changes to include `conf-rstp`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTE-MAP Mode

To configure a route map, use ROUTE-MAP mode.

To enter ROUTE-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `route-map map-name [permit | deny] [sequence-number]` command. The prompt changes to include `config-route-map`.

You can return to CONFIGURATION mode by using the `exit` command.

ROUTER BGP Mode

To enable and configure Border Gateway Protocol (BGP), use ROUTER BGP mode. For more information, see Border Gateway Protocol IPv4 (BGPv4)

To enter ROUTER BGP mode:
1. Verify that you are logged into CONFIGURATION mode.
2. Use the `router bgp` command, and then enter the AS number. The prompt changes to include `conf-router_bgp`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER ISIS Mode**

To enable and configure Intermediate System to Intermediate System (ISIS), use ROUTER ISIS mode. For more information, see Intermediate System to Intermediate System (IS-IS).

To enter ROUTER ISIS mode:

1. Verify that you are logged into CONFIGURATION mode.
2. Use the `router isis` command. The prompt changes to include `conf-router_isis`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER OSPF Mode**

To configure OSPF, use ROUTER OSPF mode. For more information, see Open Shortest Path First (OSPFv2).

To enter ROUTER OSPF mode:

1. Verify that you are logged into CONFIGURATION mode.
2. Enter the `router ospf {process-id}` command. The prompt changes to include `conf-router_ospf-id`.

You can switch to INTERFACE mode by using the `interface` command or you can switch to ROUTER RIP mode by using the `router rip` command.

**ROUTER OSPFV3 Mode**

To configure OSPF for IPv6, use ROUTER OSPFV3 mode.

To enter ROUTER OSPFV3 mode:

1. Verify that you are logged into CONFIGURATION mode.
2. Enter the `ipv6 router ospf {process-id}` command. The prompt changes to include `conf-ipv6-router_ospf`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER RIP Mode**

To enable and configure Router Information Protocol (RIP), use ROUTER RIP mode. For more information, see Routing Information Protocol (RIP).

To enter ROUTER RIP mode:

1. Verify that you are logged into CONFIGURATION mode.
2. Enter the `router rip` command. The prompt changes to include `conf-router_rip`.

You can return to CONFIGURATION mode by using the `exit` command.
SPANNING TREE Mode

To enable and configure the Spanning Tree protocol, use SPANNING TREE mode. For more information, see Spanning Tree Protocol (STP).

To enter SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree stp-id` command. The prompt changes to include `conf-stp`.

You can return to CONFIGURATION mode by using the `exit` command.

SupportAssist Mode

To enable and configure the SupportAssist, use SupportAssist mode. For more information, see SupportAssist.

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `support-assist` command. The prompt changes to include `conf-supportassist`.

You can return to CONFIGURATION mode by using the `exit` command.

TRACE-LIST Mode

To configure a Trace list, use TRACE-LIST mode.

To enter TRACE-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip trace-list` command, and the name of the Trace list. The prompt changes to include `conf-trace-acl`.

You can exit this mode by using the `exit` command.

VLT DOMAIN Mode

To enable and configure the VLT domain protocol, use VLT DOMAIN mode. For more information, see Virtual Link Trunking (VLT).

To enter VLT DOMAIN mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `vlt domain` command, and then the VLT domain number. The prompt changes to include `conf-vlt-domain`.

You can return to CONFIGURATION mode by entering the `exit` command.

VRRP Mode

To enable and configure Virtual Router Redundancy Protocol (VRRP), use VRRP mode. For more information, see Virtual Router Redundancy Protocol (VRRP).

To enter VRRP mode:

1. To enable VRRP globally, verify that you are logged in to CONFIGURATION mode.
2. Enter the `vrrp-group` command, and then enter the VRRP group ID. The prompt changes to include `conf-if-interface-type-slot/port-vrid-vrrp-group-id`. 
File Management

This section contains command line interface (CLI) commands needed to manage the configuration files, as well as other file management commands.

Topics:
- boot system
- cd
- copy
- delete
- dir
- format
- fsck flash
- mkdir
- mount nfs
- rmdir
- upgrade system
- rename
- restore factory-defaults
- show boot system
- show bootvar
- show file-systems
- show os-version
- show running-config
- show startup-config
- show version
- upgrade

**boot system**

Specify the location where the Dell Networking OS image used to boot the system is stored.

**Syntax**

```
boot system {gateway ip-address | stack-unit {stack-unit-number | all} {default | primary | secondary} {ftp: | nfsmount: | system: {A: | B: | bmp-boot} | tftp: | usbflash:}}
```

To return to the default boot sequence, use the no boot system command.

**Parameters**

- **gateway**
  - Enter the IP address of the default next-hop gateway for the management subnet.
- **ip-address**
  - Enter an IP address in dotted decimal format.
- **stack-unit**
  - Enter the keywords stack-unit to specify the stack unit number.
all

**stack-unit-number**
Enter the stack-unit number. The range is from 1 to 12.

default

Enter the keyword default to specify the default Dell Networking OS image.

primary

Enter the keyword primary to specify the primary Dell Networking OS image.

secondary

Enter the keyword secondary to specify the secondary Dell Networking OS image.

system:
Enter the keyword system: to use the system image file URL (system).

ftp:
Enter the keyword FTP: to retrieve the image from an FTP server. ftp://userid:password@hostip/filepath.

nfsmount

Enter the keyword nfsmount: to retrieve the image from a mounted NFS file system. nfsmount://filepath

system:
Enter the keyword system: to retrieve the image from the system.

usbflash

Enter the keyword usbflash: to retrieve the image from the USB flash memory. usbflash://filename.

tftp:
Enter the keyword TFTP: to retrieve the image from a TFTP server. tftp://hostip/filepath.

A: | B:
Enter A: or B: to boot one of the system partitions.

bmp-boot

Enter the keywords bmp-boot to boot the system from the image present in the DHCP offer.

| NOTE: In normal-reload, this keyword is not enabled. |

### Defaults
Not configured.

### Command Modes
CONFIGURATION

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version
- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced the support for bmp-boot on the S-Series and Z-Series switches.
- 8.3.19.0 Introduced on the S4820T.
- 8.3.11.1 Introduced on the Z9000.
- 8.3.7.0 Introduced on the S4810.

### Usage Information
To display these changes in the show bootvar command output, save the running configuration to the startup configuration (using the copy command) and reload system.
Use the `bmp-boot` keyword only when the device boots up from bare metal provisioning (BMP). For an industrial standard upgraded device, the Dell networking OS stores the image partition upgraded from the DHCP offer in the `bmp-boot` option.

### cd

Change to a different working directory.

**Syntax**

```
cd [flash: | usbflash:] <directory name and path>
```

**Parameters**

- **flash:** Use the keyword `flash:` to change the current directory to internal flash and its sub directories.
- **usbflash:** Use the keyword `usbflash:` to change the current directory to the inserted USB.
- **directory name and path** Enter the directory name and path as follows: `directory name (\[\[flash://\]directory_path\])`

**NOTE:** The `cd` command without any arguments will change the current directory to `flash:`

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Copy one file to another location. Dell Networking OS supports IPv4 and IPv6 addressing for FTP, HTTP, TFTP, and SCP (in the hostip field).

```
copy source-file-url destination-file-url
```

**Parameters**

- `compressed-config`: Enter the keywords `compressed-config` to copy a file from the current system configuration.
- `flash:`: Enter the keyword `flash:` to copy from the local file system ([flash://]filepath).
- `ftp:`: Enter the keyword `ftp:` to copy from the remote file system, IPv4, or IPv6, (ftp://userid:password@hostip/filepath).
- `http:`: Enter the keyword `http:` to copy from the remote file system, IPv4, or IPv6, (http://hostip/filepath).
- `nfsmount:`: Enter the keyword `nfsmount:` to copy from the nfs mount file system (nfsmount://<mount-point>/filepath).
- `running-config`: Enter the keywords `running-config` to copy from the current system configuration.
- `scp:`: Enter the keyword `scp:` to copy from the remote file system, IPv4, or IPv6, (scp://userid:password@hostip/filepath).
- `startup-config`: Enter the keywords `startup-config` to copy from the startup configuration.
- `tftp:`: Enter the keyword `tftp:` to copy from the remote file system, IPv4, or IPv6, (tftp://hostip/filepath).
- `usbflash:`: Enter the keyword `usbflash:` to copy the file to or from the external USB flash.

</table>
### Version | Description
--- | ---
9.0.2.0 | Introduced on the S6000.
8.4.1.0 | Added IPv6 addressing support for FTP, TFTP, and SCP.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Added `usbflash` and `rpm0usbflash` commands on E-Series.
7.6.1.0 | Introduced on the S-Series and added the SSH port number to the SCP prompt sequence on all systems.
7.5.1.0 | Introduced on the C-Series.
E-Series | Original command.

**Usage Information**

Dell Networking OS supports a maximum of 100 files at the root directory level on both the internal and external flash.

When copying a file to a remote location (for example, using Secure Copy [SCP]), enter only the keywords and Dell Networking OS prompts you for the rest of the information. For example, when using SCP, you can enter `copy running-config scp:` where `running-config` is the source and the target is specified in the ensuing prompts. Dell Networking OS prompts you to enter any required information for the named destination — remote destination, destination filename, user ID, password, and so forth.

When you use the `copy running-config startup-config` command to copy the running configuration to the startup configuration file, Dell Networking OS creates a backup file on the internal flash of the startup configuration.

When you load the startup configuration or a configuration file from a network server such as TFTP to the running configuration, the configuration is added to the running configuration. This does not replace the existing running configuration. Commands in the configuration file has precedence over commands in the running configuration.

Dell Networking OS supports copying the running-configuration to a TFTP server, an FTP server, or a remote NFS file system. For example:

- `copy running-config tftp:
- `copy running-config ftp:
- `copy running-config nfsmount://<mount-point>/filepath

You can compress the running configuration by grouping all the VLANs and the physical interfaces with the same property. You can store the operating configuration to the startup config in Compressed mode and perform an image downgrade without any configuration loss.

**Example**

```
Dell#copy running-config scp:
Address or name of remote host []: 192.168.1.1
Port number of the server [22]: 22
Destination file name [startup-config]:
User name to login remote host: username
Password to login remote host:
!
4080 bytes successfully copied
Dell#
```
In this `copy scp: flash:` example, specifying SCP in the first position indicates that you need to specify the target in the ensuing prompts. Entering `flash:` in the second position indicates that the target is the internal flash. The source is on a secure server running secure shell (SSH), so you are prompted for the user datagram protocol (UDP) port of the SSH server on the remote host.

**Example**

```bash
Dell# copy running-config nfsmount://<mount-point>/filepath
Destination file name [test.txt]:
User name to login remote host: username
Password to login remote host:
Dell#
```

**Example**

```bash
Dell# copy scp: flash:
Address or name of remote host []: 10.11.199.134
Port number of the server [22]: 99
Source file name []: test.cfg
User name to login remote host: admin
Password to login remote host:
Destination file name [test.cfg]: test1.cfg
Dell#
```

**Example**

```bash
Dell# copy compressed-config compressed-cfg
!
6655 bytes successfully copied
Dell#
Dell# copy compressed-config ftp:
Address or name of remote host []: 10.11.8.12
Destination file name [startup-config]:
User name to login remote host: spbalaji
Password to login remote host:
!
6655 bytes successfully copied
Dell#
```

**Example**

```bash
Dell# copy http://admin:admin123@10.16.206.77/sample_file flash://sample_file
Dell#
```

**Related Commands**

- `cd` – changes the working directory.

---

**delete**

Delete a file from the flash. After deletion, files cannot be restored.

**Syntax**

```
delete {flash: | nfsmount: | usbflash:} [no-confirm]
```

**Parameters**

- `flash:` To delete a file or directory on the internal flash, enter `flash://` then the filename or directory name (`[flash://]filepath`).

- `nfsmount:` To delete a file or directory on the NFS-mounted file system, enter `nfsmount://` then the mount point and the file path (`nfsmount://filepath`).

**NOTE:** While deleting a file directory on a remote NFS file system, you must specify the mount-point that indicates the working directory on the NFS file system. You cannot delete the root directory of the remote NFS file system.
To delete a file or directory on the external USB flash, enter `usbflash://` then the filename or directory name (`[usbflash://]filepath`).

(OPTIONAL) Enter the keywords `no-confirm` to specify that the Dell Networking OS does not require user input for each file prior to deletion.

**Command Modes**
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**dir**
Display the files in a file system. The default is the current directory.

```
Syntax
dir [flash: | nfsmount: | usbflash:]
```

**Parameters**
- **flash:**
  For a directory on the internal Flash, enter `flash://` directory name.

- **nfsmount:**
  For a file or directory on an NFS-mounted file system, enter `nfsmount://` then the mount point and file path.

  **NOTE:** While displaying a file directory on a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot display details corresponding to the root directory of the remote NFS file system.

- **usbflash:**
  For a directory on the external USB flash, enter `usbflash://` directory name.

</table>

**Usage Information**

You must include the colon (:) when entering this command.

After reformatting is complete, three empty directories are automatically created on flash: CRASH_LOG_DIR, TRACE_LOG_DIR and NVTRACE_LOG_DIR.

⚠️ **CAUTION:** This command deletes all files, including the startup configuration file. So, after executing this command, consider saving the running config as the startup config (use the write memory command or copy running-config startup-config command).

**Related Commands**

- `copy` — copy the current configuration to either the startup-configuration file or the terminal.
- `show file-systems` — display information about the file systems on the system.

**fsck flash**

Checks the flash file system for errors.

```
Syntax
fsck {flash: | usbflash:}
```
Parameters

flash: For a directory on the internal Flash, enter flash:// directory name.

usbflash: For a directory on the external USB flash, enter usbflash:// directory name.

Defaults
None

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
9.1(0.0) Introduced on S4810 and Z9000.
8.3.19.0 Introduced on S4820T.

Usage Information
Include the colon (:) when entering this command. This command checks the specified flash memory for errors. If errors are found, the command recommends that you format the flash.

CAUTION: If you elect to format the flash, all files — including the startup configuration file — are lost. If you do decide to format the specified flash, consider saving the running configuration as the startup configuration after formatting the flash (use the write memory command or copy running-config startup-config command).

Related Commands
- copy — copy one file to another location.
- show file-systems — display information about the file systems on the system.

mkdir

Creates a directory on the NFS mounted file system.

Syntax
mkdir nfsmount://mount-point/username

Version Description
9.10(0.0) Introduced on the S3148.
mount nfs

Mounts an NFS file system to a device.

Syntax

mount nfs rhost:path mount-point [username password]

Parameters

- **rhost:path**: Enter the remote host's path directory.
- **mount-point**: Enter the folder name in the local file system.
- **username** (OPTIONAL): Enter the user name to access the device.
- **password** (OPTIONAL): Enter the password.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0)  Introduced on the S3148.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100–ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S-Series.

Example

```
Dell# mount nfs nfstest nfs-mount-point username pwd
Dell#
```

Related Commands

- cd — change the working directory.
**rmdir**

Removes a directory from the NFS mounted file system.

**Syntax**

```
rmdir nfsmount://mount-point/username
```

**Command Modes**

CONFIGURATION

**Command History**

**Example**

```
Dell# rmdir nfsmount:/nfs-mountpoint/guest
Proceed to remove the directory [confirm yes/no]: yes
Dell#
```

**Related Commands**

- `mkdir` — create a directory.

**upgrade system**

Upgrade the Dell Networking OS image. To upgrade the bootflash or bootselector image, use the `upgrade boot` command.

**Syntax**

```
upgrade system {flash: | ftp: | nfsmount: | scp: | stack-unit {stack-unit-id | all} | tftp: | ush:} file-url {A: | B:}
```

**Parameters**

- `system` Enter the keyword `system` to upgrade the operating system (OS) image.
- `flash: file-url` Enter the keyword `flash:` and specify the location of the image file in the format `//directory-path` or press Enter to launch a prompt sequence.
- `ftp: file-url` Enter the keyword `ftp:` and specify the location of the image file in the format `//userid:password@host-ip/filepath` or press Enter to launch a prompt sequence.
- `nfsmount: //<mount-point>/filepath` Enter the keyword `nfsmount:` and specify the location of the image file in the format `//<mount-point>/filepath`.
- `scp: file-url` Enter the keyword `scp:` and specify the location of the image file in the format `userid:password@host-ip/filepath` or press Enter to launch a prompt sequence.
stack-unit stack-unit-id

- Enter the keyword stack-unit and specify the stack-unit ID to sync the image to that stack-unit.

stack-unit all

- Enter the keyword stack-unit followed by the keyword all to sync the image on all stack-units.

tftp: file-url

- Enter the keyword tftp: and specify the location of the image file in the format //host-ip/filepath or press Enter to launch a prompt sequence.

usbflash: file-url

- Enter the keyword usbflash: and specify the location of the source file in the format //directory-path to upgrade from an external flash device or press Enter to launch a prompt sequence.

A: | B:

- Specify the flash partition of the operating-system image to be upgraded.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.7.1.0</td>
<td>Added support for TFTP and SCP.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X:XX:XX:XX]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

After you upgrade the system image, by entering the command, specify the location where the Dell Networking OS image used to boot the system is stored (boot system), save the configuration to the start-up config file (write memory), and reload the system (reload).

**Example**

```
Dell# upgrade system tftp://10.11.8.12/dv-rainier-13 a:
Received block num: 50

Received block num: 64

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

................................................
```
rename

Rename a file in the local file system.

Syntax

rename url url

Parameters

url

Enter the following keywords and a filename:

- For a file on the internal Flash, enter flash:// followed by the filename.
- For a file on an NFS mounted file system, enter nfsmount:// followed by the mount point and file path.
- For a file on an external USB drive, enter usbflash:// followed by the filename.

8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on S-Series
7.5.1.0 Introduced on C-Series
E-Series Original command

restore factory-defaults

Restore factory defaults.

Syntax

restore factory-defaults stack-unit {stack-unit-number | all} {clear-all | bootvar | nvram}
Parameters

**factory-defaults**
Return the system to its factory default mode.

**stack-unit-number**
Enter the stack member unit identifier to restore only the mentioned stack-unit. The range is from 1 to 12.

**all**
Enter the keyword all to restore all units in the stack.

**bootvar**
Enter the keyword bootvar to reset boot line.

**clear-all**
Enter the keywords clear-all to reset the NvRAM, boot environment variables, and the system startup configuration.

**nvram**
Enter the keyword nvram to reset the NvRAM only.

Command Modes

EXEC Privilege

<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

Usage Information

Restoring factory defaults deletes the existing startup configuration and all persistent settings (stacking, fan-out, and so forth).

When restoring all units in a stack, all the units in the stack are placed into stand-alone mode.

When restoring a single unit in a stack, that unit placed in stand-alone mode. No other units in the stack are affected.

When restoring units in stand-alone mode, the units remain in stand-alone mode after the restoration. After the restore is complete, the units power cycle immediately.

⚠️ **CAUTION:** There is no undo for this command.

Following are the factory-default environment variables:

- baudrate
- primary_boot
- secondary_boot
- default_boot
- ipaddr
- gatewayip
- netmask
- macaddr
- mgmtautoneg
- mgmtspeed100
- mgmtfullduplex

Each boot path variable (primary_boot, secondary_boot, and default_boot) is further split into the following three independent variables:

- primary_server, primary_file, and primary_type
- secondary_server, secondary_file, and secondary_type
- default_server, default_file, and default_type

**NOTE:** For information on the default values that these variables take, refer to the Restoring Factory Default Environment Variables section in the Dell Networking OS Configuration guide.

Example (all stack units)

Dell# restore factory-defaults stack-unit all clear-all

************************************************************
* Warning - Restoring factory defaults will delete the existing *
* startup-config and all persistent settings (stacking, fanout, etc.)*
* All the units in the stack will be split into standalone units. *
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
************************************************************

Proceed with factory settings? Confirm [yes/no]:yes

-- Restore status --
Unit Nvram Config
------------------------
1 Success Success
2 Success Success
3 Success Success
4 Not present
5 Not present

Power-cycling the unit(s).
Dell#

Example (single stack)

Dell# restore factory-defaults stack-unit 1 clear-all

************************************************************
* Warning - Restoring factory defaults will delete the existing *
* startup-config and all persistent settings (stacking, fanout, etc.)*
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
************************************************************

Proceed with factory settings? Confirm [yes/no]:yes

-- Restore status --
Unit Nvram Config
------------------------
1 Success Success

Power-cycling the unit(s).
Dell#

Example (NvRAM all stack units)

Dell# restore factory-defaults stack-unit all nvram

************************************************************
* Warning - Restoring factory defaults will delete the existing *
* persistent settings (stacking, fanout, etc.) *
* All the units in the stack will be split into standalone units. *
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
************************************************************
**show boot system**

Displays information about boot images currently configured on the system.

**Syntax**

```
show boot system stack-unit {stack-unit-id | all}
```

**Parameters**

- **all**
  - Enter the keyword `all` to display the boot image information for all stack units.
- **stack-unit-id**
  - Enter the `stack-unit-id` to display boot image information for a stack-unit.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

### Related Commands
- `format flash` – erases all the existing files and reformats the file system in the internal flash memory.

## show os-version

Display the release and software image version information of the image file specified.

### Syntax
```
show os-version [file-url]
```

### Parameters
- **file-url** (OPTIONAL) Enter the following location keywords and information:
  - For a file on the internal flash, enter flash:// followed by the filename.
  - For a file on an FTP server, enter ftp://user:password@hostip/filepath.
  - For a file on a TFTP server, enter tftp://hostip/filepath.
  - For a file on the USB port, enter usbflash://filepath.

### Defaults
- none

### Command Modes
- EXEC Privilege

### Command History
- This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version
- 9.10(0.0) Introduced on the S3148.

### Usage Information

**NOTE**: A filepath that contains a dot (.) is not supported.
show running-config

Display the current configuration and display changes from the default values.

Syntax
show running-config [entity] [configured] [status] [compressed]

Parameters
entity
(Optional) To display that entity’s current (non-default) configuration, enter one of the following keywords:

- **aaa** for the current AAA configuration
- **acl** for the current ACL configuration
- **arp** for the current static ARP configuration
- **as-path** for the current AS-path configuration
- **bfd** for the current BFD configuration
- **bgp** for the current BGP configuration
- **boot** for the current boot configuration
- **cam-profile** for the current CAM profile in the configuration
- **class-map** for the current class-map configuration
- **community-list** for the current community-list configuration
- **ecmp-group** for the current ECMP group configuration
- **eis** for the current EIS configuration
- **ethernet** for the current Ethernet CFM configuration
- **fefd** for the current FEFD configuration
- **ftp** for the current FTP configuration
- **frrp** for the current FRRP configuration
- **fvrp** for the current FVRP configuration
- **gvrp** for the current GVRP configuration
- **host** for the current host configuration
- **hardware-monitor** for hardware-monitor action-on-error settings
- **hypervisor** for the current hypervisor configuration
- **igmp** for the current IGMP configuration
- **interface** for the current interface configuration
- **interface port-channel** for the current port-channel interface configuration.
- **interface tunnel** for all configured tunnels. For a specific tunnel, enter the tunnel ID. The range is from 1 to 16383.

**NOTE:** If you did not configure anything that entity, nothing displays and the prompt returns.
ip for the current IP configuration
isis for the current ISIS configuration
line for the current line configuration
lldp for the current LLDP configuration
load-balance for the current port-channel load-balance configuration
logging for the current logging configuration
mac for the current MAC ACL configuration
mac-address-table for the current MAC configuration
management-eis for the current management EIS configuration
management-route for the current Management port forwarding configuration
mld for the current MLD configuration
monitor for the current Monitor configuration
mroute for the current Mroutes configuration
msdp for the current MSDP configuration
ntp for the current NTP configuration
ospf for the current OSPF configuration
pim for the current PIM configuration

policy-map-output for the current output policy map configuration
po-failover-group for the current port-channel failover-group configuration
prefix-list for the current prefix-list configuration
privilege for the current privilege configuration
qos-policy-input for the current input QoS policy configuration
qos-policy-output for the current output QoS policy configuration
radius for the current RADIUS configuration
redirect-list for the current redirect-list configuration
redundancy for the current RPM redundancy configuration
resolve for the current DNS configuration
rip for the current RIP configuration
rmon for the current RMON configuration
route-map for the current route map configuration
for the current sFlow configuration
for the current SNMP configuration
for the current spanning tree configuration
for the current static route configuration
for the file status information
for the current SupportAssist configuration
for the current TACACS+ configuration
for the current TFTP configuration
for the current trace-group configuration
for the current trace-list configuration
for the uplink state group configuration
for the current users configuration
for the current VLT configuration
for the current wred-profile configuration

(Optional) Enter the keyword `configuration` to display line card interfaces with non-default configurations only.

(Optional) Enter the keyword `status` to display the checksum for the running configuration and the start-up configuration.

(Optional) Enter the keyword `compressed` to display the compressed group configuration. Displays the compressed configuration by grouping all similar configurations. The compression is done only for interface related configurations.

360 GigabitEthernet/IEEE 802.3 interface(s)
26 Ten GigabitEthernet/IEEE 802.3 interface(s)

Dell#

upgrade

Upgrade the bootflash image or system image of the management unit.

Syntax

upgrade boot {all | bootflash-image | bootselector-image} stack-unit {stack-unit-number | all} {booted | flash: | ftp: | nfsmount | scp: | tftp: | usbflash:} file-url

Parameters

boot
Enter the keyword boot to change the boot image.

system
Enter the keyword system to change the system image.

ftp:
After entering the keyword ftp:, you can either follow it with the location of the source file in this form: //userid:password@hostip/filepath or press Enter to launch a prompt sequence.

scp:
After entering the keyword scp:, you can either follow it with the location of the source file in this form: //userid:password@hostip/filepath or press Enter to launch a prompt sequence.

slot0:
After entering the keyword slot0:, you can either follow it with the location of the source file in this form: //hostlocation/filepath or press Enter to launch a prompt sequence.

tftp:
After entering the keyword tftp:, you can either follow it with the location of the source file in this form: //hostlocation/filepath or press Enter to launch a prompt sequence.
After entering the keyword `flash:` you can either follow it with the location of the source file in this form: `flash://filepath` or press Enter to launch a prompt sequence.

Enter the partition to upgrade from the flash.

Enter the keywords `stack-unit:` to synch the image to the stack-unit.

Enter the following location keywords and information to upgrade using an Dell Networking OS image other than the one currently running:

- To specify an Dell Networking OS image on the internal flash, enter `flash://file-path/filename`.
- To specify an Dell Networking OS image on an FTP server, enter `ftp://user:password@hostip/filepath`.
- To specify an Dell Networking OS image on the external flash, enter `slot0://file-path/filename`.
- To copy a file on a TFTP server, enter `tftp://hostip/filepath/filename`.

where `hostip` is either an IPv4 dotted decimal address or an IPv6 URI [X::X::X] format address.

---

**Defaults**

`none`

**Command Modes**

`EXEC Privilege`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

**Version**

<table>

<tr>
<td>7.7.1.0</td>
<td>Added support for TFTP and SCP.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series</td>
</tr>
</tbody>
</table>

**Usage Information**

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X::X::X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

Reload Dell Networking OS after executing this command. To copy Dell Networking OS from the management unit to one or more stack members, use the `upgrade system stack-unit` (S-Series stack member) command.

**Example**

```bash
Dell(conf)# upgrade system?
ftp: Copy from remote file system (ftp://userid:password@hostip/filepath)
scp: Copy from remote file system (scp://userid:password@hostip/filepath)
```
tftp: Copy from remote file system (tftp://hostip/filepath)

Control and Monitoring

This section contains command information to configure and monitor the system, including Telnet, file transfer protocol (FTP), and trivial file transfer protocol (TFTP).

**banner exec**

Configure a message that is displayed when you enter EXEC mode.

**Syntax**

```
banner exec c line c
```

To delete a banner, use the `no banner exec` command.

**Parameters**

- `c`  
  Enter the keywords `banner exec`, then enter a character delineator, represented here by the letter `c`. Press ENTER.

- `line`  
  Enter a text string for your banner message ending the message with your delineator. In the following example, the delineator is a percent character (%); the banner message is “testing, testing”.

**Defaults**

No banner is displayed.

**Command Modes**

### banner login

Set a message of the day banner to appear after logging on to the system.

**Syntax**

```
banner login {acknowledgement | keyboard-interactive | c line c}
```

Enter no banner login to delete the banner text. Enter no banner login keyboard-interactive to automatically go to the banner message prompt (does not require a carriage return).

**Parameters**

- **keyboard-interactive**
  - Enter the keyboard-interactive keyword and then press Enter (carriage return) to retrieve the message banner prompt.

- **acknowledgement**
  - Enter the acknowledgement keyword to require a positive acknowledgement from the user while logging in to the system.

- **c**
  - Enter a delineator character to specify the start and end of the text banner. You cannot use the delineator character in the banner message.

- **line**
  - Enter text string for your text banner message, with a maximum of 50 lines and up to 255 characters per line.

**Defaults**

No banner is configured and a carriage return (CR) is required when creating a banner.

**Command Modes**

</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>E-Series</td>
<td>Original command</td>
</tr>
</tbody>
</table>

Usage Information

Enter the banner login command, type one or more spaces and a delineator character, type the banner text, and then type the second delineator character. The message of the day banner displays first when you are connected to the router; otherwise the login banner and prompt appear. After you have logged in, the banner EXEC (if configured) displays.

Example

Dell(conf)#banner login?
acknowledgement Require positive acknowledgment after login prompt
keyboard-interactive Press enter key to get prompt
LINE c banner-text (max length 255) c, where 'c' is a
delimiting character
Dell(conf)#no banner login?
acknowledgement Disable positive acknowledgment required after login
prompt
keyboard-interactive Prompt will be displayed by default

If you configure the acknowledgement keyword, the system requires a positive acknowledgement from the user while logging in to the system.

Related Commands

- `banner motd` — sets a Message of the Day banner.
- `banner exec` — enables the display of a text string when you enter EXEC mode.

---

**banner motd**

Set a message of the day (MOTD) banner.

**Syntax**

```
banner motd  c line  c
```

To delete a Message of the Day banner, enter `no banner motd`.

**Parameters**

- `c`
  Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).

- `line`
  Enter a text string for your MOTD banner the message with your delineator. The delineator is a percent character (%).

**Defaults**

No banner is configured.

<tr>
<td>E-Series</td>
<td>Original command</td>
</tr>
</tbody>
</table>

**Usage Information**

After entering the `banner login` command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.
Related Commands

- **banner exec** — enables the display of a text string when you enter EXEC mode.
- **banner login** — sets a banner to display after successful login to the system.

**cam-acl**

Allocate content addressable memory (CAM) for IPv4 and IPv6 ACLs.

**Syntax**

cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos number l2qos number l2pt number ipmacacl number [vman-qos | vman-dual-qos] number ecfmacl number {fcoeacl number} {iscsioptacl {0|2}} {openflow {4|8}}

**Parameters**

- **default**
  - Use the default CAM profile settings and set the CAM as follows:
    - L2Acl : 2
    -Ipv4Acl : 2
    -Ipv6Acl : 0
    -Ipv4Qos : 2
    -L2Qos : 2
    -L2PT : 0
    -IpMacAcl : 1
    -VmanQos : 0
    -EtsAcl : 0
    -FcoeAcl : 0
    -iscsiOptAcl : 0
    -ipv4pbr : 0
    -vrfv4Acl : 0
    -Openflow : 0
    -fedgovacl : 0
    -nlbclusteracl : 0

Allocate space to each CAM region.

Enter the CAM profile name then the amount of CAM space to be allotted. The total space allocated must equal to 13. The ipv6acl range must be a factor of 2.

Enter 4 or 8 for the number of OpenFlow FP blocks.

- 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

8.3.12.0 | Added the keywords fcoeacl and iscsioptacl on the S4810.
8.3.11.1 | Introduced on the Z9000.
8.3.1.0 | Added the keywords ecfmacl, vman-qos, and vman-dual-qos.
8.2.1.0 | Introduced on the S-Series.
7.8.1.0 | Introduced on the C-Series.

**Usage Information**
For the new settings to take effect, save the new CAM settings to the startup-config (write-mem or copy run start) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The ipv4acl profile range is from 1 to 4.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the ipv6acl profile which is from 0 to 10. The ipv6acl allocation must be a factor of 2 (2, 4, 6, 8, 10).

If you enabled BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the reload conditional nvram-cfg-change command.

**cam-acl-vlan**

Specify the number of VFP blocks allocated to OpenFlow.

**Syntax**
```
cam-acl-vlan {default | vlanopenflow {0|1}}
```

**Defaults**
Disabled.

**Parameters**
- **default**
  Reset VLAN CAM ACL entries to default settings
- **vlanopenflow**
  Enter the number 1 to allocate VFP blocks and enable OpenFlow.
  (Default) Enter the number 0 to disable OpenFlow.

**Command Modes**
CONFIGURATION
clear line

Reset a terminal line.

Syntax

```
clear line {line-number | console 0 | vty number}
```

Parameters

- **line-number**: Enter a number for one of the 12 terminal lines on the system. The range is from 0 to 11.
- **aux 0**: Enter the keywords `aux 0` to reset the auxiliary port.
- **console 0**: Enter the keywords `console 0` to reset the console port.
- **vty number**: Enter the keyword `vty` then a number to clear a terminal line. The range is from 0 to 9.

8.3.11.1 |Introduced on the Z9000.
8.3.7.0 |Introduced on the S4810.
8.1.1.0 |Introduced on the E-Series.
### do

Allows the execution of most EXEC-level commands from all CONFIGURATION levels without returning to the EXEC level.

**Syntax**

```
do command
```

**Parameters**

- `command` Enter an EXEC-level command.

**Defaults**

none

**Command Modes**

- CONFIGURATION
- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**

The following commands are not supported by the `do` command:

- `enable`
- `disable`
enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

Syntax

```
enable [level]
```

Parameters

- `level`: (OPTIONAL) Enter a number for a privilege level of Dell Networking OS. The range is from 0 to 15.

Defaults

15

Command Modes

EXEC

</table>
Usage Information

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the enable password command to configure a password for the enable command at a specific privilege level. If no privilege level is specified, the default is privilege level 15.

**NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an enable password.

Related Commands

- `enable password` — configures a password for the enable command and to access a privilege level.

**enable optic-info-update interval**

Enable polling intervals of optical information updates for simple network management protocol (SNMP).

**Syntax**

```plaintext
enable optic-info-update [interval seconds]
```

To disable optical power information updates, use the `no enable optic-info-update interval` command.

**Parameters**

- `interval seconds` Enter the keyword `interval` then the polling interval in seconds. The range is from 120 to 6000 seconds. The default is `300 seconds` (5 minutes).

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)  Introduced on the S3148.
- 9.8(2.0)  Introduced on the S3100 series.
- 9.8(1.0)  Introduced on the Z9100-ON.
- 9.8(0.0P5)  Introduced on the S4048-ON.
- 9.8(0.0P2)  Introduced on the S3048-ON.
- 9.2(1.0)  Introduced on the Z9500.
- 9.0.2.0  Introduced on the S6000.
- 8.3.19.0  Replacement command for the S4820T. Replaces the `enable xfp-power-updates` command.
- 8.3.11.4  Replacement command for the Z9000. Replaces the `enable xfp-power-updates` command
- 8.3.10.0  Replacement command for the S4810 only. Replaces the `enable xfp-power-updates` command.
Usage Information

To enable polling and to configure the polling frequency, use this command.

end

Return to EXEC Privilege mode from other command modes (for example, CONFIGURATION or ROUTER OSPF modes).

Syntax

end

Command Modes

- CONFIGURATION
- SPANNING TREE
- MULTIPLE SPANNING TREE
- LINE
- INTERFACE
- TRACE-LIST
- VRRP
- ACCESS-LIST
- PREFIX-LIST
- AS-PATH ACL
- COMMUNITY-LIST
- ROUTER OSPF

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series and E-Series.
**exec-timeout**

Set a time interval that the system waits for input on a line before disconnecting the session.

**Syntax**

```
exec-timeout minutes [seconds]
```

To return to default settings, use the `no exec-timeout` command.

**Parameters**

- `minutes` Enter the number of minutes of inactivity on the system before disconnecting the current session. The range is from 0 to 35791. The default is **10 minutes** for the console line and **30 minutes** for the VTY line.

- `seconds` (OPTIONAL) Enter the number of seconds. The range is from 0 to 2147483. The default is **0 seconds**.

**Defaults**

- **10 minutes** for console line; **30 minutes** for VTY lines; **0 seconds**

**Command Modes**

```
LINE
```

**Command History**

### ftp-server enable

Enable FTP server functions on the system.

**Syntax**

```plaintext
ftp-server [vrf vrf-name] enable
```

**Parameters**

- `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to enable the FTP server to listen to that VRF instance.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
E-Series Original command.

Usage Information After you enable FTP server functions with the `ftp-server enable` command, Dell Networking recommends specifying a top-level directory path. Without a top-level directory path specified, the Dell Networking OS directs users to the flash directory when logging in to the FTP server.

Related Commands
- `ftp-server username` — sets a username and password for incoming FTP connections to the E-Series.

### ftp-server username

Create a user name and associated password for incoming FTP server sessions.

**Syntax**

```plaintext
ftp-server username username password [encryption-type] password
```

To delete a user name and its password, use the `no ftp-server username username` command.

**Parameters**

- `username` Enter a text string up to 40 characters long as the user name.
- `password password` Enter the keyword `password` then a string up to 40 characters long as the password. Without specifying an encryption type, the password is unencrypted.
- `encryption-type` (OPTIONAL) After the keyword `password`, enter one of the following numbers:
  - `0` (zero) for an unencrypted (clear text) password
  - `7` (seven) for a hidden text password

**Defaults**

Not enabled.

**Command Modes**

### hostname

Set the host name of the system.

**Syntax**

```
hostname name
```

**Parameters**

- `name`: Enter a text string, up to 32 characters long.

**Defaults**

`Dell`

**Command Modes**

`CONFIGURATION`

**Command History**

This command was introduced in 9.10(0.0)

- Introduced on the S3148.
- Introduced on the S3100 series.
- Introduced on the Z9100–ON.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the S6000-ON.
- Introduced on the Z9500.
- Introduced on the S6000.
- Introduced on the S4820T.
- Introduced on the S4810.
- Introduced on the Z9000.
- Introduced on the E-Series.
- Introduced on the S-Series.
Version | Description
---|---
7.5.1.0 | Introduced on the C-Series.
E-Series | Original command.

Usage Information
The hostname is used in the prompt.

**ip http source-interface**

Specify an interface as the source interface for HTTP connections.

**Syntax**

```plaintext
ip http source-interface interface
```

To delete an interface, use the `no ip http source-interface interface` command.

**Parameters**

- `interface`
Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes**

ip http vrf

Configure an HTTP client with a VRF used to connect to the HTTP server.

Syntax

    ip http vrf {management | vrf-name}

To undo the HTTP client configuration, use the ip http vrf command.

Parameters

- **management**: Enter the keyword management for configuring the management VRF that uses an HTTP client.
- **vrf-name**: Enter a VRF name that the HTTP client uses. If you do not specify a VRF name, the HTTP client uses the default VRF.

Defaults

Disabled

</tbody>
</table>

Usage Information

To make the HTTP clients VRF-aware, use the ip http vrf command. The HTTP client uses the VRF name that you specify to reach the HTTP server. If you do not specify a VRF name, the HTTP client uses the default VRF.

ip ftp password

Specify a password for outgoing FTP connections.

Syntax

    ip ftp password [encryption-type] password

To remove a password and return to the default setting, use the no ip ftp password [password] command.

Parameters

- **encryption-type**: (OPTIONAL) Enter one of the following numbers:
Enter a string up to 40 characters as the password.

Defaults
- Not configured.

Command Modes
- CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
E-Series Original command.

Usage Information
- The password is listed in the configuration file; you can view the password by entering the show running-config ftp command.
- Use the ip ftp password command when you use the ftp: parameter in the copy command.

Related Commands

ip ftp source-interface
Specify an interface's IP address as the source IP address for FTP connections.

Syntax
ip ftp source-interface interface

to delete an interface, use the no ip ftp source-interface interface command.

Parameters
- interface Enter the following keywords and the interface information:
For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.

For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.

For a port-channel interface, enter the keywords port-channel then the port-channel ID.

For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

For a tunnel interface, enter the keyword tunnel.

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

</table>

`ip ftp username`  
Assign a user name for outgoing FTP connection requests.

**Syntax**

```
ip ftp username username
```
To return to anonymous FTP connections, use the `no ip ftp username [username]` command.

**Parameters**

`username` Enter a text string as the user name up to 40 characters long.

**Defaults**
No user name is configured.

**Command Modes**
CONFIGURATION

**Usage Information**
Configure a password with the `ip ftp password` command.

**Related Commands**
- `ip ftp password` — sets the password for FTP connections.
- `ip ftp vrf` — Configures an FTP client with a VRF that is used to connect to the FTP server.

**ip ftp vrf**

Configures an FTP client with a VRF that is used to connect to the FTP server.

**Syntax**

```plaintext
ip ftp [vrf {vrf-name | management}]
```

To undo the FTP client configuration, use the `ip ftp [vrf vrf-name]` command.

**Parameters**

- `vrf-name`
Enter the `vrf-name` to specify the VRF that is used by the FTP client.

- `management`
Enter the keyword `management` to specify that the VRF used by the FTP client is a management VRF.
Defaults: Disabled

Command Modes: CONFIGURATION

Command History:
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### ip telnet server vrf

Configures the TELNET server on either a specific VRF or a management VRF.

**Syntax**

```
ip telnet server vrf {vrf-name | any | management}
```

To undo the TELNET server configuration, use the `no ip telnet server [vrf vrf-name]` command.

**Parameters**

- `vrf-name`
  - Enter the `vrf-name` to specify the VRF that is used by the TELNET server.
- `any`
  - Enter the keyword `any` to enable server from any VRF.
- `management`
  - Enter the keyword `management` to specify a management VRF that is used by the TELNET server.

**Defaults**

Disabled

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000-ON.
- 9.5(0.0) Introduced on the Z9500.
- 9.4(0.0) Introduced on the Z9000.

**Usage Information**

You can enable the TELNET server on either a management VRF or a user-defined VRF but not both. If you do not specify a VRF name, then the TELNET server is enabled on the default VRF.

**Example**

```
Dell(conf)# ip telnet server vrf vrf1
Dell(conf)# no ip telnet server vrf
```
ip telnet source-interface

Set an interface’s IP address as the source address in outgoing packets for Telnet sessions.

Syntax

ip telnet source-interface interface

To return to the default setting, use the no ip telnet source-interface [interface] command.

Parameters

- **interface**
  - Enter the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For Loopback interfaces, enter the keyword loopback then a number from zero (0) to 16383.
    - For a port channel interface, enter the keywords port-channel then a number.
    - For VLAN interface, enter the keyword vlan then a number from 1 to 4094.
    - For a tunnel interface, enter the keyword tunnel.

Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Command Modes

</tr>
</tbody>
</table>
ip telnet vrf

Configures a TELNET client to use a specific VRF.

Syntax

```
ip telnet [vrf vrf-name]
```

To undo the TELNET client configuration, use the `ip telnet [vrf vrf-name]` command.

Parameters

- `vrf-name`: Enter the keyword `vrf` and then the name of the VRF to specify the VRF that is used by the TELNET client.

Defaults

Disabled

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant FTOS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>

<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S-Series and Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

If you configure a TELNET client to use a specific VRF, then you need not explicitly specify the same VRF during the TELNET client sessions corresponding to that VRF.

Example

```
Dell(conf)# ip telnet vrf vrf1
Dell(conf)# do telnet 10.10.10.2
Dell(conf)# no ip telnet vrf vrf1
Dell(conf)#
```
ip tftp source-interface

Assign an interface’s IP address in outgoing packets for TFTP traffic.

Syntax

```
ip tftp source-interface interface
```  

To return to the default setting, use the `no ip tftp source-interface interface` command.

Parameters

```
interface
```

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Command Modes

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4820T.
8.5.1.0 Added support for 4-port 40G line cards.
8.2.1.0 Increased number of VLANs to 4094 (was 2094).
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
E-Series Original command
```
ip tftp vrf

Configures an TFTP client with a VRF that is used to connect to the TFTP server.

Syntax

ip tftp [vrf vrf-name]

To undo the TFTP client configuration, use the no ip tftp [vrf vrf-name] command.

Parameters

vrf vrf-name Enter the keyword vrf and then the name of the VRF to specify the VRF that is used by the TFTP client.

Defaults

Disabled

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.0) Introduced on the Z9500.
9.4.(0.0) Introduced on the S-Series and Z9000.

Usage Information

Use this command to make the TFTP clients VRF aware. The VRF name that you specify is used by the TFTP client to reach the TFTP server. If no VRF is specified, then the default VRF is used.

Related Commands

- ftp-server topdir — sets the directory to be used for incoming FTP connections.
- ftp-server username — sets a username and password for incoming FTP connections.

line

Enable and configure console and virtual terminal lines to the system. This command accesses LINE mode, where you can set the access conditions for the designated line.

Syntax

line {aux 0 |console 0 | vty number [end-number]}

Parameters

aux 0 Enter the keyword aux 0 to configure the auxiliary terminal connection.

console 0 Enter the keyword console 0 to configure the console port. The console option is <0-0>.

vty number Enter the keyword vty then a number from 0 to 9 to configure a virtual terminal line for remote sessions. The system supports 10 remote sessions.
**end-number**

(Optional) Enter a number from 1 to 9 as the last virtual terminal line to configure. You can configure multiple lines at one time.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION

**Usage Information**

You cannot delete a terminal connection.

**Related Commands**

- `access-class` — restricts the incoming connections to a particular IP address in an IP access control list (ACL).
- `password` — specifies a password for users on terminal lines.

---

## login concurrent-session

Configures the limit of concurrent sessions for all users on console and virtual terminal lines.

### Syntax

```plaintext
login concurrent-session {limit number-of-sessions | clear-line enable}

no login concurrent-session {limit number-of-sessions | clear-line enable}
```

### Parameters

- `limit number-of-sessions`
  - Sets the number of concurrent sessions that any user can have on console and virtual terminal lines. The range is from 1 to 12 (10 VTY lines, one console, and one AUX line).
clear-line enable

Enables you to clear your existing sessions.

**Defaults**
Not configured. You can use all the available sessions.

</tr>
</tbody>
</table>

**Usage Information**
You must have either the System Administrator or Security Administrator privileges to configure login concurrent-session limit or to enable clear-line.

To limit the number of concurrent sessions that any user can have on console, auxiliary, and virtual terminal lines, use the `login concurrent-session limit number-of-sessions` command.

If the `login concurrent-session clear-line enable` command is configured, you are provided with an option to clear any of your existing sessions after a successful login authentication. When you reach the maximum concurrent session limit, you can still log in by clearing any of your existing sessions.

**Example**
The following example shows how to limit the number of concurrent sessions that any user can have to four:

Dell(conf)# login concurrent-session limit 4
Dell(conf)#

The following example shows how to use the `login concurrent-session clear-line enable` command.

Dell(conf)# login concurrent-session clear-line enable
Dell(conf)#

When you try to log in, the following message appears with all your existing concurrent sessions, providing an option to close any one of the existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Current sessions for user admin:

2 vty 0       10.14.1.97
3 vty 1       10.14.1.97
Clear existing session? [line number/Enter to cancel]:
```
When you try to create more than the permitted number of sessions, the following message appears, prompting you to close one of your existing sessions. Close any of your existing sessions to log in to the system.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.

### Related Commands
- `login statistics` — enable and configure user login statistics on console and virtual terminal lines.
- `show login statistics` — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

### login statistics

Enable and configure user login statistics on console and virtual terminal lines.

**Syntax**

```
login statistics {enable | time-period days}
```

```
no login statistics {enable | time-period days}
```

**Parameters**

- `enable` Enables login statistics for the last 30 days by default.
- `time-period days` Sets the number of days the system stores user login statistics; range is from 1 to 30.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>

<td>Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>
**Usage Information**

Only the system and security administrators can configure login activity tracking and view the login activity details of other users.

If you enable user login statistics, the system displays the last successful login details of the current user, the details of any failed login attempts by others, and if the current user’s permissions have changed since the last login.

If you use the `login statistics time-period days` command to set a custom time period, the system only reports the login statistics during that interval.

**NOTE:** Login statistics are not applicable for login sessions that do not use authentication on user names. For example, the system does not report login activity for a telnet session that prompts only a password field.

**Example**

When you log into the system, it displays a message similar to the following:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 Line vty0 (10.11.178.14).
There were 1 unsuccessful login attempt(s) since the last successful login.
There were 1 unsuccessful login attempt(s) for user admin in the last 30 day(s).
There were 1 successful login attempt(s) for user admin in the last 30 day(s).
```

The preceding message shows that the user had previously logged in to the system using the VTY line from 10.11.178.14. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts in the last 30 days.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 on console
There were 2 unsuccessful login attempt(s) since the last successful login.
There were 3 unsuccessful login attempt(s) for user admin in last 12 day(s).
There were 1 successful login attempt(s) for user admin in the last 30 day(s).
```

The preceding message shows that the user had previously logged in to the system using the console line. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts during a custom time period.

**Related Commands**

- `login concurrent-session` — configures the limit of concurrent sessions for all users on console and virtual terminal lines.
- `show login statistics` — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

---

**motd-banner**

Enable a message of the day (MOTD) banner to appear when you log in to the system.

**Syntax**

```
motd-banner
```
To disable the MOTD banner, use the `no motd-banner` command.

**Defaults**
Enabled on all lines.

**Command Modes**
LINE

**E-Series**
Original command

---

**ping**

Test connectivity between the system and another device by sending echo requests and waiting for replies.

**Syntax**
```
ping [host | ip-address | ipv6-address] [count {number | continuous}] [datagram-size] [timeout] [source (ip src-ipv4-address) | interface] [tos] [df-bit (y|n)] [validate-reply(y|n)] [outgoing-interface] [pattern pattern] [sweep-min-size] [sweep-max-size] [sweep-interval] [source (ip src-ipv4-address) | interface] [ethernet | vrf vrf-name]
```

**Parameters**
- `host` (OPTIONAL) Enter the host name of the devices to which you are testing connectivity.
- `ip-address` (OPTIONAL) Enter the IPv4 address of the device to which you are testing connectivity. The address must be in the dotted decimal format.
- `ipv6-address` (OPTIONAL) Enter the IPv6 address, in the x:x:x::x format, to which you are testing connectivity.  
  
  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- `count` Enter the number of echo packets to be sent. The default is 5.
datagram size
- Enter the ICMP datagram size. The range is from 36 to 15360 bytes. The default is **100**.

timeout
- Enter the interval to wait for an echo reply before timing out. The range is from 0 to 3600 seconds. The default is **2 seconds**.

source
- Enter the IPv4 or IPv6 source ip address or the source interface. For IPv6 addresses, you may enter global addresses only. Enter the IP address in A.B.C.D format.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
  - For a Tunnel interface, enter the keyword `tunnel` then a number from 1 to 16383.

tos
- (IPv4 only) Enter the type of service required. The range is from 0 to 255. The default is **0**.

df-bit
- (IPv4 only) Enter `Y` or `N` for the “don't fragment” bit in IPv4 header.
  - `N`: Do not set the “don't fragment” bit.
  - `Y`: Do set “don't fragment” bit
  
  Default is **No**.

validate-reply
- (IPv4 only) Enter `Y` or `N` for reply validation.
  - `N`: Do not validate reply data.
  - `Y`: Do validate reply data.
  
  Default is **No**.

outgoing-interface
- (IPv6 link-local address) Enter the outgoing interface for ping packets to a destination link-local address.

pattern pattern
- (IPv4 only) Enter the IPv4 data pattern. Range: 0-FFFF. Default: **0xABCD**.

sweep-min-size
- Enter the minimum size of datagram in sweep range. The range is from 52 to 15359 bytes.

sweep-max-size
- Enter the maximum size of datagram in sweep range. The range is from 53 to 15359 bytes.

sweep-interval
- Enter the incremental value for sweep size. The range is from 1 to 15308 seconds.

interface
- (IPv4 only) Enter the outgoing interface for multicast packets. Enter the IP address in A.B.C.D format.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

ethernet
- Enter the keyword `ethernet` to test layer2 connectivity.

vrf vrf-name
- Enter the keyword `vrf` followed by the name of the VRF to test connectivity to the VRF.
Defaults

None.

Command Modes

- EXEC
- EXEC Privilege

Command History

</tr>
</tbody>
</table>

**Example (IPv4)**

Dell# ping 172.31.1.255

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2 seconds:
Reply to request 1 from 172.31.1.208 0 ms
Reply to request 1 from 172.31.1.216 0 ms
Reply to request 1 from 172.31.1.205 16 ms
::
Reply to request 5 from 172.31.1.209 0 ms
Reply to request 5 from 172.31.1.66 0 ms
Reply to request 5 from 172.31.1.87 0 ms
Dell#

**Example (IPv6)**

Dell# ping 100::1

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 100::1, timeout is 2 seconds:
!!!!!
Success rate is 100.0 percent (5/5), round-trip min/avg/max = 0/0/0 (ms)
Dell#

**reload**

Reboot the system.

**Syntax**

```
reload [conditional nvram-cfg-change | no-confirm [discard-running]]
```

**Parameters**

- **conditional nvram-cfg-change** (OPTIONAL) Reload into the Dell Networking Operating System (OS) if the condition is true. A configuration change to the NVRAM requires a switch reload. To reload the switch, select nvram-cfg-change.
- **no-confirm** [discard-running] Reload the chassis without prompting for further confirmation.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

| 9.10(0.0) | Introduced on the S3148. |
**send**

Send messages to one or all terminal line users.

**Syntax**

```
send [*] | [line ] | [console] | [vty]
```

**Parameters**

- `*` Enter the asterisk character * to send a message to all tty lines.
- `line` Send a message to a specific line. The range is from 0 to 11.
- `console` Enter the keyword console to send a message to the primary terminal line.
- `vty` Enter the keyword vty to send a message to the virtual terminal.

**Defaults**

none

**Command Modes**

EXEC

Messages can contain an unlimited number of lines; however, each line is limited to 255 characters. To move to the next line, use <CR>. To send the message use CTR-Z; to abort a message, use CTR-C.

**service timestamps**

To debug and log messages, add time stamps. This command adds either the uptime or the current time and date.

**Syntax**

```
service timestamps {debug | log} [datetime [localtime] [msec] [show-timezone] | uptime]
```

To disable timestamping, use the `no service timestamps [debug | log]` command.

**Parameters**

- `debug` (OPTIONAL) Enter the keyword debug to add timestamps to debug messages.
- `log` (OPTIONAL) Enter the keyword log to add timestamps to log messages with severity from 0 to 6.
- `datetime` (OPTIONAL) Enter the keyword datetime to have the current time and date added to the message.
- `localtime` (OPTIONAL) Enter the keyword localtime to include the localtime in the timestamp.
- `msec` (OPTIONAL) Enter the keyword msec to include milliseconds in the timestamp.
- `show-timezone` (OPTIONAL) Enter the keyword show-timezone to include the time zone information in the timestamp.
uptime

(Optionalal) Enter the keyword `uptime` to have the timestamp based on time elapsed since system reboot.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

**Command History**

</table>

**Usage Information**
One trace log message is generated for each command. No password information is saved to this file. A command-history trace log is saved to a file after failover. Dell Networking TAC analyzes this file to help identify the root cause of it.

**Example**
```
Dell# show command-history
[11/20 15:47:22]: CMD-(CLI):[service password-encryption]by default from console
- Repeated 3 times.
[11/20 15:47:23]: CMD-(CLI):[service timestamps log datetime]by default from console
```

---

**Version**

- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **Version 9.1(0.0)**: Introduced on S4810.
- **Version 8.3.19.0**: Introduced on the S4820T.
show cpu-traffic-stats

View the CPU traffic statistics.

Syntax

show cpu-traffic-stats [port number | all | cp ]

Parameters

port number

(Optional) Enter the port number to display traffic statistics on that port only. The range is from 1 to 1568.

all

(Optional) Enter the keyword all to display traffic statistics on all the interfaces receiving traffic, sorted based on the traffic.

cp

(Optional) Enter the keyword cp to display traffic statistics on the specified CPU.

Defaults

all

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
### Version Description

- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **9.0.0.0** Introduced on the Z9000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.12.0** Introduced on the S4810.
- **8.3.11.1** Introduced on the Z9000.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.2.1.1** Introduced on the E-Series.

### Usage Information

Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces. The traffic statistics are collected only after the `debug cpu-traffic-stats` command is executed; not from the system bootup.

**NOTE:** After debugging is complete, use the `no debug cpu-traffic-stats` command to shut off traffic statistics collection.

### Example

```
Dell# show cpu-traffic-stats
Processor : CP
-----------
Received 100% traffic on GigabitEthernet 8/2 Total packets:100
LLC:0, SNAP:0, IP:100, ARP:0, other:0
Unicast:100, Multicast:0, Broadcast:0
Processor : RP1
-----------
Received 62% traffic on GigabitEthernet 8/2 Total packets:500
LLC:0, SNAP:0, IP:500, ARP:0, other:0
Unicast:500, Multicast:0, Broadcast:0
Processor : RP2
-----------
Received 37% traffic on GigabitEthernet 8/1 Total packets:300
LLC:0, SNAP:0, IP:300, ARP:0, other:0
Unicast:300, Multicast:0, Broadcast:0
Processor : RP2
-----------
No CPU traffic statistics.
Dell#
```

### show debugging

View a list of all enabled debugging processes.

**Syntax**

```
show debugging
```

**Command Modes**

EXEC Privilege

---

**Control and Monitoring** | 133
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Example

```
Dell# show debug
Generic IP:
   IP packet debugging is on for
      ManagementEthernet 1/1
      Port-channel 1-2
      Port-channel 5
      GigabitEthernet 4/1-4/3,4/5-4/6,4/10-4/11,20
      GigabitEthernet 5/1-5/3,5/5-5/6,5/10-5/11,15,17,19,21
   ICMP packet debugging is on for
      GigabitEthernet 5/1,5/2,5/4,5/6,5/8,5/10,5/12,5/14,5/16
Dell#
```

### show environment

View system component status (for example, temperature or voltage).

**Syntax**

```
show environment [all | fan | pem | stack-unit unit-id | thermal-sensor ]
```

**Parameters**

- **all**: Enter the keyword all to view all components.
- **fan**: Enter the keyword fan to view information on the fans. The output of this command is chassis-dependent.
- **pem**: Enter the keyword pem to view only information on power entry modules.
stack-unit unit-id Enter the keywords stack-unit then the unit-id to display information on a specific stack member.

thermal-sensor Enter the keywords thermal-sensor to view information on thermal sensors.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100--ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
7.8.1.0 The output of the show environment fan command for the S Series is changed to display fan speeds instead of showing the fan status as up or down.

Usage Information

The following example shows the output of the show environment command.

Example (all)

Dell# show environment

-- Fan Status --
Unit Bay Tray Status Fan0 Speed Fan1 Speed
----------------------------------------------------
0 0 up up 6971 up 7072
0 1 up up 6971 up 7021
0 2 up up 7021 up 7021

Speed in RPM

-- Power Supplies --
Unit Bay Status Type Fan Status Fan Speed (rpm)
-----------------------------------------------------------
0 0 down UNKNOWN down 0
0 1 up AC up 6504

-- Unit Environment Status --
Unit Status Temp Voltage Temp Status
-----------------------------------------
* 0 online 36C ok 1

* Management Unit

-- Thermal Sensor Readings (deg C) --
show inventory

Display the switch type, components (including media), and Dell Networking Operating System (OS), including hardware identification numbers and configured protocols.

Syntax

```bash
show inventory [media slot]
```

Parameters

- `media slot` (OPTIONAL) Enter the keyword `media` then the stack ID of the stack member for which you want to display pluggable media inventory.

**NOTE:** This parameter is available but not supported in Dell Networking Operating System version 8.3.11.4. Because stacking is not supported, if you use this parameter, the output displays “Media not present or accessible” (refer to the Usage Information section).

Defaults

`none`

Command Modes

- `CONFIGURATION`

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(0.0) | Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100.
9.10(0.0) |Introduced on the S3148.
9.8(2.0) |Introduced on the S3100 series.
9.8(1.0) |Introduced on the Z9100-ON.
### Version Description

**9.8(0.0P5)**  
Introduced on the S4048-ON.

**9.8(0.0P2)**  
Introduced on the S3048-ON.

**9.7(0.0)**  
Introduced on the S6000-ON.

**9.2(1.0)**  
Introduced on the Z9500.

**9.0.2.0**  
Introduced on the S6000.

**9.0.0.0**  
Introduced on the Z9000.

**8.3.19.0**  
Introduced on the S4820T.

**8.3.12.0**  
Introduced on the S4810.

**8.3.11.4**  
Output expanded to include Piece Part ID (PPID) and eSR4 optics.

**8.3.11.1**  
Introduced on the Z9000.

**7.6.1.0**  
Introduced this version of the command for S-Series. S-Series output differs from E-Series.

### Usage Information

If there are no fiber ports in the unit, just the header under `show inventory media` displays. If there are fiber ports but no optics inserted, the output displays `Media not present or accessible`.

### Example (S3100)

```
Dell#show inventory
System Type            : S3124P

show login statistics

Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

Syntax

show login statistics [all | [successful-attempts | unsuccessful-attempts] [user login-id] [time-period days]] | user login-id]

Parameters

all

(Optional) Displays the login statistics of all users in the last 30 days or the custom defined time period.

time-period days

(Optional) Displays the number of failed login attempts by the current user in the specified period.

successful-attempts

(Optional) Displays the number of successful login attempts by the current user in the last 30 days or the custom defined time period.

unsuccessful-attempts

(Optional) Displays the number of failed login attempts by the current user in the last 30 days or the custom defined time period.

user login-id

(Optional) Displays the login statistics of a specific user in the last 30 days or the custom defined time period. When you use it with the unsuccessful-attempts keyword, the system displays the number of failed login attempts by a specific user in the last 30 days or the custom defined time period.

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced the successful-attempts keyword.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.8(0.0) Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

Usage Information

To view the successful and failed login details of the current user in the last 30 days or the custom defined period, use the show login statistics command.
To view the successful and failed login details of all users in the last 30 days or the custom defined period, use the `show login statistics all` command. You can use this command only if you have system or security administrator rights.

To view the successful and failed login details of a specific user in the last 30 days or the custom defined time period, use the `show login statistics user user-id` command. If you have system or security administrator rights, you can view the login statistics of other users. If you do not have system or security administrator rights, you can view your login statistics but not the login statistics of others.

**NOTE:** By default, these commands display the details for the last 30 days. If you set a custom-defined time period for login statistics using the `login statistics time-period days` command, these commands display details only for that period.

**Example**

The following is sample output of the `show login statistics` command.

```
Dell#show login statistics

User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1

------------------------------------------------------------------
```

The following is sample output of the `show login statistics all` command.

```
Dell#show login statistics all

User: admin
Last login time: 08:54:28 UTC Wed Mar 23 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 4

------------------------------------------------------------------
```

```
User: admin1
Last login time: 12:49:19 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2

------------------------------------------------------------------
```

```
User: admin2
Last login time: 12:49:27 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2

------------------------------------------------------------------
```

```
User: admin3
Last login time: 13:18:42 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
```
The following is sample output of the show login statistics user user-id command.  

Dell# show login statistics user admin

------------------------------------------------------------------
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Successful login attempt(s) in last 30 day(s): 1
------------------------------------------------------------------

The following is sample output of the show login statistics unsuccessful-attempts command.

Dell# show login statistics unsuccessful-attempts
There were 3 unsuccessful login attempt(s) for user admin in last 30 day(s).

The following is sample output of the show login statistics unsuccessful-attempts time-period command.

Dell# show login statistics unsuccessful-attempts time-period 15
There were 0 unsuccessful login attempt(s) for user admin in last 15 day(s).

The following is sample output of the show login statistics unsuccessful-attempts login-id command.

Dell# show login statistics unsuccessful-attempts user admin
There were 3 unsuccessful login attempt(s) for user admin in last 12 day(s).

The following is sample output of the show login statistics successful-attempts command.

Dell# show login statistics successful-attempts
There were 4 successful login attempt(s) for user admin in last 30 day(s).

Related Commands
- login statistics — enable and configure user login statistics on console and virtual terminal lines.
- login concurrent-session — configures the limit of concurrent sessions for all users on console and virtual terminal lines.

show memory

View current memory usage on the switch.

Syntax

show memory [stack-unit id]

Parameters

stack-unit id (OPTIONAL) Enter the keyword stack-unit then the stack unit ID to display memory information on the designated stack member.

Command Modes

- EXEC
- EXEC Privilege

Command History

</tbody>
</table>

**Usage Information**
The output for `show memory` displays the memory usage of LP part (sysdlp) of the system. The sysdlp is an aggregate task that handles all the tasks running on the S-Series’ CPU.

**Example**

```
Dell#show memory stack-unit 1
Statistics On Unit 1 Processor
========================================
  Total (b) Used (b) Free (b) Lowest (b) Largest (b)
  3177185280  2310248  3174875032  3174676264  3174875032
Dell#
```

### show processes cpu

Display CPU usage information based on processes running.

**Syntax**

```
```

**Parameters**

- `management-unit [1-99 | details]` 
  (OPTIONAL) Display processes running in the control processor. The 1–99 variable sets the number of tasks to display in order of the highest CPU usage in the past five (5) seconds. Add the keyword `details` to display all running processes (except sysdlp). Refer to Example (management-unit).

- `stack-unit id` 
  (OPTIONAL) Enter the keyword `stack-unit` then the stack member ID.
  As an option of the `show processes cpu` command, this option displays CPU usage for the designated stack member. Or, as an option of the `command`, this option limits the output of memory statistics to the designated stack member. Refer to Example (stack-unit).

- `summary` 
  (OPTIONAL) Enter the keyword `summary` to view CPU utilization of processes related to stack-unit processing.

**Command Modes**

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dell# show processes cpu management-unit

Related Commands
- `show hardware layer2 acl` — displays Layer 2 ACL data for the selected stack member and stack member port-pipe.
- `show hardware layer3` — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- `show hardware stack-unit` — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- `show hardware system-flow` — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- `show interfaces stack-unit` — displays information on all interfaces on a specific S-Series stack member.
- `show processes memory (S-Series)` — displays CPU usage information based on processes running in an S-Series.

**show processes ipc flow-control**

Display the single window protocol queue (SWPG) statistics.

**Syntax**
```
show processes ipc flow-control [cp]
```

**Related Commands**
- `show hardware layer2 acl` — displays Layer 2 ACL data for the selected stack member and stack member port-pipe.
- `show hardware layer3` — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- `show hardware stack-unit` — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- `show hardware system-flow` — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- `show interfaces stack-unit` — displays information on all interfaces on a specific S-Series stack member.
- `show processes memory (S-Series)` — displays CPU usage information based on processes running in an S-Series.
Parameters

**cp**

(Optional) Enter the keyword `cp` to view the control processor's SWPQ statistics.

Defaults

none

</tr>
<tr>
<td>#msg Ackd/Ack Rcvd</td>
<td>Number of messages acknowledged</td>
</tr>
</tbody>
</table>
### Field Description

- **Retr /Available**: Number of retries available
- **Retra**: Number of retries allowed
- **Total/ Max Retra**: Number of retries executed

### Important Points:

- The SWP provides flow control-based reliable communication between the sending and receiving software tasks.
- A sending task enqueues messages into the SWP queue for a receiving task and waits for an acknowledgement.
- If no response is received within a defined period of time, the SWP timeout mechanism resubmits the message at the head of the FIFO queue.
- After retrying a defined number of times, the SWP-2-NOMORETIMEOUT timeout message is generated.
- In the S-Series example, a retry (Retries) value of zero indicates that the SWP mechanism reached the maximum number of retransmissions without an acknowledgement.

### Example

Dell# show processes ipc flow-control cp

<table>

Dell# show processes memory

`show processes memory {management-unit | stack unit {unit-id | all | summary}}`
Enter the keyword `all` for detailed memory usage on all stack members.

Enter the keyword `summary` for a brief summary of memory availability and usage on all stack members.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**

- `show processes memory output` field

### Field Description

- **Total:** Total system memory available
- **MaxUsed:** Total maximum memory used ever (history indicated with time stamp)
- **CurrentUsed:** Total memory currently in use
- **CurrentFree:** Total system memory available
- **SharedUsed:** Total used shared memory
- **SharedFree:** Total free shared memory
- **PID:** Process ID
- **Process:** Process Name
- **ResSize:** Actual resident size of the process in memory
- **Size:** Process test, stack, and data size
- **Allocs:** Total dynamic memory allocated
- **Frees:** Total dynamic memory freed
- **Max:** Maximum dynamic memory allocated
- **Current:** Current dynamic memory in use
The output for the `show process memory` command displays the memory usage statistics running on CP part (sysd) of the system. The sysd is an aggregate task that handles all the tasks running on S-Series' CP.

For the S-Series, the output of the `show memory` command and this command differ based on which Dell OS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the output of this command, the memory size is equal to the size of the application processes plus the size of the system processes.

**Example**

```
Dell# show processes memory stack-unit 1
Total: 268435456, MaxUsed: 2420244, CurrentUsed: 2420244, CurrentFree: 266015212

Dell#```
show software ifm

Display interface management (IFM) data.

Syntax

show software ifm {clients [summary] | ifagt number | ifcb interface | stack-unit unit-ID | trace-flags}

Parameters

clients Enter the keyword clients to display IFM client information.

summary (OPTIONAL) Enter the keyword summary to display brief information about IFM clients.

ifagt number Enter the keyword ifagt then the number of an interface agent to display software pipe and IPC statistics.

ifcb interface Enter the keyword ifcb then one of the following interface IDs then the interface information to display interface control block information for that interface:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

stack-unit unit-ID Enter the keyword stack-unit then the stack member number to display IFM information for that unit.

trace-flags Enter the keyword trace-flags to display IFM information for internal trace flags.

Defaults

None.

Command Modes

- EXEC
- EXEC Privilege

Command History

Dell#
```

show system

Display the status of all stack members or a specific member.

Syntax

```
show system [brief | stack-unit unit-id]
```

Parameters

- **brief** (OPTIONAL) Enter the keyword brief to view an abbreviated list of system information.
- **stack-unit unit-id** (OPTIONAL) Enter the keywords stack-unit then the stack member ID for information on that stack member.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version      Description
9.10(0.0)    Introduced on the S3148.
9.8(2.0)     Introduced on the S3100 series.
9.8(1.0)     Introduced on the Z9100-ON.
9.8(0.0P5)   Introduced on the S4048-ON.
9.8(0.0P2)   Introduced on the S3048-ON.
9.7(0.0)     Introduced on the S6000-ON.
9.4(0.0)     Added support for the disabled-ports parameter.
9.2(1.0)     Introduced on the Z9500.
9.0.2.0      Introduced on the S6000.
9.0.0.0      Introduced on the Z9000.
8.3.19.0     Introduced on the S4820T.
```
Version | Description
--- | ---
8.3.11.4 | The `brief` parameter no longer displays the current Reload mode. To display Reload mode, use the `show reload-type` command. Modified the `show system stack-unit` command output to support Piece Part ID (PPID).
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | The Boot Flash field displays the code level for boot code 2.8.1.1 and newer, while older boot codes display as "Present".
7.7.1.0 | Added Master Priority field.
7.6.1.0 | Introduced on the S-Series.

Example (show system brief)

```
Dell#show system brief
Stack MAC : 34:17:17:18:19:1e
Reload-Type : normal-reload [Next boot : normal-reload]

show tech-support

Display a collection of data from other show commands, necessary for Dell Networking technical support to perform troubleshooting.

Syntax

show tech-support [stack-unit unit-id | page]

Parameters

stack-unit (OPTIONAL) Enter the keywords stack-unit to view CPU memory usage for the stack member designated by unit-id.

page (OPTIONAL) Enter the keyword page to view 24 lines of text at a time. Press the SPACE BAR to view the next 24 lines. Press the ENTER key to view the next line of text.

When using the pipe command ( | ), enter one of these keywords to filter command output. For details about filtering commands, refer to CLI Basics.

save Enter the keyword save to save the command output.

Example

flash: Save to local flash drive (flash://filename). A maximum of 20 characters.

Command Modes EXEC Privilege

### Usage Information

Without the `page` or `stack-unit` option, the command output is continuous. To interrupt the command output, use `Ctrl-z`.

The `save` option works with other filtering commands. This allows you to save specific information of a `show` command. The `save` entry must always be the last option. For example: `Dell# show tech-support | grep regular-expression | except regular-expression | find regular-expression | save flash://result`

This display output is an accumulation of the same information that is displayed when you execute one of the following `show` commands:

- `show version`
- `show clock`
- `show running-config`
- `show system stack-ports`
- `show interfaces`
- `show process memory`
- `show process cpu`
- `show file system`
- `show system`
- `show environment`
- `show ip traffic`
- `show ip management route`
- `show ip route summary`
- `show Inventory`
- `show log summary`
- `show command-history (last 20 commands)`
- `show log`

### Example (S-Series)

Dell# show tech-support ?
page Page through output
stack-unit Unit Number
<cr>
Dell#show tech-support stack-unit 1 ?
pipe Pipe through a command
<cr>
Dell# show tech-support stack-unit 1 | ?
except Show only text that does not match a pattern
find Search for the first occurrence of a pattern
grep Show only text that matches a pattern
no-more Don't paginate output
save Save output to a file
flash: Save to local file system (flash://filename (max 20 chars))

Dell# show tech-support stack-unit 1 | save ?
Dell# show tech-support stack-unit 1 | save flash://LauraSave
Start saving show command report ........
Dell#
Example

Dell# show tech-support stack-unit 1

redundancy auto-synchronize full
<output truncated>
**ssh-peer-stack-unit**

Open an SSH connection to the peer stack-unit.

**Syntax**

```
ssh-peer-stack-unit [-l username]
```

**Parameters**

`-l username`  
(Optional) Enter the keyword `-l` then your user name. The default is the user name associated with the terminal.

**Defaults**

Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**telnet**

Connect through Telnet to a server. The Telnet client and server in Dell Networking support IPv4 and IPv6 connections. You can establish a Telnet session directly to the router or a connection can be initiated from the router.

**NOTE:** The Telnet server and client are VRF-aware. Using the `vrf` parameter in this command, you can make a Telnet server or client to listen to a specific VRF. This capability enables a Telnet server or client to look up the correct routing table and establish a connection.

**Syntax**

```
telnet {host | ip-address | ipv6-address prefix-length | vrf vrf instance name} [/source-interface]
```

**Parameters**

`host`  
Enter the name of a server.

`ip-address`  
Enter the IPv4 address in dotted decimal format of the server.

`ipv6-address prefix-length`  
Enter the IPv6 address in the x:x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.
vrf instance

(Optional) Enter the keyword vrf then the VRF instance name.

source-interface

(Optional) Enter the keywords source-interface then the interface information to include the source interface. Enter the following keywords and the interface information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a Null interface, enter the keyword null then the Null interface number.
- For a port channel interface, enter the keywords port-channel then a number.
- For Tunnel interface types, enter the keyword tunnel then the slot/port information. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

Not configured.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.1.1.0</td>
<td>Introduced on the E-Series (IPv4).</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>
**Version** 7.5.1.0  
**Description** Introduced on the C-Series and added support for IPv6 address on the E-Series only.

**Usage Information**

The VRF configured using this command has a higher precedence than a VRF configured using the `ip telnet vrf vrf-name` command. If you do not use the VRF attribute in this command, then TELNET client uses the VRF configured using the `ip telnet vrf vrf-name` command.

The source interface configured using this command has a higher precedence than the source interface configured using the `ip telnet source-interface` command. If you do not configure a source interface using this command, then the TELNET client uses the source interface configured using the `ip telnet source-interface` command.

In case there is a mismatch between the VRF telnet source interface and the telnent VRF, then an error is reported.

**Example**

```
Dell# telnet vrf vrf1 10.10.10.2
```

---

**telnet-peer-stack-unit**

Open a Telnet connection to the peer stack unit.

**Syntax**

```
telnet-peer-stack-unit
```

**Defaults**  
Not configured.

**Command Modes**  
- EXEC
- EXEC Privilege

terminal length

Configure the number of lines displayed on the terminal screen.

Syntax

```
terminal length screen-length
```

Parameters

- `screen-length` Enter a number of lines. Entering zero causes the terminal to display without pausing. The range is from 0 to 512.

Defaults

- 24 lines

Command Modes

- EXEC
- EXEC Privilege

traceroute

View a packet’s path to a specific device.

Syntax

```
traceroute { host | vrf instance | ip-address | ipv6-address }
```

Parameters

- `host` Enter the name of device.
vrf instance  
(Optional) E-Series Only: Enter the keyword vrf then the VRF Instance name.

ip-address  
Enter the IP address of the device in dotted decimal format.

ipv6-address  
Enter the IPv6 address, in the x:x:x:x format, to which you are testing connectivity.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

Defaults

- Timeout = 5 seconds
- Probe count = 3
- 30 hops max
- 40 byte packet size
- UDP port = 33434

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

When you enter the traceroute command without specifying an IP address (Extended Traceroute), you are prompted for a target and source IP address, timeout (in seconds) (default is 5), a probe count (default is 3),
minimum TTL (default is 1), maximum TTL (default is 30), and port number (default is 33434). To keep the default setting for those parameters, press the ENTER key.

For IPv6, you are prompted for a minimum hop count (default is 1) and a maximum hop count (default is 64).

**Example (IPv4)**

```
Dell# traceroute www.Dell Networking.com
Translating "www.Dell Networking.com"...domain server (10.11.0.1) [OK]
Type Ctrl-C to abort.
-----------------------------------------------
Tracing the route to www.Dell Networking.com (10.11.84.18), 30 hops max, 40 byte packets
-----------------------------------------------
TTL Hostname      Probe1     Probe2     Probe3
1   10.11.199.190 001.000 ms 001.000 ms 002.000 ms
2   gwegress-sjc-02.Dell Networking.com (10.11.30.126) 005.000 ms 001.000 ms 001.000 ms
3   fw-sjc-01.Dell Networking.com (10.11.127.254) 000.000 ms 000.000 ms 000.000 ms
4   www.Dell Networking.com (10.11.84.18) 000.000 ms 000.000 ms 000.000 ms
Dell#
```

**Example (IPv6)**

```
Dell# traceroute 100::1
Type Ctrl-C to abort.
-----------------------------------------------
Tracing the route to 100::1, 64 hops max, 60 byte packets
-----------------------------------------------
Hops Hostname Probe1    Probe2    Probe3
1    100::1 000.000 ms 000.000 ms 000.000 ms
Dell#
```

**Example (IPv6)**

```
Dell# traceroute 3ffe:501:ffff:100:201:e8ff:fe00:4c8b
Type Ctrl-C to abort.
-----------------------------------------------
Tracing the route to 3ffe:501:ffff:100:201:e8ff:fe00:4c8b, 64 hops max, 60 byte packets
-----------------------------------------------
Hops Hostname Probe1    Probe2    Probe3
1  3ffe:501:ffff:100:201:e8ff:fe00:4c8b 000.000 ms 000.000 ms 000.000 ms
Dell#
```

**Related Commands**

- `ping` — tests the connectivity to a device.

**undebug all**

Disable all debug operations on the system.

**Syntax**

```
undebug all
```

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
virtual-ip

Configure a virtual IP address for the active management interface. You can configure virtual addresses both for IPv4 and IPv6 independently.

Syntax

```
virtual-ip {ipv4-address} [ipv6-address]
```

To return to the default, use the `no virtual-ip {ipv4-address} [ipv6-address]` command.

Parameters

- `ipv4-address`: Enter the IP address of the active management interface in a dotted decimal format (A.B.C.D.).
- `ipv6-address`: Enter an IPv6 address of the active management interface, in the x:x:x:x format.

```
NOTE: The :: notation specifies successive hexadecimal fields of zeros.
```

Defaults

none

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
E-Series Original command.
```
Usage Information

You can configure both IPv4 and IPv6 virtual addresses simultaneously, but only one of each. Each time this command is issued, it replaces the previously configured address of the same family, IPv4 or IPv6. The `no virtual-ip` command takes an address/prefix-length argument, so that the desired address only is removed. If you enter the `no virtual-ip` command without any specified address, then both IPv4 and IPv6 virtual addresses are removed.

Related Commands

- `ip address` — assigns a primary and secondary IP address to the interface.

write

Copy the current configuration to either the startup-configuration file or the terminal.

Syntax

```
write [memory [compressed] | terminal]
```

Parameters

- **memory**
  
  Enter the keyword `memory` to copy the current running configuration to the startup configuration file. This command is similar to the `copy running-config startup-config` command.

- **compressed**
  
  Enter the keyword `compressed` to write the operating configuration to the startup-config file in the compressed mode.

- **terminal**
  
  Enter the keyword `terminal` to copy the current running configuration to the terminal. This command is similar to the `show running-config` command.

Command Modes

EXEC Privilege

</tbody>
</table>

**E-Series**

Original command.

**Usage Information**

The `write memory` command saves the running-configuration to the file labeled startup-configuration. When using a LOCAL CONFIG FILE other than the startup-config not named “startup-configuration” (for example, you used a specific file during the `boot config` command), the running-config is not saved to that file; use the `copy` command to save any running-configuration changes to that local file.
802.1X is a port-based Network Access Control (PNAC) that provides an authentication mechanism to devices wishing to attach to a LAN or WLAN. Until the authentication, only extensible authentication protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell Networking OS supports remote authentication dial-in service (RADIUS) and active directory environments using 802.1X Port Authentication.

**Important Points to Remember**

Dell Networking OS limits network access for certain users by using virtual local area network (VLAN) assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server, if configured.
- If no VLAN is supplied by the RADIUS server or if you disable 802.1X authorization, the port configures in its access VLAN after successful authentication.
- If you enable 802.1X authorization but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This safeguard prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If you enable 802.1X authorization and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If you enable port security on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If you disable 802.1X on the port, it returns to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

dot1x critical-vlan

Configure critical-VLAN for users or devices when authentication server is not reachable.

Syntax

```
[no] dot1x critical-vlan vlan-id
```

Parameters

- `vlan-id` 
  Enter the VLAN identifier. The VLAN-ID range is from 1 to 4094.

Defaults

Not Configured.

Command Modes

- INTERFACE
- INTERFACE (BATCH MODE)

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
------- | -----------
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S3100 series, S4048--ON, S4048--ON, S4810, S4820T, S5000, S6000, S6000--ON, the Configuration Terminal Batch mode on C9010, Z9100--ON, and Z9500.
9.9(0.0) | Introduced on the C9000 Series.

Usage Information

The `dot1x critical-vlan` command configures critical VLAN for the interface. If the authentication server is not reachable or not responding, the authenticator places the port or the supplicant in critical VLAN within the first attempt.

Use this command in Interface Batch mode to configure critical VLAN for users in a dual-homing setup.

Example

```
Dell(conf)#show dot1x interface ten gigabit ethernet 0/41

802.1x information on Te 0/41:
-------------------------------
Dot1x Status: Enable
Port Control: AUTO
Port Auth Status: AUTHORIZED (CRITICAL-VLAN)
Re-Authentication: Enable
```
Untagged VLAN id: 400
Guest VLAN: Enable
Guest VLAN id: 400
Auth-Fail VLAN: Enable
Auth-Fail VLAN id: 400
Auth-Fail Max-Attempts: 3
Critical VLAN: Enable
Critical VLAN id: 400
Mac-Auth-Bypass: Disable
Mac-Auth-Bypass Only: Disable
Tx Period: 30 seconds
Quiet Period: 60 seconds
ReAuth Max: 2
Supplicant Timeout: 30 seconds
Server Timeout: 30 seconds
Re-Auth Interval: 60 seconds
Max-EAP-Req: 2
Host Mode: SINGLE_HOST
Auth PAE State: Authenticated
Backend State: Idle

**debug dot1x**

Display 802.1X debugging information.

**Syntax**

debug dot1x [all | auth-pae-fsm | backend-fsm | eapol-pdu] [interface interface]

**Parameters**

- **all**: Enable all debugging in dot1x.
- **auth-pae-fsm**: Enable Authentication PAE FSM debugging in dot1x.
- **backend-fsm**: Enable Backend Auth FSM debugging in dot1x.
- **eapol-pdu**: Enable EAPOL frame trace in dot1x.
- **interface interface**: Restricts the debugging information to an interface. The interface option is available only when the interface is either operationally up or dot1x related interface configuration exists before enabling debugging for that interface.

**Defaults**

Disabled

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

Syntax

```
dot1x auth-fail-vlan vlan-id [max-attempts number]
```

To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

Parameters

- `vlan-id` Enter the VLAN Identifier. The range is from 1 to 4094.
- `max-attempts number` (OPTIONAL) Enter the keywords `max-attempts` followed number of attempts desired before authentication fails. The range is from 1 to 5. The default is 3.

Defaults

- 3 attempts

Command Modes

```
CONFIGURATION (conf-if-interface-slot/port)
```

</tr>
</tbody>
</table>
Usage Information

If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface moves to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next reauthentication interval (dot1x reauthentication).

Related Commands

- **dot1x port-control** — enable port control on an interface
- **dot1x guest-vlan** — configure a guest VLAN for limited access users or for devices that are not 802.1X capable.
- **show dot1x interface** — display the 802.1X configuration of an interface.

**dot1x auth-server**

Configure the authentication server to RADIUS.

**Syntax**

`dot1x auth-server radius`

**Defaults**

None

**Command Modes**

CONFIGURATION

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.4.2.1</td>
<td>Introduced on the C-Series and S-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The prerequisites for enabling MAB-only authentication on a port are:

- Enable 802.1X authentication globally on the switch and on the port (the `dot1x authentication` command).
- Enable MAC authentication bypass on the port (the `dot1x mac-auth-bypass` command).

In MAB-only authentication mode, a port authenticates using the host MAC address even though 802.1X authentication is enabled. If the MAB-only authentication fails, the host is placed in the guest VLAN (if configured).

To disable MAB-only authentication on a port, enter the `no dot1x auth-type mab-only` command.

**Related Commands**

- `dot1x mac-auth-bypass` — enable MAC authentication bypass.
**dot1x authentication (Configuration)**

Enable dot1x globally. Enable dot1x both globally and at the interface level.

**Syntax**

```
dot1x authentication
```

To disable dot1x on a globally, use the `no dot1x authentication` command.

**Defaults**

Disabled

**Command Modes**

### Related Commands

- `dot1x authentication (Configuration)` — enable dot1x globally.

---

### dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

**Syntax**

```
dot1x guest-vlan vlan-id
```

To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

**Parameters**

- `vlan-id` Enter the VLAN Identifier. The range is from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- `CONFIGURATION (conf-if-interface-slot/port)`

---

**Command History**

<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
### Usage Information

1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication, for the device, occurs at the next reauthentication interval (dot1x reauthentication).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (dot1x auth-fail-vlan).

**NOTE:** You can create the Layer 3 portion of a guest VLAN and authentication fail VLANs regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

**Related Commands**:
- `dot1x auth-fail-vlan` — Configure an authentication failure VLAN.
- `dot1x reauthentication` — Enable periodic re-authentication of the client.
- `dot1x reauth-max` — Configure the maximum number of times to re-authenticate a port before it becomes unauthorized.

### `dot1x host-mode`

Enable single-host or multi-host authentication.

**Syntax**

```plaintext
dot1x host-mode {single-host | multi-host | multi-auth}
```

**Parameters**

- `single-host`  
  Enable single-host authentication.

- `multi-host`  
  Enable multi-host authentication.

- `multi-auth`  
  Enable multi-suppliant authentication.

**Defaults**

- `single-host`  

**Command Modes**

- `INTERFACE`
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>8.3.2.0</td>
<td>Added the single-host and multi-host options on the C-Series, E-Series, and S-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

- Single-host mode authenticates only one host per authenticator port and drops all other traffic on the port.
- Multi-host mode authenticates the first host to respond to an Identity Request and then permits all other traffic on the port.
- Multi-supplicant mode authenticates every device attempting to connect to the network on the authenticator port.

**Related Commands**

- `show dot1x interface` — display the 802.1X configuration of an interface.

---

**dot1x mac-auth-bypass**

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell Networking OS attempts to authenticate the host based on its MAC address.

**Syntax**

```plaintext
dot1x mac-auth-bypass
```

To disable MAC authentication bypass on a port, use the `no dot1x mac-auth-bypass` command.

**Defaults**

Disabled

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
## Use Case

To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

## Command

### Syntax

```
dot1x max-eap-req number
```

To return to the default, use the `no dot1x max-eap-req` command.

### Parameters

</table>
dot1x max-supplicants

Restrict the number of supplicants that can be authenticated and permitted to access the network through the port. This configuration is only effective in Multi-auth mode.

Syntax: `dot1x max-supplicants number`

Parameters:
- `number`: Enter the number of supplicants that can be authenticated on a single port in Multi-auth mode. The range is from 1 to 128. The default is 128.

Defaults: 128 hosts can be authenticated on a single authenticator port.

Command Modes: INTERFACE

Command History:
- This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
7.6.1.0 Introduced on the C-Series and S-Series.
7.4.1.0 Introduced on the E-Series.

Related Commands:
- `dot1x host-mode` — enable single-host or multi-host authentication.
**dot1x port-control**

Enable port control on an interface.

**Syntax**

```
dot1x port-control {force-authorized | auto | force-unauthorized}
```

**Parameters**

- `force-authorized`: Enter the keywords `force-authorized` to forcibly authorize a port.
- `auto`: Enter the keyword `auto` to authorize a port based on the 802.1X operation result.
- `force-unauthorized`: Enter the keywords `force-unauthorized` to forcibly de-authorize a port.

**Defaults**

None

**Command Modes**

Auto

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Command History
This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S3100 series, S4048–ON, S4810, S4820T, S5000, S6000, S6000–ON, the Configuration Terminal Batch mode on C9010, Z9100–ON, and Z9500.
9.9(0.0) Introduced on the C9010.

Usage Information
The dot1x profile command configures a dot1x profile to define a list of trusted supplicant MAC addresses. Maximum number of dot1x profiles is limited to 10. This command launches dot1x profile mode for entering profile related commands such as the mac command. The dot1x static-mab command assigns the dot1x profile to an interface.

Use this command in Configuration Terminal Batch mode to configure the dot1x profile in a dual-homing setup.

Related Commands
• dot1x static-mab
• mac

**dot1x quiet-period**

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

Syntax
dot1x quiet-period seconds

To disable quiet time, use the no dot1x quiet-time command.

Parameters
seconds
Enter the number of seconds. The range is from 1 to 65535. The default is 60.

Defaults
60 seconds

Command Modes

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
dot1x reauthentication

Enable periodic reauthentication of the client.

Syntax

```
dot1x reauthentication [interval seconds]
```

To disable periodic reauthentication, use the `no dot1x reauthentication` command.

Parameters

```
interval seconds
```

(Optional) Enter the keyword `interval` then the interval time, in seconds, after which reauthentication is initiated. The range is from 1 to 31536000 (one year). The default is `3600` (1 hour).

Defaults

`3600` seconds (1 hour)

9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
7.6.1.0 Introduced on the C-Series and S-Series.
7.4.1.0 Introduced on the E-Series.
dot1x reauth-max

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

Syntax
   dot1x reauth-max number

To return to the default, use the no dot1x reauth-max command.

Parameters
   numberateurs. The range is from 1 to 10. The default is

Defaults
   2

   7.6(1.0) Introduced on the C-Series and S-Series.
   7.4(1.0) Introduced on the E-Series.
**dot1x server-timeout**

Configure the amount of time after which exchanges with the server time-out.

**Syntax**

```plaintext
dot1x server-timeout seconds
```

To return to the default, use the `no dot1x server-timeout` command.

**Parameters**

- `seconds` Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults**

**30** seconds

**Command Modes**

</tbody>
</table>

**Usage Information**

When you configure the `dot1x server-timeout` value, take into account the communication medium used to communicate with an authentication server and the number of RADIUS servers configured. Ideally, the `dot1x server-timeout` value (in seconds) is based on the configured RADIUS-server timeout and retransmit values and calculated according to the following formula: `dot1x server-timeout seconds > (radius-server retransmit seconds + 1) * radius-server timeout seconds`.

Where the default values are as follows: `dot1x server-timeout` (30 seconds), radius-server retransmit (3 seconds), and radius-server timeout (5 seconds).

**Example**

```plaintext
Dell(conf)# radius-server host 10.11.197.105 timeout 6
Dell(conf)# radius-server host 10.11.197.105 retransmit 4
Dell(conf)# interface gigabitethernet 2/23
```
**dot1x static-mab**

Enable static MAC authorization bypass (MAB) and configure static MAB profile to an interface.

**Syntax**

```
[no] dot1x static-mab profile profile-name
```

**Parameters**

`profile profile-name` Enter the keyword `profile` and the `profile-name` to configure the static MAB profile name. The profile name length is limited to 32 characters.

**Defaults**

Disabled.

</tr>
</tbody>
</table>

**Usage Information**

The `dot1x static-mab` command enables static MAB (mac auth bypass) and configures the associated profile on a dot1x interface. Static MAB bypasses the authentication server for the supplicant MAC addresses configured in the associated profile.

Before you enable static MAB, you must do the following:

- Enable MAC authentication bypass on the port by configuring the `dot1x mac-auth-bypass` command.
- Ensure that no configured profile exists at the time of configuring the `static-mab` command.
- Use this command in Interface Batch Mode to enable static MAB in a dual-homing setup.

**Example**

```
Dell(conf)#do show dot1x interface ten gigabit ethernet 0/41
802.1x information on Te 0/41:
----------------------------------------
Dot1x Status:             Enable

mac

Configure a list of supplicant MAC addresses for dot1x profile represented with a profile-name.

**Syntax**

```
[no] mac {mac-address1 mac-address2... mac-address6}
```

**Parameters**

- `mac-address1` `mac-address2`... `mac-address6`
  Enter the keyword `mac` and type the 48–bit MAC addresses using the H.H.H format. A maximum of 6 MAC addresses are allowed.
Defaults
None

Command Modes
DOT1X PROFILE CONFIG (conf-dot1x-profile)

</tbody>
</table>

Usage Information
The `mac` command configures a list of supplicant MAC addresses for a dot1x profile represented with a profile-name. You can configure up to 6 MAC addresses in a single `mac` command. The maximum number of MAC addresses that you can configure in a single profile is limited to 100.

Use this command in Configuration Terminal Batch mode to configure a list of supplicant MAC addresses for dot1x profile in a dual-homing setup.

Example

```
Dell(conf)#dot1x profile mySupplicants
Dell(conf-dot1x-profile)#mac 00:50:56:AA:01:10 00:50:56:AA:01:11
Dell(conf-dot1x-profile)#show config
dot1x profile mySupplicants
  mac 00:50:56:aa:01:10
  mac 00:50:56:aa:01:11
Dell(conf-dot1x-profile)#
Dell(conf-dot1x-profile)#exit
```

**show dot1x cos-mapping interface**

Display the CoS priority-mapping table the RADIUS server provides and applies to authenticated supplicants on an 802.1X-enabled system.

**Syntax**

```
show dot1x cos-mapping interface interface [mac-address mac-address]
```

**Parameters**

- **interface**
  - Enter one of the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

- **mac-address**
  - (Optional) MAC address of an 802.1X-authenticated supplicant.

**Defaults**
None

**Command Modes**
- EXEC
EXEC privilege

Command History

</tbody>
</table>

Usage Information

Enter a supplicant's MAC address using the `mac-address` option to display CoS mapping information only for the specified supplicant.

You can display the CoS mapping information applied to traffic from authenticated supplicants on 802.1X-enabled ports that are in Single-Hot, Multi-Host, and Multi-Supplicant authentication modes.

Example

```
Dell# show dot1x cos-mapping interface gigabitethernet 1/32
802.1p CoS re-map table on Gi 1/32:
--------------------------------------
 Dot1p  Remapped Dot1p
   0       7
   1       6
   2       5
   3       4
   4       3
   5       2
   6       1
   7       0
Dell#

Dell# show dot1x cos-mapping interface gigabitethernet 1/32 mac-address 00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:
802.1p CoS re-map table on Gi 1/32:
--------------------------------------
 Dot1p  Remapped Dot1p
   0       7
   1       6
```
show dot1x interface

Display the 802.1X configuration of an interface.

Syntax

show dot1x interface interface [mac-address mac-address]

Parameters

interface

Enter one of the following keywords and the interface information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

mac-address

(Optional) MAC address of a supplicant.

Defaults

None

Command Modes

- EXEC
- EXEC privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000–ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.4.2.1 Added the mac-address option on the C-Series and S-Series.
7.6.1.0 Introduced on the C-Series, E-Series, and S-Series.
If you enable 802.1X multi-suppliant authentication on a port, additional 802.1X configuration details (Port Authentication status, Untagged VLAN ID, Authentication PAE state, and Backend state) display for each supplicant, as shown in the following example.

Example

Dell# show dot1x interface gigabitethernet 1/32

802.1x information on Gi 1/32:
-----------------------------
Dot1x Status: Enable
Port Control: AUTO
Port Auth Status: AUTHORIZED(MAC-AUTH-BYPASS)
Re-Authentication: Disable
Untagged VLAN id: 400
Guest VLAN: Enable
Guest VLAN id: 100

Access control lists (ACLs) are supported by the Dell Networking OS.
Dell Networking OS supports the following types of ACL, IP prefix list, and route maps:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands

**NOTE:** For ACL commands that use the Trace function, see *Trace List Commands* section in *Security*.

**NOTE:** For IPv6 ACL commands, see *IPv6 Access Control Lists (IPv6 ACLs)*.

**Topics:**
- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands
- deny (for Standard IP ACLs)
- seq (for Standard IPv4 ACLs)
- deny tcp (for Extended IP ACLs)
- deny udp (for Extended IP ACLs)
- deny arp (for Extended MAC ACLs)
- deny icmp (for Extended IP ACLs)
- deny ether-type (for Extended MAC ACLs)
- deny (for Standard MAC ACLs)
- deny (for Extended MAC ACLs)
- permit (for Standard IP ACLs)
- permit arp (for Extended MAC ACLs)
- permit ether-type (for Extended MAC ACLs)
- permit icmp (for Extended IP ACLs)
- permit udp (for Extended IP ACLs)
- permit (for Extended IP ACLs)
- permit (for Standard MAC ACLs)
- seq (for Standard MAC ACLs)
- permit tcp (for Extended IP ACLs)
- seq arp (for Extended MAC ACLs)
- seq ether-type (for Extended MAC ACLs)
- seq (for IP ACLs)
- seq (for IPv6 ACLs)
- permit udp (for IPv6 ACLs)
- permit tcp (for IPv6 ACLs)
- permit icmp (for IPv6 ACLs)
- permit (for IPv6 ACLs)
- deny udp (for IPv6 ACLs)
- deny tcp (for IPv6 ACLs)
- deny icmp (for Extended IPv6 ACLs)
- deny (for IPv6 ACLs)

### Commands Common to all ACL Types

The following commands are available within each ACL mode and do not have mode-specific options. Some commands in this chapter may use similar names, but require different options to support the different ACL types (for example, the `deny` and `permit` commands).

#### remark

Enter a description for an ACL entry.

**Syntax**

```
remark [remark-number] [description]
```

**Parameters**

- **remark-number**
  - Enter the remark number. The range is from 0 to 65535 for MAC ACL and 0 to 4294967290 for IP ACL.

- **description**
  - Enter a description of up to 80 characters.

**Defaults**

Not configured.

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
CONFIGURATION-MAC ACCESS LIST-EXTENDED

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

The `remark` command is available in each ACL mode. You can configure up to 4294967291 remarks for a given IP ACL and 65536 remarks for a given MAC ACL.

The following example shows the use of the `remark` command twice within CONFIGURATION-STANDARD-ACCESS-LIST mode. The same sequence number was used for the remark and for an associated ACL rule. The remark precedes the rule in the running-config because it is assumed that the remark is for the rule with the same sequence number, or the group of rules that follow the remark.

Example

```
Dell(config-std-nacl)# remark 10 Deny rest of the traffic
Dell(config-std-nacl)# remark 5 Permit traffic from XYZ Inc.
Dell(config-std-nacl)# show config
!
ip access-list standard test
remark 5 Permit traffic from XYZ Inc.
seq 5 permit 1.1.1.0/24
remark 10 Deny rest of the traffic
seq 10 deny any
Dell(config-std-nacl)#
```

Related Commands

- `show config` — display the current ACL configuration.
# show config

Display the current ACL configuration.

**Syntax**
```
show config
```

**Command Modes**
- CONFIGURATION-Standard-ACCESS-LIST
- CONFIGURATION-Extended-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>

**Example**
```
Dell(config-std-nacl)# show conf
!
ip access-list standard test
  remark 5 Permit traffic from XYZ Inc.
  seq 5 permit 1.1.1.0/24 count
  remark 10 Deny traffic from ABC
  seq 10 deny 2.1.1.0/24 count
Dell(config-std-nacl)#
```
Common IP ACL Commands

The following commands are available within both Ingress and Egress IP ACL modes (Standard and Extended) and do not have mode-specific options. When an ACL is created without a rule and then is applied to an interface, ACL behavior reflects an implicit permit. The platform supports both Ingress and Egress IP ACLs.

NOTE: Also refer to the Commands Common to all ACL Types section.

access-class

Apply a standard ACL to a terminal line.

Syntax

```
access-class access-list-name [ipv4 | ipv6]
```

To remove an ACL, use the no access-class command.

Parameters

- **access-list-name**: Enter the name of a configured Standard ACL, up to 140 characters.
- **ipv4**: Enter the keyword ipv4 to configure an IPv4 access class.
- **ipv6**: Enter the keyword ipv6 to configure an IPv6 access class.

Defaults

Not configured.

### ip access-group

Assign an IP access list (IP ACL) to an interface.

**Syntax**

```plaintext
ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [vrf vrf-name]
```

To delete an IP access-group configuration, use the `no ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [vrf vrf-name]` command.

**Parameters**

- **access-list-name**
  - Enter the name of a configured access list, up to 140 characters.
- **in**
  - Enter the keyword `in` to apply the ACL to incoming traffic.
- **out**
  - Enter the keyword `out` to apply the ACL to outgoing traffic.
- **implicit-permit**
  - (OPTIONAL) Enter the keyword `implicit-permit` to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).
- **vlan vlan-id**
  - (OPTIONAL) Enter the keyword `vlan` then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).
- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword `vrf` then the ID numbers of the VRFs. The range is from 1 to 63 (you can use IDs from 1 to 63).

**NOTE:** When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.

**Defaults**

Not enabled.

**Command Modes**

INTERFACE/VRF MODE

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

You can assign one ingress ACL and one egress ACL to an interface.

1. **NOTE:** This command supports Loopback interfaces EE3 and EF series route processor modules (RPMs). This command does not support Loopback interfaces ED series RPMs and S-Series Loopback interfaces.

2. **NOTE:** If you apply outbound(egress) IP acl on a switch port, the filter applies only for routed traffic egressing out of that port.

To associate an access-list to a non-default VRF, use the `vrf` attribute of this command. You can use this command at the interface context (physical/LAG) to apply the access-list to a range of VRFs.

The VRF MODE is not available for the default and management VRFs.

**Related Commands**

- `ip access-list standard` — configure a standard ACL.
- `ip access-list extended` — configure an extended ACL.

**ip control-plane egress-filter**

Enable egress Layer 3 ACL lookup for IPv4 CPU traffic.

**Syntax**

`ip control-plane egress-filter`

**Defaults**

Not enabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
show ip accounting access-list

Display the IP access-lists created on the switch and the sequence of filters.

**Syntax**

```
show ip accounting {access-list access-list-name | cam_count} interface
interface [vrf vrf-name]
```

**Parameters**

- **access-list-name**
  
Enter the name of the ACL to be displayed.

- **cam_count**
  
List the count of the CAM rules for this ACL.

- **interface interface**
  
Enter the keyword `interface` then the one of the following keywords and the interface information:

  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- **in | out**
  
Identify whether ACL is applied on the ingress or egress side.

- **vrf vrf-name**
  
(Optional) Enter the keyword `vrf` and then the name of the VRF to view the IP accounting information on either a default or a non-default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

**NOTE:** The `vrf` option is available only when VRF feature is enabled.

**show ip accounting access-lists**

Field |
|------|

"Extended IP..." |

- Displays the name of the IP ACL.

"seq 5..." |

- Displays the filter. If the keywords `count` or `byte` were configured in the filter, the number of packets or bytes the filter processes is displayed at the end of the line.

"order 4" |

- Displays the QoS order of priority for the ACL entry.

**Example**

```
Dell# show ip accounting access-list L3-ACL vrf vrf3
!
Standard Ingress IP access list L3-ACL on vrf3
Total cam count 3
  seq 5 permit 10.1.2.0/24 any negotiate 150 monitor 300 count (0 packets)
  seq 10 permit 20.1.2.0/24
  seq 15 permit 30.1.2.0/24
Dell#
```
show ip access-lists

Display all of the IP ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

Syntax

```plaintext
show ip access-lists [access-list-name] [interface interface] [in | out] [vrf vrf-name]
```

Parameters

- **access-list-name**: Enter the name of a configured MAC ACL, up to 140 characters.
- **interface interface**: Enter the keyword interface followed by the one of the following keywords and slot/port or number information:
  - For a VLAN interface, enter the keyword vlan followed by the slot/port number.
  - For a 1-Gigabit Ethernet interface, enter the keyword GigabitEthernet followed by the slot/port information.
  - For a Port Channel interface, enter the keyword port-channel followed by a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet followed by the slot/port information.
- **in | out**: Identify whether ACL is applied on the ingress or egress side.
- **vrf vrf-name**: Enter the keyword vrf and then the name of the VRF to display the access-lists that are configured on either the default or non-default VRFs.

Command Modes

- EXEC Privilege

Standard IP ACL Commands

When you create an ACL without any rule and then apply it to an interface, the ACL behavior reflects an implicit permit.
The platform supports both Ingress and Egress IP ACLs.

NOTE: Also refer to the Commands Common to all ACL Types and Common IP ACL Commands sections.

deny

To drop packets with a certain IP address, configure a filter.

Syntax

deny {source | any | host {ip-address}} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny {source [mask] | any | host ip-address} command.

Parameters

- source: Enter the IP address in dotted decimal format of the network from which the packet was sent.
- any: Enter the keyword any to specify that all routes are subject to the filter.
- host ip-address: Enter the keyword host and then enter the IP address to specify a host IP address only.
- count: (OPTIONAL) Enter the keyword count to count the packets.
- bytes: (OPTIONAL) Enter the keyword bytes to count the bytes.
- log: (OPTIONAL) Enter the keyword log to enter ACL matches in the log.
- dscp: (OPTIONAL) Enter the keyword dscp to match the IP DSCP values. The range is from 0 to 63.
- ecn: (OPTIONAL) Enter the keyword ecn to match the ECN bits. The range is from 0 to 3.
- order: (OPTIONAL) Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).
- monitor: (OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.

NOTE: For more information, see "Flow-based Monitoring" in the Port Monitoring section of the Dell Networking OS Configuration Guide.

- fragments: Enter the keyword fragments to use ACLs to control packet fragments.
- no-drop: Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

Command Modes

CONFIGURATION-STANDARD-ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
The order option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section in the Dell Networking OS Configuration Guide.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes increment.

Related Commands

- ip access-list standard — configure a standard ACL.
- permit — configure a permit filter.

**ip access-list standard**

Create a standard IP access list (IP ACL) to filter based on IP address.

**Syntax**

```
ip access-list standard access-list-name
```

To delete an access list, use the `no ip access-list standard access-list-name` command.

**Parameters**

- `access-list-name`  
  Enter a string up to 140 characters long as the ACL name.
**Defaults**

All IP access lists contain an implicit “deny any,” that is, if no match occurs, the packet is dropped.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Dell Networking OS supports one ingress and one egress IP ACL per interface.

Prior to Dell Networking OS version 7.8.1.0, names are up to 16 characters long.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications on entries allowed per ACL, refer to your line card documentation.

**Example**

```plaintext
Dell(conf)# ip access-list standard TestList
Dell(config-std-nacl)#
```

**Related Commands**

- `ip access-list extended` — create an extended access list.
- `show config` — display the current configuration.
permit

To permit packets from a specific source IP address to leave the switch, configure a filter.

Syntax

```
permit {source [mask]| any | host ip-address} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {source [mask]| any | host ip-address}` command.

Parameters

- **source**: Enter the IP address in dotted decimal format of the network from which the packet was sent.
- **mask**: (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **any**: Enter the keyword any to specify that all routes are subject to the filter.
- **host ip-address**: Enter the keyword host then the IP address to specify a host IP address or hostname.
- **count**: (OPTIONAL) Enter the keyword count to count the packets.
- **bytes**: (OPTIONAL) Enter the keyword bytes to count the bytes.
- **log**: (OPTIONAL) Enter the keyword log to enter ACL matches in the log.
- **dscp**: (OPTIONAL) Enter the keyword dscp to match the IP DSCP values. The range is from 0 to 63.
- **ecn**: (OPTIONAL) Enter the keyword ecn to match the ECN bits. The range is from 0 to 3.
- **order**: (OPTIONAL) Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).
- **monitor**: (OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.

1. **NOTE**: For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.

- **fragments**: Enter the keyword fragments to use ACLs to control packet fragments.
- **no-drop**: Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

Command Modes

- CONFIGURATION-STANDARD-ACCESS-LIST

</table>

**Usage Information**
The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the Dell Networking OS Configuration Guide.

**Related Commands**
- deny — assign a IP ACL filter to deny IP packets.
- ip access-list standard — create a standard ACL.

**resequence access-list**
Re-assign sequence numbers to entries of an existing access-list.

**Syntax**
resequence access-list {ipv4 | ipv6 | mac} {access-list-name StartingSeqNum Step-to-Increment}

**Parameters**
- `ipv4 | ipv6 | mac` Enter the keyword `ipv4` or `ipv6` or `mac` to identify the access list type to resequence.
- `access-list-name` Enter the name of a configured IP access list.
- `StartingSeqNum` Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
- `Step-to-Increment` Enter the step to increment the sequence number. The range is from 1 to 4294967290.

**Defaults**
None

Usage Information

When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing access-list.

seq

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

Syntax

```plaintext
seq sequence-number (deny | permit) (source [mask] | any | host ip-address) [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]
```

To delete a filter, use the no seq sequence-number command.

Parameters

- **sequence-number**: Enter a number from 0 to 4294967290.
- **deny**: Enter the keyword deny to configure a filter to drop packets meeting this condition.
- **permit**: Enter the keyword permit to configure a filter to forward packets meeting this criteria.
source Enter an IP address in dotted decimal format of the network from which the packet was received.

mask (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

any Enter the keyword any to specify that all routes are subject to the filter.

host ip-address Enter the keyword host then the IP address to specify a host IP address or hostname.

count (OPTIONAL) Enter the keyword count to count packets the filter processes.

bytes (OPTIONAL) Enter the keyword bytes to count bytes the filter processes.

log (OPTIONAL) Enter the keyword log to enter ACL matches in the log.

dscp (OPTIONAL) Enter the keyword dscp to match to the IP DCSCP values. The range is from 0 to 63.

ecn (OPTIONAL) Enter the keyword ecn to match to the ECN values. The range is from 0 to 3.

order (OPTIONAL) Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

monitor (OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.

NOTE: For more information, see "Flow-based Monitoring" in the Port Monitoring section of the Dell Networking OS Configuration Guide.

fragments Enter the keyword fragments to use ACLs to control packet fragments.

no-drop Enter the keywords no-drop to match only the forwarded packets.

<td>Added support for the non-contiguous mask and added the monitor option.</td>
</tr>
<tr>
<td>6.5.10</td>
<td>Expanded to include the optional QoS order priority for the ACL entry.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

**Related Commands**

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

**Extended IP ACL Commands**

When an ACL is created without any rule and then applied to an interface, ACL behavior reflects an implicit permit.

The following commands configure extended IP ACLs, which in addition to the IP address, also examine the packet’s protocol type.

The platform supports both Ingress and Egress IP ACLs.

**NOTE:** Also refer to the Commands Common to all ACL Types and Common IP ACL Commands sections.

**deny**

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax**

```
deny (ip | ip-protocol-number) {source mask | any | host ip-address} 
{destination mask | any | host ip-address} [count | byte] [log] [dscp value] 
[order] [monitor [session-ID]] [fragments] [no-drop]
```

**Example**

```sh
Router(config)#deny ip any host 10.0.0.1 count
```
To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address} command.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Enter the keyword ip to configure a generic IP access list. The keyword ip specifies that the access list denies all IP protocols.</td>
</tr>
<tr>
<td>ip-protocol-number</td>
<td>Enter a number from 0 to 255 to deny based on the protocol identified in the IP protocol header.</td>
</tr>
<tr>
<td>source</td>
<td>Enter the IP address of the network or host from which the packets were sent.</td>
</tr>
<tr>
<td>mask</td>
<td>Enter a network mask in /prefix format (/X) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.</td>
</tr>
<tr>
<td>any</td>
<td>Enter the keyword any to specify that all routes are subject to the filter.</td>
</tr>
<tr>
<td>host ip-address</td>
<td>Enter the keyword host then the IP address to specify a host IP address.</td>
</tr>
<tr>
<td>destination</td>
<td>Enter the IP address of the network or host to which the packets are sent.</td>
</tr>
<tr>
<td>count</td>
<td>(OPTIONAL) Enter the keyword count to count packets that the filter processes.</td>
</tr>
<tr>
<td>byte</td>
<td>(OPTIONAL) Enter the keyword byte to count bytes that the filter processes.</td>
</tr>
<tr>
<td>log</td>
<td>(OPTIONAL, E-Series only) Enter the keyword log to enter ACL matches in the log.</td>
</tr>
<tr>
<td>dscp</td>
<td>(OPTIONAL) Enter the keyword dscp to match to the IP DCSCP values.</td>
</tr>
<tr>
<td>order</td>
<td>(OPTIONAL) Enter the keyword order to specify the GoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).</td>
</tr>
<tr>
<td>monitor</td>
<td>(OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell Networking OS Configuration Guide.</td>
</tr>
<tr>
<td>fragments</td>
<td>Enter the keyword fragments to use ACLs to control packet fragments.</td>
</tr>
<tr>
<td>no-drop</td>
<td>Enter the keywords no-drop to match only the forwarded packets.</td>

## deny icmp

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

### Syntax

```plaintext
deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [dscp] [count [byte] [order] [fragments] [monitor [session-ID]] [no-drop]
```

### Related Commands

- `deny tcp` — assign a filter to deny TCP packets.
- `deny udp` — assign a filter to deny UDP packets.
- `ip access-list extended` — create an extended ACL.

<td>Added support for the noncontiguous mask and added the monitor option.</td>
</tr>
<tr>
<td>6.5.1.0</td>
<td>Expanded to include the optional QoS order priority for the ACL entry.</td>
</tr>
</tbody>
</table>

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section in the **Dell Networking OS Configuration Guide**.

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see **Port Monitoring**.

The C-Series and S-Series cannot count both packets and bytes, when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.
To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **source**
  - Enter the IP address of the network or host from which the packets were sent.

- **mask**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

- **any**
  - Enter the keyword `any` to specify that all routes are subject to the filter.

- **host ip-address**
  - Enter the keyword `host` then the IP address to specify a host IP address.

- **destination**
  - Enter the IP address of the network or host to which the packets are sent.

- **dscp**
  - Enter this keyword `dscp` to deny a packet based on the DSCP value. The range is from 0 to 63.

- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets processed by the filter.

- **byte**
  - (OPTIONAL) Enter the keyword `byte` to count bytes processed by the filter.

- **order**
  - (OPTIONAL) Enter the keyword `order` to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower order numbers have a higher priority) If you did not use the keyword `order`, the ACLs have the lowest order by default (255).

- **fragments**
  - Enter the keyword `fragments` to use ACLs to control packet fragments.

- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell Networking OS Configuration Guide.

- **no-drop**
  - Enter the keywords `no-drop` to match only the forwarded packets.

</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy GoS feature only. For more information, see the Quality of Service section of the Dell Networking OS Configuration Guide.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see Port Monitoring.

### deny tcp

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

**Syntax**

```
deny tcp {source mask | any | host ip-address} {bit} [operator port [port]]
{destination mask | any | host ip-address} [dscp] [bit] [operator port [port]]
[count [bytes] [order] [fragments] [monitor [session-ID]]] [no-drop]
```

**Parameters**

- **source**
  - Enter the IP address of the network or host from which the packets are sent.
- **mask**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **any**
  - Enter the keyword any to specify that all routes are subject to the filter.
- **host ip-address**
  - Enter the keyword host then the IP address to specify a host IP address.
- **dscp**
  - Enter this keyword dscp to deny a packet based on the DSCP value. The range is from 0 to 63.
- **bit**
  - Enter a flag or combination of bits:
- ack: acknowledgement field
- fin: finish (no more data from the user)
- psh: push function
- rst: reset the connection
- syn: synchronize sequence numbers
- urg: urgent field

**operator**

(Optional) Enter one of the following logical operand:
- eq = equal to
- neq = not equal to
- gt = greater than
- lt = less than
- range = inclusive range of ports (you must specify two ports for the port command)

**port port**
Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:
- 23 = Telnet
- 20 and 21 = FTP
- 25 = SMTP
- 169 = SNMP

**destination**
Enter the IP address of the network or host to which the packets are sent.

**mask**
Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**count**
(Optional) Enter the keyword count to count packets the filter processes.

**byte**
(Optional) Enter the keyword byte to count bytes the filter processes.

**order**
(Optional) Enter the keyword order to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword order, the ACLs have the lowest order by default (255).

**fragments**
Enter the keyword fragments to use ACLs to control packet fragments.

**monitor**
(Optional) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell Networking OS Configuration Guide.

**no-drop**
Enter the keywords no-drop to match only the forwarded packets.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

### Usage Information

The `order` option is relevant in the context of the Policy GoS feature only. For more information, see the Quality of Service section of the [Dell Networking OS Configuration Guide](#).

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the [Port Monitoring](#) section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, gt, lt, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.
An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Related Commands
- deny — assign a filter to deny IP traffic.
- deny udp — assign a filter to deny UDP traffic.

deny udp

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

**Syntax**

deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [dscp] [operator port [port]] [count [byte] [order] [fragments] [monitor [session-ID]] [no-drop]

To remove this filter, you have two choices:
- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address} command.

**Parameters**

- source: Enter the IP address of the network or host from which the packets were sent.
- mask: Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- any: Enter the keyword any to specify that all routes are subject to the filter.
- host ip-address: Enter the keyword host then the IP address to specify a host IP address.
- dscp: Enter this keyword dscp to deny a packet based on the DSCP value. The range is from 0 to 63.
- operator: (OPTIONAL) Enter one of the following logical operand:
  - eq = equal to
  - neq = not equal to
  - gt = greater than
port port

Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.

destination

Enter the IP address of the network or host to which the packets are sent.

mask

Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

count

(Optional) Enter the keyword count to count packets processed by the filter.

byte

(Optional) Enter the keyword byte to count bytes processed by the filter.

order

(Optional) Enter the keyword order to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword order, the ACLs have the lowest order by default (255).

fragments

Enter the keyword fragments to use ACLs to control packet fragments.

monitor

(Optional) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell Networking OS Configuration Guide.

no-drop

Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.11(0.0) Added support for session-ID to the monitor parameter.
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.8(0.0) Added the no-drop parameter.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.

lt = less than
range = inclusive range of ports (you must specify two ports for the port command)

### Related Commands
- `deny` — assign a filter to deny IP traffic.
- `deny tcp` — assign a filter to deny TCP traffic.
**ip access-list extended**

Name (or select) an extended IP access list (IP ACL) based on IP addresses or protocols.

**Syntax**

```
ip access-list extended access-list-name
```

To delete an access list, use the `no ip access-list extended access-list-name` command.

**Parameters**

- `access-list-name` Enter a string up to 140 characters long as the access list name.

**Defaults**

All access lists contain an implicit "deny any"; that is, if no match occurs, the packet is dropped.

**Command Modes**

CONFIGURATION

**Command History**

<td>7.5(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2(1.1)</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The number of entries allowed per ACL is hardware-dependent. For detailed specification about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

**Example**

```
Dell(conf)# ip access-list extended TESTListEXTEND
Dell(config-ext-nacl)#
```
Related Commands

- `ip access-list standard` — configure a standard IP access list.
- `show config` — display the current configuration.

**permit**

To pass IP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [bytes]] [dscp value] [order] [fragments] [monitor [session-ID]] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- `source`
  - Enter the IP address in dotted decimal format of the network from which the packet was sent.
- `mask`
  - (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- `any`
  - Enter the keyword any to specify that all routes are subject to the filter.
- `host ip-address`
  - Enter the keyword host then the IP address to specify a host IP address or hostname.
- `destination`
  - Enter the IP address of the network or host to which the packets are sent.
- `count`
  - (OPTIONAL) Enter the keyword count to count packets processed by the filter.
- `bytes`
  - (OPTIONAL) Enter the keyword bytes to count bytes processed by the filter.
- `dscp`
  - (OPTIONAL) Enter the keyword dscp to match to the IP DCSCP values.
- `order`
  - (OPTIONAL) Enter the keyword order to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).
- `fragments`
  - Enter the keyword fragments to use ACLs to control packet fragments.
- `monitor`
  - (OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.
- `no-drop`
  - Enter the keywords no-drop to match only the forwarded packets.

**Defaults**

Not configured.

</tr>
<tr>
<td>6.5.10</td>
<td>Expanded to include the optional QoS <code>order</code> priority for the ACL entry.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the Dell Networking OS Configuration Guide.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit tcp` — assign a permit filter for TCP packets.
- `permit udp` — assign a permit filter for UDP packets.

**permit tcp**

To pass TCP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit tcp {source mask | any | host ip-address} {bit} {operator port | port} {destination mask | any | host ip-address} [bit] [dscp] {operator port | port} [count [byte] [order] [fragments] [monitor [session-ID]] [no-drop]
```
To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

**source**
- Enter the IP address of the network or host from which the packets were sent.

**mask**
- Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**any**
- Enter the keyword *any* to specify that all routes are subject to the filter.

**host ip-address**
- Enter the keyword *host* then the IP address to specify a host IP address.

**bit**
- Enter a flag or combination of bits:
  - *ack*: acknowledgement field
  - *fin*: finish (no more data from the user)
  - *psh*: push function
  - *rst*: reset the connection
  - *syn*: synchronize sequence numbers
  - *urg*: urgent field

**dscp**
- Enter the keyword *dscp* to deny a packet based on the DSCP value. The range is from 0 to 63.

**operator**
- (OPTIONAL) Enter one of the following logical operand:
  - *eq* = equal to
  - *neq* = not equal to
  - *gt* = greater than
  - *lt* = less than
  - *range* = inclusive range of ports (you must specify two ports for the port parameter)

**port port**
- Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.
  The following list includes some common TCP port numbers:
  - 23 = Telnet
  - 20 and 21 = FTP
  - 25 = SMTP
  - 169 = SNMP

**destination**
- Enter the IP address of the network or host to which the packets are sent.

**mask**
- Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**count**
- (OPTIONAL) Enter the keyword *count* to count packets the filter processes.

**byte**
- (OPTIONAL) Enter the keyword *byte* to count bytes the filter processes.

**order**
- (OPTIONAL) Enter the keyword *order* to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-
order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

fragments

Enter the keyword fragments to use ACLs to control packet fragments.

monitor

(Optional) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.

no-drop

Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

Command Modes

CONFIGURATION-EXTENDED-ACCESS-LIST

Command History

<td>Expanded to include the optional QoS order priority for the ACL entry.</td>
</tr>
</tbody>
</table>
Usage Information

The `order` option is relevant in the context of the Policy GoS feature only. For more information, see the “Quality of Service” section of the Dell Networking OS Configuration Guide.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the Port Monitoring section.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

**Example**

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```
Dell# Data            Mask         From To   #Covered
1 0000111110100000 1111111111000000 4000 4031 32
2 0000111111000000 1111111111000000 4032 4095 64
3 0001000000000000 1111111111000000 4096 6143 2048
4 0001100000000000 1111111111000000 6144 7167 1024
5 0001110000000000 1111111111000000 7168 7679 512
6 0001111000000000 1111111111000000 7680 7935 256
7 0001111100000000 1111111111000000 7936 7999 64
8 0001111110000000 1111111111111111 8000 8000 1
```

Total Ports: 4001

**Example**

An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

```
Dell# Data            Mask         From To   #Covered
1 0000000000000000 1111110000000000 0 1023 1024
```

Total Ports: 1024

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit udp` — assign a permit filter for UDP packets.

**permit udp**

To pass UDP packets meeting the filter criteria, configure a filter.

**Syntax**

```plaintext
permit udp {source mask | any | host ip-address} [operator port [port] [destination mask | any | host ip-address] [dscp] [operator port [port]] [count [byte] [order] [fragments] [monitor [session-ID]] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.
Parameters

- **source**: Enter the IP address of the network or host from which the packets were sent.
- **mask**: Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **any**: Enter the keyword any to specify that all routes are subject to the filter.
- **host ip-address**: Enter the keyword host and then enter the IP address to specify a host IP address.
- **dscp**: Enter the keyword dscp to deny a packet based on the DSCP value. The range is from 0 to 63.
- **operator** (OPTIONAL): Enter one of the following logical operand:
  - `eq` = equal to
  - `neq` = not equal to
  - `gt` = greater than
  - `lt` = less than
  - `range` = inclusive range of ports (you must specify two ports for the `port` parameter)
- **port port**: Enter the application layer port number. Enter two port numbers if you are using the `range` logical operand. The range is 0 to 65535.
- **destination**: Enter the IP address of the network or host to which the packets are sent.
- **count** (OPTIONAL): Enter the keyword count to count packets processed by the filter.
- **byte** (OPTIONAL): Enter the keyword byte to count bytes processed by the filter.
- **order** (OPTIONAL): Enter the keyword order to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).
- **fragments**: Enter the keyword fragments to use ACLs to control packet fragments.
- **monitor** (OPTIONAL): Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.
- **no-drop**: Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

</tbody>
</table>
### Version Description

- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.8(0.0)** Added the no-drop parameter.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **8.3.19.0**Introduced on the S4820T.
- **8.3.11.1**Introduced on the Z9000.
- **8.3.7.0**Introduced on the S4810.
- **8.3.1.0** Added the keyword dscp.
- **8.2.1.0** Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
- **8.1.1.0** Introduced on the E-Series.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **7.4.1.0** Added support for non-contiguous mask and added the monitor option.
- **6.5.10** Expanded to include the optional QoS order priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the Dell Networking OS Configuration Guide.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to Port Monitoring.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, gt, lt, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

### Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Total Ports: 4001
An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

```
Dell# Data          Mask          From To   #Covered
1 0000000000000000 1111110000000000 0 1023 1024
```

Total Ports: 1024

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit tcp` — assign a permit filter for TCP packets.

**resequence access-list**

Re-assign sequence numbers to entries of an existing access-list.

**Syntax**

```
resequence access-list {ipv4 | mac} {access-list-name StartingSeqNum Step-to-Increment}
```

**Parameters**

- `ipv4 | mac` Enter the keyword `ipv4` or `mac` to identify the access list type to resequence.
- `access-list-name` Enter the name of a configured IP access list, up to 140 characters.
- `StartingSeqNum` Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
- `Step-to-Increment` Enter the step to increment the sequence number. The range is from 1 to 4294967290.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100–ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000–ON.
- 9.2(1.0) Introduced on the Z9500.
- 9.0.2.0 Introduced on the S6000.
- 8.3.11.1 Introduced on the Z9000.
- 8.1.1.0 Introduced on the E-Series (IPv4).
seq

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

**Syntax**

```plaintext
seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator [portnumber ]]] [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]
```

**Parameters**

- `sequence-number` Enter a number from 0 to 4294967290.
- `deny` Enter the keyword deny to configure a filter to drop packets meeting this condition.
- `permit` Enter the keyword permit to configure a filter to forward packets meeting this criteria.
- `ip-protocol-number` Enter a number from 0 to 255 to filter based on the protocol identified in the IP protocol header.
- `icmp` Enter the keyword icmp to configure an ICMP access list filter.
- `ip` Enter the keyword ip to configure a generic IP access list. The keyword ip specifies that the access list permits all IP protocols.
- `tcp` Enter the keyword tcp to configure a TCP access list filter.
- `udp` Enter the keyword udp to configure a UDP access list filter.
- `source` Enter an IP address in dotted decimal format of the network from which the packet was received.
- `mask` (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- `any` Enter the keyword any to specify that all routes are subject to the filter.
- `host ip-address` Enter the keyword host and then enter the IP address to specify a host IP address or hostname.
- `operator` (OPTIONAL) Enter one of the following logical operands:
  - `eq` = equal to
  - `neq` = not equal to
  - `gt` = greater than
  - `lt` = less than
**range**

(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

- 23 = Telnet
- 20 and 21 = FTP-DATA and FTP
- 25 = SMTP
- 169 = SNMP

**portnumber**

(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

**destination**

Enter the IP address of the network or host to which the packets are sent.

**count**

(OPTIONAL) Enter the keyword count to count the packets.

**bytes**

(OPTIONAL) Enter the keyword bytes to count the bytes.

**log**

(OPTIONAL) Enter the keyword log to enter ACL matches in the log.

**dscp**

(OPTIONAL) Enter the keyword dscp to match to the IP DSCP values. The range is from 0 to 63.

**ecn**

(OPTIONAL) Enter the keyword ecn to match to the ECN values. The range is from 0 to 3.

**order**

(OPTIONAL) Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

**monitor**

(OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.

**NOTE:** For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.

**fragments**

Enter the keyword fragments to use ACLs to control packet fragments.

**no-drop**

Enter the keywords no-drop to match only the forwarded packets.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION-EXTENDED-ACCESS-LIST

</tr>
</tbody>
</table>

Usage Information

The monitor option is relevant in the context of flow-based monitoring only. For more information, refer to Port Monitoring.

The order option is relevant in the context of the Policy QoS feature only. The following applies:

- The seq sequence-number command is applicable only in an ACL group.
- The order option works across ACL groups that are applied on an interface via the QoS policy framework.
- The order option takes precedence over seq sequence-number.
- If you do not configure sequence-number, the rules with the same order value are ordered according to their configuration order.
- If you configure sequence-number, the sequence-number is used as a tie breaker for rules with the same order.

When you use the log option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

If you configure the sequence-number, the sequence-number is used as a tie breaker for rules with the same order.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- **deny** — configure a filter to drop packets.
- **permit** — configure a filter to forward packets.
Common MAC Access List Commands

The following commands are available within both MAC ACL modes (Standard and Extended) and do not have mode-specific options. These commands allow you to clear, display, and assign MAC ACL configurations.

The platform supports both Ingress and Egress MAC ACLs.

The MAC ACL can be applied on Physical, Port-channel and VLAN interfaces. As per the specified rules in the ACL, the traffic on the interface/ VLAN members or Port-channel members will be permitted or denied.

clear counters mac access-group

Clear counters for all or a specific MAC ACL.

Syntax

clear counters mac access-group [mac-list-name]

Parameters

mac-list-name

(OPTIONAL) Enter the name of a configured MAC access list.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**mac access-group**

Apply a MAC ACL to traffic entering or exiting an interface. You can apply a MAC ACL on a physical, port-channel, or VLAN interface.

**Syntax**
```
mac access-group access-list-name {in [vlan vlan-range] | out}
```

To delete a MAC access-group, use the `no mac access-group mac-list-name` command.

**Parameters**
- `access-list-name`: Enter the name of a configured MAC access list, up to 140 characters.
  - **NOTE:** This option is available only with the keyword `in` option.
- `vlan vlan-range`: (OPTIONAL) Enter the keyword `vlan` and then enter a range of VLANs. The range is from 1 to 4094 (you can use IDs 1 to 4094).
  - **NOTE:** This option is available only with the keyword `in` option.
- `optimized`: Enter the keyword `optimized` to enable ACL optimization.
- `in`: Enter the keyword `in` to configure the ACL to filter incoming traffic.
- `out`: Enter the keyword `out` to configure the ACL to filter outgoing traffic.

**Defaults**
- none

**Command Modes**

9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
show mac access-lists

Display all of the Layer 2 ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

**Syntax**

```
show mac access-lists [access-list-name] [interface interface] [in | out]
```

**Parameters**

- `access-list-name` Enter the name of a configured MAC ACL, up to 140 characters.
- `interface interface` Enter the keyword `interface` then the one of the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

- `in | out` Identify whether ACL is applied on ingress or egress side.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>

<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can assign one ingress ACL and one egress ACL (standard or extended) to an interface.

**Related Commands**

- `mac access-list standard` — configure a standard MAC ACL.
- `mac access-list extended` — configure an extended MAC ACL.
show mac accounting access-list

Display MAC access list configurations and counters (if configured).

Syntax

show mac accounting access-list access-list-name interface interface in | out

Parameters

- **access-list-name**: Enter the name of a configured MAC ACL, up to 140 characters.
- **interface interface**: Enter the keyword interface then the one of the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
- **in | out**: Identify whether ACL is applied on ingress or egress side.

Command Modes

- EXEC
- EXEC Privilege

Command History

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series</td>
</tr>
<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The ACL hit counters increment the counters for each matching rule, not just the first matching rule.

**Example**

```
Dell# show mac accounting access-list TestMac interface gigabitethernet 1/8 in
Ingress Standard mac access-list TestMac on GigabitEthernet 1/89
  Total cam count 2
    seq 5 permit aa:aa:aa:aa:00:00 00:00:00:ff:ff count (0 packets)
    seq 10 deny any count (20072594 packets)
Dell#
```

**Standard MAC ACL Commands**

When you create an access control list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. These commands configure standard MAC ACLs and support both Ingress and Egress MAC ACLs.

**deny**

To drop packets with the MAC address specified, configure a filter.

**Syntax**

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.
Parameters

- **any**
  - Enter the keyword `any` to specify that all routes are subject to the filter.

- **mac-source-address**

- **mac-source-address-mask**
  - (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of `00:00:00:00:00:00` is applied (in other words, the filter allows only MAC addresses that match).

- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets processed by the filter.

- **byte**
  - (OPTIONAL) Enter the keyword `byte` to count bytes processed by the filter.

- **log**
  - (OPTIONAL, E-Series only) Enter the keyword `log` to log the packets.

- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see the “Flow-based Monitoring” in the Port Monitoring section in the *Dell Networking OS Configuration Guide*.

Defaults

- Not enabled.

Command Modes

- **CONFIGURATION-MAC ACCESS LIST-STANDARD**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

### Version Description

- **9.10(0.0)**
  - Introduced on the S3148.

- **9.8(2.0)**
  - Introduced on the S3100 series.

- **9.8(1.0)**
  - Introduced on the Z9100–ON.

- **9.8(0.0P5)**
  - Introduced on the S4048-ON.

- **9.8(0.0P2)**
  - Introduced on the S3048-ON.

- **9.7(0.0)**
  - Introduced on the S6000–ON.

- **9.0.2.0**
  - Introduced on the S6000.

- **8.3.19.0**
  - Introduced on the S4820T.

- **8.3.11.1**
  - Introduced on the Z9000.

- **8.3.7.0**
  - Introduced on the S4810.

- **8.1.1.0**
  - Introduced on the E-Series.

- **7.6.1.0**
  - Introduced on the S-Series.

- **7.5.1.0**
  - Introduced on the C-Series.

- **7.4.1.0**
  - Added the `monitor` option.

Usage Information

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

| NOTE | When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead. |

Access Control Lists (ACL)
mac access-list standard

To configure a standard MAC ACL, name a new or existing MAC access control list (MAC ACL) and enter MAC ACCESS LIST mode. Also refer to the Commands Common to all ACL Types section and the Common MAC Access List Commands section.

Syntax  
```
mac access-list standard mac-list-name
```

To delete a MAC access list, use the no mac access-list standard mac-list-name command.

Parameters  
```
mac-list-name
```
Enter a text string as the name of the standard MAC access list (140 character maximum).

Defaults  
Not configured.

</tr>
</tbody>
</table>

Usage Information  
Dell Networking OS supports one ingress and one egress MAC ACL per interface.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, see your line card documentation.
**NOTE:** Ingress ACLs are supported on C-Series and S-Series platforms only.

### Example
```
Dell(conf)# mac-access-list access-list standard TestMAC
Dell(config-std-macl)# permit 00:00:00:00:00:00 00:00:00:ff:ff count
Dell(config-std-macl)# deny any count
Dell(config-std-macl)#
```

### permit
To forward packets from a specific source MAC address, configure a filter.

**Syntax**
```
permit {any | mac-source-address [mac-source-address-mask]} [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

**Parameters**
- **any**
  - Enter the keyword `any` to forward all packets received with a MAC address.
- **mac-source-address**
- **mac-source-address-mask**
  - (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of `00:00:00:00:00:00` is applied (in other words, the filter allows only MAC addresses that match).
- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets processed by the filter.
- **byte**
  - (OPTIONAL) Enter the keyword `byte` to count bytes processed by the filter.
- **log**
  - (OPTIONAL) Enter the keyword `log` to include ACL messages in the log.
- **threshold-in-msgs**
  - (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- **interval minutes**
  - (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.

**Defaults**
Not configured.

### Version Description

- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **8.1.1.0** Introduced on the E-Series.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.1.1.0** Introduced on the E-Series.

### Usage Information

When you use the log option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

### Related Commands

- `deny` — configure a MAC ACL filter to drop packets.
- `seq` — configure a MAC ACL filter with a specified sequence number.

### seq

To a deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

#### Syntax

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

#### Parameters

- **any** Enter the keyword any to specify that all routes are subject to the filter.
- **mac-source-address** Enter a MAC address in nn:nn:nn:nn:nn:nn format.
- **mac-source-address-mask** (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).

</tr>
</tbody>
</table>

**Usage Information**

When you use the log option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.
NOTE: When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- **deny** — configure a filter to drop packets.
- **permit** — configure a filter to forward packets.

## Extended MAC ACL Commands

When an access-list is created without any rule and then applied to an interface, ACL behavior reflects implicit permit. The following commands configure Extended MAC ACLs.

The platform supports both Ingress and Egress MAC ACLs.

NOTE: For more information, also refer to the **Commands Common to all ACL Types** and **Common MAC Access List Commands** sections.

### deny

To drop packets that match the filter criteria, configure a filter.

**Syntax**

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype-operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

**Parameters**

- **any**
  
Enter the keyword `any` to drop all packets.

- **host mac-address**
  
Enter the keyword `host` and then enter a MAC address to drop packets with that host address.

- **mac-source-address**
  

- **mac-source-address-mask**
  
Specify which bits in the MAC address must match.

  The MAC ACL supports an inverse mask; therefore, a mask of `ff:ff:ff:ff:ff:ff` allows entries that do not match and a mask of `00:00:00:00:00:00` only allows entries that match exactly.

- **mac-destination-address**
  
Enter the destination MAC address and mask in `nn:nn:nn:nn:nn:nn` format.

- **mac-destination-address-mask**
  
Specify which bits in the MAC address must match.
The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.

**ethertype operator** (OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes:

- `ev2` - is the Ethernet II frame format
- `llc` - is the IEEE 802.3 frame format
- `snap` - is the IEEE 802.3 SNAP frame format

**count** (OPTIONAL) Enter the keyword count to count packets processed by the filter.

**byte** (OPTIONAL) Enter the keyword byte to count bytes processed by the filter.

**log** (OPTIONAL) Enter the keyword log to include ACL messages in the log.

**threshold-in-msgs** count (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

**interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.

**monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell Networking OS Configuration Guide.

**Defaults**

### Usage Information

Usage Information: When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

### Related Commands

- `permit` — configure a MAC address filter to pass packets.
- `seq` — configure a MAC address filter with a specified sequence number.

### mac access-list extended

Name a new or existing extended MAC access control list (extended MAC ACL).

**Syntax**

```
mac access-list extended access-list-name [cpu-qos]
```

To delete a MAC access list, use the `no mac access-list extended access-list-name` command.

**Parameters**

- `access-list-name`  
  Enter a text string as the MAC access list name, up to 140 characters.
- `cpu-qos`  
  Enter the keywords `cpu-qos` to assign this ACL to control plane traffic only (CoPP).

**Defaults**

- None

### Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

### Example

Dell(conf)# mac-access-list access-list extended TestMATExt
Dell(config-ext-macl)# remark 5 IPv4
Dell(config-ext-macl)# seq 10 permit any ev2 eq 800 count bytes
Dell(config-ext-macl)# remark 15 ARP
Dell(config-ext-macl)# seq 20 permit any ev2 eq 806 count bytes
Dell(config-ext-macl)# remark 25 IPv6
Dell(config-ext-macl)# seq 30 permit any ev2 eq 86dd count bytes
Dell(config-ext-macl)# seq 40 permit any count bytes
Dell(config-ext-macl)# exit
Dell(conf)# do show mac accounting access-list snickers interface gig 1/17 in

Extended mac access-list snickers on GigabitEthernet 1/17
seq 10 permit any ev2 eq 800 count bytes (559851886 packets 191402152148 bytes)
seq 20 permit any ev2 eq 806 count bytes (74481486 packets 5031686754 bytes)
seq 30 permit any ev2 eq 86dd count bytes (7751519 packets 797843521 bytes)

### Related Commands

- `mac access-list standard` — configure a standard MAC access list.
- `show mac accounting access-list` — display MAC access list configurations and counters (if configured)

### permit

To pass packets matching the criteria specified, configure a filter.

**Syntax**

```
permit {any | host mac-address | mac-source-address mac-source-address-mask}
  {any | host mac-address | mac-destination-address mac-destination-address-mask}
  [ethertype operator] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {any | host mac-address | mac-source-address mac-source-address-mask}
host mac-destination-address mac-destination-address-mask}` command.

**Parameters**

- **any**
  Enter the keyword `any` to forward all packets.

- **host**
  Enter the keyword `host` then a MAC address to forward packets with that host address.
mac-source-address

mac-source-address-mask

(Optional) Specify which bits in the MAC address must match.

The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.

mac-destination-address

Enter the destination MAC address and mask in nn:nn:nn:nn:nn:nn format.

mac-destination-address-mask

Specify which bits in the MAC address must be matched.

The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.

ethertype operator

(Optional) To filter based on protocol type, enter one of the following Ethertypes:

- ev2 - is the Ethernet II frame format
- llc - is the IEEE 802.3 frame format
- snap - is the IEEE 802.3 SNAP frame format

count

(Optional) Enter the keyword count to count packets the filter processes.

byte

(Optional) Enter the keyword byte to count bytes the filter processes.

log

(Optional, E-Series only) Enter the keyword log to log the packets.

monitor

(Optional) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

NOTE: For more information, see Flow-based Monitoring in the "Port Monitoring” section of the Dell Networking OS Configuration Guide.

Defaults

Not configured.

Command Modes

CONFIGURATION-MAC ACCESS LIST-EXTENDED

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

- `deny` — configure a MAC ACL filter to drop packets.
- `seq` — configure a MAC ACL filter with a specified sequence number.

### IP Prefix List Commands

When you create an access-list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. To configure or enable IP prefix lists, use these commands.

#### clear ip prefix-list

Reset the number of times traffic meets the conditions (“hit” counters) of the configured prefix lists.

**Syntax**

`clear ip prefix-list [prefix-name]`

**Parameters**

`prefix-name` (OPTIONAL) Enter the name of the configured prefix list to clear only counters for that prefix list, up to 140 characters long.

**Defaults**

Clears “hit” counters for all prefix lists unless a prefix list is specified.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Related Commands**

- `ip prefix-list` — configure a prefix list.

---

**deny**

To drop packets meeting the criteria specified, configure a filter.

**Syntax**

```plaintext
deny ip-prefix [ge min-prefix-length] [le max-prefix-length]
```

To delete a drop filter, use the `no deny ip-prefix` command.

**Parameters**

- **ip-prefix**
  - Specify an IP prefix in the network/length format. For example, 35.0.0.0/ 8 means match the first 8 bits of address 35.0.0.0.
- **ge min-prefix-length**
  - (OPTIONAL) Enter the keyword `ge` and then enter the minimum prefix length, which is a number from zero (0) to 32.
- **le max-prefix-length**
  - (OPTIONAL) Enter the keyword `le` and then enter the maximum prefix length, which is a number from zero (0) to 32.

**Defaults**

Not configured.

**Command Modes**

PREFIX-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Sequence numbers for this filter are automatically assigned starting at sequence number 5. If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

**ip prefix-list**

Enter the PREFIX-LIST mode and configure a prefix list.

**Syntax**

```
ip prefix-list prefix-name
```

To delete a prefix list, use the `no ip prefix-list prefix-name` command.

**Parameters**

- `prefix-name` Enter a string up to 16 characters long as the name of the prefix list, up to 140 characters long.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</tbody>
</table>

**Usage Information**
Prefix lists redistribute OSPF and RIP routes meeting specific criteria.

**Related Commands**
- `show ip route list` — display IP routes in an IP prefix list.
- `show ip prefix-list summary` — display a summary of the configured prefix lists.

## seq

To a deny or permit filter in a prefix list while configuring the filter, assign a sequence number.

**Syntax**
```
seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]
```

To delete a specific filter, use the `no seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number].`

**Parameters**
- `sequence-number` Enter a number. The range is from 1 to 4294967294.
- `deny` Enter the keyword deny to configure a filter to drop packets meeting this condition.
- `permit` Enter the keyword permit to configure a filter to forward packets meeting this condition.
- `any` (OPTIONAL) Enter the keyword any to match any packets.
- `ip-prefix /nn` (OPTIONAL) Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
- `ge min-prefix-length` (OPTIONAL) Enter the keyword ge and then enter the minimum prefix length, which is a number from zero (0) to 32.
- `le max-prefix-length` (OPTIONAL) Enter the keyword le and then enter the maximum prefix length, which is a number from zero (0) to 32.
- `bitmask number` Enter the keyword bitmask then enter a bit mask number in dotted decimal format.

**Defaults**
Not configured.
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
6.1.1.0 Introduced on the E-Series.

Example
Dell(conf-nprefixl)# show config
!
ip prefix-list snickers
Dell(conf-nprefixl)#
show ip prefix-list summary

Display a summary of the configured prefix lists.

Syntax
show ip prefix-list summary [prefix-name]

Parameters
prefix-name  (OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0)  Introduced on the S3148.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100–ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S6000–ON.
9.2(1.0)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.
### Route Map Commands

When you create an access-list without any rule and then applied to an interface, the ACL behavior reflects implicit permit. To configure route maps and their redistribution criteria, use the following commands.

#### continue

To a route-map entry with a higher sequence number, configure a route-map.

**Syntax**

```
continue [sequence-number]
```

**Parameters**

- `sequence-number` (OPTIONAL) Enter the route map sequence number. The range is from 1 to 65535.

**Defaults**

Not configured.

**Command Modes**

- ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>

---

**Example**

```
Dell# show ip prefix-list summary
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
Dell#
```
### Description

The `continue` feature allows movement from one route-map entry to a specific route-map entry (the sequence number). If you do not specify the sequence number, the `continue` feature simply moves to the next sequence number (also known as an implied continue). If a match clause exists, the `continue` feature executes only after a successful match occurs. If there are no successful matches, the `continue` feature is ignored.

#### Match clause with Continue clause

The `continue` feature can exist without a match clause. A continue clause without a match clause executes and jumps to the specified route-map entry.

With a match clause and a continue clause, the match clause executes first and the continue clause next in a specified route map entry. The continue clause launches only after a successful match. The behavior is:

- A successful match with a continue clause, the route map executes the set clauses and then goes to the specified route map entry upon execution of the continue clause.
- If the next route map entry contains a continue clause, the route map executes the continue clause if a successful match occurs.
- If the next route map entry does not contain a continue clause, the route map evaluates normally. If a match does not occur, the route map does not continue and falls through to the next sequence number, if one exists.

#### Set Clause with Continue Clause

If the route-map entry contains sets with the continue clause, set actions are performed first then the continue clause jumps to the specified route map entry.

- If a set action occurs in the first route map entry and then the same set action occurs with a different value in a subsequent route map entry, the last set of actions overrides the previous set of actions with the same set command.
- If set `community additive` and `set as-path prepend` are configure, the communities and AS numbers are prepended.

### Related Commands

- `set community` — specify a COMMUNITY attribute.
- `set as-path` — configure a filter to modify the AS path.

### description

Add a description to this route map.

**Syntax**

```
description {description}
```

To remove the description, use the `no description {description}` command.
Parameters

**description**
Enter a description to identify the route map (80 characters maximum).

Defaults
None

Related Commands
- route-map — enable a route map.

### match as-path

To match routes that have a certain AS number in their BGP path, configure a filter.

**Syntax**

```
match as-path as-path-name
```

To delete a match AS path filter, use the `no match as-path as-path-name` command.

**Parameters**

**as-path-name**
Enter the name of an established AS-PATH ACL, up to 140 characters.

**Defaults**
Not configured.

**Related Commands**

- `set as-path` — add information to the BGP AS_PATH attribute.

---

**match community**

To match routes that have a certain COMMUNITY attribute in their BGP path, configure a filter.

**Syntax**

```
match community community-list-name [exact]
```

To delete a community match filter, use the `no match community` command.

**Parameters**

- `community-list-name` Enter the name of a configured community list.
- `exact` (OPTIONAL) Enter the keywords `exact` to process only those routes with this community list name.

**Defaults**

Not configured.

Related Commands

- `set community` — specify a COMMUNITY attribute.

## match interface

To match routes whose next hop is on the interface specified, configure a filter.

### Syntax

```
match interface interface
```

To remove a match, use the `no match interface interface` command.

### Parameters

- `interface` Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Defaults

Not configured.

- `match route-type` — redistribute routes that match a route type.
- `match tag` — redistribute routes that match a specific tag.

### match ip address

To match routes based on IP addresses specified in an access list, configure a filter.

**Syntax**

```
match ip address prefix-list-name
```

To delete a match, use the `no match ip address prefix-list-name` command.

**Parameters**

`prefix-list-name`  Enter the name of configured prefix list, up to 140 characters.

**Defaults**

Not configured.

match ip next-hop

To match based on the next-hop IP addresses specified in an IP access list or IP prefix list, configure a filter.

Syntax

```
match ip next-hop {prefix-list prefix-list-name}
```

To delete a match, use the no match ip next-hop {prefix-list prefix-list-name} command.

Parameters

- `prefix-list prefix-list-name`: Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

Defaults

Not configured.

### match ip route-source
To match based on the routes advertised by routes specified in IP access lists or IP prefix lists, configure a filter.

**Syntax**
```plaintext
match ip route-source {prefix-list prefix-list-name}
```

**Parameters**
- **prefix-list prefix-list-name**
  - Enter the keywords `prefix-list` and then enter the name of configured prefix list, up to 140 characters.

**Defaults**
Not configured.

- match ip address — redistribute routes that match an IP address.
- match ip next-hop — redistribute routes that match the next-hop IP address.
- match metric — redistribute routes that match a specific metric.
- match route-type — redistribute routes that match a route type.
- match tag — redistribute routes that match a specific tag.

match metric

To match on a specified value, configure a filter.

Syntax

match metric metric-value

To delete a value, use the no match metric [metric-value] command.

Parameters

metric-value

Enter a value to match. The range is from zero (0) to 4294967295.

Defaults

Not configured.
To match routes based on the value found in the BGP path ORIGIN attribute, configure a filter.

Syntax

```
match origin {egp | igp | incomplete}
```

To disable matching filter, use the `no match origin {igp | egp | incomplete}` command.

Parameters

- **egp**: Enter the keyword `egp` to match routes originating outside the AS.
- **igp**: Enter the keyword `igp` to match routes originating within the same AS.
- **incomplete**: Enter the keyword `incomplete` to match routes with incomplete routing information.

Defaults

Not configured.
match route-type

To match routes based on how the route is defined, configure a filter.

Syntax

match route-type {external [type-1 | type-2] | internal | level-1 | level-2 | local}

To delete a match, use the no match route-type {local | internal | external [type-1 | type-2] | level-1 | level-2} command.

Parameters

- **external [type-1 | type-2]**: Enter the keyword external then either type-1 or type-2 to match only on OSPF Type 1 routes or OSPF Type 2 routes.
- **internal**: Enter the keyword internal to match only on routes generated within OSPF areas.
- **level-1**: Enter the keyword level-1 to match IS-IS Level 1 routes.
- **level-2**: Enter the keyword level-2 to match IS-IS Level 2 routes.
- **local**: Enter the keyword local to match only on routes generated within the switch.

Defaults

Not configured.

### Related Commands

- `match interface` — redistribute routes that match the next-hop interface.
- `match ip address` — redistribute routes that match an IP address.
- `match ip next-hop` — redistribute routes that match the next-hop IP address.
- `match ip route-source` — redistribute routes that match routes advertised by other routers.
- `match metric` — redistribute routes that match a specific metric.
- `match route-type` — redistribute routes that match a route type.

### route-map

Enable a route map statement and configure its action and sequence number. This command also places you in ROUTE-MAP mode.

**Syntax**

```
route-map map-name [permit | deny] [sequence-number]
```

To delete a route map, use the `no route-map map-name [permit | deny] [sequence-number]` command.

**Parameters**

- **map-name**
  - Enter a text string of up to 140 characters to name the route map for easy identification.
- **permit**
  - (OPTIONAL) Enter the keyword `permit` to set the route map default as permit. If you do not specify a keyword, the default is `permit`.
- **deny**
  - (OPTIONAL) Enter the keyword `deny` to set the route map default as deny.
- **sequence-number**
  - (OPTIONAL) Enter a number to identify the route map for editing and sequencing with other route maps. You are prompted for a sequence number if there are multiple instances of the route map. The range is from 1 to 65535.

**Defaults**

Not configured.
If you do not define a keyword (permit or deny) for the route map, the permit action is the default.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Use caution when you delete route maps because if you do not specify a sequence number, all route maps with the same map-name are deleted when you use the no route-map map-name command.

**Example**

```
Dell(conf)# route-map dempsey
Dell(config-route-map)#
```

**Related Commands**

- `show config` — display the current configuration.

---

**set as-path**

To modify the AS path for border gateway protocol (BGP) routes, configure a filter.

**Syntax**

```
set as-path prepend as-number [... as-number]
```

To remove an AS-Path setting, use the `no set as-path {prepend as-number | tag}` command.
Parameters

prepend as-number

Enter the keyword prepend and then enter up to eight AS numbers to be inserted into the BGP path information. The range is from 1 to 65535.

Defaults

Not configured.

</tbody>
</table>

Usage Information

You can prepend up to eight AS numbers to a BGP route.

This command influences best path selection in BGP by inserting a tag or AS number into the AS_PATH attribute.

Related Commands

- match as-path — redistribute routes that match an AS-PATH attribute.

set automatic-tag

To automatically compute the tag value of the route, configure a filter.

Syntax

set automatic-tag

To return to the default, enter no set automatic-tag.

Defaults

Not configured.

- set metric — specify the metric value assigned to redistributed routes.
- set metric-type — specify the metric type assigned to redistributed routes.
- set tag — specify the tag assigned to redistributed routes.

set comm-list delete

To remove the specified community list from the BGP route’s COMMUNITY attribute, configure a filter.

Syntax

```
set comm-list community-list-name delete
```

To insert the community list into the COMMUNITY attribute, use the `no set comm-list community-list-name delete` command.

Parameters

- `community-list-name` Enter the name of an established Community list, up to 140 characters.

Defaults

Not configured.

</table>

**Usage Information**

The community list used in the `set comm-list delete` command must be configured so that each filter contains only one community. For example, the filter `deny 100:12` is acceptable, but the filter `deny 120:13 140:33` results in an error.

If the `set comm-list delete` command and the `set community` command are configured in the same route map sequence, the deletion command (`set comm-list delete`) is processed before the insertion command (`set community`).

**Related Commands**

- `match community` — redistribute routes that match the COMMUNITY attribute.
- `set community` — specify a COMMUNITY attribute.

**set community**

Allows you to assign a BGP COMMUNITY attribute.

**Syntax**

```
set community {community-number | local-as | no-advertise | no-export | none} [additive]
```

To delete a BGP COMMUNITY attribute assignment, use the `no set community {community-number | local-as | no-advertise | no-export | none} command.`

**Parameters**

- `community-number`: Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.
local-AS

Enter the keywords `local-AS` to drop all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.

All routes with the NO_EXPORT_SUBCONFED (0xFFFFFF03) community attribute must not be advertised to external BGP peers.

no-advertise

Enter the keywords `no-advertise` to drop all routes containing the well-known community attribute of NO_ADVERTISE.

All routes with the NO_ADVERTISE (0xFFFFFF02) community attribute must not be advertised to other BGP peers.

no-export

Enter the keywords `no-export` to drop all routes containing the well-known community attribute of NO_EXPORT.

All routes with the NO_EXPORT (0xFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

none

Enter the keyword `none` to remove the community attribute from routes meeting the route map criteria.

additive

(Optional) Enter the keyword `additive` to add the communities to already existing communities.

Defaults

Not configured.

Related Commands

- `match community` — redistribute routes that match the COMMUNITY attribute.
- `show ip bgp community` — display BGP community groups.

**set level**

To specify the IS-IS level or OSPF area to which matched routes are redistributed, configure a filter.

**Syntax**

```
set level {backbone | level-1 | level-1-2 | level-2 | stub-area}
```

To remove a set level condition, use the `no set level {backbone | level-1 | level-1-2 | level-2 | stub-area}` command.

**Parameters**

- **backbone**
  
Enter the keyword `backbone` to redistribute matched routes to the OSPF backbone area (area 0.0.0.0).

- **level-1**
  
Enter the keyword `level-1` to redistribute matched routes to IS-IS Level 1.

- **level-1-2**
  
Enter the keyword `level-1-2` to redistribute matched routes to IS-IS Level 1 and Level 2.

- **level-2**
  
Enter the keyword `level-2` to redistribute matched routes to IS-IS Level 2.

- **stub-area**
  
Enter the keyword `stub` to redistribute matched routes to OSPF stub areas.

**Defaults**

Not configured.

set local-preference

To set the BGP LOCAL_PREF attribute for routers within the local autonomous system, configure a filter.

Syntax

```
set local-preference value
```

To delete a BGP LOCAL_PREF attribute, use the `no set local-preference` command.

Parameters

- **value**: Enter a number as the LOCAL_PREF attribute value. The range is from 0 to 4294967295.

Defaults

Not configured.

</table>
The `set local-preference` command changes the LOCAL_PREF attribute for routes meeting the route map criteria. To change the LOCAL_PREF for all routes, use the `bgp default local-preference` command.

**set metric**

To assign a new metric to redistributed routes, configure a filter.

**Syntax**

```
set metric [ + | - ] metric-value
```

To delete a setting, enter `no set metric`.

**Parameters**

- **+** (OPTIONAL) Enter + to add a metric-value to the redistributed routes.
- **-** (OPTIONAL) Enter - to subtract a metric-value from the redistributed routes.

**metric-value**

Enter a number as the new metric value. The range is from zero (0) to 4294967295.

**Defaults**

Not configured.

**Related Commands**

- `set automatic-tag` — compute the tag value of the route.
- `set level` — specify the OSPF area for route redistribution.
set metric-type

To assign a new route type for routes redistributed to OSPF, configure a filter.

Syntax

```
set metric-type {internal | external | type-1 | type-2}
```

To delete a setting, use the no set metric-type command.

Parameters

- **internal**: Enter the keyword `internal` to assign the Interior Gateway Protocol metric of the next hop as the route’s BGP MULTI_EXIT_DES (MED) value.
- **external**: Enter the keyword `external` to assign the IS-IS external metric.
- **type-1**: Enter the keyword `type-1` to assign the OSPF Type 1 metric.
- **type-2**: Enter the keyword `type-2` to assign the OSPF Type 2 metric.

Defaults

Not configured.

Usage Information

If you configure the `set next-hop` command, its configuration takes precedence over the `neighbor next-hop-self` command in the ROUTER BGP mode.
If you configure the `set next-hop` command with the interface's IP address (either Loopback or physical), the software declares the route unreachable.

**Related Commands**
- `match ip next-hop` — redistribute routes that match the next-hop IP address.

### set origin

To manipulate the BGP ORIGIN attribute, configure a filter.

**Syntax**
```
set origin {igp | egp | incomplete}
```

To delete an ORIGIN attribute setting, use the `no set origin` command.

**Parameters**
- `egp` Enter the keyword `egp` to set routes originating from outside the local AS.
- `igp` Enter the keyword `igp` to set routes originating within the same AS.
- `incomplete` Enter the keyword `incomplete` to set routes with incomplete routing information.

**Defaults**
Not configured.

**Command Modes**

**Related Commands**

- `set automatic-tag` — compute the tag value of the route.
- `set level` — specify the OSPF area for route redistribution.
- `set metric` — specify the metric value assigned to redistributed routes.
- `set metric-type` — specify the route type assigned to redistributed routes.
**set weight**

To add a non-RFC compliant attribute to the BGP route to assist with route selection, configure a filter.

**Syntax**

```
set weight weight
```

To delete a weight specification, use the `no set weight weight` command.

**Parameters**

- `weight`
  
Enter a number as the weight used by the route meeting the route map specification. The range is from 0 to 65535. The default is: router-originated = 32768 and all other routes = 0.

When there are multiple routes to the same destination, the routes with a higher weight are preferred.

**Defaults**

- router-originated = 32768; all other routes = 0

**Command Modes**

- ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell Networking OS Command Line Reference Guide**.

Example

Dell# show route-map
route-map firpo, permit, sequence 10
Match clauses:
Set clauses:
tag 34
Dell#

Related Commands

- `route-map` — configure a route map.

AS-Path Commands

The following commands configure AS-Path ACLs.
ip as-path access-list

Enter AS-PATH ACL mode and configure an access control list based on the BGP AS_PATH attribute.

Syntax

ip as-path access-list as-path-name

Parameters

as-path-name Enter the access-list name, up to 140 characters.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

Usage Information

To apply the AS-PATH ACL to BGP routes, use the match as-path or neighbor filter-list commands.

Example

Dell(conf)# ip as-path access-list TestPath
Dell(config-as-path)#

Related Commands

- match as-path — match on routes contain a specific AS-PATH.

show ip as-path-access-lists

Display the all AS-PATH access lists configured on the E-Series.

Syntax

show ip as-path-access-lists

Command Modes

- EXEC
- EXEC Privilege
Command History

IP Community List Commands

IP community list commands are supported on the Dell Networking OS.

ip community-list

Enter COMMUNITY-LIST mode and create an IP community-list for BGP.

Syntax

ip community-list comm-list-name

To delete a community-list, use the no ip community-list comm-list-name command.

Parameters

comm-list-name Enter a text string as the name of the community-list, up to 140 characters.

Command Modes

CONFIGURATION

Command History

Version   Description
9.10(0.0)  Introduced on the S3148.
9.8(2.0)   Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0)   Introduced on the Z9500.
8.3.19.0   Introduced on the S4820T.
8.3.7.0    Introduced on the S4810.
8.11.0     Introduced on the E-Series.
7.8.1.0    Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.11.0  Introduced on the E-Series.
Example

Dell# show ip community-lists
ip community-list ABC
  permit local-AS
  deny no-advertise
  permit no-export
Dell#

deny (for Standard IP ACLs)

To drop packets with a certain IP address, configure a filter.

Syntax

deny {source | any | host {ip-address}}[count [byte]] [dscp value] [order]
[fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny {source [mask] | any | host ip-address} command.

Parameters

log  (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
threshold-in msgs count  (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. The threshold range is from 1 to 100.
interval minutes  (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
monitor  (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes

CONFIGURATION-STANDARD-ACCESS-LIST

</tr>
</tbody>
</table>
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

- `ip access-list standard` — configure a standard ACL.
- `permit` — configure a permit filter.

**deny (for Extended IP ACLs)**

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax**

```
deny {ip | ip-protocol-number} {source mask | any | host ip-address} 
{destination mask | any | host ip-address} [count [byte]] [dscp value] [order] 
[monitor] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] 
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} 
{destination mask | any | host ip-address}` command.

**Parameters**

- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in msgs count` (OPTIONAL) Enter the threshold-inmsgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the `seq, permit, or deny` commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
monitor (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

-  `deny tcp` — assign a filter to deny TCP packets.
-  `deny udp` — assign a filter to deny UDP packets.
-  `ip access-list extended` — create an extended ACL.
seq (for Standard IPv4 ACLs)

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address}
[count [bytes]] [dscp value] [order] [fragments] [log [interval minutes]
[threshold-in-msgs [count]]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

Parameters

- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword interval followed by the time period in minutes at whichACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet

---

Dell EMC Access Control Lists (ACL) 287
count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**
- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

**deny tcp (for Extended IP ACLs)**

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

**Syntax**
```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]]
 {destination mask | any | host ip-address} [dscp] [bit] [operator port [port]]
 [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**
- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in-msgs` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. With the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- deny — assign a filter to deny IP traffic.
- deny udp — assign a filter to deny UDP traffic.

**deny udp (for Extended IP ACLs)**

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

**Syntax**

deny udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [dscp] [operator port [port]] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]}
To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **log** *(OPTIONAL)* Enter the keyword `log` to enable the triggering of ACL log messages.
- **threshold-in msgs** *(OPTIONAL)* Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- **count** *(OPTIONAL)* Enter the `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes.

<tr>
<td>9.3(0.0)</td>
<td>Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

**Related Commands**

- `deny` — assign a filter to deny IP traffic.
- `deny tcp` — assign a filter to deny TCP traffic.
deny arp (for Extended MAC ACLs)

Configure an egress filter that drops ARP packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

Syntax

deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} command.

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in-msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny icmp (for Extended IP ACLs)

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax**

deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [dscp] [message-type] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]

**Parameters**

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### deny ether-type (for Extended MAC ACLs)

Configure an egress filter that drops specified types of Ethernet packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

**Syntax**

```plaintext
deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
Use the no deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} command.

The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

- **permit** — configure a MAC address filter to pass packets.
- **seq** — configure a MAC address filter with a specified sequence number.
permit (for Standard IP ACLs)

To permit packets from a specific source IP address to leave the switch, configure a filter.

Syntax

```
permit {source [mask] | any | host ip-address} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

Parameters

- **log** *(OPTIONAL)* Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in-msgs count** *(OPTIONAL)* Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- **interval minutes** *(OPTIONAL)* Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
- **monitor** *(OPTIONAL)* Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands
- deny — assign a IP ACL filter to deny IP packets.
- ip access-list standard — create a standard ACL.

permit arp (for Extended MAC ACLs)

Configure a filter that forwards ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics; refer to your line card documentation for specifications.

Syntax

```
permit arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]][monitor]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `(destination-mac-address mac-address-mask | any) vlan vlan-id {ip-address | any | opcode code-number}` command.

Parameters

- log
  - (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- threshold-in msgs count
  - (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- interval minutes
  - (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- monitor
  - (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

Related Commands
- deny — assign a IP ACL filter to deny IP packets.
- ip access-list standard — create a standard ACL.
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### permit ether-type (for Extended MAC ACLs)

Configure a filter that allows traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**Syntax**

```
permit ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
Use the no permit ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} command.

Parameters

log

(OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in-msgs count

(OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. With the seq, permit, or deny commands. The threshold range is from 1 to 100.

interval minutes

(OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor

(OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.4(0.0) Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.

9.3(0.0) Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both
the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**permit icmp (for Extended IP ACLs)**

Configure a filter to allow all or specific ICMP messages.

```
Syntax
permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [dscp] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} command.

**Parameters**

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in-msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### permit udp (for Extended IP ACLs)

To pass UDP packets meeting the filter criteria, configure a filter.

**Syntax**

```plaintext
permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [dscp] [operator port [port]] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- `log` *(OPTIONAL)*: Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in-msgs count` *(OPTIONAL)*: Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- `interval minutes` *(OPTIONAL)*: Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` *(OPTIONAL)*: Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit tcp` — assign a permit filter for TCP packets.
**permit (for Extended IP ACLs)**

To pass IP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [bytes]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit tcp` — assign a permit filter for TCP packets.
- `permit udp` — assign a permit filter for UDP packets.

**permit (for Standard MAC ACLs)**

To forward packets from a specific source MAC address, configure a filter.

**Syntax**

```plaintext
permit {any | mac-source-address [mac-source-address-mask]} [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

**Parameters**

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands
- **deny** — configure a MAC ACL filter to drop packets.
- **seq** —configure a MAC ACL filter with a specified sequence number.

seq (for Standard MAC ACLs)
To a deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

Syntax
```
seq sequence-number {deny | permit} {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

Description
- `sequence-number` — the number of the sequence. The range is from 0 to 4294967290.
- `deny` —drop the packet.
- `permit` —forward the packet.
- `any` — permit or deny any packet.
- `count` — the number packets to be counted. The range is from 1 to 4294967295.
- `byte` — the number of bytes to be counted. This argument is optional.
- `log` — generate a log message.
- `interval minutes` — the threshold logs are maintained. The range is from 1 to 1440.
- `threshold-in-msgs [count]` — the threshold is the number of messages to log before rotating to the next threshold level. The range is from 1 to 100.
- `monitor` — monitor the ACL rule. The default is none.
To remove this filter, use the `no seq sequence-number` command.

**Parameters**

- **log** *(OPTIONAL)* Enter the keyword `log` to enable the triggering of ACL log messages.
- **threshold-in-msgs count** *(OPTIONAL)* Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both
the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands
- **deny** — configure a filter to drop packets.
- **permit** — configure a filter to forward packets.

**permit tcp (for Extended IP ACLs)**

To pass TCP packets meeting the filter criteria, configure a filter.

**Syntax**

```plaintext
permit tcp {source mask | any | host ip-address} [bit] [operator port [port]]
{destination mask | any | host ip-address} [bit] [dscp] [operator port [port]]
[count | byte] [order] [fragments] [log [interval minutes] [threshold-in-msgs
[count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs** count (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists.

### Related Commands

- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit udp` — assign a permit filter for UDP packets.

### seq arp (for Extended MAC ACLs)

Configure an egress filter with a sequence number that filters ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

#### Syntax

```
seq sequence-number {deny | permit} arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, use the no `seq sequence-number` command.

#### Parameters

- `log` *(OPTIONAL)* Enter the keyword `log` to enable the triggering of ACL log messages.
threshold-in msgs count (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. You can enter a threshold in the range of 1-100.

interval minutes (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.

monitor (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

Command Modes
CONFIGURATION-EXTENDED-ACCESS-LIST

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000--ON.
9.4(0.0) Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.
9.3.0.0 Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

Usage Information
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is reenabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is reenabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, standard and extended IPv6 ACLs, and standard and extended MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
seq ether-type (for Extended MAC ACLs)

Configure an egress filter with a specific sequence number that filters traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax**
```
seq sequence-number {deny | permit} ether-type protocol-type-number
{destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, use the no seq sequence-number command.

**Parameters**
- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. You can enter a threshold in the range of 1-100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

seq (for IP ACLs)

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

Syntax

seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]

Parameters

log

(OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in msgs count

(OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. The threshold range is from 1 to 100.

interval minutes

(OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor

(OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.
- **9.4(0.0)**
  - Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
- **9.3(0.0)**
  - Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

## seq (for IPv6 ACLs)

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

### Syntax

```
seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp | udp} {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [operator port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

### Parameters

- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of logs is stopped.
- `monitor` (OPTIONAL) Enter the keyword monitor to monitor incoming packets.
of ACL logs is terminate with the seq, permit, or deny commands. The threshold range is from 1 to 100.

- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- **permit** – configure a filter to forward packets.
permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

Syntax

```
permit udp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [operator port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs** count (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

permit tcp (for IPv6 ACLs)

Configure a filter to pass TCP packets that match the filter criteria.

Syntax

```
permit tcp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [bit] [operator port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

Parameters

- **log** (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- **threshold-in msgs** (OPTIONAL) Enter the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **count** (OPTIONAL) Enter the keyword `count` followed by the number of packets to count. The range is from 1 to 100,000.
- **interval minutes** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.
**permit icmp (for IPv6 ACLs)**

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

**Syntax**

```
permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- No permit icmp statements in the access list
- Use the no permit icmp command

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `permit` — assign a permit filter for IP packets.
- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} (destination address | any | host ipv6-address)` command.

### Parameters

- **source address**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

- **mask**
  - Enter the keyword `mask` to specify that all routes are subject to the filter.

- **any**
  - Enter the keyword `any` to specify a host IP address.

- **host ipv6-address**
  - Enter the keyword `host` then the IPv6 address to specify a host IPv6 address.

- **destination**
  - Enter the IP address of the network or host to which the packets are sent.

- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets processed by the filter.

- **byte**
  - (OPTIONAL) Enter the keyword `byte` to count bytes processed by the filter.

- **log**
  - (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- **threshold-inmsgs count**
  - (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

- **interval minutes**
  - (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**permit (for IPv6 ACLs)**

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

**Syntax**

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor] [no-drop]
```

**Parameters**

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in-msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
- **no-drop** Enter the keywords no-drop to match only the forwarded packets.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

</tr>
</tbody>
</table>

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny udp (for IPv6 ACLs)

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

Syntax

```
deny udp {source address mask | any | host ipv6-address} [operator port [port]]
{destination address | any | host ipv6-address} [operator port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command syntax if you know the filter’s sequence number
Use the `no deny udp (source address mask | any | host ipv6-address)
(destination address | any | host ipv6-address)` command

**Parameters**

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Version**

- 9.10(0.0)  Introduced on the S3148.
- 9.8(2.0)  Introduced on the S3100 series.
- 9.8(1.0)  Introduced on the Z9100–ON.
- 9.8(0.0P5)  Introduced on the S4048-ON.
- 9.8(0.0P2)  Introduced on the S3048-ON.
- 9.7(0.0)  Introduced on the S6000–ON.
- 9.5(0.1)  Introduced on the Z9500.
- 9.4(0.0)  Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.
- 9.3(0.0)  Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs.

You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.
You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

Syntax
deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [bit] [operator port [port]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]

To remove this filter, you have two choices:

- Use the no seq sequence-number command syntax if you know the filter’s sequence number
- Use the no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} command

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in-msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the seq, permit, or deny commands. The threshold range is from 1 to 100..
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

NOTE: Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

Syntax

deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. You can enter a threshold in the range of 1-100.
- **count** (OPTIONAL) Enter the keyword count to count packets.
**interval minutes** *(OPTIONAL)* Enter the keyword *interval* followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.

**monitor** *(OPTIONAL)* Enter the keyword *monitor* when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
deny (for IPv6 ACLs)

Configure a filter that drops IPv6 packets that match the filter criteria.

Syntax

```
deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

Parameters

- **log** (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- **threshold-in msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
- **no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

</table>
Version | Description
--- | ---
9.3(0.0) | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
This section describes the access control list (ACL) virtual local area network (VLAN) group, and content addressable memory (CAM) enhancements.

**member vlan**

Add VLAN members to an ACL VLAN group.

**Syntax**

```
member vlan {VLAN-range}
```

**Parameters**

- **VLAN-range**
  
Enter the member VLANs using comma-separated VLAN IDs, a range of VLAN IDs, a single VLAN ID, or a combination. For example:

  Comma-separated: 3, 4, 6
  
  Range: 5-10
  
  Combination: 3, 4, 5-10, 8

**Default**

None

**Command Modes**

CONFIGURATION (conf-acl-vl-grp)

**Command History**

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S4810, S4820T, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

**Usage Information**

At a maximum, there can be only 32 VLAN members in all ACL VLAN groups. A VLAN can belong to only one group at any given time.

You can create an ACL VLAN group and attach the ACL with the VLAN members. The optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL has a mapping with the VLAN and increased CAM space utilization occurs.
Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.

**ip access-group**

Apply an egress IP ACL to the ACL VLAN group.

**Syntax**

```
ip access-group {group name} out implicit-permit
```

**Parameters**

- **group-name**
  - Enter the name of the ACL VLAN group where you want the egress IP ACLs applied, up to 140 characters.
- **out**
  - Enter the keyword `out` to apply the ACL to outgoing traffic.
- **implicit-permit**
  - Enter the keyword `implicit-permit` to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).

**Default**

None

**Command Modes**

CONFIGURATION (conf-acl-vl-grp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0)  Introduced on the S3100 series.
- 9.8(0.0P5)  Introduced on the S4048-ON.
- 9.8(0.0P2)  Introduced on the S3048-ON.
- 9.3.(0.0)  Introduced on the S4810, S4820T, and Z9000 platforms.

**Usage Information**

You can apply only an egress IP ACL on an ACL VLAN group.

**show acl-vlan-group**

Display all the ACL VLAN groups or display a specific ACL VLAN group, identified by name.

**Syntax**

```
show acl-vlan-group {group-name | detail}
```

**Parameters**

- **group-name**
  - (Optional) Display only the ACL VLAN group that is specified, up to 140 characters.
- **detail**
  - Display information in a line-by-line format to display the names in their entirety.
  - Without the detail option, the output displays in a table style and information may be truncated.

**Default**

No default behavior or values
### Command Modes

</tr>
</tbody>
</table>

### Usage Information
When an ACL-VLAN-Group name or the Access List Group Name contains more than 30 characters, the name is truncated in the `show acl-vlan-group` command output.

### Examples
The following sample illustrates the output of the `show acl-vlan-group` command.

```
| NOTE: | Some group names and some access list names are truncated. |

Dell# show running-config acl-vlan-group
acl-vlan-group Test
  member vlan 1-100
  ip access-group test in
Dell# show acl-vlan-group
Group Name    Egress IP Acl     Ingress IP Acl     Ingress V6 Acl      Vlan Members
Test           -                 test                -                     1-100
```

The following sample output is displayed when using the `show acl-vlan-group group-name` option.

```
| NOTE: | The access list name is truncated. |

Dell# show acl-vlan-group TestGroupSeventeenTwenty
Group Name    Egress IP Acl     Ingress IP Acl     Ingress IPV6 Acl
Test          -                 test                -
Vlan Members   1-100
```

The following sample output shows the line-by-line style display when using the `show acl-vlan-group detail` option.

```
| NOTE: | No group or access list names are truncated |

Dell# show acl-vlan-group detail
Group Name :
  Test
Egress IP Acl :
  -
Ingress IP Acl :
  test
Ingress IPV6 Acl :
  -
Vlan Members :
  1-100
show cam-acl-vlan

Display the number of flow processor (FP) blocks that is allocated for the different VLAN services.

Syntax

```
show cam-acl-vlan
```

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tbody>
</table>

Usage Information
After CAM configuration for ACL VLAN groups is performed, you must reboot the system to enable the settings to be stored in nonvolatile storage. During the initialization of CAM, the chassis manager reads the NVRAM and allocates the dynamic VCAP regions.

The following table describes the output fields of this show command:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis Vlan Cam ACL</td>
<td>Details about the CAM blocks allocated for ACLs for various VLAN operations at a system-wide, global level.</td>
</tr>
<tr>
<td>Stack Unit &lt;number&gt;</td>
<td>Details about the CAM blocks allocated for ACLs for various VLAN operations for a particular stack unit.</td>
</tr>
<tr>
<td>Current Settings(in block sizes)</td>
<td>Information about the number of FP blocks that are currently in use or allocated.</td>
</tr>
<tr>
<td>VlanOpenFlow</td>
<td>Number of FP blocks for VLAN open flow operations.</td>
</tr>
<tr>
<td>VlanIscsi</td>
<td>Number of FP blocks for VLAN internet small computer system interface (iSCSI) counters.</td>
</tr>
<tr>
<td>VlanHp</td>
<td>Number of FP blocks for VLAN high performance processes.</td>
</tr>
<tr>
<td>VlanFcoe</td>
<td>Number of FP blocks for VLAN Fiber Channel over Ethernet (FCoE) operations.</td>
</tr>
<tr>
<td>VlanAclOpt</td>
<td>Number of FP blocks for ACL VLAN optimization feature.</td>
</tr>
</tbody>
</table>

Example

```
Dell# show cam-acl-vlan

-- Chassis Vlan Cam ACL --
Current Settings(in block sizes)
VlanOpenFlow :         0
VlanIscsi    :         0
VlanAclOpt   :         2
VlanHp       :         1
VlanFcoe     :         1
Dell#
```
**cam-acl-vlan**

Allocate the number of flow processor (FP) blocks or entries for VLAN services and processes.

**Syntax**

```
cam-acl-vlan { default | vlanopenflow <0-2> | vlaniscsi <0-2> | vlanaclopt <0-2>
```

**Parameters**

- **default**: Reset the number of FP blocks to default. By default, 0 groups are allocated for the ACL in VCAP. ACL VLAN groups or CAM optimization is not enabled by default, and you need to allocate the slices for CAM optimization.

- **vlanopenflow <0-2>**: Allocate the number of FP blocks for VLAN open flow operations.

- **vlaniscsi <0-2>**: Allocate the number of FP blocks for VLAN iSCSI counters.

- **vlanaclopt <0-2>**: Allocate the number of FP blocks for the ACL VLAN optimization feature.

**Default**

If you use the `default` keyword with the `cam-acl-vlan` command, the FP blocks allocated for VLAN processes are restored to their default values. No FP blocks or dynamic VLAN Content Aware Processor (VCAP) groups are allocated for VLAN operations by default.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>
<th>Description</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduced on the S3148.</td>

<td>9.5(0.1)</td>
</tr>
<tr>
<td>Introduced on the S4810 and Z9000 platforms.</td>
<td>9.3(0.0)</td>
</tr>
</tbody>
</table>

**Usage Information**

The VLAN ContentAware Processor (VCAP) application is a pre-ingress CAP that modifies the VLAN settings before packets are forwarded. To support the ACL CAM optimization functionality, the CAM carving feature is enhanced. A total of four VACP groups are present, of which two are for fixed groups and the other two are for dynamic groups. Out of the total of two dynamic groups, you can allocate zero, one, or two flow processor (FP) blocks to iSCSI Counters, OpenFlow and ACL Optimization. You can configure only two of these features at a point in time.

**show cam-usage**

View the amount of CAM space available, used, and remaining in each partition (including IPv4 Flow and Layer 2 ACL sub-partitions).

**Syntax**

```
show cam-usage [acl | router | switch]
```

**Parameters**

- **acl**

  (OPTIONAL) Enter the keyword acl to display Layer 2 and Layer 3 ACL CAM usage.
**router**  (OPTIONAL) Enter the keyword `router` to display Layer 3 CAM usage.

**switch**  (OPTIONAL) Enter the keyword `switch` to display Layer 2 CAM usage.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>

**Usage Information**
The following regions must be provided in the `show cam-usage` output:
- L3AclCam
- L2AclCam
- V6AclCam

The following table describes the output fields of this `show` command:

- **StackUnit**: The Stack unit number
- **Portpipe**: The hardware path that packets follow through a system for ACL optimization
- **CAM Partition**: Type of area in the CAM block that is used for ACL VLAN groups
- **Total CAM**: Total amount of space in the CAM block
- **Used CAM**: Amount of CAM space that is currently in use
- **Available CAM**: Amount of CAM space that is free and remaining to be allocated for ACLs

**Example:** Output of the `show cam-usage` Command

```
Dell#show cam-usage
Stackunit|Portpipe| CAM Partition | Total CAM | Used CAM | Available CAM
==========|========|---------------|-----------|----------|----------------
1 | 0 | IN-L2 ACL | 1536 | 0 | 1536
| | | IN-L3 ACL | 1024 | 1 | 1023
| | | IN-L3 FIB | 49152 | 6 | 49146
| | | IN-V6 ACL | 0 | 0 | 0
| | | IN-NLB ACL | 0 | 0 | 0
| | | IPMAC ACL | 0 | 0 | 0
| | | OUT-L2 ACL | 206 | 9 | 197
| | | OUT-L3 ACL | 178 | 9 | 169
| | | OUT-V6 ACL | 178 | 4 | 174
2 | 0 | IN-L2 ACL | 1536 | 0 | 1536
| | | IN-L3 ACL | 1024 | 1 | 1023
| | | IN-L3 FIB | 49152 | 6 | 49146
```

show running config acl-vlan-group

Display the running configuration of all or a given ACL VLAN group.

Syntax

```
show running config acl-vlan-group group name
```

Parameters

```
group-name
```

Display only the ACL VLAN group that is specified. The maximum group name is 140 characters.

Default

None

Command Modes

EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>

Examples

The following sample output shows the line-by-line style display when using the show running-config acl-vlan-group option. Note that no group or access list names are truncated.

```
Dell#show running-config acl-vlan-group

acl-vlan-group Test
  member vlan 1-100
  ip access-group test in

Dell#show running-config acl-vlan-group Test

acl-vlan-group Test
  member vlan 1-100
  ip access-group test in

Dell#
```

acl-vlan-group

Create an ACL VLAN group.

Syntax

```
acl-vlan-group {group name}
```
To remove an ACL VLAN group, use the `no acl-vlan-group (group name)` command.

**Parameters**

- **group-name**: Specify the name of the ACL VLAN group. The name can contain a maximum 140 characters.

**Default**

No default behavior or values

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.3.(0.0)</td>
<td>Introduced on the S4810, S4820T and Z9000 platforms</td>
</tr>
</tbody>
</table>

**Usage Information**

You can have up to eight different ACL VLAN groups at any given time. When you configure an ACL VLAN group, you enter the ACL VLAN Group Configuration mode.

To avoid the problem of excessive consumption of CAM area, you can configure ACL VLAN groups that combines all the VLANs that are applied with the same ACL in a single group. A unique identifier for each of ACL attached to the VLAN is used as a handle or locator in the CAM area instead of the VLAN id. This method of processing significantly reduces the number of entries in the CAM area and saves memory space in CAM.

You can create an ACL VLAN group and attach the ACL with the VLAN members. Optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL maps with the VLAN and increased CAM space utilization occurs.

Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.

---

**show acl-vlan-group detail**

Display all the ACL VLAN Groups or display a specific ACL VLAN Group by name. To display the names in their entirety, the output displays in a line-by-line format.

**Syntax**

```
show acl-vlan-group detail
```

**Parameters**

- **detail**: Display information in a line-by-line format to display the names in their entirety.

Without the detail option, the output is displayed in a table style and information may be truncated.

**Default**

No default behavior or values
Command Modes

- EXEC
- EXEC Privilege

Command History

Usage Information

The output for this command displays in a line-by-line format. This allows the ACL-VLAN-Group names (or the Access List Group Names) to display in their entirety.

Examples

The following sample output shows the line-by-line style display when using the `show acl-vlan-group detail` option. Note that no group or access list names are truncated.

Dell# show acl-vlan-group detail

Group Name :
   Test
Egress IP Acl :
   -
Ingress IP Acl :
   test
Ingress IPV6 Acl :
Vlan Members :
   1-100
Dell#

description (ACL VLAN Group)

Add a description to the ACL VLAN group.

Syntax

description description

Parameters

description

Enter a description to identify the ACL VLAN group (80 characters maximum).

Default

No default behavior or values

Command Modes

- CONFIGURATION (conf-acl-vl-grp)

Command History

</tr>
</tbody>
</table>

**Usage Information**

Enter a description for each ACL VLAN group that you create for effective and streamlined administrative and logging purposes.
Bidirectional Forwarding Detection (BFD)

Bidirectional forwarding detection (BFD) is a detection protocol that provides fast forwarding path failure detection. The Dell Networking OS implementation is based on the standards specified in the IETF Draft draft-ietf-bfd-base-03, and supports BFD on all Layer 3 physical interfaces including VLAN interfaces and port-channels.

Topics:
- bfd all-neighbors
- bfd disable
- bfd enable (Configuration)
- bfd enable (Interface)
- bfd interval
- bfd neighbor
- bfd protocol-liveness
- ip route bfd
- ipv6 ospf bfd all-neighbors
- isis bfd all-neighbors
- neighbor bfd
- neighbor bfd disable
- show bfd neighbors
- vrrp bfd neighbor

**bfd all-neighbors**

Enable BFD sessions with all neighbors discovered by Layer 3 protocols virtual router redundancy protocol (VRRP), intermediate system to intermediate system (IS-IS), open shortest path first (OSPF), OSPFv3, or border gateway protocol (BGP) on router interfaces, and (optionally) reconfigure the default timer values.

**Syntax**

```
bfd all-neighbors [interval interval min_rx min_rx multiplier value role {active | passive}]
```

**Parameters**

- `interval milliseconds` (OPTIONAL) Enter the keyword `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.
- `min_rx milliseconds` Enter the keyword `min_rx` to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is 200.
- `multiplier value` Enter the keyword `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.
- `role [active | passive]` Enter the role that the local system assumes:
• **Active** — The active system initiates the BFD session. Both systems can be active for the same session.

• **Passive** — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **active**.

**Defaults**

See Parameters.

**Command Modes**

- ROUTER OSPF
- ROUTER OSPFv3
- ROUTER BGP
- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100--ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000--ON.
9.0.2.0 | Introduced on the S6000.
9.2(1.0) | Introduced on the Z9500.
9.2.(0.0) | Introduced BFD for VRRP and OSPFv3 on Z9000, S4810, and S4820T.
9.0.0.0 | Introduced BFD for BGP on the Z9000.
8.3.19.0 | Introduced on the S4820T.
8.3.8.0 | Introduced BFD for BGP on the S4810.
8.4.1.3 | Introduced BFD for BGP on the E-Series.
8.2.1.0 | Introduced BFD for OSPF and ISIS on the E-Series.
7.6.1.0 | Introduced BFD for ISIS on the E-Series.
7.5.1.0 | Introduced BFD for OSPF on the E-Series.
7.4.1.0 | Introduced BFD for OSPF on the E-Series.

**Usage Information**

All neighbors inherit the timer values configured with the bfd neighbor command except in the following cases:

- Timer values configured with the isis bfd all-neighbors or ip ospf bfd all-neighbors commands in INTERFACE mode override timer values configured with the bfd neighbor command. Likewise, using the no bfd neighbor command does not disable BFD on an interface if you explicitly enable BFD using the isis bfd all-neighbors command.
Neighbors that have been explicitly enabled or disabled for a BFD session with the `bfd neighbor` or `neighbor bfd disable` commands in ROUTER BGP mode do not inherit the global BFD enable/disable values configured with the `bfd neighbor` command or configured for the peer group to which a neighbor belongs. The neighbors inherit only the global timer values (configured with the `bfd neighbor` command).

You can only enable BFD for VRRP in INTERFACE command mode (`vrrp bfd all-neighbors`).

**Related Commands**
- `neighbor bfd disable` — disable a BFD session explicitly with a BGP neighbor or a BGP peer group.

### bfd disable

Disable BFD on an interface.

**Syntax**

```
bfd disable
```

Re-enable BFD using the `no bfd disable` command.

**Defaults**

BFD is disabled by default.

**Command Modes**

VRRP

**Command History**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.10.0 Introduced on the S4810.
7.4.1.0 Introduced on the E-Series.

Usage Information
Protocol Liveness is a feature that notifies the BFD Manager when a client protocol (for example, OSPF and ISIS) is disabled. When a client is disabled, all BFD sessions for that protocol are torn down. Neighbors on the remote system receive an Admin Down control packet and are placed in the Down state. Peer routers might take corrective action by choosing alternative paths for the routes that originally pointed to this router.

ip route bfd

Enable BFD for all neighbors configured through static routes.

Syntax
ip route bfd [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]

To disable BFD for all neighbors configured through static routes, use the no ip route bfd [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}] command.

Parameters
- **prefix-list prefix-list-name**: (Optional) Enter the keyword prefix-list followed by the name of the prefix list to enable or disable BFD on specific neighbors.
- **interval milliseconds**: (OPTIONAL) Enter the keywords interval to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.
- **min_rx milliseconds**: Enter the keywords min_rx to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200.
- **multiplier value**: Enter the keywords multiplier to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.
- **role [active | passive]**: Enter the role that the local system assumes:
  - **Active**: active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive**: passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.
Defaults

See Parameters.

**ipv6 ospf bfd all-neighbors**

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

**Syntax**

```
ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]
```

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode.

**Parameters**

- `disable` (OPTIONAL) Enter the keyword disable to disable BFD on this interface.
- `interval milliseconds` (OPTIONAL) Enter the keyword interval to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.
- `min_rx milliseconds` Enter the keywords min_rx to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200.
- `multiplier value` Enter the keyword multiplier to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.
- `role [active | passive]` Enter the role that the local system assumes:
  - Active — active system initiates the BFD session. Both systems can be active for the same session.
• Passive — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is Active.

Defaults
See Parameters.

Usage Information
This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure ipv6 ospf BFD in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the bfd all-neighbors command. Using the no form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword disable.

isis bfd all-neighbors

Enable BFD on all IS-IS neighbors discovered on an interface.

Syntax
isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]

To remove all BFD sessions with IS-IS neighbors discovered on this interface, use the no isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]

Parameters
disable      (OPTIONAL) Enter the keyword disable to disable BFD on this interface.
interval milliseconds  (OPTIONAL) Enter the keywords interval to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.
min_rx milliseconds  Enter the keywords min_rx to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is 200.
multiplier value    Enter the keywords multiplier to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.
Enter the role that the local system assumes:

- **Active** — active system initiates the BFD session. Both systems can be active for the same session.
- **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

</tr>
</tbody>
</table>

### Usage Information

This command provides the flexibility to fine-tune the timer values based on individual interface needs when ISIS BFD is configured in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the bfd all-neighbors command. Using the no form of this command does not disable BFD if BFD is configured in CONFIGURATION mode.

To disable BFD on a specific interface while BFD is configured in CONFIGURATION mode, use the keyword disable.

### neighbor bfd

Explicitly enable a BFD session with a BGP neighbor or a BGP peer group.

**Syntax**

```
neighbor {ip-address | peer-group-name} bfd
```

**Parameters**

- **ip-address**
  - Enter the IP address of the BGP neighbor that you want to explicitly enable for BFD sessions in dotted decimal format (A.B.C.D).
- **peer-group-name**
  - Enter the name of the peer group that you want to explicitly enable for BFD sessions.

**Defaults**

None

**Command Modes**

**ROUTER BGP**
Command History

<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.4.1.3</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

When you enable a BFD session with a specified BGP neighbor or peer group using the `bfd neighbor` command, the default BFD session parameters are used (interval: 200 milliseconds, min_rx: 200 milliseconds, multiplier: 3 packets, and role: active) if you have not specified parameters with the `bfd neighbor` command.

When you explicitly enable a BGP neighbor for a BFD session with the `bfd neighbor` command:

- The neighbor does not inherit the global BFD enable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: interval, min_rx, and multiplier.

Related Commands

- `neighbor bfd disable` — disable a BFD session explicitly with a BGP neighbor or a BGP peer group.

neighbor bfd disable

Explicitly disable a BFD session with a BGP neighbor or a BGP peer group.

Syntax

```
neighbor {ip-address | peer-group-name} bfd disable
```  

Parameters

- `ip-address` Enter the IP address of the BGP neighbor that you want to explicitly disable for BFD sessions in dotted decimal format (A.B.C.D).
- `peer-group-name` Enter the name of the peer group that you want to explicitly disable for BFD sessions.

Defaults

None

Command Modes

<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.4.1.3</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you explicitly disable a BGP neighbor for a BFD session with the `neighbor bfd disable` command:

- The neighbor does not inherit the global BFD disable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: interval, min_rx, and multiplier.

When you remove the Disabled state of a BFD for a BGP session with a specified neighbor by entering the `no neighbor bfd disable` command, the BGP link with the neighbor returns to normal operation and uses the BFD session parameters globally configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.

**Related Commands**

- `neighbor bfd` — enable a BFD session explicitly with a BGP neighbor or a BGP peer group.

### show bfd neighbors

Display BFD neighbor information on all interfaces or a specified interface.

**Syntax**

```
show bfd neighbors interface [detail]
```

**Parameters**

- `interface` Enter one of the following keywords and slot/port or number information:
  - For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- `detail` (OPTIONAL) Enter the keyword `detail` to view detailed information about BFD neighbors.
Defaults
None

Command Modes
- EXEC
- EXEC Privilege

Border Gateway Protocol

BGP is an external gateway protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP version 4 (BGPv4) supports classless inter-domain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

NOTE: For more information about configuring the border gateway protocol (BGP), see the BGP section in the Dell Networking OS Configuration Guide.

BGP IPv4 Commands

Border Gateway Protocol (BGP) is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). BGP supports classless interdomain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

NOTE: Dell Networking OS supports 2-byte (16-bit) and 4-byte (32-bit) format for autonomous system numbers (ASNs), where the 2-byte format is 1 to 65535 and the 4-byte format is 1 to 4294967295.

NOTE: Dell Networking OS supports dotted format as well as the traditional plain format for AS numbers. The dot format is displayed when using the show ip bgp commands. To determine the comparable dot format for an ASN from a traditional format, use ASN/65536. ASN%65536. For more information about using the 2– or 4-byte format, refer to the Dell Networking OS Configuration Guide.

address-family

Enable the IPv4 multicast or the IPv6 address family.

Syntax

address-family [ipv4 {multicast | vrf vrf-name} | ipv6 unicast [vrf vrf-name]]

Parameters

ipv4 multicast
Enter the keyword ipv4 followed by the keyword multicast to enable BGPv4 multicast mode.

ipv4 vrf vrf-name
Enter the keyword ipv4 followed by the keyword vrf and then the name of the VRF to enable VRF mode.
NOTE: Use this attribute to start a BGP instance corresponding to either a specific address family in a default VRF or an IPv4 address family in a non-default VRF.

ipv6 unicast

Enter the keyword ipv6 followed by the keyword unicast to enable BGPv6 mode.

vrf vrf-name

(Optional) Enter the keyword vrf followed by the name of the VRF to install the IPv6 route in that VRF.

NOTE: It will not be possible to enable VRF mode for IPv6 unicast without configuring the corresponding IPv4 unicast mode for the same VRF. While deletion, whenever the IPv4 VRF mode is deleted for the VRF, it will automatically delete the IPv6 VRF configurations as well.

Defaults
Not configured.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Added support for IPv6 VRF.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
6.5.1.0 Introduced

aggregate-address

To minimize the number of entries in the routing table, summarize a range of prefixes.

Syntax
aggregate-address ip-address mask [advertise-map map-name] [as-set] [attribute-map map-name] [summary-only] [suppress-map map-name]

Parameters
ip-address mask Enter the IP address and mask of the route to be the aggregate address. Enter the IP address in dotted decimal format (A.B.C.D) and mask in /prefix format (/x).
advertise-map  (OPTIONAL) Enter the keywords advertise-map then the name of a configured route map to set filters for advertising an aggregate route.

map-name

as-set  (OPTIONAL) Enter the keyword as-set to generate path attribute information and include it in the aggregate.

AS_SET includes AS_PATH and community information from the routes included in the aggregated route.

attribute-map  (OPTIONAL) Enter the keywords attribute-map then the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.

map-name

summary-only  (OPTIONAL) Enter the keyword summary-only to advertise only the aggregate address. Specific routes are not advertised.

suppress-map  (OPTIONAL) Enter the keywords suppress-map then the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.

map-name

Defaults Not configured.

Command Modes • ROUTER BGP ADDRESS FAMILY
• ROUTER BGP ADDRESS FAMILY IPv6

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000--ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.

Usage Information At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active.

If routes within the aggregate are constantly changing, do not add the as-set parameter to the aggregate as the aggregate flaps to keep track of the changes in the AS_PATH.
In route maps used in the suppress-map parameter, routes meeting the deny clause are not suppress; in other words, they are allowed. The opposite is also true: routes meeting the permit clause are suppressed.

If the route is injected via the network command, that route still appears in the routing table if the summary-only parameter is configured in the aggregate-address command.

The summary-only parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the neighbor distribute-list command.

In the show ip bgp command, aggregates contain an ‘a’ in the first column and routes suppressed by the aggregate contain an ‘s’ in the first column.

When an aggregate address is denied using a peer’s outbound route-map, individual routes suppressed by the aggregate address are advertised to that peer.

The attribute-map corresponding to an aggregate address is applied during the outbound update creation time; the value set in that attribute-map will not be shown in the output of the show ip bgp aggregate route command.

**bgp add-path**

Allow the advertisement of multiple paths for the same address prefix without the new paths replacing any previous ones.

**Syntax**

```
bgp add-path [send | receive | both] path-count
```

**Parameters**

- **send**: Enter the keyword send to indicate that the system sends multiple paths to peers.
- **receive**: Enter the keyword receive to indicate that the system accepts multiple paths from peers.
- **both**: Enter the keyword both to indicate that the system sends and accepts multiple paths from peers.
- **path-count**: Enter the number paths supported. The range is from 2 to 64.

**Defaults**

Disabled

**Command Modes**

- ROUTER BGP
- ROUTER BGP-address-family

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.0 | Introduced on the Z9000.
8.3.8.0 | Introduced on the S4810.

Related Commands
• neighbor add-path — specify that this neighbor/peer group can send/receive multiple path advertisements.

**bgp always-compare-med**

Allows you to enable comparison of the MULTI_EXIT_DISC (MED) attributes in the paths from different external ASs.

**Syntax**

```plaintext
bgp always-compare-med
```

To disable comparison of MED, enter `no bgp always-compare-med`.

**Defaults**

Disabled (that is, the software only compares MEDs from neighbors within the same AS).

**Command Modes**

`ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000–ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Introduced command.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

Any update without a MED attribute is the least preferred route.

If you enable this command, use the `clear ip bgp *` command to recompute the best path.

**bgp asnotation**

Allows you to implement a method for AS number representation in the command line interface (CLI).

**Syntax**

```
bgp asnotation [asplain | asdot+ | asdot]
```

To disable a dot or dot+ representation and return to ASPLAIN, enter the `no bgp asnotation` command.

**Defaults**

`asplain`

**Command Modes**

`ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>8.3.1.0</td>
<td>Introduced the dynamic application of AS notation changes.</td>
</tr>
<tr>
<td>8.2.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

Before enabling this feature, enable the `enable bgp four-octet-as-support` command. If you disable the `four-octect-support` command after using dot or dot+ format, the AS numbers revert to asplain text.

When you apply an annotation, it is reflected in the running-configuration. If you change the notation type, the running-config updates dynamically and the new notation shows.

**Example**

```
Dell(conf)# router bgp 1
Dell(conf-router_bgp)# bgp asnotation asdot
Dell(conf-router_bgp)# ex
Dell(conf)#do show run | grep bgp

router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot

Dell(conf)#router bgp 1
Dell(conf-router_bgp)# bgp asnotation asdot+
Dell(conf-router_bgp)# ex

Dell(conf)#do show run | grep bgp
router bgp 1
```
```plaintext
bgp four-octet-as-support
bgp asnotation asdot+

Dell(conf)#router bgp 1
Dell(conf-router_bgp)# bgp asnotation asplain
Dell(conf-router_bgp)# ex
Dell(conf)#do show run |grep bgp
router bgp 1
  bgp four-octet-as-support

Dell(conf)#
```

**Related Commands**
- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.

---

**bgp bestpath as-path ignore**

Ignore the AS PATH in BGP best path calculations.

```
Syntax
bgp bestpath as-path ignore

To return to the default, enter the no bgp bestpath as-path ignore command.

Defaults
Disabled (that is, the software considers the AS_PATH when choosing a route as best).

Command Modes
ROUTER BGP

</tbody>
</table>

Usage Information
If you enable this command, use the clear ip bgp * command to recompute the best path.
**bgp bestpath as-path multipath-relax**

Include prefixes received from different AS paths during multipath calculation.

**Syntax**

```
bgp bestpath as-path multipath-relax
```

To return to the default BGP routing process, use the no bgp bestpath as-path multipath-relax command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

The bestpath router bgp configuration mode command changes the default bestpath selection algorithm. The multipath-relax option allows load-sharing across providers with different (but equal-length) autonomous system paths. Without this option, ECMP expects the AS paths to be identical for load-sharing.

**bgp bestpath med confed**

Enable MULTI_EXIT_DISC (MED) attribute comparison on paths learned from BGP confederations.

**Syntax**

```
bgp bestpath med confed
```

To disable MED comparison on BGP confederation paths, enter the no bgp bestpath med confed command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the `clear ip bgp *` command to recompute the best path.

```
bgp bestpath med missing-as-best
```

During path selection, indicate preference to paths with missing MED (MULTI_EXIT_DISC) over paths with an advertised MED attribute.

**Syntax**
```
bgp bestpath med missing-as-best
```
To return to the default selection, use the `no bgp bestpath med missing-as-best` command.

**Defaults**
Disabled

**Command Modes**
ROUTER BGP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
6.3.1.0 | Introduced

**Usage Information**
The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During path selection, paths with a lower MED are preferred over paths with a higher MED.

### bgp bestpath router-id ignore

Do not compare router-id information for external paths during best path selection.

**Syntax**
```
bgp bestpath router-id ignore
```

To return to the default selection, use the `no bgp bestpath router-id ignore` command.

**Defaults**
Disabled

**Command Modes**
ROUTER BGP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.1.0</td>
<td>Introduced</td>
</tr>
</tbody>
</table>

**Usage Information**
Configuring this option retains the current best-path. When sessions are then reset, the oldest received path is chosen as the best-path.
**bgp client-to-client reflection**

Allows you to enable route reflection between clients in a cluster.

**Syntax**

```
bgp client-to-client reflection
```

To disable client-to-client reflection, use the `no bgp client-to-client reflection` command.

**Defaults**
Enabled when a route reflector is configured.

**Command Modes**
ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**
Route reflection to clients is not necessary if all client routers are fully meshed.

**Related Commands**
- `bgp cluster-id` — assign an ID to a BGP cluster with two or more route reflectors.
- `neighbor route-reflector-client` — configure a route reflector and clients.

---

**bgp cluster-id**

Assign a cluster ID to a BGP cluster with more than one route reflector.

**Syntax**

```
bgp cluster-id {ip-address | number}
```

To delete a cluster ID, use the `no bgp cluster-id {ip-address | number}` command.

**Parameters**

- `ip-address` Enter an IP address as the route reflector cluster ID.
number

Enter a route reflector cluster ID as a number from 1 to 4294967295.

Defaults

Not configured.

Command Modes

ROUTER BGP

</tr>
</tbody>
</table>

Usage Information

When a BGP cluster contains only one route reflector, the cluster ID is the route reflector’s router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Assign a cluster ID with the bgp cluster-id command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster.

The default format for displaying the cluster-id is dotted decimal, but if you enter the cluster-id as an integer, it is displayed as an integer.

This command automatically restarts the BGP instance for the configuration to take effect.

bgp confederation identifier

Configure an identifier for a BGP confederation.

Syntax

```
bgp confederation identifier as-number
```

To delete a BGP confederation identifier, use the no bgp confederation identifier as-number command.
Parameters  

**as-number**  

Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

**Defaults**  

Not configured.

<td>Introduced on the C-Series. Added support for the 4-byte format</td>
</tr>
</tbody>
</table>

**Usage Information**

To accept 4-byte formats before entering a 4-byte AS number, configure your system. All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation.

Dell Networking OS accepts confederation EBGP peers without a LOCAL_PREF attribute. The software sends AS_CONFED_SET and accepts AS_CONFED_SET and AS_CONF_SEQ.

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

If the neighbor is an eBGP neighbor, then BGP performs a check on the first AS number. In this scenario, it is mandatory that the first sequence in the AS path is of type AS_SEQUENCE or AS_CONFED_SEQUENCE (in the case of confederations). If the first entry appears as an AS_CONFED_SET and the neighbor is not in the local AS, then this is strictly a problem with the neighbor node.

This command automatically restarts the BGP instance for the configuration to take effect.

**Related Commands**

- **bgp four-octet-as-support** — enable 4-byte support for the BGP process.
**bgp confederation peers**

Specify the autonomous systems (ASs) that belong to the BGP confederation.

**Syntax**

```
bgp confederation peers as-number [...as-number]
```

To return to the default, use the `no bgp confederation peers` command.

**Parameters**

- `as-number` Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).
- `...as-number` (OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems.

After specifying autonomous systems numbers for the BGP confederation, recycle the peers to update their configuration.

**Related Commands**

- `bgp confederation identifier` — configure a confederation ID.
- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.
bgp connection-retry-timer

Configures the BGP connection retry timer.

**Syntax**

```
bgp connection-retry-timer retry-timer-value
```

To return to the default configuration, enter the `no connection-retry-timer retry-timer-value` command.

**Parameters**

- **retry-timer-value**
  Enter a value that denotes the time interval after which the session retries the connection. The valid range is from 10 to 65535.

**Defaults**

60 seconds.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>

bgp dampening

Enable BGP route dampening and configure the dampening parameters.

**Syntax**

```
bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]
```

To disable route dampening, use the `no bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]` command.

**Parameters**

- **half-life**
  (OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is from 1 to 45. The default is 15 minutes.

- **reuse**
  (OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route’s Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is from 1 to 20000. The default is 750.

- **suppress**
  (OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route’s Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is from 1 to 20000. The default is 2000.
**max-suppress-time**  (OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is from 1 to 255. The default is **60 minutes**.

**route-map map-name**  (OPTIONAL) Enter the keyword route-map then the name of a configured route map. Only match commands in the configured route map are supported.

**Defaults**  Disabled.

**Command Modes**
- ROUTER BGP
- ROUTER BGP-address-family

**Command History**  This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**  If you enter the **bgp dampening** command, the default values for **half-life**, **reuse**, **suppress**, and **max-suppress-time** are applied. The parameters are position-dependent; therefore, if you configure one parameter, configure the parameters in the order they appear in the CLI.

Route refresh is sent when you enable BGP dampening.

**Related Commands**
-  **show ip bgp dampened-paths** — view the BGP paths.

---

**bgp default local-preference**

Change the default local preference value for routes exchanged between internal BGP peers.

**Syntax**

```
bgp default local-preference value
```

**Parameters**

-  **value**  Specify a local preference value ranging from 0 to 4294967295 (the maximum is 4294967295).

---
To return to the default value, use the `no bgp default local-preference` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference value, the more the route is preferred. The range is from 0 to 4294967295. The default is 100.</td>
</tr>
</tbody>
</table>

**Defaults**

100

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

All routers apply the `bgp default local-preference` command setting within the AS. To set the local preference for a specific route, use the `set local-preference` command in ROUTE-MAP mode.

**Related Commands**

- `set local-preference` — assign a local preference value for a specific route.

### bgp dmzlink-bw

Enables BGP Link Bandwidth.

**Syntax**

```bash
bgp dmzlink-bw
```

To disable BGP Link Bandwidth, enter the `no bgp dmzlink-bw` command.
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dmzlink-bw</td>
<td>Enter the keyword <code>dmzlink-bw</code> to enable BGP Link Bandwidth in BGP multipath.</td>
</tr>
</tbody>
</table>

**Defaults**

N/A

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

Configuring or un-configuring the command brings down and brings up the BGP Route Manager, this results in tear down and re-establishment of all active sessions.

Link Bandwidth has to be configured on the router to tell it to associate Link Bandwidth with prefixes (paths) and/or to use Link Bandwidth in BGP Multipath route selection.

This is done under BGP configuration and is supported per address family — for IPv4 and IPv6 address families.

The configuration for a particular address family applies across all VRFs configured.

This command must be performed on the router which is attaching link bandwidth to prefixes (typically a border router) as well as the router which is expected to load share traffic proportional to the bandwidth of the external links.

---

**bgp enforce-first-as**

Disable (or enable) enforce-first-as check for updates received from EBGP peers.

**Syntax**

`bgp enforce-first-as`

To turn off the default, use the `no bgp enforce-first-as` command.

**Defaults**

Enabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
### bgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

**Syntax**

```
bgp fast-external-fallover
```

To disable fast external fallover, use the `no bgp fast-external-fallover` command.

**Defaults**

Enabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description

- **9.10(0.0)**
  - Introduced on the S3148.

- **9.8(2.0)**
  - Introduced on the S3100 series.

- **9.8(1.0)**
  - Introduced on the Z9100-ON.
### bgp four-octet-as-support

Enable 4-byte support for the BGP process.

**Syntax**

```
bgp four-octet-as-support
```

To disable fast external failover, use the `no bgp four-octet-as-support` command.

**Defaults**

Disabled (supports 2-byte format)

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>

<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `bgp fast-external-fallover` command appears in the `show config` command output.

The fast external failover configuration is applied only after you manually reset all the existing BGP sessions. As a result, after you execute this command, you must also manually execute the `clear ip bgp` command in order for the configuration to take effect.
Version | Description
--- | ---
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

Usage Information

Routers supporting 4-byte ASNs advertise that function in the OPEN message. The behavior of a 4-byte router is slightly different depending on whether it is speaking to a 2-byte router or a 4-byte router.

When creating Confederations, all the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

Where the 2-byte format is from 1 to 65535, the 4-byte format is from 1 to 4294967295. Both formats are accepted and the advertisements reflect the entered format.

For more information about using the 2 byte or 4 byte format, refer to the Dell Networking OS Configuration Guide.

This command automatically restarts the BGP instance for the configuration to take effect.

bgp graceful-restart

To support graceful restart as a receiver only, enable graceful restart on a BGP neighbor, a BGP node, or designate a local router.

Syntax

```
bgp graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]
```

To return to the default, use the `no bgp graceful-restart` command.

Parameters

- **restart-time seconds**
  - Enter the keyword `restart-time` then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is **120 seconds**.

- **stale-path-time seconds**
  - Enter the keyword `stale-path-time` then the maximum number of seconds to wait before restarting a peer's stale paths. The default is **360 seconds**.

- **role receiver-only**
  - Enter the keyword `role receiver-only` to designate the local router to support graceful restart as a receiver only.

Defaults

as above

Command Modes

- ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information
This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.

BGP graceful restart is active only when the neighbor becomes established. Otherwise it is disabled. Graceful-restart applies to all neighbors with established adjacency.

This command automatically restarts the BGP instance for the configuration to take effect.

**bgp non-deterministic-med**

Compare MEDs of paths from different autonomous systems.

**Syntax**

```
bgp non-deterministic-med
```

To return to the default, use the `no bgp non-deterministic-med` command.

**Defaults**

Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

### Usage Information

In Non-Deterministic mode, paths are compared in the order in which they arrive. This method can lead to Dell Networking OS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (no bgp non-deterministic-med), Dell Networking OS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.

When you change the path selection from Deterministic to Non-Deterministic, the path selection for the existing paths remains Deterministic until you enter the `clear ip bgp` command to clear existing paths.

### bgp outbound-optimization

Enables outbound optimization for IBGP peer-group members.

**Syntax**

```
bgp outbound-optimization
```

To disable outbound optimization, enter the `no bgp outbound-optimization` command.

**Defaults**

Enabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

The updates are sent to all the neighbors in the peer-group and all the neighbors have the same attributes including next-hop.

Enabling or disabling outbound optimization dynamically resets all neighbor sessions.

When you enable outbound optimization, all peers receive the same update packets. Also, the next-hop address, which is chosen as one of the addresses of the neighbor's reachable interface, is the same for all peers.
**bgp outbound-optimization**

Enables outbound optimization for IBGP peer-group members.

**Syntax**

```plaintext
bgp outbound-optimization
```

To disable outbound optimization, enter the `no bgp outbound-optimization` command.

**Defaults**

Enabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

### Usage Information

This command is a knob to disable BGP next-hop resolution using BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.

The `clear ip bgp` command is required for this command to take effect and to keep the BGP database consistent. Execute the `clear ip bgp` command right after executing this command.

### Related Commands

- `clear ip bgp` — clear the ip bgp.

### bgp regex-eval-optz-disable

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

**Syntax**

```
bgp regex-eval-optz-disable
```

To re-enable optimization engine, use the `no bgp regex-eval-optz-disable` command.

**Defaults**

Enabled

**Command Modes**

- ROUTER BGP (conf-router_bgp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000–ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
7.2.1.0 | Introduced.
Version | Description
--- | ---
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
7.6.1.0 | Introduced

**Usage Information**

BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is common. In a large-scale configuration, filtering millions of routes based on regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.

BGP policies, containing regular expressions to match as-path and communities, tend to use much CPU processing time, which in turn affects the BGP routing convergence. Additionally, the `show bgp` commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The Regex Engine Performance Enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expensive of RP1 processor memory.

**Examples**

Dell(conf-router_bgp)# no bgp regex-eval-optz-disable
Dell(conf-router_bgp)# do show ip protocols
Routing Protocol is "ospf 22222"
   Router ID is 2.2.2.2
   Area 51 Routing for Networks
   10.10.10.0/00
Routing Protocol is "bgp 1"
   Cluster Id is set to 10.10.10.0
   Router Id is set to 10.10.10.0
   Fast-external-failover enabled
   Regular expression evaluation optimization enabled
   Capable of ROUTE_REFRESH
   For Address Family IPv4 Unicast
      BGP table version is 0, main routing table version 0
      Distance: external 20 internal 200 local 200
Dell(conf-router_bgp)#

**Related Commands**

- `show ip protocols` — view information on all routing protocols enabled and active on the E-Series.

**bgp router-id**

Assign a user-given ID to a BGP router.

**Syntax**

```
bgp router-id ip-address
```

To delete a user-assigned IP address, use the `no bgp router-id` command.

**Parameters**

- `ip-address` Enter an IP address in dotted decimal format to reset only that BGP neighbor.
Defaults
The router ID is the highest IP address of the Loopback interface or, if no Loopback interfaces are configured, the highest IP address of a physical interface on the router.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100--ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000--ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.

Usage Information
Peering sessions are reset when you change the router ID of a BGP router.
This command automatically restarts the BGP instance for the configuration to take effect.

clear ip bgp
Reset BGP sessions. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

Syntax
clear ip bgp [vrf vrf-name] [* | <1-4294967295> | <0.1-65535.65535> | A.B.C.D {soft (in | out)} | X:X:X:X::X {soft (in | out)} | dampening | flap-statistics | ipv4 | ipv6 | peer-group]

Parameters
vrf vrf-name Enter the keyword vrf and then the name of the VRF to clear all BGP sessions corresponding to that VRF.

NOTE: Use this attribute to clear a BGP instance corresponding to either a specific address family in a default VRF or an IPv4 address family in a non-default VRF.

* Enter an asterisk ( * ) to reset all BGP sessions.
Enter `<1-4294967295>` to clear peers with the AS number.

Enter `<0.1-65535.65535>` to clear peers with the AS number in dot format.

**A.B.C.D**
Enter the BGP neighbor address in the A.B.C.D format to clear.

**X:X:X:X**
Enter the BGP neighbor address in the X:X:X:X format to clear.

**soft**
(Optional) Enter the keyword `soft` to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.

**NOTE:** If you enter the `clear ip bgp ip-address soft` command, both inbound and outbound policies are reset.

**in**
(Optional) Enter the keyword `in` to activate only inbound policies.

**out**
(Optional) Enter the keyword `out` to activate only outbound policies.

**NOTE:** You must execute the `clear ip bgp soft out` command when ever there is a change in the local policy. If you do not run this command after a local policy change, then these policy changes are not reflected in the responses to the peer’s route refresh messages.

**dampening**
Enter the keyword `dampening` to clear the flap dampening information.

**flap-statistics**
Enter the keywords `flap-statistics` to clear the flap statistics information.

**ipv4**
Enter the ipv4 address family to clear.

**ipv6**
Enter the ipv6 address family to clear.

**peer-group**
Enter the peer-group to clear all members of the peer-group.

**Command Modes**
EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

clear ip bgp dampening

Clear information on route dampening and return the suppressed route to the Active state.

Syntax

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [dampening [ipv4-address mask | ipv6-address mask]
```

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear information on route dampening corresponding to that VRF.

  **NOTE:** You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

- **ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to clear the ipv4 multicast routes.

- **ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to clear the ipv4 unicast routes.

- **ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to clear the ipv6 unicast routes.

- **ipv4-address mask** (OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to clear dampening information only that BGP neighbor.

- **ipv6-address mask** (OPTIONAL) Enter the IPv6 address and the network mask to clear information on IPv6 route dampening.

Command Modes

**EXEC Privilege**

### clear ip bgp flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

#### Syntax

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [flap-statistics [ipv4-address mask | ipv6-address mask] | filter-list as-path-name | regexp regular-expression]
```

#### Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear BGP flap statistics corresponding to that VRF.
  
  **NOTE:** You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

- **ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to clear information related only to ipv4 multicast routes.

- **ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to clear information related only to ipv4 unicast routes.

- **ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to clear information related only to ipv6 unicast routes.

- **ipv4-address mask** (OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to reset only that prefix.

- **ipv6-address mask** (OPTIONAL) Enter the IPv6 address followed by the network mask to reset only that prefix.

- **filter-list as-path-name** (OPTIONAL) Enter the keywords `filter-list` then the name of a configured AS-PATH list.

- **regexp regular-expression** (OPTIONAL) Enter the keyword `regexp` then regular expressions. Use one or a combination of the following:
  - `.` = (period) any single character (including a white space).
  - `*` = (asterisk) the sequences in a pattern (0 or more sequences).
  - `+` = (plus) the sequences in a pattern (1 or more sequences).
• ? = (question mark) sequences in a pattern (either 0 or 1 sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the regular expression.

• [ ] = (brackets) a range of single-character patterns.
• ( ) = (parenthesis) groups a series of pattern elements to a single element.
• { } = (braces) minimum and the maximum match count.
• ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
• $ = (dollar sign) the end of the output string.

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added the ipv4 multicast and ipv6 unicast parameters.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

If you enter the `clear ip bgp flap-statistics` command without any parameters, all statistics are cleared.

**Related Commands**

• `show debugging` — view the enabled debugging operations.
• `show ip bgp flap-statistics` — view the BGP flap statistics.
• `undebug all` — disable all debugging operations.
**clear ip bgp peer-group**

Reset a peer-group’s BGP sessions.

**Syntax**

```
clear ip bgp [vrf vrf-name] peer-group peer-group-name [ipv4 [multicast | unicast] | ipv6 unicast] [soft {in | out}]
```

**Parameters**

- `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to reset the peer group corresponding to that VRF.
  
  **NOTE:** You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

- `peer-group-name` Enter the peer group name to reset the BGP sessions within that peer group.

- `ipv4 multicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to reset `ipv4 multicast` routes.

- `ipv4 unicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to reset `ipv4 unicast` routes.

- `ipv6 unicast` (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to reset `ipv6 unicast` routes.

- `soft` (OPTIONAL) Enter the keyword `soft` to reset soft configuration.

- `in` Enter the keyword `in` to re-configure soft inbound updates.

- `out` Enter the keyword `out` to re-configure soft outbound updates.

deny bandwidth

Enables you to specify link bandwidth extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

Syntax  

```plaintext
deny bandwidth
```

To disable this setting, enter the `no deny bandwidth` command.

Parameters  

- **bandwidth**
  - Enter the keyword `bandwidth` to specify extended-community attribute as the matching criteria for denying traffic. The range is from 0 to 102400.

Defaults  

N/A

Command Modes  

EXTENDED COMMUNITY LIST

Related Commands  

- **permit bandwidth** — specify link bandwidth extended-community attribute as the matching criteria to permitting incoming or outgoing traffic.

debug ip bgp

Display all information on BGP, including BGP events, keepalives, notifications, and updates.

Syntax  

```plaintext
debug ip bgp [ vrf vrf-name | A.B.C.D | X:X:X::X | peer-group peer-group-name ] [ in | out ]
```

To disable all BGP debugging, use the `no debug ip bgp` command.
Parameters

**vrf vrf-name**
Enter the keyword `vrf` and then the name of the VRF to debug BGP information corresponding to that VRF.

**NOTE:** Use this attribute to debug BGP protocol operations corresponding to either a default or non-default VRF.

**A.B.C.D**
Enter the IPv4 address of the neighbor in dotted decimal format.

**X:XXX:XX**
(Optional) Enter an IPv6 address.

**peer-group peer-group-name**
Enter the keywords `peer-group` then the name of the peer group to debug.

**in**
(Optional) Enter the keyword `in` to view only information on inbound BGP routes.

**out**
(Optional) Enter the keyword `out` to view only information on outbound BGP routes.

**A.B.C.D**
Enter the IP address of peer in the A.B.C.D format.

**X:XXX:XX**
Enter the IPv6 IP address of peer in the X:XXX:XX format.

**dampening**
Enter the keyword `dampening` to view BGP dampening.

**events**
Enter the keyword `events` to view BGP protocol events.

**ipv4**
Enter the ipv4 IP address to view the IPv4 route information.

**ipv6**
Enter the ipv6 IP address to view the IPv6 route information.

**keepalives**
Enter the keyword `keepalives` to view BGP keepalives.

**notifications**
Enter the keyword `notifications` to view BGP notifications.

**soft-reconfiguration**
Enter the keywords `soft-reconfiguration` to view only information on inbound BGP soft reconfiguration.

**updates**
Enter the keyword `updates` to view BGP updates.

</tr>
</tbody>
</table>
Usage Information

To view information on both incoming and outgoing routes, do not include the in and out parameters in the debugging command. The in and out parameters cancel each other; for example, if you enter the debug ip bgp in command and then enter the debug ip bgp out command, you do not see information on the incoming routes.

Entering a no debug ip bgp command removes all configured debug commands for BGP.

Related Commands

- **debug ip bgp events** — view information about BGP events.
- **debug ip bgp keepalives** — view information about BGP keepalives.
- **debug ip bgp notifications** — view information about BGP notifications.
- **debug ip bgp updates** — view information about BGP updates.
- **show debugging** — view enabled debugging operations.

### debug ip bgp dampening

View information on routes being dampened.

**Syntax**

```
debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening
```

To disable debugging, use the no debug ip bgp dampening command.

**Parameters**

- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
- **ipv4 multicast**
  - (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view dampened-route information related only to ipv4 multicast routes.
- **ipv4 unicast**
  - (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view dampened-route information related only to ipv4 unicast routes.
- **ipv6 unicast**
  - (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view dampened-route information related only to ipv6 unicast routes.

9.8(0.0P2) | Introduced on the S3048-ON.
**debug ip bgp events**

Display information on local BGP state changes and other BGP events.

**Syntax**

```plaintext
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]
```

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display BGP state changes corresponding to that VRF.
- `A.B.C.D` (OPTIONAL) Enter the IPv4 address of the neighbor.
- `X:X:X:X::X` (OPTIONAL) Enter an IPv6 address.
- `peer-group peer-group-name` (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- `in` (OPTIONAL) Enter the keyword `in` to view only events on inbound BGP messages.
- `out` (OPTIONAL) Enter the keyword `out` to view only events on outbound BGP messages.

- **7.7.1.0**: Introduced on the C-Series.

### Usage Information
To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp keepalives
Display information about BGP keepalive messages.

### Syntax
```
display ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] keepalives [in | out]
```

### Parameters
- **vrf vrf-name**: (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to display BGP keepalive information corresponding to that VRF.
- **A.B.C.D**: (OPTIONAL) Enter the IPv4 address of the neighbor.
- **X:X:X::X**: (OPTIONAL) Enter an IPv6 address.
- **peer-group peer-group-name**: (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- **in**: (OPTIONAL) Enter the keyword `in` to view only inbound keepalive messages.
- **out**: (OPTIONAL) Enter the keyword `out` to view only outbound keepalive messages.

### Command Modes
EXEC Privilege

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description
- **9.10(0.0)**: Introduced on the S3148.
### debug ip bgp notifications

Allows you to view information about BGP notifications received from neighbors.

**Syntax**
```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] notifications [in | out]
```

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] notifications [in | out]` command.

**Parameters**
- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view neighbor BGP notification information corresponding to that VRF.
- **A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor.
- **X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- **peer-group peer-group-name** (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- **in** (OPTIONAL) Enter the keyword `in` to view BGP notifications received from neighbors.
- **out** (OPTIONAL) Enter the keyword `out` to view BGP notifications sent to neighbors

**Command Modes**
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**
- 9.10(0.0)
- 9.8(2.0)

**Description**
- Introduced on the S3148.
- Introduced on the S3100 series.
### debug ip bgp soft-reconfiguration

Enable soft-reconfiguration debug.

**Syntax**
```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group-name] soft-reconfiguration
```

To disable, use the `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group-name] soft-reconfiguration` command.

**Parameters**
- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable soft-reconfiguration debugging on that VRF.
- **A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor in dotted decimal format.
- **X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- **peer-group-name** (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.

**Defaults**
Disabled

**Command Modes**
EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**Usage Information**

This command turns on BGP soft-reconfiguration inbound debugging. If no neighbor is specified, debug turns on for all neighbors.

**debug ip bgp updates**

Allows you to view information about BGP updates.

**Syntax**

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]
```

to disable debugging, use the **no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]** command.

**Parameters**

- **vrf vrf-name**
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to view BGP updates information corresponding to that VRF.

- **A.B.C.D**
  (OPTIONAL) Enter an IPv4 address of the neighbor.

- **X:X:X::X**
  (OPTIONAL) Enter an IPv6 address.

- **peer-group peer-group-name**
  (OPTIONAL) Enter the keyword peer-group followed by the name of the peer group.

- **in**
  (OPTIONAL) Enter the keyword in to view only BGP updates received from neighbors.

- **out**
  (OPTIONAL) Enter the keyword out to view only BGP updates sent to neighbors.

- **prefix-list prefix-list-name**
  (OPTIONAL) Enter the keyword prefix-list then the name of an established prefix list. If the prefix list is not configured, the default is permit (to allow all routes).

- **ip-address**
  (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
peer-group-name  (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.

Usage Information
To remove all configured debug commands for BGP, enter the no debug ip bgp command.

default-metric

Allows you to change the metric of redistributed routes to locally originated routes. Use this command with the redistribute command.

Syntax
default-metric number

Parameters
number

Enter a number as the metric to be assigned to routes from other protocols. The range is from 1 to 4294967295.

Defaults
0

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information: The `default-metric` command in BGP sets the value of the BGP MULTI_EXIT_DISC (MED) attribute for redistributed routes only.

Related Commands:
- `bgp always-compare-med` — enable comparison of all BGP MED attributes.
- `redistribute` — redistribute routes from other routing protocols into BGP.

**description**

Enter a description of the BGP routing protocol.

Syntax:
```
description {description}
```

To remove the description, use the `no description {description}` command.

Parameters:
- **description**: Enter a description to identify the BGP protocol (80 characters maximum).

Defaults:
- none

Command Modes:
- ROUTER BGP

Command History:
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
**maximum-paths**

Configure the maximum number of parallel routes (multipath support) BGP supports.

**Syntax**

```
maximum-paths {ebgp | ibgp} number
```

To return to the default values, enter the `no maximum-paths` command.

**Parameters**

- `ebgp`  
  Enter the keyword `ebgp` to enable multipath support for External BGP routes.
- `ibgp`  
  Enter the keyword `ibgp` to enable multipath support for Internal BGP routes.
- `number`  
  Enter a number as the maximum number of parallel paths. The range is from 2 to 64.

**Defaults**

none

**Command Modes**

- ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S3148.

9.8(1.0) | Introduced on the Z9100--ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000--ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
pre-7.7.1.0 | Introduced.
**neighbor activate**

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier).

**Syntax**

`neighbor [ip-address | peer-group-name] activate`

To disable, use the `no neighbor [ip-address | peer-group-name] activate` command.

**Parameters**

- `ip-address` (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name` (OPTIONAL) Enter the name of the peer group.
- `activate` Enter the keyword `activate` to enable the neighbor/peer group in the new AFI/SAFI.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

By default, when you create a neighbor/peer group configuration in the Router BGP context, this enables IPv4/Unicast AFI/SAFI. When you use activate in the new context, the neighbor/peer group enables for AFI/SAFI. It is not possible to de-activate a peer from the IPv4 unicast address family.

**neighbor add-path**

This command allows the specified neighbor/peer group to send/receive multiple path advertisements.

**Syntax**

`neighbor [ip-address | peer-group-name] add-path [send | receive | both] path-count`

**Parameters**

- **ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name** (OPTIONAL) Enter the name of the peer group.
- **send** Enter the keyword send to indicate that the system sends multiple paths to peers.
- **receive** Enter the keyword receive to indicate that the system accepts multiple paths from peers.
- **both** Enter the keyword both to indicate that the system sends and accepts multiple paths from peers.
- **path-count** Enter the number paths supported. The range is from 2 to 64.

**Defaults**

none

**Command Modes**

CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY

**Command History**

</table>
Related Commands

- **bgp add-path** — allow the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previous ones.

### neighbor advertisement-interval

Set the advertisement interval between BGP neighbors or within a BGP peer group.

**Syntax**

```
neighbor {ip-address | peer-group-name} advertisement-interval seconds
```

To return to the default value, use the `no neighbor {ip-address | peer-group-name} advertisement-interval` command.

**Parameters**

- **ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name** Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- **seconds** Enter a number as the time interval, in seconds, between BGP advertisements. The range is from 0 to 600 seconds. The default is **5 seconds** for internal BGP peers and **30 seconds** for external BGP peers.

**Defaults**

- seconds = **5 seconds** (internal peers)
- seconds = **30 seconds** (external peers)

**Command Modes**

- ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.

8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
neighbor advertisement-start

To send BGP routing updates, set the minimum interval before starting.

**Syntax**
```
neighbor {ip-address} advertisement-start seconds
```

To return to the default value, use the `no neighbor {ip-address} advertisement-start` command.

**Parameters**
- `ip-address` (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- `seconds` Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.

**Defaults**
none

**Command Modes**
ROUTER BGP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
**neighbor allowas-in**

Set the number of times an AS number can occur in the AS path.

**Syntax**

```
neighbor {ip-address | peer-group-name} allowas-in number
```

To return to the default value, use the `no neighbor {ip-address | peer-group-name} allowas-in` command.

**Parameters**

- **ip-address**
  - (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**
  - Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- **number**
  - Enter a number of times to allow this neighbor ID to use the AS path. The range is from 1 to 10.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

**Related Commands**

- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.
neighbor default-originate

Inject the default route to a BGP peer or neighbor.

**Syntax**

```
neighbor {ip-address | peer-group-name} default-originate [route-map map-name]
```

To remove a default route, use the `no neighbor {ip-address | peer-group-name} default-origininate` command.

**Parameters**

- **ip-address**
  - (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.

- **peer-group-name**
  - Enter the name of the peer group to set the default route of all routers in that peer group.

- **route-map map-name**
  - (OPTIONAL) Enter the keyword `route-map` then the name of a configured route map.

**Defaults**

Not configured.

**Command Modes**

`ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

If you apply a route map to a BGP peer or neighbor with the `neighbor default-originate` command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.

When you configure a route-map for a BGP peer or peer group with the `neighbor default-originate` command, the command checks for the existence of the route in BGP RIB.

Route-map configuration on a BGP peer or peer group works only when the LOC-RIB contains at least one route.
When you apply a default route to a BGP peer or peer group using the `neighbor default-originate` command, changes to the configured default route-map are applied to the BGP peer or peer group only after a delay of 15 seconds. As a result, you must wait for a period of 15 seconds before manually resetting BGP using the `clear ip bgp` command.

In case of eBGP, the `neighbor default-originate` command does not support `extended-community` as a non-transitive route-map attribute.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

In order that settings corresponding to the `neighbor default-originate` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor default-originate` command.

**neighbor description**

Assign a character string describing the neighbor or group of neighbors (peer group).

**Syntax**

```
neighbor {ip-address | peer-group-name} description text
```

To delete a description, use the `no neighbor {ip-address | peer-group-name} description` command.

**Parameters**

- `ip-address`: Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name`: Enter the name of the peer group.
- `text`: Enter a continuous text string up to 80 characters.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

</table>
**neighbor distribute-list**

Distribute BGP information via an established prefix list.

**Syntax**

```
neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}
```

To delete a neighbor distribution list, use the no neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out} command.

**Parameters**

- **ip-address**
  - Enter the IP address of the neighbor in dotted decimal format.

- **peer-group-name**
  - Enter the name of the peer group to apply the distribute list filter to all routers in the peer group.

- **prefix-list-name**
  - Enter the name of an established prefix list.
    - If the prefix list is not configured, the default is permit (to allow all routes).

- **in**
  - Enter the keyword in to distribute only inbound traffic.

- **out**
  - Enter the keyword out to distribute only outbound traffic.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000–ON.
9.2(1.0) | Introduced on the Z9500.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
Version | Description
--- | ---
7.7.1.0 | Introduced on the C-Series.

Usage Information
Other BGP filtering commands include: neighbor filter-list, ip as-path access-list, and neighbor route-map.

Related Commands
• neighbor route-map — assign a route map to a neighbor or peer group.

neighbor ebgp-multihop

Attempt and accept BGP connections to external peers on networks that are not directly connected.

Syntax
neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]

To disallow and disconnect connections, use the no neighbor {ip-address | peer-group-name} ebgp-multihop command.

Parameters
ip-address | peer-group-name | ttl
--- | --- | ---
Enter the IP address of the neighbor in dotted decimal format.
Enter the name of the peer group.
(Optional) Enter the number of hops as the Time to Live (ttl) value. The range is from 1 to 255. The default is 255.

Defaults
Disabled.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
Usage Information
To prevent loops, the neighbor ebgp-multihop command does not install the default routes of the multihop peer. Networks not directly connected are not considered valid for best-path selection.

**neighbor fall-over**

Enable or disable fast fall-over for BGP neighbors.

**Syntax**

```
neighbor {ipv4-address | peer-group-name} fall-over
```

To disable, use the `no neighbor {ipv4-address | peer-group-name} fall-over` command.

**Parameters**

- `ipv4-address`: Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name`: Enter the name of the peer group.

**Defaults**

Disabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.4.1.0</td>
<td>Introduced</td>
</tr>
</tbody>
</table>

**Usage Information**

When you enable failover, BGP keeps track of IP or IPv6 ability to reach the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for the peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

**Related Commands**

- `show ip bgp neighbors` — display information on the BGP neighbors.
neighbor local-as

To accept external routes from neighbors with a local AS number in the AS number path, configure Internal BGP (IBGP) routers.

**Syntax**
```
neighbor {ip-address | peer-group-name} local-as as-number [no-prepend]
```
To return to the default value, use the no neighbor {ip-address | peer-group-name} local-as command.

**Parameters**
- `ip-address` Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name` Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- `as-number` Enter the AS number to reset all neighbors belonging to that AS. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte) or from 0.1 to 65535.65535 (dotted format).
- `no prepend` Specifies that local AS values do not prepend to announcements from the neighbor.

**Defaults**
Not configured.

**Command Modes**
ROUTER BGP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

This command automatically restarts the neighbor session for the configuration to take effect.
Related Commands

- bgp four-octet-as-support — enable 4-byte support for the BGP process.

neighbor maximum-prefix

Control the number of network prefixes received.

Syntax

neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold] [warning-only]
To return to the default values, use the no neighbor {ip-address | peer-group-name} maximum-prefix maximum command.

Parameters

- **ip-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group.
- **maximum**: Enter a number as the maximum number of prefixes allowed for this BGP router. The range is from 1 to 4294967295.
- **threshold** (OPTIONAL): Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is from 1 to 100 percent. The default is 75.
- **warning-only** (OPTIONAL): Enter the keyword warning-only to set the router to send a log message when the maximum value is reached. If this parameter is not set, the router stops peering when the maximum number of prefixes is reached.

NOTE: When you set this option, the router accepts BGP prefixes only until the maximum configured value. After the maximum number is reached, the router drops any additional prefixes that it receives.

Defaults

threshold = 75

Command Modes

ROUTER BGP

</table>
## neighbor next-hop-self

Allows you to configure the router as the next hop for a BGP neighbor.

**Syntax**

```
neighbor {ip-address | peer-group-name} next-hop-self [all]
```

To return to the default setting, use the `no neighbor {ip-address | peer-group-name} next-hop-self [all]` command.

**Parameters**

- `ip-address`
  - Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name`
  - Enter the name of the peer group.
- `all`
  - Specifies that the route reflector is the next hop for both iBGP and eBGP-learned routes.

**Defaults**

Disabled.

**Command Modes**

ROUTER BGP

**Command History**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you configure the set next-hop command in ROUTE-MAP mode, the configuration takes precedence over the neighbor next-hop-self command.
If you do not use the `all` keyword, the next hop of only eBGP-learned routes is updated by the route reflector. If you use the `all` keyword, the next hop of both eBGP- and iBGP-learned routes are updated by the route reflector.

**neighbor password**

Enable message digest 5 (MD5) authentication on the TCP connection between two neighbors.

`Syntax`  
```
neighbor {ip-address | peer-group-name} password [encryption-type] password
```
To delete a password, use the `no neighbor {ip-address | peer-group-name} password` command.

`Parameters`

- `ip-address` Enter the IP address of the router to be included in the peer group.
- `peer-group-name` Enter the name of a configured peer group.
- `encryption-type` (OPTIONAL) Enter 7 as the encryption type for the password entered. 7 means that the password is encrypted and hidden.
- `password` Enter a text string up to 80 characters long. The first character of the password must be a letter.
  
  You cannot use spaces in the password.

`Defaults`  
Not configured.

</tr>
</tbody>
</table>

`Usage Information`  
This command automatically restarts the neighbor session for the configuration to take effect.
Configure the same password on both BGP peers or a connection does not occur. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection between them is verified and the MD5 digest is checked on every segment sent on the TCP connection.

Configuring a password for a neighbor causes an existing session to be torn down and a new one established.

If you specify a BGP peer group by using the peer-group-name parameter, all the members of the peer group inherit the characteristic configured with this command.

If you configure a password on one neighbor, but you have not configured a password for the neighboring router, the following message appears on the console while the routers attempt to establish a BGP session between them:

```
%RPM0-P:RP1 %KERN-6-INT: No BGP MD5 from [peer's IP address]:179 to [local router's IP address]:65524
```

Also, if you configure different passwords on the two routers, the following message appears on the console:

```
%RPM0-P:RP1 %KERN-6-INT: BGP MD5 password mismatch from [peer's IP address] : 11502 to [local router's IP address] :179
```

**neighbor peer-group (assigning peers)**

Allows you to assign one peer to an existing peer group.

**Syntax**

```
neighbor {ip-address | peer-group peer-group-name} dmzlink-bw
```

To delete a peer from a peer group, use the `no neighbor {ip-address | peer-group peer-group-name}` command.

To disable dmzlink-dw for the peer group, use the `no neighbor ip-address dmzlink-dw` command.

**Parameters**

- `ip-address` Enter the IP address of the router to be included in the peer group.
- `peer-group-name` Enter the name of a configured peer group.
- `dmzlink-bw` Enter the keyword `dmzlink-bw` to attach a link bandwidth to received routes.

**Defaults**

Not configured.

**Command Modes**

```
ROUTER BGP
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
**Version** | **Description**
---|---
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added the dmzlink-bw parameter.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

You can assign up to 256 peers to one peer group.

When you add a peer to a peer group, it inherits all the peer group’s configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:

- `neighbor advertisement-interval`
- `neighbor distribute-list`
- `neighbor route-map`
- `neighbor route-reflector-client`

If a neighbor’s configuration is more specific than its peer group’s configuration, the neighbor may retain its configuration after it is added to the peer group. The neighbor’s configuration does not affect outgoing updates.

A peer group must exist (be enabled) before you add a peer to it. If the peer group is disabled (shutdown), the peers within that group are also disabled (shutdown).

In BGP, you cannot associate a peer to a peer-group without configuring the remote-as for Internal BGP (IBGP) or External BGP (EBGP).

This command automatically restarts the neighbor session for the configuration to take effect.

**Related Commands**

- `clear ip bgp` — reset BGP sessions.
- `neighbor peer-group (creating group)` — create a peer group.
- `show ip bgp peer-group` — view BGP peers.
- `show ip bgp neighbors` — view BGP neighbors configurations.

### neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

**Syntax**

```
neighbor peer-group-name peer-group
```

To delete a peer group, use the `no neighbor peer-group-name peer-group` command.

**Parameters**

- `peer-group-name` Enter a text string up to 16 characters long as the name of the peer group.
Defaults
Not configured.

Command Modes
ROUTER BGP

Usage Information
When you create a peer group, it is disabled (Shut mode).

Related Commands
- neighbor peer-group (assigning peers) — assign routers to a peer group.
- neighbor remote-as — assign a indirectly connected AS to a neighbor or peer group.
- neighbor shutdown — disable a peer or peer group.

neighbor peer-group passive
Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

Syntax
neighbor peer-group-name peer-group passive [limit sessions]

Parameters
- peer-group-name: Enter a text string up to 16 characters long as the name of the peer group.
- limit: (Optional) Enter the keyword limit to constrain the numbers of sessions for this peer-group. The range is from 2 to 256. The default is 256.

Defaults
Not configured.

Command Modes
ROUTER BGP

<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

After you configure a peer group as passive, assign it a subnet using the neighbor soft-reconfiguration inbound command.

For passive eBGP limits, the Remote AS must be different from the AS for this neighbor.

Related Commands

- neighbor soft-reconfiguration inbound — assign a subnet to a dynamically configured BGP neighbor.
- neighbor remote-as — assign an indirectly connected AS to a neighbor or peer group.

neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

Syntax

```
neighbor {ip-address | peer-group-name} remote-as number
```

To delete a remote AS entry, use the no neighbor {ip-address | peer-group-name} remote-as number command.

Parameters

- **ip-address**
  - Enter the IP address of the neighbor to enter the remote AS in its routing table.

- **peer-group-name**
  - Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group.

- **number**
  - Enter a number of the AS. The range is from 0 to 65535 (2 byte) or from 1 to 4294967295 (4 byte).
IPv4 or IPv6 address of the neighbor.

Defaults
Not configured.

Command Modes
- ROUTER BGP
- CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series. Added 4-byte support.

Usage Information
- To accept 4-byte formats before entering a 4 byte AS Number, configure your system. If the number parameter is the same as the AS number used in the router bgp command, the remote AS entry in the neighbor is considered an internal BGP peer entry.
- This command creates a peer and the newly created peer is disabled (Shutdown).
- This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands
- **router bgp** — enter ROUTER BGP mode and configures routes in an AS.
- **bgp four-octet-as-support** — enable 4-byte support for the BGP process.

**neighbor remove-private-as**

Remove private AS numbers from the AS-PATH of outgoing updates.

Syntax
```
neighbor {ip-address | peer-group-name} remove-private-as
```

To return to the default, use the `no neighbor {ip-address | peer-group-name} remove-private-as` command.

Parameters
- **ip-address** Enter the IP address of the neighbor to remove the private AS numbers.
- **peer-group-name** Enter the name of the peer group to remove the private AS numbers.

Defaults
Disabled (that is, private AS number are not removed).
Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Applies to EBGP neighbors only.

Configure your system to accept 4-byte formats before entering a 4 byte AS Number.

If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGP neighbor, the private AS numbers are not removed.

If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path.

Private AS numbers are from 64512 to 65535 (2 byte).

neighbor route-map

Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

Syntax

```
neighbor {ip-address | peer-group-name} route-map map-name {in | out}
```

To remove the route map, use the no neighbor {ip-address | peer-group-name} route-map map-name {in | out} command.

Parameters

- **ip-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group.
- **map-name**: Enter the name of an established route map.
If the Route map is not configured, the default is **deny** (to drop all routes).

in Enter the keyword **in** to filter inbound routes.

out Enter the keyword **out** to filter outbound routes.

**NOTE:** This command sends routes to peers only if an outbound policy is configured and if there is a change in the existing outbound policy.

**Defaults**
Not configured.

**Command Modes**
ROUTER BGP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
When you apply a route map to outbound routes, only routes that match at least one section of the route map are permitted.

If you identify a peer group by name, the peers in that peer group inherit the characteristics in the Route map used in this command. If you identify a peer by IP address, the Route map overwrites either the inbound or outbound policies on that peer.

**neighbor route-reflector-client**

Configure the router as a route reflector and the specified neighbors as members of the cluster.

**Syntax**

```
neighbor {ip-address | peer-group-name} route-reflector-client
```

**neighbor**
Configure neighborset at that router.

**route-reflector-client**
Configure the router to act as a route reflector

**ip-address**
Define IP address of the neighbor.

**peer-group-name**
Define peer-group.

**Example**

```
Dell(config-router)#neighbor 10.10.10.10 route-reflector-client
Dell (config-router)#
```
To remove one or more neighbors from a cluster, use the `no neighbor {ip-address | peer-group-name} route-reflector-client` command. If you delete all members of a cluster, you also delete the route-reflector configuration on the router.

**Parameters**

- **ip-address**
  
  Enter the IP address of the neighbor in dotted decimal format.

- **peer-group-name**
  
  Enter the name of the peer group.

  All routers in the peer group receive routes from a route reflector.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>7.8(1.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

A route reflector reflects routes to the neighbors assigned to the cluster. Neighbors in the cluster do not need not to be fully meshed. By default, when you use `no route reflector`, the internal BGP (IBGP) speakers in the network must be fully meshed.

The first time you enter this command, the router configures as a route reflector and the specified BGP neighbors configure as clients in the route-reflector cluster.

When you remove all clients of a route reflector using the `no neighbor route-reflector-client` command, the router no longer functions as a route reflector.

If the clients of a route reflector are fully meshed, you can configure the route reflector to not reflect routes to specified clients by using the `no bgp client-to-client reflection` command.

This command automatically restarts the neighbor session for the configuration to take effect.
Related Commands

- bgp client-to-client reflection — enable route reflection between the route reflector and the clients.

neighbor sender-side-loopdetect

Enables sender-side loop detection for BGP.

Syntax

neighbor {ip-address | peer-group-name} sender-side-loopdetect

To disable sender-side loop detection, use the no neighbor {ip-address | peer-group-name} sender-side-loopdetect command.

Parameters

- ip-address: Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name: Enter the name of the peer group to enable or disable all routers with in the peer group. All routers in the peer group receive routes from a route reflector.

Defaults

Enabled.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command enables sender-side-loopdetect for a specified BGP neighbor. BGP does not advertise a route to a peer if the AS-Path of the route already contains the peer's AS.

NOTE: If you configure a neighbor to accept such routes using the neighbor allowas-in command, you must disable sender-side loop detection for that neighbor.

Related Commands

- bgp client-to-client reflection — enable route reflection between the route reflector and the clients.
neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

Syntax

neighbor {ip-address | peer-group-name} send-community [extended | standard]

To disable sending a COMMUNITY attribute, use the no neighbor {ip-address | peer-group-name} send-community command.

Parameters

- **ip-address**: Enter the IP address of the peer router in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group.
- **extended** (OPTIONAL): Enter the keyword extended to send extended community attribute.
- **standard** (OPTIONAL): Enter the keyword standard to send standard community attribute.

Defaults

Not configured and COMMUNITY attributes are not sent to neighbors.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>7.8(1.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

To configure a COMMUNITY attribute, use the set community command in ROUTE-MAP mode. In order that settings corresponding to the neighbor send-community command take effect, you must execute the clear ip bgp command immediately after you execute the neighbor send-community command.
If you do not set any of the optional parameters (standard or extended), then both standard as well as extended attributes are sent. If you set either the standard or extended parameter, only the attribute that is specified is sent.

**neighbor shutdown**

Disable a BGP neighbor or peer group.

**Syntax**

```plaintext
neighbor {ip-address | peer-group-name} shutdown
```

To enable a disabled neighbor or peer group, use the `neighbor {ip-address | peer-group-name} no shutdown` command.

**Parameters**

- **ip-address**
  - Enter the IP address of the neighbor in dotted decimal format.

- **peer-group-name**
  - Enter the name of the peer group to disable or enable all routers within the peer group.

**Defaults**

Enabled (that is, BGP neighbors and peer groups are disabled.)

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Peers that are enabled within a peer group are disabled when their peer group is disabled.

The `neighbor shutdown` command terminates all BGP sessions on the BGP neighbor or BGP peer group. Use this command with caution as it terminates the specified BGP sessions. When a neighbor or peer group is shut down, use the `show ip bgp summary` command to confirm its status.

**Related Commands**

- `show ip bgp summary` — display the current BGP configuration.
neighbor soft-reconfiguration inbound

Enable soft-reconfiguration for BGP.

Syntax
neighbor {ip-address | peer-group-name} soft-reconfiguration inbound

To disable, use the no neighbor {ip-address | peer-group-name} soft-reconfiguration inbound command.

Parameters
- **ip-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to disable or enable all routers within the peer group.

Defaults
Disabled

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.4.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

Usage Information
This command enables soft-reconfiguration for the BGP neighbor specified. BGP stores all the updates the neighbor receives but does not reset the peer-session.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

⚠️ **CAUTION**: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.
NOTE: This command is supported in BGP Router Configuration mode for IPv4 Unicast address only.

Related Commands

- show ip bgp neighbors — display routes received by a neighbor.

neighbor timers

Set keepalive and hold time timers for a BGP neighbor or a peer group.

Syntax

neighbor {ip-address | peer-group-name} timers keepalive holdtime

Parameters

- ip-address: Enter the IP address of the peer router in dotted decimal format.
- peer-group-name: Enter the name of the peer group to set the timers for all routers within the peer group.
- keepalive: Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is 60 seconds.
- holdtime: Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is 180 seconds.

Defaults

- keepalive = 60 seconds
- holdtime = 180 seconds

Command Modes

- ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
**Usage Information**

Timer values configured with the `neighbor timers` command override the timer values configured with any other command.

When two neighbors, configured with different `keepalive` and `holdtime` values, negotiate for new values, the resulting values are as follows:

- the lower of the `holdtime` value is the new `holdtime` value, and
- whichever is the lower value: one-third of the new `holdtime` value, or the configured `keepalive` value, is the new `keepalive` value.

## neighbor update-source

Enable the E-Series software to use Loopback interfaces for TCP connections for BGP sessions.

**Syntax**

```plaintext
neighbor {ip-address | peer-group-name} update-source interface
```

To use the closest interface, use the `no neighbor {ip-address | peer-group-name} update-source interface` command.

**Parameters**

- `ip-address` Enter the IP address of the peer router in dotted decimal format.
- `peer-group-name` Enter the name of the peer group to disable all routers within the peer group.
- `interface` Enter the keyword `loopback` then a number of the Loopback interface. The range is from 0 to 16383.

**Defaults**

Not configured.

**Command Modes**

`ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>
Usage Information
Loopback interfaces are up constantly and the BGP session may need one interface constantly up to stabilize the session. The neighbor update-source command is not necessary for directly connected internal BGP sessions.
Neighbors are sorted according to the source and destination ip addresses. If an update-source ip address exists, then the source ip address determines the order in which the neighbors are displayed.

neighbor weight
Assign a weight to the neighbor connection, which is used to determine the best path.

Syntax
neighbor \{ip-address | peer-group-name\} weight weight
To remove a weight value, use the no neighbor \{ip-address | peer-group-name\} weight command.

Parameters
- **ip-address**: Enter the IP address of the peer router in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to disable all routers within the peer group.
- **weight**: Enter a number as the weight. The range is from 0 to 65535. The default is 0.

Defaults
0

Command Modes
- ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
Version Description
7.7.1.0 Introduced on the C-Series.

Usage Information
In the Dell Networking OS best path selection process, the path with the highest weight value is preferred.

**NOTE:** In the Dell Networking OS best-path selection process, the path with the highest weight value is preferred.

If you configure the `set weight` command in a route map applied to this neighbor, the weight set in that command overrides the weight set in the `neighbor weight` command.

Related Commands
- `set weight` — assign a weight to all paths meeting the route map criteria.

**network**

Specify the networks for the BGP process and enter them in the BGP routing table.

**Syntax**
```
network ip-address mask [route-map map-name]
```
To remove a network, use the `no network ip-address mask [route-map map-name]` command.

**Parameters**
- `ip-address` Enter an IP address in dotted decimal format of the network.
- `mask` Enter the mask of the IP address in the slash prefix length format (for example, /24).
  
  The mask appears in command outputs in dotted decimal format (A.B.C.D).
- `route-map map-name` (OPTIONAL) Enter the keyword `route-map` then the name of an established route map.
  
  Only the following ROUTE-MAP mode commands are supported:
  - `match ip address`
  - `set community`
  - `set local-preference`
  - `set metric`
  - `set next-hop`
  - `set origin`
  - `set weight`
  
  If the route map is not configured, the default is `deny` (to drop all routes).

**Defaults**
- Not configured.

**Command Modes**
- `ROUTER BGP`
**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Dell Networking OS software resolves the network address the `network` command configures with the routes in the main routing table to ensure that the networks are reachable using non-BGP routes and non-default routes. As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

In BGP, the next-hop for the route is calculated from the information that is acquired through IGP or static routes.

**Related Commands**

- `redistribute` — redistribute routes into BGP.

**network backdoor**

Specify this IGP route as the preferred route.

**Syntax**

```
network ip-address mask backdoor
```

To remove a network, use the `no network ip-address mask backdoor` command.

**Parameters**

- `ip-address`: Enter an IP address in dotted decimal format of the network.
mask

Enter the mask of the IP address in the slash prefix length format (for example, /24).
The mask appears in command outputs in dotted decimal format (A.B.C.D).

**Defaults**
Not configured.

**Command Modes**
ROUTER BGP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
Although Dell Networking OS does not generate a route due to the backdoor config, there is an option for injecting/sourcing a local route in the presence of network backdoor config on a learned route.

### permit bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to permit incoming or outgoing traffic.

**Syntax**

```
permit bandwidth
```

To disable this setting, enter the `no permit bandwidth` command.

**Parameters**

- `bandwidth` Enter the keyword bandwidth to specify extended-community attribute as the matching criteria for permitting traffic. The range is from 0 to 102400.

**Defaults**
N/A

**Command Modes**
EXTENDED COMMUNITY LIST

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Version Description
- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S-Series.

### Related Commands
- `deny bandwidth` – link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

### redistribute

Redistribute routes into BGP.

#### Syntax
```
redistribute {connected | static} [route-map map-name]
```
To disable redistribution, use the `no redistribution {connected | static}` command.

#### Parameters
- **connected**: Enter the keyword `connected` to redistribute routes from physically connected interfaces.
- **static**: Enter the keyword `static` to redistribute manually configured routes. These routes are treated as incomplete routes.
- **route-map map-name**: (OPTIONAL) Enter the keyword `route-map` then the name of an established route map. Only the following ROUTE-MAP mode commands are supported:
  - `match ip address`
  - `set community`
  - `set local-preference`
  - `set metric`
  - `set next-hop`
  - `set origin`
  - `set weight`
  If the route map is not configured, the default is `deny` (to drop all routes).

#### Defaults
- Not configured.

#### Command Modes
- ROUTER BGP
### Command History

<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

### Usage Information

You can use the redistribute command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and applied outbound to an EBGP peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

If you do not configure the default-metric command, in addition to the redistribute command, or there is no route map to set the metric, the metric for redistributed static and connected is "0".

To redistribute the default route (0.0.0.0/0), configure the **neighbor default-originate** command.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

### Related Commands

- **neighbor default-originate** — inject the default route.
**redistribute ospf**

Redistribute OSPF routes into BGP.

**Syntax**

```
redistribute ospf process-id [[match external {1 | 2}] [match internal]]
[route-map map-name]
```

To stop redistribution of OSPF routes, use the no redistribute ospf process-id command.

**Parameters**

- **process-id**
  - Enter the number of the OSPF process. The range is from 1 to 65535.

- **match external {1 | 2}**
  - (OPTIONAL) Enter the keywords match external to redistribute OSPF external routes. You can specify 1 or 2 to redistribute those routes only.

- **match internal**
  - (OPTIONAL) Enter the keywords match internal to redistribute OSPF internal routes only.

- **route-map map-name**
  - (OPTIONAL) Enter the keywords route-map then the name of a configured route map.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)
  - Introduced on the S3148.

- 9.8(2.0)
  - Introduced on the S3100 series.

- 9.8(1.0)
  - Introduced on the Z9100–ON.

- 9.8(0.0P5)
  - Introduced on the S4048-ON.

- 9.8(0.0P2)
  - Introduced on the S3048-ON.

- 9.7(0.0)
  - Introduced on the S6000–ON.

- 9.2(1.0)
  -Introduced on the Z9500.

- 9.0.2.0
  - Introduced on the S6000.

- 8.3.19.0
  - Introduced on the S4820T.

- 8.3.11.1
  - Introduced on the Z9000.

- 8.3.7.0
  - Introduced on the S4810.

- 8.3.1.0
  - Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as **internal**.

- 7.8.1.0
  - Introduced on the S-Series.

- 7.7.1.0
  - Introduced on the C-Series.
You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and apply outbound to an EBGP peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as MED.

When you enter the `redistribute isis process-id` command without any other parameters, Dell Networking OS redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes. RFC does not support this feature.

**router bgp**

To configure and enable BGP, enter ROUTER BGP mode.

```
Syntax
  router bgp as-number

Parameters
  as-number
    Enter the AS number. The range is from 1 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

Defaults
  Not enabled.

</tbody>
</table>
Usage Information: At least one interface must be in Layer 3 mode for the `router bgp` command to be accepted. If all interfaces are configured under VRF, at least one interface should be in the default VRF for the `router bgp` command to be accepted. If no interfaces are enabled for Layer 3, an error message appears:

```
% Error: No router id configured
```

BGP does not allow 23456 (AS-TRANS) as a configured AS number.

Example:

```
Dell(conf)# router bgp 3
Dell(conf-router_bgp)#
```

**shutdown all**

Disables all the BGP neighbors.

Syntax:
```
shutdown all
```

Use the `no shutdown all` command to enable all the configured BGP neighbors.

Command Modes:
- ROUTER BGP

Command History:
- **Version 9.11.0.0**
  - Introduced on the S-Series, Z-Series, MXL, and IOM.

Usage Information:
You can use this command to disable all the configured BGP neighbors.

This command is global for all VRFs.

**shutdown address-family-ipv4-multicast**

Disables all the BGP neighbors corresponding to the multicast IPv4 address families.

Syntax:
```
shutdown address-family-ipv4-unicast
```

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the multicast IPv4 address families.

Command Modes:
- ROUTER BGP
- CONFIGURATION

Command History:
- **Version 9.11.0.0**
  - Introduced on the S-Series, Z-Series, MXL, and IOM.

Usage Information:
You can use this command to disable all the configured BGP neighbors corresponding to the multicast IPv4 address families.

This command is global for all VRFs.
**shutdown address-family-ipv4-unicast**

Disables all the BGP neighbors corresponding to the unicast IPv4 address families.

**Syntax**
```
shutdown address-family-ipv4-unicast
```

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the unicast IPv4 address families.

</tbody>
</table>

Usage Information

A new policy command is introduced in order to attach the Link Bandwidth extended community only to the prefixes that are received from a neighbor that satisfy the desired conditions. This command is relevant for both inbound as well as outbound policy handling (for received prefixes). Also, there is no change to the set of supported conditions or filters.

During configuration, the bandwidth is specified in Mbps, not in bytes/second. While creating the actual LB extended community, the system will attach the AS number and encode the bandwidth in floating point format.

show capture bgp-pdu neighbor

Display BGP packet capture information for an IPv4 address on the system.

Syntax

show capture bgp-pdu neighbor ipv4-address

Parameters

- **ipv4-address**
  - Enter the IPv4 address (in dotted decimal format) of the BGP address to display packet information for that address.

Command Modes

EXEC Privilege

<tr>
<td>8.3.8.0</td>
<td>Added the add-path option to the S4810. Output on the S4810 shows the ADDPATH parameters.</td>
</tr>
<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you enable the bgp non-deterministic-med command, the show ip bgp command output for a BGP route does not list the INACTIVE reason.

In BGP, this command displays the exact reason why the route is discarded.

The following describes the show ip bgp command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the BGP route’s metric, if assigned.</td>
</tr>
<tr>
<td>LocPrf</td>
<td>Displays the BGP LOCAL_PREF attribute for the route.</td>
</tr>
<tr>
<td>Weight</td>
<td>Displays the route’s weight.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>
The `show ip bgp` command displays the `dmzlink-dw` details only if `dmzlink-bw` is enabled using the `bgp dmzlink-dw` command.

**Example**

```
Dell# show ip bgp
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
        n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop            Metric     LocPrf Weight Path
*>  55.0.0.0/24    172.16.0.2                                 0 200 i
*>  66.0.0.0/24    172.16.0.2                                 0 200 i
```

All the `show` and `debugs` commands display the link band width extended-community prefixed with DMZ-Link-bw along with other extended communities.

```
Dell# show ip bgp 3.3.3.0/24
BGP routing table entry for 3.3.3.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
   1.1.1.2 (3.3.3.1)   Best
   AS_PATH : 1.1.1.2, Cost : 0
   Origin IGP, Metric  0, LocalPref 100, Weight  0, internal
   Extended Communities :
       DMZ-Link Bw: 2000 kbytes*
```

**Related Commands**
- `show ip bgp community` — view the BGP communities.
- `neighbor maximum-prefix` — control the number of network prefixes received.

# show ip bgp cluster-list

View BGP neighbors in a specific cluster.

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] cluster-list [cluster-id]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view cluster information of BGP neighbors corresponding to that VRF.
- `ipv4 multicast` (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- `ipv4 unicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- `ipv6 unicast` (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related to only to the ipv6 unicast routes.
**cluster-id**

(Optional) Enter the cluster id in dotted decimal format. The range is 1 — 4294967295.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0) | Added support for VRF.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

The following describes the `show ip bgp cluster-list` command shown in the following example.

**Field**

- **Network**: Displays the destination network prefix of each BGP route.
- **Next Hop**: Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
- **Metric**: Displays the BGP route's metric, if assigned.
- **LocPrf**: Displays the BGP LOCAL_PREF attribute for the route.
- **Weight**: Displays the route's weight.
- **Path**: Lists all the ASs the route passed through to reach the destination network.

**Example**

```
Dell# show ip bgp cluster-list
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.6
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

<table>
<thead>
<tr>

<td>500</td>
</tr>
</tbody>
</table>
```
show ip bgp community

View information on all routes with Community attributes or view specific BGP community groups.

Syntax

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] community [community-number] [local-as] [no-export] [no-advertise]

Parameters

vrf vrf-name
  (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view information either on all routes with community attributes or specific BGP community routes corresponding to that VRF.

ipv4 unicast
  (OPTIONAL) Enter the keywords ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.

ipv4 multicast
  (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.

ipv6 unicast
  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

community-number
  Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.

You can specify up to eight community numbers to view information on those community groups.

local-AS
  Enter the keywords local-AS to view all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.

All routes with the NO_EXPORT_SUBCONFED (0xFFFFFF03) community attribute must not be advertised to external BGP peers.

no-advertise
  Enter the keywords no-advertise to view all routes containing the well-known community attribute of NO_ADVERTISE.

All routes with the NO_ADVERTISE (0xFFFFFF02) community attribute must not be advertised to other BGP peers.
no-export

Enter the keywords **no-export** to view all routes containing the well-known community attribute of NO_EXPORT.

All routes with the NO_EXPORT (0xFFFFFFFF1) community attribute must not be advertised outside a BGP confederation boundary.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.</td>
</tr>
<tr>

```

**show ip bgp community-list**

View routes that a specific community list affects.

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] community-list community-list-name [exact-match]
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view routes affected by a specific community list corresponding to that VRF.
- **ipv4 unicast** (OPTIONAL) Enter the keywords ipv4 unicast to view information only related to ipv4 unicast routes.
- **ipv4 multicast** (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- **ipv6 unicast** (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.
- **community-list-name** Enter the name of a configured IP community list (maximum 140 characters).
- **exact-match** Enter the keyword for an exact match of the communities.

**Command Modes**

- EXEC
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>

The show ip bgp community-list command without any parameters lists BGP routes matching the Community List and the output is the same as for the show ip bgp command output.

The following describes the show ip bgp community-list pass command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the BGP route’s metric, if assigned.</td>
</tr>
<tr>
<td>LocPrf</td>
<td>Displays the BGP LOCAL_PREF attribute for the route.</td>
</tr>
<tr>
<td>Weight</td>
<td>Displays the route’s weight.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

Example

```
Dell# conf t
Dell(config)# ip community-list cl1
Dell(config-community-list)# permit 1000:1
Dell(config-community-list)# end
Dell# show ip bgp community-list cl1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

*>  55.0.0.0/24        172.16.0.2                                 0 200 i
Dell# show ip bgp 55.0.0.0/24
BGP routing table entry for 55.0.0.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
172.16.0.2 (172.16.0.2)   Best
AS_PATH : 200
Next-Hop : 172.16.0.2, Cost : 0
Origin IGP, Metric  4294967295 (Default), LocalPref 100, Weight 0, external
Communities :
200:1        1000:1       3000:1
Dell# show ip bgp dampened-paths
View BGP routes that are dampened (non-active).

Syntax
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths

Parameters
vrf vrf-name  (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
ipv4 multicast  (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
ipv4 unicast  (OPTIONAL) Enter the keywords ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.
ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

Command Modes
•  EXEC
•  EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version    Description
9.10(0.0)   Introduced on the S3148.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)    Added support for VRF.
Usage Information

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the network ID to which the route is dampened.</td>
</tr>
<tr>
<td>From</td>
<td>Displays the IP address of the neighbor advertising the dampened route.</td>
</tr>
<tr>
<td>Reuse</td>
<td>Displays the hour:minutes:seconds until the dampened route is available.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the dampened route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

Example

```
Dell# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
          n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network            From            Reuse     Path
     d   55.0.0.0/24      172.16.0.2             00:36:23      200

Dell#
```

show ip bgp detail

Display BGP internal information for the IPv4 Unicast address family.

**Syntax**

```
show ip bgp [ipv4 unicast] detail
```

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

Border Gateway Protocol | 445

Peer Grp List
Nbr List
Conf Peer List
Address Family specific Information
show ip bgp extcommunity-list

View information on all routes with Extended Community attributes.

Syntax
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] extcommunity-list [list name]

Parameters
- vrf vrf-name: (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view information on all routes with extended community attributes corresponding to that VRF.
- ipv4 multicast: (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- ipv4 unicast: (OPTIONAL) Enter the keywords ipv4 unicast to view information only related to ipv4 unicast routes.
- ipv6 unicast: (OPTIONAL) Enter the keyword ipv6 unicast to view information related only to ipv6 unicast routes.
- list name: Enter the extended community list name you wish to view. The range is 140 characters.

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Added the ipv4 multicast and ipv6 unicast parameters.
### Version and Description

- **9.4.(0.0)** - Added support for VRF.
- **9.2(1.0)** - Introduced on the Z9500.
- **9.0.2.0** - Introduced on the S6000.
- **8.3.19.0** - Introduced on the S4820T.
- **8.3.11.1** - Introduced on the Z9000.
- **8.3.7.0** - Introduced on the S4810.
- **7.8.1.0** - Introduced on the S-Series.
- **7.7.1.0** - Introduced on the C-Series.

### Usage Information

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

### Example

```
Dell# show run extcommunity-list
  !
  ip extcommunity-list ecl1
  permit rt 100:4
  Dell#show ip bgp extcommunity-list ecl1
  BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
  BGP local router ID is 192.168.11.5
  Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
  n - network, D - denied, S - stale
  Origin codes: i - IGP, e - EGP, ? - incomplete
  Network            Next Hop            Metric     LocPrf Weight Path
  *>  55.0.0.0/24        172.16.0.2                                 0 200 i
  *>  77.0.0.0/24        172.16.0.2                                 0 200 i
  Dell#show ip bgp extcommunity-list ec
  % Error: Extended community list does not exist.
  Dell#
```

### show ip bgp filter-list

View the routes that match the filter lists.

#### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] filter-list as-path-name
```

#### Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view route information that matches the filter lists corresponding to that VRF.
- **ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- **ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

as-path-name  Enter an AS-PATH access list name. The range is 140 characters.

Command Modes
- EXEC
- EXEC Privilege

Command History

<td>i</td>
</tr>
</tbody>
</table>

Dell#

**show ip bgp flap-statistics**

View flap statistics on BGP routes.

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] flap-statistics [ip-address [mask]] [filter-list as-path-name] [regexp regular-expression]
```

**Parameters**

- **vrf vrf-name**  (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view flap statistics on BGP routes corresponding to that VRF.
- **ipv4 multicast**  (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- **ipv4 unicast**  (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.
- **ipv6 unicast**  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.
- **ip-address**  (OPTIONAL) Enter the IP address (in dotted decimal format) of the BGP network to view information only on that network.
- **mask**  (OPTIONAL) Enter the network mask (in slash prefix (/x) format) of the BGP network address.
- **filter-list as-path-name**  (OPTIONAL) Enter the keyword filter-list then the name of a configured AS-PATH ACL. The range is 140 characters.
- **regexp regular-expression**  Enter a regular expression then use one or a combination of the following characters to match. The range is 256 characters.
  - . = (period) any single character (including a white space).
  - * = (asterisk) the sequences in a pattern (zero or more sequences).
  - + = (plus) the sequences in a pattern (one or more sequences).
  - ? = (question mark) sequences in a pattern (either zero or one sequences).
NOTE: Enter an escape sequence (CTRL+v) prior to entering the regular expression.

- \[ ] = (brackets) a range of single-character patterns.
- \( ) = (parenthesis) groups a series of pattern elements to a single element.
- \{ \} = (braces) minimum and the maximum match count.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- $ = (dollar sign) the end of the output string.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

<tr>
<td>Reuse</td>
<td>Displays the hours:minutes:seconds until the flapped route is available.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the flapping route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>
## show ip bgp inconsistent-as

View routes with inconsistent originating autonomous system (AS) numbers; that is, prefixes that are announced from the same neighbor AS but with a different AS-Path.

### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 unicast] inconsistent-as
```

### Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf and then the name of the VRF to view routes corresponding to the VRF that contain inconsistent originating AS numbers.
- **ipv4 unicast** (OPTIONAL) Enter the keywords ipv4 unicast to view information only related to ipv4 unicast routes.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dell#```
show ip bgp neighbors

Allows you to view the information BGP neighbors exchange.

Syntax

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] neighbors [ip-address [advertised-routes | dampened-routes | detail | flap-statistics | routes | [received-routes [network [network-mask]]] | [denied-routes [network [network-mask]]]]

Parameters

vrf vrf-name (OPTIONAL) Enter the keyword vrf and then the name of the VRF to view information exchanged by BGP neighbors corresponding to that VRF.

NOTE: You can use this attribute to view information exchanged by BGP neighbors that correspond to either a default or a non-default VRF.

ipv4 multicast (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.

ipv4 unicast (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.

ipv6 unicast (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

ip-address (OPTIONAL) Enter the IP address of the neighbor to view only BGP information exchanged with that neighbor.

advertised-routes (OPTIONAL) Enter the keywords advertised-routes to view only the routes the neighbor sent.

dampened-routes (OPTIONAL) Enter the keywords dampened-routes to view information on dampened routes from the BGP neighbor.

detail (OPTIONAL) Enter the keyword detail to view neighbor-specific internal information for the IPv4 Unicast address family.

flap-statistics (OPTIONAL) Enter the keywords flap-statistics to view flap statistics on the neighbor’s routes.

routes (OPTIONAL) Enter the keyword routes to view only the neighbor’s feasible routes.

received-routes [network [network-mask]] (OPTIONAL) Enter the keywords received-routes then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information received from neighbors.

NOTE: Configure the neighbor soft-reconfiguration inbound command prior to viewing all the information received from the neighbors.

denied-routes [network [network-mask]] (OPTIONAL) Enter the keywords denied-routes then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information on routes denied via neighbor inbound filters.

Command Modes

• EXEC
EXEC Privilege

</tbody>
</table>

Usage Information

After a peer reset, the contents of the notification log messages is displayed in hex values for debugging.

The neighbor information that this command displays does not include counts corresponding to ignored prefixes and updates. However, the martian case is an exception where neighbor information corresponding to ignored updates is displayed.

BGP shows the exact information that is exchanged between the BGP peers. It also indicates whether or not this information is received by the BGP peer.

The following describes the show ip bgp neighbors command shown in the following examples.

The Lines Beginning with:         Description

BGP neighbor                   Displays the BGP neighbor address and its AS number. The last phrase in the line indicates whether the link between the BGP router and its neighbor is an external or internal one. If they are located in the same AS, the link is internal; otherwise the link is external.

BGP version                    Displays the BGP version (always version 4) and the remote router ID.

BGP state                      Displays the neighbor’s BGP state and the amount of time in hours:minutes:seconds it has been in that state.

Last read                      This line displays the following information:
The Lines
Beginning with:

• last read is the time (hours:minutes:seconds) the router read a message from its neighbor
• hold time is the number of seconds configured between messages from its neighbor
• keepalive interval is the number of seconds between keepalive messages to help ensure that the TCP session is still alive.

Received messages
This line displays the number of BGP messages received, the number of notifications (error messages), and the number of messages waiting in a queue for processing.

Sent messages
The line displays the number of BGP messages sent, the number of notifications (error messages), and the number of messages waiting in a queue for processing.

Received updates
This line displays the number of BGP updates received and sent.

Soft reconfiguration
This line indicates that soft reconfiguration inbound is configured.

Minimum time
Displays the minimum time, in seconds, between advertisements.

(list of inbound and outbound policies)
Displays the policy commands configured and the names of the Route map, AS-PATH ACL, or Prefix list configured for the policy.

For address family:
Displays the IPv4 Unicast as the address family.

BGP table version
Displays which version of the primary BGP routing table the router and the neighbor are using.

accepted prefixes
Displays the number of network prefixes the router accepts and the amount of memory used to process those prefixes.

Prefix advertised
Displays the number of network prefixes advertised, the number rejected, and the number withdrawn from the BGP routing table.

Connections established
Displays the number of TCP connections established and dropped between the two peers to exchange BGP information.

Last reset
Displays the amount of time since the peering session was last reset. Also states if the peer resets the peering session. If the peering session was never reset, the word never is displayed.

Local host:
Displays the peering address of the local router and the TCP port number.

Foreign host:
Displays the peering address of the neighbor and the TCP port number.

Example
Dell# show ip bgp neighbors 172.16.0.2
BGP neighbor is 172.16.0.2, remote AS 200, external link
Member of peer-group port0 for session parameters
BGP remote router ID 172.16.0.2
BGP state ESTABLISHED, in this state for 00:13:55
Last read 00:00:03, Last write 00:00:55
Hold time is 180, keepalive interval is 60 seconds
Received 50 messages, 0 in queue
  1 opens, 0 notifications, 34 updates
15 keepalives, 0 route refresh requests
Sent 18 messages, 0 in queue
  1 opens, 0 notifications, 0 updates
16 keepalives, 0 route refresh requests
Route refresh request: received 0, sent messages 1
Minimum time between advertisement runs is 30 seconds
Minimum time before advertisements start is 0 seconds
Capabilities received from neighbor for IPv4 Unicast:
MULTIPROTO_EXT(1)
ROUTE_REFRESH(2)

Capabilities advertised to neighbor for IPv4 Unicast :
MULTIPROTO_EXT(1)
ROUTE_REFRESH(2)
ADD_PATH(69)
CISCO_ROUTE_REFRESH(128)

For address family: IPv4 Unicast
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
InQ : Added 0, Replaced 0, Withdrawn 0
OutQ : Added 0, Withdrawn 0
Allow local AS number 0 times in AS-PATH attribute
Prefixes accepted 2, withdrawn 15 by peer, martian prefixes ignored 0
Prefixes advertised 0, denied 0, withdrawn 0 from peer

Connections established 1; dropped 0
Last reset never
Local host: 172.16.0.1, Local port: 58145
Foreign host: 172.16.0.2, Foreign port: 179

Dell#

Related Commands
• show ip bgp — view the current BGP routing table.

show ip bgp next-hop

View all next hops (using learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.

Syntax
show ip bgp [vrf vrf-name] next-hop

Command Modes
• EXEC
• EXEC Privilege

Command History

<tr>
<td>Via</td>
<td>Displays the IP address and interface used to reach the next hop.</td>
</tr>
<tr>
<td>RfCount</td>
<td>Displays the number of BGP routes using this next hop.</td>
</tr>
<tr>
<td>Cost</td>
<td>Displays the cost associated with using this next hop.</td>
</tr>
<tr>
<td>Flaps</td>
<td>Displays the number of times the next hop has flapped.</td>
</tr>
</tbody>
</table>

Example

```
Dell# show ip bgp next-hop
   Next-hop          Resolved
   172.16.0.2         YES
Dell#
```

**show ip bgp paths**

View all the BGP path attributes in the BGP database.

**Syntax**

```
show ip bgp [vrf vrf-name] paths [regexp regular-expression]
```

**Parameters**

- **vrf vrf-name**
  
  (OPTIONAL) Enter the keyword **vrf** to view all path attributes in the BGP database corresponding to that VRF.

  **NOTE:** You can use this attribute to view information on all path attributes in the BGP database that correspond to either a default or a non-default VRF.

- **regexp regular-expression**

  Enter a regular expression then use one or a combination of the following characters to match:

  - . = (period) any single character (including a white space).
  - * = (asterisk) the sequences in a pattern (zero or more sequences).
  - + = (plus) the sequences in a pattern (one or more sequences).
  - ? = (question mark) sequences in a pattern (either zero or one sequences).

  **NOTE:** Enter an escape sequence (CTRL+v) prior to entering the ? regular expression.
- `[ ]` = (brackets) a range of single-character patterns.
- `( )` = (parenthesis) groups a series of pattern elements to a single element.
- `{ }` = (braces) minimum and the maximum match count.
- `^` = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- `$` = (dollar sign) the end of the output string.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

### Example

```
Dell# show ip bgp paths community
Total 2 communities
Refcount  Community
1         NO-ADVERTISE
1         200:1        1000:1       3000:1
Dell#
```

### show ip bgp peer-group

Allows you to view information on the BGP peers in a peer group.

#### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] peer-group [peer-group-name [detail | summary]]
```

#### Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` to view information on BGP peers in a peer group corresponding to that VRF.

  **NOTE:** You can use this attribute to view information on BGP peers in a peer group that correspond to either a default or a non-default VRF.

- **ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.

- **ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.

- **ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

- **peer-group-name** (OPTIONAL) Enter the name of a peer group to view information about that peer group only.

- **detail** (OPTIONAL) Enter the keyword `detail` to view detailed status information of the peers in that peer group.

- **summary** (OPTIONAL) Enter the keyword `summary` to view status information of the peers in that peer group. The output is the same as that found in the `show ip bgp summary` command.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Version Description

- **9.10(0.0)** Introduced on the S3148.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.8.0** Added the `add-path` option to the S4810. Output on the S4810 shows the ADDPATH parameters.
- **8.3.7.0** Introduced on the S4810.
- **7.8.1.0** Introduced on the S-Series.
- **7.7.1.0** Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp peer-group` command shown in the following example.

<table>
<thead>
<tr>
<th>Line beginning with:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer-group</td>
<td>Displays the peer group’s name.</td>

<tr>
<td>Administratively shut</td>
<td>Displays the peer group’s status if the peer group is not enabled. If you enable the peer group, this line is not displayed.</td>
</tr>
<tr>
<td>BGP version</td>
<td>Displays the BGP version supported.</td>
</tr>
<tr>
<td>Minimum time</td>
<td>Displays the time interval between BGP advertisements.</td>
</tr>
<tr>
<td>For address family</td>
<td>Displays IPv4 Unicast as the address family.</td>
</tr>
<tr>
<td>BGP neighbor</td>
<td>Displays the name of the BGP neighbor.</td>
</tr>
<tr>
<td>Number of peers</td>
<td>Displays the number of peers currently configured for this peer group.</td>
</tr>
<tr>
<td>Peer-group members:</td>
<td>Lists the IP addresses of the peers in the peer group. If the address is outbound optimized, an * is displayed next to the IP address.</td>
</tr>
</tbody>
</table>

### Example

```bash
Dell# show ip bgp peer-group
Peer-group port0, remote AS 200
BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
BGP neighbor is port0, peer-group external
Update packing has 4_OCTET_AS support enabled

Number of peers in this group 1
Maximum limit on the accepted connections 256

Peer-group members (* - outbound optimized):
    172.16.0.2
Dell#
```
Related Commands

- `neighbor peer-group (assigning peers)` — assign a peer to a peer-group.
- `neighbor peer-group (creating group)` — create a peer group.

**show ip bgp regexp**

Display the subset of the BGP routing tables matching the regular expressions specified.

**Syntax**

```plaintext
show ip bgp [vrf vrf-name] regexp regular-expression [character]
```

**Parameters**

- `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to view the subset of BGP routing tables that match the regular expression specified on that VRF.

  **NOTE:** You can use this attribute to view the subset of BGP routing tables that match the regular expression that is specified on either a default or a non-default VRF.

- `regular-expression`

  Enter a regular expression then use one or a combination of the following characters to match:
  - . = (period) any single character (including a white space).
  - * = (asterisk) the sequences in a pattern (zero or more sequences).
  - + = (plus) the sequences in a pattern (one or more sequences).
  - ? = (question mark) sequences in a pattern (either zero or one sequences).

  **NOTE:** Enter an escape sequence (CTRL+v) prior to entering the regular expression.

  - [ ] = (brackets) a range of single-character patterns.
  - ( ) = (parenthesis) groups a series of pattern elements to a single element.
  - { } = (braces) minimum and the maximum match count.
  - ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
  - $ = (dollar sign) the end of the output string.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

  Introduced on the S6000.
- **8.3.19.0**  
  Introduced on the S4820T.
- **8.3.11.1**  
  Introduced on the Z9000.
- **8.3.7.0**  
  Introduced on the S4810.
- **7.8.1.0**  
  Introduced on the S-Series.
- **7.7.1.0**  
  Introduced on the C-Series.

### Usage Information
The following describes the `show ip bgp regexp` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then non-BGP routes exist in the router’s routing table.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the BGP router’s metric, if assigned.</td>
</tr>
<tr>
<td>LocPrf</td>
<td>Displays the BGP LOCAL_PREF attribute for the route.</td>
</tr>
<tr>
<td>Weight</td>
<td>Displays the route’s weight</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the AS paths the route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

### Example
```
Dell# show ip bgp regexp ^200
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network            Next Hop            Metric     LocPrf Weight Path
*  >  55.0.0.0/24        172.16.0.2                                 0 200 i
*  >  66.0.0.0/24        172.16.0.2                                 0 200 i
Dell#
```

### show ip bgp summary

Allows you to view the status of all BGP connections.

#### Syntax
```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] summary
```
Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view the status of all BGP connections corresponding to that VRF.
- **ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- **ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- **ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

</tbody>
</table>

Usage Information

In BGP, route attributes are maintained at different locations. When attributes that correspond to multiple routes change, then attribute counts that the `show ip bgp summary` command displays are calculated as summations of attributes corresponding to all the associated routes. For example, if cluster_id is an attribute associated with thousand routes that contain exactly the same set of attributes, then the cluster_id count is 1. If these thousand routes are set with different attribute values with the same cluster_id, then the cluster_id count is 1000, since the same value is stored for thousand different attribute records.

The attribute next-hop is a part of the BGP attribute data structure.

If two peers send the same route that contains similar path attributes, then two entries are maintained in the back-end, as both these entries have different next-hops. If this same route is sent to a different peer, an entry for each peer is created, as the next-hop is different. As a result, the BGP attributes count in the summary output will differ accordingly.
The following describes the `show ip bgp summary` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP router identifier</td>
<td>Displays the local router ID and the AS number.</td>
</tr>
<tr>
<td>BGP table version</td>
<td>Displays the BGP table version and the main routing table version.</td>
</tr>
<tr>
<td>network entries</td>
<td>Displays the number of network entries, route paths, and the amount of memory used to process those entries.</td>
</tr>
<tr>
<td>paths</td>
<td>Displays the number of paths and the amount of memory used.</td>
</tr>
<tr>
<td>denied paths</td>
<td>Displays the number of denied paths and the amount of memory used.</td>
</tr>
<tr>
<td>BGP path attribute entries</td>
<td>Displays the number of BGP path attributes and the amount of memory used to process them.</td>
</tr>
<tr>
<td>BGP AS-PATH entries</td>
<td>Displays the number of BGP AS_PATH attributes processed and the amount of memory used to process them.</td>
</tr>
<tr>
<td>BGP community entries</td>
<td>Displays the number of BGP COMMUNITY attributes processed and the amount of memory used to process them. The <code>show ip bgp community</code> command provides more details on the COMMUNITY attributes.</td>
</tr>
<tr>
<td>Dampening enabled</td>
<td>Displayed only when you enable dampening. Displays the number of paths designated as history, dampened, or penalized.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>Displays the BGP neighbor address.</td>
</tr>
<tr>
<td>AS</td>
<td>Displays the AS number of the neighbor.</td>
</tr>
<tr>
<td>MsgRcvd</td>
<td>Displays the number of BGP messages that neighbor received.</td>
</tr>
<tr>
<td>MsgSent</td>
<td>Displays the number of BGP messages that neighbor sent.</td>
</tr>
<tr>
<td>TblVer</td>
<td>Displays the version of the BGP table that was sent to that neighbor.</td>
</tr>
<tr>
<td>InQ</td>
<td>Displays the number of messages from that neighbor waiting to be processed.</td>
</tr>
<tr>
<td>OutQ</td>
<td>Displays the number of messages waiting to be sent to that neighbor. If a number appears in parentheses, the number represents the number of messages waiting to be sent to the peer group.</td>
</tr>
<tr>
<td>Up/Down</td>
<td>Displays the amount of time that the neighbor is in the Established stage. If the neighbor has never moved into the Established stage, the word never is displayed.</td>
</tr>
</tbody>
</table>

The output format is:

<table>
<thead>
<tr>
<th>Time</th>
<th>Display Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 1 day</td>
<td>00:12:23 (hours:minutes:seconds)</td>
</tr>
<tr>
<td>&lt; 1 week</td>
<td>1d21h (DaysHours)</td>
</tr>
<tr>
<td>&gt; 1 week</td>
<td>11w2d (WeeksDays)</td>
</tr>
</tbody>
</table>

**State/Pfxrcd**

If the neighbor is in Established stage, the number of network prefixes received.  

If a maximum limit was configured with the `neighbor maximum-prefix` command, (prfxd) appears in this column.
Field Description
If the neighbor is not in Established stage, the current stage is displayed (Idle, Connect, Active, OpenSent, OpenConfirm). When the peer is transitioning between states and clearing the routes received, the phrase (Purging) may appear in this column.

If the neighbor is disabled, the phrase (Admin shut) appears in this column.

Example
Dell# show ip bgp summary
BGP router identifier 192.168.11.5, local AS number 100
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
2 network entrie(s) using 152 bytes of memory
2 paths using 208 bytes of memory
BGP-RIB over all using 210 bytes of memory
2 BGP path attribute entrie(s) using 144 bytes of memory
1 BGP AS-PATH entrie(s) using 10 bytes of memory
2 neighbor(s) using 16384 bytes of memory
Neighbor    AS    MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down State/Pfx
172.16.0.2  200    10       8    0    0    0 00:05:34 2
192.168.10.2 100    0       22    0    0    0 00:00:00 (shut)

show running-config bgp

To display the current BGP configuration, use this feature.

Syntax
show running-config bgp

Defaults
none

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.O) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.
7.6.1.0 Introduced on the E-Series.
Example

Dell# show running-config bgp
!
router bgp 100
  network 1.1.11.1/32
  network 1.1.12.1/32
  network 1.1.13.1/32
  neighbor 10.1.1.2 remote-as 200
  neighbor 10.1.1.2 no shutdown
Dell#

**timers bgp**

Adjust the BGP Keep Alive and Hold Time timers.

**Syntax**

```plaintext
timers bgp keepalive holdtime
```

To return to the default, use the `no timers bgp` command.

**Parameters**

- `keepalive`  
  Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is 60 **seconds**.

- `holdtime`  
  Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is 180 **seconds**.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) |Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000–ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.

8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
**MBGP Commands**

Multiprotocol BGP (MBGP) is an enhanced BGP that enables multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (ASs).

Dell Networking OS MBGP is implemented as per IETF RFC 1858.

BGPv4 is supported in the following:

<table>
<thead>
<tr>
<th>Dell Networking OS Version</th>
<th>Platform Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.8.1.0, MBGP for IPv4 Multicast Only</td>
<td>S-Series</td>
</tr>
</tbody>
</table>

**debug ip bgp dampening**

View information on routes being dampened.

**Syntax**

```
debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening
```

To disable debugging, use the `no debug ip bgp dampening` command.

**Parameters**

- **vrf vrf-name**
  - Enter the keyword `vrf` followed by the name of the VRF to view information on dampened routes corresponding to that VRF.

- **ipv4 multicast**
  - (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view dampened-route information related only to ipv4 multicast routes.

- **ipv4 unicast**
  - (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view dampened-route information related only to ipv4 unicast routes.

- **ipv6 unicast**
  - (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view dampened-route information related only to ipv6 unicast routes.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
</tbody>
</table>
distance bgp

Configure three administrative distances for routes.

Syntax
distance bgp external-distance internal-distance local-distance
To return to default values, use the no distance bgp command.

Parameters
- **external-distance** Enter a number to assign to routes learned from a neighbor external to the AS. The range is from 1 to 255. The default is 20.
- **internal-distance** Enter a number to assign to routes learned from a router within the AS. The range is from 1 to 255. The default is 200.
- **local-distance** Enter a number to assign to routes learned from networks listed in the network command. The range is from 1 to 255. The default is 200.

Defaults
- external-distance = 20
- internal-distance = 200
- local-distance = 200

Command Modes
- ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
| 9.8(2.0) | Introduced on the S3100 series.
Version | Description
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(1.0) | Introduced on the Z9500.
8.3.19.0 | Introduced on the S4820T.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

⚠️ **CAUTION:** Dell Networking recommends not changing the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.

The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as internal BGP routes.

**Related Commands**

- `router bgp` — enter ROUTER mode on the switch.

### show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
- `ipv4 multicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- `ipv4 unicast` (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- `ipv6 unicast` (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

**Field** | **Description**
--- | ---
Network | Displays the network ID to which the route is dampened.
From | Displays the IP address of the neighbor advertising the dampened route.
Reuse | Displays the hour:minutes:seconds until the dampened route is available.
Path | Lists all the ASs the dampened route passed through to reach the destination network.

**Example**

Dell# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>d 55.0.0.0/24</td>
<td>172.16.0.2</td>
<td>00:36:23</td>
<td>200</td>
</tr>
</tbody>
</table>

Dell#
BGP Extended Communities (RFC 4360)

BGP Extended Communities, as defined in RFC 4360, is an optional transitive BGP attribute. BGP Extended Communities provides two major advantages over Standard Communities:

- The range is extended from 4-octet (AA:NN) to 8-octet (Type:Value) to provide enough number communities.
- Communities are structured using a new “Type” field (1 or 2-octets), allowing you to provide granular control/filter routing information based on the type of extended communities.

set extcommunity rt

To set Route Origin community attributes in Route Map, use this feature.

Syntax

```
set extcommunity rt {as4 ASN4:NN [non-trans] | ASN:NNNN [non-trans] | IPADDR:NN [non-trans]} [additive]
```

To delete the Route Origin community, use the no set extcommunity command.

Parameters

- **as4 ASN4:NN** Enter the keyword as4 then the 4-octet AS specific extended community number in the format ASN4:NN (4-byte AS number:2-byte community value).
- **ASN:NNNN** Enter the 2-octet AS specific extended community number in the format ASN:NNNN (2-byte AS number:4-byte community value).
- **IPADDR:NN** Enter the IP address specific extended community in the format IPADDR:NN (4-byte IPv4 Unicast Address:2-byte community value).
- **additive** (OPTIONAL) Enter the keyword additive to add to the existing extended community.
- **non-trans** (OPTIONAL) Enter the keywords non-trans to indicate a non-transitive BGP extended community.

Defaults

none

Command Modes

ROUTE MAP (config-route-map)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

<td>Introduced on the S4820T</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z-9000.</td>
</tr>
</tbody>
</table>
Version | Description
---|---
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.
7.6.1.0 | Introduced on the E-Series.

Usage Information
If the set community `rt` and `soo` are in the same route-map entry, the behavior defines as:

- If the `rt` option comes before `soo`, with or without the `additive` option, `soo` overrides the communities `rt` sets.
- If the `rt` option comes after `soo`, without the `additive` option, `rt` overrides the communities `soo` sets.
- If the `rt` with the `additive` option comes after `soo`, `rt` adds the communities `soo` sets.

Related Commands
- `set extcommunity soo` — set the extended community site-of-origin in the route-map.

**set extcommunity soo**

To set extended community site-of-origin in Route Map, use this feature.

Syntax
```
set extcommunity soo {as4 ASN4:NN | ASN:NNNN | IPADDR:NN [non-trans]}
```

To delete the site-of-origin community, use the `no set extcommunity` command.

Parameters
- `as4 ASN4:NN` Enter the keyword `as4` then the 4-octet AS specific extended community number in the format ASN4:NN (4-byte AS number:2-byte community value).
- `ASN:NNNN` Enter the 2-octet AS specific extended community number in the format ASN:NNNN (2-byte AS number:4-byte community value).
- `IPADDR:NN` Enter the IP address specific extended community in the format IPADDR:NN (4-byte IPv4 Unicast Address:2-byte community value).
- `non-trans` (OPTIONAL) Enter the keywords `non-trans` to indicate a non-transitive BGP extended community.

Defaults
- none

9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
### Usage Information

If the set community `rt` and `soo` are in the same route-map entry, the behavior defines as:

- If the `rt` option comes before `soo`, with or without the additive option, `soo` overrides the communities `rt` sets.
- If the `rt` option comes after `soo`, without the additive option, `rt` overrides the communities `soo` sets.
- If the `rt` with the additive option comes after `soo`, `rt` adds the communities `soo` sets.

### Related Commands

- `set extcommunity rt` — set the extended community route origins using the route-map.

### show ip bgp paths extcommunity

To display all BGP paths having extended community attributes, use this feature.

**Syntax**

```
show ip bgp paths extcommunity
```

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
8.3.7.0 Introduced on the S4810.
Version 7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.
7.6.1.0 Introduced on the E-Series.

Usage Information
The following describes the `show ip bgp paths extcommunity` command shown in the following example.

**Field**
- **Address**: Displays the internal address where the path attribute is stored.
- **Hash**: Displays the hash bucket where the path attribute is stored.
- **RefCount**: Displays the number of BGP routes using these extended communities.
- **Community**: Displays the extended community attributes in this BGP path.

**Example**
```
Dell# show ip bgp paths extcommunity
Total 1 Extended Communities
Address Hash Refcount Extended Community
0x41d57024 12272 1 RT:7:200 SoO:5:300 SoO:0.0.0.3:1285
Dell#
```

### show ip extcommunity-list
Display the IP extended community list.

**Syntax**
```
show ip extcommunity-list [word]
```

**Parameters**
- **word**: Enter the name of the extended community list you want to view.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**
- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
### IPv6 BGP Commands

IPv6 border gateway protocol (IPv6 BGP) is supported on the platform.

BGP is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

#### clear ip bgp ipv6 unicast soft

Clear and reapply policies for IPv6 unicast routes without resetting the TCP connection; that is, perform BGP soft reconfiguration.

**Syntax**

```
clear ip bgp { * | as-number | ipv4-neighbor-addr | ipv6-neighbor-addr | peer-group name } ipv6 unicast soft [in | out]
```

**Parameters**

- `*` Clear and reapply policies for all BGP sessions.
- `as-number` Clear and reapply policies for all neighbors belonging to the AS. The range is from 0 to 65535 (2 Byte), from 1 to 4294967295 (4 Byte), or from 0.1 to 0.65535.65535 (Dotted format).
- `ipv4-neighbor-addr` Clear and reapply policies for a neighbor.
- `ipv6-neighbor-addr` Clear and reapply policies for a neighbor.
- `peer-group name` Clear and reapply policies for all BGP routers in the specified peer group.
- `ipv6 unicast` Clear and reapply policies for all IPv6 unicast routes.
- `in` Reapply only inbound policies.

**NOTE:** If you enter `soft`, without an `in` or `out` option, both inbound and outbound policies are reset.
out

Reapply only outbound policies.

NOTE: If you enter soft, without an in or out option, both inbound and outbound policies are reset.

Command Modes EXEC Privilege

**debug ip bgp ipv6 unicast soft-reconfiguration**

Enable soft-reconfiguration debugging for IPv6 unicast routes.

**Syntax**

`debug ip bgp [ipv4-address | ipv6-address | peer-group-name] ipv6 unicast soft-reconfiguration`

To disable debugging, use the `no debug ip bgp [ipv4-address | ipv6-address | peer-group-name] ipv6 unicast soft-reconfiguration` command.

**Parameters**

- `ipv4-address | ipv6-address` Enter the IP address of the neighbor on which you want to enable soft-reconfiguration debugging.
- `peer-group-name` Enter the name of the peer group on which you want to enable soft-reconfiguration debugging.
- `ipv6 unicast` Debug soft reconfiguration for IPv6 unicast routes.

**Defaults**

Disabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
This command turns on BGP soft-reconfiguration inbound debugging for IPv6 unicast routes. If no neighbor is specified, debug is turned on for all neighbors.

**ipv6 prefix-list**

Configure an IPv6 prefix list.

**Syntax**

```
ipv6 prefix-list prefix-list name
```

**Parameters**

- `prefix-list name` Enter the name of the prefix list.

**Defaults**

`none`

**Command Modes**

`CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

neighbor soft-reconfiguration inbound

Enable a BGP soft-reconfiguration and start storing updates for inbound IPv6 unicast routes.

Syntax

neighbor {ipv4-address | ipv6-address | peer-group-name} soft-reconfiguration inbound

Parameters

- **ipv4-address | ipv6-address**
  - Enter the IP address of the neighbor for which you want to start storing inbound routing updates.

- **peer-group-name**
  - Enter the name of the peer group for which you want to start storing inbound routing updates.

Defaults

Disabled.

Command Modes

ROUTER BGPV6 ADDRESS FAMILY (conf-router_bgpv6_af)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced</td>
</tr>
</tbody>
</table>

Usage Information

This command enables soft-reconfiguration for the specified BGP neighbor. BGP stores all updates for inbound IPv6 unicast routes the neighbor receives but does not reset the peer-session.

⚠️ CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.
**show ipv6 prefix-list**

Displays the specified IPv6 prefix list.

**Syntax**

```
show ipv6 prefix-list detail {prefix-list name} | summary
```

**Parameters**

- `detail` Display a detailed description of the selected IPv6 prefix list.
- `prefix-list name` Enter the name of the prefix list.

**NOTE:** There is a 140-character limit for prefix list names.

- `summary` Display a summary of RPF routes.

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Related Commands**

- `ipv6 prefix-list` — configure an IPv6 prefix-list.

**IPv6 MBGP Commands**

Multiprotocol BGP (MBGP) is an enhanced BGP that enables the multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (AS). FTOS MBGP is implemented as per IETF RFC 1858.
show ipv6 mbgproutes

Display the selected IPv6 MBGP route or a summary of all MBGP routes in the table.

Syntax

show ipv6 mbgproutes ipv6-address prefix-length | summary

Parameters

ipv6-address prefix-length (OPTIONAL) Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

summary Display a summary of RPF routes.

Command Modes

EXEC

Content Addressable Memory (CAM)

You can use content addressable memory (CAM) commands to configure the amount of memory allocated to CAM memory partitions.

**NOTE:** Not all CAM commands are supported on all platforms. Be sure to note the platform when looking for a command.

**WARNING:** If you are using these features for the first time, contact Dell Networking Technical Assistance Center (TAC) for guidance.

**CAM Profile Commands**

The CAM profiling feature allows you to partition the CAM to best suit your application. For example:

- Configure more Layer 2 forwarding information base (FIB) entries when the system is deployed as a switch.
- Configure more Layer 3 FIB entries when the system is deployed as a router.
- Configure more access control lists (ACLs) (when IPv6 is not employed).
- Hash multi-protocol label switching (MPLS) packets based on source and destination IP addresses for link aggregation groups (LAGs).
- Hash based on bidirectional flow for LAGs.
- Optimize the virtual local area network (VLAN) ACL Group feature, which permits group VLANs for IP egress ACLs.

**Important Points to Remember**

- Dell Networking OS supports CAM allocations on the C-Series and S-Series.
- All line cards within a single system must have the same CAM profile (including CAM sub-region configurations); this profile must match the system CAM profile (the profile on the primary route processor module [RPM]).
- Dell Networking OS automatically reconfigures the CAM profile on line cards and the secondary RPM to match the system CAM profile by saving the correct profile on the card and then rebooting it.
- The CAM configuration is applied to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- When budgeting your CAM allocations for ACLs and quality of service (QoS) configurations, remember that ACL and QoS rules might consume more than one CAM entry depending on complexity. For example, transmission control protocol (TCP) and user datagram protocol (UDP) rules with port range options might require more than one CAM entry.
- After you install a secondary RPM, copy the running-configuration to the startup-configuration so that the new RPM has the correct CAM profile.
- You MUST save your changes and reboot the system for CAM profiling or allocations to take effect.

**CAM Profile Commands**

The CAM profiling feature allows you to partition the CAM to best suit your application. For example:

- Configure more Layer 2 forwarding information base (FIB) entries when the system is deployed as a switch.
- Configure more Layer 3 FIB entries when the system is deployed as a router.
- Configure more access control lists (ACLs) (when IPv6 is not employed).

Dell EMC
• Hash multi-protocol label switching (MPLS) packets based on source and destination IP addresses for link aggregation groups (LAGs).
• Hash based on bidirectional flow for LAGs.
• Optimize the virtual local area network (VLAN) ACL Group feature, which permits group VLANs for IP egress ACLs.

Important Points to Remember

• Dell Networking OS supports CAM allocations on the C-Series and S-Series.
• All line cards within a single system must have the same CAM profile (including CAM sub-region configurations); this profile must match the system CAM profile (the profile on the primary route processor module [RPM]).
• Dell Networking OS automatically reconfigures the CAM profile on line cards and the secondary RPM to match the system CAM profile by saving the correct profile on the card and then rebooting it.
• The CAM configuration is applied to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
• When budgeting your CAM allocations for ACLs and quality of service (QoS) configurations, remember that ACL and QoS rules might consume more than one CAM entry depending on complexity. For example, transmission control protocol (TCP) and user datagram protocol (UDP) rules with port range options might require more than one CAM entry.
• After you install a secondary RPM, copy the running-configuration to the startup-configuration so that the new RPM has the correct CAM profile.
• You MUST save your changes and reboot the system for CAM profiling or allocations to take effect.

cam-acl (Configuration)

Select the default CAM allocation settings or reconfigure a new CAM allocation for Layer 2, IPv4, and IPv6 ACLs, Layer 2 and Layer 3 (IPv4) QoS, Layer 2 Protocol Tunneling (L2PT), IP and MAC source address validation for DHCP, Ethernet Connectivity Fault Management (CFM) ACLs, OpenFlow, and Policy-based Routing (PBR).

Syntax
cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos number l2qos number l2pt number ipmacacl number [vman-qos | vman-dual-qos number] ecfmacl number [nblclusteracl number] ipv4pbr number | openflow number | fcoe number} [iscsioptracl number] [vrfv4acl number]

Parameters
default Use the default CAM profile settings and set the CAM as follows:
• L2Acl : 6
• IPv4Acl : 4
• IPv6Acl : 0
• IPv4Qos : 2
• L2Qos : 1
• L2PT : 0
• IpMacAcl : 0
• VmanQos : 0
• VmanDualQos : 0
• EcfmAcl : 0
• nblclusteracl : 0
• FcoeAcl : 0
• iscsiOptAcl : 0
• ipv4pbr : 0
Allocate space to each CAM region.

- `vrfv4Acl`: 0
- `Openflow`: 0
- `fedgovacl`: 0

### CAM Regions

- **l2acl number**
  - Enter the keyword `l2acl` and then the number of l2acl blocks. The range is from 1 to 8.

- **ipv4acl number**
  - Enter the keyword `ipv4acl` and then the number of FP blocks for IPv4. The range is from 0 to 8.

- **ipv6acl number**
  - Enter the keyword `ipv6acl` and then the number of FP blocks for IPv6. The range is from 0 to 4.

- **ipv4qos number**
  - Enter the keyword `ipv4qos` and then the number of FP blocks for IPv4. The range is from 0 to 8.

- **l2qos number**
  - Enter the keyword `l2qos` and then the number of FP blocks for l2 qos. The range is from 1 to 8.

- **l2pt number**
  - Enter the keyword `l2pt` and then the number of FP blocks for l2 protocol tunnelling. The range is from 0 to 1.

- **ipmacacl number**
  - Enter the keyword `ipmacacl` and then the number of FP blocks for IP and MAC ACL. The range is from 0 to 6.

- **ecfmacnumber**
  - Enter the keyword `ecfmacnumber` and then the number of FP blocks for ECFM ACL. The range is from 0 to 5.

- **nlbclusteracl number**
  - Enter the keyword `nlbclusteracl` and then the number of FP blocks for nlbcluster ACL. The range is from 0 to 2. By default, the value is 0 and it supports 8 NLB ARP entries reserved for internal functionality.

  **NOTE:** When you reconfigure CAM allocation, use the `nlbclusteracl number` command to change the number of NLB ARP entries. The range is from 0 to 2. The default value is 0. At the default value of 0, eight NLB ARP entries are available for use. This platform supports up to 512 CAM entries. Select 1 to configure 256 entries. Select 2 to configure 512 entries. Even though you can perform CAM carving to allocate the maximum number of NLB entries, Dell Networking recommends that you use a maximum of 64 NLB ARP entries.

- **vman-qos**
  - Enter the keyword `vman-qos` and then the number of FP blocks for VMAN QoS. The range is from 0 to 6.

- **vman-dual-qos number**
  - Enter the keyword `vman-dual-qos` and then the number of FP blocks for VMAN dual QoS. The range is from 0 to 4.

- **ipv4pbr number**
  - Enter the keyword `ipv4pbr` and then the number of FP blocks for ipv4pbr ACL. The range is from 0 to 8.

- **Openflow number**
  - Enter the keyword `openflow` and then the number of FP blocks for open flow (multiples of 4). The range is from 0 to 8.

- **fcoeacl number**
  - Enter the keyword `fcoeacl` and then the number of FP blocks for FCOE ACL. The range is from 0 to 6.

- **iscsioptacl number**
  - Enter the keyword `iscsioptacl` and then the number of FP blocks for iSCSI optimization ACL. The range is from 0 to 2.
Enter 4 or 8 for the number of OpenFlow FP blocks.

- 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

The fcoe range is 0–6 groups. Each group has 128 entries; the value given must be an even number. This information is stored in the NVRAM and is effective after rebooting the switch.

</tr>
</tbody>
</table>

Usage Information

Save the new CAM settings to the startup-config (write-mem or copy run start) then reload the system for the new settings to take effect.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks; these blocks cannot be reallocated. Only 13 number of blocks can be configured by the user.

The ipv6acl allocation must be a factor of 2.
If allocation values are not entered for the CAM regions, the value is 0.

If you enable BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the command `reload conditional nvram-cfg-change`.

cam-acl-egress

Allocate CAM for egress ACLs.

**Syntax**

```
cam-acl-egress default | l2acl number ipv4acl number ipv6acl number
```

**Parameters**

- `default`  
  Reset egress CAM ACL entries to default settings.
- `l2acl number`  
  Allocate space to each CAM region. The total space allocated must equal 4. The ipv6acl range must be a factor of 2.

</tr>
</tbody>
</table>

Usage Information  | When you enable this command, if a Policy Map containing classification rules (ACL and/or dscp/ip-precedence rules) is applied to more than one physical interface on the same port pipe, only a single copy of the policy is written (only one FP entry is used).

**NOTE:** An ACL itself may still require more that a single FP entry, regardless of the number of interfaces. For more information, refer to the “IP Access Control Lists”, “Prefix Lists”, and “Route-map” sections in the Dell Networking OS Configuration Guide.

**show cam-acl**

Display the details of the CAM profiles on the chassis and all stack units.

**Syntax**  
show cam-acl

**Defaults**  
none

**Command Modes**  
EXEC Privilege
### Command History

### Usage Information

The display reflects the settings implemented with the `cam-acl` command.

### Example

```
Dell\# show cam-acl

-- Chassis Cam ACL --
Current Settings(in block sizes)
  1 block = 256 entries
L2Acl    :  2
Ipv4Acl  :  4
Ipv6Acl  :  4
Ipv4Qos  :  2
L2Qos    :  1
L2PT     :  0
IpMacAcl :  0
VmanQos  :  0
EcfmAcl  :  0
FcoeAcl  :  0
iscsiOptAcl :  0
ipv4pbr  :  0
vrfv4Acl :  0
Openflow :  0
fedgovacl:  0
nlbclusteracl:  0

-- stack-unit 1 --
Current Settings(in block sizes)
  1 block = 256 entries
L2Acl    :  2
Ipv4Acl  :  4
Ipv6Acl  :  4
Ipv4Qos  :  2
L2Qos    :  1
L2PT     :  0
IpMacAcl :  0
VmanQos  :  0
EcfmAcl  :  0
FcoeAcl  :  0
iscsiOptAcl :  0
ipv4pbr  :  0
```
show cam-usage

Display Layer 2, Layer 3, ACL, or all CAM usage statistics.

Syntax

```
show cam-usage [acl | router | switch]
```

Parameters

- **acl**
  (OPTIONAL) Enter the keyword acl to display Layer 2 and Layer 3 ACL CAM usage.
- **router**
  (OPTIONAL) Enter the keyword router to display Layer 3 CAM usage.
- **switch**
  (OPTIONAL) Enter the keyword switch to display Layer 2 CAM usage.

Defaults

none

Command Modes

EXEC Privilege

Command History

- **Version**
  - **9.11.0.0**
    The `show cam-usage` command is updated to display ECMP count information.
  - **9.7(0.0)**
    Introduced on the S6000-ON.
  - **9.7(0.0)**
    Introduced on the S4810, S4820T, S6000 and Z9000.

Example

```
Dell#show cam-usage

Stackunit|Portpipe|CAM Partition| Total CAM | Used CAM | Available CAM
-----------|---------|-------------|-----------|---------|---------------
          | 0       | IN-L2 ACL   | 1024      | 0       | 1024
          |         | IN-L3 ACL   | 1024      | 1       | 1023
          |         | IN-L3 FIB   | 163840    | 16      | 163824

### test cam-usage

Verify that enough CAM space is available for the IPv6 ACLs you have created.

**Syntax**

```plaintext
test cam-usage service-policy input input policy name stack-unit {number | all}
```

**Parameters**

- `policy-map name` Enter the name of the policy-map to verify. Maximum is 32 characters.
- `number` Enter `all` to get information for all the stack-units or enter the stack-unit number to get information for a specific stack-unit.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
This command applies to both IPv4 and IPv6 CAM Profiles, but is best used when verifying QoS optimization for IPv6 ACLs.

QoS Optimization for IPv6 ACLs does not impact the CAM usage for applying a policy on a single (or the first of several) interfaces. It is most useful when a policy is applied across multiple interfaces; it can reduce the impact to CAM usage across subsequent interfaces.

The following describes the `test cam-usage` command shown in the following example.

<table>
<thead>
<tr>
<th>Term</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack-Unit</td>
<td>Lists the stack unit or units that are checked. Entering all shows the status for all stacks.</td>
</tr>
<tr>
<td>Portpipe</td>
<td>Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering all shows the status for stack-units and port-pipes in the chassis. The port set value is from 0 to 0.</td>
</tr>
<tr>
<td>CAM Partition</td>
<td>Shows the CAM profile of the CAM.</td>
</tr>
<tr>
<td>Available CAM</td>
<td>Identifies the amount of CAM space remaining for that profile.</td>
</tr>
<tr>
<td>Estimated CAM per</td>
<td>Estimates the amount of CAM space the listed policy will require.</td>
</tr>
<tr>
<td>Port</td>
<td></td>
</tr>
<tr>
<td>Status</td>
<td>Indicates whether or not the policy will be allowed in the CAM.</td>
</tr>
</tbody>
</table>

Example

```
Dell# test cam-usage service-policy input In stack-unit all
Stack-Unit|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port|Status
-------------------------------------------------------------------------------
 1 | 0 | IPv4Flow | 102 | 0 | Allowed
Dell#
Dell# test cam-usage service-policy input In stack-unit 1 port-set 0
Stack-Unit|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port|Status
-------------------------------------------------------------------------------
 1 | 0 | IPv4Flow | 102 | 0 | Allowed
Dell#```

Content Addressable Memory (CAM)
Control Plane Policing (CoPP)

Control plane policing (CoPP) uses access control list (ACL) rules and quality of service (QoS) policies to create filters for a system's control plane. The CoPP filters prevent traffic that is not identified as legitimate from reaching the control plane, and rate-limit traffic to an acceptable level.

Topics:
- control-plane-cpuqos
- service-policy rate-limit-cpu-queues
- service-policy rate-limit-protocols
- ip unknown-unicast
- ipv6 unknown-unicast
- show cpu-queue rate cp
- show ip protocol-queue-mapping
- show ipv6 protocol-queue-mapping
- show mac protocol-queue-mapping

control-plane-cpuqos

To manage control-plane traffic, enter control-plane mode and configure the switch.

Syntax
control-plane-cpuqos

Defaults
Not configured.

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
service-policy rate-limit-cpu-queues

Apply a policy map for the system to rate limit control traffic on a per-queue basis.

**Syntax**

```
service-policy rate-limit-cpu-queues policy-name
```

**Parameters**

- **policy-name**
  - Enter the service-policy name, using a string up to 32 characters.

**Defaults**

Not configured.

**Command Modes**

CONTROL-PLANE-CPUQOS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

Create a policy-map by associating a queue number with the qos-policy.

Create QoS policies prior to enabling this command.

For CoPP, use the keyword cpu-qos when creating qos-policy-input.

**Related Commands**

- `qos-policy-input` — create a QoS input policy map.
- `policy-map-input` — create an input policy map.
**service-policy rate-limit-protocols**

Apply a policy for the system to rate limit control protocols on a per-protocol basis.

**Syntax**

```
service-policy rate-limit-protocols policy-name
```

**Parameters**

- `policy-name` Enter the service-policy name, using a string up to 32 characters.

**Defaults**

Not configured.

**Command Modes**

CONTROL-PLANE-CPUQOS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command applies the service-policy based on the type of protocol defined in the ACL rules.

Create ACL and QoS policies prior to enabling this command.

For CoPP, use the keyword `cpu-qos` when creating `qos-policy-input`.

**Related Commands**

- `ip access-list extended` — creates an extended IP ACL.
- `mac access-list extended` — creates an extended MAC ACL.
- `qos-policy-input` — creates a QoS input policy map.
- `class-map` — creates a QoS class map.
- `policy-map-input` — creates an input policy map.
**ip unknown-unicast**

Enable IPv4 catch-all route.

Syntax

```
ip unknown-unicast [vrf vrf-name]
```

To remove the IPv4 catch-all route (0.0.0.0/0) from the LPM route forwarding table in hardware which gets added as a default configuration after the initialization of FIB Agent module, use the `no ip unknown-unicast` command.

Defaults

None

Parameters

- `vrf vrf-name` (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable catch-all routes corresponding to that VRF.

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Use this command to add the IPv4 catch-all route (0.0.0.0/0) in the LPM route forwarding table if it was deleted using the `no ip unknown-unicast` command previously. This will be the default configuration after reload.

**ipv6 unknown-unicast**

Disable soft forwarding of unknown IPv6 destination packets.

Syntax

```
[no] ipv6 unknown-unicast
```

Defaults

Soft forwarding is enabled.

Command Modes

- CONFIGURATION
show cpu-queue rate cp

Display the rates for each CPU queue.

Syntax

show cpu-queue rate cp

Defaults

Not configured.

Debugging and Diagnostics

The basic debugging and diagnostic commands are supported by the Dell Networking OS.

Topics:
- Diagnostics and Monitoring Commands
- Offline Diagnostic Commands
- Hardware Commands

Diagnostics and Monitoring Commands

The following section describes the diagnostics and monitoring commands. For similar commands, refer to the Control and Monitoring chapter.

logging coredump stack-unit

Enable coredump on a stack.

Syntax
logging coredump stack-unit {stack-unit-number | all}

Parameters

stack-unit-number
Enter the stack-unit id to enable coredump in a particular stack-unit.

all
Enable coredump on all stack-unit.

Defaults
Disabled by default on customer builds.

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

## Usage Information

The Kernel core dump can be large and may take up to 5 to 30 minutes to upload. Dell Networking OS does not overwrite application core dumps so you should delete them as necessary to conserve space on the flash; if the flash is out of memory, the coredump is aborted. On the S-Series, if the FTP server is not reachable, the application coredump is aborted. Dell Networking OS completes the coredump process and wait until the upload is complete before rebooting the system.

## Offline Diagnostic Commands

The offline diagnostics test suite is useful for isolating faults and debugging hardware. While tests are running, Dell Networking OS results are saved as a text file (TestReport-SU-X.txt) in the flash directory. This `show file` command is available only on master and standby.

### Important Points to Remember

- Offline diagnostics can only be run when the unit is offline.
- You can only run offline diagnostics on a unit to which you are connected via the console. In other words, you cannot run diagnostics on a unit to which you are connected to via a stacking link.
- The system stores the diagnostic results in the flash directory (TestReport-SU-X.txt). The system displays the following message after the diagnostic test is over.

  ```
  05:37:17 : Diagnostic test results are stored on file: flash:/TestReport-SU-1.txt
  05:37:22: %S3048-ON:1 %DIAGAGT-6-DA_DIAG_DONE: Diags finished on stack-unit 1
  ```

- Diagnostics only test connectivity, not the entire data path.

### diag stack-unit

Run offline diagnostics on a stack unit.

**Syntax**

```bash
diag stack-unit number [alllevels | level0 | level1 | level2] verbose [testname | no-reboot]
```

**Parameters**

- `number` Enter the stack-unit id.
- `alllevels` Enter the keyword alllevels to run the complete set of offline diagnostic tests.
- `level0` Enter the keyword level0 to run Level 0 diagnostics. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.
- `level1` Enter the keyword level1 to run Level 1 diagnostics. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, EEPROM, and CPLD) wherever possible. There are no tests on 10G links. At this level, stack ports are shut down automatically.
level2 Enter the keyword level2 to run Level 2 diagnostics. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations. To test 10G links, physically remove the unit from the stack.

verbose Enter the keyword verbose to run the diagnostic in Verbose mode. Verbose mode gives more information in the output than Standard mode.

testname Enter the keyword testname to run a specific test case. Enclose the test case name in double quotes (" "). For example: diag stack-unit 1 level1 testname "first". You can use this option only for interactive tests.

no-reboot Enter the keyword no-reboot to prevent the system from rebooting after the test. To bring the stack unit to online state, use the online stack-unit stack-unit-number command.

Defaults None

</tbody>
</table>

Usage Information

You cannot enter this command on a Master or Standby unit.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the offline stack-unit command is implemented.

Warning: Diagnostic execution will cause stack-unit to reboot after completion of diags.

Proceed with Offline-Diags [confirm yes/no]: y

online stack-unit

Place a stack unit in the online state.

Syntax

online stack-unit number

Parameters

t

number

Enter the stack-unit number.

Defaults

None

Usage Information
You cannot enter this command on a Master or Standby unit.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

Warning - Diagnostic execution will cause stack-unit to reboot after completion of diags.

Proceed with Offline-Diags [confirm yes/no]:y

**Hardware Commands**

These commands display information from a hardware sub-component or ASIC.

### clear hardware stack-unit

Clear statistics from selected hardware components.

**Syntax**

```
clear hardware stack-unit id {counters | cpu {data-plane statistics | i2c statistics | management statistics | party-bus statistics | sata-interface statistics} | unit number counters | stack-port stack-port-number}
```

**Parameters**

- `stack-unit id`: Enter the keywords `stack-unit` then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data. The range is from 1 to 12.
- `counters`: Enter the keyword `counters` to clear the counters on the selected stack member.
- `cpu data-plane statistics`: Enter the keywords `cpu data-plane statistics` to clear the data plane statistics.
- `cpu i2c statistics`: Enter the keywords `cpu i2c statistics` to clear the i2c devices statistics.
### clear hardware system-flow

Clear system-flow statistics from selected hardware components.

**Syntax**
```
clear hardware system-flow layer2 stack-unit number port-set 0–0 counters
```

**Parameters**
- `stack-unit number`: Enter the keywords `stack-unit` then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data.
- `port-set 0–0 counters`: Enter the keywords `port-set` along with a port-pipe number, then the keyword `counters` to clear the system-flow counters on the selected port-pipe. The range is from 0 to 0.

**Defaults**
None

**Command Modes**
EXEC Privilege

**Command History**

**Related Commands**
- `show hardware stack-unit` — display the data plane or management plane input and output statistics of the designated component of the designated stack member.

---

### clear cpu statistics

Clear management and SATA interface statistics.

**Syntax**
```
clear cpu party-bus statistics
```
```
clear cpu sata-interface statistics
```
```
clear stack-port
```

**Parameters**
- `cpu party-bus statistics`: Enter the keywords `cpu party-bus statistics` to clear the management statistics.
- `cpu sata-interface statistics`: Enter the keywords `cpu sata-interface statistics` to clear the SATA interface statistics.
- `stack-port`: Enter the keywords `stack-port` then the port number of the stacking port to clear the statistics of the particular stacking port. The range is from 1 to 52.

clear hardware vlan-counters

Clear VLAN statistics.

Syntax

```
clear hardware vlan-counters vlan-id
```

Parameters

- `vlan-id` Enter the interface VLAN number. The range is from 1 to 4094.

Defaults

None

Command Modes

EXEC Privilege

Command History

Usage Information

This command enables a hardware watchdog mechanism that automatically reboots an Dell Networking OS switch/router with a single unresponsive unit. This behavior is a last-resort mechanism intended to prevent a manual power cycle.

show hardware mac

Display MAC ACL entries for the specified stack-unit, port-pipe and pipeline ID.

Syntax

```
show hardware mac {eg-acl | in-acl} stack-unit id port-set 0-0
```

Parameters

- `eg-acl | in-acl`: Enter either the keyword `eg-acl` or the keyword `in-acl` to select between ingress or egress ACL data.
- `stack-unit id`: Enter the keyword `stack-unit` to select the stack unit ID.
- `port-set 0–0`: Enter the keywords `port-set` with a port-pipe number to display the MAC ACL entries for the specified port-pipe number. The range is from 0 to 0.

Defaults

None

Command Modes

EXEC Privilege

Debugging and Diagnostics
show hardware ip

Display ACL or GoS data for the selected stack member and stack member port-pipe.

Syntax

show hardware layer3 {acl | qos} stack-unit number port-set 0-0

Parameters

- **acl | qos**: Enter either the keyword acl or the keyword qos to select between ACL or GoS data.
- **stack-unit number**: Enter the keywords stack-unit then a number to select a stack ID.
- **port-set 0-0**: Enter the keyword port-set with a port-pipe number. The range is from 0 to 0.

Defaults

None

show hardware stack-unit

Display the data plane or management plane input and output statistics of the designated component of the designated stack member.

Syntax

```
stack-unit stack-unit-number {cpu data-plane statistics | cpu management
statistics | [ drops [unit number | fpga register | party-bus statistics |
stack-port | ti-monitor | unit 0-1 {counters | details | port-stats [detail] |
register}}
```

Parameters

- **stack-unit stack-unit-number**: Enter the keywords stack-unit to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered. The range is from 1 to 12.
- **cpu data-plane statistics**: Enter the keywords cpu data-plane statistics then the keywords stack port and its number, from 1 to 52 to display the data plane statistics, which shows the High Gig (Higig) port raw input/output counter statistics to which the stacking module is connected.
- **cpu management statistics**: Enter the keywords cpu management statistics to display the counters of the management port.
- **cpu party-bus statistics**: Enter the keywords cpu party-bus statistics, to display the Management plane input/output counter statistics of the pseudo party bus interface.
- **cpu sata-interface statistics**: Enter the keywords cpu sata-interface statistics to display the sata interface error counter statistics.
- **drops [unit unit-number]**: Enter the keyword drops to display internal drops on the selected stack member. Enter the optional keyword unit unit-number to display the internal drop counters of the specified port pipe.
- **fpga register**: Enter the keyword to display the register value of the fpga register.
- **unit unit-number (counters | details | port-stats [detail] | register)**: Enter the keyword unit then a number and then enter one of the keywords to troubleshoot errors on the selected port-pipe and to give status on why a port is not coming up to register level.
- **TI monitor**: Enter the unit keyword to show information regarding the TI register.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Related Commands

- clear hardware system-flow — clear the statistics from selected hardware components.
show interfaces stack-unit — display information on all interfaces on a specific S-Series stack member.
show processes cpu (S-Series) — display the CPU usage information based on the processes running in an S-Series.
show system — display the current status of all the stack members or a specific member.

show hardware buffer interface

Display buffer statistics for a specific interface.

Syntax

```
show hardware buffer interface interface{priority-group { id | all } | queue { id | all } } buffer-info
```

Parameters

- **interface interface** Enter any of the keywords and slot/port or number information:
  - For a 1-Gigabit Ethernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

- **priority-group** Enter the keyword priority-group followed by *id* for specific priority-group or keyword all.

- **queue** Enter the keyword queue followed by *id* for specific queue or keyword all.

- **buffer-info** To display total buffer information for the interface, enter the keywords buffer-info.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.8(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.

Example displaying total-buffer information for the interface

```
Dell# show hardware buffer interface gigabitethernet 1/1 buffer-info
----- Buffer Stats for Interface Gi 1/1 ----- 
Maximum Shared Limit for the Interface: 38336 
Default Packet Buffer allocate for the Interface: 120 
Used Packet Buffer for the Interface: 0
```

Example displaying priority-group range

```
Dell# show hardware buffer interface gigabitethernet 1/1 priority-group 0 buffer-info
----- Buffer stats for unit: 0 port: 1 (interface Gi 1/1) -----
```
Example displaying queue range

Dell# show hardware buffer interface gigabitethernet 1/1 queue all buffer-info

----- Buffer Stats for Interface Gi 1/1 Queue 0 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 1 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 2 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 3 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 4 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 5 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 6 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 7 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 8 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 9 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 10 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

----- Buffer Stats for Interface Gi 1/1 Queue 11 -----  
Maximum Shared Limit: 29514  
Default Packet Buffer allocate for the Queue: 8  
Used Packet Buffer: 0  

<output truncated for brevity>
Parameters

- **counters**: Enter the keywords `counters` to display counter value for the specified stack-member the port-pipe.

- **interface interface**: Enter any of the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

RX - Jabber Frame Counter                          0
RX - VLAN Tag Frame Counter                        0
```
show hardware buffer-stats-snapshot

Displays buffer statistics tracking resource information for a specific interface.

Syntax

show hardware buffer-stats-snapshot resource interface interface {{priority-group {id | all} | queue ucast {id | all} mcast {id | all} | all} [detail]}

Parameters

interface interface

Enter any of the following keywords and the interface information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

queue

Enter the keyword queue followed by all for displaying details of all queues, ucast queue-id or all for displaying Unicast queue details, and mcast queue-id or all for displaying Multicast queue details.

priority-group

Enter the keyword priority-group followed by id for specific priority-group or keyword all.

Command Modes

EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0)   Introduced on the S3148.
9.8(2.0)    Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.

<output truncated for brevity>
show hardware stack-unit buffer-stats-snapshot (Total Buffer Information)

View the buffer statistics tracking resource information depending on the type of buffer information, such as device-level details, port-level counters, queue-based snapshots, or priority group-level snapshot in the egress and ingress direction of traffic.

Syntax

```
show hardware stack-unit <id> buffer-stats-snapshot unit <id> resource x
```

Parameters

- `stack-unit stack-unit-number` — Unique ID of the stack unit to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered.
- `buffer-stats-snapshot unit number` — Display the historical snapshot of buffer statistical values unit Enter the keyword `unit` along with a port-pipe number. The range is from 0 to 0.
- `buffer-info` — Buffer and traffic manager resources usage, where X can be one of the following:
  - `All` - Displays ingress and egress device, port, and queue snapshots
  - `Interface all queue {all} - egress queue-level snapshot for both unicast and multicast packets`
  - `Interface all queue ucast {id | all} - egress queue-level snapshot for unicast packets only`
  - `Interface all queue mcast {id | all} - egress queue-level snapshot for multicast packets only`
  - `Interface all prio-group {id | all} - ingress priority-group level snapshot`

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
### Usage Information

The following information is displayed based on the buffer-info type, such as device-level details, queue-based snapshots, or priority group-level snapshot in the egress and ingress direction of traffic:

- **Device-ingress** — Displays total buffer accounting usage for the unit.
- **Device-egress** — Displays total buffer usage for the unit, total multicast buffer usage for the unit and also on per-service-pool basis.

When the buffer-stats-snapshot is disabled, the following informational message is displayed when you run the show command: %Info: Buffer-stats-snapshot feature is disabled.

### Example

```
Dell# show hardware buffer-stats-snapshot resource interface fortyGigE 0/0 priority-group 7
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
--------------------------------------------------
PG# PRIORITIES     SHARED CELLS     HEADROOM CELLS
--------------------------------------------------
7   0-2,5          0                0

Dell# show hardware buffer-stats-snapshot resource interface fortyGigE 0/0 priority-group 7
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
--------------------------------------------------
PG# PRIORITIES     SHARED CELLS     HEADROOM CELLS

0   -              0                0
1   -              0                0
2   -              0                0
3   7              0                0
4   6              0                0
5   4              0                0
6   3              0                0
7   0-2,5          0                0
```

### show hardware system-flow

Display Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

#### Syntax

```
show hardware system-flow stack-unit id port-set number [counters]
```

#### Parameters

- **stack-unit id**
  - Enter the keywords `stack-unit` to select a stack member ID.
- **port-set number [counters]**
  - Enter the keywords `port-set` with a port-pipe number.
  - (OPTIONAL) Enter the keyword `counters` for the specified port-pipe.

#### Defaults

None

#### Command Modes

EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
show hardware vlan-counters

Display the hardware VLAN statistics.

Syntax

show hardware vlan-counters vlan-id

Parameters

- **vlan-id** Enter the interface VLAN number. The range is from 1 to 4094.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
show hardware vlan-counters

Displays internal drops on the specified interface or for a range of interface.

Syntax

```
show hardware drops interface interface
```

Parameters

- **drops**: Enter the keyword drops to display internal drops.
- **interface**: Enter any of the following keywords and the interface or interface range information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

Command Modes

- EXEC
- EXEC Privilege

Command History

- This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dynamic Host Configuration Protocol (DHCP)

Dynamic host configuration protocol (DHCP) is an application layer protocol that dynamically assigns IP addresses and other configuration parameters to network end-stations (hosts) based on the configuration policies the network administrators determine.

Topics:
- Commands to Configure the System to be a DHCP Server
- Commands to Configure Secure DHCP
- Commands to Configure DNS

Commands to Configure the System to be a DHCP Server

To configure the system to be a DHCP server, use the following commands.

**clear ip dhcp**

Reset the DHCP counters.

**Syntax**

```
clear ip dhcp [binding {address} | conflict | server statistics]
```

**Parameters**

- **binding**
  - Enter the keyword `binding` to delete all entries in the binding table.
- **address**
  - Enter the IP address to clear the binding entry for a single IP address.
- **conflicts**
  - Enter the keyword `conflicts` to delete all of the log entries created for IP address conflicts.
- **server statistics**
  - Enter the keywords `server statistics` to clear all the server counter information.

**Defaults**

```
None
```

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
Usage Information
Press Enter after the clear ip dhcp binding command clears all the IPs from the binding table.

display ip dhcp server

Display Dell OS debugging messages for DHCP.

Syntax
display ip dhcp server [events | packets]

Parameters
- **events**: Enter the keyword events to display the DHCP state changes.
- **packet**: Enter the keyword packet to display packet transmission/reception.

Defaults
None

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced on the C-Series and S-Series.
Version Description
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced on the C-Series and S-Series.

**debug ipv6 dhcp**

To enable debug logs for DHCPv6 relay agent transactions.

**Syntax**

default-router address [address2...address8]

**Parameters**

- **address** Enter a list of routers that may be the default gateway for clients on the subnet. You may specify up to eight routers. List them in order of preference.

**Defaults**

None

**Command Modes**

DHCP <POOL>

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S4810, S4820T, S6000 and Z-Series.
disable

Disable the DHCP server.

Syntax

```
disable
```

DHCP Server is disabled by default. To enable the system to be a DHCP server, use the `no disable` command.

Defaults

Disabled

Command Modes

- **CONFIGURATION**
- **DHCP <POOL>**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**excluded-address**

Prevent the server from leasing an address or range of addresses in the pool.

Syntax

```
excluded-address [address | low-address high-address]
```

Parameters

- **address**

  Enter a single address to be excluded from the pool.

- **low-address**

  Enter the lowest address in a range of addresses to be excluded from the pool.
**high-address**

Enter the highest address in a range of addresses to be excluded from the pool.

**Defaults**
None

**hardware-address**

For manual configurations, specify the client hardware address.

**Syntax**

hardware-address address

**Parameters**

- **address**
  Enter the hardware address of the client.

**Defaults**
None

**Command Modes**
DHCP <POOL>

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
</tbody>
</table>
**host**

For manual (rather than automatic) configurations, assign a host to a single-address pool.

**Syntax**

```
host address
```

**Parameters**

- `address/mask` Enter the host IP address and subnet mask.

**Defaults**

None

**Command Modes**

DHCP <POOL>

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)  Introduced on the S3148.
- 9.8(2.0)  Introduced on the S3100 series.
- 9.8(1.0)  Introduced on the Z9100-ON.
- 9.8(0.0P5)  Introduced on the S4048-ON.
- 9.8(0.0P2)  Introduced on the S3048-ON.
- 9.7(0.0)  Introduced on the S6000-ON.
- 9.2(1.0)  Introduced on the Z9500.
- 9.0.2.0  Introduced on the S6000.
- 8.3(19.0)  Introduced on the S4820T.
- 8.3(11.1)  Introduced on the Z9000.
- 8.3(7.0)  Introduced on the S4810.
- 8.2(1.0)  Introduced on the C-Series and S-Series.
### lease

Specify a lease time for the addresses in a pool.

**Syntax**

```plaintext
lease {days [hours] [minutes] | infinite}
```

**Parameters**

- `days` Enter the number of days of the lease. The range is from 0 to 31.
- `hours` Enter the number of hours of the lease. The range is from 0 to 23.
- `minutes` Enter the number of minutes of the lease. The range is from 0 to 59.
- `infinite` Specify that the lease never expires.

**Defaults**

24 hours

**Command Modes**

DHCP <POOL>

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
netbios-name-server

Specify the NetBIOS Windows Internet Naming Service (WINS) name servers, in order of preference, that are available to Microsoft Dynamic Host Configuration Protocol (DHCP) clients.

Syntax

netbios-name-server address [address2...address8]

Parameters

address

Enter the address of the NETBIOS name server. You may enter up to eight, in order of preference.

Defaults

None

Command Modes

DHCP <POOL>

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced on the C-Series and S-Series.

netbios-node-type

Specify the NetBIOS node type for a Microsoft DHCP client. Dell Networking recommends specifying clients as hybrid.

Syntax

netbios-node-type type

Parameters

type

Enter the NETBIOS node type:
network

Specify the range of addresses in an address pool.

Syntax

```
network network /prefix-length
```

Parameters

- `network` Specify a range of addresses. Prefix-length range is from 17 to 31.

Defaults

None

Command Modes

- DHCP <POOL>

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### show ip dhcp configuration

Display the DHCP configuration.

**Syntax**

```
show ip dhcp configuration [global | pool name]
```
**show ip dhcp configuration pool**

Display the configuration for a DHCP pool.

**Parameters**

- **pool name**: Display the configuration for a DHCP pool.
- **global**: Display the DHCP configuration for the entire system.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

DNS Servers : 10.11.0.1
Default Routers : 1.1.1.1
Network : 1.1.1.0 255.255.255.0
```

**show ip dhcp conflict**

Display the address conflict log.

**Syntax**

```
show ip dhcp conflict address
```
show ip dhcp server

Display the DHCP server statistics.

Syntax

```plaintext
show ip dhcp server statistics
```

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.

8.3.7.0 Introduced on the S4810.

8.2.1.0 Introduced on the C-Series and S-Series.
### Commands to Configure Secure DHCP

DHCP, as defined by RFC 2131, provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

#### arp inspection

Enable dynamic arp inspection (DAI) on a VLAN.

**Syntax**

```
arp inspection
```

**Defaults**

Disabled

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

- `arp inspection` — enable dynamic ARP inspection on a VLAN.
## clear ip dhcp snooping

Clear the DHCP binding table.

### Syntax

```plaintext
clear ip dhcp snooping {binding | source-address-validation discard-counters [interface interface]}
```

### Parameters

- **binding**
  
  Clears the binding table.

- **source-address-validation discard-counters**

  Clears discard counters from all the interfaces configured with IP Source Guard.

- **interface interface**

  (OPTIONAL) Specifies an interface to clear the discard counters.
  
  Enter any of the following keywords and the interface information:

  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.

### Defaults

None

### Command Modes

EXEC Privilege

### Command History

The following example shows how to clear the discard counters globally:

Dell> clear ip dhcp snooping source-address-validation discard-counters

The following example shows how to clear the discard counters on an interface:

Dell> clear ip dhcp snooping source-address-validation discard-counters
interface Gigabitethernet 1/10

The following example shows how to clear the discard counters on a port channel interface:

Dell> clear ip dhcp snooping source-address-validation discard-counters
interface portchannel 1

Related Commands

- `show ip dhcp snooping` — display the contents of the DHCP binding table.

**clear ipv6 dhcp snooping binding**

Clear all the DHCPv6 snooping binding database entries.

**Syntax**

```
clear ipv6 dhcp snooping binding
```

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.

- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

**Example**

```
Dell# clear ipv6 dhcp snooping binding
```

**ip dhcp relay**

Enable Option 82.

**Syntax**

```
ip dhcp relay information-option [remote-id {port | hostname:port | mac} |
circuit-d {port | hostname:port | mac} | trust-downstream]
```

548 Dynamic Host Configuration Protocol (DHCP)
Parameters

**remote-id**
Enter the keyword `remote-id` to configure the system to enable the remote-id string in option-82.

**remote-id port**
Enter the keywords `remote-id port` to configure the port as the remote id in option-82.

**remote-id hostname:port**
Enter the keywords `remote-id hostname:port` to configure the format of the hostname and port attributes.

**remote-id mac**
Enter the keywords `remote-id mac` to configure the chassis MAC address as the remote-id in option-82.

**circuit-id**
Enter the keyword `circuit-id` to configure the system to enable the circuit-id string in option-82.

**circuit-id port**
Enter the keywords `circuit-id port` to configure the port as the circuit-id in option-82.

**circuit-id hostname:port**
Enter the keywords `circuit-id hostname:port` to configure the circuit-id format that is sent to the server.

**circuit-id mac**
Enter the keywords `circuit-id mac` to configure the chassis MAC address as the circuit-id in option-82.

**trust-downstream**
Configure the system to trust Option 82 when it is received from the previous-hop router.

</tr>
</tbody>
</table>

Usage Information

When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP snooping, the
binding table deletes and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

Introduced in Dell Networking OS version 7.8.1.0, DHCP snooping was available for Layer 3 only and dependent on
DHCP Relay Agent (ip helper-address). Dell Networking OS version 8.2.1.0 extends DHCP Snooping to
Layer 2. You do not have to enable relay agent to snoop on Layer 2 interfaces.

ipv6 dhcp snooping

Enable DHCPv6 snooping globally for ipv6.

Syntax

[no] ipv6 dhcp snooping

Dynamic Host Configuration Protocol (DHCP)
To disable the snooping globally, use the `no ipv6 dhcp snooping` command.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

### `ipv6 dhcp snooping vlan`

Enable ipv6 DHCP Snooping on VLAN or range of VLANs.

**Syntax**

```
[no] ip dhcp snooping vlan <vlan-id>
```

To disable the ipv6 dhcp snooping on VLAN basis or range of VLAN, use the `no ipv6 dhcp snooping vlan <vlan-id>` command.

**Parameters**

- `<vlan-id>` Enter the name of a VLAN id or list of the VLANs to enable DHCP Snooping.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

ip dhcp snooping binding

Create a static entry in the DHCP binding table.

Syntax

[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address
interface interface-type lease number

Parameters

mac address Enter the keyword mac then the MAC address of the host to which the server is leasing the IP address.

vlan-id vlan-id Enter the keywords vlan-id then the VLAN to which the host belongs. The range is from 2 to 4094.

ip ip-address Enter the keyword ip then the IP address that the server is leasing.

interface interface-type Enter the keyword interface then the type of interface to which the host is connected:

• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

lease time Enter the keyword lease then the amount of time the IP address are leased. The range is from 1 to 4294967295.

Defaults

None

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
Version | Description
--- | ---
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
8.3.7.0 | Introduced on the S4810.
8.3.1.0 | Introduced on the E-Series.
7.8.1.0 | Introduced on the C-Series and S-Series.

Related Commands
- `show ip dhcp snooping` — display the contents of the DHCP binding table.

**IPv6 DHCP Snooping Binding**

Create a static DHCP snooping binding entry in the snooping database.

**Syntax**
```
[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value
```

To delete the DHCP snooping binding entry from DHCP snooping database, use the `[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value` command.

**Parameters**
- `mac address` Enter the keyword `mac` then the MAC address of the host to which the server is leasing the IPv6 address.
- `vlan-id` Enter the keywords `vlan-id` then the VLAN to which the host belongs. The range is from 2 to 4094.
- `ipv6 ipv6-address` Enter the keyword `ipv6` then the IPv6 address that is leased to the client.
- `interface type` Enter the keyword `interface` then the type of interface to which the host is connected:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- `interface number` Enter the number of the interface.
- `lease value` Enter the keyword `lease` then the amount of time the IPv6 address are leased. The range is from 1 to 4294967295.

**Defaults**
None

ipv6 dhcp snooping trust

Configure an interface as trusted for DHCP snooping.

Syntax

[no] ipv6 dhcp snooping trust

To disable dhcp snooping trusted capability on this interface, use the no ipv6 dhcp snooping trust command.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
**ip dhcp source-address-validation**

Enable the IP Source Guard.

**Syntax**

```
[no] ip dhcp source-address-validation [ipmac] [vlan vlan-id]
```

**Parameters**

- **ipmac**: Enable IP+MAC Source Address Validation.
- **vlan vlan-id**: (OPTIONAL) SAV validates the source IP address along with the source VLAN ID against the DHCP snooping binding table.

**Defaults**

Disabled

**Command Modes**

- INTERFACE
- INTERFACE PORTCHANNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.
9.6(0.0) | Added the vlan keyword and the vlan-id variable. Introduced support for SAV on port channels interfaces.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.3.1.0 | Introduced on the E-Series.
Version | Description
--- | ---
8.2.1.0 | Added the keyword ipmac.
7.8.1.0 | Introduced on the C-Series and S-Series.

Usage Information
Allocate at least one FP block to ipmacacl before you can enable IP+MAC Source Address Validation and SAV with VLAN option.

1 Use the cam-acl 12acl command from CONFIGURATION mode.
2 Save the running-config to the startup-config.
3 Reload the system.

**ip dhcp relay information-option**

Enable Option 82.

**Syntax**

```plaintext
ip dhcp relay information-option [remote-id {hostname | mac | WORD}] [circuit-id {hostname:port}] [trust-downstream] [vpn]
```

**Parameters**

- `remote-id`
  - Enter the keyword `remote-id` to configure the system to enable the remote-id string in option-82.
- `remote-id hostname`
  - Enter the keywords `remote-id hostname` to configure the port as the remote id in option-82.
- `remote-id mac`
  - Enter the keywords `remote-id mac` to configure the chassis MAC address as the remote-id in option-82.
- `remote-id WORD`
  - Enter the `remote-id WORD` option to configure the system to enable the remote-id string in option 82.
- `circuit-id`
  - Enter the keyword `circuit-id` to configure the system to enable the circuit-id string in option-82.
- `circuit-id hostname:port`
  - Enter the keywords `circuit-id hostname:port` to configure the circuit-id format that is sent to the server.
- `trust-downstream`
  - Configure the system to trust Option 82 when it is received from the previous-hop router.
- `vpn`
  - Enter the keyword `vpn` to add VPN/VRF related sub-option to relay agent information Option 82.

**NOTE:** Adds the VPN/VRF related sub-options into the relay agent information option(82). When DHCP broadcasts are forwarded by the relay agent from clients to DHCP server.

**Default**
Disabled.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(2.0P1) | Introduced the `circuit-id` attribute in the command.
ip dhcp snooping verify mac-address

Validate a DHCP packet’s source hardware address against the client hardware address field (CHADDR) in the payload.

Syntax

```
[no] ip dhcp snooping verify mac-address
```

Defaults

Disabled

</tr>
</tbody>
</table>

**Usage Information**

Use this command on the interfaces where the DHCP clients are connected to forward the packets from clients to DHCP server and vice-versa.

**Example**

Dell(conf-if-gi-1/12)# ip helper-address vrf jay 10.0.0.2

**ipv6 helper-address**

Configures the ipv6 DHCP helper addresses without VRF.

**Syntax**

```
[no] ipv6 helper-address ipv6-address
```

To delete the ipv6 helper address, use the [no] ipv6 helper-address ipv6-address command.

**Parameters**

- **ipv6-address**
  
Enter the keyword `ipv6-address` through which the server address can be reached.

**Default**

Disabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Example

The following example displays the interfaces configured with IP Source Guard:

```
Dell> show ip dhcp snooping source-address-validation
ip sav access-list on GigabitEthernet 1/1
Total cam count 3
  permit host 0.0.0.0 count (0 packets)
  permit host 10.1.1.252 count (0 packets)
  permit host 10.1.1.253 count (0 packets)
ipmac-vlan sav access-list on GigabitEthernet 1/2
Total cam count 4
  permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
  permit host 10.1.1.2 host 00:00:00:aa:00:01 count (0 packets)
  permit vlan 10 host 10.1.1.2 host 00:00:00:aa:00:02 count (0 packets)
  permit vlan 20 host 10.2.2.1 host 00:00:00:aa:00:03 count (0 packets)
  permit vlan 20 host 10.2.2.2 host 00:00:00:aa:00:04 count (0 packets)
```

The following example displays the port channel interfaces configured with IP Source Guard:

```
Dell> show ip dhcp snooping source-address-validation interface portchannel 10
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 1
Total cam count 5
  permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
  permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
  permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
  permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 2
Total cam count 5
  permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
  permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
  permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
  permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 3
Total cam count 5
  permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
  permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0 packets)
  permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
  permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)
```

**NOTE:** The output for port-channel interfaces does not display the physical interface.
The following example displays the SAV discard counters on all interfaces:

Dell> show ip dhcp snooping source-address-validation discard-counters
deny access-list on GigabitEthernet 1/1
Total cam count 1
deny count (0 packets)
deny access-list on GigabitEthernet 1/2
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)

The following example displays the SAV discard counters on a particular interface:

Dell> show ip dhcp snooping source-address-validation discard-counters
interface GigabitEthernet 1/1
deny access-list on GigabitEthernet 1/1
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)

The following example displays the SAV discard counters on a port channel interface:

Dell> show ip dhcp snooping source-address-validation discard-counters
interface portchannel 10
deny access-list on Port-channel 10 on stack-unit 1
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 2
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 3
Total cam count 1
deny vlan 10 count (0 packets)

NOTE: The output for port-channel interfaces does not display the physical interface. If the LAG member interfaces belong to different stack-units, the counters are displayed per stack-unit for that port channel.

show ipv6 dhcp snooping

Display the DHCPv6 snooping binding database.

Syntax
show ipv6 dhcp snooping

Defaults
None

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
Commands to Configure DNS

To configure the Domain Names Systems (DNS) on the system, use the following commands:

**ip name-server**

Configures one or more name server (DNS) IP addresses. You can configure up to six IP addresses.

**Syntax**

```
ip name-server [vrf vrf-name] ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]
```

To undo the name server ip address configuration for VRF, use the `no ip name-server [vrf vrf-name] ip-address` command.

**Parameters**

- **vrf vrf-name**: (Optional) Enter the key word `vrf` and then the name of the VRF to configure the name server IP addresses for that VRF.
- **ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]**: Enter the IP address of the name server in dotted decimal format.

**NOTE:** Use the additional `ip-address` parameters (`ip-address2 to ip-address6`) in a sequential order to specify up to a maximum of six IP addresses per VRF.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.
<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>

</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S-Series and Z-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Use this command to associate the system with one or more DNS servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the `ip name-server` command is configured.

**Example**

```
•    Dell(conf)#ip name-server vrf jay 2.2.2.2
•    Dell(conf)#ip name-server vrf jay 2.2.2.2 3.3.3.3 4.4.4.4 5.5.5.5 6.6.6.6 7.7.7.7
```

**ip domain-name**

Configures the default domain corresponding to a specific VRF. This domain is appended to the incomplete DNS requests corresponding to the specified VRF.

**Syntax**

```
ip domain-name [vrf vrf-name] name
```

**Parameters**

- `vrf vrf-name`  
  (Optional) Enter the key word `vrf` and then the name of the VRF to configure the domain corresponding to that VRF.

- `name`  
  Enter the name of the domain to be appended to the incomplete DNS requests corresponding to the specified VRF.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
### Version Description
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.4.(0.0)**: Introduced on the S-Series and Z-Series.

### Usage Information
Use this command to configure a domain name corresponding to a VRF. This domain is appended to the incomplete DNS requests corresponding to the specified VRF.

### Example
```
Dell(conf)# ip domain-name vrf jay dell.com
```

### ip domain-list

Adds a domain name to the DNS list. This domain name is appended to incomplete host names in DNS requests corresponding to a specific VRF.

#### Syntax
```
ip domain-list [vrf vrf-name] name
```

To remove a domain name from DNS list, use the `no ip domain-list [vrf vrf-name] name` command.

#### Parameters
- **vrf vrf-name**: (Optional) Enter the key word `vrf` and then the name of the VRF to add a domain name to the DNS list corresponding to that VRF.
- **name**: Enter the name of the domain to be appended to the DNS list corresponding to the VRF.

#### Defaults
None

#### Command Modes
EXEC

#### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version Description
- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.4.(0.0)**: Introduced on the S-Series and Z-Series.
Usage Information

Use this command to add domain names to the DNS lists corresponding to a specific VRF. You can add up to a maximum of six domain names to the DNS list corresponding to a VRF. This domain is used to complete the unqualified host names.

Example

Dell(conf)# ip domain-list vrf jay dell.com
Dell(conf)# ip domain-list vrf jay force10.com

ip host

Configures a mapping between the host name server and the IP address for a specific VRF. This mapping information is used by the name-to-IP address table to resolve host names.

Syntax

```
ip host [vrf vrf-name] name ip-address
```

To undo the host name server to IP address mapping for VRFs, use the `no ip host [vrf vrf-name] name ip-address` command.

Parameters

- **vrf vrf-name**: (Optional) Enter the key word `vrf` and then the name of the VRF to configure the name server to IP address mapping for that VRF.
- **name**: Enter the name of the host to be associated with an IP address.
- **ip-address**: Enter the IP address of the name server in dotted decimal format.

Defaults

None

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.4(0.0) Introduced on the S-Series and Z-Series.
```

Usage Information

Use this command to create a mapping between a host name server and its IP addresses for a specific VRF.

Example

Dell(conf)# ip host vrf jay dell 1.1.1.1
clear host

Removes one or all dynamically learned host table entries for a specific VRF.

Syntax

```
clear host [vrf vrf-name] {* | host-name}
```

Parameters

- **vrf vrf-name**  (Optional) Enter the key word vrf and then the name of the VRF to delete dynamically learned host table entries corresponding to that VRF.
- **host-name**  Enter the name of the host corresponding to which you want to delete the dynamically learnt host table entries.
- *****  Enter * to delete all host table entries.

Defaults

None

Command Modes

EXEC

</tr>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S-Series and Z-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Use this command to delete one or all dynamically learned host table entries corresponding to a specific VRF.

Example

```
Dell# clear host vrf jay dell
Dell# clear host vrf jay *
```
Equal Cost Multi-Path (ECMP)

Equal cost multi-path (ECMP) supports multiple "best paths" in next-hop packet forwarding to a destination device.

Topics:
- ecmp-group
- hash-algorithm
- ip ecmp-group
- ip ecmp weighted
- link-bundle-monitor enable
- link-bundle-distribution trigger-threshold
- show config
- show link-bundle distribution

ecmp-group

Provides a mechanism to monitor traffic distribution on an ECMP link bundle. A system log is generated when the standard deviation of traffic distribution on a member link exceeds a defined threshold.

Syntax
```
ecmp-group {ecmp-group-id interface interface | link-bundle-monitor}
```

To remove the selected interface, use the `ecmp-group no interface` command.

To disable link bundle monitoring, use the `ecmp-group no link-bundle-monitor` command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ecmp-group ID</td>
<td>Enter the identifier number for the ECMP group. The range is from 2 to 64.</td>
</tr>
<tr>
<td>interface</td>
<td>Enter the following keywords and the interface information to add the interface to the ECMP group:</td>
</tr>
<tr>
<td></td>
<td>• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.</td>
</tr>
<tr>
<td></td>
<td>• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.</td>
</tr>
<tr>
<td></td>
<td>• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.</td>
</tr>
<tr>
<td></td>
<td>• For a LAG interface, enter the keywords port-channel then the slot/port information.</td>
</tr>
</tbody>
</table>

Defaults

Off
commandmodes

</tbody>
</table>

usageinformation

Using CONFIGURATION mode, create an ECMP group ID. You can then assign interfaces to the ECMP group using CONFIGURATION ECMP-GROUP mode. You can also enable on the port-channel configuration using the CONFIGURATION ECMP-GROUP command mode.

hash-algorithm

Changes the hash algorithm used to distribute traffic flows across a Port Channel and ECMP. The ECMP and LAG options are supported on the S-Series and Z-Series.

Syntax

hash-algorithm {ecmp | lag | seed }

To return to the default hash algorithm, use the no hash-algorithm command.

To return to the default ECMP hash algorithm, use the no hash-algorithm ecmp algorithm-value command.

Parameters

- **ecmp**
  
  Enter the keyword ecmp then one of the following options:
  
  - **crc16**: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
  - **crc16cc**: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
  - **crc32MSB**: Use CRC32_UPPER — MSB 16 bits of computed CRC32
  - **crc32LSB**: Use CRC32_LOWER — LSB 16 bits of computed CRC32
  - **crc-upper**: Uses the upper 32 bits of the key for the hash computation
- **dest-ip**: Uses the destination IP for ECMP hashing
- **lsb**: Returns the LSB of the key as the hash
- **xor1**: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- **xor2**: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- **xor4**: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- **xor8**: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- **xor16**: Use CR16 — 16 bit XOR

**lag**

Enter the keyword *lag* and then one of the following options:

- **crc16**: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
- **crc16cc**: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- **crc32MSB**: Use CRC32_UPPER — MSB 16 bits of computed CRC32
- **crc32LSB**: Use CRC32_LOWER — LSB 16 bits of computed CRC32
- **xor1**: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- **xor2**: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- **xor4**: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- **xor8**: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- **xor16**: Use CR16 — 16 bit XOR

**seed**

Enter the keyword *seed* and the seed value of the hash algorithm. The value ranges from 0 to 2147483646.

**Defaults**

IPSA and IPDA mask value is FF for the stack-unit.

**Command Modes**

CONFIGURATION

</tbody>
</table>
Version | Description
---|---
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.10.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Added the nh-ecmp option.
7.7.1.1 | Added the nh-ecmp option.

**Usage Information**
To ensure that CRC is not used for LAG, set the default hash-algorithm method on E-Series systems. For example, `hash-algorithm ecmp xor lag checksum nh-ecmp checksum`.

The hash value calculated with the hash-algorithm command is unique to the entire unit. The hash algorithm command with the stack-unit option changes the hash for a particular stack-unit by applying the mask specified in the IPSA and IPDA fields.

The stack-unit option is applicable with the lag-hash-align microcode only. Any other microcode returns an error message as follows:

```
Dell(conf)#hash-algorithm linecard 5 ip-sa-mask ff ip-da-mask ff
% Error: This command is not supported in the current microcode configuration
```

The different hash algorithms are based on the number of Port Channel members and packet values. The default hash algorithm (number 0) yields the most balanced results in various test scenarios, but if the default algorithm does not provide a satisfactory distribution of traffic, use the hash-algorithm command to designate another algorithm.

When a Port Channel member leaves or is added to the Port Channel, the hash algorithm is recalculated to balance traffic across the members.

### ip ecmp-group
Enable and specify the maximum number of ecmp that the L3 CAM hold for a route. By default, when maximum paths are not configured, the CAM can hold a maximum of 16 ecmp per route.

**Syntax**
```
ip ecmp-group {maximum-paths | {number} {path-fallback}}
```

To negate a command, use the `no ip ecmp-group maximum-paths {number}` command.

**Parameters**
- **maximum-paths**
- **number**
- **path-fallback**

**Defaults**
16

**Command Modes**
CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description

- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **9.0.0.0**: Introduced on the Z9000.
- **8.3.10.0**: Introduced on the S4810.

### Usage Information

You must save the new ECMP settings to the startup-config (write-mem) then reload the system for the new settings to take effect.

### Command History

```
ip ecmp weighted
```

Enables weighted ECMP calculations.

**Syntax**

```
ip ecmp weighted
```

To disable weighted ECMP calculations, enter the `no ip ecmp weighted` command.

**Defaults**

N/A

**Command Modes**

CONFIGURATION

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description

- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **9.0.0.0**: Introduced on the Z9000.
- **8.3.10.0**: Introduced on the S4810.

### Usage Information

Enabling this CLI would inform the FIB to re-program the destination prefix paths with weights in the HW/CAM on the fly.
If disabled, the CLI would inform the FIB to re-program the destination prefix paths with no weights or regular ECMP.

Example

Dell(conf)# ip ecmp ?
weighted Enables Weighted ECMP
Dell(conf)# ip ecmp weighted
Dell(conf)# do show running-config | grep ecmp
ip ecmp weighted
Dell(conf)#
Dell(conf)# no ip ecmp ?
weighted Disables Weighted ECMP
Dell(conf)# no ip ecmp weighted
Dell(conf)# do show running-config | grep ecmp

link-bundle-monitor enable

Provides a mechanism to enable monitoring of traffic distribution on an ECMP link bundle.

Syntax

link-bundle-monitor enable

To exit from ECMP group mode, use the exit command.

Command Modes

- ECMP-GROUP
- PORT-CHANNEL INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**link-bundle-distribution trigger-threshold**

Provides a mechanism to set the threshold to trigger when traffic distribution begins being monitored on an ECMP link bundle.

**Syntax**

```
link-bundle-distribution trigger-threshold [percent]
```

To exit from ecmp group mode, use the `exit` command.

**Parameters**

- `percent` Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is **60%**.

**Command Modes**

- **EXEC Privilege**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**show config**

Display the ECMP configuration.

**Syntax**

```
show config
```

**Command Modes**

- **CONFIGURATION-ECMP-GROUP**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
show link-bundle distribution

Display the link-bundle distribution for the interfaces in the bundle, type of bundle (LAG or ECMP), and the most recently calculated interface utilization (either bytes per second rate or maximum rate) for each interface.

Syntax
show link-bundle-distribution

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.

Example
Dell# show link-bundle-distribution
Link-bundle trigger threshold - 30
ECMP bundle - 64 Utilization[In Percent] - 0 Alarm State - Inactive

Equal Cost Multi-Path (ECMP)
To configure federal information processing standards (FIPS) cryptography, use the following commands:

Topics:
- fips mode enable
- show fips status
- show ip ssh
- ssh

**fips mode enable**

Enable the FIPS cryptography mode on the platform.

**Syntax**

```
[no] fips mode enable
```

To disable the FIPS cryptography mode, use the `no fips mode enable` command.

**Default**

Disabled

**Command Modes**

**Example**

Dell# show ip ssh
SSH server : enabled.
SSH server version : v2.
SSH server vrf : default.
SSH server ciphers : aes256-ctr, aes256-cbc, aes192-ctr, aes192-cbc,
aes128-ctr, aes128-cbc, 3des-cbc.
SSH server macs : hmac-sha2-256, hmac-shal, hmac-shal-96, hmac-md5,
hmac-md5-96.
SSH server kex algorithms : diffie-hellman-group14-shal.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication : disabled.
Vty Encryption HMAC Remote IP

With FIPS Mode enabled:

Dell# show ip ssh
SSH server : enabled.
SSH server version : v2.
SSH server vrf : default.
SSH server ciphers : 3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-
ctr,aes192-ctr,aes256-ctr.
SSH server macs : hmac-shal-96.
SSH server kex algorithms : diffie-hellman-group14-shal.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication : disabled.
Vty Encryption HMAC Remote IP
0 3des-cbc hmac-shal-96 10.1.20.48
1 3des-cbc hmac-shal-96 10.1.20.48

With FIPS Mode disabled:

Dell# show ip ssh
SSH server : enabled.
SSH server version : v1 and v2.
SSH server vrf : default.
SSH server ciphers : 3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-
ctr,aes192-ctr,aes256-ctr.
SSH server macs : hmac-md5,hmac-md5-96,hmac-shal,hmac-shal-96,hmac-
sha2-256.
SSH server kex algorithms : diffie-hellman-group-exchange-shal,diffie-hellman-
group1-shal,diffie-hellman-group14-shal.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication : disabled.
Vty Encryption HMAC Remote IP
0 3des-cbc hmac-shal-96 10.1.20.48
1 3des-cbc hmac-shal-96 10.1.20.48
Open an SSH connection specifying the hostname, username, port number, and version of the SSH client.

**Syntax**

```
ssh {hostname|ipv4 address|ipv6 address} [-c encryption cipher|-l username|-m HMAC algorithm|-p port-number|-v {1|2}]
```

**Parameters**

- `hostname` (OPTIONAL) Enter the IP address or the hostname of the remote device.
- `ipv4 address` (OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.
- `ipv6 addressprefix` (OPTIONAL) Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- `-c encryption cipher` Enter the following encryption cipher to use. (For v2 clients only.)
  - `3des-cbc`: Force ssh to use 3des-cbc encryption cipher.
  - `aes256-ctr`: Force ssh to use the aes256–ctr encryption cipher.
  - `aes256-cbc`: Force ssh to use the aes128–cbc encryption cipher.
  - `aes192-ctr`: Force ssh to use the aes128–cbc encryption cipher.
  - `aes192-cbc`: Force ssh to use the aes256–cbc encryption cipher.
  - `aes128-ctr`: Force ssh to use the aes256–cbc encryption cipher.
  - `aes128-cbc`: Force ssh to use the aes128–cbc encryption cipher.
  - `3des-cbc`: Force ssh to use 3des-cbc encryption cipher.

- `-l username` (OPTIONAL) Enter the keyword –l then the user name used in this SSH session. The default is the user name of the user associated with the terminal.

- `-m HMAC algorithm` Enter one of the following HMAC algorithms to use. (For v2 clients only.)
  - Without the FIPS mode enabled:
    - `hmac-sha1–96`: Force ssh to use the hmac-sha1–96 HMAC algorithm.
    - `hmac-sha1`: Force ssh to use the hmac-sha1 HMAC algorithm.
    - `hmac-md5–96`: Force ssh to use the hmac-md5–96 HMAC algorithm.
    - `hmac-md5`: Force ssh to use the hmac-md5 HMAC algorithm.
  - With the FIPS mode enabled:
    - `hmac-sha2-256`: Force ssh to use the hmac-sha2-256 HMAC algorithm.
    - `hmac-sha1–96`: Force ssh to use the hmac-sha1–96 HMAC algorithm.
    - `hmac-sha1`: Force ssh to use the hmac-sha1 HMAC algorithm.
    - `hmac-md5–96`: Force ssh to use the hmac-md5–96 HMAC algorithm.
    - `hmac-md5`: Force ssh to use the hmac-md5 HMAC algorithm.

- `-p port-number` (OPTIONAL) Enter the keyword –p then the port number.
  The range is 1 to 65535.
-v (1|2)  (OPTIONAL) Enter the keyword -v then the SSH version 1 or 2. The default: The version from the protocol negotiation.

NOTE: If the FIPS mode is enabled, this option does not display in the output.

Defaults

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version  Description
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Removed the support for hmac-sha2-256-96 algorithm.
9.8(2.0)   Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.5(0.1)   Introduced on the Z9500.
9.1(0.0)   Introduced on the Z9000.
8.3.19.0   Introduced on the S4820T.
8.3.12.0   Introduced on the S4810.

Related Commands
ip ssh server  Configure an SSH server.
show ip ssh client-pub-keys  Display the client-public keys.

Usage Information

Dell Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

NOTE: Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

Example

If FIPS mode is not enabled:

Dell# ssh 10.10.10.10 ?
-c Encryption cipher to use (for v2 clients only)
-l User name option
-m HMAC algorithm to use (for v2 clients only)
-p SSH server port option (default 22)
-v SSH protocol version
<cr>
Dell# ssh 10.10.10.10 -c ?
3des-cbc  Force ssh to use 3des-cbc encryption cipher
aes128-cbc  Force ssh to use aes128-cbc encryption cipher
aes192-cbc  Force ssh to use aes192-cbc encryption cipher
aes256-cbc  Force ssh to use aes256-cbc encryption cipher
aes128-ctr  Force ssh to use aes128-ctr encryption cipher
aes192-ctr  Force ssh to use aes192-ctr encryption cipher
aes256-ctr  Force ssh to use aes256-ctr encryption cipher
Dell# ssh 10.10.10.10 -m ?
hmac-md5          Force ssh to use hmac-md5 HMAC algorithm
hmac-md5-96       Force ssh to use hmac-md5-96 HMAC algorithm
hmac-sha1         Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96      Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-sha2-256     Force ssh to use hmac-sha2-256 HMAC algorithm

With FIPS mode enabled:

Dell# ssh 10.10.10.10 ?
-c   Encryption cipher to use (for v2 clients only)
-l   User name option
-m   HMAC algorithm to use (for v2 clients only)
-p   SSH server port option (default 22)
<cr>
Dell# ssh 10.10.10.10 -c ?
3des-cbc         Force ssh to use 3des-cbc encryption cipher
aes128-cbc       Force ssh to use aes128-cbc encryption cipher
aes192-cbc       Force ssh to use aes192-cbc encryption cipher
aes256-cbc       Force ssh to use aes256-cbc encryption cipher
aes128-ctr       Force ssh to use aes128-ctr encryption cipher
aes192-ctr       Force ssh to use aes192-ctr encryption cipher
aes256-ctr       Force ssh to use aes256-ctr encryption cipher
Dell#ssh 10.10.10.10 -m ?
hmac-sha1        Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96     Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-sha2-256     Force ssh to use hmac-sha2-256 HMAC algorithm
Force10 Resilient Ring Protocol (FRRP)

FRRP is a proprietary protocol for that offers fast convergence in a Layer 2 network without having to run the spanning tree protocol (STP). The resilient ring protocol is an efficient protocol that transmits a high-speed token across a ring to verify the link status. All the intelligence is contained in the master node with practically no intelligence required of the transit mode.

Important Points to Remember

- FRRP is media- and speed-independent.
- FRRP is a Dell Networking proprietary protocol that does not interoperate with any other vendor.
- Spanning Tree must be disabled on both primary and secondary interfaces before Resilient Ring protocol is enabled.
- A VLAN configured as the control VLAN for a ring cannot be configured as a control or member VLAN for any other ring.
- Member VLANs across multiple rings are not supported in Master nodes.
- If multiple rings share one or more member VLANs, they cannot share any links between them.
- Each ring can have only one Master node; all others are Transit nodes.

Topics:
- clear frrp
- debug frrp
- description
- disable
- interface
- member-vlan
- mode
- protocol frrp
- show frrp
- timer

clear frrp

Clear the FRRP statistics counters.

Syntax

```
clear frrp [ring-id]
```

Parameters

- **ring-id** (Optional) Enter the ring identification number. The range is from 1 to 255.

Defaults

None
Command Modes
EXEC

</tbody>
</table>

Usage Information
Executing this command without the optional ring-id command clears the statistics counters on all the available rings. Dell Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Example
Dell# clear frrp
Clear frrp statistics counter on all ring [confirm] yes
Dell#clear frrp 4
Clear frrp statistics counter for ring 4 [confirm] yes
Dell#

Related Commands
- show frrp — display the Resilient Ring Protocol configuration.
**debug frrp**

Clear the FRRP statistics counters.

**Syntax**

```plaintext
debug frrp {event | packet | detail} [ring-id] [count number]
```

To disable debugging, use the `no debug frrp {event | packet | detail} {ring-id} [count number]` command.

**Parameters**

- **event**: Enter the keyword `event` to display debug information related to ring protocol transitions.
- **packet**: Enter the keyword `packet` to display brief debug information related to control packets.
- **detail**: Enter the keyword `detail` to display detailed debug information related to the entire ring protocol packets.
- **ring-id**: (Optional) Enter the ring identification number. The range is from 1 to 255.
- **count number**: Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION (conf-frrp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Introduced on the C-Series.
7.4.1.0 | Introduced.
Because the resilient ring protocol can potentially transmit 20 packets per interface, restrict debug information.

**description**

Enter an identifying description of the ring.

**Syntax**

```
description Word
```

To remove the ring description, use the `no description [Word]` command.

**Parameters**

Word

Enter a description of the ring. Maximum: 255 characters.

**Defaults**

None

**Command Modes**

interface

Configure the primary, secondary, and control-vlan interfaces.

Syntax

interface {primary interface secondary interface control-vlan vlan-id}
To return to the default, use the no interface {primary interface secondary interface control-vlan vlan-id} command.

**Parameters**

- **primary interface**
  - Enter the keyword primary to configure the primary interface then one of the following interfaces and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.

- **secondary interface**
  - Enter the keyword secondary to configure the secondary interface then one of the following interfaces and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.

- **control-vlan vlan-id**
  - Enter the keyword control-vlan then the VLAN ID. The range is from 1 to 4094.

**Defaults**

None

**Command Modes**

CONFIGURATION (conf-frrp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information

This command causes the Ring Manager to take ownership of the two ports after IFM validates the configuration. Ownership is relinquished for a port only when the interface does not play a part in any control VLAN, that is, the interface does not belong to any ring.

Related Commands

- `show frrp` — display the Resilient Ring Protocol configuration information.

member-vlan

Specify the member VLAN identification numbers.

Syntax

```
member-vlan {vlan-range}
```

To return to the default, use the `no member-vlan [vlan-range]` command.

Parameters

- `vlan-range` Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10. Combination: 3, 4, 5-10, 8.

Defaults

None

mode

Set the Master or Transit mode of the ring.

Syntax

```
mode {master | transit}
```

To reset the mode, use the `no mode {master | transit}` command.

Parameters

- **master**: Enter the keyword `master` to set the Ring node to Master mode.
- **transit**: Enter the keyword `transit` to set the Ring node to Transit mode.

Defaults

Mode None

Usage Information

This command places you into the resilient ring protocol. After executing this command, the command line prompt changes to `conf-frrp`.
show frrp

Display the resilient ring protocol configuration.

Syntax

```
show frrp [ring-id [summary]] | [summary]
```

Parameters

- `ring-id` Enter the ring identification number. The range is from 1 to 255
- `summary` (OPTIONAL) Enter the keyword `summary` to view just a summarized version of the Ring configuration.

Defaults

None

Command Modes

Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters
Usage Information

Executing this command without the optional \texttt{ring-id} command clears the statistics counters on all the available rings. Dell Networking OS requires a command line confirmation before the command is executed. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Example (Summary)

Example (Summary)

Dell\# show frrp summary

\begin{verbatim}

Dell#
\end{verbatim}

Related Commands

- \textbf{protocol frrp} — enter the resilient ring protocol and designate a ring identification.

**timer**

Set the hello interval or dead interval for the Ring control packets.

\textbf{Syntax}

\texttt{timer \{hello-interval \textit{milliseconds}\}| \{dead-interval \textit{milliseconds}\}}

To remove the timer, use the no timer \{hello-interval \textit{milliseconds}\}| \{dead-interval \textit{milliseconds}\} command.

\textbf{Parameters}

- **hello-interval** \textit{milliseconds}:
Enter the keyword \texttt{hello-interval} then the time, in milliseconds, to set the hello interval of the control packets. The milliseconds must be entered in increments of 50
Enter the keyword `dead-interval` then the time, in milliseconds, to set the dead interval of the control packets. The range is from 50 to 6000 ms. Default: 1500 ms.

**NOTE:** The configured dead interval must be at least three times the hello interval.

**Defaults**
- 500 ms for `hello-interval milliseconds`
- 1500 ms for `dead-interval milliseconds`

**Usage Information**
The `hello interval` command is the interval at which ring frames are generated from the primary interface of the master node. The `dead interval` command is the time that elapses before a time-out occurs.
GARP VLAN Registration (GVRP)

The Dell Networking operating system supports the basic GVRP commands on the Dell Networking OS.

The generic attribute registration protocol (GARP) mechanism allows the configuration of a GARP participant to propagate through a network quickly. A GARP participant registers or de-registers its attributes with other participants by making or withdrawing declarations of attributes. At the same time, based on received declarations or withdrawals, GARP handles attributes of other participants.

GVRP enables a device to propagate local VLAN registration information to other participant devices and dynamically update the VLAN registration information from other devices. The registration information updates local databases regarding active VLAN members and through which port the VLANs can be reached.

GVRP ensures that all participants on a bridged LAN maintain the same VLAN registration information. The VLAN registration information propagated by GVRP includes both manually configured local static entries and dynamic entries from other devices.

GVRP participants have the following components:

- The GVRP application
- GARP information propagation (GIP)
- GARP information declaration (GID)

Important Points to Remember

- GVRP is supported on Layer 2 ports only.
- All VLAN ports added by GVRP are tagged.
- GVRP is supported on untagged ports belonging to a default VLAN and tagged ports.
- GVRP cannot be enabled on untagged ports belonging to a non-default VLAN unless native VLAN is turned on.
- GVRP requires end stations with dynamic access NICs.
- Based on updates from GVRP-enabled devices, GVRP allows the system to dynamically create a port-based VLAN (unspecified) with a specific VLAN ID and a specific port.
- On a port-by-port basis, GVRP allows the system to learn about GVRP updates to an existing port-based VLAN with that VLAN ID and IEEE 802.1Q tagging.
- GVRP allows the system to send dynamic GVRP updates about your existing port-based VLAN.
- GVRP updates are not sent to any blocked spanning tree protocol (STP) ports. GVRP operates only on ports that are in the forwarding state.
- GVRP operates only on ports that are in the STP forwarding state. If you enable GVRP, a port that changes to the STP Forwarding state automatically begin to participate in GVRP. A port that changes to an STP state other than forwarding no longer participates in GVRP.
- VLANs created dynamically with GVRP exist only as long as a GVRP-enabled device is sending updates. If the devices no longer send updates, or GVRP is disabled, or the system is rebooted, all dynamic VLANs are removed.
- GVRP manages the active topology, not non-topological data such as VLAN protocols. If a local bridge must classify and analyze packets by VLAN protocols, manually configure protocol-based VLANs, and simply rely on GVRP for VLAN updates. But if the local bridge must know only how to reach a given VLAN, then GVRP provides all necessary information.
- The VLAN topologies that GVRP learns are treated differently from VLANs that are statically configured. The GVRP dynamic updates are not saved in NVRAM, while static updates are saved in NVRAM. When GVRP is disabled, the system deletes all VLAN interfaces that were learned through GVRP and leaves unchanged all VLANs that were manually configured.

- disable
garp timers
- gvrp enable
gvrp registration
- protocol gvrp
- show config
- show garp timers
- show gvrp
- show gvrp statistics

**clear gvrp statistics**

Clear GVRP statistics on an interface.

**Syntax**

```
clear gvrp statistics interface interface
```

**Parameters**

`interface interface` Enter the following keywords and the interface information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.

**Defaults**

None

debug gvrp

Enable debugging on GVRP.

Syntax

debug gvrp {config | events | pdu}

To disable debugging, use the no debug gvrp {config | events | pdu} command.

Parameters

- **config**: Enter the keyword config to enable debugging on the GVRP configuration.
- **event**: Enter the keyword event to enable debugging on the JOIN/LEAVE events.
- **pdu**: Enter the keyword pdu then one of the following Interface keywords and the interface information:

  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.

Related Commands

- `gvrp enable` — enable GVRP on physical interfaces and LAGs.
- `protocol gvrp` — access GVRP protocol.

**garp timers**

Set the intervals (in milliseconds) for sending GARP messages.

**Syntax**

```plaintext
garp timers {join | leave | leave-all}
```

To return to the previous setting, use the `no garp timers {join | leave | leave-all}` command.

**Parameters**

- `join`
  - Enter the keyword `join` then the number of milliseconds to configure the join time. The range is from 100 to 147483647 milliseconds. The default is **200 milliseconds**.
  - **NOTE:** Designate the milliseconds in multiples of 100.

- `leave`
  - Enter the keyword `leave` then the number of milliseconds to configure the leave time. The range is from 100 to 2147483647 milliseconds. The default is **600 milliseconds**.
  - **NOTE:** Designate the milliseconds in multiples of 100.

- `leave-all`
  - Enter the keywords `leave-all` then the number of milliseconds to configure the leave-all time. The range is from 100 to 2147483647 milliseconds. The default is **1000 milliseconds**.
  - **NOTE:** Designate the milliseconds in multiples of 100.

**Defaults**

As above.

9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000–ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
### gvrp enable

Enable GVRP on physical interfaces and LAGs.

**Syntax**

```
gvrp enable
```

To disable GVRP on the interface, use the `no gvrp enable` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION-INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### gvrp registration

Configure the GVRP register type.

**Syntax**

```
gvrp registration {fixed | normal | forbidden}
```

To return to the default, use the `gvrp register normal` command.

**Parameters**

- **fixed**: Enter the keyword `fixed` then the VLAN range in a comma-separated VLAN ID set.
- **normal**: Enter the keyword `normal` then the VLAN range in a comma-separated VLAN ID set. This setting is the default.
- **forbidden**: Enter the keyword `forbidden` then the VLAN range in a comma-separated VLAN ID set.

**Defaults**

`normal`

</tbody>
</table>
Usage Information

Fixed registration prevents an interface, configured using the command line, to belong to a VLAN (static configuration) from being unconfigured when it receives a Leave message. Therefore, Registration mode on that interface is fixed.

Normal registration is the default registration. The port’s membership in the VLAN depends on GVRP. The interface becomes a member of a VLAN after learning about the VLAN through GVRP. If the VLAN is removed from the port that sends GVRP advertisements to this device, the port stops being a member of the VLAN.

To advertise or learn about VLANs through GVRP, use the forbidden command when you do not want the interface.

Related Commands

- **show gvrp** — display the GVRP configuration including the registration.

**protocol gvrp**

Access GVRP protocol — (config-gvrp)#.

**Syntax**

```
protocol gvrp
```

**Defaults**

Disabled.

Example
Dell# show garp timers
GARP Timers                  Value (milliseconds)
----------------------------------------
Join Timer                    200
Leave Timer                   600
LeaveAll Timer                10000
Dell#

Related Commands
- `garp timers` — set the intervals (in milliseconds) for sending GARP messages.
show gvrp

Display the GVRP configuration.

Syntax

```
show gvrp [brief | interface]
```

Parameters

- **brief**  
  (OPTIONAL) Enter the keyword `brief` to display a brief summary of the GVRP configuration.
- **interface**  
  (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
Usage Information
If no ports are GVRP participants, the message output changes from `GVRP Participants running on <port_list>` to `GVRP Participants running on no ports`.

Example
```text
Dell# show gvrp brief
GVRP Feature is currently enabled.

Port                GVRP Status      Edge-Port
----------------------------------------------
Gi 3/1              Disabled          No
Gi 3/2              Enabled           No
Gi 3/3              Disabled          No
Gi 3/4              Disabled          No
Gi 3/5              Disabled          No
Gi 3/6              Disabled          No
Gi 3/7              Disabled          No
Gi 3/8              Disabled          No

Dell# show gvrp brief
```

Related Commands
- `show gvrp statistics` — display the GVRP statistics.

show gvrp statistics

Display the GVRP configuration statistics.

Syntax
```
show gvrp statistics {interface interface | summary}
```

Parameters
- `interface` (OPTIONAL) Enter the keyword `interface` then one of the interface keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- `summary` Enter the keyword `summary` to display just a summary of the GVRP statistics.

Defaults
None

Command Modes
- EXEC
- EXEC Privilege

Command History

</tr>
</tbody>
</table>

**Usage Information**

Invalid messages/attributes skipped can occur in the following cases:

- The incoming GVRP PDU has an incorrect length.
- "End of PDU" was reached before the complete attribute could be parsed.
- The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01).
- The attribute that was being parsed had an invalid attribute length.
- The attribute that was being parsed had an invalid GARP event.
- The attribute that was being parsed had an invalid VLAN ID. The valid range is from 1 to 4095.

A failed registration can occur for the following reasons:

- Join requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state).
- An entry for a new GVRP VLAN could not be created in the GVRP database.

**Example**

Dell# show gvrp statistics int gi 1/1

Join Empty Received: 0
Join In Received: 0
Empty Received: 0
LeaveIn Received: 0
Leave Empty Received: 0
Leave All Received: 40
Join Empty Transmitted: 156
Join In Transmitted: 0
Empty Transmitted: 0
Leave In Transmitted: 0
Leave Empty Transmitted: 0
Leave All Transmitted: 41
Invalid Messages/Attributes skipped: 0
Failed Registrations: 0
Dell#

**Related Commands**

- `show gvrp` — display the GVRP configuration.
High Availability (HA)

High availability (HA) in the Dell Networking OS is the configuration synchronization to minimize recovery time in the event of a route processor module (RPM) failure.

In general, a protocol is defined as “hitless” in the context of an RPM failure/failover and not failures of a line card, SFM, or power module. A protocol is defined as hitless if an RPM failover has no impact on the protocol.

You must specifically enable some protocols for HA. Some protocols are only hitless if related protocols are also enabled as hitless (for example, using the redundancy protocol command).

Topics:
- `patch flash://RUNTIME_PATCH_DIR`
- `redundancy disable-auto-reboot`
- `redundancy force-failover`
- `redundancy primary`
- `redundancy protocol`
- `redundancy reset-counter`
- `redundancy synchronize`
- `show patch`
- `show redundancy`

**patch flash://RUNTIME_PATCH_DIR**

Insert an In-Service Modular Hot-Fix patch.

**Syntax**

```
patch flash://RUNTIME_PATCH_DIR/patch-filename
```

To remove the patch, use the `no patch flash://RUNTIME_PATCH_DIR/patch-filename` command.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
Version | Description
--- | ---
9.8(0.0P2) | Introduced on the S3048-ON.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.2.1.0 | Introduced.

Usage Information

The patch filename includes the Dell Networking OS version, the platform, the CPU, and the process it affects (FTOS-platform-cpu-process-patchversion.rtp). For example, a patch labeled “7.8.1.0-EH-rp2-l2mgr-1.rtp” identifies that this patch applies to Dell Networking OS version 7.8.1.0 — E-Series platform, for RP2, addressing the layer 2 management process, and this patch is the first version of this patch.

There is no need to reload or reboot the system when you insert the patch. The In-Service Modular patch replaces the existing process code. After installation is complete, the system executes the patch code as though it was always there.

Related Commands

- show patch — display the system patches loaded with the in-service modular hot fix command.

redundancy disable-auto-reboot

Prevent the system from auto-rebooting the failed module.

Syntax

```
redundancy disable-auto-reboot stack-unit [stack-unit ID| members] [rpm| card number | all]
```

To return to the default, use the `no redundancy disable-auto-reboot stack-unit rpm` command.

Parameters

- rpm
- stack-unit

Default

Disabled — the failed module is automatically rebooted.

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
<table>
<thead>
<tr>

<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the E-Series</td>
</tr>
</tbody>
</table>

Usage Information: Enabling this command keeps the failed RPM in the failed state. If there are two RPMs in the system, enabling this command prevents the failed RPM from becoming a working Standby RPM. If there is only one RPM in the system, the failed RPM does not recover and affects the system.

redundancy force-failover

Force the secondary stack unit to become the primary stack unit. You can also use this command to upgrade the software on one stack unit from the other when the other has been loaded with the upgraded software.

Syntax

redundancy force-failover stack-unit

Parameters

stack-unit Enter the keyword stack-unit then the stack-unit ID number.

Default

Not configured.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
To provide a hitless or warm upgrade, use this command. A hitless upgrade means that a software upgrade does not require a reboot of the line cards. A warm upgrade means that a software upgrade requires a reset of the line cards. A warm upgrade is possible for major releases and lower, while a hitless upgrade can only support patch releases.

**redundancy primary**

Set an RPM as the primary RPM.

**Syntax**

```plaintext
redundancy primary [rpm0 | rpm1]
```

To delete a configuration, use the `no redundancy primary` command.

**Parameters**

- `rpm0`:
  - Enter the keyword `rpm0` to set the RPM in slot R0 as the primary RPM.

- `rpm1`:
  - Enter the keyword `rpm1` to set the RPM in slot R1 as the primary RPM.

**Default**

The RPM in slot R0 is the Primary RPM.

**Command Modes**

- `CONFIGURATION`

**Command History**

- 8.3.12.0
- 8.1.1.0
- 7.5.1.0
- 7.6.1.0

**Description**

- Introduced on the S3148.
- Introduced on the S3100 series.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the S4820T.
- Introduced on the S4810.
- Introduced on the E-Series.
- Introduced on the C-Series.
- Introduced on the E-Series.
**redundancy protocol**

Enable hitless protocols.

**Syntax**

```
redundancy protocol {lacp | xstp}
```

To disable a hitless protocol, use the `no redundancy protocol {lacp | xstp}` command.

**Parameters**

- `lacp` Enter the keyword `lacp` to make LACP hitless.
- `xstp` Enter the keyword `xstp` to invoke hitless STP (all STP modes — MSTP, PVST+, RSTP, and STP).

**Default**

Disabled

**redundancy synchronize**

Manually synchronize data once between the Master and Stand-by stack units.

**Syntax**

```
redundancy synchronize [full]
```

**Parameters**

- `full` Enter the keyword `full` to synchronize all data.

**Default**

Not configured.

**Command Modes**

EXEC Privilege

Usage Information

The following describes the show redundancy command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPM Status</td>
<td>Displays the following information:</td>
</tr>
<tr>
<td></td>
<td>- Slot number of the RPM.</td>
</tr>
<tr>
<td></td>
<td>- Whether the RPM is Primary or Standby.</td>
</tr>
<tr>
<td></td>
<td>- The state of the RPM: Active, Standby, Booting, or Offline.</td>
</tr>
<tr>
<td></td>
<td>- Whether the link to the second RPM is up or down.</td>
</tr>
<tr>
<td>PEER RPM Status</td>
<td>Displays the state of the second RPM, if present</td>
</tr>
<tr>
<td>RPM Redundancy</td>
<td>Displays the following information:</td>
</tr>
<tr>
<td>Configuration</td>
<td>- which RPM is the preferred Primary on next boot (the redundancy primary command)</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
• the data sync method configured (the `redundancy synchronize` command) • the failover type (you cannot change this type; it is software-dependent). **Hot Failover** means that the running configuration and routing table are applied on secondary RPM. **Fast Failover** means that the running configuration is not applied on the secondary RPM until failover occurs, and the routing table on line cards is cleared during failover. • the status of auto booting the RPM (the `redundancy disable-auto-reboot` command) • the parameter for auto failover limit control (the `redundancy auto-failover-limit` command)

**RPM Failover Record** Displays the following information:
• RPM failover counter (to reset the counter, use the `redundancy reset-counter` command)
• the time and date of the last RPM failover
• the reason for the last RPM failover

**Last Data Sync Record** Displays the data sync information and the timestamp for the data sync:
• Start-up Config is the contents of the `startup-config` file.
• Line Card Config is the line card types configured and interfaces on those line cards.
• Runtime Event Log is the contents of the Event log.
• Running Config is the current running-config.
This field only appears when you enter the command from the Primary RPM.

**Example**

```
Dell# show redundancy
-- RPM Status --
--------------------------------------------------
RPM Slot ID:         1
RPM Redundancy Role: Primary
RPM State:           Active
RPM SW Version:      7.5.1.0
Link to Peer:        Up
-- PEER RPM Status --
--------------------------------------------------
RPM State:       Standby
RPM SW Version:  7.5.1.0
-- RPM Redundancy Configuration --
--------------------------------------------------
Primary RPM:         rpm0
Auto Data Sync:      Full
Failover Type:       Hot Failover
Auto reboot RPM:     Enabled
Auto failover limit: 3 times in 60 minutes
-- RPM Failover Record --
--------------------------------------------------
Failover Count:           1
Last failover timestamp:  Jul 13 2007 21:25:32
Last failover Reason:    User request
-- Last Data Block Sync Record: --
```
Dell#
This section lists and describes the possible ICMP message type resulting from a ping. The first three columns list the possible symbol or type/code. For example, you would receive a "!" or "03" as an echo reply from your ping.

Internet Group Management Protocol (IGMP)

The IGMP commands are supported on the Dell Networking OS.

Topics:
- IGMP Commands
- IGMP Snooping Commands

IGMP Commands

Dell Networking OS supports IGMPv1/v2/v3 and is compliant with RFC-3376.

Important Points to Remember

- Dell Networking OS supports protocol-independent multicast-sparse (PIM-SM) and protocol-independent source-specific multicast (PIM-SSM) include and exclude modes.
- IGMPv2 is the default version of IGMP on interfaces. You can configure IGMPv3 on interfaces. It is backward compatible with IGMPv2.
- The maximum number of interfaces supported 95.
- There is no hard limit on the maximum number of groups supported.
- IGMPv3 router interoperability with IGMPv2 and IGMPv1 routers on the same subnet is not supported.
- An administrative command (ip igmp version) is added to manually set the IGMP version.
- All commands previously used for IGMPv2 are compatible with IGMPv3.

**clear ip igmp groups**

Clear entries from the group cache table.

**Syntax**

```
clear ip igmp [vrf vrf-name] groups [group-address | interface]
```

**Parameters**

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.
  
  **NOTE:** Applies to specific VRF if input is provided, else applies to default VRF.

- **group-address**
  - (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

- **interface interface**
  - Enter the following keywords and the interface information:
• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
• For a port channel interface, enter the keywords port-channel then a number.
• For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

EXEC

E-Series legacy command

debag ip igmp

Enable debugging of IGMP packets.

Syntax

debag ip igmp [vrf vrf-name] [group address | interface]

• To disable IGMP debugging, use the no debag ip igmp [vrf vrf-name] [group address | interface] command.
• To disable all debugging, use the undebug all command.
Parameters

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable debugging of IGMP packets corresponding to that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **group-address**
  - (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

- **interface interface**
  - Enter the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.

Defaults

Disabled.

Command Modes

- EXEC Privilege

Command History

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.
ip igmp access-group

To specify access control for packets, use this feature.

Syntax

```
ip igmp access-group access-list
```

To remove the feature, use the `no ip igmp access-group access-list` command.

Parameters

`access-list` Enter the name of the extended ACL (16 characters maximum).

Defaults

Not configured

Command Modes

INTERFACE (conf-if-interface-slot/port)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the C-Series and S-Series.</td>
</tr>
<tr>
<td>7.6(1.0)</td>
<td>Introduced on E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The access list accepted is an extended ACL. To block IGMP reports from hosts, on a per-interface basis based on the group address and source address that you specify in the access list, use this feature.
ip igmp immediate-leave

Enable IGMP immediate leave.

Syntax
ip igmp immediate-leave [group-list prefix-list-name]
To disable ip igmp immediate leave, use the no ip igmp immediate-leave command.

Parameters
group-list prefix-list-name
Enter the keywords group-list then a string up to 16 characters long of the prefix-list-name.

Defaults
Not configured.

Command Modes INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.
7.4.1.0 E-Series legacy command

Usage Information
Querier normally sends some group-specific queries when a leave message is received for a group prior to deleting a group from the membership database. There may be situations when you require immediate deletion of a group from the membership database. This command provides a way to achieve the immediate deletion. In addition, this command provides a way to enable immediate-leave processing for specified groups.
ip igmp last-member-query-interval

Change the last member query interval, which is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages. This interval is also the interval between Group-Specific Query messages.

Syntax

```
ip igmp last-member-query-interval milliseconds
```

To return to the default value, use the `no ip igmp last-member-query-interval` command.

Parameters

- `milliseconds` Enter the number of milliseconds as the interval. For IGMP version 2, the range is from 100 to 25599. For IGMP version 3, the range is from 100 to 65535. The default value is 1000 milliseconds.

Defaults

1000 milliseconds

ip igmp query-interval

Change the transmission frequency of IGMP general queries the Querier sends.

Syntax

```
ip igmp query-interval seconds
```

To return to the default values, use the `no ip igmp query-interval` command.

Parameters

- `seconds` Enter the number of seconds between queries sent out. The range is from 1 to 18000. The default is `60 seconds`.

Defaults

- `60 seconds`

Command Modes

- `INTERFACE`

</tbody>
</table>
Version Description
E-Series legacy command.

Usage Information If you have configured the hello interval value to be greater than 18000, you must first reset that value to be less than or equal to 18000 before upload. Otherwise, the command execution fails during bootup and the hello interval value is set to the default value.

**ip igmp query-max-resp-time**

Set the maximum query response time advertised in general queries.

**NOTE:** The IGMP query-max-resp-time value must be less than the IGMP query-interval value.

**Syntax**

```
ip igmp query-max-resp-time seconds
```

To return to the default values, use the `no ip igmp query-max-resp-time` command.

**Parameters**

- **seconds** Enter the number of seconds for the maximum response time. The range is from 1 to 25. The default is 10 seconds.

**Defaults**

10 seconds

Version | Description
--- | ---
7.6.1.0 | Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0 | Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.

**E-Series legacy command.**

### ip igmp ssm-map

To translate (*,G) memberships to (S,G) memberships, use a statically configured list.

**Syntax**

```
ip igmp [vrf vrf-name] ssm-map std-access-list source-address
```

Undo this configuration, that is, remove SSM map (S,G) states and replace them with (*,G) state, use the `ip igmp [vrf vrf-name] ssm-map std-access-list source-address` command.

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  | **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **std-access-list** Specify the standard IP access list that contains the mapping rules for multicast groups.

- **source-address** Specify the multicast source address to which the groups are mapped.

**Command Modes**

- CONFIGURATION

**Command History**

### ip igmp version

Manually set the version of the router to IGMPv2 or IGMPv3.

#### Syntax

```
ip igmp version {2 | 3}
```

#### Parameters

- **2**
  
Enter the number 2 to set the IGMP version number to IGMPv2.
- **3**
  
Enter the number 3 to set the IGMP version number to IGMPv3.

#### Defaults

2 (IGMPv2)

**show ip igmp groups**

View the IGMP groups.

**Syntax**

```
show ip igmp [vrf vrf-name] groups [group-address [detail] | detail | interface [group-address [detail]]]
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
- **group-address** (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
- **interface** (OPTIONAL) Enter the interface type and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- **detail** (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
------------|-----------------------------------|
9.10(0.0)   | Introduced on the S3148.          |
9.10(0.0)   | Introduced on the S6100--ON.      |
9.8(2.0)    | Introduced on the S3100 series.   |
**Version**  | **Description**  
--- | ---  
9.8(1.0)  | Introduced on the Z9100-ON.  
9.8(0.0P5)  | Introduced on the S4048-ON.  
9.8(0.0P2)  | Introduced on the S3048-ON.  
9.7(0.0)  | Added support for VRF. Introduced on the S6000-ON.  
9.5(0.1)  | Introduced on the Z9500.  
9.0.2.0  | Introduced on the S6000.  
8.3.19.0  | Introduced on the S4820T.  
8.3.11.1  | Introduced on the Z9000.  
8.3.7.0  | Introduced on the S4810.  
7.6.1.0  | Introduced on the S-Series and C-Series.  
7.5.1.0  | Expanded to support the detail option.  

**E-Series legacy command.**

**Usage Information**  
This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

**Field**  | **Description**  
--- | ---  
Group Address  | Lists the multicast address for the IGMP group.  
Interface  | Lists the interface type, slot and port number.  
Mode  | Displays the IGMP version used.  
Uptime  | Displays the amount of time the group has been operational.  
Expires  | Displays the amount of time until the entry expires.  
Last Reporter  | Displays the IP address of the last host to be a member of the IGMP group.  

**Example**

```
Dell# show ip igmp groups  
Total Number of Groups: 5  
IGMP Connected Group Membership  
Group Address Interface Uptime Expires  
225.0.0.0  Vlan 100  00:00:05 00:02:04  
225.0.0.1  Vlan 100  00:00:05 00:02:04  
225.0.0.2  Vlan 100  00:00:05 00:02:04  
225.0.0.3  Vlan 100  00:00:05 00:02:04  
225.0.0.4  Vlan 100  00:00:05 00:02:04  
```

**Example (VLT)**

```
Dell# show ip igmp groups  
Total Number of Groups: 5  
IGMP Connected Group Membership  
```

**NOTE:** The asterisk (*) after the port channel number (Po 2) highlighted in the following example indicates the port channel is VLT, that the local VLT port channel is down and the remote VLT port is up.
Example (Details)

Dell# show ip igmp group details
Interface                  Vlan 20
Group                         232.1.1.5
Uptime                      00:11:22
Expires                       Never
Router mode           INCLUDE
Last reporter            35.0.0.2
Group source list
Source address          Expires
  65.0.0.1                         00:01:22
  65.0.0.2                         00:01:22
  65.0.0.3                         00:01:22
  65.0.0.4                         00:01:22
  65.0.0.5                         00:01:22

show ip igmp interface

View information on the interfaces participating in IGMP.

Syntax

show ip igmp [vrf vrf-name] interface [interface]

Parameters

vrf vrf-name

(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to view IGMP interfaces associated with that VRF.

interface

(OPTIONAL) Enter the interface type and the interface information:

  • For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  • For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  • For a port channel interface, enter the keywords port-channel then a number.
  • For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

  • EXEC
  • EXEC Privilege

Internet Group Management Protocol (IGMP)
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Usage Information

IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.

The `show ip igmp interface` command does not display information corresponding to the loop-back interfaces.

### Example

Dell# show ip igmp interface
GigabitEthernet 1/1 is down, line protocol is down
Internet protocol processing disabled
GigabitEthernet 1/5 is down, line protocol is down
Internet protocol processing disabled
GigabitEthernet 1/6 is down, line protocol is down
Internet protocol processing disabled
GigabitEthernet 1/7 is up, line protocol is down
Internet protocol processing disabled
Vlan 20
Inbound IGMP access group is not set
Internet address is 35.0.0.1/24
IGMP is enabled on interface
IGMP query interval is 60 seconds
IGMP querier timeout is 125 seconds
IGMP max query response time is 10 seconds
IGMP last member query response interval is 1000 ms
IGMP immediate-leave is enabled for all groups
IGMP activity: 0 joins
IGMP querying router is 35.0.0.1 (this system)
IGMP version is 2

### Example (VRF)

Dell# show ip igmp vrf BLUE interface
GigabitEthernet 1/20
Inbound IGMP access group is not set
Internet address is 50.10.4.1/24
show ip igmp ssm-map

Display is a list of groups that are currently in the IGMP group table and contain SSM mapped sources.

Syntax

```
show ip igmp [vrf vrf-name] ssm-map [group]
```

Parameters

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **group**
  - (OPTIONAL) Enter the multicast group address in the form A.B.C.D to display the list of sources to which this group is mapped.

Command Modes

- EXEC
- EXEC Privilege

65.0.0.5                         00:01:22
```

**Related Commands**

- `ip igmp ssm-map` — use a statically configured list to translate (*,G) memberships to (S,G) memberships.

**IGMP Snooping Commands**

Dell Networking OS supports IGMP Snooping version 2 and 3 on all Dell Networking systems.

**Important Points to Remember for IGMP Snooping**

- Dell Networking OS supports version 1, version 2, and version 3 hosts.
- Dell Networking OS IGMP snooping implementation is based on IP multicast address (not based on Layer 2 multicast mac address) and the IGMP snooping entries are in Layer 3 flow table not in Layer 2 forwarding information base (FIB).
- Dell Networking OS IGMP snooping implementation is based on draft-ietf-magma-snoop-10.
- Dell Networking OS supports IGMP snooping on JUMBO-enabled cards.
- IGMP snooping is not enabled by default on the switch.
- A maximum of 1800 groups and 600 VLAN are supported.
- IGMP snooping is not supported on a default VLAN interface.
- IGMP snooping is not supported over VLAN-Stack-enabled VLAN interfaces (you must disable IGMP snooping on a VLAN interface before configuring VLAN-Stack-related commands).
- IGMP snooping does not react to Layer 2 topology changes triggered by spanning tree protocol (STP).
- IGMP snooping reacts to Layer 2 topology changes multiple spanning tree protocol (MSTP) triggers by sending a general query on the interface that comes in the FWD state.
Important Points to Remember for IGMP Querier

- The IGMP snooping Querier supports version 2.
- You must configure an IP address to the VLAN interface for IGMP snooping Querier to begin. The IGMP snooping Querier disables itself when a VLAN IP address is cleared, and then it restarts itself when an IP address is reassigned to the VLAN interface.
- When enabled, IGMP snooping Querier does not start if there is a statically configured multicast router interface in the VLAN.
- When enabled, IGMP snooping Querier starts after one query interval in case no IGMP general query (with IP SA lower than its VLAN IP address) is received on any of its VLAN members.
- When enabled, IGMP snooping Querier periodically sends general queries with an IP source address of the VLAN interface. If it receives a general query on any of its VLAN member, it checks the IP source address of the incoming frame. If the IP SA in the incoming IGMP general query frame is lower than the IP address of the VLAN interface, the switch disables its IGMP snooping Querier functionality.
- If the IP SA of the incoming IGMP general query is higher than the VLAN IP address, the switch continues to work as an IGMP snooping Querier.

clear ip igmp snooping groups

Clear snooping entries from the group cache table.

Syntax

```
clear ip igmp snooping groups [group-address interface | interface]
```

Parameters

- `group-address` (OPTIONAL) Enter the IP multicast group address in dotted decimal format.
- `interface` Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.

Command Modes

EXEC

debug ip igmp snooping

Enable debugging of IGMP snooping packets on interfaces and groups.

Syntax
debug ip igmp snooping [group address | interface]

• To disable debugging of IGMP snooping, use the no debug ip igmp snooping [group address | interface] command.
• To disable all debugging, use the undebug all command.

Parameters

snooping
Enter the keyword snooping to enable debugging of IGMP snooping.

group-address
(Optional) Enter the IP multicast group address in dotted decimal format.

interface
Enter the following keywords and the interface information:

• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
• For a port channel interface, enter the keywords port-channel then a number.

Defaults
Disabled.

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.

Usage Information
IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.
ip igmp snooping enable

Enable IGMP snooping on all or a single VLAN. This command is the master on/off switch to enable IGMP snooping.

**Syntax**

ip igmp snooping enable

To disable IGMP snooping, use the no ip igmp snooping enable command.

**Defaults**

Disabled.

**Command Modes**

- CONFIGURATION
- INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

To enable IGMP snooping, enter this command. When you enable this command from CONFIGURATION mode, IGMP snooping enables on all VLAN interfaces (except the default VLAN).

**NOTE:** Execute the no shutdown command on the VLAN interface for IGMP Snooping to function.
ip igmp snooping fast-leave

Enable IGMP snooping fast-leave for this VLAN.

**Syntax**

```
ip igmp snooping fast-leave
```

To disable IGMP snooping fast leave, use the `no igmp snooping fast-leave` command.

**Defaults**

Not configured.

**Command Modes**

```
INTERFACE VLAN — (conf-if-vl-n)
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**E-Series legacy command.**

**Usage Information**

Queriers normally send some queries when a leave message is received prior to deleting a group from the membership database. There may be situations when you require a fast deletion of a group. When you enable IGMP fast leave processing, the switch removes an interface from the multicast group as soon as it detects an IGMP version 2 leave message on the interface.
**ip igmp snooping flood**

This command controls the flooding behavior of unregistered multicast data packets.

**Syntax**

```
ip igmp snooping flood
```

To undo this configuration, use the `no ip igmp snooping flood` command.

**Defaults**

Enabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>8.2.1.0</td>
<td>Introduced on the C-Series and S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

On the C-Series and S-Series, unregistered multicast data traffic drops when you disable flooding; they do not forward the packets to multicast router ports. On the C-Series and S-Series, in order to disable Layer 2 multicast flooding, disable Layer 3 multicast (no ip multicast-routing).

**ip igmp snooping last-member-query-interval**

The last member query interval is the maximum response time inserted into Group-Specific queries sent in response to Group-Leave messages.

**Syntax**

```
ip igmp snooping last-member-query-interval milliseconds
```

**Usage Information**

This command is not supported on the E-Series.
To return to the default value, use the no ip igmp snooping last-member-query-interval command.

**Parameters**

**milliseconds**
Enter the interval in milliseconds. The range is from 100 to 65535. The default is 1000 milliseconds.

**Defaults**

1000 milliseconds

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

This last-member-query-interval is also the interval between successive Group-Specific Query messages. To change the last-member-query interval, use this command.

### ip igmp snooping mrouter

**Description**

Statically configure a VLAN member port as a multicast router interface.

**Syntax**

```plaintext
ip igmp snooping mrouter interface interface
```
To delete a specific multicast router interface, use the `no ip igmp snooping mrouter interface` command.

**Parameters**

- `interface interface` Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults**

Not configured.

**Command Modes**

`INTERFACE VLAN` — (conf-if-vl-n)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

The Dell Networking OS provides the capability of statically configuring the interface to which a multicast router is attached. To configure a static connection to the multicast router, enter the `ip igmp snooping mrouter interface` command in the VLAN context. The interface to the router must be a part of the VLAN where you are entering the command.
ip igmp snooping querier

Enable IGMP querier processing for the VLAN interface.

Syntax

ip igmp snooping querier

To disable IGMP querier processing for the VLAN interface, use the no ip igmp snooping querier command.

Defaults

Not configured.

Command Modes

INTERFACE VLAN — (conf-if-vl-n)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.2(0.0) Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.

E-Series legacy command

Usage Information

This command enables the IGMP switch to send General Queries periodically. This behavior is useful when there is no multicast router present in the VLAN because the multicast traffic is not routed. Assign an IP address to the VLAN interface for the switch to act as a querier for this VLAN.
show ip igmp snooping groups

Display snooping related information for all the IGMP groups, interface or one group of one interface.

Syntax

```
show ip igmp snooping groups [group-address [detail] | detail | interface [group-address [detail]]]
```

Parameters

- **snooping**
  - Enter the keyword `snooping` to display snooping related information.
- **group-address** (OPTIONAL)
  - Enter the group address in dotted decimal format to view information on that group only.
- **interface** (OPTIONAL)
  - Enter the interface type and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- **detail** (OPTIONAL)
  - Enter the keyword `detail` to display the IGMPv3 source information.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.
### Field Description
- **Group Address**: Lists the multicast address for the IGMP group.
- **Interface**: Lists the interface type, slot and port number.
- **Mode**: Displays the IGMP version used.
- **Uptime**: Displays the amount of time the group has been operational.
- **Expires**: Displays the amount of time until the entry expires.
- **Last Reporter**: Displays the IP address of the last host to be a member of the IGMP group.
- **Member Ports**: Indicates the port channel. If the port channel is VLT, an asterisk (*) after the port channel number indicates the port channel is locally down and that a remote VLT port is up.

### Example
```
Dell# show ip igmp snooping groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address Interface Mode Uptime Expires Last Reporter
225.1.1.1 Vlan 10 IGMPv2-Compat 00:00:07 00:02:09 1.1.1.2
Member Ports: Gi 1/17
Dell#
```

### show ip igmp snooping mrouter
Display multicast router interfaces.

#### Syntax
```
show ip igmp snooping mrouter [vlan number]
```

#### Parameters
- **vlan number**: Enter the keyword `vlan` then the vlan number. The range is from 1 to 4094.

#### Command Modes
- EXEC
- EXEC Privilege

#### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version Description
- **9.10(0.0)**: Introduced on the S3148.
- **9.10(0.0)**: Introduced on the S6100–ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100–ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.

</tbody>
</table>

**E-Series legacy command.**

**Usage Information**

If the port channel is a VLT port channel, an asterisk (*) after the port channel number (Po 100*) indicates the port channel is locally down and that a remote VLT port is up.

**Example**

```
Dell# show ip igmp snooping mrouter
Interface Router Ports
Vlan 2 Gi 1/3, Po 1
Dell#
```

**Related Commands**

- `ip igmp snooping mrouter` — configure a static connection to the multicast router.
- `show ip igmp groups` — view groups.
To configure egress, port channel, time domain, and UDP, use these interface commands.

Topics:
- Basic Interface Commands
- Egress Interface Selection (EIS) Commands
- Port Channel Commands
- Time Domain Reflectometer (TDR) Commands
- UDP Broadcast Commands

## Basic Interface Commands

The following commands are for Physical, Loopback, and Null interfaces.

### clear counters

Clear the counters displayed in the show interfaces commands for all virtual router redundancy protocol (VRRP) groups, virtual local area networks (VLANs), and physical interfaces, or selected ones.

**Syntax**

```
clear counters [interface | vrrp {vr-id | ipv6 vr-id} | learning-limit | vlan vlan-id]
```

**Parameters**

- **interface**: (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:
  - For IPv4 access-group counters, enter the keyword `ip`
  - For IPv6 access-group counters, enter the keyword `ipv6`
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For MAC access-group counters, enter the keyword `mac`
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For the management interface, enter the keyword `ManagementEthernet` then slot/port information.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a tunnel interface, enter the keyword `tunnel`. The range is from 1 to 16383.
NOTE: This command also enables you to clear the port configurations corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.

- For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

vrrp [ipv6 {vr-id} | vr-id] (OPTIONAL) Enter the keyword vrrp to clear the counters of all VRRP groups. To clear the counters of VRRP groups on all IPv6 interfaces, enter ipv6. To clear the counters of a specified group, enter a VRID number from 1 to 255.

learning-limit (OPTIONAL) Enter the keywords learning-limit to clear unknown source address (SA) drop counters when MAC learning limit is configured on the interface.

vlan vlan-id Enter the keyword vlan followed by the interface VLAN number. The range is from 1 to 4094.

Defaults
Without an interface specified, the command clears all interface counters.

</table>
clear counters eee

Clear the counters for EEE on all copper ports or specific ports.

Syntax

```
clear counters [interface-type [slot/port | slot/port-range]] eee
```

Parameters

- `interface-type` Enter the interface information as GigabitEthernet or TenGigabitEthernet followed by the slot and the port number or range of port numbers.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S3100 series, S4820T, and S5000.

Usage Information

Use the `clear counters eee` command to clear counters for EEE on all the copper ports.

Use the `clear counters interface-type slot/port eee` command to clear the counters for EEE on the specified port.

Use the `clear counters interface-type slot/port-range eee` command to clear the counters for EEE on the specified range of ports.

Example

```
Dell# clear counters eee
Clear eee counters on all Copper Ports [confirm] y
Dell#

Dell# clear counters gigabitethernet 1/1 eee
Clear eee counters on Gi 1/1 [confirm] y
Dell#

Dell# clear counters gigabitethernet 1/1-10 eee
```
clear dampening

Clear the dampening counters on all the interfaces or just the specified interface.

**Syntax**

```
clear dampening [interface]
```

**Parameters**

`interface`

(Optional) Enter any of the following keywords and the interface information to clear counters from a specified interface:

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**Defaults**

Without an interface specified, the command clears all interface dampening counters.

**Command Modes**

EXEC Privilege

**Command History**

Example

Dell# clear dampening gigabitethernet 1/10
Clear dampening counters on TeGi 1/10 [confirm] y
Dell#

Related Commands

- show interfaces dampening — display interface dampening information.
- dampening — configure dampening on an interface.

combo-port-type

You can pre-provision the medium of combo ports as copper or fiber.

Syntax

```
combo-port-type{copper | fiber}
```

Parameters

- `copper` Enter the keyword `copper` to provision the combo port as a copper port.
- `fiber` Enter the keyword `fiber` to provision the combo port as a fiber port.

Defaults

None

Command Modes

INTERFACE

Command History

- Version 9.11(0.0) Introduced on the N20xx and N30xx series port extenders.
- Version 9.10(0.0) Introduced on the S3100 series.

Usage Information

By default, a combo port is in Hybrid mode. Use the `combo-port-type` command to provision the combo port as either copper or fiber. Use the `no combo-port-type` command to change the combo port to Hybrid mode.

The `negotiation auto` command is not available on the combo ports in the hybrid mode. You need to provision the combo port as copper or fiber medium using the `combo-port-type` command.

Example

```
Dell(conf-if-gi-1/23)# combo-port-type copper
Dell(conf-if-gi-1/23)# combo-port-type fiber
```

dampening

Configure dampening on an interface.

Syntax

```
dampening [[[half-life] [reuse-threshold]] [suppress-threshold]] [max-suppress-time]]
```

Parameters

- `half-life` Enter the number of seconds after which the penalty is decreased. The penalty decreases half after the half-life period expires. The range is from 1 to 30 seconds. The default is 5 seconds.
- `reuse-threshold` Enter a number as the reuse threshold, the penalty value below which the interface state is changed to “up”. The range is from 1 to 20000. The default is 750.
**suppress-threshold** Enter a number as the suppress threshold, the penalty value above which the interface state is changed to “error disabled”. The range is from 1 to 20000. The default is 2500.

**max-suppress-time** Enter the maximum number for which a route can be suppressed. The default is four times the half-life value. The range is from 1 to 86400. The default is 20 seconds.

**Defaults** Disabled.

**Command Modes** INTERFACE (conf-if-)

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information** With each flap, Dell Networking OS penalizes the interface by assigning a penalty (1024) that decays exponentially depending on the configured half-life. After the accumulated penalty exceeds the suppress threshold value, the interface moves to the Error-Disabled state. This interface state is deemed as "down" by all static/dynamic Layer 2 and Layer 3 protocols. The penalty is exponentially decayed based on the half-life timer. After the penalty decays below the reuse threshold, the interface enables. The configured parameters are as follows:

- suppress-threshold should be greater than reuse-threshold
- max-suppress-time should be at least 4 times half-life

**NOTE:** You cannot apply dampening on an interface that is monitoring traffic for other interfaces.

**Example**

```plaintext
Dell(conf-if-gi-1/10)# dampening 20 800 4500 120
Dell(conf-if-gi-1/10)#
```

**Related Commands**

- `clear dampening` — clear the dampening counters on all the interfaces or just the specified interface.
**default interface**

Reset a physical interface to its factory default settings.

**Syntax**

default interface interface-type slot/port - range

**Parameters**

- **interface-type slot/port**
  - Enter the interface type and slot/port information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

- **range**
  - For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.
  - For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.9(0.0)</td>
<td>Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

Use the `default interface` command to set a Gigabit Ethernet, 10-Gigabit Ethernet, or 40-Gigabit Ethernet interface to its factory-default state. By default, a physical interface is disabled (shutdown) with no assigned IP address or switchport (no ip address). This command removes all software settings and all L3, VLAN, VXLAN, and port-channel configurations on a physical interface.

**Example**

Dell(conf-if-gi-1/5)# show config

```
interface GigabitEthernet 1/5
  description testconfig
  no ip address
  portmode hybrid
  switchport
  rate-interval 8
  mac learning-limit 10 no-station-move
  no shutdown
```

Dell(conf-if-gi-1/5)#

Dell(conf)# default interface gigabitethernet 1/5
Dell(conf-if-gi-1/5)# show config
!
interface GigabitEthernet 1/5
  no ip address
  shutdown

Related Commands
  • show running-config — display the current configuration.

description

Assign a descriptive text string to the interface.

Syntax
description desc_text

To delete a description, use the no description command.

Parameters
desc_text Enter a text string up to 240 characters long.

Defaults None

Command Modes INTERFACE

Command History

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Modified for E-Series: Revised from 78 to 240 characters.</td>
</tr>
</tbody>
</table>
Usage Information

**Important Points to Remember:**

- To use special characters as a part of the description string, you must enclose the whole string in double quotes.
- Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks ("desc_text").
- Entering a text string after the description command overwrites any previous text string that you previously configured as the description.
- The shutdown and description commands are the only commands that you can configure on an interface that is a member of a port-channel.
- Use the show interfaces description command to display descriptions configured for each interface.

### eee

Enable Energy-Efficient Ethernet (EEE) on native or optional module copper ports.

**Syntax**

```
eee
```

To disable EEE, use the `no eee` command.

**Defaults**

None.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S4820T and S5000.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

**Usage Information**

EEE is an IEEE 802.3 az standard that reduces power consumptions on Ethernet ports. When EEE is enabled, transmission is stopped when there is no data to be transmitted and is resumed on arrival of new packets. You can enable EEE only on one Gigabit and ten Gigabit native or optional module copper ports.

**Example**

To enable EEE:

```
Dell(conf)# interface gigabitethernet 1/1
Dell(conf-if-gi-1/1)# eee
```

To disable EEE:

```
Dell(conf)# interface gigabitethernet 1/1
Dell(conf-if-gi-1/1)# no eee
```

### flowcontrol

Control how the system responds to and generates 802.3x pause flow control frames.

**Syntax**

```
flowcontrol {rx {off | on} tx {off | on} [negotiate | pause-threshold value | resume-offset value] | [monitor session-ID]}
```
To return to the default, use the no form of this command.

**Parameters**

- **rx on**
  - Enter the keywords `rx on` to process the received flow control frames on this port.
  
  **NOTE:** Flow-control packets are mirrored only when flow-control `rx` is enabled on an interface.

- **rx off**
  - Enter the keywords `rx off` to ignore the received flow control frames on this port.

- **tx on**
  - Enter the keywords `tx on` to send control frames from this port to the connected device when a higher rate of traffic is received.

- **tx off**
  - Enter the keywords `tx off` so that flow-control frames are not sent from this port to the connected device when a higher rate of traffic is received.

- **pause-threshold**
  - Enter the buffer threshold limit for generating PAUSE frames.

- **resume-offset**
  - Enter the offset value for generating PAUSE frames to resume traffic.

- **negotiate**
  - (Optional) Enter the keyword `negotiate` to enable the pause-negotiation with the egress port of the peer device. If the `negotiate` command is not used, pause-negotiation is disabled. 40-gigabit Ethernet interfaces do not support pause-negotiation.

- **monitor**
  - Enter the keyword `monitor` then the session-ID to enable mirror flow control frames on the interface. The range is from 0 to 65535.

**Defaults**

- `rx on tx off`

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>

<tr>
<td>8.3(7.0)</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.1(1.0)</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Interfaces** 659
**Version**

- **6.5.1.9 and 7.4.1.0**
  Introduced on the E-Series.

- **7.8.1.0**
  Introduced on the C-Series and S-Series with the thresholds option.

**Usage Information**

The globally assigned 48-bit multicast address 01-80-C2-00-00-01 is used to send and receive pause frames. To allow full-duplex flow control, stations implementing the pause operation instruct the MAC to enable the reception of frames with a destination address equal to this multicast address.

When a port receives traffic at a higher rate than it can process, the frames are stored in the port buffer. As a result, buffer usage increases. When the buffer usage reaches the value specified in the “pause-threshold” argument, the port sends PAUSE frame to the connected link partner to stop sending the traffic. Eventually this reduces the buffer usage. When the buffer usage drops by the value specified in the “resume-threshold”, the port again sends a PAUSE frame with 0 as wait-time. This results in resume of the paused traffic flow.

**Important Points to Remember**

- Do not enable tx pause when buffer carving is enabled. For information and assistance, consult Dell Networking TAC.

- Speeds less than one Gig cannot be configured when the asymmetric flow control configuration is on. The following error is returned:
  ```plaintext
  Can’t configure speed <1G when Asymmetric flowcontrol is on, config ignored
  ```

- Dell Networking OS only supports rx on tx on and rx off tx off for speeds less than one Gig (Symmetric).

  **NOTE:** If you use the disable rx flow control command, Dell Networking recommends rebooting the system.

  **NOTE:** Dell Networking OS does not support mirroring of tx pause frames.

**Example**

```plaintext
Dell(conf-if-Gi-1/1)# show config
!
interface GigabitEthernet 1/1
no ip address
switchport
no negotiation auto
flowcontrol rx off tx on
no shutdown
...
```

**Example (Values)**

This Example shows how Dell Networking OS negotiates the flow control values between two Dell Networking chassis connected back-to-back using 1G copper ports.

```

off off off off
off on off off
on on off off
off on off off
on on off off
on on off off

660 Interfaces
```
interface

Configure a physical or virtual interface on the switch.

Syntax

interface interface

Parameters

interface

Enter one of the following keywords and the interface information:

- For a null interface, enter the keyword null then the slot/port information. The Null interface number is 0.
- For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Tunnel interface, enter the keyword tunnel then the tunnel ID. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
- For a port channel interface, enter the keywords port-channel then a number.

Defaults

Not configured.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.4.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

You cannot delete a physical interface.

By default, physical interfaces are disabled (shutdown) and are not assigned to an IP address or switchport. To place an interface in Layer 2 mode, ensure that the interface's configuration does not contain an IP address and enter the switchport command.

You can create up to 64 tunnel interfaces. The tunnel is added as a logical interface with no default configuration. To delete a tunnel interface, use the no interface tunnel tunnel-id command.

The tunnel interface operates as an ECMP (equal cost multi path) only when the next hop to the tunnel destination is over a physical interface. If you select any other interface as the next hop to the tunnel destination, the tunnel interface does not operate as an ECMP.

**Example**

```
Dell(conf)# int tengigabitethernet 1/10
Dell(conf-if-gi-1/10)# exit
Dell(conf)#
```

**Related Commands**

- `interface loopback` — configure a Loopback interface.
- `interface null` — configure a Null interface.
- `interface port-channel` — configure a port channel.
- `interface vlan` — configure a VLAN.
interface group

Create or delete group of VLANs with a single command. You can also use this command to apply a set of configurations on a group of interfaces.

Syntax

interface group [interface | vlan vlanid { - vlanid } ]

To delete a range of VLANs, use the following command:

no interface group vlan vlanid { - vlanid }

Parameters

interface, interface,...

Enter the keywords interface group and one of the interfaces — slot/port or VLAN number. Select the range of interfaces for bulk configuration. Spaces are not required between the commas. Comma-separated ranges can include VLANs and physical interfaces.

Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10.

Slot/Port information need not contain a space before and after the dash. For example, both of the following commands are valid: interface group gigabitethernet 1/1 - 1/5; interface group gigabitethernet 1/1-1/5.

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

CONFIGURATION

Command History

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch.</td>
</tr>
</tbody>
</table>

Usage Information

The interface group command will create all the non-existent VLANs specified in the range. On successful command execution, the CLI switches to the interface group context.

The configuration commands inside the group context will be the similar to that of the existing range command.
Note: For release 9.4(0.0), the group command is supported only for VLANs and physical interfaces.

Example

Dell(conf)# interface group ?
gigabitethernet GigabitEthernet interface IEEE 802.3z
tengigabitethernet TenGigabit Ethernet interface
vlan VLAN keyword
Dell(conf)# interface group vlan 1 - 2 , tengigabitethernet 1/10
Dell(conf-if-group-vl-1-2,gi-1/10)# no shutdown
Dell(conf-if-group-vl-1-2,gi-1/10)# end

Related Commands

- interface range — configure a range of interfaces.
- interface vlan — configures a VLAN.

### interface loopback

Configure a Loopback interface.

**Syntax**

```plaintext
interface loopback number
```

To remove a loopback interface, use the `no interface loopback number` command.

**Parameters**

- **number**
  
Enter a number as the interface number. The range is from 0 to 16383.

**Defaults**

Not configured.

Version         Description
7.5.1.0          Introduced on the C-Series.
6.4.1.0          Introduced

Example
Dell(conf)# interface loopback 1655
Dell(conf-if-lo-1655)#

Related Commands
  •  interface — configure a physical interface.
  •  interface null — configure a Null interface.
  •  interface port-channel — configure a port channel.
  •  interface vlan — configure a VLAN.

interface managementEthernet

Configure the Management port on the system (either the Primary or Standby RPM).

Syntax
interface managementEthernet slot/port

Parameters
  slot/port

Defaults
Not configured.

Command Modes
  CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version     Description
9.10(0.0)    Introduced on the S3148.
9.10(0.0)    Introduced on the S6100-ON.
9.8(2.0)     Introduced on the S3100 series.
9.8(1.0)     Introduced on the Z9100-ON.
9.8(0.0P5)   Introduced on the S4048-ON.
9.8(0.0P2)   Introduced on the S3048-ON.
9.7(0.0)     Introduced on the S6000-ON.
9.2(1.0)     Introduced on the Z9500.
9.0.2.0       Introduced on the S6000.
8.3.19.0      Introduced on the S4820T.
8.3.11.1      Introduced on the Z9000.
8.3.11.1      Introduced on the S55, S60, and S4810.
8.11.1        Introduced on the E-Series.
7.5.1.0       Introduced on the C-Series.
### interface managementethernet

Configure a Management port on the switch.

**Syntax**

```
interface managementethernet slot/port
```

**Parameters**

- `slot/port`: Enter the slot number and port number of the Management port.

**Defaults**

Not configured.

**Command Modes**

- `CONFIGURATION` mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Example

Dell(conf)# interface managementethernet 1/1
Dell(conf-if-ma-1/1)#

---

### interface null

Configure a Null interface on the switch.

**Syntax**

```
interface null number
```

**Parameters**

- `number`: Enter zero (0) as the Null interface number.

**Defaults**

Not configured; number = 0

**Command Modes**

- `CONFIGURATION` mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Example

Dell(conf)# interface null 0

---

### Example

Dell(conf)# interface managementethernet 1/1
Dell(conf-if-ma-1/1)#

**Related Commands**

- `management route` — configure a static route that points to the Management interface or a forwarding router.
- `speed (Management interface)` — Set the speed for the Management interface.
Version | Description
--- | ---
7.5.1.0 | Introduced on the C-Series.
6.4.1.0 | Introduced

Usage Information

You cannot delete the Null interface. The only configuration command possible in a Null interface is `ip unreachables`.

Example

```
Dell(conf)# interface null 0
Dell(conf-if-nu-0)#
```

Related Commands

- `interface` — configure a physical interface.
- `interface loopback` — configure a Loopback interface.
- `interface port-channel` — configure a port channel.
- `interface vlan` — configure a VLAN.
- `ip unreachables` — enable generation of internet control message protocol (ICMP) unreachable messages.

**interface range**

This command permits configuration of a range of interfaces to which subsequent commands are applied (bulk configuration). Using the `interface range` command, you can enter identical commands for a range of interface.

**Syntax**

```
interface range interface {slot/port | port} - {slot/port | port}, interface {slot/port | port} - {slot/port | port},...
```

**Parameters**

Enter `interface range` and one of the interfaces and then the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. The ranges can include VLANs, port-channels, and physical interfaces.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a Tunnel interface, enter the keyword `Tunnel` then a number from 1 to 16383.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When creating an interface range, interfaces appear in the order they are entered; they are not sorted. The command verifies that interfaces are present (physical) or configured (logical).

**Important Points to Remember:**

- Bulk configuration is created if at least one interface is valid.
- Non-existing interfaces are excluded from the bulk configuration with a warning message.
- The `interface range` prompt includes interface types with slot/port information for valid interfaces. The prompt allows for a maximum of 32 characters. If the bulk configuration exceeds 32 characters, it is represented by an ellipsis ( ... ).
- When the `interface range` prompt has multiple port ranges, the smaller port range is excluded from the prompt.
- If overlapping port ranges are specified, the port range is extended to the smallest start port and the biggest end port.

**Example (Bulk)**

```
Dell(conf)# interface range gigabitethernet 1/1 - 1/11, tengigabitethernet 3/3, gigabitethernet 3/10
% Warning: Non-existing ports (not configured) are ignored by interface-range
```

**Example (Multiple Ports)**

```
Dell(conf)# interface range gigabitethernet 2/10 - 2/23, gigabitethernet 2/12 - 2/17
Dell(conf-if-range-gi-2/10-2/23)#
```

**Example (Overlapping Ports)**

```
Dell(conf)# interface range gigabitethernet 2/3 - 2/11, gigabitethernet 2/3 - 2/23
Dell(conf-if-range-gi-2/3-2/23)#
```

**Usage Information**

Only VLAN and port-channel interfaces created using the `interface vlan` and `interface port-channel` commands can be used in the `interface range` command.
Use the `show running-config` command to display the VLAN and port-channel interfaces. VLAN or port-channel interfaces that are not displayed in the `show running-config` command cannot be used with the bulk configuration feature of the `interface range` command. You cannot create virtual interfaces (VLAN, Port-channel) using the `interface range` command.

### NOTE

If a range has VLAN, physical and port-channel interfaces, only commands related to physical interfaces can be bulk configured. To configure commands specific to VLAN and port-channel only those respective interfaces should be configured in a particular range.

**Example (Single Range)**

This example shows a single range bulk configuration.

```plaintext
Dell(config)# interface range gigabitethernet 5/3 - 23
Dell(config-if-range-gi-5/3-5/23)# no shutdown
Dell(config-if-range-gi-5/3-5/23)#
```

**Example (Multiple Range)**

This example shows how to use commas to add different interface types to a range of interfaces.

```plaintext
Dell(config-if)# interface range gigabitethernet 5/1 - 5/23, gigabitethernet 1/1 - 1/2
Dell(config-if-range-gi-5/1-5/23,gi-1/1-1/2)# no shutdown
Dell(config-if-range-gi-5/1-5/23,gi-1/1-1/2)#
```

**Example (Multiple Range)**

This example shows how to use commas to add VLAN and port-channel interfaces to the range.

```plaintext
Dell(config-if)# interface range gigabitethernet 5/1 - 5/23, gigabitethernet 1/1 - 1/2,
Vlan 2-100, Port 1-25
Dell(config-if-range-gi-1/1-1/2,gi-5/1-5/23,vl-2-100,po-1-25)# no shutdown
Dell(config-if-range-gi-1/1-1/2,gi-5/1-5/23,vl-2-100,po-1-25)#
```

**Related Commands**

- `interface port-channel` — configure a port channel group.
- `interface vlan` — configure a VLAN interface.
- `show config (from INTERFACE RANGE mode)` — display the bulk configuration interfaces.
- `show range` — display the bulk configuration ranges.
- `interface range macro (define)` — define a macro for an interface-range.

---

**interface range macro (define)**

Defines a macro for an interface range and then saves the macro in the running configuration.

**Syntax**

```
define interface range macro name interface , interface , ...
```

**Parameters**

- `name`:
  Enter up to 16 characters for the macro name.

- `interface , interface...`:
  Enter the keywords `interface range` and the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. Comma-separated ranges can include VLANs, port-channels, and physical interfaces.
  - For a 1-GigabitEthernet interface, enter the keyword *GigabitEthernet* then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword *TenGigabitEthernet* then the slot/port information.
For a Tunnel interface, enter the keyword tunnel then the tunnel ID. The range is from 1 to 16383.

For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Example (Single Range)**

This example shows how to define an interface range macro named test. Execute the show running-config command to display the macro definition.

```
Dell(config)# define interface-range test gigabitethernet 1/1 - 1/3,
gigabitethernet 5/1 - 5/22, gigabitethernet 3/1 - 3/8
```

```
Dell# show running-config | grep define
define interface-range test gigabitethernet 1/1 - 1/3, gigabitethernet 5/1 -
5/22, gigabitethernet 3/1 - 3/8
Dell(config)# interface range macro test
Dell(config-if-range-gi-1/1-1/3,te-5/1-5/22,te-3/1-3/8)#
```

**Related Commands**

- `interface range` — configure a range of command (bulk configuration).
interface range macro name

Run the interface-range macro to automatically configure the pre-defined range of interfaces.

Syntax

interface range macro name

Parameters

name Enter the name of an existing macro.

Defaults

None

Example (Single Range)

This example shows the macro named test that was defined earlier.

Dell(config)# interface range macro test
Dell(config-if-range-gi-1/1-3,gi-5/1-47,gi-2/1-89)#
Dell

Related Commands

- interface range — configure a range of command (bulk configuration).
- interface range macro (define) — define a macro for an interface range (bulk configuration).
interface vlan

Configure a VLAN. You can configure up to 4094 VLANs.

Syntax

```
interface vlan vlan-id [of-instance{of-id}]
```

Parameters

- **vlan-id**
  - Enter a number as the VLAN Identifier. The range is from 1 to 4094.
- **of-instance{of-id}**
  - Enter the keyword of-instance then the OpenFlow instance ID to add the VLAN to the specified OpenFlow instance. The range is from 1 to 8.

**NOTE:** Associate the OpenFlow instance with the VLAN when the VLAN is created. An existing VLAN cannot be associated with an OpenFlow instance.

Defaults

Not configured, except for the Default VLAN, which is configured as VLAN 1.

Command Modes

</tr>
</tbody>
</table>

Usage Information

For more information about VLANs and the commands to configure them, see Virtual LAN (VLAN) Commands.

FTP, TFTP, and SNMP operations are not supported on a VLAN. MAC ACLs and IP ACLs are supported. For more information, see Access Control Lists (ACL).

The following features are not supported on VLANs associated with an OpenFlow instance:

- IPv4
- IPv6
- MTU

If OpenFlow VLANs are configured on the switch, spanning-tree protocols cannot be enabled simultaneously.
Example (Single Range)

Dell(conf)# int vlan 3
Dell(conf-if-vl-3)#

Related Commands

- interface — configure a physical interface.
- interface loopback — configure a loopback interface.
- interface null — configure a null interface.
- interface port-channel — configure a port channel group.
- show vlan — display the current VLAN configuration on the switch.
- shutdown — disable/enable the VLAN.
- tagged — add a Layer 2 interface to a VLAN as a tagged interface.
- untagged — add a Layer 2 interface to a VLAN as an untagged interface.

keepalive

Send keepalive packets periodically to keep an interface alive when it is not transmitting data.

Syntax

keepalive

To stop sending keepalive packets, use the no keepalive command.

Defaults

Enabled.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>
Usage Information

When you configure keepalive, the system sends a self-addressed packet out of the configured interface to verify that the far end of a WAN link is up. When you configure no keepalive, the system does not send keepalive packets and so the local end of a WAN link remains up even if the remote end is down.

**negotiation auto**

Enable auto-negotiation on an interface.

**Syntax**

```
negotiation auto
```

To disable auto-negotiation, use the no negotiation auto command.

**Defaults**

Enabled.

**Command Modes**

INTERFACE

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

This command is supported on 10/100/1000 Base-T Ethernet interfaces.

The no negotiation auto command is only available if you first manually set the speed of a port to 10Mbits or 100Mbits.

The negotiation auto command provides a mode option for configuring an individual port to forced-master/forced slave after you enable auto-negotiation.

**NOTE:** The mode option is not available on non-10/100/1000 Base-T systems.
If you do not use the mode option, the default setting is slave. If you do not configure forced-master or forced-slave on a port, the port negotiates to either a master or a slave state. Port status is one of the following:

- Forced-master
- Force-slave
- Master
- Slave
- Auto-neg Error — typically indicates that both ends of the node are configured with forced-master or forced-slave.

⚠️ **CAUTION:** Ensure that one end of your node is configured as forced-master and one is configured as forced-slave. If both are configured the same (that is, forced-master or forced-slave), the show interfaces command flaps between an auto-neg-error and forced-master/slave states.

⚠️ **NOTE:** In S3100 series, the negotiation auto command is not available on the combo ports in the hybrid mode. You need to provision the combo port as copper or fiber medium using the combo-port-type command. See combo-port-type.

You can display master/slave settings with the show interfaces command.

**Example (Master/Slave)**

Dell(conf)# interface gigabitethernet 1/1
Dell(conf-if)# neg auto
Dell(conf-if-autoneg)# ?

- end          Exit from configuration mode
- exit         Exit from autoneg configuration mode
- mode         Specify autoneg mode
- no           Negate a command or set its defaults
- show         Show autoneg configuration information

Dell(conf-if-autoneg)# mode ?

- forced-master  Force port to master mode
- forced-slave   Force port to slave mode

Dell(conf-if-autoneg)#

**Example (Configured)**

Dell# show interfaces configured
GigabitEthernet 1/18 is up, line protocol is up
Hardware is Force10Eth, address is 00:01:e8:05:f7:fc
Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interfaces" counters 00:12:42
Queueing strategy: fifo
Input Statistics:
...

**User Information**

Both sides of the link must have auto-negotiation enabled or disabled for the link to come up.

The following details the possible speed and auto-negotiation combinations for a line between two 10/100/1000 Base-T Ethernet interfaces.

**Port 0**

- auto-negotiation enabled* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled* speed 1000 or auto

**Port 1**
- auto-negotiation enabled* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100

**Link Status Between Port 1 and Port 2**
- Up at 1000 Mb/s
- Up at 100 Mb/s
- Up at 100 Mb/s
- Down
- Down

* You cannot disable auto-negotiation when the speed is set to 1000 or auto.

**monitor interface**

Monitor counters on a single interface or all interfaces. The screen is refreshed every five seconds and the CLI prompt disappears.

**Syntax**
```
monitor interface [interface]
```
To disable monitoring and return to the CLI prompt, press the q key.

**Parameters**

interface (OPTIONAL) Enter the following keywords and the interface information:
- For the Management interface on the stack-unit, enter the keyword managementEthernet then the slot/port information.
- For a port channel interface, enter the keyword port-channel and then a number.
- For a Tunnel interface, enter the keyword tunnel then the slot/port. The range is from 1 to 16383.
- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Interfaces
mtu

Set the link maximum transmission unit (MTU) (frame size) for an Ethernet interface.

Syntax

```
mtu value
```

To return to the default MTU value, use the `no mtu` command.

Parameters

- **value**: Enter a maximum frame size in bytes. The range is from 594 to 12000.

Defaults

- **1554**

Command Modes

- **INTERFACE**

Command History

</tr>
</tbody>
</table>

Usage Information

- If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (ip mtu command) must be enough bytes to include the Layer 2 header.

  When you enter the `no mtu` command, Dell Networking OS reduces the IP MTU value to 1536 bytes.

- Link MTU and IP MTU considerations for port channels and VLANs are as follows.

  **port channels:**

  - All members must have the same link MTU value and the same IP MTU value.
• The port channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU of 2000, the port channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

VLANs:

• All members of a VLAN must have the same IP MTU value.
• Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
• The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following shows the difference between Link MTU and IP MTU.

<table>
<thead>
<tr>
<th>Layer 2 Overhead</th>
<th>Link MTU and IP MTU Delta</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet (untagged)</td>
<td>18 bytes</td>
</tr>
<tr>
<td>VLAN Tag</td>
<td>22 bytes</td>
</tr>
<tr>
<td>Untagged Packet with VLAN-Stack Header</td>
<td>22 bytes</td>
</tr>
<tr>
<td>Tagged Packet with VLAN-Stack Header</td>
<td>26 bytes</td>
</tr>
</tbody>
</table>

portmode hybrid

To accept both tagged and untagged frames, set a physical port or port-channel. A port configured this way is identified as a hybrid port in report displays.

Syntax

portmode hybrid

To return a port to accept either tagged or untagged frames (non-hybrid), use the no portmode hybrid command.

Defaults

non-hybrid

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
### Usage Information

The following describes the `interface` command shown in the following example. This example sets a port as hybrid, makes the port a tagged member of VLAN 20, and an untagged member of VLAN 10, which becomes the native VLAN of the port. The port now accepts:

- untagged frames and classify them as VLAN 10 frames
- VLAN 20 tagged frames

The following describes the `do show interfaces` command shown in the following example. This example shows output with “Hybrid” as the newly added value for 802.1QTagged. The options for this field are:

- True — port is tagged
- False — port is untagged
- Hybrid — port accepts both tagged and untagged frames

The following describes the `interface vlan` command shown in the following example. This example shows unconfiguration of the hybrid port using the `no portmode hybrid` command.

**NOTE:** Remove all other configurations on the port before you can remove the hybrid configuration from the port.

### Example

Dell(conf)# interface gigabitethernet 1/1
Dell(conf-if-gi-1/1)# portmode hybrid
Dell(conf-if-gi-1/1)# interface vlan 10
Dell(conf-if-vl-10)# untagged gigabitethernet 1/1

</tbody>
</table>
rate-interval

Configure the traffic sampling interval on the selected interface.

Syntax

rate-interval seconds

Parameters

seconds

Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

NOTE: Because polling occurs every 15 seconds, the number of seconds designated here rounds to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45.

Defaults

299 seconds

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3(19.0) Introduced on the S4820T.
8.3(11.1) Introduced on the Z9000.
8.3(7.0) Introduced on the S4810.
8.11.0 Introduced on the E-Series.
7.6(1.0) Introduced on the S-Series.
7.5(1.0) Introduced on the C-Series.
6.1.1.0 Introduced

Usage Information

The output of the show interfaces command displays the configured rate interval, along with the collected traffic data.
rate-interval (Configuration Mode)

Configure the traffic sampling interval for all physical and logical port-channel interfaces globally. The support to configure rate-interval globally enables you to modify the default interval rate for all physical and logical interfaces at one time.

Syntax

```
rate-interval seconds
```

Use the `no rate-interval` command to remove the sampling interval configuration.

Parameters

- **seconds**: Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

  **NOTE**: Because polling occurs every 15 seconds, the number of seconds designated here round to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45. If you configure this value to be less than 5, then the entire buffer is cleared; the `show int stats` command shows the rate information to be 0 as the polling interval is less than 5.

Defaults

299 seconds

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced on all Dell Networking OS platforms.</td>
</tr>
</tbody>
</table>

Usage Information

The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

- When rate-interval is not configured in the global configuration mode or interface mode, the default value of 299 seconds is applied.
- When rate-interval is configured only in the global configuration mode and not in the interface mode, the global rate-interval value is applied at the interface level also.
- When rate-interval is configured at the interface level and not in the global configuration mode, the interface level rate-interval value is applied for an interface.
- When rate-interval is configured in both global configuration mode as well as interface mode, then the rate-interval value configured at interface level is applied as it takes precedence over the global value.

show config

Display the interface configuration.

Syntax

```
show config
```

Command Modes

INTERFACE

</tbody>
</table>

### Example

#### show config (from INTERFACE RANGE mode)

Display the bulk configured interfaces (interface range).

**Syntax**

```
show config
```

**Command Modes**

CONFIGURATION INTERFACE (conf-if-range)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Example**

Dell(conf)# interface range gigabitethernet 1/1 - 1/2
Dell(conf-if-range-gi-1/1-2)# show config

```
! interface GigabitEthernet 1/1
   no ip address
   switchport
   no shutdown
!
interface GigabitEthernet 1/2
   no ip address
   switchport
   no shutdown
Dell(conf-if-range-gi-1/1-1/2)#
```

**show hardware**

Display the hardware counters on a specified interface or on a specified stack unit.

**Syntax**

```
show hardware {counters interface interface-type slot/port | stack-unit stack-unit-number unit unit-number counters}
```

**Parameters**

- **counters**
  - Enter the keyword `counters` to display the counters on a specified interface.
- **interface**
  - Enter the keyword `interface` followed by the interface information and the slot/port number.
- **stack-unit**
  - Enter the keyword `stack-unit` followed by a stack unit-number to display the counters on a specified stack unit.
- **unit**
  - Enter the keyword `unit` followed by a unit-number.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
</tbody>
</table>
**Version**
9.10(0.1)

**Description**
Introduced on the S3100 series, S4820T, and S5000.

**Usage Information**
Use the `show hardware counters interface interface-type slot/port` to view the hardware counters on the specified interface.

Use the `show hardware stack-unit stack-unit-number unit unit-number counters` to view the hardware counters on the specified stack unit.

**Example**

```
Dell#show hardware counters interface gigabitethernet 10/1
unit: 0 port: 1 (interface Gi 10/1)
```

</tbody>
</table>
show interfaces

Display information on a specific physical interface or virtual interface.

Syntax

```
show interfaces interface-type[-range]
```

Parameters

- **interface**
  - Enter one of the following keywords and the interface information:
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For stack-units, enter the keywords `stack-unit` then the slot/port information.
    - For a Null interface, enter the keyword `null` then the Null interface number.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
    - For a tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.

- **-range**
  - (Optional) Enter the range of interfaces for which you want to view the information. The format is `interface-type slot/port-slot/port`

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Version | Description
--- | ---
9.11(0.0) | Included the FEC BER details in the output for 100G interfaces of S6100–ON and Z9100–ON.
 | Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100.
 | Included display information about EEE on the S3048–ON.
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON. Included display information about EEE on the S3100 series, S4820T, and S5000.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.9(0.0) | Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
9.2(0.2) | Added support for the tunnel interface type.
9.1(0.0) | Updated Management Ethernet output to include two global IPv6 addresses on S4810 and Z9000 and added output example showing OpenFlow instance ID.
8.3.12.1 | Updated command output to support multiple IPv6 addresses on S4810.
8.3.11.4 | Output expanded to support eSR4 optics in Z9000.
8.3.11.1 | Introduced on the Z9000.
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
8.3.7.0 | Introduced on the S4810.
8.2.1.2 | Included SFP and SFP+ optics power detail in the E-Series and C-Series output.
8.2.1.0 | Added support for 4093 VLANs on the E-Series. Prior releases supported 2094.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Output expanded to include SFP+ media on the C-Series.
7.6.1.0 | Introduced on the S Series.
7.5.1.0 | Introduced on the C-Series.
6.4.1.0 | Changed the organization of the display output.
6.3.1.0 | Added the Pluggable Media Type field in the E-Series output.

**Usage Information**

Use the `show interfaces` command for details on a specific interface.
**NOTE:** In the CLI output, the power value is rounded to a 3-digit value. For receive/transmit power that is less than 0.000, an `snmp query` returns the corresponding dbm value even though the CLI displays as 0.000.

**NOTE:** After the counters are cleared, the line-rate continues to increase until it reaches the maximum line rate. When the maximum line rate is reached, there is no change in the line-rate.

User Information

The following table describes the `show interfaces` command shown in the 10G example.

<table>
<thead>
<tr>
<th>Line</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TenGigabitEthernet 1/1</td>
<td>Interface type and administrative and line protocol status.</td>
</tr>
<tr>
<td>Hardware is...</td>
<td>Interface hardware information, assigned MAC address, and current address.</td>
</tr>
<tr>
<td>Pluggable media present...</td>
<td>Present pluggable media wavelength, type, and rate. The error scenarios are:</td>
</tr>
<tr>
<td></td>
<td>• Wavelength, Non-qualified — Dell ID is not present, but wavelength information is available from XFP or SFP serial data</td>
</tr>
<tr>
<td></td>
<td>• Wavelength, F10 unknown — Dell ID is present, but not able to determine the optics type</td>
</tr>
<tr>
<td></td>
<td>• Unknown, Non-qualified — if wavelength is reading error, and F10 ID is not present</td>
</tr>
</tbody>
</table>

Dell Networking allows unsupported SFP and XFP transceivers to be used, but Dell Networking OS might not be able to retrieve some data about them. In that case, typically when the output of this field is “Pluggable media present, Media type is unknown”, the Medium and the XFP/SFP receive power reading data might not be present in the output.

| Interface index... | Displays the interface index number the SNMP uses to identify the interface. |
| Internet address... | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed. |
| MTU 1554... | Displays link and IP MTU information. |
| LineSpeed | Displays the interface’s line speed, duplex mode, and negotiation mode. |
| Energy Efficient Ethernet | Displays whether Energy Efficient Ethernet has been enabled or not. |
| ARP type... | Displays the ARP type and the ARP timeout value for the interface. |
| Last clearing... | Displays the time when the `show interfaces` counters where cleared. |
| Queuing strategy... | States the packet queuing strategy. FIFO means first in first out. |
| Input Statistics: | Displays all the input statistics including: |
|                   | • Number of packets and bytes into the interface |
|                   | • Number of packets with VLAN tagged headers |
|                   | • Packet size and the number of those packets inbound to the interface |
|                   | • Number of Multicast and Broadcast packets: |
|                   | • Multicasts = number of MAC multicast packets |
|                   | • Broadcasts = number of MAC broadcast packets |
|                   | • Number of runts, giants, and throttles packets: |
|                   | • runts = number of packets that are less than 64B |
|                   | • giants = packets that are greater than the MTU size |
|                   | • throttles = packets containing PAUSE frames |
|                   | • Number of CRC, overrun, and discarded packets: |
Line Description
- CRC = packets with CRC/FCS errors
- overrun = number of packets discarded due to FIFO overrun conditions
- discarded = the sum of runts, giants, CRC, and overrun packets discarded without any processing

Output Statistics: Displays output statistics sent out of the interface including:
- Number of packets, bytes, and underruns out of the interface
- Packet size and the number of the packets outbound to the interface
- Number of Multicast, Broadcast, and Unicast packets:
  - Multicasts = number of MAC multicast packets
  - Broadcasts = number of MAC broadcast packets
  - Unicasts = number of MAC unicast packets
- Number of VLANs, throttles, discards, and collisions:
  - Vlans = number of VLAN tagged packets
  - throttles = packets containing PAUSE frames
  - discarded = number of packets discarded without any processing
  - collisions = number of packet collisions
- wred=count both packets discarded in the MAC and in the hardware-based queues

Rate information... Estimate of the input and output traffic rate over a designated interval (30 to 299 seconds). Traffic rate is displayed in bits, packets per second, and percent of line rate.

Time since... Elapsed time since the last interface status change (hh:mm:ss format).

Example
Dell# show interfaces
GigabitEthernet 2/1 is down, line protocol is down
Hardware is DellForce10Eth, address is 00:01:e8:8b:3d:e7
Current address is 00:01:e8:8b:3d:e7
Pluggable media present, Media type is unknown
Wavelength unknown
Interface index is 100992002
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
Flowcontrol rx on tx off
ARP type: ARPA, ARP Timeout 04:00:00
Energy Efficient Ethernet : Yes
Last clearing of "show interface" counters 3d17h53m
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 throttles, 0 discarded, 0 collisions, 0 wredrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Usage Information

The Management port is enabled by default (no shutdown). If necessary, use the ip address command to assign an IP address to the Management port. If two RPMs are installed in your system, use the show redundancy command to display which RPM is the Primary RPM.

Example

Dell# show interfaces gigabitethernet 1/1
GigabitEthernet 1/1 is up, line protocol is down
Hardware is Force10Eth, address is 00:01:e8:41:77:95
Current address is 00:01:e8:41:77:95
Pluggable media present, SFP type is 1000BASE-SX
  Wavelength is 850nm
Interface index is 100974648
Port will not be disabled on partial SFM failure
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit
Flowcontrol rx on tx on

Energy Efficient Ethernet : Yes
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 1w0d5h
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions, 0 wreddrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 1w0d5h
Dell#

Example (Management Ethernet)

Dell# show interfaces managementethernet 1/1
ManagementEthernet 1/1 is up, line protocol is up
Hardware is Force10Eth, address is 00:01:e8:0b:a9:4c
Current address is 00:01:e8:0b:a9:4c
Pluggable media not present
Interface index is 503595208
Internet address is 10.11.201.5/16
Link local IPv6 address: fe80::201:e8ff:fe0b:a94c/64
Global IPv6 address: 2222::5/64
Virtual-IP is not set
Virtual-IP IPv6 address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 10 Mbit, Mode full duplex
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 04:01:08
Queueing strategy: fifo
Input 943 packets, 78347 bytes, 190 multicast
  Received 0 errors, 0 discarded
Output 459 packets, 102388 bytes, 15 multicast
Output 0 errors, 0 invalid protocol
Time since last interface status change: 00:03:09
Dell# show interfaces managementethernet 1/1
ManagementEthernet 1/1 is up, line protocol is up
Hardware is DellForce10Eth, address is 00:01:e8:a0:bf:f3
Current address is 00:01:e8:a0:bf:f3
Pluggable media not present
Interface index is 302006472
Internet address is 10.16.130.5/16
Link local IPv6 address: fe80::201:e8ff:fea0:bff3/64
Global IPv6 address: 1::1/
Global IPv6 address: 2::1/64
Virtual-IP is not set
Virtual-IP IPv6 address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 00:06:14
Queueing strategy: fifo
Input 791 packets, 62913 bytes, 775 multicast
Received 0 errors, 0 discarded
Output 21 packets, 3300 bytes, 20 multicast
Output 0 errors, 0 invalid protocol
Time since last interface status change: 00:06:03

Dell# show interfaces vlan 6
Vlan 6 is down, line protocol is down
Address is 00:01:e8:8a:e1:8c, Current address is 00:01:e8:8a:e1:8c
Interface index is 1107525638
of-instance: 2
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto

ARP type: ARPA, ARP Timeout 04:00:00

Last clearing of "show interface" counters 00:05:12

Queueing strategy: fifo

Time since last interface status change: 00:05:12

Related Commands

- `show interfaces configured` – display any interface with a non-default configuration.
- `show ip interface` – display Layer 3 information about the interfaces.
- `show range` – display all interfaces configured using the interface range command.

  10 packets, 10000 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 10 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  1 packets, 64 bytes, 0 underruns
  1 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 1 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 00:04:59
Dell#

**show interfaces dampening**

Display interface dampening information.

**Syntax**

show interfaces dampening [[interface] [summary] [detail]]

**Parameters**

- **Interface**
  - (Optional) Enter one of the following keywords and the interface information:
    - For a port channel interface, enter the keywords port-channel then a number.
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  
  **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

  - For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.
  - For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to display information
corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

**summary** (OPTIONAL) Enter the keyword summary to display the current summary of dampening data, including the number of interfaces configured and the number of interfaces suppressed, if any.

**detail** (OPTIONAL) Enter the keyword detail to display detailed interface dampening data.

### Defaults
None

### Example
```
Dell# show interfaces dampening
Interface Supp   Flaps Penalty Half-Life Reuse Suppress Max-Sup
State           
Gi 1/2    Up     0     0        20       800   4500     120
Gi 1/10   Up     0     0        5        750   2500     20
Dell#
```

### Related Commands
- `dampening` — configure dampening on an interface.
- `show interfaces configured` — display any interface with a non-default configuration.
**show interfaces eee**

Display whether EEE is enabled on interfaces.

### Syntax

```
show interfaces [interface-type [slot/port | slot/port-range]] eee
```

### Parameters

- **interface-type**: Enter the interface information as `GigabitEthernet` or `TenGigabitEthernet` followed by the slot and the port number or range of port numbers.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

The `show interfaces eee` command displays whether EEE has been enabled and shows the status of all the interfaces.

Use the `show interfaces interface-type slot/port eee` command to view the status of EEE on the specified port.

Use the `show interfaces interface-type slot/port-range eee` command to view the status of EEE on the specified range of ports.

### Example

Example for all the interfaces:

```
S3100 Series
Dell#show interfaces eee

Interface            EEE Status      Speed      Duplex
Gi 1/1                Yes down        Auto       Auto
Gi 1/2                Yes down        Auto       Auto
Gi 1/3                Yes down        Auto       Auto
Gi 1/4                Yes down        Auto       Auto
Gi 1/5                Yes down        Auto       Auto
Gi 1/6                Yes down        Auto       Auto
Gi 1/7                Yes down        Auto       Auto
Gi 1/8                Yes down        Auto       Auto
Gi 1/9                Yes down        Auto       Auto
Gi 1/10               Yes down        Auto       Auto
Gi 1/11               Yes down        Auto       Auto
Gi 1/12               Yes down        Auto       Auto
Gi 1/13               Yes down        Auto       Auto
Gi 1/14               Yes down        Auto       Auto
Gi 1/15               Yes down        Auto       Auto
Gi 1/16               Yes down        Auto       Auto
Gi 1/17               Yes down        Auto       Auto
Gi 1/18               Yes down        Auto       Auto
Gi 1/19               Yes down        Auto       Auto
Gi 1/20               Yes down        Auto       Auto
Gi 1/21               Yes down        Auto       Auto
```
GigabitEthernet 1/22          Yes down        Auto        Auto
GigabitEthernet 1/23          Yes down        Auto        Auto
GigabitEthernet 1/24          Yes down        Auto        Auto
TenGigabitEthernet 1/25       N/A down        Auto        Auto
TenGigabitEthernet 1/26       N/A down        Auto        Auto
<<Output Truncated>>

Example for a specific interface:

**S3100 Series**

```
Dell#show interfaces gigabitethernet 1/1 eee
Interface                    EEE Status      Speed       Duplex
GigabitEthernet 1/1          Yes down        Auto        Auto
```

**Related Commands**

- `show interfaces` — display information on a specific physical interface or virtual interface.

---

**show interfaces eee statistics**

Display the statistical details of Energy Efficient Ethernet (EEE).

**Syntax**

```
show interfaces [interface-type [slot/port | slot/port-range]] eee statistics
```

**Parameters**

- `interface-type` Enter the interface information as GigabitEthernet or TenGigabitEthernet followed by the slot and the port number or range of port numbers.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>

RxLPIDuration
Gi 1/1 Yes Yes 0 0 0 0

Related Commands
• show interfaces — display information on a specific physical interface or virtual interface.

show interfaces phy

Display auto-negotiation and link partner information.

Syntax
show interfaces gigabitethernet slot/port phy

Parameters

gigabitethernet Enter the keyword gigabitethernet then the slot/port information.
tengigabitethernet Enter the keyword tengigabitethernet then the slot or port information.

NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

• For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.

• For ON platforms, you can specify multiple ports as slot/port/([subport]) - slot/port/([subport]). For example, if you want to display information
corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

**Command Modes**

**Usage Information**

The following describes the show interfaces gigabitethernet command following example.

**Mode Control** Indicates if auto negotiation is enabled. If so, indicates the selected speed and duplex.

**Mode Status** Displays auto negotiation fault information. When the interface completes auto negotiation successfully, the autoNegComplete field and the linkstatus field read “True.”

**AutoNegotiation Advertise** Displays the control words the local interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the local interface supports.

**AutoNegotiation Remote Partner’s Ability** Displays the control words the remote interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the remote interface supports.

**AutoNegotiation Expansion** ParallelDetectionFault is the handshaking scheme in which the link partner continuously transmit an “idle” data packet using the Fast Ethernet MLT-3 waveform. Equipment that does not support auto-negotiation must be configured to exactly match the mode of operation as the link partner or else no link can be established.

**1000Base-T Control** 1000Base-T requires auto-negotiation. The IEEE Ethernet standard does not support setting a speed to 1000 Mbps with the speed command without auto-negotiation. E-Series line cards support both full-duplex and half-duplex 1000BaseT.
**Phy Specific Control**

Values are:

- 0 - Manual MDI
- 1 - Manual MDIX
- 2 - N/A
- 3 - Auto MDI/MDIX

**Phy Specific Status**

Displays PHY-specific status information. Cable length represents a rough estimate in meters:

- 0 - < 50 meters
- 1 - 50 - 80 meters
- 2 - 80 - 110 meters
- 3 - 110 - 140 meters
- 4 - 140 meters

Link Status: Up or Down

**Speed:**

- Auto
- 1000MB
- 100MB
- 10MB

**Example**

Dell# show interfaces gigabitethernet 1/1 phy

Mode Control:
- SpeedSelection: 10b
- AutoNeg: ON
- Loopback: False
- PowerDown: False
- Isolate: False
- DuplexMode: Full

Mode Status:
- AutoNegComplete: False
- RemoteFault: False
- LinkStatus: False
- JabberDetect: False

AutoNegotiation Advertise:
- 100MegFullDplx: True
- 100MegHalfDplx: True
- 10MegFullDplx: False
- 10MegHalfDplx: True
- Asym Pause: False
- Sym Pause: False

AutoNegotiation Remote Partner’s Ability:
- 100MegFullDplx: False
- 100MegHalfDplx: False
- 10MegFullDplx: False
- 10MegHalfDplx: False
- Asym Pause: False
- Sym Pause: False

AutoNegotiation Expansion:
- ParallelDetectionFault: False

...
show interfaces stack-unit

Display information on all interfaces on a specific S-Series or Z-Series stack member.

Syntax
show interfaces stack-unit unit-number

Parameters
unit-number Enter the stack member number.

Command Modes
• EXEC
• EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.

Example
Dell# show interfaces stack-unit 1
GigabitEthernet 1/1 is down, line protocol is down
Hardware is Force10Eth, address is 00:01:e8:4c:f2:82
  Current address is 00:01:e8:4c:f2:82
Pluggable media not present
Interface index is 34129154
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto, Mode auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 3w0d17h
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  5144 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 throttles, 0 discarded, 0 collisions
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 3w0d17h
  GigabitEthernet 1/2 is down, line protocol is down
  Hardware is Force10Eth, address is 00:01:e8:4c:f2:83
  Current address is 00:01:e8:4c:f2:83
!----------output truncated ----------------!

Related Commands
  • show hardware stack-unit — display data plane and management plane input/output statistics.

show interfaces status

To display status information on a specific interface only, display a summary of interface information or specify a stack-unit slot and interface.

Syntax

Parameters

  interface  (OPTIONAL) Enter one of the following keywords the interface information:

  • For a port channel interface, enter the keywords port-channel then a number.
  • For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

  NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

  • For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.
  • For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

  stack-unit slot-number  (OPTIONAL) Enter the keyword stack-unit then the slot number. The range is from 0 to 5.

Defaults

  None

Command Modes

  • EXEC
  • EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Command History

#### Version Description

- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.9(0.0)** Added support to display the interface configurations corresponding to a range of ports.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P6)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **8.5.1.0** Added support for 4-port 40G line cards on the E-Series.
- **8.1.1.0** Introduced on the E-Series.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **7.5.1.0** Introduced on the E-Series.

### Example

```
Dell# show interfaces status

Port    Description  Status  Speed    Duplex  Vlan
Gi 1/1   Up        1000 Mbit Auto    --
Gi 1/2   Down      Auto      Auto    1
Gi 1/3   Down      Auto      Auto    1
Gi 1/4   Down      Auto      Auto    --
Gi 1/5 DellPort Up        1000 Mbit Auto  30-130
Gi 1/6   Down      Auto      Auto    --
Gi 1/7   Down      Auto      Auto    --
Gi 1/8   Up        1000 Mbit Auto  1502,1504,1506-1508,1602
Gi 1/9   Down      Auto      Auto    --
Gi 1/10  Down      Auto      Auto    --
Gi 1/11  Down      Auto      Auto    --
Gi 1/12  Down      Auto      Auto    --
Gi 1/13  Down      Auto      Auto    --
Gi 1/14  Down      Auto      Auto    --
Gi 1/15  Down      Auto      Auto    --
Gi 1/16  Down      Auto      Auto    --
```

Dell#
**show interfaces switchport**

Display only virtual and physical interfaces in Layer 2 mode. This command displays the Layer 2 mode interfaces’ IEEE 802.1Q tag status and VLAN membership.

**Syntax**

```plaintext
show interfaces switchport [interface-type | stack-unit unit-id ]
```

**Parameters**

- `interface-type` (OPTIONAL) Enter one of the following keywords and the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a backup interface for this interface, enter the keyword `backup`.

  **NOTE:** This command also enables you to view information corresponding to a range of ports.

  - For physical interfaces, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
  - For port-channel interfaces, you can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces port-channel 1 - 4`.

- `stack-unit unit-id` (OPTIONAL) Enter the keywords `stack-unit` then the stack member number.

**Command Modes**

- EXEC
- EXEC Privilege

Version | Description
--- | ---
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
8.2.1.0 | Added support for 4093 VLANs on E-Series.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Support added for hybrid port/native VLAN, introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.

**E-Series legacy command**

**Usage Information**
The following describes the show interfaces switchport command for the following example.

<table>
<thead>
<tr>
<th>Items</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Displays the interface's type, slot/port number.</td>
</tr>
<tr>
<td>802.1QTagged</td>
<td>Displays whether if the VLAN tagged (“True”), untagged (“False”), or hybrid (“Hybrid”), which supports both untagged and tagged VLANs by the port.</td>
</tr>
<tr>
<td>Vlan membership</td>
<td>Lists the VLANs to which the interface is a member. Starting with Dell Networking OS version 7.6.1, this field can display native VLAN membership by the port.</td>
</tr>
</tbody>
</table>

**Example**
```
Dell# show interfaces switchport
Name: GigabitEthernet 1/1
  802.1QTagged: Hybrid
  Vlan membership:
     Vlan  2, Vlan 20
     Native VlanId: 20

Name: GigabitEthernet 1/2
  802.1QTagged: True
  Vlan membership:
     Vlan  2

Name: GigabitEthernet 1/3
  802.1QTagged: True
  Vlan membership:
     Vlan  2

Name: GigabitEthernet 1/4
  802.1QTagged: True
  Vlan membership:
     Vlan  2
     --More--
```

**Related Commands**
- `interface` — configure a physical interface on the switch.
- `show ip interface` — display Layer 3 information about the interfaces.
- `show interfaces transceiver` — display the physical status and operational status of an installed transceiver. The output also displays the transceiver’s serial number.
show interfaces transceiver

Display the details of an installed transceiver.

Syntax

```
show interfaces [interface number] transceiver
```

Parameters

- **interfaces interface number** (OPTIONAL) Enter one of the following keywords and then the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

Command Modes

<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>RX Power High Warning threshold</td>
<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>Temp Low Warning threshold</td>
<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>Voltage Low Warning threshold</td>
<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>Bias Low Warning threshold</td>
<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>TX Power Low Warning threshold</td>
<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>Power Low Warning threshold</td>
<td>Factory-defined setting. Value can differ between SFP and SFP+.</td>
</tr>
<tr>
<td>Temperature</td>
<td>Current temperature of the SFPs. If this temperature crosses Temp High alarm/warning thresholds, the temperature high alarm/warning flag is set to true.</td>
</tr>
<tr>
<td>Voltage</td>
<td>Current voltage of the SFPs. If this voltage crosses voltage high alarm/warning thresholds, the voltage high alarm/warning flag is set to true.</td>
</tr>
<tr>
<td>Tx Bias Current</td>
<td>Present transmission (Tx) bias current of the SFP. If this crosses bias high alarm/warning thresholds, the TX bias high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the TX bias low alarm/warning flag is set to true.</td>
</tr>
<tr>
<td>Tx Power</td>
<td>Present Tx power of the SFP. If this crosses Tx power high alarm/warning thresholds, the Tx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Tx power low alarm/ warning flag is set to true.</td>
</tr>
<tr>
<td>Rx Power</td>
<td>Present receiving (Rx) power of the SFP. This value is either average Rx power or OMA. This depends on the Rx Power measurement type displayed above. If this crosses Rx power alarm/warning thresholds, the Rx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Rx power low alarm/warning flag is set to true.</td>
</tr>
<tr>
<td>Data Ready state Bar</td>
<td>This field indicates that the transceiver has achieved power up and data is ready. This is set to true if data is ready to be sent and set to false if data is being transmitted.</td>
</tr>
<tr>
<td>Rx LOS state</td>
<td>This is the digital state of the Rx LOS output pin. This is set to true if the operating status is down.</td>
</tr>
<tr>
<td>Tx Fault state</td>
<td>This is the digital state of the Tx Fault output pin.</td>
</tr>
<tr>
<td>Rate Select state</td>
<td>This is the digital state of the SFP rate select input pin.</td>
</tr>
<tr>
<td>RS state</td>
<td>This is the reserved digital state of the pin AS(1) per SFF-8079 and RS(1) per SFF-8431.</td>
</tr>
<tr>
<td>Tx Disable state</td>
<td>If the admin status of the port is down then this flag is set to true.</td>
</tr>
<tr>
<td>Temperature High Alarm Flag</td>
<td>This can be either true or false, depending on the Current voltage value displayed above.</td>
</tr>
<tr>
<td>Line</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>

show interfaces vlan

Display VLAN statistics.

Syntax

```
show interfaces vlan {vlan-id} [LINE] {description}
```

Parameters

- **vlan-id**: Enter the interface VLAN number. The range is from 1 to 4094.
- **LINE** (OPTIONAL): Enter the name of the VLAN.
- **description**: Displays the VLAN interface information with description.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>

</tr>
</tbody>
</table>

Usage Information

- **NOTE**: This command also enables you to view information corresponding to a range of ports.
  - You can specify multiple ports as port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1 - 4`.

Example

```
Dell# show interfaces vlan 10
Vlan 10 is up, line protocol is down
Address is 90:b1:1c:f4:99:ce, Current address is 90:b1:1c:f4:99:ce
Interface index is 1107787786
Internet address is not set
Mode of IPv4 Address Assignment: NONE
DHCP Client-ID: 90b11cf499ce
```

Related Commands

- `interface` — configure a physical interface on the switch.
- `show ip interface` — display Layer 3 information about the interfaces.
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 2d17h26m
Queueing strategy: fifo
Time since last interface status change: 2d17h26m
Input Statistics:
  0 packets, 0 bytes
Output Statistics:
  0 packets, 0 bytes, 0 underruns

**show range**

Display all interfaces configured using the interface range command.

**Syntax**

```
show range
```

**Command Modes**

INTERFACE RANGE (config-if-range)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Example**

```
Dell(conf-if-range-gi-2/2,fo-2/56)# show range
2/2 - 0
2/56 - 0
Dell(conf-if-range-gi-2/2,fo-2/56)#
```
### Related Commands
- `interface` — configure a physical interface on the switch.
- `show ip interface` — display Layer 3 information about the interfaces.

### show running-config ecmp-group

Display interfaces, LAG, or LAG link bundles being monitored for uneven traffic distribution using the `ecmp-group monitoring enable` command. The ECMP group could have a LAG or a list of interfaces (not just LAG link-bundles).

**Syntax**
```
show running-config ecmp-group
```

**Defaults**
Disabled.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Related Commands**
- `ecmp-group` — configure a mechanism to monitor traffic distribution.

### shutdown

Disable an interface.

**Syntax**
```
shutdown
```

To activate an interface, use the `no shutdown` command.

**Defaults**
The interface is disabled.

**Command Modes**
INTERFACE

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
The `shutdown` command marks a physical interface as unavailable for traffic. To discover if an interface is disabled, use the `show ip interface brief` command. Disabled interfaces are listed as down.

Disabling a VLAN or a port channel causes different behavior. When a VLAN is disabled, the Layer 3 functions within that VLAN are disabled. Layer 2 traffic continues to flow. Entering the `shutdown` command on a port channel disables all traffic on the port channel and the individual interfaces within the port channel. To enable a port channel, enter `no shutdown` on the port channel interface and at least one interface within that port channel.

The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port channel.

**Related Commands**

- `interface port-channel` — create a port channel interface.
- `interface vlan` — create a VLAN.
- `show ip interface` — display the interface routing status. Add the keyword `brief` to display a table of interfaces and their status.

### speed (for 10/100/1000/10000 interfaces)

Set the speed for 10/100/1000/10000 interfaces. Set both sides of a link to the same speed (10/100/1000/10000) or to auto or the link may not come up.

**Syntax**

```
speed {10 | 100 | 1000 | 10000 | auto}
```

To return to the default setting, use the `no speed {10 | 100 | 1000 | 10000}` command.

**Parameters**

- **10**
  
Enter the keyword `10` to set the interface's speed to 10 Mb/s.
NOTE: This interface speed is not supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card. If the command is entered for these interfaces, an error message appears.

100

Enter the keyword 100 to set the interface’s speed to 10/100 Mb/s.

NOTE: When this setting is enabled, only 100Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.

1000

Enter the keyword 1000 to set the interface’s speed to 1000 Mb/s. Auto-negotiation is enabled. For more information, refer to negotiation auto.

NOTE: When this setting is enabled, only 1000Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.

10000

Enter the keyword 10000 to set the interface’s speed to 10000 Mb/s. Auto-negotiation is enabled. For more information, refer to negotiation auto.

auto

Enter the keyword auto to set the interface to auto-negotiate its speed. Auto-negotiation is enabled. For more information, refer to negotiation auto.

Defaults

auto

Command Modes

INTERFACE

</tbody>
</table>

Usage Information

This command is found on the 10/100/1000/10000 Base-T Ethernet interfaces.
When you enable auto, the system performs an automatic discovery to determine the optics installed and configure the appropriate speed.

When you configure a speed for the 10/100/1000/10000 interface, confirm the negotiation auto command setting. Both sides of the link must have auto-negotiation either enabled or disabled. For speed settings of 1000 or auto, the software sets the link to auto-negotiation and you cannot change that setting.

**NOTE:** Starting with Dell Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the speed command. When you set the speed to 10 or 100 Mbps, you can also use the duplex command.

**NOTE:** In S3100 series, the speed command is not available on the combo ports in the hybrid mode. You need to provision the combo port as copper or fiber medium using the combo-port-type command. See combo-port-type.

If you use an active optical cable (AOC), you can convert the QSFP+ port to a 10 Gigabit SFP+ port or 1 Gigabit SFP port. Use the speed command to enable the required speed.

### Related Commands
- `negotiation auto` — enable or disable auto-negotiation on an interface.

### speed (Management interface)

Set the speed for the Management interface.

**Syntax**
```
speed {10 | 100 | 1000 | auto}
```

To return to the default setting, use the `no speed` command.

**Parameters**
- **10**
  - Enter the keyword 10 to set the interface's speed to 10 Mb/s.
- **100**
  - Enter the keyword 100 to set the interface's speed to 100 Mb/s.
- **1000**
  - Enter the keyword 1000 to set the interface's speed to 1000 Mb/s.
- **auto**
  - Enter the keyword auto to set the interface to auto-negotiate its speed.

**Defaults**
- auto

**Command Modes**
- INTERFACE

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

pre-Version 6.2.1.0 | Introduced on the E-Series.

Usage Information

This command is found on the Management interface only.

Related Commands

- `interface ManagementEthernet` — configure the Management port on the system (either the Primary or Standby RPM).
- `management route` — configure a static route that points to the Management interface or a forwarding router.

**switchport**

Place an interface in Layer 2 mode.

**Syntax**

```
switchport [ [backup interface { interface | port-channel number }] ] | mode private-vlan { host | promisucous | trunk }]
```

To remove an interface from Layer 2 mode and place it in Layer 3 mode, enter the `no switchport` command. If a switchport backup interface is configured, first remove the backup configuration. To remove a switchport backup interface, enter the `no switchport backup interface` command.

**Parameters**

- `backup` (OPTIONAL) Use this option to configure a redundant Layer 2 link without using Spanning Tree. The keyword `backup` configures a backup port so that if the primary port fails, the backup port changes to the up state. If the primary later comes up, it becomes the backup.
- `interface interface` (OPTIONAL) Enter any of the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- `port-channel` (OPTIONAL) Enter the keywords `port-channel` if the backup port is a static or dynamic port channel.
- `mode` (OPTIONAL) Enter the keyword `mode` to set the interface mode.
- `private-vlan` (OPTIONAL) Enter the keywords `private-vlan` to set the interface mode to private VLAN mode.
- `host` (OPTIONAL) Enter the keyword `host` to set the private VLAN interface to host mode.
(OPTIONAL) Enter the keyword **promiscuous** to set the private VLAN interface to promiscuous mode.

**trunk**

(OPTIONAL) Enter the keyword **trunk** to set the private VLAN interface to trunk mode.

**Defaults**

Disabled — interface is in Layer 3 mode.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

If an IP address or VRRP group is assigned to the interface, you cannot use the switchport command on the interface. To use the switchport command on an interface, only the no ip address and no shutdown statements must be listed in the show config output.

When you enter the switchport command, the interface is automatically added to the default VLAN.

To use the switchport backup interface command on a port, first enter the switchport command. For more information, see “Configuring Redundant Links” in the Layer 2 section in the Dell Networking OS Configuration Guide.
wavelength

Set the wavelength for tunable 10–Gigabit SFP+ optics.

Syntax

```
wavelength
```

To retain the existing wavelength, use the **no wavelength** command.

Defaults

```
none
```

Command Modes

```
INTERFACE
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6000, S6000–ON, S5000, S4810, S4820T, S3048–ON, S4048–ON, M I/O Aggregator, FN I/O Module, MXL, C9010, S3100 series, and Z9100-ON.</td>
</tr>
</tbody>
</table>

Usage Information

The wavelength can be configured only on a tunable 10–Gigabit SFP+ optic. The wavelength range is from 1528.3 nm to 1568.77nm.

If you configure the wavelength on a non-tunable optic, there is no change to the existing wavelength. The configured wavelength is saved in the running configuration and is applicable, when a tunable optic is used.

If you do not configure the wavelength on an inserted tunable optic, the existing wavelength is used.

Example

The following example shows the wavelength set for a tunable 10–Gigabit SFP+ optic:

```
Dell(conf-if-gi-1/1)# wavelength 1528.30
```

Related Commands

- **show config** — displays the interface configuration.

## Egress Interface Selection (EIS) Commands

The following commands are Egress Interface Selection (EIS) commands.

### application

Configure the management egress interface selection.

```
application (all | application-type)
```

To remove a management application configuration, use the **no application (all | application-type)** command.

Parameters

- **application-type**
  - Enter any of the following keywords:
    - For DNS, enter the keyword **dns**.
• For FTP, enter the keyword `ftp`.
• For NTP, enter the keyword `ntp`.
• For Radius, enter the keyword `radius`.
• For sFlow collectors, enter the keyword `sflow-collector`.
• For SNMP (traps and MIB responses), enter the keywords `snmp`.
• For SSH, enter the keyword `ssh`.
• For Syslog, enter the keyword `syslog`.
• For TACACS, enter the keyword `tacacs`.
• For Telnet, enter the keyword `telnet`.
• For TFTP, enter the keyword `tftp`.

```
application (for HTTP and ICMP)
```

 Configure the management egress interface selection for HTTP and ICMP.

**NOTE:** Only the options that have been newly introduced are described here. For a complete description on all of the keywords and variables that are available with this command, refer the respective Command Reference Guide of the applicable platform of the Release 9.2(0.0) documentation set.

**Syntax**
```
application (all | application-type)
```

To remove a management application configuration, use the `no application (all | application-type)` command.

**Parameters**
```
application-type
```
Enter any of the following keywords:

- For HTTP, enter the keyword `http`.
For ICMP, enter the keyword `icmp`.

**all**

Configure all applications.

**Defaults**

None.

**Command Modes**

EIS Mode (conf-mgmt-eis)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

**clear management application pkt-fallback-cntr**

Clear management application packet fallback counters for all management application types.

**Syntax**

```
clear management application pkt-fallback-cntr
```

**Defaults**

None.

**Command Modes**

EXEC Privilege
management egress-interface-selection

To make configured application traffic egress through the management port instead of the front-end (FE) port, enable and configure a management egress interface.

Syntax

management egress-interface-selection

To disable and remove management egress interface selection (EIS) configurations, use the no management egress-interface-selection command.

Defaults
None.

Command Modes

telnet    : 0
tftp      : 0

Port Channel Commands

A Link Aggregation Group (LAG) is a group of links that appear to a MAC client as if they were a single link according to IEEE 802.3ad. In Dell Networking OS, a LAG is referred to as a Port Channel.

- The platform supports 128 port channels and 16 members per port channel.

As each port can be assigned to only one Port Channel, and each Port Channel must have at least one port, some of those nominally available Port Channels might have no function because they could have no members if there are not enough ports installed. But stack members can provide those ports.

NOTE: The Dell Networking OS implementation of LAG or Port Channel requires that you configure a LAG on both switches manually. For information about Dell Networking OS link aggregation control protocol (LACP) for dynamic LAGs, refer to the Link Aggregation Control Protocol (LACP) chapter. For more information about configuring and using Port Channels, refer to the Dell Networking OS Configuration Guide.
Add an interface to the Port Channel, while in INTERFACE PORTCHANNEL mode.

**Syntax**

```
channel-member interface
```

To delete an interface from a Port Channel, use the `no channel-member interface` command.

**Parameters**

- **interface**
  
  (OPTIONAL) Enter any of the following keywords and the interface information:

  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**Defaults**

Not configured.

**Command Modes**

INTERFACE PORTCHANNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>pre-Version 6.2.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Use the `interface port-channel` command to access this command.
You cannot add an interface to a Port Channel if the interface contains an IP address in its configuration. Only the `shutdown`, `description`, `mtu`, and `ip mtu` commands can be configured on an interface if it is added to a Port Channel. The `mtu` and `ip mtu` commands are only available when the chassis is in Jumbo mode.

Link MTU and IP MTU considerations for Port Channels are:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

When an interface is removed from a Port Channel with the `no channel-member` command, the interface reverts to its configuration prior to joining the Port Channel.

An interface can belong to only one Port Channel.

You can have 16 interfaces per Port Channel. The interfaces can be located on different line cards but must be the same physical type and speed (for example, all 10-Gigabit Ethernet interfaces).

For more information about Port Channels, refer to the *Dell Networking OS Configuration Guide*.

**Related Commands**

- `description` — assign a descriptive text string to the interface.
- `interface port-channel` — create a Port Channel interface.
- `shutdown` — disable/enable the port channel.

### group

Group two LAGs in a supergroup (“fate-sharing group” or “failover group”).

**Syntax**

```
group group_number port-channel number port-channel number
```

To remove an existing LAG supergroup, use the `no group group_number` command.

**Parameters**

- `group_number` Enter an integer from 1 to 32 that uniquely identifies this LAG fate-sharing group.
- `port-channel number` Enter the keywords `port-channel` then an existing LAG number. Enter this keyword/variable combination twice, identifying the two paired LAGs.

**Defaults**

None

**Command Modes**

- PORT-CHANNEL FAILOVER-GROUP (conf-po-failover-grp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</table>
### interface port-channel

Create a Port Channel interface, which is a link aggregation group (LAG) containing 16 physical interfaces on the S-Series.

**Syntax**

```plaintext
interface port-channel channel-number
```

To delete a Port Channel, use the `no interface port-channel channel-number` command.

**Parameters**

- **channel-number**
  For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults**

Not configured.

**Command Modes**

**Related Commands**

- **port-channel failover-group** — access PORT-CHANNEL FAILOVER-GROUP mode to configure a LAG failover group.
- **show interfaces port-channel** — display information on configured Port Channel groups.
### Version Description
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.12.0** Introduced on S4810.
- **8.3.11.1** Introduced on Z9000.
- **8.1.1.0** Introduced on E-Series.
- **7.6.1.0** Introduced on S-Series.
- **7.5.1.0** Introduced on C-Series.
- **pre-Version 6.2.1.0** Introduced on E-Series.

### Usage Information
Port Channel interfaces are logical interfaces and can be either in Layer 2 mode (by using the switchport command) or Layer 3 mode (by configuring an IP address). You can add a Port Channel in Layer 2 mode to a VLAN.

The shutdown, description, and name commands are the only commands that you can configure on an interface while it is a member of a Port Channel. To add a physical interface to a Port Channel, the interface can only have the shutdown, description, and name commands configured. The Port Channel's configuration is applied to the interfaces within the Port Channel.

A Port Channel can contain any physical interface. Based on the first interface configured in the Port Channel and enabled, Dell Networking OS determines the common speed. For more information, refer to channel-member.

If the line card is in a Jumbo mode chassis, you can also configure the mtu and ip mtu commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

**NOTE:** In a Jumbo-enabled system, all members of a Port Channel must be configured with the same link MTU values and the same IP MTU values.

#### Example
```
Dell(conf)# int port-channel 2
Dell(conf-if-po-2)#
```

#### Related Commands
- channel-member — add a physical interface to the LAG.
- interface — configure a physical interface.
- interface loopback — configure a Loopback interface.
- interface null — configure a null interface.
- interface vlan — configure a VLAN.
- shutdown — disable/enable the port channel.

## minimum-links

Configure the minimum number of links in a LAG (Port Channel) that must be in "oper up" status for the LAG to also be in "oper up" status.

### Syntax
```
minimum-links number
```
Parameters

number

Enter the number of links in a LAG that must be in "oper up" status. The range is from 1 to 16. The default is 1.

Defaults

1

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

If you use this command to configure the minimum number of links in a LAG that must be in "oper up" status, the LAG must have at least that number of "oper up" links before it can be declared as up. For example, if the required minimum is four, and only three are up, the LAG is considered down.

port-channel failover-group

To configure a LAG failover group, access PORT-CHANNEL FAILOVER-GROUP mode.

Syntax

port-channel failover-group

To remove all LAG failover groups, use the no port-channel failover-group command.

Defaults

None

Command Modes

CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

### Usage Information

This feature groups two LAGs to work in tandem as a supergroup. For example, if one LAG goes down, the other LAG is taken down automatically, providing an alternate path to reroute traffic, avoiding oversubscription on the other LAG. You can use both static and dynamic (LACP) LAGs to configure failover groups. For more information, see the “Port Channel” section in the Dell Networking OS Configuration Guide.

### Related Command

- `group` — group two LAGs in a supergroup (“fate-sharing group”).
- `show interfaces port-channel` — display information on configured Port Channel groups.

### show config

Display the current configuration of the selected LAG.

**Syntax**

```
show config
```

**Command Modes**

INTERFACE PORTCHANNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
show interfaces port-channel

Display information on configured Port Channel groups.

Syntax

```
show interfaces port-channel [channel-number] [brief] [description]
```

Parameters

- `channel-number`: For a Port Channel interface, enter the keyword `port-channel` then a number. The range is from 1 to 128.

- `brief` (OPTIONAL) Enter the keyword `brief` to display only the port channel number, the state of the port channel, and the number of interfaces in the port channel.

- `description` (OPTIONAL) Displays the port-channel information with description.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S3148.
9.9(0.0) | Added support to display the interface configurations corresponding to a range of ports.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the S-Series. Modified to display the LAG failover group status.
7.5.1.0 | Introduced on the C-Series.

**E-Series legacy command**

**Usage Information**

The following describes the `show interfaces port-channel` command shown in the following example.

**Field** | **Description**
---|---
Port-Channel 1... | Displays the LAG’s status. In the Example, the status of the LAG’s LAG fate-sharing group (“Failover-group”) is listed.
Hardware is... | Displays the interface’s hardware information and its assigned MAC address.
Port-channel is part... | Indicates whether the LAG is part of a LAG fate-sharing group (“Failover-group”).
Internet address... | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.
MTU 1554... | Displays link and IP MTU.
LineSpeed | Displays the interface’s line speed. For a port channel interface, it is the line speed of the interfaces in the port channel.
Members in this... | Displays the interfaces belonging to this port channel.
ARP type:... | Displays the ARP type and the ARP timeout value for the interface.
Last clearing... | Displays the time when the `show interfaces` counters were cleared.
Queueing strategy | States the packet queuing strategy. FIFO means first in first out.
packets input... | Displays the number of packets and bytes into the interface.
Input 0 IP packets... | Displays the number of packets with IP headers, VLAN tagged headers, and MPLS headers. The number of packets may not add correctly because a VLAN tagged IP packet counts as both a VLAN packet and an IP packet.
Field Description
0 64-byte... Displays the size of packets and the number of those packets entering that interface. This information is displayed over two lines.

Received 0... Displays the type and number of errors or other specific packets received. This information is displayed over three lines.

Output 0... Displays the type and number of packets sent out the interface. This information is displayed over three lines.

Rate information... Displays the traffic rate information into and out of the interface. Traffic rate is displayed in bits and packets per second.

Time since... Displays the time since the last change in the configuration of this interface.

Example
Dell# show interfaces port-channel 20
Port-channel 20 is up, line protocol is up (Failover-group 1 is down)
Hardware address is 00:01:e8:01:46:fa
Port-channel is part of failover-group 1
Internet address is 1.1.120.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 2000 Mbit
Members in this channel: Gi 2/5 Gi 2/18

Dell#

User Information
The following describes the show interfaces port-channel brief command shown in the following example.

Field Description
LAG Lists the port channel number.
Mode Lists the mode:
  • L3 — for Layer 3
  • L2 — for Layer 2
Status Displays the status of the port channel.
  • down — if the port channel is disabled (shutdown)
  • up — if the port channel is enabled (no shutdown)
Uptime Displays the age of the port channel in hours:minutes:seconds.
Ports Lists the interfaces assigned to this port channel.
Field | Description
--- | ---
(untitled) | Displays the status of the physical interfaces (up or down).

- In Layer 2 port channels, an * (asterisk) indicates which interface is the primary port of the port channel. The primary port sends out interface PDU.
- In Layer 3 port channels, the primary port is not indicated.

Example

```
Dell# show interfaces port-channel 1 brief
LAG Mode Status Uptime Ports
 1  L2   up    00:00:08 Gi 3/1 (Up) *
      Gi 3/2 (Down)
      Gi 3/3 (Up)
Dell#
```

Related Commands
- `show lacp` — display the LACP matrix.

**show port-channel-flow**

Display an egress port in a given port-channel flow.

**Syntax**

```
show port-channel-flow outgoing-port-channel number incoming-interface interface {source-ip address destination-ip address} | {source-port number destination-port number} | {source-mac address destination-mac address {vlan vlanid | ether-type}}
```

**Parameters**

- **outgoing-port-channel number**
  - Enter the keywords outgoing-port-channel then the number of the port channel to display flow information.
  - For a Port Channel interface, enter the keywords port-channel then a number. The range is from 1 to 128.

- **incoming-interface interface**
  - Enter the keywords incoming-interface then the interface type and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

- **source-ip address**
  - Enter the keywords source-ip then the IP source address in IP address format.

- **destination-ip address**
  - Enter the keywords destination-ip then the IP destination address in IP address format.

- **source-port number**
  - Enter the keywords source-port then the source port number. The range is from 1 to 65536. The default is None.

- **destination-port number**
  - Enter the keywords destination-port then the destination port number. The range is from 1 to 65536. The default is None.

- **source-mac address**
  - Enter the keywords source-mac then the MAC source address in the nn:nn:nn:nn:nn:nn format.
destination-mac address
Enter the keywords destination-mac then the MAC destination address in the nn:nn:nn:nn:nn:nn format.

vlan vlan-id
Enter the keywords vlan then the VLAN-id. The range is from 0 to 4094.

ether-type
Enter the keywords ether-type in the XX:XX format.

Command Modes
EXEC

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>8.3.10.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information
Because this command calculates based on a Layer 2 hash algorithm, use this command to display flows for switched Layer 2 packets, not for routed packets (use the show ip flow command to display routed packets).

The show port-channel-flow command returns the egress port identification in a given port-channel if a valid flow is entered. A mismatched flow error occurs if MAC-based hashing is configured for a Layer 2 interface and you are trying to display a Layer 3 flow.

The output displays three entries:

- Egress port for unfragmented packets.
- In the event of fragmented packets, the egress port of the first fragment.
- In the event of fragmented packets, the egress port of the subsequent fragments.

NOTE: In the show port channel flow command output, the egress port for an unknown unicast, multicast, or broadcast traffic is not displayed.

The following example shows the show port-channel-flow outgoing-port-channel number incoming-interface interface source-mac address destination-mac address

- Load-balance is configured for MAC
- Load-balance is configured for IP 4-tuple/2-tuple
- A non-IP payload is going out of Layer 2 LAG interface that is a member of VLAN with an IP address

Example
Dell# show port-channel-flow outgoing-port-channel 1 incoming-interface gi 3/3 source-mac 00:00:50:00:00:00 destination-mac 00:00:a0:00:00:00
Egress Port for port-channel 1, for the given flow, is Gi 13/2

Time Domain Reflectometer (TDR) Commands

TDR is useful for troubleshooting an interface that is not establishing a link; either it is flapping or not coming up at all. TDR detects open or short conditions of copper cables on 100/1000 Base-T modules.

Important Points to Remember

- The interface and port must be enabled (configured—refer to the interface command) before running TDR. An error message is generated if you have not enabled the interface.
- The interface on the far-end device must be shut down before running TDR.
- Because TDR is an intrusive test on an interface that is not establishing a link, do not run TDR on an interface that is passing traffic.
- When testing between two devices, do not run the test on both ends of the cable.

tdr-cable-test

Test the condition of copper cables on 100/1000 Base-T modules.

Syntax

```
tdr-cable-test interface
```

Parameters

- `interface` Enter the keyword GigabitEthernet then the slot/port information for the 100/1000 Ethernet interface.

Defaults

None

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### show tdr

Display the TDR test results.

**Syntax**

```
show tdr interface
```

**Parameters**

- `interface`: Enter the keyword `GigabitEthernet` then the slot/port information for the 100/1000 Ethernet interface.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.9(0.0) | Introduced on the C9010.
9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S5000.
8.3(19.0) | Introduced on the S4820T.
8.3(11.1) | Introduced on the Z9000.
8.3(7.0) | Introduced on the S4810.
8.2(1.0) | Introduced on the E-Series.
7.7(1.0) | Introduced on the S-Series.
7.6(1.0) | Introduced on the C-Series.
### Version Description
6.1.1.0 Introduced.

#### Usage Information
If the TDR test has not been run, an error message is generated:

%Error: Please run the TDR test first

The following describes the TDR test status.

<table>
<thead>
<tr>
<th>Status</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OK Status:</strong></td>
<td>TDR test is complete, no fault is detected on the cable, and the test is terminated.</td>
</tr>
<tr>
<td>Terminated</td>
<td>A short is detected on the cable. The location, in this Example is 92 meters. The short is accurate to plus or minus one meter.</td>
</tr>
<tr>
<td><strong>Length:</strong></td>
<td><strong>92 (+/- 1) meters,</strong> Status: <strong>Shorted</strong></td>
</tr>
<tr>
<td><strong>Length:</strong></td>
<td><strong>93 (+/- 1) meters,</strong> Status: <strong>Open</strong></td>
</tr>
<tr>
<td>Status: <strong>Impedance Mismatch</strong></td>
<td>There is an impedance mismatch in the cables.</td>
</tr>
</tbody>
</table>

**Example**

Dell# show tdr gigabitethernet 10/47
Time since last test: 00:00:02
    Pair A, Length: OK Status: Terminated
    Pair B, Length: 92 (+/- 1) meters, Status: Short
    Pair C, Length: 93 (+/- 1) meters, Status: Open
    Pair D, Length: 0 (+/- 1) meters, Status: Impedance Mismatch

#### Related Commands
- `tdr-cable-test` — run the TDR test.

### UDP Broadcast Commands

The user datagram protocol (UDP) broadcast feature is a software-based method to forward low throughput (not to exceed 200 pps) IP/UDP broadcast traffic arriving on a physical or VLAN interface.

#### Important Points to Remember
- This feature is available only on the S4810, S4820T, S3048–ON, S4048–ON, Z9000 platforms.
- Routing information protocol (RIP) is not supported with the UDP Broadcast feature.
- If you configure this feature on an interface using the `ip udp-helper udp-port` command, the `ip directed-broadcast` command becomes ineffective on that interface.
- The existing `show interface` command has been modified to display the configured broadcast address.

#### debug ip udp-helper

Enable UDP debug and display the debug information on a console.

**Syntax**

```
debug ip udp-helper
```
To disable debug information, use the `no debug ip udp-helper` command.

**Defaults**
Debug disabled.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>Pre-version 8.3.7.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Example**

**Related Commands**
- `ip udp-helper udp-port` — enable the UDP broadcast feature on an interface.
- `show ip udp-helper` — display the configured UDP helper(s) on all interfaces.

### ip udp-broadcast-address

Configure an IP UDP address for broadcast.

**Syntax**

```
ip udp-broadcast-address address
```

To delete the configuration, use the `no ip udp-broadcast-address address` command.

**Parameters**

- `address` Enter an IP broadcast address in dotted decimal format (A.B.C.D).

**Defaults**
Not configured.

**Command Modes**
INTERFACE (conf-if)

**Command History**
This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.
ip udp-helper udp-port

Enable the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.

Syntax

```
ip udp-helper udp-port [udp-port-list]
```

To disable the UDP broadcast on a port, use the `no ip udp-helper udp-port [udp-port-list]` command.

Parameters

- `udp-port-list` (OPTIONAL) Enter up to 16 comma-separated UDP port numbers.

```
| NOTE: If you do not use this option, all UDP ports are considered by default. |
```

Defaults

None

Command Modes

INTERFACE (config-if)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
Pre-version 8.3.7.0 Introduced on the E-Series ExaScale.
Usage Information

If you configure the `ip helper-address` command and `ip udp-helper udp-port` command, the behavior is that the UDP broadcast traffic with port numbers 67/68 is unicast relayed to the DHCP server per the `ip helper-address` configuration. This occurs regardless if the `ip udp-helper udp-port` command contains port numbers 67/68 or not.

If you only configure the `ip udp-helper udp-port` command, all the UDP broadcast traffic is flooded, including ports 67/68 traffic if those ports are part of the `udp-port-list`.

Related Commands

- `ip helper-address` — configure the destination broadcast or host address for the DHCP server.
- `debug ip udp-helper` — enable debug and displays the debug information on a console.
- `show ip udp-helper` — display the configured UDP helpers on all interfaces.

show ip udp-helper

Display the configured UDP helpers on all interfaces.

Syntax

```
show ip udp-helper
```

Defaults

None

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
Pre-version 8.3.7.0 Introduced on the E-Series.

Example

```
Dell# show ip udp-helper
--------------------------------------------------
Port    UDP  port  list
--------------------------------------------------
Gi 10/2  656, 658
Gi 10/3  All
```

Related Commands

- `debug ip udp-helper` — enable debug and displays the debug information on a console.
- `ip udp-helper udp-port` — enable the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.
Internet Protocol Security (IPSec)

Internet protocol security (IPSec) is an end-to-end security scheme for securing IP communications by authenticating and encrypting all packets in a session. Use IPSec between hosts, gateways, or hosts and gateways.

IPSec uses a series of protocol functions to achieve information security:

- **Authentication Headers (AH)** — Connectionless integrity and origin authentication for IP packets.
- **Encapsulating Security Payloads (ESP)** — Confidentiality, authentication, and data integrity for IP packets.
- **Security Associations (SA)** — Algorithm-provided parameters required for AH and ESP protocols.

IPSec capability is available on control (protocol) and management traffic; end-node support is required.

IPSec supports two operational modes: Transport and Tunnel.

- **Transport** is the default mode for IPSec and encrypts only the payload of the packet. Routing information is unchanged.
- **Tunnel mode** is used to encrypt the entire packet, including the routing information in the IP header. Tunnel mode is typically used in creating virtual private networks (VPNs).

Transport mode provides IP packet payload protection using ESP. You can use ESP alone or in combination with AH to provide additional authentication. AH protects data from modification but does not provide confidentiality.

SA is the configuration information that specifies the type of security provided to the IPSec flow. The SA is a set of algorithms and keys used to authenticate and encrypt the traffic flow. The AH and ESP use SA to provide traffic protection for the IPSec flow.

**NOTE:**
Due to performance limitations on the control processor, you cannot enable IPSec on all packets in a communication session.

Topics:
- crypto ipsec transform-set
- crypto ipsec policy
- management crypto-policy
- match
- session-key
- show crypto ipsec transform-set
- show crypto ipsec policy
- transform-set
crypto ipsec transform-set

Create a transform set, or combination of security algorithms and protocols, of cryptos.

Syntax

```
crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}
```

To delete a transform set, use the `no crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}` command.

Parameters

- **name**: Enter the name for the transform set.
- **ah-authentication**: Enter the keywords `ah-authentication` then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.
  - `md5` — Use Message Digest 5 (MD5) authentication.
  - `sha1` — Use Secure Hash Algorithm 1 (SHA-1) authentication.
  - `null` — Causes an encryption policy configured for the area to not be inherited on the interface.
- **esp-authentication**: Enter the keywords `esp-authentication` then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.
  - `md5` — Use Message Digest 5 (MD5) authentication.
  - `sha1` — Use Secure Hash Algorithm 1 (SHA-1) authentication.
  - `null` — Causes an encryption policy configured for the area to not be inherited on the interface.
- **esp-encryption**: Enter the keywords `esp-encryption` then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.
  - `3des` — Use 3DES encryption.
  - `cbc` — Use CDC encryption.
  - `des` — Use DES encryption.
  - `null` — Causes an encryption policy configured for the area to not be inherited on the interface.

Defaults

None

Command Modes

- **CONFIGURATION**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Usage Information
- Both sides of the link must specify the same transform set.
- You can create up to 64 transform sets.

### Example
```
Dell(conf)# do show crypto ipsec transform-set
Transform-Set Name  : ts1
Transform-Set refCnt : 0
AH Transform        : md5
ESP Auth Transform  :
ESP Encry Transform :
Dell(conf)#
```

### crypto ipsec policy
Create a crypto policy used by ipsec.

**Syntax**
```
crypto ipsec policy name seq-num ipsec-manual
```
To delete a crypto policy entry, use the `no crypto ipsec policy name seq-num ipsec-manual` command.

**Parameters**
- `name` Enter the name for the crypto policy set.
- `seq-num` Enter the sequence number assigned to the crypto policy entry.

**Defaults**
None

**Command Modes**
- CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description
- **9.10(0.0)** Introduced on the S3148.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.2(0.2)** Introduced on the Z9000, S4810, and S4820T.
- **9.2(1.0)** Introduced on the Z9500.
This command creates a crypto policy entry and enters the crypto policy configuration mode for configuring the flow parameters.

Example

Dell(conf)# crypto ipsec policy West 10 ipsec-manual
Dell(conf-crypto-policy)#

**management crypto-policy**

Apply the crypto policy to management traffic.

**Syntax**

management crypto-policy name

To remove the management traffic crypto policy, use the no management crypto-policy name command.

**Parameters**

- name: Enter the name for the crypto policy.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
**match**

Apply an match filter to the crypto policy.

**Syntax**

```
match seq-num tcp [source ip address | ipv6 address {mask} {source-port number}] [destination ip address | ipv6 address {mask} {destination-port number}]
```

To remove the match filter for the crypto map, use the `no match seq-num tcp [source ip address | ipv6 address {mask} {source-port number}] [destination ip address | ipv6 address {mask} {destination-port number}]` command.

**Parameters**

- **seq-num**: Enter the match command sequence number.
- **source ip address | ipv6 address**: Enter the keyword `source` then the IPv4 or IPv6 address for the source.
- **mask**: Enter the mask prefix length in `/nn` format.
- **source-port number**: Enter the source port number.
- **destination-port number**: Enter the destination port number.

**Defaults**

None

**Command Modes**

`CONFIG-CRYPTO-POLICY`

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

- IPv4 addresses support only `/32` mask types.
- IPv6 addresses support only `/128` mask types.
- Configure match for bi-directional traffic for optimal routing.
- Only TCP is supported.

**Example**

```
match 0 tcp a::1 /128 0 a::2 /128 23
match 1 tcp a::1 /128 23 a::2 /128 0
match 2 tcp a::1 /128 0 a::2 /128 21
match 3 tcp a::1 /128 21 a::2 /128 0
```
match 4 tcp 1.1.1.1 /32 0 1.1.1.2 /32 23
match 5 tcp 1.1.1.1 /32 23 1.1.1.2 /32 0
match 6 tcp 1.1.1.1 /32 0 1.1.1.2 /32 21
match 7 tcp 1.1.1.1 /32 21 1.1.1.2 /32 0

**session-key**

Specify the session keys used in the crypto policy entry.

**Syntax**

```
session-key {inbound | outbound} {ah spi hex-key-string | esp spi encrypt hex-key-string auth hex-key-string}
```

To delete the session key information from the crypto policy, use the **no session-key {inbound | outbound} {ah | esp}** command.

**Parameters**

- **name**
  - Enter the name for the transform set.
- **inbound**
  - Specify the inbound session key for IPSec.
- **outbound**
  - Specify the outbound session key for IPSec.
- **ah**
  - Use the AH protocol when you select the AH transform set in the crypto policy.
- **esp**
  - Use the ESP protocol when you select the ESP transform set in the crypto policy.
- **spi**
  - Enter the security parameter index number.
- **hex-key-string**
  - Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key.
- **encrypt**
  - Indicates the ESP encryption transform set key string.
- **auth**
  - Indicates the ESP authentication transform set key string.

**Defaults**

None

**Command Modes**

CONF-CRYPTO-POLICY

**Command History**

**Usage Information**

- This command is only available in the ipsec-manual model.
The key information entry is associated with the global method for enabling clear text or encrypted display in the running config.

**show crypto ipsec transform-set**

Display the transform set configuration.

**Syntax**

```
show crypto ipsec transform-set name
```

**Parameters**

- `name` Enter the name of the transform set.

**Command Modes**

EXEC

Dell(conf-crypto-policy)#

transform-set

Specify the transform set the crypto policy uses.

Syntax

transform-set transform-set-name
To delete a transform set from the crypto policy, use the `no transform-set transform-set-name` command.

**Parameters**

- `transform-set-name` Enter the name for the crypto policy transform set.

**Defaults**

None

**Command Modes**

CONFIG-CRYPTO-POLICY

**Command History**

</tbody>
</table>
The basic IPv4 commands are supported by Dell Networking OS on the platform.

Topics:
- `arp`
- `arp backoff-time`
- `arp learn-enable`
- `arp max-entries`
- `arp retries`
- `arp timeout`
- `clear arp-cache`
- `clear host`
- `clear ip fib stack-unit`
- `clear ip route`
- `clear tcp statistics`
- `debug arp`
- `debug ip dhcp`
- `debug ip icmp`
- `debug ip packet`
- `ip address`
- `ip directed-broadcast`
- `ip domain-list`
- `ip domain-lookup`
- `ip domain-name`
- `ip helper-address`
- `ip helper-address hop-count disable`
- `ip host`
- `ip icmp source-interface`
- `ipv6 icmp source-interface`
- `ip max-frag-count`
- `ip max-routes`
- `ip mtu`
- `ip name-server`
- `ip proxy-arp`
- `ip route`
- `ip source-route`
- `ip unreachable`
- `load-balance`
- `load-balance hg`
- `management route`
To associate an IP address with a MAC address in the switch, use address resolution protocol (ARP).

**Syntax**

```
arp [vrf vrf-name] ip-address mac-address interface
```

To remove an ARP address, use the `no arp ip-address` command.

**Parameters**

- **vrf vrf-name**
  - Enter a VRF name to configure an ARP entry for that VRF. Use the VRF option after the keyword `arp` to configure a static arp on that particular VRF.

- **ip-address**
  - Enter an IP address in dotted decimal format.

- **mac-address**
  - Enter a MAC address in nnnn.nnnn.nnnn format.

- **interface**
  - (OPTIONAL) Enter any of the following keywords and slot/port or number information:
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults**

Not configured.

**Command Modes**

```
CONFIGURATION
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

You cannot use Class D or Class E IP addresses or zero IP address (0.0.0.0) when creating a static ARP. Zero MAC addresses (00:00:00:00:00:00) are also invalid.

You can use the `vrf` attribute of this command to create a static ARP entry on either a default or a non-default VRF. You cannot use this parameter to create any static ARPs corresponding to management VRFs. When a VRF is deleted using the `no ip vrf` command, all the static ARP configurations that belong to that VRF are removed automatically.

Although static ARP entries take precedence over dynamically-learnt ARP entries, a static ARP entry that points to a wrong port is not included in the FIB or ARP entries.

**Related Commands**

- `clear arp-cache` — clear dynamic ARP entries from the ARP table.
- `show arp` — display the ARP table.

---

**arp backoff-time**

Set the exponential timer for resending unresolved ARPs.

**Syntax**

```
arp backoff-time seconds
```
Parameters

```
seconds
```

Enter the number of seconds an ARP entry is black-holed. The range is from 1 to 3600. The default is 30.

Defaults

```
30
```

Command Mode

```
CONFIGURATION
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.8.0 Introduced on the S4810.
```

Usage Information

This timer is an exponential backoff timer. Over the specified period, the time between ARP requests increases. This behavior reduces the potential for the system to slow down while waiting for a multitude of ARP responses.

Related Commands

```
• show arp retries — display the configured number of ARP retries.
```

arp learn-enable

Enable ARP learning using gratuitous ARP.

```
Syntax

```
arp learn-enable
```

Defaults

```
Disabled
```

Command Modes

```
CONFIGURATION
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version Description

9.10(0.0) Introduced on the S3148.
```

Related Commands

```
• show arp retries — display the configured number of ARP retries.
```

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

In Dell Networking OS versions prior to 8.3.1.0, if a gratuitous ARP is received some time after an ARP request is sent, only RP2 installs the ARP information. For example:

1. At time t=0, Dell Networking OS sends an ARP request for IP A.B.C.D.
2. At time t=1, Dell Networking OS receives an ARP request for IP A.B.C.D.
3. At time t=2, Dell Networking OS installs an ARP entry for A.B.C.D only on RP2.

Beginning with Dell Networking OS version 8.3.1.0, when a gratuitous ARP is received, Dell Networking OS installs an ARP entry on all three CPUs.

**arp max-entries**

Enables you to configure the maximum number of ARP entries per VRF that are allowed for IPv4.

**Syntax**

```
arp max-entries [vrf vrf-name] max-number
```

**Parameters**

- **vrf vrf-name**
  - Enter the name of a specific VRF for which you want to configure maximum number of ARP entries that IPv4 allows.

- **max-number**
  - Enter the maximum number of ARP entries that a VRF RTM can hold. The range is from 0 to 65535.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Use this command to specify the maximum number of ARP entries that the Route Table Manager can hold for a specific VRF. This command does not apply to the management VRFs.

**arp retries**

Set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

**Syntax**

```
arp retries number
```

**Parameters**

- `number`: Enter the number of retries. The range is from 1 to 20. The default is 5.

**Defaults**

5

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)  Introduced on the S3148.
- 9.8(2.0)  Introduced on the S3100 series.
- 9.8(1.0)  Introduced on the Z9100-ON.
- 9.8(0.0P5)  Introduced on the S4048-ON.
- 9.8(0.0P2)  Introduced on the S3048-ON.
- 9.7(0.0)  Introduced on the S6000-ON.
- 9.4.(0.0)  Introduced on the S4810 and S4820T.

- 9.10(0.0)  Introduced on the S3148.
- 9.8(2.0)  Introduced on the S3100 series.
- 9.8(1.0)  Introduced on the Z9100-ON.
- 9.8(0.0P5)  Introduced on the S4048-ON.
- 9.8(0.0P2)  Introduced on the S3048-ON.
- 9.7(0.0)  Introduced on the S6000-ON.
- 9.2(1.0)  Introduced on the Z9500.
- 9.0.2.0  Introduced on the S6000.
- 8.3.19.0  Introduced on the S4820T.
- 8.3.11.1  Introduced on the Z9000.
- 8.3.7.0  Introduced on the S4810.
Version Description
8.3.1.0 Introduced.

Usage Information
Retries are 20 seconds apart.

Related Commands
• show arp retries — display the configured number of ARP retries.

arp timeout
Set the time interval for an ARP entry to remain in the ARP cache.

Syntax
arp timeout minutes

Parameters
minutes Enter the number of minutes. The range is from 0 to 35790. The default is 240 minutes.

Defaults
240 minutes (4 hours)

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
clear arp-cache

Clear the dynamic ARP entries from a specific interface or optionally delete (no-refresh) ARP entries from the content addressable memory (CAM).

**Syntax**

```
clear arp-cache [vrf vrf-name | interface | ip ip-address] [no-refresh]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear the ARP cache corresponding to that VRF.
- `interface` (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- `ip ip-address` (OPTIONAL) Enter the keyword `ip` then the IP address of the ARP entry you wish to clear.
- `no-refresh` (OPTIONAL) Enter the keywords `no-refresh` to delete the ARP entry from CAM. Or use this option with `interface` or `ip ip-address` to specify which dynamic ARP entries you want to delete.

**NOTE:** Transit traffic may not be forwarded during the period when deleted ARP entries are resolved again and re-installed in CAM. Use this option with extreme caution.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**

**clear ip fib stack-unit**

Clear all FIB entries in the specified stack unit (use this command with caution, refer to *Usage Information*.)

**Syntax**

```
clear ip fib stack-unit unit-number vrf vrf-name
```

**Parameters**

- `unit-number`  Enter the number of the stack unit.
- `vrf vrf-name` Enter the keyword `vrf` followed by the name of the VRF to clear all FIB entries corresponding to that VRF.

**Command Modes** EXEC Privilege

**Usage Information**

To clear Layer 3 CAM inconsistencies, use this command.

⚠️ **CAUTION:** Executing this command causes traffic disruption.

**Related Commands**

- `show ip fib stack-unit` — show FIB entries on a specified stack-unit.
clear ip route

Clear one or all routes in the routing table.

Syntax

```
clear ip route [vrf vrf-name] {* | ip-address mask}
```

Parameters

- **vrf vrf-name** (Optional) Enter the keyword vrf and then the name of the VRF to clear the routes corresponding to that VRF.
- ***** Enter an asterisk (*) to clear all learned IP routes.
- **ip-address mask** Enter a specific IP address and mask in dotted decimal format to clear that IP address from the routing table.

Usage Information

Use the vrf vrf-name attribute of this command to clear routes corresponding to either a specific VRF or the default VRF.
You cannot use this attribute to clear routes corresponding to a management VRF.

Related Commands

- `ip route` — assign an IP route to the switch.
- `show ip route` — view the routing table.
- `show ip route summary` — view a summary of the routing table.

### clear tcp statistics

Clear TCP counters.

**Syntax**

```plaintext
clear tcp statistics [all | cp]
```

**Parameters**

- `all` (Optional) Enter the `all` to clear all TCP statistics maintained on all switch processors.
- `cp` (Optional) Enter the `cp` to clear only statistics from the Control Processor.
- `rp` (Optional) Enter the `rp` to clear only the statistics from Route Processor.

**debug arp**

View information on ARP transactions.

**Syntax**

debug arp [interface] [count value]

To stop debugging ARP transactions, use the no debug arp command.

**Parameters**

- **interface** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

- **count value** (OPTIONAL) Enter the keyword count then the count value. The range is from 1 to 65534.

**Defaults**

None

Related Commands
  - ip helper-address – specify the destination broadcast or host address for the DHCP server request.
  - ip helper-address hop-count disable – disable the hop-count increment for the DHCP relay agent.

debug ip icmp

View information on the internal control message protocol (ICMP).

Syntax
debug ip icmp [interface] [count value]
To disable debugging, use the no debug ip icmp command.

Parameters
  interface  (OPTIONAL) Enter the following keywords and the interface information:
For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

```
count value
```

(Optional) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is `infinity`.

ICMP: echo request sent to dst 40.40.40.40
```

**Usage Information**
To stop packets from flooding the user terminal when debugging is turned on, use the count option.
**debug ip packet**

View a log of IP packets sent and received.

**Syntax**

```
debug ip packet [access-group name] [count value] [interface]
```

To disable debugging, use the `no debug ip packet [access-group name] [count value] [interface]` command.

**Parameters**

- **access-group name**  
  Enter the keyword `access-group` then the access list name (maximum 16 characters) to limit the debug output based on the defined rules in the ACL.

- **count value**  
  (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is Infinity.

- **interface**  
  (OPTIONAL) Enter the following keywords and the interface information:

  - For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

</table>
Version | Description
--- | ---
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Added the `access-group` option.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.3.1.0 | Added the `count` option.

**Usage Information**
The following describes the `debug ip packet` command in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>s=</code></td>
<td>Lists the source address of the packet and the name of the interface (in parentheses) that received the packet.</td>
</tr>
<tr>
<td><code>d=</code></td>
<td>Lists the destination address of the packet and the name of the interface (in parentheses) through which the packet is being sent out on the network.</td>
</tr>
<tr>
<td><code>len</code></td>
<td>Displays the packet’s length.</td>
</tr>
<tr>
<td><code>sending, rcvd, fragment, sending broad/multicast proto, unroutable</code></td>
<td>The last part of each line lists the status of the packet.</td>
</tr>
</tbody>
</table>

**TCP src=**
Displays the source and destination ports, the sequence number, the acknowledgement number, and the window size of the packets in that TCP packets.

**UDP src=**
Displays the source and destination ports for the UDP packets.

**ICMP type=**
Displays the ICMP type and code.

**IP Fragment**
States that it is a fragment and displays the unique number identifying the fragment (Ident) and the offset (in 8-byte units) of this fragment (fragment offset) from the beginning of the original datagram.

**Example**

```
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 1/1), len 54, sending
   TCP src=23, dst=40869, seq=2112994894, ack=606901739, win=8191 ACK PUSH
IP: s=10.1.2.206 (Ma 1/1), d=10.1.2.62, len 40, rcvd
   TCP src=0, dst=0, seq=0, ack=0, win=0
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 1/1), len 226, sending
   TCP src=23, dst=40869, seq=2112994896, ack=606901739, win=8192 ACK PUSH
IP: s=10.1.2.216 (Ma 1/1), d=10.1.2.255, len 78, rcvd
   UDP src=0, dst=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 1/1), len 1500, sending fragment
   IP Fragment, Ident = 4741, fragment offset = 0
   ICMP type=0, code=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 1/1), len 1500, sending fragment
   IP Fragment, Ident = 4741, fragment offset = 1480
IP: s=40.40.40.40 (local), d=224.0.0.5 (Gi 4/11), len 64, sending broad/multicast
   proto=89
IP: s=40.40.40.40 (local), d=224.0.0.6 (Gi 4/11), len 28, sending broad/multicast
   proto=2
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
   ICMP type=8, code=0
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
   ICMP type=8, code=0
```
Usage Information
To stop packets from flooding the user terminal when debugging is turned on, use the count option.

The access-group option supports only the equal to (eq) operator in TCP ACL rules. Port operators not equal to (neq), greater than (gt), less than (lt), or range are not supported in access-group option (refer to the following example). ARP packets (arp) and Ether-type (ether-type) are also not supported in the access-group option. The entire rule is skipped to compose the filter.

The access-group option pertains to:

- IP protocol number: from 0 to 255
- Internet control message protocol (icmp) but not the ICMP message type (from 0 to 255)
- Any internet protocol (ip)
- Transmission Control Protocol (tcp) but not on the rst, syn, or urg bits
- User Datagram Protocol (udp)

In the case of ambiguous access control list rules, the debug ip packet access-control command is disabled. A message appears identifying the error (refer to the Example below).

Example (Error Messages)
Dell# debug ip packet access-group test
%Error: port operator GT not supported in access-list debug
%Error: port operator LT not supported in access-list debug
%Error: port operator RANGE not supported in access-list debug
%Error: port operator NEQ not supported in access-list debug
Dell#00:10:45: %RPM0-P:CP
%IPMGR-3-DEBUG_IP_PACKET_ACL_AMBIGUOUS_EXP: Ambiguous rules not supported in access-list debug, access-list debugging is turned off
Dell#

ip address
Assign a primary and secondary IP address to the interface.

Syntax
ip address ip-address mask [secondary]

To delete an IP address from an interface, use the no ip address [ip-address] command.

Parameters
- ip-address: Enter an IP address in dotted decimal format.
- mask: Enter the mask of the IP address in slash prefix format (for example, /24).
- secondary: (OPTIONAL) Enter the keyword secondary to designate the IP address as the secondary address.

Defaults
Not configured.

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Usage Information
You must be in INTERFACE mode before you add an IP address to an interface. Assign an IP address to an interface prior to entering ROUTER OSPF mode.

**ip directed-broadcast**

Enables the interface to receive directed broadcast packets.

**Syntax**

```
ip directed-broadcast
```

To disable the interface from receiving directed broadcast packets, use the `no ip directed-broadcast` command.

**Defaults**

Disabled (that is, the interface does not receive directed broadcast packets)

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

To configure a list of possible domain names, configure the `ip domain-list` command up to six times. If you configure both the `ip domain-name` and `ip domain-list` commands, the software tries to resolve the name using the `ip domain-name` command. If the name is not resolved, the software goes through the list of names configured with the `ip domain-list` command to find a match.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command. To view a DNS-related configuration, use the `show running-config resolve` command.

**Related Commands**
- `ip domain-name` — specify a DNS server.

**ip domain-lookup**

To address resolution (that is, DNS), enable dynamic host-name.

**Syntax**

```
ip domain-lookup
```

To disable DNS lookup, use the `no ip domain-lookup` command.

**Defaults**

Disabled.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
### Version Description
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **8.1.1.0**: Introduced on the E-Series.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.

**Usage Information**

To fully enable DNS, also specify one or more domain name servers with the `ip name-server` command.

Dell Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out all other
interfaces, including the Management port.

To view current bindings, use the `show hosts` command.

**Related Commands**
- `ip name-server` — specify a DNS server.
- `show hosts` — view the current bindings.

### ip domain-name

Configure one domain name for the switch.

**Syntax**

```plaintext
ip domain-name name
```

To remove the domain name, use the `no ip domain-name` command.

**Parameters**

- **name**: Enter one domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

**Defaults**

Not configured.

**Command Modes**

- **CONFIGURATION**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

**Version** **Description**
- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can only configure one domain name with the `ip domain-name` command. To configure more than one domain name, configure the `ip domain-list` command up to six times.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command.

**Related Commands**

- `ip domain-list` — configure additional names.

**ip helper-address**

Specify the address of a DHCP server so that DHCP broadcast messages can be forwarded when the DHCP server is not on the same subnet as the client.

**Syntax**

```plaintext
ip helper-address ip-address
```

To remove a DHCP server address, use the `no ip helper-address` command.

**Parameters**

- `ip-address`  
Enter an IP address in dotted decimal format (A.B.C.D).

**Defaults**

Not configured.

**Command Modes**

INTERFACE

</tbody>
</table>

You can add multiple DHCP servers by entering the `ip helper-address` command multiple times. If multiple servers are defined, an incoming request is sent simultaneously to all configured servers and the reply is forwarded to the DHCP client.

Dell Networking OS uses standard DHCP ports, that is UDP ports 67 (server) and 68 (client) for DHCP relay services. It listens on port 67 and if it receives a broadcast, the software converts it to unicast, and forwards to it to the DHCP-server with source port=68 and destination port=67.

The server replies with source port=67, destination port=67 and Dell Networking OS forwards to the client with source port=67, destination port=68.

**ip helper-address hop-count disable**

Disable the hop-count increment for the DHCP relay agent.

**Syntax**  
`ip helper-address hop-count disable`
To re-enable the hop-count increment, use the no ip helper-address hop-count disable command.

**Defaults**

Enabled; the hops field in the DHCP message header is incremented by default.

**Command Modes**

</tr>
</tbody>
</table>

**Usage Information**

This command disables the incrementing of the hops field when boot requests are relayed to a DHCP server through Dell Networking OS. If the incoming boot request already has a non-zero hops field, the message is relayed with the same value for hops. However, the message is discarded if the hops field exceeds 16, to comply with the relay agent behavior specified in RFC 1542.

**Related Commands**

- `ip helper-address` — specify the destination broadcast or host address for DHCP server requests.
- `show running-config` — display the current configuration and changes from the default values.

---

### ip host

Assign a name and an IP address to the host-to-IP address mapping table.

**Syntax**

```
ip host name ip-address
```

To remove an IP host, use the `no ip host name [ip-address]` command.
Parameters

- **name**
Enter a text string to associate with one IP address.

- **ip address**
Enter an IP address, in dotted decimal format, to be mapped to the name.

Defaults

Not configured.

**ip icmp source-interface**

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv4 packets.

**Syntax**

```
ip icmp source-interface interface
```  

**Parameters**

- **interface**
Enter one of the following keywords and slot/port or number information:
  - For a Management Ethernet interface, enter the keyword managementethernet.
When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configured without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

**Usage Information**
You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the `traceroute` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `traceroute` and `ping` applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the ping and `traceroute` utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

**Example**
```
Dell(conf)# ip icmp source-interface gigabitethernet 1/1
Dell(conf)#
```
ipv6 icmp source-interface

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv6 packets.

Syntax
ipv6 icmp source-interface interface

Parameters
interface
Enter one of the following keywords and slot/port or number information:
- For a Management Ethernet interface, enter the keyword managementethernet.
- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults
Not configured.

Command Modes
CONFIGURATION

Command History

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.3(0.0) Introduced on the S4810, S4820T, S6000, and Z9000 platforms.

Usage Information
You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the traceroute command output. The loopback address must be unique in a particular domain.
In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the traceroute and ping applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the ping and traceroute utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

Example

Dell(conf)# ipv6 icmp source-interface gigabitethernet 1/1
Dell(conf)#

**ip max-frag-count**

Set the maximum number of fragments allowed in one packet for packet re-assembly.

**Syntax**

```
ip max-frag-count count
```

To place no limit on the number of fragments allowed, use the `no ip max-frag-count` command.

**Parameters**

- `count`: Enter a number for the number of fragments allowed for re-assembly. The range is from 2 to 256.

**Defaults**

No limit is set on number of fragments allowed.

**Command Modes**

CONFIGURATION

ip max-routes

Enables you to configure the maximum number of protocol routes per VRF that are allowed for IPv4.

Syntax

```
ip max-routes [vrf vrf-name] max-number
```

Parameters

- **vrf vrf-name**: Enter the keyword vrf and then the name of the VRF for which you want to configure maximum number of protocol routes that IPv4 allows.
- **max-number**: Enter the maximum number of protocol routes that a VRF RTM can hold. The range is from 0 to 7500.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0)  Introduced on the S3148.
9.8(2.0)  Introduced on the S3100 series.
9.4.(0.0)  Introduced on the S4810 and S4820T.

Usage Information

Use this command to specify the maximum number of protocol routes that the Route Table Manager can hold for a specific VRF. This command does not apply to the management VRFs.

Related Commands

-  `show ip route` — view the switch routing table.
-  `show ipv6 route` — display the IPv6 routes.
**ip mtu**

Set the IP MTU (frame size) of the packet the RPM transmits for the line card interface. If the packet must be fragmented, Dell Networking OS sets the size of the fragmented packets to the size specified in this command.

**Syntax**

```
ip mtu value
```

To return to the default IP MTU value, use the `no ip mtu` command.

**Parameters**

- **value**
  
  Enter the maximum MTU size if the IP packet is fragmented. The range is from 576 to 9234. The default is **1500 bytes**.

**Defaults**

**1500 bytes**

**Command Modes**

INTERFACE (Gigabit Ethernet and 10-Gigabit Ethernet interfaces)

<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you enter the `no mtu` command, Dell Networking OS reduces the `ip mtu` value to 1536 bytes. To return the IP MTU value to the default, use the `no ip mtu` command.

Starting with Dell Networking OS Release 9.2(0.2), the `ip mtu` command is not supported to configure the IP MTU value that is used when the IP packet is fragmented. Instead of having to configure the IP MTU value, this value is automatically computed by the software when you configure an interface. As a result, the `ip mtu` command is not available for configuration. However, you can continue to specify the link MTU value by using the `mtu` command.

Compensate for Layer 2 header when configuring link MTU on an Ethernet interface or Dell Networking OS may not fragment packets. If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (the `ip mtu command`) must be enough bytes to include for the Layer 2 header.

Link MTU and IP MTU considerations for Port Channels and VLANs are as follows...
Port Channels:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

VLANs:

- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following describes the difference between Link MTU and IP MTU.

<table>
<thead>
<tr>
<th>Layer 2 Overhead</th>
<th>Difference between Link MTU and IP MTU</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet (untagged)</td>
<td>18 bytes</td>
</tr>
<tr>
<td>VLAN Tag</td>
<td>Tag 22 bytes</td>
</tr>
<tr>
<td>Untagged Packet with VLAN-Stack Header</td>
<td>22 bytes</td>
</tr>
<tr>
<td>Tagged Packet with VLAN-Stack Header</td>
<td>26 bytes</td>
</tr>
</tbody>
</table>

Related Commands:

- `mtu` — set the link MTU for an Ethernet interface.

**ip name-server**

Enter up to six IPv4 addresses of name servers. The order you enter the addresses determines the order of their use.

**Syntax**

```
ip name-server ipv4-address [ipv4-address2...ipv4-address6]
```

To remove a name server, use the `no ip name-server ip-address` command.

**Parameters**

- `ipv4-address` Enter the IPv4 address, in dotted decimal format, of the name server to be used.
- `ipv4-address2...` (OPTIONAL) Enter up to five more IPv4 addresses, in dotted decimal format, of name servers to be used. Separate the addresses with a space.

**Defaults**

No name servers are configured.
ip proxy-arp

Enable proxy ARP on an interface.

Syntax  ip proxy-arp

To disable proxy ARP, use the no ip proxy-arp command.

Defaults Enabled.

Command Modes INTERFACE
Command History

Related Commands

- `show ip interface` — display the interface routing status and configuration.

**ip route**

Assign a static route to the switch.

**Syntax**

```
ip route [vrf vrf-name] ip-address mask [ip-address | interface [ip-address]]
   [distance] [permanent] [tag tag-value] [vrf vrf-name] [weight weight-value]
```  

To delete a specific static route, use the `no ip route destination mask` command.

To delete all routes matching a certain route, use the `no ip route destination mask` command.

**Parameters**

- `vrf vrf-name`  
  (Optional) Enter the keyword `vrf` and then the name of the VRF to configure a static route corresponding to that VRF. Use this VRF option after the `ip route` keyword to configure a static route on that particular VRF.

- `destination`  
  Enter the IP address in dotted decimal format of the destination device.

- `mask`  
  Enter the mask in the slash prefix format (/x) of the destination IP address.
**ip-address**
Enter the IP address of the forwarding router in dotted decimal format.

**interface**
Enter one of the following keyword followed by the interface information:

- For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

If you configure a static IPv6 route using an egress interface and enter the ping command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the ping command to detect the destination address.

**interface ip-address**
Enter the keyword `interface` then the IP address.

**distance**
(Optional) Enter the value of the distance metric assigned to the route. The range is from 1 to 255.

**permanent**
(Optional) Enter the keyword `permanent` to specify that the route must not be removed even if the interface assigned to that route goes down. The route must be currently active to be installed in the routing table. If you disable the interface, the route is removed from the routing table.

**tag tag-value**
(Optional) Enter the keyword `tag` then a number to assign to the route. The range is from 1 to 4294967295.

**vrf vrf-name**
Enter the keyword `vrf` followed by the name of the VRF. Use this VRF option after the next hop to specify which VRF the next hop belongs to. This setting is used in route leaking cases. See “R”oute Leaking VRFs” in the Virtual Routing and Forwarding (VRF) section of the Configuration guide.

**weight weight-value**
Enter the keyword `weight` followed by a weight value. The range is from 0 to 255.

NOTE: Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

### Version Description
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.4.(0.0)** Added support for VRF.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **9.2.(0.0)** Added support for tunnel interface type.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.5.1.0** Added support for 4-port 40G line cards on the E-Series.
- **8.3.7.0** Introduced on the S4810.
- **8.2.1.0** Added support for 4094 VLANs on the E-Series (the prior limit was 2094).
- **8.1.1.0** Introduced on the E-Series.
- **7.9.1.0** Introduced VRF on the E-Series.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **pre-6.1.1.0** Introduced on the E-Series.

### Usage Information
Using the following example of a static route: `ip route 33.33.33.0 /24 tengigabitethernet 1/1 172.31.5.43`
- The software installs a next hop that is not on the directly connected subnet but which recursively resolves to a next hop on the interface's configured subnet. In the example, if teng 1/1 has an ip address on subnet 2.2.2.0 and if 172.31.5.43 recursively resolves to 2.2.2.0, Dell Networking OS installs the static route.
- When the interface goes down, Dell Networking OS withdraws the route.
- When the interface comes up, Dell Networking OS re-installs the route.
- When recursive resolution is "broken," Dell Networking OS withdraws the route.
- When recursive resolution is satisfied, Dell Networking OS re-installs the route.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

You cannot use the VRF attribute of this command to configure routes in a management VRF. When a specific VRF is deleted, all the configured static routes corresponding to that VRF are automatically removed.

### Example
```
Dell(conf)# ip route 1.1.1.0/24 4.4.4.2 weight 100
Dell(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)# do show running-config | grep route ip route 1.1.1.0/24 4.4.4.2
```
weight 100 ip route 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)# ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100
Dell(conf)# ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)#
Dell(conf)# do show running-config | grep route ip route vrf test 1.1.1.0/24
4.4.4.2 weight 100 ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200

Related Commands
  - show ip route — view the switch routing table.

**ip source-route**

Enable Dell Networking OS to forward IP packets with source route information in the header.

**Syntax**

```
ip source-route
```

To drop packets with source route information, use the `no` `ip` `route-source` command.

**Defaults**

Enabled.

load-balance

By default, for C-Series and S-Series, Dell Networking OS uses an IP 4-tuple (IP SA, IP DA, Source Port, and Destination Port) to distribute IP traffic over members of a Port Channel as well as equal-cost paths. To designate another method to balance traffic over Port Channel members, use the load-balance command.

Syntax

load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}

To return to the default setting (IP 4-tuple), use the no load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]} command.

Parameters

ip-selection (dest-ip | source-ip)

Enter the keywords to distribute IP traffic based on the following criteria:

- dest-ip — Uses destination IP address and destination port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
- source-ip — Uses source IP address and source port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

mac (dest-mac | source-dest-mac | source-mac)

Enter the keywords to distribute MAC traffic based on the following criteria:

- dest-mac — Uses the destination MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
- source-dest-mac — Uses the destination and source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
- source-mac — Uses the source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

tcp-udp enable

Enter the keywords to distribute traffic based on the following:

- enable — Takes the TCP/UDP source and destination ports into consideration when doing hash computations. This option is enabled by default.

ingress-port enable

Enter the keywords to distribute traffic based on the following:

- enable — Takes the source port into consideration when doing hash computations. This option is disabled by default.

Defaults

IP 4-tuple (IP SA, IP DA, Source Port, Destination Port)

</tbody>
</table>

Usage Information

By default, Dell Networking OS distributes incoming traffic based on a hash algorithm using the following criteria:
- IP source address
- IP destination address
- TCP/UDP source port
- TCP/UDP destination port

load-balance hg

Choose the traffic flow parameters the hash calculation uses while distributing the traffic across internal higig links.

Syntax

```
```

Parameters

`{[(ip-selection) | ipv6-selection [source-ip | source-ipv6 | source-port-id | source-module-id | dest-ip | dest-ipv6 | dest-port-id | dest-module-id | protocol]` To use IPv4 key fields in hash computation, enter the keyword ip-selection then one of the parameters. To use IPv6 key fields in hash computation, enter the keyword ipv6-selection then one of the parameters.
- `source-ip` — Use IPv4 src-ip field in hash calculation.
- `source-ipv6` — Use IPv6 src-ip field in hash calculation
- `source-port-id` — Use src-port-id field in hash calculation
- `source-module-id` — Use src-module-id field in hash calculation
- `dest-ip` — Use IPv4 dest-ip field in hash calculation
To use MAC key fields in hash computation, enter the keyword **mac** then one of the parameters:

- source-mac — Use source-mac field in hash calculation.
- source-port-id — Use src-port-id field in hash calculation.
- source-module-id — Use src-module-id field in hash calculation.
- dest-mac — Use dest-mac field in hash calculation.
- dest-port-id — Use dest-port-id field in hash calculation.
- dest-module-id — Use dest-module-id field in hash calculation.
- ethertype — Use Ethertype field in hash calculation.
- source-dest-mac — Use SMAC and DMAC fields in hash calculation.

To use tunnel key fields in hash computation, enter the keyword **tunnel** then one of the parameters:

- ipv4-over-ipv4 — Use ipv4-over-ipv4 field in hash calculation.
- ipv4-over-gre-ipv4 — Use ipv4-over-gre-ipv4 field in hash calculation.
- mac-in-mac — Use mac-in-mac field in hash calculation.

Defaults

IP selection 5-tuples (source-ip dest-ip vlan protocol L4-source-port L4-dest-port).

management route

Configure a static route that points to the Management interface or a forwarding router.

Syntax

management route {ip-address mask | ipv6-address 1.1.1.1prefix-length} 
(forwarding-router-address | managementethernet| vlan | gigabitethernet | tengigabitethernet)

To remove a static route, use the no management route command.

Parameters

**ip-address mask**
- Enter an IP address (dotted decimal format) and mask (/prefix format) of the destination subnet.

**ipv6-address prefix-length**
- Enter an IPv6 address (x:x:x:x format) and mask (/prefix format) of the destination subnet. Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format. The range is from /0 to /128.

**forwarding-router-address**
- Enter an IP address (dotted decimal format) or an IPv6 address (x:x:x:x:x format) of a forwarding router.

**managementethernet**
- Enter the keyword managementethernet for the Management interface on the Primary RPM.

**vlan**
- Enter the keyword vlan to specify a vlan interface.

**gigabitethernet**
- Enter the keyword gigabitethernet to specify a one Gigabit Ethernet interface.

**tengigabitethernet**
- Enter the keyword tengigabitethernet to specify a ten Gigabit Ethernet interface.

Defaults

Not configured.

### Version Description

- **9.7(0.0)**
  Added support for forty gigabit, vlan, and tengigabit ethernet interfaces. Introduced on the S6000-ON.
- **9.0.2.0**
  Introduced on the S6000.
- **9.0.0.0**
  Introduced on the Z9000 and added support for IPv6.
- **8.3.19.0**
  Introduced on the S4820T.
- **8.3.11.1**
  Introduced on the S4810.
- **8.1.1.0**
  Introduced on the E-Series.
- **7.5.1.0**
  Introduced on the C-Series.
- **pre-6.1.1.0**
  Introduced on the E-Series.

### Usage Information

When a static route (or a protocol route) overlaps with Management static route, the static route (or a protocol route) is preferred over the Management Static route. Also, Management static routes and the Management Connected prefix are not reflected in the hardware routing tables. Separate routing tables are maintained for IPv4 and IPv6 management routes. This command manages both tables.

### Related Commands

- `interface ManagementEthernet` — configure the Management port on the system (either the Primary or Standby RPM).
- `speed (Management interface)` — set the speed for the Management interface.

### show arp

Display the ARP table.

#### Syntax

```
show arp [vrf vrf-name] [interface interface | ip ip-address [mask] | macaddress mac-address [mac-address mask]] [retries] [static | dynamic] [inspection {database | statistics}[summary]]
```

#### Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf and then the name of the VRF.
  
  **NOTE:** Use this attribute to start a BGP instance for either a specific address family corresponding to the default VRF or an IPv4 address family corresponding to a non-default VRF.

- **interface interface** (OPTIONAL) Enter the following keywords and the interface information:
  
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
**Command Modes**

Version Description
pre-6.1.0 Introduced on the E-Series.

Usage Information
The following example shows two VLANs that are associated with a private VLAN (PVLAN) (refer to Private VLAN (PVLAN)).

If you have entered the clear arp-cache command to remove a large number of ARP entries and the command is still being processed in the background, an error message display if you attempt to enter the show arp command:

Clear arp in-progress. Please try after sometime!

The following describes the show arp command shown in the following example.

Description
Protocol Displays the protocol type.
Address Displays the IP address of the ARP entry.
Age(min) Displays the age (in minutes) of the ARP entry.
Hardware Address Displays the MAC address associated with the ARP entry.
Interface Displays the first two letters of the interfaces type and the slot/port associated with the ARP entry.
VLAN Displays the VLAN ID, if any, associated with the ARP entry.
CPU Lists which CPU the entries are stored on.

Example
Dell> show arp
Protocol Address Age(min) Hardware Address Interface VLAN CPU
-----------------------------------------------
Internet 192.2.1.254 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.253 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.252 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.251 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.250 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.249 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.248 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.247 1 00:00:c0:02:01:02 Gi 2/13 - CP
Internet 192.2.1.246 1 00:00:c0:02:01:02 Gi 2/13 - CP

Usage Information
The following describes the show arp summary command shown in the following example.

Example (Private VLAN)

NOTE: In this example, Line 1 shows community VLAN 200 (in primary VLAN 10) in a PVLAN. Line 2 shows primary VLAN 10.

Dell# show arp
Protocol Address Age(min) Hardware Address Interface VLAN CPU
-----------------------------------------------
Internet 5.5.5.1 - 00:01:e8:43:96:5e - Vl 10 pv 200 CP
Internet 5.5.5.10 - 00:01:e8:44:99:55 - Vl 10 CP
Internet 10.1.2.4 1 00:01:e8:d5:9e:e2 Ma 1/1 - CP
Internet 10.10.10.4 1 00:01:e8:d5:9e:e2 Ma 1/1 - CP
Internet 10.16.127.53 1 00:01:e8:d5:9e:e2 Ma 1/1 - CP
Internet 10.16.134.254 20 00:01:e8:d5:9e:e2 Ma 1/1 - CP
Internet 133.33.33.4 1 00:01:e8:d5:9e:e2 Ma 1/1 - CP
Description

Total Entries
Lists the total number of ARP entries in the ARP table.

Static Entries
Lists the total number of configured or static ARP entries.

Dynamic Entries
Lists the total number of learned or dynamic ARP entries.

CPU
Lists which CPU the entries are stored on.

Example (Summary)

Dell# show arp summary

TotalEntries Static Entries Dynamic Entries CPU
----------------------------------------------
83             0               83           CP
Dell#

Related Commands

-  `ip local-proxy-arp` — enable/disable Layer 3 communication in secondary VLANs.
-  `switchport mode private-vlan` — set PVLAN mode of the selected port.

show arp retries

Display the configured number of ARP retries.

Syntax

`show arp retries`

Command Modes

- EXEC
- EXEC Privilege

Usage Information

The following describes the `show hosts` command in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default domain...</td>
<td>Displays the domain name (if configured).</td>
</tr>
</tbody>
</table>
### Field Description

**Name/address lookup...** States if DNS is enabled on the system.
- If DNS is enabled, the Name/Address lookup is domain service.
- If DNS is not enabled, the Name/Address lookup is static mapping.

**Name servers are...** Lists the name servers, if configured.

**Host** Displays the host name assigned to the IP address.

**Flags** Classifies the entry as one of the following:
- perm — the entry was manually configured and will not time out
- temp — the entry was learned and will time out after 72 hours of inactivity.

Also included in the flag is an indication of the validity of the route:
- ok — the entry is valid.
- ex — the entry expired.
- ?? — the entry is suspect.

**TTL** Displays the amount of time until the entry ages out of the cache. For dynamically learned entries only.

**Type** Displays IP as the type of entry.

**Address** Displays the IP addresses assigned to the host.

### Example

```plaintext
Dell# show hosts
Default domain is not set
Name/address lookup uses static mappings
Name servers are not set
Host     Flags     TTL   Type   Address
-------- -----     ----  ----   -------
ks      (perm, OK) -     IP     2.2.2.2
4200-1  (perm, OK) -     IP     192.68.69.2
1230-3  (perm, OK) -     IP     192.68.99.2
Zr      (perm, OK) -     IP     192.71.18.2
Z10-3   (perm, OK) -     IP     192.71.23.1
Dell#
```

### Related Commands
- **traceroute** — view the DNS resolution.
- **ip host** — configure a host.

## show ip cam stack-unit

Display CAM entries for a port-pipe of a stack-unit on a S-Series or Z-Series switch.

### Syntax

```
show ip cam stack-unit {stack-unit-number} [port-set {pipe-number} | vrf vrf-name {ip-address mask [longer-prefixes [ecmp-group detail]]}]} | ecmp-group {detail | member-info [detail [group-index index-number]]} | summary]
```

### Parameters

- **stack-unit-number** Enter the stack-unit ID. The range is from 1 to 12.
- **port-set pipe-number** Enter the keyword **port-set** then the number of the stack unit’s port-pipe. The unit ID range is from 0 to 0.
vrf vrf-name  Enter the keyword vrf followed by the name of the VRF to display CAM entries corresponding to that VRF.

network mask  [longer-prefixes  [ecmp-group detail]]  (OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only. You can enter one of the following keywords to filter results.

  • Enter the keyword longer-prefixes to view routes with a common prefix.
  • Enter the keyword ecmp-group detail to view the ECMP group index.

ecmp-group (detail  [member-info  [detail [group-index index-number]]])  (OPTIONAL) Enter the keyword ecmp-group then one of the following keywords to filter results.

  • Enter the keyword detail to view the ECMP group index.
  • Enter the keyword member-info to view the member information for the ECMP group.
  • Enter the keyword member-info detail to view detailed ECMP membership and n-hop information.
  • Enter the keyword group-index then the index number to show ECMP membership per group. The range is from 0 to 1022.

summary  (OPTIONAL) Enter the keyword summary to view a table listing route prefixes and the total number routes which can be entered in to CAM.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0)  Increased the stacking range to 12 units in S3100 series.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100-ON.
9.8(0.0P6)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S6000-ON.
9.4(0.0)  Added support for VRF.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.
8.3.7.0  Introduced on the S4810.
7.7.1.0  Added support for up to seven stack members.
7.6.1.0  Introduced on the S-Series.

Usage Information

The following describes the show ip cam command shown in the following example.

Field  Description
Destination  Displays the destination route of the index.
## show ip fib stack-unit

View all Forwarding Information Base (FIB) entries of a specific stack-unit.

### Syntax

```
show ip fib stack-unit stack-unit-number vrf vrf-name [ip-address [mask] [longer-prefixes] | summary]
```

### Parameters

- `stack-unit-number` Enter the stack unit ID.

### Example

```
Dell# show ip fib stack-unit 3
Destination      Mask       Pre  Cost   Outgoing Int  
-----------------------------  -----  -------  ----------------
10.0.0.0/8        0.0.0.0     0      0       FastEthernet0/0
Dell#
```
vrf vrf-name

Enter the keyword vrf followed by the name of the VRF to view FIB entries corresponding to that VRF.

ip-address mask

(OPTIONAL) Enter the IP address of the network destination to view only information on that destination. Enter the IP address in dotted decimal format (A.B.C.D). Enter the mask in slash prefix format (/X).

longer-prefixes

(OPTIONAL) Enter the keywords longer-prefixes to view all routes with a common prefix.

summary

(OPTIONAL) Enter the keyword summary to view the total number of prefixes in the FIB.

Command Modes

- EXEC
- EXEC Privilege

Command History

<td>Displays the first hop IP address.</td>
</tr>
<tr>
<td>Mac-Addr</td>
<td>Displays the MAC address.</td>
</tr>
<tr>
<td>Port</td>
<td>Displays the egress-port information.</td>
</tr>
<tr>
<td>VId</td>
<td>Displays the VLAN ID. If no VLAN is assigned, zero (0) is listed.</td>
</tr>
</tbody>
</table>
### Field Description

**EC** Displays the number of ECMP paths.

If weighted ECMP is enabled, then the `show ip fib stack-unit` command displays a new column named **W-EC** (Weighted ECMP). This column displays either a value of 1 or 0 depending on whether or not a route is assigned with a weight.

#### Example

```
Dell# show ip fib stack-unit 1
Destination   Gateway               First-Hop  Mac-Addr           Port    VId  EC
------------------------------------------------------------------------------------
1.1.1.2/32     via 1.1.1.2, Vl 1000 1.1.1.2    00:01:00:00:00:02   Gi 3/42   1000  0
2.1.1.2/32     via 2.1.1.2, Vl 20   2.1.1.2    00:00:00:00:00:02   Po 10       20   0
0.0.0.0/0      Direct, Vl 1000     0.0.0.0     00:00:00:00:00:02   CP    0    0
1.1.1.0/24     Direct, Vl 1000     0.0.0.0     00:00:00:00:00:02   CP    0    0
2.1.1.0/24     Direct, Vl 20       0.0.0.0     00:00:00:00:00:02   CP    0    0
2.1.1.1/24     via 2.1.1.2, Vl 1000 2.1.1.2    00:00:00:00:00:02   GL 3/42   1000  1
100.1.1.0/24   via 1.1.1.2, Vl 1000 1.1.1.2    00:00:00:00:00:02   GL 3/42   1000  1
100.1.1.0/24   via 2.1.1.2, Vl 20   2.1.1.2    00:00:00:00:00:02   Po 10       20   1
```

#### Example (Show command output with Weighted ECMP Enabled)

```
Dell# show ip fib stack-unit 1
Destination Gateway First-Hop  Mac-Addr Port  VId  EC  RC W
------------------------------------------------------------------------------------
0.0.0.0/0     -             -             -             CP    0    0    -    -
1.1.0/24       Direct, Lo 0  0.0.0.0     00:00:00:00:00:00   CP    0    0    -    -
1.1.1.1/24     via 2.1.1.2, Vl 1000 2.1.1.2    00:00:00:00:00:02   CP    0    0    -    -
```

The **RC** and **W** columns in the show output appear only if the weighted ECMP is enabled using the `ip ecmp weighted` command.

#### Related Commands
- `clear ip fib stack-unit` — clear FIB entries on a specified stack-unit.
- `ip ecmp weighted` — enable weighted ECMP calculations.

### show ip flow

Show how a Layer 3 packet is forwarded when it arrives at a particular interface.

#### Syntax

```
show ip flow interface {source-ip address destination-ip address} {protocol number [tcp | udp]} {src-port number destination-port number}
```

#### Parameters
- **interface interface** Enter the keyword `interface` then one of the following interface keywords.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- **source-ip address** Enter the keywords `source-ip` then the IP source address in IP address format.
- **destination-ip address** Enter the keywords `destination-ip` then the IP destination address in IP address format.
- **protocol number [tcp | udp]** Enter the keyword `protocol` then one of the protocol type keywords: `tcp`, `udp`, or `protocol number`. The protocol number range is from 0 to 255.
src-port number          Enter the keywords src-port then the source port number.
destination-port number Enter the keywords destination-port then the destination port number.

Command Modes
EXEC Privilege

</tbody>
</table>

Usage Information
This command provides egress port information for a given IP flow. This information is useful in identifying which interface the packet follows in the case of Port-channel and Equal Cost Multi Paths. Use this command for routed packed only. For switched packets, use the show port-channel-flow command.

The show ip flow command does not compute the egress port information when load-balance mac hashing is also configured due to insufficient information (the egress MAC is not available).

S-Series produces the following error message: %Error: Unable to read IP route table.

Example
Dell# show ip flow interface Gi 2/42 20.1.1.1 100.1.1.2 protocol tcp
Flow: 20.1.1.1 100.1.1.2 6
Ingress interface: Gi 2/42
Egress Interface: Gi 2/43
Dell#
**show ip interface**

View IP-related information on all interfaces.

**Syntax**

```console
show ip interface [interface | brief] [configured]
```

**Parameters**

- `interface` (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a Null interface, enter the keyword null then the Null interface number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
  - For a stack-unit interface, enter the keyword stack-unit then the stack unit number.
  - For a tunnel interface, enter the keyword tunnel then the tunnel interface number. The range is from 1 to 16383.

- `brief` (OPTIONAL) Enter the keyword brief to view a brief summary of the interfaces and whether an IP address is assigned.

- `configured` (OPTIONAL) Enter the keyword configured to display the physical interfaces with non-default configurations only.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

<tr>
<td>Inbound access...</td>
<td>Displays the name of the configured incoming access list. If none is configured, the phrase “not set” is displayed.</td>
</tr>
<tr>
<td>Proxy ARP...</td>
<td>States whether proxy ARP is enabled on the interface.</td>
</tr>
<tr>
<td>Split horizon...</td>
<td>States whether split horizon for RIP is enabled on the interface.</td>
</tr>
<tr>
<td>Poison Reverse...</td>
<td>States whether poison for RIP is enabled on the interface.</td>
</tr>
<tr>
<td>ICMP redirects...</td>
<td>States if ICMP redirects are sent.</td>
</tr>
<tr>
<td>ICMP unreachables...</td>
<td>States if ICMP unreachable messages are sent.</td>
</tr>
</tbody>
</table>

**Example**

```
Dell# show ip interface gigabitethernet 1/1
GigabitEthernet 1/1 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
Dell#
```

```
Dell# show ip interface port-channel 128
Port-channel 128 is down, line protocol is down
```
Internet address is 10.1.1.1/16
Broadcast address is 10.1.255.255
Address determined by user input
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
Dell#

Dell# show ip interface vlan 1
Vlan 1 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Directed broadcast forwarding is disabled
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent
IP unicast RPF check is not supported
Dell#

Usage Information
The following describes the show ip interface brief command shown in the following example.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays type of interface and the associated slot and port number.</td>
</tr>
<tr>
<td>IP-Address</td>
<td>Displays the IP address for the interface, if configured.</td>
</tr>
<tr>
<td>Ok?</td>
<td>Indicates if the hardware is functioning properly.</td>
</tr>
<tr>
<td>Method</td>
<td>Displays “Manual” if the configuration is read from the saved configuration.</td>
</tr>
<tr>
<td>Status</td>
<td>States whether the interface is enabled (up) or disabled (administratively down).</td>
</tr>
<tr>
<td>Protocol</td>
<td>States whether IP is enabled (up) or disabled (down) on the interface.</td>
</tr>
</tbody>
</table>

Example (Brief)

Dell# show ip interface brief
Interface       IP-Address    OK? Method Status           Protocol
GigabitEthernet 1/1 unassigned  NO Manual administratively down down
GigabitEthernet 1/2 unassigned  NO Manual administratively down down
GigabitEthernet 1/3 unassigned  YES Manual up                    up
GigabitEthernet 1/4 unassigned  YES Manual up                    up
GigabitEthernet 1/5 unassigned  YES Manual up                    up
GigabitEthernet 1/6 10.10.10.1 YES Manual up                    up
GigabitEthernet 1/7 unassigned  NO Manual administratively down down

show ip management-route

View the IP addresses assigned to the Management interface.

Syntax

show ip management-route [all | connected | summary | static]
Parameters

- **all** (OPTIONAL) Enter the keyword `all` to view all IP addresses assigned to all Management interfaces on the switch.
- **connected** (OPTIONAL) Enter the keyword `connected` to view only routes directly connected to the Management interface.
- **summary** (OPTIONAL) Enter the keyword `summary` to view a table listing the number of active and non-active routes and their sources.
- **static** (OPTIONAL) Enter the keyword `static` to view non-active routes also.

Command Modes

- EXEC
- EXEC Privilege

Command History

Dell#
```
# show ipv6 management-route

Display the IPv6 static routes configured for the management interface.

## Syntax

```
show ipv6 management-route [all | connected | summary | static]
```

## Parameters

- **all**: (OPTIONAL) Enter the keyword all to view all IP addresses assigned to all Management interfaces on the switch.
- **connected**: (OPTIONAL) Enter the keyword connected to view only routes directly connected to the Management interface.
- **summary**: (OPTIONAL) Enter the keyword summary to view a table listing the number of active and non-active routes and their sources.
- **static**: (OPTIONAL) Enter the keyword static to view non-active routes also.

## Command Modes

**EXEC Privilege**

Example

Dell# show ip protocols
Routing Protocol is "bgp 1"
Cluster Id is set to 20.20.20.3
Router Id is set to 20.20.20.3
Fast-external-fallover enabled
Regular expression evaluation optimization enabled
Capable of ROUTE_REFRESH
For Address Family IPv4 Unicast
BGP table version is 0, main routing table version 0
Distance: external 20 internal 200 local 200
Neighbor(s):
   Address : 20.20.20.2
show ip route

View information, including how they were learned, about the IP routes on the switch.

Syntax

show ip route [vrf vrf-name] hostname | ip-address [mask] [longer-prefixes] | list prefix-list | protocol [process-id | routing-tag] | all | connected | static | summary

Parameters

vrf vrf-name (OPTIONAL) Enter the keyword vrf and then the VRF name to list the routes in the route table of a specific VRF.
ip-address (OPTIONAL) Specify a name of a device or the IP address of the device to view more detailed information about the route.
mask (OPTIONAL) Specify the network mask of the route. Use this parameter with the IP address parameter.
longer-prefixes (OPTIONAL) Enter the keywords longer-prefixes to view all routes with a common prefix.
list prefix-list (OPTIONAL) Enter the keyword list and the name of a configured prefix list. For more information, refer to the show ip route list command.
protocol (OPTIONAL) Enter the name of a routing protocol (bgp, isis, ospf, rip) or the keywords connected or static.

1 | NOTE: bgp, isis, ospf, and rip.

• If you enter bgp, you can include the BGP as-number.
• If you enter isis, you can include the ISIS routing-tag.
• If you enter ospf, you can include the OSPF process-id.

process-id (OPTIONAL) Specify that only OSPF routes with a certain process ID must be displayed.
routing-tag (OPTIONAL) Specify that only ISIS routes with a certain routing tag must be displayed.
connected (OPTIONAL) Enter the keyword connected to view only the directly connected routes.
all (OPTIONAL) Enter the keyword all to view both active and non-active routes.
static (OPTIONAL) Enter the keyword static to view only routes the ip route command configures.
summary (OPTIONAL) Enter the keyword summary. For more information, refer to the show ip route summary command.

Command Modes

• EXEC

</tbody>
</table>

Usage Information

The following describes the show ip route all command in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(undefined)</td>
<td>Identifies the type of route:</td>
</tr>
<tr>
<td></td>
<td>• C = connected</td>
</tr>
<tr>
<td></td>
<td>• S = static</td>
</tr>
<tr>
<td></td>
<td>• R = RIP</td>
</tr>
<tr>
<td></td>
<td>• B = BGP</td>
</tr>
<tr>
<td></td>
<td>• IN = internal BGP</td>
</tr>
<tr>
<td></td>
<td>• EX = external BGP</td>
</tr>
<tr>
<td></td>
<td>• LO = Locally Originated</td>
</tr>
<tr>
<td></td>
<td>• O = OSPF</td>
</tr>
<tr>
<td></td>
<td>• IA = OSPF inter area</td>
</tr>
<tr>
<td></td>
<td>• N1 = OSPF NSSA external type 1</td>
</tr>
<tr>
<td></td>
<td>• N2 = OSPF NSSA external type 2</td>
</tr>
<tr>
<td></td>
<td>• E1 = OSPF external type 1</td>
</tr>
<tr>
<td></td>
<td>• E2 = OSPF external type 2</td>
</tr>
<tr>
<td></td>
<td>• i = IS-IS</td>
</tr>
</tbody>
</table>
### Field Description
- L1 = IS-IS level-1
- L2 = IS-IS level-2
- IA = IS-IS inter-area
- * = candidate default
- > = non-active route
- + = summary routes

The weight for weighted ECMP route calculations is displayed for each path in the route in the `show ip route` command. The ECMP weight is displayed only if weighted ECMP is enabled using the `ip ecmp weighted` command is enabled.

If weighted ECMP is disabled, the `show ip route` command does not show the weighted ECMP route information.

### Example
```
Dell# show ip route all
Codes:C- connected, S - static, R - RIP
     B- BGP, IN - internal BGP, EX - external BGP, LO - Locally Originated
     O- OSPF, IA - OSPF inter area N1 - OSPF NSSA external type 1
     N2- OSPF NSSA external type 2, E1 - OSPF external type 1
     E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1
     L2- IS-IS level-2, IA - IS-IS inter area, * - candidate default
     >- non-active route + - summary route
Gateway of last resort is not set

              ----              ------------  ----------- -----------
        Destination         Gateway            Dist/Metric Last Change
              ----              ------------  ----------- -----------
   R  3.0.0.0/8       via 100.10.10.10, Gi 2/8 120/1   00:07:12
       via 101.10.10.10, Gi 2/9
   > R 100.10.10.0/24  Direct, Gi 2/8     0/0        00:08:54
     100.10.10.0/24  Direct, Gi 2/8     0/0        00:08:54
   C 101.10.10.0/24  Direct, Gi 2/9     120/0      00:09:15
   > R 101.10.10.0/24 Direct, Gi 2/9     120/0      00:09:15
Dell#
```

### Example (Summary)
```
Dell# show ip route summary

Route Source  Active Routes   Non-active Routes
connected     2               0
static        1               0
Total         3               0
Total 3 active route(s) using 612 bytes
```

```bash
R1_E600i>show ip route static ?
| P | Pipe through a command
<cr>
R1_E600i>show ip route static

              ----              ------------  ----------- -----------
        Destination         Gateway            Dist/Metric Last Change
              ----              ------------  ----------- -----------
*S  0.0.0.0/0       via 10.10.91.9, Gi 1/2     1/0        3d2h
Dell>
```
Example (vrf)

Dell# show ip route vrf test1

Codes: C - connected, S - static, R - RIP, B - BGP, IN - internal BGP, EX - external BGP, LO - Locally Originated, O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2, E1 - OSPF external type 1, E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default, > - non-active route, + - summary route

Dell(conf)#
show ip route list

Display IP routes in an IP prefix list.

Syntax

    show ip route [vrf vrf-name] list prefix-list

Parameters

- **prefix-list**: Enter the name of a configured prefix list.
- **vrf vrf-name**: Enter the keyword vrf followed by the name of the VRF to display IP routes in an IP prefix list corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
-------------|--------------------------------------------------
9.10(0.0)    | Introduced on the S3148.
9.8(2.0)     | Introduced on the S3100 series.
9.8(1.0)     | Introduced on the Z9100-ON.
9.8(0.0P6)   | Introduced on the S4048-ON.
9.8(0.0P2)   | Introduced on the S3048-ON.
9.7(0.0)     | Introduced on the S6000-ON.
9.4(0.0)     | Added support for VRF.
9.2(1.0)     | Introduced on the Z9500.
9.0.2.0      | Introduced on the S6000.
8.3.19.0     | Introduced on the S4820T.

**Related Commands**

- `ip prefix-list` — enter CONFIGURATION-IP PREFIX-LIST mode and configures a prefix list.
- `show ip prefix-list summary` — display a summary of the configured prefix lists.

### show ip route summary

View a table summarizing the IP routes in the switch.

**Syntax**

```
show ip route [vrf vrf-name] [summary]
```

**Parameters**

- `vrf vrf-name`: Enter the keyword `vrf` followed by the name of the VRF to view information on the IP routes corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### show ip route summary

The following describes the `show ip route summary` shown in the following example.

**Column Heading** | **Description**
--- | ---
Route Source | Identifies how the route is configured in Dell Networking OS.
Active Routes | Identifies the best route if a route is learned from two protocol sources.
Non-active Routes | Identifies the back-up routes when a route is learned by two different protocols. If the best route or active route goes down, the non-active route becomes the best route.
ospf 100 | If routing protocols (OSPF, RIP) are configured and routes are advertised, then information on those routes is displayed.
Total 1388 active... | Displays the number of active and non-active routes and the memory usage of those routes. If there are no routes configured in the Dell Networking OS, this line does not appear.

**Example**

Dell> show ip route summary

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Active Routes</th>
<th>Non-active Routes</th>
</tr>
</thead>
<tbody>
<tr>
<td>connected</td>
<td>17</td>
<td>0</td>

<td>Inter-area: 1: 600</td>
<td>External-1: 600</td>
</tr>
<tr>
<td>Total</td>
<td>1388</td>
<td>2</td>
</tr>
<tr>
<td>Total 1388 active route(s) using 222440 bytes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total 2 non-active route(s) using 128 bytes</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Dell>

**Related Commands**

- `show ip route` — display information about the routes found in the switch.

### show ip traffic

View IP, ICMP, UDP, TCP and ARP traffic statistics.

**Syntax**

```
show ip traffic [all | cp | rp1 | rp2]
```

**NOTE:** These options are supported only on the E-Series.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enter the keyword <strong>all</strong> to view statistics from all processors. If you do not enter a keyword, you also view all statistics from all processors.</td>
</tr>
<tr>

<tr>
<td>... no port</td>
<td>The incoming broadcast/multicast packet did not have any listener.</td>
</tr>
<tr>
<td>... socket full</td>
<td>The applications buffer is full and the incoming packet are dropped.</td>
</tr>
</tbody>
</table>

The Dell Monitoring MIB provides access to the following statistics:

- **IP Statistics: Bcast: Received**: Object = f10BcastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.1
- **IP Statistics: Bcast: Sent**: Object = f10BcastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.2
- **IP Statistics: Mcast: Received**: Object = f10McastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.3
- **IP Statistics: Mcast: Sent**: Object = f10McastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.4
- **ARP Statistics: Rcvd: Request**: Object = f10ArpReqRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.1
- **ARP Statistics: Rcvd: Replies**: Object = f10ArpReplyRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.3
- **ARP Statistics: Sent: Request**: Object = f10ArpReqSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.2
- **ARP Statistics: Sent: Replies**: Object = f10ArpReplySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.4
- **ARP Statistics: Sent: Proxy**: Object = f10ArpProxySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.5

**Example**

Dell# show ip traffic
Control Processor IP Traffic:

**IP statistics:**
- Rcvd: 23857 total, 23829 local destination
- 0 format errors, 0 checksum errors, 0 bad hop count
- 0 unknown protocol, 0 not a gateway
- 0 security failures, 0 bad options
- Frags: 0 reassembled, 0 timeouts, 0 too big
- Bcast: 28 received, 0 sent; Mcast: 0 received, 0 sent
- Sent: 16048 generated, 0 forwarded
- 21 encapsulation failed, 0 no route

**ICMP statistics:**
- Rcvd: 0 format errors, 0 checksum errors, 0 redirects, 0 unreachable
- 0 echo, 0 echo reply, 0 mask requests, 0 mask replies, 0 quench
- 0 parameter, 0 timestamp, 0 info request, 0 other
- Sent: 0 redirects, 0 unreachable, 0 echo, 0 echo reply
- 0 mask requests, 0 mask replies, 0 quench, 0 timestamp
- 0 info reply, 0 time exceeded, 0 parameter problem

**UDP statistics:**
- Rcvd: 0 total, 0 checksum errors, 0 no port
- 0 short packets, 0 bad length, 0 no port broadcasts, 0 socket full
- Sent: 0 total, 0 forwarded broadcasts
TCP statistics:
  Rcvd: 23829 total, 0 checksum errors, 0 no port
  Sent: 16048 total
ARP statistics:
  Rcvd: 156 requests, 11 replies
  Sent: 21 requests, 10 replies (0 proxy)
Routing Processor1 IP Traffic:

show tcp statistics

View information on TCP traffic through the switch.

Syntax
  show tcp statistics {all | cp}

Parameters
  all
    Enter the keyword all to view all TCP information.
  cp
    Enter the keyword cp to view only TCP information from the Control Processor.

Command Modes
  EXEC Privilege

Command History
  This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
  OS Command Line Reference Guide.

Version
  9.10(0.0)  Introduced on the S3148.
  9.10(0.0)  Introduced on the S3148.
  9.8(2.0)   Introduced on the S3100 series.
  9.8(1.0)   Introduced on the Z9100-ON.
  9.8(0.0P5) Introduced on the S4048-ON.
  9.8(0.0P2) Introduced on the S3048-ON.
  9.2(1.0)   Introduced on the Z9500.
  9.0.2.0     Introduced on the S6000.
  8.3(19.0)  Introduced on the S4820T.
  8.3(11.1)  Introduced on the S9000.
  8.3(7.0)   Introduced on the S4810.
  8.1(10)    Introduced on the E-Series.
  6.4(1.0)   Introduced

Usage Information
  The following describes the show tcp statistics cp command shown in the following example.

Field            Description
Rcvd:            Displays the number and types of TCP packets received by the switch.
  •  Total = total packets received
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no port</td>
<td>number of packets received with no designated port</td>
</tr>
<tr>
<td>0 checksum error...</td>
<td>Displays the number of packets received with the following:</td>
</tr>
<tr>
<td></td>
<td>checksum errors</td>
</tr>
<tr>
<td></td>
<td>bad offset to data</td>
</tr>
<tr>
<td></td>
<td>too short</td>
</tr>
<tr>
<td>329 packets...</td>
<td>Displays the number of packets and bytes received in sequence.</td>
</tr>
<tr>
<td>17 dup...</td>
<td>Displays the number of duplicate packets and bytes received.</td>
</tr>
<tr>
<td>0 partially...</td>
<td>Displays the number of partially duplicated packets and bytes received.</td>
</tr>
<tr>
<td>7 out-of-order...</td>
<td>Displays the number of packets and bytes received out of order.</td>
</tr>
<tr>
<td>0 packets with data after window</td>
<td>Displays the number of packets and bytes received that exceed the switch's window size.</td>
</tr>
<tr>
<td>0 packets after close</td>
<td>Displays the number of packet received after the TCP connection was closed.</td>
</tr>
<tr>
<td>0 window probe packets...</td>
<td>Displays the number of window probe and update packets received.</td>
</tr>
<tr>
<td>41 dup ack...</td>
<td>Displays the number of duplicate acknowledgement packets and acknowledgement packets with data received.</td>
</tr>
<tr>
<td>10184 ack...</td>
<td>Displays the number of acknowledgement packets and bytes received.</td>
</tr>
<tr>
<td>Sent:</td>
<td>Displays the total number of TCP packets sent and the number of urgent packets sent.</td>
</tr>
<tr>
<td>25 control packets...</td>
<td>Displays the number of control packets sent and the number retransmitted.</td>
</tr>
<tr>
<td>11603 data packets...</td>
<td>Displays the number of data packets sent.</td>
</tr>
<tr>
<td>24 data packets retransmitted</td>
<td>Displays the number of data packets resent.</td>
</tr>
<tr>
<td>355 ack...</td>
<td>Displays the number of acknowledgement packets sent and the number of packet delayed.</td>
</tr>
<tr>
<td>0 window probe...</td>
<td>Displays the number of window probe and update packets sent.</td>
</tr>
<tr>
<td>7 Connections initiated...</td>
<td>Displays the number of TCP connections initiated, accepted, and established.</td>
</tr>
<tr>
<td>14 Connections closed...</td>
<td>Displays the number of TCP connections closed, dropped.</td>
</tr>
<tr>
<td>20 Total rxmt...</td>
<td>Displays the number of times the switch tried to re-send data and the number of connections dropped during the TCP retransmit timeout period.</td>
</tr>
<tr>
<td>0 Keepalive....</td>
<td>Lists the number of keepalive packets in timeout, the number keepalive probes and the number of TCP connections dropped during keepalive.</td>
</tr>
</tbody>
</table>

**Example**

Dell# show tcp stat cp

Control Processor TCP:
Rcvd: 10585 Total, 0 no port
  0 checksum error, 0 bad offset, 0 too short
329 packets (1263 bytes) in sequence
17 dup packets (6 bytes)
0 partially dup packets (0 bytes)
7 out-of-order packets (0 bytes)
0 packets (0 bytes) with data after window
0 packets after close
0 window probe packets, 41 window update packets
41 dup ack packets, 0 ack packets with unsend data
10184 ack packets (12439508 bytes)
Sent: 12007 Total, 0 urgent packets
25 control packets (including 24 retransmitted)
11603 data packets (12439677 bytes)
24 data packets (7638 bytes) retransmitted
355 ack only packets (41 delayed)
0 window probe packets, 0 window update packets
7 Connections initiated, 8 connections accepted, 15 connections established
14 Connections closed (including 0 dropped, 0 embryonic dropped)
20 Total rxmt timeout, 0 connections dropped in rxmt timeout
0 Keepalive timeout, 0 keepalive probe, 0 Connections dropped in keepalive
IPv6 Access Control Lists (IPv6 ACLs)

IPv6 ACLs and IPv6 Route Map commands are supported on Dell Networking OS.

**NOTE:** For IPv4 ACL commands, see Access Control Lists (ACL).

### Important Points to Remember

- Certain platforms require manual CAM usage space allotment. For more information, see cam-acl.
- Egress IPv6 ACL and IPv6 ACL on the Loopback interface is not supported.
- Reference to an empty ACL permits any traffic.
- ACLs are not applied to self-originated traffic (for example, Control Protocol traffic not affected by IPv6 ACL because the routed bit is not set for Control Protocol traffic and for egress ACLs the routed bit must be set).
- You can use the same access list name for both IPv4 and IPv6 ACLs.
- You can apply both IPv4 and IPv6 ACLs on an interface at the same time.
- You can apply IPv6 ACLs on physical interfaces and a logical interfaces (Port-channel/VLAN).
- Non-contiguous masks are not supported in source or destination addresses in IPv6 ACL entries.
- Because the prefix mask is specified in /x format in IPv6 ACLs, inverse mask is not supported.

### Topics:

- show cam-acl-egress
- show cam-acl
- permit icmp
- permit
- ipv6 control-plane egress-filter
- ipv6 access-list
- cam-acl-egress
- cam-acl

### show cam-acl-egress

Show information on FP groups allocated for egress ACLs.

**Syntax**

```
show cam-acl-egress
```

**Command Modes**

- EXEC
- EXEC Privilege

Dell#

Related Commands

- cam-acl — configure CAM profiles to support IPv6 ACLs.

**permit icmp**

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

**Syntax**

```
permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

**Parameters**

- source address mask | any | host ipv6-address
- destination address | any | host ipv6-address
- message-type
- count [byte]
- log
- monitor

**Defaults**

Not configured.

**Command Modes**

ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
permit

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

Syntax

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter’s sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

Parameters

- `ipv6-protocol-number`: Enter an IPv6 protocol number. The range is from 0 to 255.
- `icmp`: Enter the keyword ` icmp` to filter internet Control Message Protocol version 6.
- `ipv6`: Enter the keyword `ipv6` to filter any internet Protocol version 6.
- `tcp`: Enter the keyword `tcp` to filter the Transmission Control protocol.
- `udp`: Enter the keyword `udp` to filter the User Datagram Protocol.

Defaults

Not configured.

ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

Syntax
ipv6 access-list {access-list-name} cpu-qos

To delete an access list, use the no ipv6 access-list {access-list-name} command.

Parameters

access-list-name
Enter the access list name as a string, up to 140 characters.

cpu-qos
Enter the keyword cpu-qos to assign this ACL to control plane traffic only (CoPP).

permit
Enter the keyword permit to configure a filter to forward packets meeting this condition.

deny
Enter the keyword deny to configure a filter to drop packets meeting this condition.

ospfv3
Specify that this ACL is for OSPFv3 control plane traffic.

Defaults
All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

### cam-acl-egress

Allocate space for IPv6 egress ACLs.

#### Syntax

```
cam-acl-egress {default | l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4}
```

#### Parameters

- **default**
  - Use the default CAM profile settings, and set the CAM as follows:
    - L2 ACL (l2acl): 1
    - L3 ACL (ipv4acl): 1
    - IPv6 L3 ACL (ipv6acl): 2
  - Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The ipv6acl range must be a factor of 2.

#### Command Modes

- **CONFIGURATION**

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version

- **9.10(0.0)**
  - Introduced on the S3148.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.8(1.0)**
  - Introduced on the Z9100-ON.
- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.
- **9.2(1.0)**
  - Introduced on the Z9500.
- **9.0.2.0**
  - Introduced on the S6000.
- **8.3.19.0**
  - Introduced on the S4820T.
- **8.3.11.1**
  - Introduced on the Z9000.
- **8.3.7.0**
  - Introduced on the S4810.
**cam-acl**

Allocate space for IPv6 ACLs.

**Syntax**

cam-acl {default | l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 12qos 1-10}

**Parameters**

default

Use the default CAM profile settings, and set the CAM as follows:

- L3 ACL (ipv4acl): 6
- L2 ACL(l2acl): 5
- IPv6 L3 ACL (ipv6acl): 0
- L3 QoS (ipv4qos): 1
- L2 QoS (12qos): 1

l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 12qos 1-10

Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 13. The ipv6acl range must be a factor of 2 (2, 4, 6, 8, 10).

</tr>
</tbody>
</table>

Usage Information

For the new settings to take effect, save the new CAM settings to the startup-config (write-mem or copy run start) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The ipv4acl profile range is from 1 to 4.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the ipv6acl profile which is from 0 to 10. The ipv6acl allocation must be a factor of 2 (2, 4, 6, 8, 10).
IPv6 basic commands are supported on the Dell Networking OS.

**NOTE:** For information about the Dell Networking OS version and platform that supports IPv6 in each software feature, see the IPv6 Addressing section in the Dell Networking OS Configuration Guide.

- `trust ipv6-diffserv`
**cam-ipv6 extended-prefix**

Enable LPM partitioning to support IPv6 /65 to /128 route prefixes to be stored in Partition 1.

Syntax

```
cam-ipv6 extended-prefix <Max-IPv6-prefixes>
```

To remove LPM partitioning configuration, use `no cam-ipv6 extended-prefix`.

**Parameters**

- **Max-IPv6-Prefix**: Maximum number of IPv6 prefixes in the mask length of /65 to /128. The possible values are 1024, 2048, and 3072.

**Defaults**

LPM is not partitioned with Partition 1 and therefore /65 to /128 prefixes are not converted to /64 prefixes and are installed and saved in LPM. All the packets for those routes traverse through the default route path.

**Command Modes**

- **CONFIGURATION**

**Command History**

- **Version Description**
  - 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
  - 9.10(0.0) Introduced on the S6100–ON.
  - 9.8(1.0) Introduced on the Z9100–ON.
  - 9.8(0.0P5) Introduced on the S4048–ON.
  - 9.8(0.0P2) Introduced on the S3048–ON.
  - 9.7(0.0) Introduced on the S6000-ON.
  - 9.5(0.1) Introduced on the Z9500.
  - 9.3(0.1) Introduced on the S6000.

**Usage Information**

You can partition the LPM table to store IPv6 prefixes greater than /64 mask length. Requires reboot of the switch to take effect as the SDK handles this only during its initialization.

**clear ipv6 fib**

Clear (refresh) all forwarding information base (FIB) entries on a stack unit.

Syntax

```
clear ipv6 fib [vrf vrf-name] [stack-unit unit-number]
```

**Parameters**

- **vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF to clear the neighbor corresponding to that VRF.
NOTE: If you do not specify this option, neighbors corresponding to the default VRF are cleared.

```
slot
unit-number
```

Enter the slot number to clear the FIB.

Enter the stack member number. The range is from 1 to 6

**Command Modes**

EXEC Privilege

**Command History**

---

**clear ipv6 route**

Clear (refresh) all or a specific route from the IPv6 routing table.

**Syntax**

```
clear ipv6 route [vrf vrf-name] { * | ipv6-address prefix-length}
```

**Parameters**

- `vrf vrf-name`  
  (Optional) Enter the keyword vrf followed by the name of the VRF to clear the IPv6 routes corresponding to that VRF.

- `*`  
  Enter the * to clear (refresh) all routes from the IPv6 routing table.

- `ipv6-address prefix-length`  
  Enter the IPv6 address in the \(x:x:x:x:x\) format then the prefix length in the \(/x\) format. The range is from /0 to /128.

**NOTE:** The \(::\) notation specifies successive hexadecimal fields of zeros.

</tbody>
</table>
maximum dynamic-routes-ipv6

Specify the maximum number of dynamic (protocol) IPv6 routes a VRF can have.

Syntax

maximum dynamic-routes-ipv6 limit {warn-threshold threshold-value | warning-only}

To remove the limit on the maximum number of IPv6 routes used, use the no maximum dynamic-routes-ipv6 command.

Parameters

- **limit**: Maximum number of IPv6 routes allowed in a VRF. Valid range is from 1 to 8000 (or maximum allowable for that platform if smaller value).
- **warn-threshold**: Warning threshold value is expressed as a percentage of the limit value. When the number of IPv6 routes reaches the specified percentage of the limit, a warning message is generated. Valid range is 1 to 100. When warn-threshold is used, once the limit is reached, additional routes will not be allowed into the RTM (route table manager) itself.
- **warning-only**: When the warning-only option is used, a syslog message will be thrown when maximum number of dynamic IPv6 routes reaches the limit. Additional dynamic IPv6 routes will still be allowed.

Defaults

No limit is set on the maximum number of dynamic IPv6 routes for a VRF.

Command Modes

CONFIGURATION-VRF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

<td>Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>

Usage Information

If the maximum IPv6 route limit is not specified for a VRF (valid range is from 1 to 8000), then it has unlimited space that extends to the maximum number of entries allowed for the system. This command is not applicable to the default and management VRFs.
ipv6 address autoconfig

Configure IPv6 address auto-configuration for the management interface.

Syntax

```
ipv6 address autoconfig
```

To disable the address autoconfig operation on the management interface, use the no ipv6 address autoconfig command.

Default

Disabled

Command Modes

INTERFACE (management interface only)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

- SAA can configure up to two addresses. If any preferred prefix or valid timers time out, the corresponding address are deprecated or removed. If an address is removed due to a time-out, an address from the current unused prefix is used to create a new address. If there are no remaining prefixes, the software waits to receive a new prefix from the RA.
- If auto-configuration is enabled, all IPv6 addresses on that management interface are auto-configured. Manual and auto-configurations are not supported on a single management interface.
- Removing auto-configuration removes all auto-configured IPv6 addresses and the link-local IPv6 address from that management interface.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across a platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.
**ipv6 address**

Configure an IPv6 address to an interface.

**Syntax**

```
ipv6 address {ipv6-address prefix-length}
```

To remove the IPv6 address, use the no ipv6 address {ipv6-address prefix-length} command.

**Parameters**

- `ipv6-address prefix-length`
  
  Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Defaults**

None

**Command Modes**

<td>78.1.0</td>
<td>Introduced on the C-Series and S-Series.</td>
</tr>
<tr>
<td>7.4(1.0)</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

- If two addresses are configured, delete an existing address before configuring a new address.
- If the last manually-configured global IPv6 address is removed using the "no" form of the command, the link-local IPv6 address is removed automatically.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.
NOTE: Do not use the /128 prefix length on physical or port channel interfaces. You can use the /128 prefix length on loopback interfaces.

Example

Dell(conf)# interface gigabitethernet 1/2
Dell(conf-if-gi-1/2)# ipv6 address ?
X:X:X::X IPv6 address
Dell(conf-if-gi-1/2)# ipv6 address 2002:1:2::3 ?
<0-128> Prefix length in bits
Dell(conf-if-gi-1/2)# ipv6 address 2002:1:2::3 /96 ?
<cr>
Dell(conf-if-gi-1/2)# ipv6 address 2002:1:2::3 /96
Dell(conf-if-gi-1/2)# show config
!
interface GigabitEthernet 1/2
 no ip address
 ipv6 address 2002:1:2::3 /96
 no shutdown

ipv6 address eui64

Configure IPv6 EUI64 address configuration on the interface.

Syntax

ipv6 address {ipv6-address prefix-length} eui64

To disable IPv6 EUI64 address autoconfiguration, use the no ipv6 address {ipv6-address prefix-length} eui64 command.

Parameters

ipv6-address prefix-length

Enter the IPv6 prefix in the x:x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.2(0.2) Introduced.
Usage Information

This command allows you to create an EUI64 address based on the specified prefix and MAC address only. Prefixes may be configured on the interface using the `ipv6 nd prefix` command without creating an EUI64 address.

Example

```
Dell(conf)# int gig 1/4
Dell(conf-if-gi-1/4)# ipv6 address 200:1::/64 eui64
Dell(conf)# int gig 1/6
Dell(conf-if-gi-1/6)# ipv6 address 801:10::/64 eui64
```

**ipv6 control-plane icmp error-rate-limit**

Configure the maximum number of ICMP error packets per second that can be sent per second.

**Syntax**

```
ipv6 control-plane icmp error-rate-limit {1-200}
```

To restore the default value, use the `no ipv6 control-plane icmp error-rate-limit` command.

**Parameters**

- **pps**
  
Enter the maximum number of error packets generated per second. The range is from 1 to 200, where 0 disables the rate-limiting.

**Default**

100 pps

**Command Modes**

</table>
ipv6 flowlabel-zero

Configure system to set the flow label field in the packets to zero.

Syntax

ipv6 flowlabel-zero

To disable the 0 from being set in the field and allow the protocol operations to fill the field, use the no ipv6 flowlabel-zero command.

Default

Disabled

Command Modes

</tbody>
</table>

Usage Information

If the flowlabel value is already set for BGP or SSH, the system defaults to the already configured value. All packets on the same connection are considered part of the same flow by the system. For new connections, set the new flowlabel to zero.

ipv6 host

Assign a name and IPv6 address the host-to-IPv6 address mapping table uses.

Syntax

ipv6 host name ipv6-address

To remove an IP host, use the no ipv6 host name {ipv6-address}.

Parameters

name

Enter a text string to associate with one IP address.
ipv6-address

Enter the IPv6 address (X::X::X) to be mapped to the name.

Defaults
Not configured.

ipv6 name-server

Enter up to six IPv6 addresses of name servers. The order you enter the addresses determines the order of their use.

Syntax
ipv6 name-server ipv6-address [ipv6-address2... ipv6-address6]
To remove a name server, use the no ipv6 name-server ipv6-address command.

Parameters
ipv6-address
Enter the IPv6 address (X::X::X) of the name server to be used.
Note: The :: notation specifics successive hexadecimal fields of zeros.

ipv6-address2...
(OPTIONAL) Enter up to five more IPv6 addresses, in the x::x::x format, of name servers to be used. Separate the IPv6 addresses with a space.

Defaults
None

### Configuration Information

**Version**
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.0.0** Introduced on the Z9000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.7.0** Introduced on the S4810.
- **8.4.2.1** Introduced on the C-Series and S-Series.
- **8.4.1.0** Introduced on the E-Series.

**Usage Information**

You can separately configure both IPv4 and IPv6 domain name servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the `ip name-server` command is configured.

### ipv6 nd dad attempts

To perform duplicate address detection (DAD) on an interface, configure the number of neighbor solicitation messages that are sent.

**Syntax**

```
ipv6 nd dad attempts {number of attempts}
```

To restore the default value, use the `no ipv6 nd dad attempts` command.

**Parameters**

- **number of attempts**
  - Enter the number of attempts to be made to detect a duplicate address. The range is from 0 to 15. Setting the value to 0 disables DAD on the interface.

**Default**

3 attempts

**Command Modes**

- INTERFACE (management interface only)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**
- **9.10(0.0)** Introduced on the S3148.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
ipv6 nd disable-reachable-timer

Keep the learnt neighbor discovery entries stateless so that the entries do not time out.

Syntax
ipv6 nd disable-reachable-timer
To restore to default, use the no ipv6 nd disable-reachable-timer command.

Default
Disabled

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.11.0.1 Introduced on the S3100 series, S3048–ON, S4048–ON, S4048T-ON, S4810, S4820, S5000, S6000, S6010–ON, S6000–ON, S6100–ON, Z9100–ON, C9010, Z9500, MXL, and FN IOM.

ipv6 nd dns-server

Configures Recursive DNS Server (RDNSS) addresses to be distributed via IPv6 router advertisements to an IPv6 device.

Syntax
ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}
To remove the IPv6 RDSS configuration, use no ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}

Parameters
ipv6-RDNSS-address
Enter the IPv6 Recursive DNS Server’s (RDNSS) address. You can specify up to 4 IPv6 RDNSS server addresses.

lifetime
Enter the lifetime in seconds. The amount of time the IPv6 host can use the IPv6 RDNSS address for name resolution. The range is 0 to 4294967295 seconds. When you specify the maximum lifetime value of 4294967295 or infinite, the lifetime does not expire. A value of 0 indicates to the host that the RDNSS address should not be used. You must specify a lifetime using the lifetime or infinite parameter.

infinite
Enter the keyword infinite to specify that the RDNSS lifetime does not expire.

Defaults
Not Configured

Command Modes
INTERFACE CONFIG

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version | Description
---|---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.0) | Introduced on the Z9000, S6000, S4810, S4820T, and MXL.

Usage Information
Use this command to add, edit, or delete an IPv6 RDNSS address and lifetime value. You can configure up to four IPv6 RDNSS addresses. You must specify a lifetime using the lifetime or infinite parameter.

Example
```
Dell(conf-if-gi-1/1)# ipv6 nd dns-server 1000::1 1
```

**ipv6 nd prefix**

Specify which IPv6 prefixes are included in Neighbor Advertisements.

**Syntax**
```
ipv6 nd prefix {ipv6-prefix | prefix-length | default} [no-advertise] [no-autoconfig] [no-rtr-address] [off-link] [lifetime {valid | infinite} {preferred | infinite}]
```

**Parameters**
- **ipv6-prefix**: Enter an IPv6 prefix.
- **prefix-length**: Enter the prefix then the prefix length. The length range is from 0 to 128.
- **default**: Enter the keyword default to set default parameters for all prefixes.
- **no-advertise**: Enter the keyword no-advertise to prevent the specified prefix from being advertised.
- **no-autoconfig**: Enter the keywords no-autoconfig to disable Stateless Address Autoconfiguration.
- **no-rtr-address**: Enter the keyword no-rtr-address to exclude the full router address from router advertisements (the R bit is not set).
- **off-link**: Enter the keywords off-link to advertise the prefix without stating to recipients that the prefix is either on-link or off-link.
- **valid-lifetime | infinite**: Enter the amount of time that the prefix is advertised, or enter infinite for an unlimited amount of time. The range is from 0 to 4294967295. The default is 2592000. The maximum value means that the preferred lifetime does not expire for the valid-life time parameter.
- **preferred-lifetime | infinite**: Enter the amount of time that the prefix is preferred, or enter infinite for an unlimited amount of time. The range is from 0 to 4294967295. The default is 604800. The maximum value means that the preferred lifetime and does not expire.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.2.0</td>
<td>Introduced on the E-Series, C-Series, and S-Series.</td>
</tr>
</tbody>
</table>

Usage Information

By default, all prefixes configured as addresses on the interface are advertised. This command allows control over the individual parameters per prefix; you can use the default keyword to use the default parameters for all prefixes. If a prefix has been configured with lifetime parameter values, the default values cannot be applied using the `ipv6 nd prefix default no-autoconfig` command.

**ipv6 route**

Establish a static IPv6 route.

**Syntax**

```
ipv6 route [vrf vrf-name] ipv6-address prefix-length [ipv6-address | interface | interface ipv6-address] [distance] [tag value] [permanent] [weight weight-value]
```

To remove the IPv6 route, use the `no ipv6 route` command.

**Parameters**

- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to install IPv6 routes in that VRF.

- **ipv6-address prefix-length**

  Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **interface**

  (OPTIONAL) Enter the following keywords and slot/port or number information:

  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
For a port channel interface, enter the keywords `port-channel` then a number.

- For a Null interface, enter the keyword `null` then the Null interface number.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `VLAN` then the vlan number. The range is from 1 to 4094.

If you configure a static IPv6 route using an egress interface and enter the `ping` command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the `ping` command to detect the destination address.

```
ipv6-address
```

(OPTIONAL) Enter the forwarding router IPv6 address in the `::` format.

```
NOTE: The `::` notation specifies successive hexadecimal fields of zeros.
```

```
distance
```

(OPTIONAL) Enter a number as the metric distance assigned to the route. The range is from 1 to 255.

```
tag value
```

(OPTIONAL) Enter the keyword `tag` then a tag value number. The range is from 1 to 4294967295.

```
permanent
```

(OPTIONAL) Enter the keyword `permanent` to specify that the route is not to be removed, even if the interface assigned to that route goes down.

```
weight weight-value
```

Enter the keyword `weight` followed by a weight value. The range is from 0 to 255.

```
NOTE: Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.
```

**Defaults**

None

</tbody>
</table>

**Usage Information**

When the interface goes down, Dell Networking OS withdraws the route. The route is re-installed, by Dell Networking OS, when the interface comes back up. When a recursive resolution is “broken,” Dell Networking OS withdraws the route. The route is re-installed, by Dell Networking OS, when the recursive resolution is satisfied.

After an IPv6 static route interface is created, if an IP address is not assigned to a peer interface, the peer must be manually pinged to resolve the neighbor information.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

**Example**

```bash
Dell(conf)# ipv6 route 44::/64 33::1 weight 100
Dell(conf)# ipv6 route 44::/64 33::2 weight 200
Dell(conf)# do show running-config | grep ipv6 route
Dell(conf)# ipv6 route vrf vrf_test 44::/64 33::1 weight 100
Dell(conf)# ipv6 route vrf vrf_test 44::/64 33::2 weight 200
Dell(conf)# do show running-config | grep ipv6 route vrf
```

**Related Commands**

- `show ipv6 route` — view the IPv6 configured routes.

### ipv6 unicast-routing

Enable IPv6 unicast routing on the device.

**Syntax**

```
ipv6 unicast-routing
```

To disable unicast routing, use the `no ipv6 unicast-routing` command.

**Defaults**

Enabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Usage Information

Because this command is enabled by default, it does not appear in the running configuration. When you disable unicast routing, the no ipv6 unicast-routing command is included in the running configuration. Whenever unicast routing is disabled or re-enabled, Dell Networking OS generates a syslog message indicating the action. Disabling unicast routing on an E-Series chassis causes the following behavior:

- static and protocol learned routes are removed from RTM and from the CAM; packet forwarding to these routes is terminated
- connected routes and resolved neighbors remain in the CAM and new IPv6 neighbors are still discoverable
- additional protocol adjacencies (OSPFv3 and BGP4) are brought down and no new adjacencies are formed
- the IPv6 address family configuration (under router bgp) is deleted
- IPv6 Multicast traffic continues to flow unhindered

**show ipv6 cam stack-unit**

Displays the IPv6 CAM entries for the specified stack-unit.

**Syntax**

```
show ipv6 cam [vrf vrf-name] stack-unit unit-number port-set {0-1} [summary | index | ipv6 address]
```

**Parameters**

- `vrf vrf-name`  
  (Optional) Enter the keyword vrf followed by the name of the VRF to display IPv6 CAM entries corresponding to that VRF.
  
  **NOTE:** If you do not specify this option, IPv6 CAM entries corresponding to the default VRF are displayed.

- `unit-number`  
  Enter the stack unit’s ID number.

- `port-set`  
  Enter the keyword Port Set.
show ipv6 control-plane icmp

Displays the status of the icmp control-plane setting for the error eate limit setting.

Syntax

show ipv6 control-plane icmp
show ipv6 fib stack-unit

View all FIB entries.

Syntax

show ipv6 fib [vrf vrf-name] stack-unit unit-number [summary | ipv6-address]

Parameters

- **vrf vrf-name**: (Optional) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.
- **slot-number**: Enter the number of the stack unit.
- **summary**: (OPTIONAL) Enter the keyword summary to view a summary of entries in IPv6 cam.
- **ipv6-address**: Enter the IPv6 address in the x:x:x:x:n format to display networks that have more specific prefixes. The range is from /0 to /128.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### show ipv6 flowlabel-zero

Display the flow label zero setting.

**Syntax**

```show ipv6 flowlabel-zero```

**Default**

Disabled

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**Usage Information**

Host tables are not stored in CAM tables on S-Series platforms. Entries for `camIndex` displays as zero (0) on the `show ipv6 fib stack-unit` output for neighbor entries, such as address resolution protocol (ARP) entries.

- **Related Commands**
  - `ipv6 nd dad attempts` — configure system to set the flow label field in the packets to zero.
show ipv6 interface

Display the status of interfaces configured for IPv6.

Syntax

show ipv6 interface interface {slot | slot/port} [brief] [configured] [stack-unit id]

Parameters

interface  (OPTIONAL) Enter the following keywords and slot/port or number information:

  - For a 1-Gigabit Ethernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a Null interface, enter the keyword null then the Null interface number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
  - For stacking, enter the keywords stack-unit then the stack-unit ID.
  - For a tunnel interface, enter the keyword tunnel then the tunnel ID.

brief  (OPTIONAL) View a summary of IPv6 interfaces.

configured  (OPTIONAL) View information on all IPv6 configured interfaces.

gigabitethernet  (OPTIONAL) View information for an IPv6 gigabitethernet interface.

managementethernet slot/port  (OPTIONAL) View information on an IPv6 Management port. Enter the slot number (0-1) and port number zero (0).

loopback  (OPTIONAL) View information for IPv6 Loopback interfaces.

port-channel  (OPTIONAL) View information for IPv6 port channels.

tengigabitethernet  (OPTIONAL) View information for an IPv6 tengigabitethernet interface.

stack-unit id  (OPTIONAL) View information for stacking.

tunnel tunnel-id  (OPTIONAL) View information for a tunnel interface.

vlan  (OPTIONAL) View information for IPv6 VLANs.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.11(0.0) Updated the command output to include the unicast reverse path forwarding (uRPF) status.

9.10(0.0) Introduced on the S3148.
<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.5(0.1)</td>
<td>Added support for IPv6 recursive DNS addresses on the Z9500.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.2.0.0</td>
<td>Added support for tunnel interface.</td>
</tr>
<tr>
<td>9.0.0.0</td>
<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.19.0</td>

<td>7.8.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information
The Management port is enabled by default (no shutdown). If necessary, use the ipv6 address command to assign an IPv6 address to the Management port.

Example
```
Dell(conf) # show ipv6 interface gigabit 1/12
GigabitEthernet 1/12 is up, line protocol is up
  IPv6 is enabled
  Link Local address: fe80::201:e8ff:fe8a:e846
  Global Unicast address(es):
    100::2, subnet is 100::/64 (MANUAL)
    Remaining lifetime: infinite
  Global Anycast address(es):
  Joined Group address(es):
    ff02::1
    ff02::2
    ff02::1:ff00:2
    ff02::1:ff00:2
    ND MTU is 0
    ICMP redirects are not sent
    DAD is enabled, number of DAD attempts: 3
    ND reachable time is 39610 milliseconds
    ND base reachable time is 30000 milliseconds
    ND advertised reachable time is 0 milliseconds
    ND advertised retransmit interval is 0 milliseconds
    ND router advertisements are sent every 198 to 600 seconds
    ND router advertisements live for 1800 seconds
    ND advertised hop limit is 64
    IPv6 hop limit for originated packets is 64
    IPv6 unicast RPF check is not supported
Dell(conf) #
```
```
Dell(conf) # show ipv6 interface port-channel 128
Port-channel 128 is down, line protocol is down
  IPv6 is enabled
  Link Local address: fe80::201:e8ff:fe8a:e846
  Global Unicast address(es):
    aabb::aa11, subnet is aabb::/64 (MANUAL)
    Remaining lifetime: infinite
```
Global Anycast address(es):
Joined Group address(es):
  ff02::1
  ff02::2
  ff02::1:ff00:a11
  ff02::1:ff8a:e846
ND MTU is 0
ICMP redirects are not sent
DAD is enabled, number of DAD attempts: 3
ND reachable time is 27550 milliseconds
ND base reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 198 to 600 seconds
ND router advertisements live for 1800 seconds
ND advertised hop limit is 64
IPv6 hop limit for originated packets is 64
IPv6 unicast RPF check is not supported

Dell# show ipv6 interface vlan 112
Vlan 112 is down, line protocol is down
IPv6 is enabled
Link Local address: fe80::201:e8ff:fe8a:e846
Global Unicast address(es):
  1111::bbbb, subnet is 1111::/64 (MANUAL)
    Remaining lifetime: infinite
Global Anycast address(es):
Joined Group address(es):
  ff02::1
  ff02::2
  ff02::1:ff00:bbbb
  ff02::1:ff8a:e846
ND MTU is 0
ICMP redirects are not sent
DAD is enabled, number of DAD attempts: 3
ND reachable time is 19390 milliseconds
ND base reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 198 to 600 seconds
ND router advertisements live for 1800 seconds
ND advertised hop limit is 64
IPv6 hop limit for originated packets is 64
IPv6 unicast RPF check is not supported

Dell# show ipv6 interface management 1/1
ManagementEthernet 1/1 is up, line protocol is up
IPv6 is enabled
Link Local address: fe80::201:e8ff:fea7:497e
Global Unicast address(es):
  Actual address is 300::1, subnet is 300::/64 (MANUAL)
    Remaining lifetime: infinite
  Virtual-IP IPv6 address is not set
Global Anycast address(es):
Joined Group address(es):
  ff02::1
  ff02::1:ff00:1
  ff02::1:ffa7:497e
ND MTU is 0
ICMP redirects are not sent
DAD is enabled, number of DAD attempts: 3
ND reachable time is 20410 milliseconds
ND base reachable time is 30000 milliseconds
ND retransmit interval is 1000 milliseconds
ND hop limit is 64
Dell# show ipv6 interface brief
GigabitEthernet 1/2 [administratively down/down]  
    fe80::201:e8ff:fea7:497e  
    2002::1:2::3/96
GigabitEthernet 1/12 [up/up]  
    fe80::201:e8ff:fea7:497e  
    100::2/64
ManagementEthernet 1/1 [up/up]  
    fe80::201:e8ff:fea7:497e  
    300::1/64
Dell#

Example (Tunnel)  
Dell# show ipv6 interface tunnel 1
Tunnel 1 is up, line protocol is up
    Link Local address: fe80::201:e8ff:fea7:497e
    Global Unicast address(es):
        400::1, subnet is 400::/64 (MANUAL)
        Remaining lifetime: infinite
    Global Anycast address(es):
    Joined Group address(es):
        ff02::1
        ff02::2
        ff02::1:ff00:1
        ff02::1:ffa7:497e
    ND MTU is 0
    ICMP redirects are not sent
    DAD is enabled, number of DAD attempts: 3
    ND reachable time is 20410 milliseconds
    ND base reachable time is 30000 milliseconds
    ND advertised reachable time is 0 milliseconds
    ND advertised retransmit interval is 0 milliseconds
    ND router advertisements are sent every 190 to 600 seconds
    ND router advertisements live for 1800 seconds
    ND advertised hop limit is 64
    IPv6 hop limit for originated packets is 64
    IPv6 unicast RPF check is not supported
Dell#

show ipv6 mld_host

Display the IPv6 MLD host counters.

Syntax  
show ipv6 mld_host

Command Modes  
EXEC

Command History  
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
### Version Description

- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.

### Usage Information

The following describes the `show ipv6 mld-host` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid MLD Packets</td>
<td>The total number of packets received and sent from the last time the elapsed time was cleared.</td>
</tr>
<tr>
<td>Reports</td>
<td>The total number of reports (queries and unsolicited reports generated from joins or leaves) that have been received or sent.</td>
</tr>
<tr>
<td>Leaves</td>
<td>The number of Multicast leaves that have been sent.</td>
</tr>
<tr>
<td>MLDv1 queries</td>
<td>The number of MLDv1 queries that have been received.</td>
</tr>
<tr>
<td>MLDv2 queries</td>
<td>The number of MLDv2 queries that have been received.</td>
</tr>
<tr>
<td>Malformed Packets</td>
<td>The number of MLDv1 and MLDv2 packets that do not match the requirement for a valid MLD packet.</td>
</tr>
</tbody>
</table>

### Example

**MLD Host Traffic Counters**

Elapsed time since counters cleared: 00:28:33:52

<table>
<thead>
<tr>
<th>Field</th>
<th>Received</th>
<th>Sent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid MLD Packets</td>
<td>97962</td>
<td>18036</td>
</tr>
<tr>
<td>Reports</td>
<td>79962</td>
<td>18034</td>
</tr>
<tr>
<td>Leaves</td>
<td>----</td>
<td>0</td>
</tr>
<tr>
<td>MLDv2 Queries</td>
<td>18000</td>
<td>----</td>
</tr>
<tr>
<td>MLDv1 Queries</td>
<td>0</td>
<td>----</td>
</tr>
</tbody>
</table>

**Errors:**

- Malformed Packets: 4510

### show ipv6 route

Displays the IPv6 routes.

#### Syntax

```
show ipv6 route [ipv6-address prefix-length] [vrf vrf-name] [hostname] [all] [bgp as number] [connected] [isis tag] [list prefix-list name] [ospf process-id] [rip] [static] [summary]
```

#### Parameters

- **ipv6-address prefix-length** (OPTIONAL) Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.
vrf vrf-name

(Optional) Enter the keyword vrf followed by the name of the VRF to display IPv6 routes corresponding to that VRF.

NOTE: If you do not specify this option, routes corresponding to the default VRF are displayed.

hostname

(Optional) View information for this IPv6 routes with Host Name.

all

(Optional) View information for all IPv6 routes.

bgp

(Optional) View information for all IPv6 BGP routes.

connected

(Optional) View only the directly connected IPv6 routes.

isis

(Optional) View information for all IPv6 IS-IS routes.

list

(Optional) View the IPv6 prefix list.

ospf

(Optional) View information for all IPv6 OSPF routes.

rip

(Optional for E-Series only) View information for all IPv6 RIP routes.

static

(Optional) View only routes configured by the ipv6 route command.

summary

(Optional) View a brief list of the configured IPv6 routes.

Defaults

none

Command Modes

• EXEC
• EXEC Privilege

Total                 4               0
Total 4 active route(s) using 928 bytes
Dell#

trust ipv6-diffserv

Allows the dynamic classification of IPv6 DSCP.

Syntax
trust ipv6-diffserv
To remove the definition, use the no trust ipv6-diffserv command.

Defaults
None

Command Modes
CONFIGURATION-POLICY-MAP-IN

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>

<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information
When you configure trust IPv6 diffserv, matched bytes/packets counters are not incremented in the show qos statistics command.

Trust diffserv (IPv4) can co-exist with trust ipv6-diffserv in an Input Policy Map. Dynamic classification happens based on the mapping as shown:
<table>
<thead>
<tr>

</tr>
</tbody>
</table>
iSCSI Optimization

Internet small computer system interface (iSCSI) optimization enables quality-of-service (QoS) treatment for iSCSI storage traffic on an S3100 series system.

To configure and verify the iSCSI optimization feature, use the following Dell Networking OS commands.

Topics:
- `iscsi aging time`
- `iscsi cos`
- `iscsi enable`
- `iscsi priority-bits`
- `iscsi profile-compellant`
- `iscsi target port`
- `show iscsi`
- `show iscsi session`
- `show iscsi session detailed`
- `show run iscsi`

### iscsi aging time

Set the aging time for iSCSI sessions.

**Syntax**

```
iscsi aging time time
```

To remove the iSCSI session aging time, use the `no iscsi aging time` command.

**Parameters**

- `time`
  
  Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes.

**Defaults**

10 minutes

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>

<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>
**iscsi cos**

Set the QoS policy that is applied to the iSCSI flows.

**Syntax**

```
iscsi cos {enable | disable | dot1p vlan-priority-value [remark] | dscp dscp-value [remark]}
```

To disable the QoS policy, use the `no iscsi cos` command.

**Parameters**

- `enable`: Enter the keyword `enable` to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default is: the iSCSI packets are handled with dot1p priority 4 without remark.
- `disable`: Enter the keyword `disable` to disable the application of preferential QoS treatment to iSCSI frames.
- `dot1p vlan-priority-value`: Enter the dot1p value of the VLAN priority tag assigned to the incoming packets in an iSCSI session. The range is from 0 to 7. The default is the dot1p value in ingress iSCSI frames is not changed and is the same priority is used in iSCSI TLV advertisements if you did not enter the `iscsi priority-bits` command.
- `dscp dscp-value`: Enter the DSCP value assigned to the incoming packets in an iSCSI session. The valid range is from 0 to 63. The default is: the DSCP value in ingress packets is not changed.
- `remark`: Marks the incoming iSCSI packets with the configured dot1p or DSCP value when they egress to the switch. The default is: the dot1 and DSCP values in egress packets are not changed.

**Defaults**

Disabled.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0): Introduced on the S3148.
- 9.8(2.0): Introduced on the S3100 series.
- 9.8(1.0): Introduced on the Z9100-ON.
- 9.8(0.0P5): Introduced on the S4048-ON.
- 8.3.19.0: Introduced on the S4820T.
- 8.3.12.0: Introduced on the S4810.
- 8.3.16.0: Introduced on MXL 10/40GbE Switch IO Module.

**Usage Information**

By default, iSCSI flows are assigned to dot1p priority 4.
**iscsi enable**

Globally enable iSCSI optimization.

**Syntax**

```
iscsi enable
```

To disable iSCSI optimization, use the **no iscsi enable** command.

**Parameters**

- **enable**
  
Enter the keyword **enable** to enable the iSCSI optimization feature.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

</tbody>
</table>

**iscsi priority-bits**

Configure the priority bitmap that advertises in the iSCSI application TLVs.

**Syntax**

```
iscsi priority-bits
```

To remove the configured priority bitmap, use the **no iscsi priority-bits** command.

**Defaults**

4 (0x10 in the bitmap)

**Command Modes**

PROTOCOL LLDP (only on the global, not on the interface)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**iscsi profile-compellant**

Configure the auto-detection of Dell Compellent arrays on a port.

**Syntax**

```
iscsi profile-compellant
```

**Defaults**

Dell Compellent disk arrays are not detected.

**Command Modes**

INTERFACE

**Command History**

**iscsi target port**

Configure the iSCSI target ports and optionally, the IP addresses on which iSCSI communication is monitored.

**Syntax**

```
iscsi target port [tcp-port-2...tcp-port-16]ip-address [ip-address]
```

To remove the configured iSCSI target ports or IP addresses, use the `no iscsi target port` command.

**Parameters**

- **tcp-port-2...tcp-port-16**
  - Enter the tcp-port number of the iSCSI target ports. The tcp-port-n is the TCP port number or a list of TCP port numbers on which the iSCSI target listens to requests. Separate port numbers with a comma. The default is **860, 3260**.

- **ip-address** (Optional)
  - Enter the ip-address that the iSCSI monitors. The ip-address specifies the IP address of the iSCSI target.

**Defaults**

**860, 3260**

**Command Modes**

CONFIGURATION
show iscsi

Display the currently configured iSCSI settings.

Syntax

```
show iscsi
```

Command Modes

- EXEC
- EXEC Privilege

Example

```
Dell# show iscsi
iSCSI is enabled
iSCSI session monitoring is disabled
iSCSI COS : dot1p is 4 no-remark
Session aging time: 10
Maximum number of connections is 256
------------------------------------------------
iSCSI Targets and TCP Ports:
```
Related Commands

- `show iscsi session` — display information about active iSCSI sessions on the switch.
- `show iscsi session detailed` — display detailed information about active iSCSI sessions on the switch.
- `show run iscsi` — show run iscsi.

show iscsi session

Display information about active iSCSI sessions on the switch.

Syntax

```
show iscsi session
```

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

Example

```
Dell# show iscsi session
Session 0:
---------
Target: iqn.2001-05.com.equallogic:0-8a0906-0e70c2002-10a0018426a48c94-iom010
Initiator: iqn.1991-05.com.microsoft:win-x9l8v27yajg
ISID: 400001370000

Session 1:
---------
Target: iqn.2001-05.com.equallogic:0-8a0906-0f60c2002-0360018428d48c94-iom011
Initiator: iqn.1991-05.com.microsoft:win-x9l8v27yajg
ISID: 400001370000
```

Usage Information

- Only sessions the switch observes are learned; sessions flowing through an adjacent switch are not learned.

After the switch is reloaded, any information exchanged during the initial handshake is not available. If the switch picks up the communication after reloading, it would detect a session was in progress but could not obtain complete information for it. Any incomplete information of this type would not be available in the `show` commands.
Related Commands

- `show iscsi` — display the currently configured iSCSI settings.
- `show iscsi session detailed` — display detailed information about active iSCSI sessions on the switch.
- `show run iscsi` — show `run iscsi`.

**show iscsi session detailed**

Display detailed information on active iSCSI sessions on the switch.

**Syntax**

```
show iscsi session detailed [session isid]
```

**Parameters**

- `isid` Enter the session's iSCSI ID to display detailed information about the specified iSCSI session.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Intermediate System to Intermediate System (IS-IS)

IS-IS is an interior gateway protocol that uses shortest-path-first algorithm. IS-IS facilitates the communication between open systems, supporting routers passing through both IP and OSI traffic.

A router is considered as an intermediate system. Networks are partitioned into manageable routing domains called areas. Intermediate systems send, receive, and forward packets to other routers within their area (Level 1 and Level 1-2 devices). Only Level 1-2 and Level 2 devices communicate with other areas.

IS-IS protocol standards are listed in the Standard Compliance chapter in the Dell Networking OS Configuration Guide.

**NOTE:** The fundamental mechanisms of IS-IS are the same for IPv4 and IPv6. However some command modes might vary when applied to IPv4 and IPV6. These variations have been explicitly explained for such commands. If the variation is not mentioned, then the information applies to both the protocol versions.

- graceful-restart t1
- graceful-restart t2
- graceful-restart t3
adjacency-check

Verify that the “protocols supported” field of the IS-IS neighbor contains matching values to this router.

Syntax

adjacency-check
To disable adjacency check, use the no adjacency-check command.

Defaults

Enabled.

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0)
9.8(1.0)
9.8(0.0P5)
9.8(0.0P2)
9.7(0.0)
9.5(0.1)
9.0.2.0
8.3.19.0
8.3.12.0
8.3.11.1
7.5.1.0 Introduced on the S3100 series.
Introduced on the Z9100-ON.
Introduced on the S4048-ON.
Introduced on the S3048-ON.
Introduced on the S6000-ON.
Introduced on the Z9500.
Introduced on the S6000.
Introduced on the S4820T.
Introduced on the S4810.
Introduced on the Z9000.
Introduced on the E-Series.

Usage Information

To perform protocol-support consistency checks on hello packets, use this command. The adjacency-check is enabled by default.

If a BFD session goes down indicating that IPv4 or IPv6 connectivity to its neighbor is lost, it does not imply that the adjacency is lost altogether. The hello adjacency runs over Layer 2, and does not require IP connectivity. However, if IPv4 connectivity is lost to a neighbor, then when the next SPF calculation is performed, the system ensures that it does not calculate any IPv4 or IPv6 routes through that neighbor.

advertise

Leak routes between levels (distribute IP prefixes between Level 1 and Level 2 and vice versa).

Syntax

advertise {level1-into-level2 | level2-into-level1} prefix-list-name

To return to the default, use the no advertise {level1-into-level2 | level2-into-level1} [prefix-list-name] command.

Parameters

- level1-into-level2 Enter the keywords level1-into-level2 to advertise Level 1 routes into Level 2 LSPs. This setting is the default.
- level2-into-level1 Enter the keywords level2-into-level1 to advertise Level 2 inter-area routes into Level 1 LSPs. This behavior is described in RFC 2966.
prefix-list-name

Enter the name of a configured IP prefix list. Routes meeting the criteria of the IP Prefix list are leaked.

Defaults

level1-into-level2 (Level 1 to Level 2 leaking is enabled.)
level2-into-level1 (Level 2 to Level 1) leaking is disabled.

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>7.5.1.0</td>
<td>Added IPv6 ISIS support.</td>
</tr>
<tr>
<td>6.3.1.0</td>
<td>Version 6.3.1.0 Introduced</td>
</tr>
</tbody>
</table>

Usage Information

You cannot disable leaking from Level 1 to Level 2. Also, you cannot enable leaking from Level 2 to Level 1. However, you can regulate the rate flow from one level to another using an IP Prefix list. If you do not configure the IP Prefix list, all Level 1 routes are leaked.

You can find more information in IETF RFC 2966, Domain-wide Prefix Distribution with Two-Level IS-IS.

area-password

Configure a hash message authentication code (HMAC) password for an area.

Syntax

area-password [hmac-md5 | encryption-type] password

To delete a password, use the no area-password command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hmac-md5</td>
<td>(OPTIONAL) Enter the keywords hmac-md5 to encrypt the password.</td>
</tr>
<tr>
<td>encryption-type</td>
<td>(OPTIONAL) Enter 7 to encrypt the password using DES.</td>
</tr>
</tbody>
</table>
Enter a 1 to 16-character length alphanumeric string to prevent unauthorized access or incorrect routing information corrupting the link state database. The password is processed as plain text, which only provides limited security.

Defaults
Not configured.

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.

Usage Information
To prevent the link state database from receiving incorrect routing information from unauthorized routers, use the area-password command on routers within an area.

The configured password injects into Level 1 LSPs, CSNPs, and PSNPs.

Related Commands
- domain-password — set the authentication password for a routing domain.
- isis password — configure an authentication password for an interface.

-clear config
Clear IS-IS configurations that display under the router isis heading of the show running-config command output.

Syntax
clear config

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

Version Description
9.10(0.0) Introduced on the S3148.
<table>
<thead>
<tr>

<td>8.3.7.1</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

⚠️ **CAUTION:** Use caution when you enter this command. Back up your configuration prior to using this command or your IS-IS configuration will be erased.

**clear isis**

Restart the IS-IS process. All IS-IS data is cleared.

**Syntax**

```
clear isis [vrf vrf-name] [tag] {* | database | traffic}
```

**Parameters**

- **vrf vrf-name**
  - (Optional) Enter the keyword vrf followed by the name of the VRF to restart the IS-IS process corresponding to that VRF.
- **tag**
  - (Optional) Enter an alphanumeric string to specify the IS-IS routing tag area.
- *****
  - Enter the keyword * to clear all IS-IS information and restart the IS-IS process. This command removes IS-IS neighbor information and IS-IS LSP database information and the full SPF calculation is done.
- **database**
  - Clears IS-IS LSP database information.
- **traffic**
  - Clears IS-IS counters.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
clns host

Define a name-to-network service mapping point (NSAP) that you use with commands that require NSAPs and system IDs.

Syntax
clns host name nsap

Parameters
name

Enter an alphanumeric string to identify the name-to-NSAP mapping.

nsap

Enter a specific NSAP address that is associated with the name parameter.

Defaults
Not configured.

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.

Usage Information
To configure a shortcut name that you can use instead of entering a long string of numbers associated with an NSAP address, use this command.

Related Commands
- hostname dynamic — enable dynamic learning of host names from routers in the domain and allows the routers to advertise the host names in LSPs.
**debug isis**

Enable debugging for all IS-IS operations.

**Syntax**

debug isis

To disable debugging of IS-IS, use the no debug isis command.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**

Entering debug isis enables all debugging parameters.

To display all debugging information in one output, use this command. To turn off debugging, you normally enter separate no forms of each command. To disable all debug messages for IS-IS at once, enter the no debug isis command.

**debug isis adj-packets**

Enable debugging on adjacency-related activity such as hello packets that are sent and received on IS-IS adjacencies.

**Syntax**

debug isis [vrf vrf-name] adj-packets [interface]

To turn off debugging, use the no debug isis [vrf vrf-name]adj-packets [interface] command.
debug isis local-updates
To debug IS-IS local update packets, enable debugging on a specific interface and provides diagnostic information.

Syntax
debug isis [vrf vrf-name] local-updates [interface]
To turn off debugging, use the no debug isis [vrf vrf-name] updates [interface] command.

Parameters
vrf vrf-name  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable the debugging information on IS-IS corresponding to that VRF. This information contains local updates for IS-IS.
updates tied to the VRF that you specify. This command displays the local LSP debugging
details of the current unit.

interface (OPTIONAL) Identifies the interface type as one of the following:
- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the
  slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then
  the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

debug isis snp-packets

To debug IS-IS complete sequence number PDU (CSNP) and partial sequence number PDU (PSNP) packets, enable debugging on a
specific interface and provides diagnostic information.

Syntax

```
debug isis [vrf vrf-name] snp-packets [interface]
```

To turn off debugging, use the no debug isis [vrf vrf-name] snp-packets [interface] command.
**Parameters**

- **vrf vrf-name** *(Optional)* Enter the keyword vrf followed by the name of the VRF to enable debugging information on ISIS for CSNP/PSNP packets tied to that VRF. The command displays the SNP (CSNP/PSNP) related debugging information.

- **interface** *(OPTIONAL)* Identifies the interface type as one of the following:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**

- **EXEC Privilege**

**debug isis spf-triggers**

Enable debugging on the events that triggered IS-IS shortest path first (SPF) events for debugging purposes.

**Syntax**

debug isis [vrf vrf-name] spf-triggers

To turn off debugging, use the no debug isis [vrf vrf-name] spf-triggers command.

**Parameters**

- **vrf vrf-name** *(OPTIONAL)* Enter the keyword vrf followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains SPF.
trigger detail tied to the VRF that you specify. When SPF is triggered, this debugging information is displayed.

**debug isis update-packets**

Enable debugging on link state PDUs (LSPs) that a router detects.

**Syntax**

debug isis [vrf vrf-name] update-packets [interface]

To turn off debugging, use the no debug isis update-packets [interface] command.

**Parameters**

**vrf vrf-name**

(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable the debugging information on IS-IS. This information contains updates from neighbors tied to the VRF that you specify. This command displays the debugging details of the received LSPs from the neighbors.

**interface**

(OPTIONAL) Identifies the interface type and the interface information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**

- EXEC Privilege

**Command History**

### default-information originate

Generates a default route into an IS-IS routing domain and controls the distribution of default information.

**Syntax**

default-information originate [always] [metric metric] [route-map map-name]

To disable the generation of a default route into the specified IS-IS routing domain, use the no default-information originate [always] [metric metric] [route-map map-name] command.

**Parameters**

- **always** (OPTIONAL) Enter the keyword always to have the default route always advertised.
- **metric metric** (OPTIONAL) Enter the keyword metric then a number to assign to the route. The range is from 0 to 16777215.
- **route-map map-name** (OPTIONAL) A default route the routing process generates if the route map is satisfied.

**Defaults**

Not configured.

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.
7.5.1.0 | Added IPv6 ISIS support.
6.3.1.0 | Introduced.

Usage Information
When you use this command to redistribute routes into a routing domain, the router becomes an autonomous system (AS) boundary router. An AS boundary router does not always generate a default route into a routing domain. The router still requires its own default route before it can generate one.

How a metric value assigned to a default route advertises depends on the metric-style command configuration. If the metric-style command is set for Narrow mode and the metric value in the default-information originate command is set to a number higher than 63, the metric value advertised in the LSPs is 63. If the metric-style command is set for Wide mode, the metric value in the default-information originate command is advertised.

Related Commands
• redistribute — redistribute routes from one routing domain to another routing domain.

description

Enter a description of the IS-IS routing protocol.

Syntax
description {description}

To remove the description, use the no description {description} command.

Parameters
description Enter a description to identify the IS-IS protocol (80 characters maximum).

Defaults
None

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Intermediate System to Intermediate System (IS-IS)  |  887
### Version | Description
---|---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.
pre-7.7.1.0 | Introduced.

**Related Commands**
- router isis — enter ROUTER mode on the switch.

## distance

Define the administrative distance for learned routes.

**Syntax**
```
distance weight [ip-address mask [prefix-list]]
```

To return to the default values, use the `no distance weight` command.

**Parameters**
- **weight**
  - The administrative distance value indicates the reliability of a routing information source. The range is from 1 to 255. (A higher relative value indicates lower reliability. Routes with smaller values are given preference.) The default is 115.
- **ip-address mask** (OPTIONAL)
  - Enter the next-hop address in dotted decimal format and enter a mask in either dotted decimal or /prefix format.
- **prefix-list** (OPTIONAL)
  - Enter the name of a prefix list name.

**Defaults**
- `weight = 115`

**Command Modes**
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
Usage Information

The administrative distance indicates the trust value of incoming packets. A low administrative distance indicates a high trust rate. A high value indicates a lower trust rate. For example, a weight of 255 is interpreted that the routing information source is not trustworthy and should be ignored.

**distribute-list in**

Filter network prefixes received in updates.

**Syntax**

distribute-list prefix-list-name in [interface]

To return to the default values, use the no distribute-list prefix-list-name in [interface] command.

**Parameters**

- **prefix-list-name** Specify the prefix list to filter prefixes in routing updates.

- **interface** (OPTIONAL) Identifies the interface type and the interface following:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Related Commands
- `distribute-list out` — suppress networks from being advertised in updates.
- `redistribute` — redistribute routes from one routing domain to another routing domain.

**distribute-list out**

Suppress network prefixes from being advertised in outbound updates.

**Syntax**

```
distribute-list prefix-list-name out [connected | bgp as number | ospf process-id | rip | static]
```

To return to the default values, use the `no distribute-list prefix-list-name out [bgp as number connected | ospf process-id | rip | static]` command.

**Parameters**

- `prefix-list-name` Specify the prefix list to filter prefixes in routing updates.
- `connected` (OPTIONAL) Enter the keyword `connected` for directly connected routing process.
- `ospf process-id` (OPTIONAL) Enter the keyword `ospf` then the OSPF process-ID number. The range is from 1 to 65535.
- `bgp as number` (OPTIONAL) Enter the BGP then the AS Number. The range is from 1 to 65535.
- `rip` (OPTIONAL) Enter the keyword `rip` for RIP routes.
- `static` (OPTIONAL) Enter the keyword `static` for user-configured routing process.

**Defaults**

Not configured.

**Command Modes**

- ROUTER ISIS (for IPv4)
The `distribute-list` command allows you to apply a prefix list to IS-IS routes derived from a specified routing process. This is useful for filtering or redistributing IS-IS routes based on specific criteria.

**Usage Information**
- You can assign a route map to a routing process so that prefix list IS is applied to only the routes derived from the specified routing process.
- For more information on configuring route maps, refer to [Routing Policy](https://www.dell.com/support/article/sln316407).

**Related Commands**
- `distribute-list in` — filter the networks received in updates.
- `redistribute` — redistribute routes from one routing domain to another routing domain.

### distribute-list redistributed-override

This command suppresses flapping of routes when the same route is redistributed into IS-IS from multiple routers in the network.

**Syntax**
```
distribute-list redistributed-override in
```

To return to the default, use the `no` command.

**Defaults**
- none

**Command Modes**
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
Version          Description
9.8(1.0)          Introduced on the Z9100-ON.
9.8(0.0P5)        Introduced on the S4048-ON.
9.8(0.0P2)        Introduced on the S3048-ON.
9.7(0.0)          Introduced on the S6000-ON.
9.5(0.1)          Introduced on the Z9500.
9.0.2.0           Introduced on the S6000.
8.3.19.0          Introduced on the S4820T.
8.3.12.0          Introduced on the S4810.
8.3.11.1          Introduced on the Z9000.
7.8.1.0           Added IPv6 ISIS support.
6.3.1.0           Introduced.

Usage Information When you execute this command, IS-IS does not download the route to the routing table if the same route was redistributed into IS-IS routing protocol on the same router.

domain-password

Set the authentication password for a routing domain.

Syntax

```
domain-password [hmac-md5 | encryption-type] password
```

To disable the password, use the `no domain-password` command.

Parameters

- `<hmac-md5>` (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- `<encryption-type>` (OPTIONAL) Enter `7` to encrypt the password using DES.
- `<password>` Enter an alphanumeric string up to 16 characters long. If you do not specify an encryption type or `hmac-md5` keywords, the password is processed as plain text which provides limited security.

Defaults

No default password.

Command Modes

`ROUTER ISIS`

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version          Description
9.10(0.0)         Introduced on the S3148.
9.8(2.0)          Introduced on the S3100 series.
9.8(1.0)          Introduced on the Z9100-ON.
9.8(0.0P5)        Introduced on the S4048-ON.
9.8(0.0P2)        Introduced on the S3048-ON.
9.7(0.0)          Introduced on the S6000-ON.
### graceful-restart ietf

Enable graceful restart on an IS-IS router.

**Syntax**

```
graceful-restart ietf
```

To return to the default, use the `no graceful-restart ietf` command.

**Parameters**

- `ietf` Enter ietf to enable graceful restart on the IS-IS router.

**Defaults**

Graceful restart disabled.

**Command Modes**

`ROUTER ISIS`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

The domain password is inserted in Level 2 link state PDUs (LSPs), complete sequence number PDUs (CSNPs), and partial sequence number PDUs (PSNPs).

**Related Commands**

- `area-password` — configure an IS-IS area authentication password.
- `isis priority` — configure the authentication password for an interface.
Every graceful restart enabled router’s HELLO PDUs includes a restart TLV. This restart enables (re)starting as well as the existing ISIS peers to detect the GR capability of the routers on the connected network. A flag in the Restart TLV contains restart request (RR), restart acknowledge (RA) and suppress adjacency advertisement (SA) bit flags.

The ISIS graceful restart-enabled router can co-exist in mixed topologies where some routers are graceful restart-enabled and others are not. For neighbors that are not graceful restart-enabled, the restarting router brings up the adjacency per the usual methods.

**graceful-restart interval**

Set the graceful restart grace period, the time during that all graceful restart attempts are prevented.

**Syntax**

```
graceful-restart interval minutes
```

To return to the default, use the `no graceful-restart interval` command.

**Parameters**

- `minutes` 
  - Enter the graceful-restart interval minutes. The range is from 1 to 20 minutes. The default is **5 minutes**.

**Defaults**

5 minutes

**Command Modes**

ROUTER ISIS

</tbody>
</table>
graceful-restart restart-wait

Enable the graceful restart maximum wait time before a restarting peer comes up.

Syntax

NOTE: Set the t3 timer to adjacency on the restarting router when implementing this command.

graceful-restart restart-wait seconds
To return to the default, use the no graceful-restart restart-wait command.

Parameters

seconds Enter the graceful restart time in seconds. The range is from 5 to 300 seconds. The default is 30 seconds.

Defaults

30 seconds

Command Modes

ROUTER ISIS

Related Commands

- graceful-restart t3 — configure the overall wait time before graceful restart completes.

graceful-restart t1

Set the graceful restart wait time before unacknowledged restart requests are generated. This wait time is the interval before the system sends a restart request (an IIH with RR bit set in Restart TLV) until the CSNP is received from the helping router.

Syntax

general-graceful-restart t1 {interval seconds | retry-times value}
To return to the default, use the no graceful-restart t1 command.
**Parameters**

- **interval**
  - Enter the keyword `interval` to set the wait time. The range is from 5 to 120 seconds. The default is **5 seconds**.

- **retry-times**
  - Enter the keywords `retry-times` to set the number of times the request interval is extended until a CSNP is received from the helping router. The range is from 1 to 10 attempts. The default is **1**.

**Defaults**

See Parameters.

**Command Modes**

ROUTER ISIS

**Command History**

---

**graceful-restart t2**

Configure the wait time for the graceful restart timer T2 that a restarting router uses as the wait time for each database to synchronize.

**Syntax**

```
graceful-restart t2 {level-1 | level-2} seconds
```

To return to the default, use the `no graceful-restart t2` command.

**Parameters**

- **level-1, level-2**
  - Enter the keywords `level-1` or `level-2` to identify the database instance type to which the wait interval applies.

- **seconds**
  - Enter the `graceful-restart t2` time in seconds. The range is from 5 to 120 seconds. The default is **30 seconds**.

**Defaults**

**30 seconds**

**Command Modes**

ROUTER ISIS
graceful-restart t3

Configure the overall wait time before graceful restart completes.

Syntax

```
graceful-restart t3 {adjacency | manual} seconds
```

To return to the default, use the `no graceful-restart t3` command.

Parameters

- **adjacency**
  - Enter the keyword `adjacency` so that the restarting router receives the remaining time value from its peer and adjusts its T3 value so if you have configured this option.

- **manual**
  - Enter the keyword `manual` to specify a time value that the restarting router uses. The range is from 50 to 120 seconds. The default is 30 seconds.

Defaults

- `manual, 30 seconds`

Command Modes

- ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
| 8.3.1.0   | Introduced on the E-Series.
**Version** | **Description**  
--- | ---  
9.7(0.0) | Introduced on the S6000-ON.  
9.5(0.1) | Introduced on the Z9500.  
9.0.2.0 | Introduced on the S6000.  
8.3.19.0 | Introduced on the S4820T.  
8.3.12.0 | Introduced on the S4810.  
8.3.11.1 | Introduced on the Z9000.  
8.3.1.0 | Introduced on the E-Series.

**Usage Information**  
The running router sets the remaining time value to the current adjacency hold time. You can override this setting by implementing this command.

Override the default restart-wait time by entering the `no graceful-restart restart-wait` command. When you disable `restart-wait`, the current adjacency hold time is used.

Set the t3 timer to `adjacency` on the restarting router when implementing this command. The restarting router gets the remaining time value from its peer and adjusts its T3 value so only when you have configured `graceful-restart t3 adjacency`.

**Related Commands**
- `graceful-restart restart-wait` — enable the graceful restart maximum wait time before a restarting peer comes up.

**hello padding**

Use to turn ON or OFF padding for LAN and point-to-point hello PDUs or to selectively turn padding ON or OFF for LAN or point-to-point hello PDUs.

**Syntax**

```
hello padding [multi-point | point-to-point]
```

To return to the default, use the `no hello padding [multi-point | point-to-point]` command.

**Parameters**

- **multi-point** (OPTIONAL) Enter the keywords `multi-point` to pad only LAN hello PDUs.
- **point-to-point** (OPTIONAL) Enter the keywords `point-to-point` to pad only point-to-point PDUs.

**Defaults**

Both LAN and point-to-point hello PDUs are padded.

**Command Modes**

`ROUTER ISIS`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**  
--- | ---  
9.10(0.0) | Introduced on the S3148.  
9.8(2.0) | Introduced on the S3100 series.  
9.8(1.0) | Introduced on the Z9100-ON.  
9.8(0.0P5) | Introduced on the S4048-ON.
### Usage Information
IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS Hellos (IIHS) to the full MTU provides early error detection of large frame transmission problems or mismatched MTUs on adjacent interfaces.

### Related Commands
- `isis hello padding` — turn ON or OFF hello padding on an interface basis.

---

### hostname dynamic

Enables dynamic learning of hostnames from routers in the domain and allows the routers to advertise the hostname in LSPs.

**Syntax**

```
hostname dynamic
```

To disable this command, use the `no hostname dynamic` command.

**Defaults**

Enabled.

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
ignore-lsp-errors

Ignore LSPs with bad checksums instead of purging those LSPs.

Syntax

```
ignore-lsp-errors
```

To return to the default values, use the `no ignore-lsp-errors` command.

Defaults

In IS-IS, the default deletes LSPs with internal checksum errors (`no ignore-lsp-errors`).

Command Modes

- ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

IS-IS normally purges LSPs with an incorrect data link checksum causing the LSP source to regenerate the message. A cycle of purging and regenerating LSPs can occur when a network link continues to deliver accurate LSPs even though there is a link causing data corruption. This process could cause disruption to your system operation.

ip router isis

Configure IS-IS routing processes on an interface and attach an area tag name to the routing process.

Syntax

```
ip router isis [tag]
```

To disable IS-IS on an interface, use the `no ip router isis [tag]` command.
**Parameters**

| tag | (OPTIONAL) The tag you specify identifies a specific area routing process. If you do not specify a tag, a null tag is assigned. |

**Defaults**

No processes are configured.

**Command Modes**

INTERFACE

**Command History**

<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

To assign a network entity title to enable IS-IS, use the `net` command. This command accepts even if an IP address is not configured. This command is cached in the L3 Manager till the IP address is configured. When the IP address configuration reaches the L3Manager, the circuit add message is sent to IS-IS.

NOTE: IP address is not mandatory for forming IS-IS adjacency.

**Related Commands**

- `net` — configure an IS-IS network entity title (NET) for the routing process.
- `router isis` — enable the IS-IS routing protocol.

### ipv6 router isis

Enable the IPv6 IS-IS routing protocol and specify an IPv6 IS-IS process.

**Syntax**

```
ipv6 router isis [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

**Example**

```
Router# configure terminal
Router(config)# ipv6 router isis 1
```
Parameters  
tag  

(Optional) This parameter is a unique name for a routing process. A null tag is assumed if the tag option is not specified. The tag name must be unique for all IP router processes for a given router.

Defaults  
Not configured.

Command Modes  
ROUTER ISIS

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Configure a network entity title (the net command) to specify the area address and the router system ID.

To establish adjacencies and establish dynamic routing, enable routing on one or more interfaces.

You can configure only one IS-IS routing process to perform Level 2 routing. A level-1-2 designation performs Level 1 and Level 2 routing at the same time.

Related Commands

- net — configure an IS-IS network entity title (NET) for the routing process.
- is-type — assign a type for a given area.

**isis circuit-type**

Configure the adjacency type on interfaces.

**Syntax**

```plaintext
isis circuit-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no isis circuit-type` command.

**Parameters**

- `level-1`

  You can form a Level 1 adjacency if there is at least one common area address between this system and neighbors. You cannot form Level 2 adjacencies on this interface.
You can form a Level 1 and Level 2 adjacencies when the neighbor is also configured as Level-1-2 and there is at least one common area, if not, a Level 2 adjacency is established. This setting is the default.

You can form a Level 2 adjacencies when other Level 2 or Level 1-2 routers and their interfaces are configured for Level 1-2 or Level 2. Level 1 adjacencies cannot be established on this interface.

Defaults

Command Modes INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

Because the default establishes Level 1 and Level 2 adjacencies, you do not need to configure this command. Routers in an IS-IS system must be configured as a Level 1-only, Level 1-2, or Level 2-only system.

Only configure interfaces as Level 1 or Level 2 on routers that are between areas (for example, a Level 1-2 router) to prevent the software from sending unused hello packets and wasting bandwidth.

**isis csnp-interval**

Configure the IS-IS complete sequence number PDU (CSNP) interval on an interface.

**Syntax**

```plaintext
isis csnp-interval seconds [level-1 | level-2]
```

To return to the default values, use the no `isis csnp-interval [seconds] [level-1 | level-2]` command.

**Parameters**

- `seconds` Interval of transmission time between CSNPs on multi-access networks for the designated intermediate system. The range is from 0 to 65535. The default is 10.

- `level-1` (OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 1.
(OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 2.

**Defaults**
seconds = **10**: **level-1** (if not otherwise specified)

**Command Modes**
INTERFACE

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**
The default values of this command are typically satisfactory transmission times for a specific interface on a designated intermediate system. To maintain database synchronization, the designated routers send CSNPs.

You can configure Level 1 and Level 2 CSNP intervals independently.

### isis hello-interval

Specify the length of time between hello packets sent.

**Syntax**
`isis hello-interval seconds [level-1 | level-2]`

To return to the default values, use the `no isis hello-interval [seconds] [level-1 | level-2]` command.

**Parameters**
- **seconds**
  - Allows you to set the length of time between hello packet transmissions. The range is from 1 to 65535. The default is **10**.

- **level-1**
  - (OPTIONAL) Select this value to configure the hello interval for Level 1. This value is the default.

- **level-2**
  - (OPTIONAL) Select this value to configure the hello interval for Level 2.

**Defaults**
seconds = **10**: **level-1** (if not otherwise specified)

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

Hello packets are held for a length of three times the value of the hello interval. To conserve bandwidth and CPU usage, use a high hello interval seconds. Use a low hello interval seconds for faster convergence (but uses more bandwidth and CPU resources).

Related Commands

- `isis hello-multiplier` — specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency as down.

**isis hello-multiplier**

Specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency down.

**Syntax**

```
isis hello-multiplier multiplier [level-1 | level-2]
```

To return to the default values, use the `no isis hello-multiplier [multiplier] [level-1 | level-2]` command.

**Parameters**

- `multiplier` Specifies an integer that sets the multiplier for the hello holding time. Never configure a hello-multiplier lower than the default (3). The range is from 3 to 1000. The default is 3.
- `level-1` (OPTIONAL) Select this value to configure the hello multiplier independently for Level 1 adjacencies. This value is the default.
- `level-2` (OPTIONAL) Select this value to configure the hello multiplier independently for Level 2 adjacencies.

**Defaults**

```
multiplier = 3, level-1 (if not otherwise specified)
```

**Command Modes**

```
INTERFACE
```
isis hello padding

Turn ON or OFF padding of hello PDUs from INTERFACE mode.

Syntax

```
isis hello padding
```

To return to the default, use the `no isis hello padding` command.

Defaults

Padding of hello PDUs is enabled (ON).

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

The holdtime (the product of the hello-multiplier multiplied by the hello-interval) determines how long a neighbor waits for a hello packet before declaring the neighbor is down so routes can be recalculated.

Related Commands

- `isis hello-interval` — specify the length of time between hello packets.
Usage Information
Hello PDUs are “padded” only when both the global and interface padding options are ON. Turning either one OFF disables padding for the corresponding interface.

Related Commands
• hello padding — turn ON or OFF padding for LAN and point-to-point hello PDUs.

isis ipv6 metric

Assign metric to an interface for use with IPv6 information.

Syntax
isis ipv6 metric default-metric [level-1 | level-2]

To return to the default values, use the no ipv6 isis metric [default-metric] [level-1 | level-2] command.

Parameters
default-metric

Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215. The default is 10.

level-1

(OPTIONAL) Enter the keywords level-1 to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This value is the default.

level-2

(OPTIONAL) Enter the keywords level-2 to configure the SPF calculation for Level 2 (inter-area) routing.

Defaults
default-metric = 10; level-1 (if not otherwise specified)

INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
### isis metric

Assign a metric to an interface.

**Syntax**

```plaintext
isis metric default-metric [level-1 | level-2]
```

To return to the default values, use the `no isis metric [default-metric] [level-1 | level-2]` command.

**Parameters**

- `default-metric` Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215 irrespective of the metric style. The default is 10.

  If metric value is configured to more than 63, system throws the following warning:

  ```plaintext
  Warning: for metrics greater than 63, 'metric-style wide' should be configured on level-1-2, or it will be capped at 63.
  ```

  If the metric style is WIDE, the metric values that are greater than 63 are only effective.

- `level-1` (OPTIONAL) Enter the keywords `level-1` to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This setting is the default.

- `level-2` (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

**Defaults**

```plaintext
default-metric = 10; level-1 (if not otherwise specified)
```

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.

---

Dell Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.
Usage Information

Dell Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

### isis network point-to-point

Enable the software to treat a broadcast interface as a point-to-point interface.

**Syntax**

```
isis network point-to-point
```

To disable the feature, use the `no isis network point-to-point` command.

**Defaults**

Not enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**isis password**

Configure an authentication password for an interface.

```
isis password [hmac-md5] password [level-1 | level-2]
```

To delete a password, use the `no isis password [password] [level-1 | level-2]` command.

### Parameters

- **encryption-type** (OPTIONAL) Enter 7 to encrypt the password using DES.
- **hmac-md5** (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- **password** Assign the interface authentication password.
- **level-1** (OPTIONAL) Independently configures the authentication password for Level 1. The router acts as a station router for Level 1 routing. This setting is the default.
- **level-2** (OPTIONAL) Independently configures the authentication password for Level 2. The router acts as an area router for Level 2 routing.

### Defaults

No default password. **level-1** (if not otherwise specified).

</tbody>
</table>

### Usage Information

To protect your network from unauthorized access, use this command to prevent unauthorized routers from forming adjacencies.

You can assign different passwords for different routing levels by using the keywords `level-1` and `level-2`.

The `no` form of this command disables the password for Level 1 or Level 2 routing, using the respective keywords `level-1` or `level-2`.

This password provides limited security as it is processed as plain text.
**isis priority**

Set the priority of the designated router you select.

**Syntax**

```plaintext
isis priority value [level-1 | level-2]
To return to the default values, use the no isis priority [value] [level-1 | level-2] command.
```

**Parameters**

- **value**
  - This value sets the router priority. The higher the value, the higher the priority. The range is from 0 to 127. The default is 64.
- **level-1**
  - (OPTIONAL) Specify the priority for Level 1. This setting is the default.
- **level-2**
  - (OPTIONAL) Specify the priority for Level 2.

**Defaults**

value = 64; level-1 (if not otherwise specified).

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3(11.1)</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can configure priorities independently for Level 1 and Level 2. Priorities determine which router on a LAN is the designated router. Priorities are advertised within hellos. The router with the highest priority becomes the designated intermediate system (DIS).

![NOTE: Routers with a priority of 0 cannot be a designated router.](image)

Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If all the routers have priority 0, one with highest MAC address becomes DIS even though its priority is 0.
is-type

Configure IS-IS operating level for a router.

Syntax

```
is-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no is-type` command.

Parameters

- **level-1**: Allows a router to act as a Level 1 router.
- **level-1-2**: Allows a router to act as both a Level 1 and Level 2 router. This setting is the default.
- **level-2-only**: Allows a router to act as a Level 2 router.

Defaults

- level-1-2

Command Modes

- ROUTER ISIS

Command History

</tr>
</tbody>
</table>

Usage Information

The IS-IS protocol automatically determines area boundaries and are able to keep Level 1 and Level 2 routing separate. Poorly planned use of this feature may cause configuration errors, such as accidental area partitioning.

If you are configuring only one area in your network, you do not need to run both Level 1 and Level 2 routing algorithms. You can configure the IS type as Level 1.

log-adjacency-changes

Generate a log messages for adjacency state changes.

Syntax

```
log-adjacency-changes
```

912 | Intermediate System to Intermediate System (IS-IS)
To disable this function, use the `no log-adjacency-changes` command.

**Defaults**

Adjacency changes are not logged.

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command allows you to monitor adjacency state changes, which are useful when you monitor large networks. Messages are logged in the system’s error message facility.

---

**lsp-gen-interval**

Set the minimum interval between successive generations of link-state packets (LSPs).

**Syntax**

```
  lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]
```

To restore default values, use the `no lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

**Parameters**

- `level-1` (OPTIONAL) Enter the keywords `level-1` to apply the configuration to generation of Level-1 LSPs.
- `level-2` (OPTIONAL) Enter the keywords `level-2` to apply the configuration to generation of Level-2 LSPs.
- `interval seconds` Enter the maximum number of seconds between LSP generations. The range is from 0 to 120 seconds. The default is 5 seconds.
- `initial_wait_interval seconds` (OPTIONAL) Enter the initial wait time, in seconds, before running the first LSP generation. The range is from 0 to 120 seconds. The default is 1 second.
- `second_wait_interval seconds` (OPTIONAL) Enter the wait interval, in seconds, between the first and second LSP generation. The range is from 0 to 120 seconds. The default is 5 seconds.
Defaults
See Parameters.

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
7.5.1.0 Added support for LSP Throttling Enhancement.

Usage Information
LSP throttling slows down the frequency at which LSPs are generated during network instability. Even though
throttling LSP generations slows down network convergence, no throttling can result in a network not functioning
as expected. If network topology is unstable, throttling slows down the scheduling of LSP generations until the
topology regains its stability.

The first generation is controlled by the initial wait interval and the second generation is controlled by the second
wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the
maximum wait time specified (interval seconds). After the network calms down and there are no triggers for
two times the maximum interval, fast behavior is restored (the initial wait time).

lsp-mtu

Set the maximum transmission unit (MTU) of IS-IS link-state packets (LSPs). This command only limits the size of LSPs this router
generates.

Syntax
lsp-mtu size
To return to the default values, use the no lsp-mtu command.

Parameters
size
The maximum LSP size, in bytes. The range is from 512 to 16000 for Non-Jumbo mode
and from 128 to 9195 for Jumbo mode. The default is 1497.

Defaults
1497 bytes.

Command Modes
ROUTER ISIS

Usage Information
NOTE: The appropriate interface circuit is brought down and removed.

Dell EMC Internal Use Only
lsp-refresh-interval

Set the link state PDU (LSP) refresh interval. LSPs must be refreshed before they expire. When the LSPs are not refreshed after a refresh interval, they are kept in a database until their max-lsp-lifetime reaches zero and then LSPs is purged.

Syntax

```
  lsp-refresh-interval  seconds
```

To restore the default refresh interval, use the `no  `lsp-refresh-interval command.

Parameters

- **seconds**
  The LSP refresh interval, in seconds. This value must be 300 seconds less than the value specified in the max-lsp-lifetime command. The range is from 1 to 65535 seconds. The default is 900.

Defaults

- **900** seconds

Command Modes

- ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Added support for LSP Throttling Enhancement.</td>
</tr>
</tbody>
</table>

Usage Information

The link MTU and the LSP MTU size must be the same.

Because each device can generate a maximum of 255 LSPs, consider carefully whether you use the `lsp-mtu` command.
**Usage Information**

The refresh interval determines the rate at which route topology information is transmitted preventing the information from becoming obsolete.

The refresh interval must be less than the LSP lifetime specified with the `max-lsp-lifetime` command. A low value reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. A higher value reduces the link utilization the flooding of refreshed packets causes.

**Related Commands**

- `max-lsp-lifetime` — set the maximum interval that LSPs persist without being refreshed.

---

**max-area-addresses**

Configure manual area addresses.

**Syntax**

```
max-area-addresses number
```

To return to the default values, use the `no max-area-addresses` command.

**Parameters**

- `number` 
  Set the maximum number of manual area addresses. The range is from 3 to 6. The default is 3.

**Defaults**

3 addresses

**Command Modes**

- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) 
  Introduced on the S3148.

- 9.8(2.0) 
  Introduced on the S3100 series.

- 9.8(1.0) 
  Introduced on the Z9100-ON.

- 9.8(0.0P5) 
  Introduced on the S4048-ON.

- 9.8(0.0P2) 
  Introduced on the S3048-ON.

- 9.7(0.0) 
  Introduced on the S6000-ON.

- 9.5(0.1) 
  Introduced on the Z9500.

- 9.0.2.0 
  Introduced on the S6000.

- 8.3.19.0 
  Introduced on the S4820T.

- 8.3.12.0 
  Introduced on the S4810.

- 8.3.11.1 
  Introduced on the Z9000.

- 7.5.1.0 
  Added support for LSP Throttling Enhancement.
Usage Information
To configure the number of area addresses on router, use this command. This value must be consistent with routers in the same area, otherwise the router forms only Level 2 adjacencies. The value must be same among all the routers to form Level 1 adjacencies.

max-lsp-lifetime

Set the maximum time that link-state packets (LSPs) exist without being refreshed.

Syntax
max-lsp-lifetime seconds

To restore the default time, use the no max-lsp-lifetime command.

Parameters
seconds

The maximum lifetime of LSP in seconds. This value must be greater than the lsp-refresh-interval command. The higher the value the longer the LSPs are kept. The range is from 1 to 65535. The default is 1200.

Defaults
1200 seconds

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
7.5.1.0 Added support for LSP Throttling Enhancement.
Usage Information
Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than
the LSP refresh interval.

The seconds parameter enables the router to keep LSPs for the specified length of time. If the value is higher,
the overhead is reduced on slower-speed links.

Related Commands
• lsp-refresh-interval — set the link-state packet (LSP) refresh interval.

maximum-paths

Allows you to configure the maximum number of equal cost paths allowed in a routing table.

NOTE: Enables you to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

Syntax
maximum-paths number

To return to the default values, use the no maximum-paths command.

Parameters
number Enter a number as the maximum number of parallel paths an IP routing installs in a routing
table. The range is from 1 to 64. The default is 4.

Defaults
4

Command Modes
• ROUTER ISIS (for IPv4)
• CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
metric-style

To generate and accept old-style, new-style, or both styles of type, length, and values (TLV), configure a router.

Syntax

```
metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]
```

To return to the default values, use the no metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2] command.

Parameters

- **narrow**: Allows you to generate and accept old-style TLVs. The metric range is from 0 to 63.
- **transition**: Allows you to generate both old-style and new-style TLVs. The metric range is from 0 to 63.
- **wide**: Allows you to generate and accept only new-style TLVs. The metric range is from 0 to 16777215.
- **level-1**: Enables the metric style on Level 1.
- **level-2**: Enables the metric style on Level 2.

Defaults

- **narrow**: if no Level is specified, Level-1 and Level-2 are configured.

Command Modes

- **ROUTER ISIS**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>
If you enter the **metric-style wide** command, the Dell Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.

The new-style TLVs have wider metric fields than old-style TLVs.

When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that is requires.

**Related Commands**

- `isis metric` — configure a metric for an interface.

### multi-topology

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

**Syntax**

```
multi-topology [transition]
```

To return to a single topology configuration, use the `no multi-topology [transition]` command.

**Parameters**

- `transition`

**Defaults**

Disabled

**Command Modes**

- `CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**net**

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

**Syntax**

```plaintext
net network-entity-title
```

To remove a net, use the `no net network-entity-title` command.

**Parameters**

- **network-entity-title**
  Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

**Defaults**

Not configured.

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**passive-interface**

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

**Syntax**

```plaintext
passive-interface interface
```

To delete a passive interface configuration, use the `no passive-interface interface` command.

**Parameters**

- **interface**
  Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
ROUTER ISIS

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>

**Usage Information**
Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.

### redistribute

Redistribute routes from one routing domain to another routing domain.

**Syntax**
```
redistribute {static | connected | rip} [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

To end redistribution or disable any of the specified keywords, use the `no redistribute {static | connected | rip} [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]` command.

**Parameters**
- `connected`
Enter the keyword `connected` to redistribute active routes into IS-IS.
- `rip`
Enter the keyword `rip` to redistribute RIP routes into IS-IS.
- `static`
Enter the keyword `static` to redistribute user-configured routes into IS-IS.
metric metric-value  (OPTIONAL) Assign a value to the redistributed route. The range is from 0 to 16777215. The default is 0. Use a value that is consistent with the destination protocol.

metric-type  
(external | internal)  
(OPTIONAL) The external link type associated with the default route advertised into a routing domain. Specify one of the following:

- external
- internal

level-1  
(OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.

level-1-2  
(OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.

level-2  
(OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.

route-map map-name  
(OPTIONAL) If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.

Defaults

- metric metric-value = 0
- metric-type= internal; level-2

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

To redistribute a default route (0.0.0.0/0), configure the default-information originate command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.
When an LSP with an internal metric is received, the Dell Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the distribute-list out command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the metric-style command. If the metric-style command is set for Narrow or Transition mode and the metric value in the redistribute command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the metric-style command is set for Wide mode, the metric value in the redistribute command is advertised.

Related Commands

- default-information originate — generate a default route for the IS-IS domain.
- distribute-list out — suppress networks from being advertised in updates. This command filters redistributed routing information.

redistribute bgp

Redistribute routing information from a BGP process.

Syntax

redistribute bgp AS number [level-1| level-1-2 | level-2] [metric metric-value] [metric-type {external| internal}] [route-map map-name]

To return to the default values, use the no redistribute bgp command with the appropriate parameters.

Parameters

- **AS number**: Enter a number that corresponds to the autonomous system number. The range is from 1 to 65535.
- **level-1**: (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.
- **level-1-2**: (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.
- **level-2**: (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.
- **metric metric-value**: (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is 0.
- **metric-type**: (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are:
  - external
  - internal
- **route-map map-name**: (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are:
  - map-name is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol.
  - If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

Defaults

- IS-IS Level 2 routes only
- ROUTER ISIS (for IPv4)

Command Modes

- ROUTER ISIS (for IPv4)
CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information

BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

Example

Dell(conf)# router is
Dell(conf-router_isis)# redistribute bgp 1 level-1 metric 32 metric-type external route-map rmap-isis-to-bgp
Dell(conf-router_bgp)# show running-config isis

    !
    router isis
    redistribute bgp 1 level-1 metric 32 metric-type external route-map rmap-isis-to-bgp

redistribute ospf

Redistribute routing information from an OSPF process.

Syntax

redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]

To return to the default values, use the no redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name] command.

Parameters

- **process-id**: Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65535.
metric metric-value  (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is 0.

metric-type  (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are:

- external
- internal

level-1  (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.

level-1-2  (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.

level-2  (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.

match (external | internal)  (OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are

- internal
- external

route-map map-name  map-name is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol. If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

Defaults  See Parameters.

Command Modes  
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
### Version Description

**7.5.1.0**  Added support for IPv6 ISIS.

**6.3.1.0**  Introduced.

### Usage Information

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

### router isis

Allows you to enable the IS-IS routing protocol and to specify an IP IS-IS process.

#### Syntax

```
router isis [vrf vrf-name] [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

#### Parameters

- **vrf vrf-name**  
Enter the keyword `vrf` followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.

- **tag**  
  (OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the `tag` option is not specified. The tag name must be unique for all IP router processes for a given router.

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version Description

**9.10(0.0)**  Introduced on the S3148.

**9.8(2.0)**  Introduced on the S3100 series.

**9.8(1.0)**  Introduced on the Z9100-ON.

**9.8(0.0P5)**  Introduced on the S4048-ON.

**9.8(0.0P2)**  Introduced on the S3048-ON.

**9.7(0.0)**  Added support for VRF. Introduced on the S6000-ON.

**9.5(0.1)**  Introduced on the Z9500.

**9.0.2.0**  Introduced on the S6000.

**8.3.19.0**  Introduced on the S4820T.

**8.3.12.0**  Introduced on the S4810.
## Version Description

8.3.11.1 Introduced on the Z9000.

### Usage Information
Configure a network entity title (the `net` command) to specify the area address and the router system ID.

Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

### Related Commands
- `ip router isis` — configure IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.
- `net` — configure an IS-IS network entity title (NET) for a routing process.
- `is-type` — assign a type for a given area.

---

### set-overload-bit

To set the overload bit in zeroth fragment of non-pseudonode LSPs on the router, configure the router. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

**Syntax**

```
set-overload-bit
```

To return to the default values, use the `no set-overload-bit` command.

**Defaults**

Not set.

**Command Modes**

- `ROUTER ISIS (for IPv4)`
- `CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

## Example (Router-Isis)

The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
Dell(conf-router_isis)# show config
!
router isis
clns host ISIS 49.0000.0001.F100.E120.0013.00
log-adjacency-changes
net 49.0000.0001.F100.E120.0013.00
!
address-family ipv6 unicast
maximum-paths 16
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
```
spf-interval level-2 120 20 25
exit-address-family

Example (Address-Family_IPv6)

The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

Dell(conf-router_isis-af_ipv6)# show conf
! address-family ipv6 unicast
maximum-paths 16
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family

show isis database

Display the IS-IS link state database.

Syntax
show isis [vrf vrf-name] database [level-1 | level-2] [local] [detail | summary] [system-id] [lspid]

Parameters

- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to display IS-IS link state database corresponding to that VRF.

  **NOTE:** If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed.

- **level-1** (OPTIONAL) Displays the Level 1 IS-IS link-state database.
- **level-2** (OPTIONAL) Displays the Level 2 IS-IS link-state database.
- **local** (OPTIONAL) Displays local link-state database information.
- **detail** (OPTIONAL) Displays the detailed link-state database information of each LSP when specified. If not specified, a summary displays.
- **summary** (OPTIONAL) Displays the summary of link-state database information when specified.
- **lspid** (OPTIONAL) Display only the specified LSP.
- **system-id** (OPTIONAL) Displays the link-state database for system-id.

Command Modes

- EXEC
- EXEC Privilege

Command History

### Version Description

- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Added support for VRF. Introduced on the S6000-ON.
- **9.5(0.1)**: Introduced on the Z9500.
- **9.2(0.2)**: Introduced on the Z9000.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.7.1**: Introduced on the S4810.

### Usage Information

The following describes the `show isis database` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS-IS Level-1/Level-2 Link State Database</td>
<td>Displays the IS-IS link state database for Level 1 or Level 2.</td>
</tr>
<tr>
<td>LSPID</td>
<td>Displays the LSP identifier. The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router. The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems. The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number. An * after the LSPID indicates that the system originates an LSP where this command was issued.</td>
</tr>
<tr>
<td>LSP Seq Num</td>
<td>This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.</td>
</tr>
<tr>
<td>LSP Checksum</td>
<td>This is the checksum of the entire LSP packet.</td>
</tr>
<tr>
<td>LSP Holdtime</td>
<td>This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.</td>
</tr>
<tr>
<td>ATT</td>
<td>This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router.</td>
</tr>
<tr>
<td>P</td>
<td>This value represents the P bit. This bit is always set to zero as Dell Networking does not support area partition repair.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>OL</td>
<td>This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.</td>
</tr>
</tbody>
</table>

**Example**

The bold sections identify that MultiTopology IS-IS is enabled.

```
Dell# show isis database

```
show isis graceful-restart detail

Display detailed IS-IS graceful restart related settings.

Syntax

show isis [vrf vrf-name] graceful-restart detail

Command Modes

• EXEC
  • EXEC Privilege

Parameters

vrf vrf-name  (Optional) Enter the keyword vrf followed by the name if the VRf to display IS-IS graceful restart details corresponding to that VRF.

| NOTE: If you do not specify this option, the IS-IS graceful restart details corresponding to the default VRF are displayed.

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

T3 Timer                : Manual
T3 Timeout Value        : 30
T2 Timeout Value        : 30 (level-1), 30 (level-2)
T1 Timeout Value        : 5, retry count: 1
 adjacency wait time     : 30

Operational Timer Value
```
show isis hostname

Display IS-IS host names configured or learned on the switch.

Syntax

show isis [vrf vrf-name] hostname

Parameters

vrf vrf-name

Enter the keyword vrf followed by the name of the VRF to display IS-IS host names corresponding to that VRF.

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Added support for VRF. Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.

Example

Dell# show isis hostname
System Id Dynamic Name Static Name
*F100.E120.0013 Force10 ISIS
Dell#
show isis interface

Display detailed IS-IS interface status and configuration information.

Syntax

\`show isis [vrf vrf-name] interface [interface]\`

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS interface status information corresponding to that VRF.
- **interface** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Example

```
Dell> show isis int
GigabitEthernet 1/7 is up, line protocol is up
   MTU 1497, Encapsulation SAP
```
show isis neighbors

Display information about neighboring (adjacent) routers.

Syntax

show isis [vrf vrf-name] neighbors [level-1 | level-2] [detail] [interface]

Parameters

vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display adjacent router information corresponding to that VRF.

level-1 (OPTIONAL) Displays information about Level 1 IS-IS neighbors.

level-2 (OPTIONAL) Displays information about Level 2 IS-IS neighbors.

detail (OPTIONAL) Displays detailed information about neighbors.

interface (OPTIONAL) Enter the following keywords and the interface information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added support for VRF. Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.

**Usage Information**

Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Id</td>
<td>The value that identifies a system in an area.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface, slot, and port in which the router was discovered.</td>
</tr>
<tr>
<td>State</td>
<td>The value providing status about the adjacency state. The range is Up and Init.</td>
</tr>
<tr>
<td>Type</td>
<td>This value displays the adjacency type (Layer 2, Layer 2 or both).</td>
</tr>
<tr>
<td>Priority</td>
<td>IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface.</td>
</tr>
<tr>
<td>Uptime</td>
<td>Displays the interfaces uptime.</td>
</tr>
<tr>
<td>Circuit Id</td>
<td>The neighbor’s interpretation of the designated router for the interface.</td>
</tr>
</tbody>
</table>

**Example**

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

```
Dell# show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Gi 7/1 Up L1L2 (M) 127 09:28:01 TEST.02
!
Dell#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Gi 7/1 Up L1L2 (M) 127 09:28:04 TEST.02 Area Address(es): 49.0000.0001
IP Address(es): 25.1.1.3*
MAC Address: 0000.0000.0000
Hold Time: 28
Link Local Address: fe80::201:e8ff:fe00:492c
Topology: IPv4 IPv6, Common (IPv4 IPv6)
Adjacency being used for MTs: IPv4 IPv6
Dell#
```
**show isis protocol**

Display IS-IS routing information.

**Syntax**
```
show isis [vrf vrf-name] protocol
```

**Parameters**
- **vrf vrf-name** 
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS routing information corresponding to that VRF.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Example**
The bold section identifies that Multi-Topology IS-IS is enabled.

```
Dell# show isis protocol
IS-IS Router: <Null Tag>
  System Id: F100.E120.0013 IS-Type: level-1-2
  Manual area address(es):
    49.0000.0001
  Routing for area address(es):
    49.0000.0001
  Interfaces supported by IS-IS:
    GigabitEthernet 1/1 - IP - IPv6
    GigabitEthernet 1/2 - IP - IPv6
    GigabitEthernet 1/10 - IP - IPv6
    Loopback 0 - IP - IPv6
  Redistributing:
    Distance: 115
  Generate narrow metrics: level-1-2
```
show isis traffic

This command allows you to display IS-IS traffic interface information.

**Syntax**

```
show isis [vrf vrf-name] traffic [interface]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS traffic interface information corresponding to that VRF.</td>
</tr>
<tr>
<td>interface</td>
<td>(OPTIONAL) Identifies the interface type and the interface following:</td>
</tr>
<tr>
<td></td>
<td>• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.</td>
</tr>
<tr>
<td></td>
<td>• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.</td>
</tr>
<tr>
<td></td>
<td>• For a port channel interface, enter the keywords port-channel then a number.</td>
</tr>
<tr>
<td></td>
<td>• For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

## Usage Information

The following describes the `show isis traffic` command shown in the following example.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level-1/Level-2 Hellos (sent/rcvd)</td>
<td>Displays the number of Hello packets sent and received.</td>
</tr>
<tr>
<td>PTP Hellos (sent/rcvd)</td>
<td>Displays the number of point-to-point Hellos sent and received.</td>
</tr>
<tr>
<td>Level-1/Level-2 LSPs sourced (new/refresh)</td>
<td>Displays the number of new and refreshed LSPs.</td>
</tr>
<tr>
<td>Level-1/Level-2 LSPs flooded (sent/rcvd)</td>
<td>Displays the number of flooded LSPs sent and received.</td>
</tr>
<tr>
<td>Level-1/Level-2 LSPs CSNPs (sent/rcvd)</td>
<td>Displays the number of CSNP LSPs sent and received.</td>
</tr>
<tr>
<td>Level-1/Level-2 LSPs PSNPs (sent/rcvd)</td>
<td>Displays the number of PSNP LSPs sent and received.</td>
</tr>
<tr>
<td>Level-1/Level-2 DR Elections</td>
<td>Displays the number of times designated router elections ran.</td>
</tr>
<tr>
<td>Level-1/Level-2 SPF Calculations</td>
<td>Displays the number of shortest path first calculations.</td>
</tr>
<tr>
<td>LSP checksum errors received</td>
<td>Displays the number of checksum errors LSPs received.</td>
</tr>
<tr>
<td>LSP authentication failures</td>
<td>Displays the number of LSP authentication failures.</td>
</tr>
</tbody>
</table>

### Example

```plaintext
Dell# show isis traffic
IS-IS: Level-1 Hellos (sent/rcvd) : 0/721
IS-IS: Level-2 Hellos (sent/rcvd) : 900/943
IS-IS: PTP Hellos (sent/rcvd) : 0/0
IS-IS: Level-1 LSPs sourced (new/refresh) : 0/0
IS-IS: Level-2 LSPs sourced (new/refresh) : 1/3
IS-IS: Level-1 LSPs flooded (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs flooded (sent/rcvd) : 5934/5217
IS-IS: Level-1 LSPs CSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs CSNPs (sent/rcvd) : 472/238
IS-IS: Level-1 LSPs PSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs PSNPs (sent/rcvd) : 10/337
IS-IS: Level-1 DR Elections : 4
IS-IS: Level-2 DR Elections : 4
IS-IS: Level-1 SPF Calculations : 0
IS-IS: Level-2 SPF Calculations : 389
IS-IS: LSP checksum errors received : 0
IS-IS: LSP authentication failures : 0
Dell#
```
spf-interval

Specify the minimum interval between shortest path first (SPF) calculations.

Syntax

spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]

To restore default values, use the no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]] command.

Parameters

level-1 (OPTIONAL) Enter the keyword level-1 to apply the configuration to Level-1 SPF calculations.

level-2 (OPTIONAL) Enter the keyword level-2 to apply the configuration to Level-2 SPF calculations.

interval seconds Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is 10 seconds.

initial_wait_interval seconds (OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is 5 seconds.

second_wait_interval seconds (OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is 5 seconds.

Defaults

See Parameters.

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

**Version** 7.5.1.0  
**Description** Added support for SPF Throttling Enhancement.

**Usage Information**

This command `spf-interval` in `CONFIG-ROUTER-ISIS-AF-IPV6` mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in `CONFIG-ROUTER-ISIS` mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (interval seconds). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).
Link Aggregation Control Protocol (LACP)

This section contains commands for Dell Networks’ implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as "port-channels" in the Dell Networking OS.

**NOTE:** For static LAG commands based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications, see Port Channel Commands.

Topics:

- clear lacp counters
- debug lacp
- lACP long-timeout
- lACP port-priority
- lACP system-priority
- port-channel-protocol lACP
- show lACP

### clear lacp counters

Clear port channel counters.

**Syntax**

```
clear lacp port-channel-number counters
```

**Parameters**

- `port-channel-number` Enter a port-channel number. The range is from 1 to 128.

**Defaults**

Without a Port Channel specified, the command clears all Port Channel counters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

- **7.5.1.0**
  - Introduced on the C-Series.
- **6.2.1.1**
  - Introduced on the E-Series.

### Related Commands

- **show lacp** — display the LACP configuration.

### debug lacp

#### Description
Debug LACP (configuration, events, and so on).

#### Syntax

```
depend [config | events | pdu [interface-type [in | out]]]
```

To disable LACP debugging, use the `no [config | events | pdu [interface-type [in | out]]]` command.

#### Parameters

- **config**
  - (OPTIONAL) Enter the keyword `config` to debug the LACP configuration.
- **events**
  - (OPTIONAL) Enter the keyword `events` to debug the LACP event information.
- **pdu**
  - (OPTIONAL) Enter the keyword `pdu` to debug the LACP Protocol Data Unit information.
- **interface-type**
  - (OPTIONAL) Enter the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - Optionally, enter an `in` or `out` parameter:
    - Receive enter `in`
    - Transmit enter `out`

#### Defaults

None
Command Modes

- EXEC
- EXEC Privilege

Command History

**lacp long-timeout**

Configure a long timeout period (30 seconds) for an LACP session.

Syntax

```
lacp long-timeout
```

To reset the timeout period to a short timeout (1 second), use the `no lacp long-timeout` command.

Defaults

```
1 second
```

Command Modes

```
INTERFACE (conf-if-po-number)
```

Command History

7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.2.1.1 | Introduced on the E-Series.

Usage Information
This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect.

Related Commands
- `show lacp` — display the LACP configuration.

**lacp port-priority**

To influence which ports will be put in Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, configure the port priority.

**Syntax**

```
lacp port-priority priority-value
```

To return to the default setting, use the `no lacp port-priority priority-value` command.

**Parameters**

- `priority-value` Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is `32768`.

**Defaults**

- `32768`

**Command Modes**

- `INTERFACE`

### lACP system-priority

Configure the LACP system priority.

**Syntax**

```
lacp system-priority priority-value
```

**Parameters**

- **priority-value**: Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is **32768**.

**Defaults**

- **32768**

6.2.1.1 Introduced on the E-Series.

Related Commands

- show lacp — display the LACP information.
- show interfaces port-channel — display information on configured Port Channel groups.
show lacp

Display the LACP matrix.

Syntax

show lacp port-channel-number [sys-id | counters]

Parameters

port-channel-number

Enter a port-channel number. The range is from 1 to 128.

sys-id

(Optional) Enter the keywords sys-id and the value that identifies a system.

counters

(Optional) Enter the keyword counters to display the LACP counters.

Defaults

Without a Port Channel specified, the command clears all Port Channel counters.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000–ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.

8.3.7.0 Introduced on the S4810.

7.6.1.0 Introduced on the S-Series.

7.5.1.0 Introduced on the C-Series.

6.2.1.1 Introduced on the E-Series.

Example (Port-Channel-Number)

Dell# show lacp 1
Port-channel 1 admin up, oper up, mode lacp
Actor System ID:Priority 32768, Address 0001.e800.a12b
Partner System ID:Priority 32768, Address 0001.e801.45a5
Actor Admin Key 1, Oper Key 1, Partner Oper Key 1
LACP LAG 1 is an aggregatable link

A-Active LACP, B-Passive LACP, C-Short Timeout, D-Long Timeout
E-Aggregatable Link, F-Individual Link, G-IN_SYNC, H-OUT_OF_SYNC
I-Collection enabled, J-Collection disabled, K-Distribution enabled, L-Distribution disabled,
M-Partner Defaulted, N-Partner Non-defaulted, O-Receiver is in expired state,
P-Receiver is not in expired state

Port Gi 1/6 is enabled, LACP is enabled and mode is lacp
  Actor   Admin: State ACEHJLMP Key 1    Priority 128
     Oper: State ACEGKINP Key 1    Priority 128

## MAC Addressing Commands

The following commands are related to configuring, managing, and viewing MAC addresses.

### clear mac-address-table

Clear the MAC address table of all MAC address learned dynamically.

**Syntax**

```
clear mac-address-table {dynamic | sticky }{address mac-address | all | interface interface | vlan vlan-id}
```

**Parameters**
- **dynamic**: Enter the keyword `dynamic` to specify dynamically-learned MAC addresses.
- **sticky**: Enter the keyword `sticky` to specify sticky MAC addresses.
- **address mac-address**: Enter the keyword `address` then a MAC address in nn:nn:nn:nn:nn:nn format.
- **all**: Enter the keyword `all` to delete all MAC address entries in the MAC address table.
- **interface interface**: Enter the following keywords and slot/port or number information:
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- **vlan vlan-id**: Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Command Modes**
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</tbody>
</table>
mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

Syntax

mac-address-table aging-time seconds

Parameters

seconds

Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is 1800 seconds.

Defaults

1800 seconds

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.1.1.1 Introduced on the E-Series.
### mac-address-table disable-learning

Disable MAC address learning from LACP or LLDP BPDUs.

**Syntax**

```
mac-address-table disable-learning [lacp | lldp]
```

**Parameters**

- `lacp`: Enter lacp to disable MAC address learning from LACP BPDUs.
- `lldp`: Enter lldp to disable MAC address learning from LLDP BPDUs.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) Introduced on the S3048–ON, S3100 series, S4048–ON, S4810, S4820T, S5000, S6000, S6000–ON, Z9100–ON, and Z9500.

**Usage Information**

If you use the `mac-address-table disable-learning` command without specifying any option, the system does not learn source MAC addresses from LACP or LLDP BPDUs.

### mac-address-table static

Associate specific MAC or hardware addresses to an interface and VLANs.

**Syntax**

```
mac-address-table static mac-address {multicast vlan vlan-id output-range interface} {output interface vlan vlan-id}
```

To remove a MAC address, use the `no mac-address-table static mac-address output interface vlan vlan-id` command.
Parameters

**mac-address**
Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.

**multicast**
Enter a vlan port to where L2 multicast MAC traffic is forwarded.

**NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.

**output interface**
For a unicast MAC address, enter the keyword output then one of the following interfaces for which traffic is forwarded:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.

(output-range)
For a multicast MAC address, enter the keyword output-range then one of the following interfaces to indicate a range of ports for which traffic is forwarded:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.

**vlan vlan-id**
Enter the keyword vlan then a VLAN ID number from 1 to 4094.

Defaults
Not configured.

Command Modes
**CONFIGURATION**

Usage Information

For more information about using this command, see NIC Teaming in the Layer 2 section of the Dell Networking OS Configuration Guide.

mac learning-limit

Limit the maximum number of MAC addresses (static + dynamic) learned on a selected interface.

Syntax

mac learning-limit address_limit [vlan vlan-id] [station-move-violation [dynamic]] [dynamic [no-station-move| station-move]]

Parameters

- **address_limit**: Enter the maximum number of MAC addresses that can be learned on the interface. The range is from 1 to 1000000.
- **vlan vlan-id**: Enter the keyword then the VLAN ID. The range is from 1 to 4094.
- **dynamic** (OPTIONAL): Enter the keyword dynamic to allow aging of MACs even though a learning limit is configured.
- **station-move-violation** (OPTIONAL): Enter the keywords station-move to allow a station move on learned MAC addresses.

Defaults

- On S-Series, the default behavior is dynamic.

**NOTE**: “Static” means manually entered addresses, which do not age.

Version | Description
--- | ---
8.3.1.0 | Added the vlan option on the E-Series.
8.2.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series. Added the station-move option.
6.5.1.0 | Added support for MAC Learning-Limit on the LAG.

Usage Information

This command and its options are supported on physical interfaces, static LAGs, LACP LAGs, and VLANs.

If you do not specify the vlan option, the MAC address counters are not VLAN-based. That is, the sum of the addresses learned on all VLANs (not having any learning limit configuration) is counted against the MAC learning limit.

MAC Learning Limit violation logs and actions are not available on a per-VLAN basis.

With the keyword no-station-move option, MAC addresses learned through this feature on the selected interface persist on a per-VLAN basis, even if received on another interface. Enabling or disabling this option has no effect on already learned MAC addresses.

After the MAC address learning limit is reached, the MAC addresses do not age out unless you add the dynamic option. To clear statistics on MAC address learning, use the clear counters command with the learning-limit parameter.

NOTE: If you configure this command on an interface in a routed VLAN, and after the MAC addresses learned reaches the limit set in the mac learning-limit command, IP protocols are affected. For example, VRRP sets multiple VRRP Masters and OSPF may not come up.

When a channel member is added to a port-channel and there is not enough ACL CAM space, the MAC limit functionality on that port-channel is undefined. When this occurs, un-configure the existing configuration first and then reapply the limit with a lower value.

Related Commands

- `mac learning-limit mac-address-sticky` — replace deprecated no-station-move parameter.
- `show mac learning-limit` — display MAC learning-limit configuration.

mac learning-limit learn-limit-violation

Configure an action for a MAC address learning-limit violation.

Syntax

```
mac learning-limit learn-limit-violation {log | shutdown}
```

To return to the default, use the `no mac learning-limit learn-limit-violation {log | shutdown}` command.

Parameters

- `log` | Enter the keyword log to generate a syslog message on a learning-limit violation.
- `shutdown` | Enter the keyword shutdown to shut down the port on a learning-limit violation.
Defaults None

Usage Information This command is supported on physical interfaces, static LAGs, and LACP LAGs.

Related Commands
- show mac learning-limit — display details of the mac learning-limit.

mac learning-limit mac-address-sticky

Maintain the dynamically learned mac addresses as sticky MAC addresses on the selected port.

Syntax
mac learning-limit mac-address-sticky

To convert the sticky MAC addresses to dynamic MAC addresses, use the no mac learning-limit command.

Parameters
mac-address-sticky Configures the dynamic MAC addresses as sticky on an interface.

Defaults
None

Command Modes INTERFACE
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

If you configure `mac-learn-limit` and the sticky MAC feature is enabled, dynamically learned MAC addresses are converted to sticky for that port. Any new MAC address that is learned also becomes sticky for that port.

### Related Commands

- `show mac learning-limit` — display the details of the mac learning-limit.

---

**mac learning-limit station-move-violation**

Specify the actions for a station move violation.

**Syntax**

```
mac learning-limit station-move-violation {log | shutdown-both | shutdown-offending | shutdown-original}
```

To disable a configuration, use the `no mac learning-limit station-move-violation` command, then the configured keyword.

**Parameters**

- `log` Enter the keyword `log` to generate a syslog message on a station move violation.
- `shutdown-both` Enter the keyword `shutdown` to shut down both the original and offending interface and generate a syslog message.
- `shutdown-offending` Enter the keywords `shutdown-offending` to shut down the offending interface and generate a syslog message.
- `shutdown-original` Enter the keywords `shutdown-original` to shut down the original interface and generate a syslog message.

**Defaults**

None
### Command Modes

show cam mac stack-unit

Display the content addressable memory (CAM) size and the portions allocated for MAC addresses and for MAC ACLs.

Syntax

```
show cam mac stack-unit unit_number port-set port-pipe count [vlan vlan-id] [interface interface]
```

Parameters

- **stack-unit unit_number**  
  (REQUIRED) Enter the keyword stack-unit followed by a stack member number to select the stack unit. The range is from 1 to 12.
- **port-set port-pipe**  
  (REQUIRED) Enter the keywords port-set followed by a Port-Pipe number to select the Port-Pipe.
- **address mac-addr**  
  (OPTIONAL) Enter the keyword address followed by a MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.
- **dynamic**  
  (OPTIONAL) Enter the keyword dynamic to display only those MAC addresses learned dynamically by the switch.
- **static**  
  (OPTIONAL) Enter the keyword static to display only those MAC address specifically configured on the switch.
- **interface interface**  
  (OPTIONAL) Enter the keyword interface followed by the interface type, slot and port information:
    - For a 1-Gigabit Ethernet interface, enter the keyword GigabitEthernet followed by the slot/port information.
    - For a Port Channel interface, enter the keywords port-channel followed by a number. For the S-Series, the range is 1 to 128.
For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

```
vlan vlan-id
```

(Optional) Enter the keyword vlan followed by the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**

**show mac-address-table**

Display the MAC address table.

**Syntax**

```
show mac-address-table [address mac-address | interface interface | vlan vlan-id] [aging-time] [dynamic | static] [count [vlan vlan-id] [interface interface-type [slot [/port]]]]
```

**Parameters**

- **address mac-address**
  
  (OPTIONAL) Enter the keyword address then a MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.

- **dynamic**
  
  (OPTIONAL) Enter the keyword dynamic to display only those MAC addresses the switch dynamically learns. Optionally, you can also add one of these combinations: address/mac-address, interface/interface, or vlan vlan-id.

- **static**
  
  (OPTIONAL) Enter the keyword static to display only those MAC addresses specifically configured on the switch. Optionally, you can also add one of these combinations: address/mac-address, interface/interface, or vlan vlan-id.

- **aging-time**
  
  Enter the keyword aging-time to display only aging-time information.

- **interface interface**
  
  (OPTIONAL) Enter the keyword interface and the interface information:

  - For a port channel interface, enter the keywords port-channel then a number.
For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.

For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

interface interface-type (OPTIONAL) Instead of entering the keyword interface then the interface type, slot/port information, as above, you can enter the interface type, then just a slot number.

vlan vlan-id (OPTIONAL) Enter the keyword vlan then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.

count (OPTIONAL) Enter the keyword count, then optionally, by an interface or VLAN ID, to display total or interface-specific static addresses, dynamic addresses, and MAC addresses in use.

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.12.0 Updated the output.
8.3.1.0 Added support for 4-port 40G line cards on the E-Series.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.2.1.1 Introduced on the E-Series.

Usage Information
The following describes the show mac-address-table command shown in the following example.

Column Heading Description
VlanId Displays the VLAN ID number.

Layer 2 | 963
### show mac-address-table

Display the aging times assigned to the MAC addresses on the switch.

#### Syntax

```
show mac-address-table aging-time [vlan vlan-id]
```
Parameters

**vlan vlan-id**  
(Optionalal) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

</tbody>
</table>

Example

```
Dell# show mac-address-table aging-time
Mac-address-table aging time : 1800
Dell#
```

Related Commands

- `show mac-address-table` — display the current MAC address configuration.

### show mac accounting destination

Display destination counters for Layer 2 traffic (available on physical interfaces only).

**Syntax**

```
show mac accounting destination [mac-address vlan vlan-id] [interface interface
[mac-address vlan vlan-id] [vlan vlan-id]] [vlan vlan-id]
```
Parameters

- **mac-address** (OPTIONAL) Enter the MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.
- **interface interface** (OPTIONAL) Enter the keyword interface then the interface type, slot and port information:
  - For a 1-Gigabit Ethernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- **vlan vlan-id** (OPTIONAL) Enter the keyword vlan then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>pre-6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

MAC Accounting information can be accessed using SNMP via the Force10 Monitor MIB. For more information about enabling SNMP, refer to the Dell Networking OS Configuration Guide.

**NOTE:** Currently, the Force10 MONITOR MIB does not return the MAC addresses in an increasing order using SNMP. As a workaround, you can use the -C c option in snmpwalk or snmpbulkwalk to access the Force10 MONITOR MIB. For example: `% snmpwalk -C c -v 2c -c public 133.33.33.131 enterprise.6027.3.3.3`

Example

```
Dell-1# show mac accounting destination interface gigabitethernet 2/1

Destination   Out Port  VLAN  Packets  Bytes
---------------------------------------------------
00:44:00:00:00:02  Gi 11/1  1000  10000  5120000
00:44:00:00:01:01  Gi 11/1  1000  10000  5120000
00:22:00:00:00:00  Gi 11/1  1000  10000  5120000

00:44:00:00:00:01  Gi 11/1  2000  10000  5120000

Dell-1#
```
show mac learning-limit

Display MAC address learning limits set for various interfaces.

Syntax

```
show mac learning-limit [violate-action] [detail] [interface interface]
```

Parameters

- **violate-action**: (OPTIONAL) Enter the keywords `violate-action` to display the MAC learning limit violation status.
- **detail**: (OPTIONAL) Enter the keyword `detail` to display the MAC learning limit in detail.
- **interface interface**: (OPTIONAL) Enter the keyword `interface` with the following keywords and the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

Command Modes

- EXEC
- EXEC Privilege

</tbody>
</table>
Virtual LAN (VLAN) Commands

The following commands configure and monitor virtual LANs (VLANs). VLANs are a virtual interface and use many of the same commands as physical interfaces.

You can configure an IP address and Layer 3 protocols on a VLAN called Inter-VLAN routing. FTP, TFTP, ACLs and SNMP are not supported on a VLAN.

Occasionally, while sending broadcast traffic over multiple Layer 3 VLANs, the VRRP state of a VLAN interface may continually switch between Master and Backup.

NOTE: For more information, refer to VLAN Stacking and VLAN-related commands, such as portmode hybrid in the Interfaces chapter.

default vlan-id

Specify a VLAN as the Default VLAN.

Syntax

default vlan-id vlan-id

To remove the default VLAN status from a VLAN and VLAN 1 does not exist, use the no default vlan-id vlan-id syntax.

Parameters

 vlan-id Enter the VLAN ID number of the VLAN to become the new Default VLAN. The range is from 1 to 4094. The default is 1.

Defaults

Default VLAN is VLAN 1.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
default-vlan disable

Disable the default VLAN so that all switchports are placed in the Null VLAN until they are explicitly configured as a member of another VLAN.

**Defaults**

Enabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
**name**

Assign a name to the VLAN.

**Syntax**

```
name vlan-name
```

To remove the name from the VLAN, use the `no name` command.

**Parameters**

- `vlan-name`: Enter up to 32 characters as the name of the VLAN.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
show vlan

Display the current VLAN configurations on the switch.

Syntax

show vlan [brief | id vlan-id | name vlan-name]

Parameters

brief

(Optional) Enter the keyword brief to display the following information:

- VLAN ID
- VLAN name (left blank if none is configured)
- Spanning Tree Group ID
- MAC address aging time
- IP address

id vlan-id

(Optional) Enter the keyword id then a number from 1 to 4094. Only information on the VLAN specified is displayed.

name vlan-name

(Optional) Enter the keyword name then the name configured for the VLAN. Only information on the VLAN named is displayed.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.1(0.0) Updated to support OpenFlow.
### Version | Description
---|---
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Augmented to display PVLAN data for the C-Series and S-Series and revised the output to include the Description field to display a user-entered VLAN description.
7.6.1.0 | Introduced on the S-Series and revised the output to display Native VLAN.
pre-6.2.1.1 | Introduced on the E-Series.

### Usage Information
The following describes the `show vlan` command shown in the following example.

<table>
<thead>
<tr>
<th>Column Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NUM</strong></td>
<td>Displays existing VLAN IDs.</td>
</tr>
<tr>
<td><strong>Status</strong></td>
<td>Displays the word <strong>Inactive</strong> for inactive VLANs and the word <strong>Active</strong> for active VLANs.</td>
</tr>
<tr>
<td><strong>G</strong></td>
<td>Displays G for GVRP tagged</td>
</tr>
<tr>
<td><strong>Ports</strong></td>
<td>Displays the type, slot, and port information.</td>
</tr>
</tbody>
</table>

### Example
```
Dell# show vlan

Codes: * = Default VLAN, G = GVRP VLANS, P = Primary, C = Community, I =
```
### Example (VLAN ID)

Dell# show vlan id 40

<table>
<thead>
<tr>
<th>NUM</th>
<th>Status</th>
<th>Description</th>
<th>Q Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td>Active</td>
<td>M Gi 1/47</td>
<td></td>
</tr>
</tbody>
</table>

Dell# show vlan id 41

<table>
<thead>
<tr>
<th>NUM</th>
<th>Status</th>
<th>Description</th>
<th>Q Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>41</td>
<td>Active</td>
<td>T Gi 1/47</td>
<td></td>
</tr>
</tbody>
</table>

Dell# show vlan id 42

<table>
<thead>
<tr>
<th>NUM</th>
<th>Status</th>
<th>Description</th>
<th>Q Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>42</td>
<td>Active</td>
<td>U Gi 1/47</td>
<td></td>
</tr>
</tbody>
</table>

### Example (Brief)

Dell# show vlan br

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Name</th>
<th>STG</th>
<th>MAC Aging</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>0</td>
<td>1800</td>
<td>unassigned</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>0</td>
<td>1800</td>
<td>2.2.2.2/24</td>
</tr>
</tbody>
</table>
Example (Name)

Dellconf)# interface vlan 222
Dell(conf-if-vl-222)#name test
Dell(conf-if-vl-222)#do show vlan name test

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

<table>
<thead>
<tr>
<th>NUM</th>
<th>Status</th>
<th>Description</th>
<th>Q Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>222</td>
<td>Inactive</td>
<td></td>
<td>U Gi 1/22</td>
</tr>
</tbody>
</table>

Example (OpenFlow instance)

<table>
<thead>
<tr>
<th>NUM</th>
<th>Status</th>
<th>Description</th>
<th>Q Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>1</td>
<td>Inactive</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Inactive</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Inactive</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Inactive</td>
<td></td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>Inactive</td>
<td></td>
<td>Gi 1/10</td>
</tr>
</tbody>
</table>

Related Commands

- `vlan-stack compatible` — enable the Stackable VLAN feature on the selected VLAN.
- `interface vlan` — configure a VLAN.

**tagged**

Add a Layer 2 interface to a VLAN as a tagged interface.

**Syntax**

```
tagged interface
```

To remove a tagged interface from a VLAN, use the `no tagged interface` command.

**Parameters**

- `interface`
  
  Enter the following keywords and the interface information:
  
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**Defaults**

All interfaces in Layer 2 mode are untagged.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you use the `no tagged` command, the interface is automatically placed in the Default VLAN as an untagged interface unless the interface is a member of another VLAN. If the interface belongs to several VLANs, remove it from all VLANs to change it to an untagged interface.

Tagged interfaces can belong to multiple VLANs, while untagged interfaces can only belong to one VLAN at a time.

**Related Commands**

- `interface vlan` — configure a VLAN.
- `untagged` — specify which interfaces in a VLAN are untagged.

**track ip**

Track the Layer 3 operational state of a Layer 3 VLAN, using a subset of the VLAN member interfaces.

**Syntax**

`track ip interface`

To remove the tracking feature from the VLAN, use the `no track ip interface` command.

**Parameters**

- `interface`
  
  Enter the following keywords and the interface information:
  
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults**
Not configured.

**Command Modes**
INTERFACE VLAN

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
When this command is configured, the VLAN is operationally UP if any of the interfaces specified in the `track ip` command are operationally UP, and the VLAN is operationally DOWN if none of the tracking interfaces are operationally UP.

If the `track ip` command is not configured, the VLAN's Layer 3 operational state depends on all the members of the VLAN.

The Layer 2 state of the VLAN, and the Layer 2 traffic, is not affected by the `track ip` command configuration.

**Related Commands**
- `interface vlan` — configure a VLAN.
- `tagged` — specify which interfaces in a VLAN are tagged.
Add a Layer 2 interface to a VLAN as an untagged interface.

**Syntax**

```plaintext
untagged interface
```

To remove an untagged interface from a VLAN, use the `no untagged interface` command.

**Parameters**

- `interface`
  - Enter the following keywords and the interface information:
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**Defaults**

All interfaces in Layer 2 mode are untagged.

**Command Modes**

- INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>
Usage Information
Untagged interfaces can only belong to one VLAN.

In the Default VLAN, you cannot use the no untagged interface command. To remove an untagged interface from all VLANs, including the Default VLAN, enter INTERFACE mode and use the no switchport command.

Related Commands
- interface vlan — configure a VLAN.
- tagged — specify which interfaces in a VLAN are tagged.

Far-End Failure Detection (FEFD)

The Dell Networking operating software supports far-end failure detection (FEFD) on the Ethernet interfaces of the platform. The FEFD feature detects and reports far-end link failures.

- FEFD is not supported on the Management interface.
- During an RPM failover, FEFD is operationally disabled for approximately 8 to 10 seconds.
- By default, FEFD is disabled.

debug fefd

Enable debugging of FEFD.

Syntax
debug fefd {events | packets} [interface]

To disable debugging of FEFD, use the no debug fefd {events | packets} [interface] command.

Parameters
- events
  - Enter the keyword events to enable debugging of FEFD state changes.
- packets
  - Enter the keyword packets to enable debugging of FEFD to view information on packets sent and received.
- interface
  - (OPTIONAL) Enter the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

Command Modes

</tr>
</tbody>
</table>
fefd

Enable Far-End Failure Detection on an interface, set the FEFD interval, or select the FEFD mode.

Syntax

```
fefd {disable|interval|mode {aggressive|normal}}
```

Parameters

- **disable**
  - Enter the keyword `disable` to disable FEFD for the specified interface.

- **interval**
  - Enter the keyword `interval`, followed by a value to specify the FEFD interval in seconds. Range is from 3 to 300. Default is 15.

- **mode**
  - Enter the keyword `mode` followed by the mode type to specify the FEFD mode.
    - **normal**: Change the link state to “unknown” when a far-end failure is detected by the software on that interface. When the interface is placed in an “unknown” state, the software brings down the line protocol.
    - **aggressive**: Change the link state to “error-disabled” when a far-end failure is detected by the software on that interface. When an interface is placed in an “error-disabled” state, you must enter the `fefd reset` command to reset the interface state. Range is normal or aggressive. Default is normal.

Defaults

Disabled.

Command Modes

- INTERFACE

Command History

<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
## Usage Information

When you enter `no fefd` for an interface and `fefd-global`, FEFD is enabled on the interface because the `no fefd` command is not retained in the configuration file. To keep the interface FEFD disabled when the global configuration changes, use the `fefd reset` command.

## Related Commands

- `fefd disable` — disable far-end failure detection on an interface.
- `fefd reset` — enable FEFD globally on the system.
- `fefd mode` — change FEFD mode on an interface.

### fefd disable

Disable FEFD on an interface only. This command overrides the `fefd reset` command for the interface.

#### Syntax

```
fefd disable
```

To re-enable FEFD on an interface, use the `no fefd disable` command.

#### Defaults

Not configured.

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
### fefd interval

Set an interval between control packets.

**Syntax**

```
fefd interval seconds
```

To return to the default value, use the `no fefd interval` command.

**Parameters**

- **seconds**
  
Enter a number as the time between FEFD control packets. The range is from 3 to 255 seconds. The default is **15 seconds**.

**Defaults**

- **15 seconds**

**Command Modes**

- INTERFACE

**Command History**

**Legacy E-Series command.**

**Usage Information**

You can set up the interval between control packets using the `fefd interval` command.

**Related Commands**

- `fefd` — enable far-end failure detection.
**fefd mode**

Change the FEFD mode on an interface.

**Syntax**
```
  fefd mode {normal | aggressive}
```

To return the FEFD mode to the default of normal, use the `no fefd mode` command.

**Parameters**
- **normal**  
  (OPTIONAL) Enter the keyword `normal` to change the link state to “unknown” when a far-end failure the software detects on that interface. When the interface is placed in “unknown” state, the software brings down the line protocol.

- **aggressive**  
  (OPTIONAL) Enter the keyword `aggressive` to change the link state to “error-disabled” when a far-end failure the software detects on that interface. When an interface is placed in “error-disabled” state, enter the `fefd reset` command to reset the interface state.

**Defaults**
Normal

  - 8.3.11.1  
    Introduced on the Z9000.
  - 8.3.7.0  
    Introduced on the S4810.

**Legacy E-Series command.**

**Related Commands**
- `fefd` — enable far-end failure detection.

**fefd reset**

Reset all interfaces or a single interface that was in “error-disabled” mode.

**Syntax**
```
  fefd reset [interface]
```

Layer 2 | 983
Parameters

- **interface** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

Defaults

Not configured.

Command Modes

- EXEC Privilege

### fefd-global interval

Configure an interval between FEFD control packets.

**Syntax**

```
fefd-global interval seconds
```

To return to the default value, use the `no fefd-global interval` command.

**Parameters**

- **seconds**

  Enter a number as the time between FEFD control packets. The range is from 3 to 300 seconds. The default is **15 seconds**.

**Defaults**

- **15 seconds**

**Command Modes**

### Related Commands

- `fefd` — enable far-end failure detection.
- `fefd-global` — enable FEFD globally on the system.

### fefd-global

Enable FEFD globally on the system.

**Syntax**

```plaintext
fefd-global [interval seconds] [mode {normal | aggressive}]
```

To disable FEFD globally, use the `no fefd-global [mode {normal | aggressive}]` command.

**Parameters**

- **interval seconds**
  
  Enter the keyword `interval` followed by the number of seconds to wait between FEFD control packets. Range is from 3 to 300 seconds. Default is 15 seconds.

- **normal**
  
  (OPTIONAL) Enter the keywords `mode normal` to change the link state to “unknown” when a far-end failure the software detects on that interface. When the interface is placed in “unknown” state, the software brings down the line protocol. The default is Normal mode.

- **aggressive**
  
  (OPTIONAL) Enter the keywords `mode aggressive` to change the link state to “error-disabled” when a far-end failure the software detects on that interface. When an interface is placed in “error-disabled” state, enter the `fefd reset` command to reset the interface state.

**Defaults**

- Disabled.

**Command Modes**

- CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Legacy E-Series command.

Usage Information
If you enter only the `fefd-global` syntax, the mode is normal and the default interval is 15 seconds.

If you disable FEFD globally (`no fefd-global`), the system does not remove the FEFD interface configuration.

Related Commands
- `fefd` — enable far-end failure detection.
- `fefd-global interval` — configure an interval between FEFD control packets.
- `show fefd` — display the FEFD command output.

show fefd

View FEFD status globally or on a specific interface.

Syntax
```
show fefd [interface]
```

Parameters
- `interface` (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

Command Modes
- EXEC
- EXEC Privilege
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description

- **9.10(0.0)**
  - Introduced on the S3148.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.8(1.0)**
  - Introduced on the Z9100–ON.
- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.
- **9.2(1.0)**
  - Introduced on the Z9500.
- **9.0.2.0**
  - Introduced on the S6000.
- **8.3.19.0**
  - Introduced on the S4820T.
- **8.3.11.1**
  - Introduced on the Z9000.
- **8.3.12.0**
  - Introduced on the S4810.
- **Legacy E-Series command.**

Usage Information

The following describes the `show fefd` command shown in the following example.

### Field Description

- **Interface**
  - Displays the interfaces type and number.
- **Mode**
  - Displays the mode (aggressive or normal) or NA if the interface contains `fefd reset` in its configuration.
- **Interval**
  - Displays the interval between FEFD packets.
- **State**
  - Displays the state of the interface and can be one of the following:
    - bi-directional (interface is up, connected and hearing neighbor’s echoes).
    - err-disabled (only found when FEFD mode is aggressive and when the interface has not hearing its neighbor’s echoes for three times the message interval. To reset an interface in this state, use the `fefd reset` command.)
    - unknown (only found when FEFD mode is normal.
    - locally disabled (interface contains the `fefd reset` command in its configuration).
    - Admin Shutdown (interface is disabled with the `shutdown` command).

Example

Dell# show fefd
FED is globally 'ON', interval is 10 seconds, mode is 'Aggressive'.

Gi 5/10  NA          NA         Locally disabled
Gi 5/11  Aggressive 10         Err-disabled
Dell#

Related Commands

- `fefd` — enable far-end failure detection.
- `fefd disable` — disable FEFD on an interface only.
- `fefd-global` — enable FEFD globally on the system.
- `fefd reset` — reset all interfaces or a single interface that was in “error-disabled” mode.
Link Layer Discovery Protocol (LLDP)

The link layer discovery protocol (LLDP) advertises connectivity and management from the local station to the adjacent stations on an IEEE 802 LAN. LLDP facilitates multi-vendor interoperability by using standard management tools to discover and make available a physical topology for network management. The Dell Networking operating software implementation of LLDP is based on IEEE standard 801.1ab.

The Dell Networking OS supports the basic LLDP commands on platform.

The starting point for using LLDP is invoking LLDP with the `protocol lldp` command in either CONFIGURATION or INTERFACE mode.

The information LLDP distributes is stored by its recipients in a standard management information base (MIB). You can access the information by a network management system through a management protocol such as simple network management protocol (SNMP).

Topics:

- LLDP Commands
- LLDP-MED Commands

LLDP Commands

The following are LLDP commands.

advertise dot1-tlv

Advertise dot1 TLVs (Type, Length, Value).

**Syntax**

```
advertise dot1-tlv {port-protocol-vlan-id | port-vlan-id | vlan-name}
```

To remove advertised dot1-tlv, use the `no advertise dot1-tlv {port-protocol-vlan-id | port-vlan-id | vlan-name}` command.

**Parameters**

- **port-protocol-vlan-id**
  - Enter the keywords `port-protocol-vlan-id` to advertise the port protocol VLAN identification TLV.
- **port-vlan-id**
  - Enter the keywords `port-vlan-id` to advertise the port VLAN identification TLV.
- **vlan-name**
  - Enter the keywords `vlan-name` to advertise the vlan-name TLV. This keyword is only supported on the C-Series and S-Series.

**Defaults**

Disabled.
Command Modes

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

Related Commands
- protocol lldp (Configuration) — enable LLDP globally.
- debug lldp interface — debug LLDP.
- show lldp neighbors — display the LLDP neighbors.

advertise dot3-tlv

Advertise dot3 TLVs (Type, Length, Value).

S3100 series

Syntax

advertise dot3-tlv {max-frame-size | power-via-mdi}

To remove advertised dot3-tlv, use the no advertise dot3-tlv {max-frame-size | power-via-mdi} command.

Parameters

max-frame-size
power-via-mdi

Enter the keywords max-frame-size to advertise the dot3 maximum frame size TLV.

Enter the keyword power-via-mdi to advertise IEEE 802.3 at power-via-mdi TLV.

Defaults

None

Command Modes

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The `advertise dot3-tlv power-via-mdi` command enables the system to advertise IEEE 802.3 at power-via-mdi TLV to advertise its power negotiation capabilities with the powered devices via Link Layer Discovery Protocol (LLDP). You can configure this command either on a specific interface or globally.

Example

Dell(conf)# int gigabitethernet 1/1
Dell(conf-if-gi-1/1)# protocol lldp
Dell(conf-if-gi-1/1-lldp)# advertise dot3-tlv power-via-mdi
Dell(conf-if-gi-1/1-lldp)# show config
!
protocol lldp
  advertise dot3-tlv power-via-mdi
Dell(conf-if-gi-1/1-lldp)#

advertise interface-port-desc

Advertise port descriptor.

Syntax

```
advertise interface-port-desc {description | port-id}
```

To remove the advertised port descriptor, use the `no advertise interface-port-desc {description | port-id}` command.

Parameters

- **description**: Enter the keyword `description` then the interface description.
- **port-id**: Enter the keyword `port-id` then the port-id. The range is from 0 to 7.

Defaults

None
Command Modes

- CONFIGURATION (conf-lldp)
- INTERFACE (conf-if-interface-lldp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(2.0P2)</td>
<td>Introduced the description and port-id options.</td>
</tr>
</tbody>
</table>

Usage Information

If you do not specify the option, by default the port-id takes higher precedence and sends the port-id in the LLDP packets.

**advertise management-tlv**

Advertise management TLVs (Type, Length, Value).

**Syntax**

```
advertise management-tlv {management-address | system-capabilities | system-description | system-name}
```

To remove advertised management TLVs, use the `no advertise management-tlv {management-address | system-capabilities | system-description | system-name}` command.

**Parameters**

- `management-address`: Enter the keyword management-address to advertise the management IP address TLVs to the LLDP peer.
- `system-capabilities`: Enter the keywords system-capabilities to advertise the system capabilities TLVs to the LLDP peer.
- `system-description`: Enter the keywords system-description to advertise the system description TLVs to the LLDP peer.
- `system-name`: Enter the keywords system-name to advertise the system name TLVs to the LLDP peer.

**Defaults**

None

**Command Modes**

- CONFIGURATION (conf-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

9.2(1.0) Introduced on the Z9500.
9.1.(0.0) Modified to support management-address parameter.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.7.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
7.4.1.0 Introduced on the E-Series.

Usage Information The command options management-address, system-capabilities, system-description, and system-name can be invoked individually or together, in any sequence.

advertise management-tlv (Interface)

Advertise management type, length, values (TLVs) to the specified interface.

Syntax
advertise management-tlv {management-address | system-capabilities | system-description | system-name}
To remove advertised management TLVs, use the no advertise management-tlv {management-address | system-capabilities | system-description | system-name} command.

Parameters
management-address Enter the keywords management-address to advertise the management IP address TLVs to the specified interface.

system-capabilities Enter the keywords system-capabilities to advertise the system capabilities TLVs to the specified interface.

system-description Enter the keywords system-description to advertise the system description TLVs to the specified interface.

system-name Enter the keywords system-name to advertise the system name TLVs to the specified interface.

Defaults
None

9.8(2.0) Introduced on the S3100 series.
clear lldp counters

Clear LLDP transmitting and receiving counters for all physical interfaces or a specific physical interface.

Syntax

```
clear lldp counters [interface interface]
```

Parameters

- **interface interface** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

debug lldp interface

To display timer events, neighbor additions or deletions, and other information about incoming and outgoing packets, enable LLDP debugging.

**Syntax**

dump lldp interface {interface | all}{events | packet {brief | detail} {tx | rx | both}}

To disable debugging, use the no debug lldp {interface {interface | all}{events} {packet {brief | detail} {tx | rx | both}}]} command.

**Parameters**

- **interface interface**
  - Enter the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - Enter the keyword all to display information on all interfaces.

- **events**
  - Enter the keyword events to display major events such as timer events.

- **packet**
  - Enter the keyword packet to display information regarding packets coming in or going out.

- **brief**
  - Enter the keyword brief to display brief packet information.

- **detail**
  - Enter the keyword detail to display detailed packet information.

- **tx**
  - Enter the keyword tx to display transmit-only packet information.

- **rx**
  - Enter the keyword rx to display receive-only packet information.

- **both**
  - Enter the keyword both to display both receive and transmit packet information.

### disable

Enable or disable LLDP.

**Syntax**

```markdown
disable
```

To enable LLDP, use the `no disable` command.

**Defaults**

Enabled — no disable.

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

## hello

Configure the rate at which the LLDP control packets are sent to its peer.

**Syntax**

```plaintext
hello seconds
```

To revert to the default, use the `no hello seconds` command.

**Parameters**

- `seconds` Enter the rate, in seconds, at which the control packets are sent to its peer. The rate is from 5 to 180 seconds. The default is `30 seconds`.

**Defaults**

`30 seconds`

**Command Modes**

- `CONFIGURATION (conf-lldp)` and `INTERFACE (conf-if-interface-lldp)`

management-interface

Enable and configure LLDP protocol parameters on the management interface.

Syntax
management-interface

To remove LLDP configuration on a management interface, use the no management-interface command.

Command Modes
LLDP (conf-lldp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.2(0.2) Introduced on the Z9000 and S4810.

Usage Information
To enable LLDP on the management interface, use the no disable command in LLDP-MANAGEMENT-INTERFACE mode (conf-lldp-mgmtif).

mode

To receive or transmit, set LLDP.

Syntax
mode \( \{tx \mid rx\} \)

To return to the default, use the no mode command.

Parameters

- \( tx \)
  - Enter the keyword \( tx \) to set the mode to transmit.

- \( rx \)
  - Enter the keyword \( rx \) to set the mode to receive.
Defaults
Both **transmit** and **receive**.

Command Modes
CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Related Commands
- **protocol lldp (Configuration)** — enable LLDP globally.
- **show lldp neighbors** — display the LLDP neighbors.

**multiplier**
Set the multiple of the hello timer before LLDP declares the interface dead.

**Syntax**
```
multiplier number
```
To return to the default, use the `no multiplier` command.

**Parameters**
- `integer` Enter the number of consecutive misses before the LLDP declares the interface dead. The range is from 2 to 10.

**Defaults**
4

**Command Modes**
CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)
protocol lldp (Configuration)

Enable the LLDP globally on the switch.

Syntax

```
protocol lldp
```

To disable LLDP globally on the chassis, use the `no protocol lldp` command.

Defaults

Enabled.

Command Modes

- CONFIGURATION (conf-lldp)
- PROTOCOL LLDP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
**protocol lldp (Interface)**

Enter the LLDP protocol in INTERFACE mode.

**Syntax**

```
[no] protocol lldp
```

To return to the global LLDP configuration mode, use the `no protocol lldp` command from Interface mode.

**Defaults**

LLDP is not enabled on the interface.

**Command Modes**

INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.0)**
  Introduced on the S3148.
- **9.8(2.0)**
  Introduced on the S3100 series.
- **9.8(1.0)**
  Introduced on the Z9100-ON.
- **9.8(0.0P5)**
  Introduced on the S4048-ON.
- **9.8(0.0P2)**
  Introduced on the S3048-ON.
- **9.7(0.0)**
  Introduced on the S6000-ON.
- **9.2(1.0)**
  Introduced on the Z9500.
- **9.0.2.0**
  Introduced on the S6000.
- **8.3.19.0**
  Introduced on the S4820T.
- **8.3.11.1**
  Introduced on the Z9000.
- **8.3.7.0**
  Introduced on the S4810.
- **7.7.1.0**
  Introduced on the S-Series.
- **7.6.1.0**
  Introduced on the C-Series.
- **7.4.1.0**
  Introduced on the E-Series.
Usage Information

Before LLDP can be configured on an interface, it must be enabled globally from CONFIGURATION mode. This command places you in LLDP mode on the interface; it does not enable the protocol.

When you enter the LLDP protocol in the Interface context, it overrides global configurations. When you execute the no protocol lldp from INTERFACE mode, interfaces begin to inherit the configuration from global LLDP CONFIGURATION mode.

show lldp neighbors

Display LLDP neighbor information for all interfaces or a specified interface.

Syntax

show lldp neighbors [interface interface] [detail]

Parameters

- interface (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

- detail (OPTIONAL) Enter the keyword detail to display all the TLV information, remote management IP addresses, timers, and LLDP tx and rx counters.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
show lldp neighbors

Usage Information

Omitting the keyword detail displays only the remote chassis ID, Port ID, and Dead Interval.

Example

R1(conf-if-gi-1/31)# do show lldp neighbors
Loc PortID Rem  Host Name       Rem     Port Id Rem Chassis Id
--------------------------------------------------------------
Gi   1/21    R2   GigabitEthernet    2/11   00:01:e8:06:95:3e
Gi   1/31    R3   GigabitEthernet    3/11   00:01:e8:09:c2:4a

show lldp statistics

Display the LLDP statistical information.

Syntax

show lldp statistics

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
show management-interface

Display LLDP management interface configuration information.

Syntax

show management-interface

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.2(1.0) Introduced on the Z9500.

9.2.(0.0) Introduced on the Z9000 and S4810.

show running-config lldp

Display the current global LLDP configuration.

Syntax

show running-config lldp

Defaults

None

Command Modes

EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Example
```
Dell# show running-config lldp
!
protocol lldp
   advertise dot1-tlv port-protocol-vlan-id port-vlan-id
   advertise dot3-tlv max-frame-size
   advertise management-tlv system-capabilities system-description
   hello 15
   multiplier 3
   no disable
Dell#
```

### LLDP-MED Commands

The following are the LLDP-MED (Media Endpoint Discovery) commands. Dell Networking OS LLDP-MED commands are an extension of the set of LLDP TLV advertisement commands.

As defined by ANSI/TIA-1057, LLDP-MED provides organizationally specific TLVs (Type Length Value), so that endpoint devices and network connectivity devices can advertise their characteristics and configuration information. The Organizational Unique Identifier (OUI) for the Telecommunications Industry Association (TIA) is 00-12-BB.

- LLDP-MED Endpoint Device — any device that is on an IEEE 802 LAN network edge, can communicate using IP, and uses the LLDP-MED framework.
- LLDP-MED Network Connectivity Device — any device that provides access to an IEEE 802 LAN to an LLDP-MED endpoint device, and supports IEEE 802.1AB (LLDP) and TIA-1057 (LLDP-MED). The Dell Networking system is an LLDP-MED network connectivity device.

Regarding connected endpoint devices, LLDP-MED provides network connectivity devices with the ability to:

- manage inventory
- identify physical location
advertise med guest-voice

To advertise a separate limited voice service for a guest user with their own IP telephony handset or other appliances that support interactive voice services, configure the system.

Syntax

advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}

To return to the default, use the no advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.

Parameters

- **vlan-id**
  - Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**
  - Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value**
  - Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number**
  - Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

Defaults

- Unconfigured.

Command Modes

- CONFIGURATION (conf-lldp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Related Commands

- protocol lldp (Configuration) — enable LLDP globally.
To advertise a separate limited voice service for a guest user when the guest voice control packets use a separate network policy than the voice data, configure the system.

**Syntax**

```
advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

- `vlan-id` Enter the VLAN ID. The range is from 1 to 4094.
- `layer2_priority` Enter the Layer 2 priority. The range is from 0 to 7.
- `DSCP_value` Enter the DSCP value. The range is from 0 to 63.
- `priority-tagged number` Enter the keywords `priority-tagged`, the Layer 2 priority, and then the DSCP value.

**Defaults**

Unconfigured.

**Command Modes**

CONFIGURATION (conf-lldp)

**Command History**

Related Commands

- `debug lldp interface` — debug LLDP.
- `show lldp neighbors` — display the LLDP neighbors.

advertise med location-identification

To advertise a location identifier, configure the system.

Syntax

```
advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}
```

To return to the default, use the `no advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}` command.

Parameters

- `coordinate-based value` Enter the keywords `coordinate-based` then the coordinated based location in hexadecimal value of 16 bytes.
- `civic-based value` Enter the keywords `civic-based` then the civic based location in hexadecimal format. The range is from 6 to 255 bytes.
- `ecs-elin value` Enter the keywords `ecs-elin` then the Emergency Call Service (ecs) Emergency Location Identification Number (elin) numeric location string. The range is from 10 to 25 characters.

Defaults

Unconfigured.

Command Modes

- `CONFIGURATION (conf-lldp)`

Command History

advertise med softphone-voice

To advertise softphone to enable IP telephony on a computer so that the computer can be used as a phone, configure the system.

Syntax

advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}

To return to the default, use the no advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.

Parameters

- **vlan-id**
  - Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**
  - Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value**
  - Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number**
  - Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

Related Commands

- `debug lldp interface` — debug LLDP.
- `show lldp neighbors` — display the LLDP neighbors.

**advertise med streaming-video**

To advertise streaming video services for broadcast or multicast-based video, configure the system. This command does not include video applications that rely on TCP buffering.

Syntax

```
advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

Parameters

- **vlan-id** Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority** Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value** Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number** Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

Defaults

Unconfigured.

Command Modes

- CONFIGURATION (conf-lldp)

### advertise med video-conferencing

To advertise dedicated video conferencing and other similar appliances that support real-time interactive video, configure the system.

**Syntax**

advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number}

To return to the default, use the no advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.

**Parameters**

- **vlan-id**
  - Enter the VLAN ID. The range is from 1 to 4094.

- **layer2_priority**
  - Enter the Layer 2 priority. The range is from 0 to 7.

- **DSCP_value**
  - Enter the DSCP value. The range is from 0 to 63.

- **priority-tagged number**
  - Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

**Defaults**

Unconfigured.

### advertise med video-signaling

To advertise video control packets that use a separate network policy than video data, configure the system.

**Syntax**

```
advertise med video-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med video-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

**Parameters**

- **vlan-id**: Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**: Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value**: Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number**: Enter the keywords `priority-tagged`, the Layer 2 priority, and then the DSCP value.

**Defaults**

Unconfigured.

advertise med voice

To advertise a dedicated IP telephony handset or other appliances supporting interactive voice services, configure the system.

Syntax

```
advertise med voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

Parameters
- **vlan-id**
  - Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**
  - Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value**
  - Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number**
  - Enter the keywords `priority-tagged`, the Layer 2 priority, and then the DSCP value.

Defaults
- Unconfigured.

Command Modes
- CONFIGURATION (conf-lldp)

### advertise med voice-signaling

To advertise when voice control packets use a separate network policy than voice data, configure the system.

#### Syntax

```
advertise med voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

#### Parameters

- `vlan-id`  
  Enter the VLAN ID. The range is from 1 to 4094.
- `layer2_priority`  
  Enter the Layer 2 priority. The range is from 0 to 7.
- `DSCP_value`  
  Enter the DSCP value. The range is from 0 to 63.
- `priority-tagged`  
  Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

#### Defaults

Unconfigured.

#### Command Modes

Microsoft Network Load Balancing

Network load balancing (NLB) is a clustering functionality that is implemented by Microsoft on Windows 2000 Server and Windows Server 2003 operating systems. Microsoft NLB clustering allows multiple servers running Microsoft Windows to be represented by one MAC and one IP address to provide transparent failover and load-balancing. The Dell Networking OS does not recognize server clusters by default; you must configure NLB functionality on a switch to support server clusters. The maximum NLB entry limit from 8 to 11 is increased and support for more CAM-ACL to increase.

Topics:
- mac-address-table static (for Multicast MAC Address)
- ip vlan-flooding

mac-address-table static (for Multicast MAC Address)

For multicast mode of network load balancing (NLB), configure a static multicast MAC address, associate the multicast MAC address with the VLAN used to switch Layer 2 multicast traffic, and add output ports that will receive multicast streams on the VLAN. To delete a configured static multicast MAC address from the MAC address table on the router, enter the no mac-address-table static multicast-mac-address command.

Syntax
```
mac-address-table static multicast-mac-address multicast vlan vlan-id range-output {single-interface | interface-list | interface-range}
```

To remove a MAC address, use the no mac-address-table static multicast-mac-address output interface vlan vlan-id command.

Parameters
- **multicast-mac-address**
  - Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.
- **multicast**
  - Enter a vlan port to where L2 multicast MAC traffic is forwarded.

**NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.

- **output interface**
  - For a multicast MAC address, enter the keyword output then one of the following interfaces for which traffic is forwarded:
    - For a Port Channel interface, enter the keywords port-channel then a number.
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

- **output-range interface**
  - For a multicast MAC address, enter the keyword output-range then one of the following interfaces to indicate a range of ports for which traffic is forwarded:
• For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
• For a Management interface, enter the keyword managementethernet followed by slot/port numbers.
• For a Port Channel interface, enter the keywords port-channel followed by a number.
• For a port channel interface, enter the keywords port-channel then a number.
• For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

```
vlan vlan-id
```
Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

<td>Introduced on the S4810, S4820T, S6000, Z9000, and MXL platforms.</td>
</tr>
</tbody>
</table>

**Default**

Enabled

**Usage Information**

By default this command is disabled. There might be some ARP table entries which are resolved through ARP packets which had Ethernet MAC SA different from MAC information inside the ARP packet. This unicast data traffic flooding occurs only for those packets which use these ARP entries.
Multicast Source Discovery Protocol (MSDP)

Multicast source discovery protocol (MSDP) connects multiple PIM sparse-mode (PIM-SM) domains together. MSDP peers connect using TCP port 639. Peers send keepalives every 60 seconds. A peer connection is reset after 75 seconds if no MSDP packets are received. MSDP connections are parallel with MBGP connections.

The Dell Networking OS supports MSDP commands on the platform.

Topics:
- clear ip msdp peer
- clear ip msdp sa-cache
- clear ip msdp statistic
- debug ip msdp
- ip msdp cache-rejected-sa
- ip msdp default-peer
- ip msdp log-adjacency-changes
- ip msdp mesh-group
- ip msdp originator-id
- ip msdp peer
- ip msdp redistribute
- ip msdp sa-filter
- ip msdp sa-limit
- ip msdp shutdown
- ip multicast-msdp
- show ip msdp
- show ip msdp sa-cache rejected-sa

**clear ip msdp peer**

Reset the TCP connection to the peer and clear all the peer statistics.

**Syntax**

clear ip msdp peer \(\text{peer address}\)

**Parameters**

- **peer address**: Enter the peer address in a dotted decimal format (A.B.C.D.)

**Defaults**

Not configured.

**Command Modes**

EXEC Privilege
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

## clear ip msdp sa-cache

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

### Syntax

clear ip msdp sa-cache [group-address | rejected-sa | local]

### Parameters

- **group-address**
  - Enter the group IP address in dotted decimal format (A.B.C.D.).

- **rejected-sa**
  - Enter the keywords rejected-sa to clear the cache source-active entries that are rejected because the RPF check failed, an SA filter or limit is configured, the RP or MSDP peer is unreachable, or because of a format error.

- **local**
  - Enter the keyword local to clear out local PIM advertised entries. It applies the redistribute filter (if present) while adding the local PIM SA entries to the SA cache.

### Defaults

Without any options, this command clears the entire source-active cache.

### Command Modes

EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### clear ip msdp statistic

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

**Syntax**

```
clear ip msdp statistic peer peer-address
```

**Parameters**

- `peer` Enter the keyword `peer` to clear the MSDP peer entries.
- `peer-address` Enter the IP address of the MSDP peer.

**Defaults**

Without any options, this command clears the entire source-active cache.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### debug ip msdp

Turn on MSDP debugging.

#### Syntax

ddebug ip msdp {event peer address | packet peer address | pim}

To turn debugging off, use the no debug ip msdp {event peer address | packet peer address | pim} command.

#### Parameters

- **event peer address**: Enter the keyword event then the peer address in a dotted decimal format (A.B.C.D.).
- **packet peer address**: Enter the keyword packet then the peer address in a dotted decimal format (A.B.C.D.).
- **pim**: Enter the keyword pim to debug advertisement from PIM.

#### Defaults

Not configured.

#### Command Modes

EXEC Privilege

#### Command History

ip msdp cache-rejected-sa

Enable an MSDP cache for the rejected source-active entries.

Syntax

    ip msdp cache-rejected-sa {number}

To clear the MSDP rejected source-active entries, use the no ip msdp cache-rejected-sa {number} command then the ip msdp cache-rejected-sa {number} command.

Parameters

    number

Enter the number of rejected SA entries to cache. The range is from 0 to 32766.

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.4.1.0 Introduced

Related Commands

- show ip msdp sa-cache rejected-sa — display the rejected SAs in the SA cache.
ip msdp default-peer

Define a default peer from which to accept all source-active (SA) messages.

Syntax

```
ip msdp default-peer peer address [list name]
```
To remove the default peer, use the no ip msdp default-peer {peer address} list name command.

Parameters

- **peer address**: Enter the peer address in a dotted decimal format (A.B.C.D.)
- **list name**: Enter the keywords list name and specify a standard access list that contains the RP address that should be treated as the default peer. If no access list is specified, then all SAs from the peer are accepted.

Defaults

Not configured.

Usage Information

If a list is not specified, all SA messages received from the default peer are accepted. You can enter multiple default peer commands.
ip msdp log-adjacency-changes

Enable logging of MSDP adjacency changes.

Syntax

```
ip msdp log-adjacency-changes
```

To disable logging, use the `no ip msdp log-adjacency-changes` command.

Defaults

Not configured.

ip msdp mesh-group

To be a member of a mesh group, configure a peer.

Syntax

```
ip msdp mesh-group {name} {peer address}
```

To remove the peer from a mesh group, use the `no ip msdp mesh-group {name} {peer address}` command.
Parameters

- **name**: Enter a string of up to 16 characters long for the mesh group name.
- **peer address**: Enter the peer address in a dotted decimal format (A.B.C.D).

Defaults

Not configured.

</tbody>
</table>

Usage Information

An MSDP mesh group is a mechanism for reducing SA flooding, typically in an intra-domain setting. When some subset of a domain’s MSDP speakers are fully meshed, they can be configured into a mesh-group. If member X of a mesh-group receives a SA message from an MSDP peer that is also a member of the mesh-group, member X accepts the SA message and forwards it to all of its peers that are not part of the mesh-group. However, member X cannot forward the SA message to other members of the mesh-group.

**ip msdp originator-id**

Configure the MSDP Originator ID.

**Syntax**

```
ip msdp originator-id {interface}
```

To remove the originator-id, use the **no ip msdp originator-id {interface}** command.

**Parameters**

- **interface**: Enter the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword **GigabitEthernet** then the slot/port information.
For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
• For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
• For a port channel interface, enter the keywords port-channel then a number.
• For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults
Not configured.

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the S4810.
8.5.1.0 Added support for 4-port 40G line cards on the E-Series.
6.2.1.1 Introduced

ip msdp peer
Configure an MSDP peer.

Syntax
ip msdp peer peer address [connect-source] [description] [sa-limit number]
To remove the MSDP peer, use the no ip msdp peer peer address [connect-source interface] [description name] [sa-limit number] command.

Parameters
peer address Enter the peer address in a dotted decimal format (A.B.C.D.).
connect-source Enter the keywords connect-source then one of the interfaces and slot/port or number information:
interface

For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**description name** (OPTIONAL) Enter the keyword description then a description name (maximum 80 characters) to designate a description for the MSDP peer.

**sa-limit number** (OPTIONAL) Enter the maximum number of SA entries in SA-cache. The range is from 1 to 100000.

**Defaults**
See Parameters.

<td>Introduced</td>
</tr>
</tbody>
</table>

**Usage Information**
The connect-source option is used to supply a source IP address for the TCP connection. When an interface is specified using the connect-source option, the primary configured address on the interface is used.

If the total number of SA messages received from the peer is already larger than the limit when this command is applied, those SA messages continue to be accepted. To enforce the limit in such situation, use the clear ip msdp peer command to reset the peer.

**Related Commands**
- ip msdp sa-limit — configure the MSDP SA Limit.
- clear ip msdp peer — clear the MSDP peer.
show ip msdp — display the MSDP information.

**ip msdp redistribute**

Filter local PIM SA entries in the SA cache. SAs which the ACL denies time out and are not refreshed. Until they time out, they continue to reside in the MSDP SA cache.

**Syntax**

```plaintext
ip msdp redistribute [list acl-name]
```

**Parameters**

- `list acl-name`: Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Modifications to the ACL do not have an immediate effect on the sa-cache.

To apply the redistribute filter to entries already present in the SA cache, use the `clear ip msdp sa-cache local command`. 
ip msdp sa-filter

Permit or deny MSDP source active (SA) messages based on multicast source and/or group from the specified peer.

Syntax

```
ip msdp sa-filter {in | out} peer-address list [access-list name]
```

Remove this configuration using the `no ip msdp sa-filter {in | out} peer address list [access-list name]` command.

Parameters

- **in**: Enter the keyword `in` to enable incoming SA filtering.
- **out**: Enter the keyword `out` to enable outgoing SA filtering.
- **peer-address**: Enter the peer address of the MSDP peer in a dotted decimal format (A.B.C.D.).
- **access-list name**: Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

Defaults

- Not configured.

</tbody>
</table>
ip msdp sa-limit

Configure the upper limit of source-active (SA) entries in SA-cache.

Syntax

ip msdp sa-limit number

To return to the default, use the no ip msdp sa-limit number command.

Parameters

number

Enter the maximum number of SA entries in SA-cache. The range is from 1 to 500000.

Defaults

50000

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.5.1.0 Introduced on the E-Series.

Usage Information

Dell Networking OS counts the SA messages originated by itself and those messages received from the MSDP peers. When the total SA messages reach this limit, the subsequent SA messages are dropped (even if they pass RPF checking and policy checking).

If the total number of SA messages is already larger than the limit when this command is applied, those SA messages that are already in Dell Networking OS continue to be accepted. To enforce the limit in such situation, use the clear ip msdp sa-cache command.

Related Commands

- ip msdp peer — configure the MSDP peer.
- clear ip msdp peer — clear the MSDP peer.
- show ip msdp — display the MSDP information.
ip msdp shutdown

Administratively shut down a configured MSDP peer.

Syntax

```
ip msdp shutdown {peer address}
```

Parameters

- `peer address` Enter the peer address in a dotted decimal format (A.B.C.D.).

Defaults

Not configured.

ip multicast-msdp

Enable MSDP.

Syntax

```
ip multicast-msdp
```

To exit MSDP, use the no ip multicast-msdp command.

Defaults

Not configured.
show ip msdp

Display the MSDP peer status, SA cache, or peer summary.

Syntax

show ip msdp {peer peer address | sa-cache | summary}

Parameters

peer peer address  Enter the keyword peer then the peer address in a dotted decimal format (A.B.C.D.).
sa-cache  Enter the keywords sa-cache to display the Source-Active cache.
summary  Enter the keyword summary to display an MSDP peer summary.

Defaults

Not configured.

Multiple Spanning Tree Protocol (MSTP)

Multiple spanning tree protocol (MSTP), as implemented by the Dell Networking OS, conforms to IEEE 802.1s. This command supports the Dell Networking platform.

Topics:
- debug spanning-tree mstp
- disable
- forward-delay
- hello-time
- max-age
- msti
- name
- protocol spanning-tree mstp
- revision
- show config
- show spanning-tree mst configuration
- show spanning-tree msti
- spanning-tree
- spanning-tree msti
- tc-flush-standard

debug spanning-tree mstp

Enable debugging of the multiple spanning tree protocol and view information on the protocol.

Syntax
debug spanning-tree mstp [all | bpdu interface {in | out} | events]

To disable debugging, enter no debug spanning-tree mstp

Parameters
- all (OPTIONAL) Enter the keyword all to debug all spanning tree operations.
- bpdu interface (OPTIONAL) Enter the keyword bpdu to debug bridge protocol data units (BPDU).
- (in | out) (OPTIONAL) Enter the interface keyword along with the type slot/port of the interface you want displayed. Type slot/port options are the following:
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

Optionally, enter an in or out parameter with the optional interface:

- For Receive, enter the keyword in.
- For Transmit, enter the keyword out.

**events**

(OPTIONAL) Enter the keyword events to debug MSTP events.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Related Commands**

- `protocol spanning-tree mstp` — enter MULTIPLE SPANNING TREE mode.

### forward-delay

The amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

**Syntax**

```
forward-delay seconds
```

To return to the default setting, use the `no forward-delay` command.

**Parameters**

- `seconds` Enter the number of seconds the interface waits in the Blocking State and the Learning State before transiting to the Forwarding State. The range is from 4 to 30. The default is 15 seconds.

**Defaults**

15 seconds

Related Commands
- max-age — change the wait time before MSTP refreshes protocol configuration information.
- hello-time — change the time interval between bridge protocol data units (BPDUs).

**hello-time**

Set the time interval between generation of MSTB bridge protocol data units (BPDUs).

**Syntax**

```
hello-time seconds
```

To return to the default value, use the `no hello-time` command.

**Parameters**

- `seconds` Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is **2 seconds**.

**Defaults**

**2 seconds**

**Command Modes**

MULTIPLE SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
max-age

To maintain configuration information before refreshing that information, set the time interval for the MSTB.

Syntax

    max-age seconds

To return to the default values, use the no max-age command.

Parameters

    max-age  Enter a number of seconds the Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is 20 seconds.

Defaults

    20 seconds

Command Modes

Related Commands
- `forward-delay` — amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.
- `hello-time` — change the time interval between BPDUs.

### msti

Configure multiple spanning tree instance, bridge priority, and one or multiple VLANs mapped to the MST instance.

#### Syntax

```
msti instance {vlan range | bridge-priority priority}
```

To disable mapping or bridge priority, use the `no msti instance {vlan range | bridge-priority priority}` command.

#### Parameters

- **msti instance**
  - Enter the MSTP instance. The range is from zero (0) to 63.
- **vlan range**
  - Enter the keyword `vlan` then the identifier range value. The range is from 1 to 4094.
- **bridge-priority priority**
  - Enter the keywords `bridge-priority` then a value in increments of 4096 as the bridge priority. The range is from zero (0) to 61440.
  
  Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.

#### Defaults

- **default bridge-priority is 32768.**

#### Command Modes

- **INTERFACE**

Usage Information

By default, all VLANs are mapped to MST instance zero (0) unless you use the `vlan range` command to map it to a non-zero instance.

name

The name you assign to the multiple spanning tree region.

Syntax

```
name region-name
```

To remove the region name, use the `no name` command.

Parameters

- `region-name`: Enter the MST region name. The range is 32 character limit.

Defaults

No default name.

Command Modes

MULTIPLE SPANNING TREE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>

**Version** | **Description**
--- | ---
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.5.1.0 | Introduced.

**Usage Information**
For two MSTP switches to be within the same MSTP region, the switches must share the same region name (including matching case).

**Related Commands**
- `msti` — map the VLAN(s) to an MST instance.
- `revision` — assign the revision number to the MST configuration.

**protocol spanning-tree mstp**
To enable and configure the multiple spanning tree group, enter MULTIPLE SPANNING TREE mode.

**Syntax**
```
protocol spanning-tree mstp
```
To disable the multiple spanning tree group, use the `no protocol spanning-tree mstp` command.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.

9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
**Revision**

The revision number for the multiple spanning tree configuration.

**Syntax**

```
revision range
```

To return to the default values, use the `no revision` command.

**Parameters**

- `range`  
  Enter the revision number for the MST configuration. The range is from 0 to 65535. The default is **0**.

**Defaults**

- **0**

**Command Modes**

- MULTIPLE SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
**Usage Information**
For two MSTP switches to be within the same MST region, the switches must share the same revision number.

**Related Commands**
- `msti` — map the VLAN(s) to an MST instance.
- `name` — assign the region name to the MST region.

## show config

View the current configuration for the mode. Only non-default values are shown.

**Syntax**
```
show config
```

**Command Modes**

show spanning-tree msti

View the multiple spanning tree instance.

Syntax

```
show spanning-tree msti [instance-number [brief]] [guard]
```

Parameters

- `instance-number` (Optional) Enter the multiple spanning tree instance number. The range is from 0 to 63.
- `brief` (Optional) Enter the keyword `brief` to view a synopsis of the MST instance.
- `guard` (Optional) Enter the keyword `guard` to display the type of guard enabled on an MSTP interface and the current port state.

Command Modes

- EXEC
- EXEC Privilege

### Version | Description
--- | ---
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.4.2.1 | Support for the optional keyword `guard` was added on the C-Series, S-Series, and E-Series.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.4.1.0 | Expanded to display the port error disable state (EDS) loopback BPDU inconsistency causes.

### Usage Information
Enable the multiple spanning tree protocol prior to using this command.

### Example
```plaintext
Dell# show spanning-tree msti 10
MSTI 10 VLANs mapped 101-105

Bridge Identifier has priority 32768, Address 0001.e802.3506
Configured hello time 2, max age 20, forward delay 15, max hops 5
Current root has priority 16384, Address 0001.e800.0a5c
Number of topology changes 0, last change occurred 3058087

Port 82 (GigabitEthernet 2/1) is designated Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.82
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.82, designated path cost
Number of transitions to forwarding state 1
BPDU (Mrecords): sent 1109, received 0
The port is not in the portfast mode

Port 88 (GigabitEthernet 2/6) is root Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.88
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.88, designated path cost
Number of transitions to forwarding state 4
BPDU (Mrecords): sent 19, received 1103
The port is not in the portfast mode

Port 89 (GigabitEthernet 2/7) is alternate Discarding
Port path cost 0, Port priority 128, Port Identifier 128.89
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.89, designated path cost
Number of transitions to forwarding state 3
BPDU (Mrecords): sent 7, received 1103
The port is not in the portfast mode
```

### Example (EDS and LBK)
The bold line shows the loopback BPDU inconsistency (LBK_INC).

```plaintext
Dell# show spanning-tree msti 0 brief
MSTI 0 VLANs mapped 1-4094

Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32768, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15, max hops 20
Bridge ID Priority 32768, Address 0001.e801.6aa8
We are the root of MSTI 0 (CIST)
```
Configured hello time 2, max age 20, forward delay 15, max hops 20
CIST regional root ID Priority 32768, Address 0001.e801.6aa8
CIST external path cost 0

Number of transitions to forwarding state 1
BPDU (MRecords): sent 21, received 9
The port is not in the Edge port mode

Usage Information
The following describes the show spanning-tree msti 5 guard command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Name</td>
<td>MSTP interface.</td>
</tr>
<tr>
<td>Instance</td>
<td>MSTP instance.</td>
</tr>
<tr>
<td>Sts</td>
<td>Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut).</td>
</tr>
<tr>
<td>Guard Type</td>
<td>Type of STP guard configured (Root, Loop, or BPDU guard).</td>
</tr>
</tbody>
</table>

Example (Guard)
Dell# show spanning-tree msti 5 guard
Interface
Name  Instance  Sts  Guard  type
-----------------------------------
Gi 1/1  5  INCON(Root)  Rootguard
Gi 1/2  5  FWD  Loopguard
Gi 1/3  5  EDS(Shut)  Bpduguard
spanning-tree

Enable the multiple spanning tree protocol on the interface.

Syntax

```
spanning-tree
```

To disable the multiple spanning tree protocol on the interface, use the `no spanning-tree` command.

Parameters

- `spanning-tree` Enter the keywords `spanning-tree` to enable the MSTP on the interface.

Defaults

Enable.

Command Modes

- INTERFACE

1052  | Multiple Spanning Tree Protocol (MSTP)
spanning-tree msti

Configure multiple spanning tree instance cost and priority for an interface.

Syntax

```
spanning-tree msti instance {cost cost | priority priority}
```

Parameters

```
msti instance
```

Enter the keyword `msti` and the MST instance number. The range is from zero (0) to 63.

```
cost cost
```

(Optional) Enter the keyword `cost` then the port cost value. The range is from 1 to 200000. The defaults are:

```
• 100 Mb/s Ethernet interface = 200000
• 1-Gigabit Ethernet interface = 20000
• 10-Gigabit Ethernet interface = 2000
• Port Channel interface with one 100 Mb/s Ethernet = 200000
• Port Channel interface with one 1 Gigabit Ethernet = 20000
• Port Channel interface with one 10 Gigabit Ethernet = 2000
• Port Channel with two 1 Gigabit Ethernet = 18000
• Port Channel with two 10 Gigabit Ethernet = 1800
• Port Channel with two 100 Mbps Ethernet = 180000

```
priority priority
```

Enter keyword `priority` then a value in increments of 16 as the priority. The range is from 0 to 240. The default is 128.

Defaults

- `cost` = depends on the interface type
- `priority` = 128

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version Description
9.10(0.0)  Introduced on the S3148.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
```
### tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

**Syntax**

tc-flush-standard

To disable, use the no tc-flush-standard command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**

By default, Dell Networking OS implements an optimized flush mechanism for MSTP. This mechanism helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology...
changes. However, if a standards-based flush mechanism is needed, this knob command can be turned on to enable flushing MAC addresses after receiving every topology change notification.
The multicast commands are supported by Dell Networking OS on all S3100 series platform.

IPv4 Multicast Commands

The following section contains the IPv4 multicast commands.

**clear ip mroute**

Clear learned multicast routes on the multicast forwarding table. To clear the protocol-independent multicast (PIM) tree information base, use the `clear ip pim tib` command.

**Syntax**

```
clear ip mroute [vrf vrf-name] {group-address [source-address] | * | snooping}
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `group-address` Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.

- `source-address` Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.

- `*` Enter * to clear all multicast routes.

- `snooping` Enter the keyword `snooping` to delete multicast snooping route table entries.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the C-Series.

E-Series legacy command

**Related Commands**
- `show ip pim tib` — show the PIM tree information base.

**ip mroute**

Assign a static mroute.

**Syntax**

```
ip mroute [vrf vrf-name] destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]```

To delete a specific static mroute, use the `no ip mroute [vrf vrf-name] destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]` command.

To delete all mroutes matching a certain mroute, use the `no ip mroute [vrf vrf-name]destination mask` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to assign a static mroute to that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `destination` Enter the IP address in dotted decimal format of the destination device.

- `mask` Enter the mask in slash prefix formation (/x) or in dotted decimal format.

- `null 0` (OPTIONAL) Enter the keyword `null` then zero (0).

- `protocol [process-id | tag] ip-address` (OPTIONAL) Enter one of the routing protocols:
  - Enter the BGP as-number then the IP address in dotted decimal format of the reverse path forwarding (RPF) neighbor. The range is from 1 to 65535.
  - Enter the OSPF process identification number then the IP address in dotted decimal format of the RPF neighbor. The range is from 1 to 65535.
  - Enter the IS-IS alphanumeric tag string then the IP address in dotted decimal format of the RPF neighbor.
  - Enter the RIP IP address in dotted decimal format of the RPF neighbor.
**ip multicast-limit**

To limit the number of multicast entries on the system, use this feature.

**Syntax**

```
ip multicast-limit [vrf vrf-name] limit
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to limit the number of multicast on the VRF.
- `limit` Enter the desired maximum number of multicast entries on the system. The range is from 1 to 16000.

**Defaults**

The default is 4000.

**Command Modes**

CONFIGURATION

**Related Commands**

- `show ip mroute` — display the routing table.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This feature allows you to limit the number of multicast entries on the system. This number is the total of all the multicast entries on all line cards in the system. On each line card, the multicast module only installs the maximum number of entries, depending on the configured CAM profile.

To store multicast routes, use the IN-L3-McastFib CAM partition. It is a separate hardware limit that exists per port-pipe. This hardware space limitation can supersede any software-configured limit. The opposite is also true, the CAM partition might not be exhausted at the time the system-wide route limit set by the ip multicast-limit command is reached.

Related Commands

- `show ip igmp groups` — display the IGMP groups.

ip multicast-routing

Enable IP multicast forwarding.

Syntax

```
ip multicast-routing [vrf vrf-name]
```

To disable multicast forwarding, use the `no ip multicast-routing [vrf vrf-name]` command.

Defaults

Disabled.
Parameters

vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable IP multicast forwarding on that VRF.

Command Modes

CONFIGURATION

Usage Information

After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the ip pim sparse-mode command to enable IGMP and PIM on the interface.

Related Commands

- `ip pim sparse-mode` — enable IGMP and PIM on an interface.

mtrace

Trace a multicast route from the source to the receiver.

Syntax

mtrace [vrf vrf-name] {source-address/hostname} {destination-address/hostname} [group-address/hostname]

Parameters

- `vrf vrf-name` Enter the keyword vrf followed by the name of the VRF. If VRF name is not mentioned, the default VRF will be used. Mtrace is not supported for management VRF.
- `source-address/hostname` Enter the source IP address in dotted decimal format (A.B.C.D). This is a unicast address of the beginning of the path to be traced.
- `destination-address/hostname` Enter the destination (receiver) IP address in dotted decimal format (A.B.C.D). If omitted, the mtrace starts from the system at which the command is typed.
- `group-address/hostname` Enter the multicast group address in dotted decimal format (A.B.C.D). If group address is not given then software shall invokes a weak mtrace. A weak mtrace is one that follows
the RPF path to the source, regardless of whether any router along the path has multicast routing table state.

Command Modes

EXEC Privilege

<td>7.5.1.0</td>
<td>Expanded to support originator.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Expanded to support the intermediate (transit) router.</td>
</tr>
</tbody>
</table>

Usage Information

Mtrace is an IGMP based protocol that provides a multicast trace route facility and is implemented according to the IETF draft “A trace route facility for IP Multicast” (draft-fenner-traceroute-ipm-01.txt). Dell Networking OS supports the Mtrace client and transit functionality.

As an Mtrace client, Dell Networking OS transmits Mtrace queries, receives, parses, and prints out the details in the response packet received.

A transit or intermediate router, forwards mtrace requests to the RPF neighbor after appending its response block to the packet. In case it is the first hop router, it sends a response.

As an Mtrace transit or intermediate router, Dell Networking OS returns the response to Mtrace queries. After receiving the Mtrace request, Dell Networking OS computes the RPF neighbor for the source, fills in the request and forwards the request to the RPF neighbor.

Example

R1>mtrace 103.103.103.3 1.1.1.1 226.0.0.3
Type Ctrl-C to abort.

Querying reverse path for source 103.103.103.3 to destination 1.1.1.1 via group 226.0.0.3
From source (?) to destination (?)

<table>
<thead>
<tr>
<th>Hop</th>

</tr>
<tr>
<td>-4</td>
<td>103.103.103.3</td>
<td>--&gt;</td>
<td>Source</td>
<td></td>
</tr>
</tbody>
</table>

The mtrace command traverses the path of the response data block in the reverse direction of the multicast data traffic. The mtrace command traverses the reverse path to the source from the destination. As a result, the tabular output of the mtrace command displays the destination details in the first row, followed by the RPF router details along the path in the consequent rows, and finally the source details in the last row. The tabular output contains the following columns:

- Hop — a hop number (counted negatively to indicate reverse-path)
- OIF IP — outgoing interface address
- Proto — multicast routing protocol
- Forwarding code — error code as present in the response blocks
- Source Network/Mask — source mask
show ip mroute

View the multicast routing table.

Syntax

show ip mroute [vrf vrf-name] [static | group-address [source-address]] | count | snooping [vlan vlan-id] [group-address [source-address]] | summary | vlt [group-address [source-address] | count]

Parameters

vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.

static (OPTIONAL) Enter the keyword static to view static multicast routes.

group-address [source-address] (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.

count (OPTIONAL) Enter the keyword count to view the number of multicast routes and packets.

snooping [vlan vlan-id] [group-address [source-address]] Enter the keyword snooping to display information on the multicast routes PIM-SM snooping discovers.

Enter a VLAN ID to limit the information displayed to the multicast routes PIM-SM snooping discovers on a specified VLAN. The VLAN ID range is from 1 to 4094.

Enter a multicast group address and, optionally, a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes PIM-SM snooping discovers for a specified multicast group and source.

summary (OPTIONAL) Enter the keyword summary to view a summary of all routes.

vlt (OPTIONAL) Enter the keyword vlt to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter the keyword count to display the total number of multicast routes with the spanned IIF.

**Example (Static)**

Dell# show ip mroute static

Mroute: 23.23.23.0/24, interface: Lo 2
Protocol: static, distance: 0, route-map: none, last change: 00:00:23

**Example (Snooping)**

Dell# show ip mroute snooping

IPv4 Multicast Snooping Table

(*, 224.0.0.0), uptime 17:46:23
Incoming vlan: Vlan 2
Outgoing interface list:
   GigabitEthernet 4/13

(*, 225.1.2.1), uptime 00:04:16
Incoming vlan: Vlan 2
Outgoing interface list:
   GigabitEthernet 4/11
   GigabitEthernet 4/13

(165.87.1.7, 225.1.2.1), uptime 00:03:17
Incoming vlan: Vlan 2
Outgoing interface list:
   GigabitEthernet 4/11
   GigabitEthernet 4/13
   GigabitEthernet 4/20

**Example (VLT)**

Dell# show ip mroute vlt

IP Multicast Routing Table

Flags: S - Synced

(*, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
   Vlan 20 (S)
   Vlan 30

(50.1.1.2, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
Vlan 20 (S)

Usage Information
The following describes the `show ip mroute` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(S, G)</td>
<td>Displays the forwarding entry in the multicast route table.</td>
</tr>
<tr>
<td>uptime</td>
<td>Displays the amount of time the entry has been in the multicast forwarding table.</td>
</tr>
<tr>
<td>Incoming interface</td>
<td>Displays the reverse path forwarding (RPF) information towards the source for (S,G) entries and the RP for (*,G) entries.</td>
</tr>
<tr>
<td>Outgoing interface list:</td>
<td>Lists the interfaces that meet one of the following:</td>
</tr>
<tr>
<td></td>
<td>• a directly connected member of the Group</td>
</tr>
<tr>
<td></td>
<td>• statically configured member of the Group</td>
</tr>
<tr>
<td></td>
<td>• received a (*,G) or (S,G) Join message</td>
</tr>
</tbody>
</table>

Example
Dell# show ip mroute

IP Multicast Routing Table

(*) 224.10.10.1, uptime 00:05:12
   Incoming interface: GigabitEthernet 3/12
   Outgoing interface list:
              GigabitEthernet 3/13

(1.13.1.100, 224.10.10.1), uptime 00:04:03
   Incoming interface: GigabitEthernet 3/4
   Outgoing interface list:
              GigabitEthernet 3/12
              GigabitEthernet 3/13

(*, 224.20.20.1), uptime 00:05:12
   Incoming interface: GigabitEthernet 3/12
   Outgoing interface list:
              GigabitEthernet 3/4

**show ip rpf**

View reverse path forwarding.

Syntax
`show ip rpf`

Command Modes
- EXEC
- EXEC Privilege

Command History

</tbody>
</table>

E-Series legacy command

**Usage Information**

Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

NOTE: The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

**Example**

```
Dell# show ip rpf
RPF information for 10.10.10.9
  RPF interface: Gi 3/4
  RPF neighbor: 165.87.31.4
  RPF route/mask: 10.10.10.9/255.255.255.255
  RPF type: unicast
```
Neighbor Discovery Protocol (NDP)

The neighbor discovery protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. NDP defines mechanisms for solving the following problems:

- Router discovery — hosts can locate routers residing on a link
- Prefix discovery — hosts can discover address prefixes for the link
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination
- Neighbor unreachability detection (NUD) — determine that a neighbor is no longer reachable on the link.
- Duplicate address detection (DAD) — allow a node to check whether a proposed address is already in use.
- Redirect — the router can inform a node about a better first-hop.

NDP uses the following five ICMPv6 packet types in its implementation:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

Topics:

- clear ipv6 neighbors
- ipv6 neighbor
- show ipv6 neighbors
- IPv6 Router Advertisement (RA) Guard

**clear ipv6 neighbors**

Delete all entries in the IPv6 neighbor discovery cache or neighbors of a specific interface. Static entries are not removed using this command.

**Syntax**

```
clear ipv6 neighbors [vrf vrf-name] [ipv6-address | interface]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to clear the neighbor corresponding to that VRF.
NOTE: If you do not specify this option, the neighbors in the default VRF are cleared.

**ipv6-address**
Enter the IPv6 address of the neighbor in the x:x:x:x::x format to remove a specific IPv6 neighbor.

NOTE: The :: notation specifies successive hexadecimal fields of zero.

**interface interface**
To remove all neighbor entries learned on a specific interface, enter the keyword interface then the interface type and slot/port or number information of the interface:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**
- EXEC
- EXEC Privilege

**ipv6 neighbor**
Configure a static entry in the IPv6 neighbor discovery.

**Syntax**
```
ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface} (hardware_address)
```
To remove a static IPv6 entry from the IPv6 neighbor discovery, use the `no ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface}` command.

### Parameters

- **vrf vrf-name**
  (Optional) Enter the keyword `vrf` followed by the name of the VRF to install IPv6 routes in that VRF.
- **ipv6-address**
  Enter the IPv6 address of the neighbor in the `x:x:x:x::x` format.

**NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

- **interface interface**
  Enter the keyword `interface` then the interface type and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
  - For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

- **hardware_address**

### Usage Information

Neighbor Discovery Protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. It defines mechanisms for solving problems, such as:

- Router discovery: Hosts can locate routers residing on a link.
Prefix discovery: Hosts can discover address prefixes for the link.
Parameter discovery.
Address autoconfiguration — configuration of addresses for an interface.
Address resolution — mapping from IP address to link-layer address.
Next-hop determination.
Neighbor Unreachability Detection (NUD): Determine that a neighbor is no longer reachable on the link.
Duplicate Address Detection (DAD): Allow a node to check whether a proposed address is already in use.
Redirect: The router can inform a node about a better first-hop.

Use the ipv6 neighbor command to manually configure the IPv6 address of a neighbor to be discovered by the switch.

show ipv6 neighbors

Display IPv6 discovery information. Entering the command without options shows all IPv6 neighbor addresses stored on the control processor (CP).

Syntax

show ipv6 neighbors [vrf vrf-name] [ipv6-address| interface interface]

Parameters

vrf vrf-name

(Optional) Enter the keyword vrf and the name of the VRF to display the neighbors corresponding to that VRF.

NOTE: If you do not specify this option, neighbors corresponding to the default VRF are displayed.

ipv6-address

Enter the IPv6 address of the neighbor in the x:x:x:x::x format.

NOTE: The :: notation specifies successive hexadecimal fields of zero.

interface interface

Enter the keyword interface then the interface type and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Management interface, enter the keyword managementethernet followed by slot/port numbers.
- For a Port Channel interface, enter the keywords port-channel followed by a number.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege
Command History

```

IPv6 Router Advertisement (RA) Guard

The IPv6 RA guard provides support to perform conditional forwarding or blocking of the router advertisement messages that are received at the network device platform. This functionality analyzes and filters the RAs sent by the devices and compares the configuration information on the layer 2 device with the RA frame. Once the layer 2 device validates the content of the RA frame against the configuration, it forwards the RA to its unicast or multicast destination. On failure to validate the RA frame content, the RA frame is dropped.

The IPv6 RA guard supports two different modes:

- **Host mode** — When a policy with device role as host is applied on an interface, all the RA packets are dropped without validation. You can also configure the host mode policy with VLAN option to drop the RA packets on that specific VLAN and port.
- **Router mode** — When a policy with device role as router is applied on an interface, all the RA packets are validated based on the configuration information in the policy. Similarly, you can also apply this mode over any specific VLAN and the validation is performed only for that particular VLAN RA packets.

To configure the IPv6 RA guard, use the following Dell Networking OS commands.

```
display ipv6 nd ra-guard
```

Enable debugging for IPv6 RA guard snooping information.

**Syntax**

```
display ipv6 nd ra-guard [interface_type slot/port | count value]
```
Parameters

interface_type slot/port

Enter the one of the following interfaces and slot/port information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

count value

Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534. The default is infinity.

Defaults

None

Command Modes

EXEC Privilege

### Version Description

- **9.9(0.0)** Introduced on the Z9500.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S4810, S4820T, S5000, S6000, S6000–ON, and Z9000 switches.

### Related Commands

- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.
- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.

### hop-limit

Enable the verification of the advertised hop count limit. If this command is not configured, the verification process is bypassed.

#### Syntax

```
hop-limit {maximum | minimum limit}
```

To reset the hop count limit, use the `no hop-limit {maximum | minimum limit}` command.

#### Parameters

- **maximum limit** Enter the keyword `maximum` then the hop limit value. The range is from 0 to 254.
- **minimum limit** Enter the keyword `minimum` then the hop limit value. The range is from 0 to 254.

- [ipv6 nd ra-guard enable](#) — configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — define the RA guard policy name and enter the RA guard policy configuration mode.
ipv6 nd ra-guard attach-policy

Apply the IPv6 RA guard to a specific interface.

**Syntax**

```
ipv6 nd ra-guard attach-policy policy-name [vlan [vlan 1, vlan 2, vlan 3.....]]
```

**Parameters**

- `policy policy-name` Enter the keyword `policy` then the policy name. The policy-name allows a maximum of 140 characters.
- `vlan [vlan 1, vlan 2, vlan 3.......]` Enter the keyword `vlan` then the VLAN range. The VLAN range is from 1 to 4094.

**Related Commands**

- `ipv6 nd ra-guard enable` — configure the RA guard related commands.
- `ipv6 nd raguard policy policy-name` — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

### match ra

Enable verifying either of the configured source IPv6 address or prefix address or the source MAC address in the inspected messages. If this command is not configured, the verification process is bypassed.

**Syntax**

match ra {ipv6-access-list name | ipv6-prefix-list name | mac-access-list name}

To reset the access list, use the `no match ra{ipv6-access-list | ipv6-prefix-list | mac-access-list}command.

**Parameters**

- **ipv6-access-list name**: Enter the keywords `ipv6-access-list` then the access-list name. The access-list name allows a maximum of 140 characters.
- **ipv6-prefix-list name**: Enter the keywords `ipv6-prefix-list` then the prefix-list name. The prefix-list name allows a maximum of 140 characters.
- **ipv6-mac-access-list name**: Enter the keywords `ipv6-mac-access-list` then the mac-access-list name. The mac-access-list name allows a maximum of 140 characters.

**Defaults**

None

**Command Modes**

POLICY LIST CONFIGURATION
mtu

Enable the verification of the configured maximum transmission unit (MTU) value in the received RA packets.

Syntax

mtu value

To reset the MTU value, use the no mtu value command.

Parameters

value

Enter the maximum transmission unit value in bytes. The range is from 1,280 to 11,982 bytes.

Defaults

0

**Related Commands**

- **ipv6 nd raguard policy policy-name** — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.
- **ipv6 nd ra-guard enable** — configure the RA guard related commands.

### router-lifetime

Set the router lifetime.

**Syntax**

```
router-lifetime value
```

**Parameters**

- **value**
  
  Enter the router lifetime in seconds. The range is from 0 to 9,000 seconds.

**Defaults**

None

**Command Modes**

**Related Commands**

- **ipv6 nd ra-guard enable** — configure the RA guard related commands.
• `ipv6 nd raguard policy policy-name` — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

**router-preference maximum**

Enable the verification of the advertised default router preference (DRP) value. The preference value is lower than or equal to the specified limit. If this command is not configured, the verification process is bypassed.

**Syntax**
```
router-preference maximum {high | low | medium}
```

To reset the default router preference value, use the `no router-preference maximum {high | low | medium}` command.

**Parameters**
- **high**
  - Enter the keyword `high` to set the DRP value as high.
- **low**
  - Enter the keyword `low` to set the DRP value as low.
- **medium**
  - Enter the keyword `medium` to set the DRP value as medium.

**Defaults**
None

### Example

Dell(conf)# ipv6 nd ra-guard policy test
Dell(conf-ra_guard_policy_list)#show config

```
ipv6 nd ra-guard policy test
   device-role router
   hop-limit maximum 251
   mtu 1350
   other-config-flag on
   reachable-time 540
   retrans-timer 101
   router-preference maximum medium
   trusted-port
```

### Related Commands

- `ipv6 nd ra-guard enable` — configure the RA guard related commands.
- `ipv6 nd ra-guard policy` — define the RA guard policy name and enter the RA guard policy list configuration mode.
- `device-role` — specify the role of the device attached to the port.
- `hop-limit` — enable the verification of the advertised hop count limit.
- `mtu` — set the maximum transmission unit (MTU) value.
- `other-config-flag` — enable the verification of the advertised other configuration parameter.
- `reachable-time` — set the advertised reachability time.
- `retrans-timer` — set the advertised retransmission time.
- `router-preference maximum` — enable the verification of the advertised default router preference (DRP) value.
- `trusted-port` — apply the policy to trusted ports.

### show ipv6 nd ra–guard policy

Display the configurations applied on all the RA guard policies or a specific RA guard policy.

**Syntax**

```
show ipv6 nd ra-guard policy policy-name
```
**Parameter**

| policy policy-name | Enter the keyword policy then the policy name. The policy name allows a maximum of 140 characters. |

**Command Modes**

| EXEC Privilege |

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Example**

```
Dell# show ipv6 nd ra-guard policy test
ipv6 nd ra-guard policy test
  device-role router
  hop-limit maximum 1
  match ra ipv6-access-list access
  other-config-flag on
  router-preference maximum medium
  trusted-port
  Interfaces :
    Gi 1/1
Dell#
```

**Related Commands**

- `ipv6 nd ra-guard enable` — configure the RA guard related commands.
- `ipv6 nd ra-guard policy` — define the RA guard policy name and enter the RA guard policy list configuration mode.
- `device-role` — specify the role of the device attached to the port.
- `hop-limit` — enable the verification of the advertised hop count limit.
- `mtu` — set the maximum transmission unit (MTU) value.
- `other-config-flag` — enable the verification of the advertised other configuration parameter.
- `reachable-time` — set the advertised reachability time.
- `retrans-timer` — set the advertised retransmission time.
- `router-preference maximum` — enable the verification of the advertised default router preference (DRP) value.
- `trusted-port` — apply the policy to trusted ports.
- `ipv6 nd raguard attach-policy` — apply the IPv6 RA guard to a specific interface.
trusted-port

Allow bypassing the configured RA guard validation and forwards the RA packets received on the interface, which has the trusted port policy attached.

Syntax

trusted-port

To reset the policy applied to the trusted port, use the no trusted-port command.

Defaults
None

Command Modes

Version Description
9.11(0.0) Introduced on the C9010.
9.10(0.0) Introduced on the S3148.
9.9(0.0) Introduced on the Z9500.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches.

Usage Information
Use this command to disable all the RA guard policies.

Related Commands
- ipv6 nd ra-guard enable — configure the RA guard related commands.
- ipv6 nd raguard policy policy-name — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.
Object Tracking supports IPv4 and IPv6, and is available on the Dell Networking platforms. Object tracking allows you to define objects of interest, monitor their state, and report to a client when a change in an object’s state occurs. The following tracked objects are supported:

- Link status of Layer 2 interfaces
- Routing status of Layer 3 interfaces (IPv4 and IPv6)
- Reachability of IPv4 and IPv6 routes
- Metric thresholds of IPv4 and IPv6 routes

You can configure client applications, such as virtual router redundancy protocol (VRRP), to receive a notification when the state of a tracked object changes.

Topics:
- IPv4 Object Tracking Commands
- IPv6 Object Tracking Commands

### IPv4 Object Tracking Commands

The following section describes the IPv4 VRRP commands.

#### debug track

Enables debugging for tracked objects.

**Syntax**

```
debug track [all | notifications | object-id]
```

**Parameters**

- `all` Enables debugging on the state and notifications of all tracked objects.
- `notifications` Enables debugging on the notifications of all tracked objects.
- `object-id` Enables debugging on the state and notifications of the specified tracked object. The range is 1 to 500.

**Defaults**

Enable debugging on the state and notifications of all tracked objects (`debug track all`).

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Example

Dell# debug track all

04:35:04: %RPM0-P:RP2 %OTM-5-STATE: track 6 - Interface GigabitEthernet 1/2 line-protocol DOWN

04:35:04: %RPM0-P:RP2 %OTM-5-NOTIF: VRRP notification: resource ID 6 DOWN

delay

Configure the time delay used before communicating a change in the status of a tracked object to clients.

Syntax

    delay { [up seconds] [down seconds] }

To return to the default setting, use the no delay command.

Parameters

    seconds

Enter the number of seconds the object tracker waits before sending a notification about the change in the UP and/or DOWN state of a tracked object to clients. The range is 0 to 180. The default is 0 seconds.

Defaults

0 seconds

Command Modes

OBJECT TRACKING (conf_track_object-id)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version          Description
--------------------------------------
9.10(0.0)         Introduced on the S3148.
9.8(2.0)          Introduced on the S3100 series.
9.8(1.0)          Introduced on the Z9100-ON.
9.8(0.0P5)        Introduced on the S4048-ON.
9.8(0.0P2)        Introduced on the S3048-ON.
9.7(0.0)          Introduced on the S6000-ON.
9.5(0.1)          Introduced on the Z9500.
8.3.12.0          Introduced on the S4810.
8.4.1.0           Introduced.
Usage Information

You can configure an UP and/or DOWN timer for each tracked object to set the time delay before a change in the state of a tracked object is communicated to clients. The configured time delay starts when the state changes from UP to DOWN or vice-versa.

If the state of an object changes back to its former UP/DOWN state before the timer expires, the timer is cancelled and the client is not notified. For example, if the DOWN timer is running when an interface goes down and comes back up, the DOWN timer is cancelled and the client is not notified of the event.

If the timer expires and an object’s state has changed, a notification is sent to the client. If no delay is configured, a notification is sent immediately after a change in the state of a tracked object is detected. The time delay in communicating a state change is specified in seconds.

Related Commands

- track interface ip routing — configure object tracking on the routing status of an IPv4 Layer 3 interface.
- track interface line-protocol — configure object tracking on the line-protocol state of a Layer 2 interface.
- track ip route metric threshold — configure object tracking on the threshold of an IPv4 route metric.
- track ip route reachability — configure object tracking on the reachability of an IPv4 route.

description

Enter a description of a tracked object.

Syntax
description {text}

To remove the description, use the no description {text} command.

Parameters
text Enter a description to identify a tracked object (80 characters maximum).

Defaults

None

Command Modes

OBJECT TRACKING (conf_track_object-id)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

8.4.1.0 Introduced.

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

8.312.0 Introduced on the S4810.

8.4.1.0 Introduced.
Related Commands

- track interface ip routing – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- track interface line-protocol – configure object tracking on the line-protocol state of a Layer 2 interface.
- track ip route metric threshold – configure object tracking on the threshold of an IPv4 route metric.
- track ip route reachability – configure object tracking on the reachability of a specific IP address. Policy-based Routing uses the track command to track the next-hop ip address.

**show running-config track**

Display the current configuration of tracked objects.

**Syntax**

```
show running-config track [object-id]
```

**Parameters**

- `object-id` (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```

**Example (Object-id)**

```
Dell# show running-config track 300
track 300 ip route 10.0.0.0/8 metric threshold
delay down 3
```
Related Commands

- show track — display information about tracked objects, including configuration, current state, and clients which track the object.
- track interface ip routing — configure object tracking on the routing status of an IPv4 Layer 3 interface.
- track interface line-protocol — configure object tracking on the line-protocol state of a Layer 2 interface.
- track ip route metric threshold — configure object tracking on the threshold of an IPv4 route metric.
- track ip route reachability — configure object tracking on the reachability of an IPv4 route.

show track

Display information about tracked objects, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

Syntax

```
show track [object-id [brief] | interface [brief] [vrf vrf-name] | ip route [brief] [vrf vrf-name] | resolution | vrf vrf-name [brief] | brief]
```

Parameters

- **object-id** (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.
- **interface** (OPTIONAL) Display information on all tracked interfaces (Layer 2 and IPv4 Layer 3).
- **ip route** (OPTIONAL) Display information on all tracked IPv4 routes.
- **resolution** (OPTIONAL) Display information on the configured resolution values used to scale protocol-specific route metrics. The range is 0 to 255.
- **brief** (OPTIONAL) Display a single line summary of the tracking information for a specified object, object type, or all tracked objects.
- **vrf vrf-name** (OPTIONAL) E-Series only: Display information on only the tracked objects that are members of the specified VRF instance. The maximum is 32 characters. If you do not enter a VRF name, information on the tracked objects from all VRFs displays.

Command Modes

- EXEC Privilege

Usage Information

The following describes the **show track** command shown in the Example below.
Output | Description
--- | ---
Track object-id | Displays the number of the tracked object.
Interface type slot/port, IP route ip-address, IPv6 route ipv6-address | Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.
object is Up/Down | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.
number changes, last change time | Number of times that the state of the tracked object has changed and the time since the last change in hours:minutes:seconds.
First hop interface | Displays the type and slot/port number of the first-hop interface of the tracked route.
Tracked by | Client that is tracking an object’s state; for example, VRRP.

Example

Dell# show track

Track 1
IP route 23.0.0.0/8 reachability
Reachability is Down (route not in route table)
2 changes, last change 00:16:08
Tracked by:

Track 2
IPv6 route 2040::/64 metric threshold
Metric threshold is Up (STATIC/0/0)
5 changes, last change 00:02:16
Metric threshold down 255 up 254
First-hop interface is GigabitEthernet 1/2
Tracked by:
VRRP GigabitEthernet 2/3 IPv6 VRID 1

Track 3
IPv6 route 2050::/64 reachability
Reachability is Up (STATIC)
5 changes, last change 00:02:16
First-hop interface is GigabitEthernet 1/2
Tracked by:
VRRP GigabitEthernet 2/3 IPv6 VRID 1

Usage Information

The following describes the show track brief command shown in the Example below.

Output | Description
--- | ---
Resld | Number of the tracked object.
Resource | Type of tracked object.
Parameter | Detailed description of the tracked object.
State | Up or Down state of the tracked object.
Last Change | Time since the last change in the state of the tracked object.

Example (Brief)

Dell> show track brief

ResId Resource Parameter State LastChange
--- ------------------- ------ ---- ---------
1 IP route reachability 10.16.0.0/16 Up 00:01:08
2 Interface line-protocol Ethernet0/2 Down 00:05:00
3 Interface ip routing VLAN100 Up 01:10:05
Related Commands

- show running-config track – display configuration information about tracked objects.
- track interface ip routing – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- track interface line-protocol – configure object tracking on the line-protocol state of a Layer 2 interface.
- track ip route metric threshold – configure object tracking on the threshold of an IPv4 route metric.
- track ip route reachability – configure object tracking on the reachability of an IPv4 route.

threshold metric

Configure the metric threshold used to determine the UP and/or DOWN state of a tracked IPv4 or IPv6 route.

Syntax

```
threshold metric {up number | down number}
```

To return to the default setting, use the no threshold metric {up number | down number} command.

Parameters

- **up number**: Enter a number for the UP threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default UP threshold is **254**. The routing state is UP if the scaled route metric is less than or equal to the UP threshold.

- **down number**: Enter a number for the DOWN threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default DOWN threshold is **255**. The routing state is DOWN if the scaled route metric is greater than or equal to the DOWN threshold.

Defaults

None

Command Modes

OBJECT TRACKING (conf_track_object-id)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant **Dell Networking OS Command Line Reference Guide**.

</tbody>
</table>

Usage Information

Use this command to configure the UP and/or DOWN threshold for the scaled metric of a tracked IPv4 or IPv6 route.

Determine the UP/DOWN state of a tracked route by the threshold for the current value of the route metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value.
The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

Configure the UP and DOWN thresholds for each tracked route with the `threshold metric` command. The default UP threshold is 254; the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

The tracking process uses a protocol-specific resolution value to convert the actual metric in the routing table to a scaled metric in the range 0 to 255. You can configure the resolution value used to scale route metrics for supported protocols with the `track resolution ip route` and `track resolution ipv6 route` commands.

**Related Commands**

- `track ip route metric threshold` – configure object tracking on the threshold of an IPv4 route metric.
- `track resolution ip route` – configure the protocol-specific resolution value used to scale an IPv4 route metric.

**track interface ip routing**

Configure object tracking on the routing status of an IPv4 Layer 3 interface.

**Syntax**

```
track object-id interface interface ip routing
```

To return to the default setting, use the `no track object-id` command.

**Parameters**

- `object-id` Enter the ID number of the tracked object. The range is 1 to 500.
- `interface` Enter one of the following values:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel`.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

None

</tr>
</tbody>
</table>
**Version** | **Description**
---|---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON. Added support for tunnel interface.
8.3.12.0 | Introduced on the S4810.
8.4.1.0 | Introduced.

**Usage Information**

Use this command to create an object that tracks the routing state of an IPv4 Layer 2 interface:

- The status of the IPv4 interface is UP only if the Layer 2 status of the interface is UP and the interface has a valid IP address.
- The Layer 3 status of an IPv4 interface goes DOWN when its Layer 2 status goes down (for a Layer 3 VLAN, all VLAN ports must be down) or the IP address is removed from the routing table.

**Related Commands**

- `show track` — display information about tracked objects, including configuration, current state, and clients which track the object.
- `track interface line-protocol` — configure object tracking on the line-protocol state of a Layer 2 interface.

---

**track interface line-protocol**

Configure object tracking on the line-protocol state of a Layer 2 interface.

**Syntax**

```
track object-id interface interface line-protocol
```

To return to the default setting, use the `no track object-id` command.

**Parameters**

- **object-id**
  
  Enter the ID number of the tracked object. The range is 1 to 500.

- **interface**
  
  Enter one of the following values:

  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel`.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

<tbody>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
Usage Information

Use this command to create an object that tracks the line-protocol state of a Layer 2 interface by monitoring its operational status (UP or DOWN).

When the link-level status goes down, the tracked object status is considered to be DOWN; if the link-level status is up, the tracked object status is considered to be UP.

Related Commands

- `show track` – display information about tracked objects, including configuration, current state, and clients which track the object.
- `track interface ip routing` – configure object tracking on the routing status of an IPv4 Layer 3 interface.

track ip host reachability

Configure object tracking on the reachability of an IPv4 host.

Syntax

```
track object-id ip host host-ip-address/prefix-len reachability [vrf vrf-name]
```

To return to the default setting, use the `no track object-id` command.

Parameters

- **object-id**
  
  Enter the ID number of the tracked object. The range is 1 to 500.

- **host-ip-address/prefix-len**
  
  Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.

- **vrf vrf-name**
  
  (Optional) You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs.

Defaults

None

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

8.3.12.0 Introduced on the S4810.

8.4.1.0 Introduced.
track ip route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

Syntax

track object-id ip route ip-address/prefix-len metric threshold [vrf vrf-name]  
To return to the default setting, use the no track object-id command.

Parameters

object-id Enter the ID number of the tracked object. The range is 1 to 500.

ip-address/prefix-len Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.

vrf vrf-name (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs.

Defaults

None

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

8.3.12.0 Introduced on the S4810.

8.4.1.0 Introduced.

Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv4 route metric. In order for a route’s metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv4 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower
value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked route by using the threshold metric command. The default UP threshold is 254, the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

Related Commands
- show track – display information about tracked objects, including configuration, current state, and clients which track the object.
- threshold metric – configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- track resolution ip route – configure the protocol-specific resolution value used to scale an IPv4 route metric.

track ip route reachability

Configure object tracking on the reachability of an IPv4 route.

Syntax
track object-id ip route ip-address/prefix-len reachability [vrf vrf-name]

To return to the default setting, use the no track object-id command.

Parameters
- object-id: Enter the ID number of the tracked object. The range is 1 to 500.
- ip-address/prefix-len: Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.
- vrf vrf-name: (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs.

Usage Information
Use this command to create an object that tracks the reachability of an IPv4 route. In order for a route’s reachability to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure IPv4 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route’s next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

Related Commands
- `show track` – display information about tracked objects, including configuration, current state, and clients which track the object.
- `track ip route metric threshold` – configure object tracking on the threshold of an IPv4 route metric.

track resolution ip route

Configure the protocol-specific resolution value used to scale an IPv4 route metric.

Syntax
```
track resolution ip route {isis resolution-value | ospf resolution-value}
```
To return to the default setting, use the `no track object-id` command.

Parameters
- `object-id` Enter the ID number of the tracked object. The range is 1 to 500.
- `isis resolution-value` Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric.
- `ospf resolution-value` Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric.

Defaults
None

</tbody>
</table>
Usage Information

Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv4 route in the routing table to a scaled metric in the range 0 to 255.

The UP/DOWN state of a tracked IPv4 route is determined by a user-configurable threshold (the threshold metric command) for the route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is 10.
- For OSPF, you can set the resolution in the range 1 to 1592, where the default is 1.
- The resolution value used to map static routes is not configurable. By default, Dell Networking OS assigns a metric of 0 to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

Related Commands

- `threshold metric` — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- `track ip route metric threshold` — configure object tracking on the threshold of an IPv4 route metric.

IPv6 Object Tracking Commands

The following section describes the IPv6 object tracking commands.

The following object tracking commands apply to IPv4 and IPv6:

- `debug track`
- `delay`
- `description`
- `show running-config track`
- `threshold metric`
- `track interface line-protocol`

**show track ipv6 route**

Display information about all tracked IPv6 routes, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

**Syntax**

```
show track ipv6 route [brief]
```

**Parameters**

- `brief` (OPTIONAL) Display a single line summary of information for tracked IPv6 routes.

**Command Modes**

- EXEC
EXEC Privilege

Usage Information
The following describes the show track ipv6 route command shown in the Example below.

Output  | Description
---      | ---
Track    | Displays the number of the tracked object.
object-id| Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.
Interface type slot/port, IP route ip-address, IPv6 route ipv6-address object is Up/Down | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.
number changes, last change time | Number of times that the state of the tracked object has changed and the time since the last change in hours:minutes:seconds.
First hop interface | Displays the type and slot/port number of the first-hop interface of the tracked route.
Tracked by | Client that is tracking an object’s state; for example, VRRP.

Example
Dell# show track ipv6 route

Track 2
IPv6 route 2040::/64 metric threshold
Metric threshold is Up (STATIC/0/0)
5 changes, last change 00:02:30
Metric threshold down 255 up 254
First-hop interface is GigabitEthernet 1/2
Tracked by:
  VRRP GigabitEthernet 2/4 IPv6 VRID 1

Track 3
IPv6 route 2050::/64 reachability
Reachability is Up (STATIC)
5 changes, last change 00:02:30
First-hop interface is GigabitEthernet 1/2
Tracked by:
  VRRP GigabitEthernet 2/4 IPv6 VRID 1

Usage Command
The following describes the show track ipv6 route brief command shown in the Example below.
### track interface ipv6 routing

Configure object tracking on the routing status of an IPv6 Layer 3 interface.

#### Syntax

```
track object-id interface interface ipv6 routing
```

To return to the default setting, use the `no track object-id` command.

#### Parameters

- **object-id**
  - Enter the ID number of the tracked object. The range is 1 to 500.
- **interface**
  - Enter one of the following values:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a tunnel interface, enter the keyword `tunnel`.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

9.7(0.0) | Introduced on the S6000-ON.
8.3.12.0 | Introduced on the S4810.
8.4.1.0 | Introduced.
Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv6 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv6 route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv6 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked IPv6 route by using the threshold metric command. The default UP threshold is 254; the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

Related Commands

- show track ipv6 route — display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- threshold metric — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- track resolution ipv6 route — configure the protocol-specific resolution value used to scale an IPv6 route metric.

track ipv6 route reachability

Configure object tracking on the reachability of an IPv6 route.

Syntax

```
track object-id ipv6 route ip-address/prefix-len reachability
```

To return to the default setting, use the no track object-id command.

Parameters

- **object-id**
  - Enter the ID number of the tracked object. The range is 1 to 500.

- **ipv6-address/prefix-len**
  - Enter an IPv6 address in X:XX::X format. The valid IPv6 prefix lengths are from /0 to /128.

Defaults

None

Use this command to create an object that tracks the reachability of an IPv6 route. In order for a route’s reachability to be tracked, the route must appear as an entry in the routing table.

A tracked route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the tracked route is considered to be DOWN.

When you configure IPv6 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route’s next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

Related Commands

- `show track ipv6 route` - display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- `track ipv6 route reachability` - configure object tracking on the reachability of an IPv4 route.

### track resolution ipv6 route

Configure the protocol-specific resolution value used to scale an IPv6 route metric.

**Syntax**

```
track resolution ipv6 route {isis resolution-value | ospf resolution-value}
```

To return to the default setting, use the `no track object-id` command.

**Parameters**

- **object-id**
  - Enter the ID number of the tracked object. Use the range to 1 to 500.
- **isis resolution-value**
  - Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric.
- **ospf resolution-value**
  - Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric.

9.7(0.0) Introduced on the S6000-ON.
8.3.12.0 Introduced on the S4810.
8.4.1.0 Introduced.

Usage Information
Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv6 route in the routing table to a scaled metric in the range 0 to 255.

The UP/DOWN state of a tracked IPv6 route is determined by the user-configurable threshold (the threshold metric command) for a route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is 10.
- For OSPF, you can set the resolution in the range 1 to 1592, where the default is 1.
- The resolution value used to map static routes is not configurable. By default, Dell Networking OS assigns a metric of 0 to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

Related Commands
- threshold metric — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- track ipv6 route metric threshold — configure object tracking on the threshold of an IPv6 route metric.
Open Shortest Path First (OSPFv2 and OSPFv3)

Open Shortest Path First version 2 for IPv4 is supported on platform. OSPF is an interior gateway protocol (IGP), which means that it distributes routing information between routers in a single autonomous system (AS). OSPF is also a link-state protocol in which all routers contain forwarding tables derived from information about their links to their neighbors.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) are the same for OSPFv2 and OSPFv3. OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis.

The Dell Networking OS versions 9.4(0.0) and 9.7(0.0) introduce support for VRF on OSPFv2 and OSPFv3 respectively. The multi-process OSPF feature supported on Dell Networking OS version 7.8.1.0 is modified. In earlier versions, multiple OSPF processes were created without VRF (prior to 9.4(0.0)). In the Dell Networking OS versions 9.4(0.0) and 9.7(0.0) (for OSPFv3), multiple OSPF processes can be created on a router, but with only one OSPF process per VRF. However, there can be one OSPFV2 and one OSPFv3 on the same VRF.

This section is divided into two sections. There is no overlap between the two sets of commands. You cannot use an OSPFv2 command in the IPv6 OSPFv3 mode. OSPFv2 is supported on IPv4 tunnels only and OSPFv3 is supported on IPv6 tunnels only.

Topics:
- OSPFv2 Commands
- OSPFv3 Commands

OSPFv2 Commands

The Dell Networking implementation of OSPFv2 is based on IETF RFC 2328.

**area default-cost**

Set the metric for the summary default route the area border router (ABR) generates into the stub area. Use this command on the border routers at the edge of a stub area.

**Syntax**

```
area area-id default-cost cost
```

To return default values, use the `no area area-id default-cost` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>area-id</strong></td>
<td>Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.</td>
</tr>
<tr>
<td><strong>cost</strong></td>
<td>Specifies the stub area’s advertised external route metric. The range is from zero (0) to 65535.</td>
</tr>
</tbody>
</table>
Defaults
\texttt{cost = 1}; no areas are configured.

Command Modes
\texttt{ROUTER OSPF}

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information
In the Dell Networking operating software (OS), \texttt{cost} is defined as reference bandwidth/bandwidth.

Related Commands
- \texttt{area stub} — create a stub area.

\textbf{area nssa}

Specify an area as a not so stubby area (NSSA).

Syntax
\texttt{area area-id nssa [default-information-originate] [no-redistribution] [no-summary]}

To delete an NSSA, use the \texttt{no area area-id nssa} command.

Parameters
- \texttt{area-id} Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.
- \texttt{no-redistribution} (OPTIONAL) Specify that the redistribute command does not distribute routes into the NSSA. Only use this command in an NSSA area border router (ABR).
**default-information-originate**

(Optional) Allows external routing information to be imported into the NSSA by using Type 7 default.

**no-summary**

(Optional) Specify that no summary LSAs should be sent into the NSSA.

**Defaults**

Not configured.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**area range**

Summarize routes matching an address/mask at an area border router (ABR).

**Syntax**

area area-id range ip-address mask [not-advertise]

To disable route summarization, use the no area area-id range ip-address mask command.

**Parameters**

- **area-id**
  - Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

- **ip-address**
  - Specify an IP address in dotted decimal format.
mask Specify a mask for the destination prefix. Enter the full mask (for example, 255.255.255.0).

not-advertise (OPTIONAL) Enter the keywords not-advertise to set the status to DoNotAdvertise (that is, the Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas.)

Defaults Not configured.

Command Modes ROUTER OSPF

</tbody>
</table>

Usage Information Only the routes within an area are summarized, and that summary is advertised to other areas by the ABR. External routes are not summarized.

Related Commands

- area stub — create a stub area.
- router ospf — enter ROUTER OSPF mode to configure an OSPF instance.

area stub

Configure a stub area, which is an area not connected to other areas.

Syntax

area area-id stub [no-summary]
To delete a stub area, use the `no area area-id stub` command.

**Parameters**

- **area-id**
  Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

- **no-summary**
  (OPTIONAL) Enter the keywords `no-summary` to prevent the ABR from sending summary Link State Advertisements (LSAs) into the stub area.

**Defaults**
Disabled.

**Command Modes**
ROUTER OSPF

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**
- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000-ON.
- 9.2(1.0) Introduced on the Z9500.
- 9.0.2.0 Introduced on the S6000.
- 8.3.19.0 Introduced on the S4820T.
- 8.3.11.1 Introduced on the Z9000.
- 8.3.7.0 Introduced on the S4810.
- 7.8.1.0 Added support for the Multi-Process OSPF.
- 7.6.1.0 Introduced on the S-Series.
- 7.5.1.0 Introduced on the C-Series.
- pre-6.1.1.1 Introduced on the E-Series.

**Usage Information**
To configure all routers and access servers within a stub, use this command.

**Related Commands**
- `router ospf` — enter ROUTER OSPF mode to configure an OSPF instance.

---

**auto-cost**

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

**Syntax**

```
auto-cost [reference-bandwidth ref-bw]
```
To return to the default bandwidth or to assign cost based on the interface type, use the `no auto-cost [reference-bandwidth]` command.

**Parameters**

- **ref-bw**
  
  (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is **100 megabits per second**.

**Defaults**

- **100 megabits per second**

**Command Modes**

- **ROUTER OSPF**

**Command History**

### clear ip ospf

Clear all OSPF routing tables.

**Syntax**

```plaintext
clear ip ospf process-id [vrf vrf-name] [process]
```

**Parameters**

- **process-id**
  
  Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.

- **vrf vrf-name**
  
  Enter the keyword `vrf` and then the name of the VRF to clear all OSPF routing tables corresponding to that VRF.
process  (OPTIONAL) Enter the keyword process to reset the OSPF process.

Command Modes  
EXEC Privilege

**clear ip ospf statistics**

Clear the packet statistics in interfaces and neighbors.

**Syntax**

```
clear ip ospf [process-id] [vrf vrf-name] statistics [interface name [neighbor router-id]]
```  

**Parameters**

- **process-id**  
  Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.

- **vrf vrf-name**  
  Enter the keyword vrf followed by the name of the VRF to clear all OSPF routing tables corresponding to that VRF.

- **statistics**  
  Enter the keyword statistics to clear the packet statistics in interfaces and neighbors.

- **interface name**  
  (OPTIONAL) Enter the keyword interface then one of the following interface keywords and slot/port or number information:
For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.

For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

For Port Channel groups, enter the keywords `port-channel` then a number.

```
neighbor router-id
```

(Optional) Enter the keyword `neighbor` then the neighbor’s router-id in dotted decimal format (A.B.C.D).

**Defaults**

None

**Related Commands**

- `show ip ospf statistics` — display the OSPF statistics.
**debug ip ospf**

Display debug information on OSPF. Entering the `debug ip ospf` commands enables OSPF debugging for the first OSPF process.

**Syntax**
```
debug ip ospf [process-id] [vrf vrf-name] [bfd |event | packet | spf | database-timer rate-limit]
```

To cancel the debug command, use the `no debug ip ospf` command.

**Parameters**
- `process-id` Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.
- `vrf vrf-name` Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.
- `bfd` (OPTIONAL) Enter the keyword `bfd` to debug only OSPF BFD information.
- `event` (OPTIONAL) Enter the keyword `event` to debug only OSPF event information.
- `packet` (OPTIONAL) Enter the keyword `packet` to debug only OSPF packet information.
- `spf` (OPTIONAL) Enter the keyword `spf` to display the Shortest Path First information.
- `database-timer rate-limit` (OPTIONAL) Enter the keywords `database-timer rate-limit` to display the LSA throttling timer information. This applies to the S4810 platform only.

</tr>
<tr>
<td></td>
<td>• N + (N-bit is set)</td>
</tr>
<tr>
<td></td>
<td>• N - (N-bit is not set)</td>
</tr>
<tr>
<td></td>
<td>• MC+ (bit used by MOSPF is set and router is able to forward IP multicast packets)</td>
</tr>
<tr>
<td></td>
<td>• MC- (bit used by MOSPF is not set and router cannot forward IP multicast packets)</td>
</tr>
<tr>
<td></td>
<td>• E + (router is able to accept AS External LSAs)</td>
</tr>
</tbody>
</table>
### Field Description
- **E** - (router cannot accept AS External LSAs)
- **T +** - (router can support TOS)
- **T -** - (router cannot support TOS)

**hi:** Displays the amount of time configured for the HELLO interval.

**di:** Displays the amount of time configured for the DEAD interval.

**dr:** Displays the IP address of the designated router.

**bdr:** Displays the IP address of the Border Area Router.

### Example
```
Dell# debug ip ospf 1 packet
OSPF process 90, packet debugging is on

Dell#
08:14:24 : OSPF(100:00):
  Xmt. v:2 t:1(HELLO) l:44 rid:192.1.1.1
  aid:0.0.0.1 chk:0xa098 aut:0 auk: keyid:0 to:G1 4/3 dst:224.0.0.5
  netmask:255.255.255.0 pri:1 N-, MC-, E+, T-,
  hi:10 di:40 dr:90.1.1.1 bdr:0.0.0.0
```

### default-information originate

To generate a default external route into an OSPF routing domain, configure Dell Networking Operating System (OS).

**Syntax**
```
default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]
```

To return to the default values, use the `no default-information originate` command.

**Parameters**
- **always** (OPTIONAL) Enter the keyword `always` to specify that default route information must always be advertised.
- **metric metric-value** (OPTIONAL) Enter the keyword `metric` then a number to configure a metric value for the route. The range is from 1 to 16777214.
- **metric-type type-value** (OPTIONAL) Enter the keywords `metric-type` then an OSPF link state type of 1 or 2 for default routes. The values are:
  - 1 = Type 1 external route
  - 2 = Type 2 external route
- **route-map map-name** (OPTIONAL) Enter the keywords `route-map` then the name of an established route map.

**Defaults**
- Disabled.

**Command Modes**
- `ROUTER OSPF`

**Command History**
- This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
**default-metric**

Change the metrics of redistributed routes to a value useful to OSPF. Use this command with the `redistribute` command.

```
Syntax
default-metric number

To return to the default values, use the no default-metric [number] command.

Parameters

```

**number**
Enter a number as the metric. The range is from 1 to 16777214.

**Defaults**
Disabled.

**Command Modes**
ROUTER OSPF

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**description**

Add a description about the selected OSPF configuration.

**Syntax**

```
description description
```

To remove the OSPF description, use the `no description` command.

**Parameters**

- `description`: Enter a text string description to identify the OSPF configuration (80 characters maximum).

**Defaults**

None

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre- 6.1.1.1 | Introduced on the E-Series.

**Related Commands**
- `show ip ospf asbr` — display the VLAN configuration.

---

**distance**

Define an administrative distance for particular routes to a specific IP address.

**Syntax**

```plaintext
distance weight [ip-address mask access-list-name]
```

To delete the settings, use the `no distance weight [ip-address mask access-list-name]` command.

**Parameters**

- `weight` Specify an administrative distance. The range is from 1 to 255. The default is 110.
- `ip-address` (OPTIONAL) Enter a router ID in the dotted decimal format. If you enter a router ID, include the mask for that router address.
- `mask` (OPTIONAL) Enter a mask in dotted decimal format or /n format.
- `access-list-name` (OPTIONAL) Enter the name of an IP standard access list, up to 140 characters.

**Defaults**

110

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
distance ospf

Configure an OSPF distance metric for different types of routes.

Syntax

```
distance ospf [external dist3] [inter-area dist2] [intra-area dist1]
```

To delete these settings, use the no distance ospf command.

Parameters

- **external dist3** (OPTIONAL) Enter the keyword external then a number to specify a distance for external type 5 and 7 routes. The range is from 1 to 255. The default is 110.
- **inter-area dist2** (OPTIONAL) Enter the keywords inter-area then a number to specify a distance metric for routes between areas. The range is from 1 to 255. The default is 110.
- **intra-area dist1** (OPTIONAL) Enter the keywords intra-area then a number to specify a distance metric for all routes within an area. The range is from 1 to 255. The default is 110.

Defaults

- external dist3 = 110
- inter-area dist2 = 110
- intra-area dist1 = 110

Command Modes

- ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.
distribute-list in

Apply a filter to incoming routing updates from OSPF to the routing table.

Syntax
distribute-list prefix-list-name in [interface]

To delete a filter, use the no distribute-list prefix-list-name in [interface] command.

Parameters

prefix-list-name Enter the name of a configured prefix list.

interface (OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For Port Channel groups, enter the keywords port-channel then a number.
- For a VLAN, enter the keyword vlan then a number from 1 to 4094.

Defaults
Not configured.

Command Modes
ROUTER OSPF

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information
To specify a distance for routes learned from other routing domains, use the redistribute command.
distribute-list out

To restrict certain routes destined for the local routing table after the SPF calculation, apply a filter.

Syntax

```
distribute-list prefix-list-name out [bgp | connected | isis | rip | static]
```

To remove a filter, use the `no distribute-list prefix-list-name out [bgp | connected | isis | rip | static]` command.

Parameters

- **prefix-list-name**: Enter the name of a configured prefix list.
- **bgp**
  
  (OPTIONAL) Enter the keyword `bgp` to specify that BGP routes are distributed.
  
  **NOTE**: BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.

- **connected**
  
  (OPTIONAL) Enter the keyword `connected` to specify that connected routes are distributed.

- **isis**
  
  (OPTIONAL) Enter the keyword `isis` to specify that IS-IS routes are distributed.
  
  **NOTE**: BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.

- **rip**
  
  (OPTIONAL) Enter the keyword `rip` to specify that RIP routes are distributed.
NOTE: BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.

static

(Optional) Enter the keyword static to specify that only manually configured routes are distributed.

Defaults

Not configured.

Command Modes

ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

The distribute-list out command applies to routes autonomous system boundary routers (ASBRs) redistributes into OSPF. It can be applied to external type 2 and external type 1 routes, but not to intra-area and inter-area routes.

fast-convergence

This command sets the minimum LSA origination and arrival times to zero (0), allowing more rapid route computation so that convergence takes less time.

Syntax

fast-convergence {number}

To cancel fast-convergence, use the no fast convergence command.
Parameters

**number**
Enter the convergence level desired. The higher this parameter is set, the faster OSPF converge takes place. The range is from 1 to 4.

Defaults

None.

Command Modes

ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on all platforms.</td>
</tr>
</tbody>
</table>

Usage Information

The higher this parameter is set, the faster OSPF converge takes place.

**NOTE:** The faster the convergence, the more frequent the route calculations and updates. This behavior impacts CPU utilization and may impact adjacency stability in larger topologies.

Generally, convergence level 1 meets most convergence requirements. Higher convergence levels should only be selected following consultation with Dell Networking technical support.

```
graceful-restart grace-period
```

Specifies the time duration, in seconds, that the router’s neighbors continue to advertise the router as fully adjacent regardless of the synchronization state during a graceful restart.

**NOTE:** This command enables OSPFv2 graceful restart globally by setting the grace period (in seconds) that an OSPFv2 router’s neighbors continues to advertise the router as adjacent during a graceful restart.

```
graceful-restart grace-period seconds
```

To disable the grace period, use the no graceful-restart grace-period command.
Parameters

seconds  Time duration, in seconds, that specifies the duration of the restart process before OSPF terminates the process. The range is from 40 to 1800 seconds.

Defaults
Not Configured

Command Modes
ROUTER OSPF

</tr>
</tbody>
</table>

Usage Information
The Helper mode is enabled by default on the device. To enable the restart mode also on the device, you must configure the grace period using this command. After you enable restart mode the router advertises the neighbor as fully adjacent during a restart.

**graceful-restart helper-reject**

Specify the OSPF router to not act as a helper during graceful restart.

Syntax

```
graceful-restart helper-reject ip-address
```

To return to default value, use the no graceful-restart helper-reject command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>Enter the OSPF router-id, in IP address format, of the restart router that will not act as a helper during graceful restart.</td>

**graceful-restart mode**

Enable the graceful restart mode.

**Syntax**

```
graceful-restart mode [planned-only | unplanned-only]
```

To disable graceful restart mode, use the `no graceful-restart mode` command.

**Parameters**

- **planned-only**
  - (OPTIONAL) Enter the keywords `planned-only` to indicate graceful restart is supported in a planned restart condition only.

- **unplanned-only**
  - (OPTIONAL) Enter the keywords `unplanned-only` to indicate graceful restart is supported in an unplanned restart condition only.

**Defaults**
Support for both planned and unplanned failures.

**Command Modes**
ROUTER OSPF
**graceful-restart role**

Specify the role for your OSPF router during graceful restart.

**Syntax**

```plaintext
graceful-restart role [helper-only | restart-only]
```

To disable graceful restart role, use the `no graceful-restart role` command.

**Parameters**

- **role helper-only**
  - (OPTIONAL) Enter the keywords `helper-only` to specify the OSPF router is a helper only during graceful restart.

- **role restart-only**
  - (OPTIONAL) Enter the keywords `restart-only` to specify the OSPF router is a restart only during graceful-restart.

**Defaults**

By default, OSPF routers are both helper and restart routers during a graceful restart.

**Command Modes**

`ROUTER OSPF`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.

7.5.1.0 | Introduced on the C-Series.
pre- 6.1.1.1 | Introduced on the E-Series.
ip ospf auth-change-wait-time

OSPF provides a grace period while OSPF changes its interface authentication type. During the grace period, OSPF sends out packets with new and old authentication scheme until the grace period expires.

Syntax

```
ip ospf auth-change-wait-time seconds
```

to return to the default, use the no ip ospf auth-change-wait-time command.

Parameters

- **seconds**: Enter the seconds. The range is from 0 to 300.

Defaults

zero (0) seconds.

**ip ospf authentication-key**

Enable authentication and set an authentication key on OSPF traffic on an interface.

**Syntax**

```
ip ospf authentication-key [encryption-type] key
```

To delete an authentication key, use the `no ip ospf authentication-key` command.

**Parameters**

- `encryption-type` (OPTIONAL) Enter 7 to encrypt the key.
- `key` Enter an eight-character string. Strings longer than eight characters are truncated.

**Defaults**

Not configured.

### ip ospf cost

Change the cost associated with the OSPF traffic on an interface.

**Syntax**

```plaintext
ip ospf cost cost
To return to default value, use the no ip ospf cost command.
```

**Parameters**

- `cost`
  
  Enter a number as the cost. The range is from 1 to 65535.

**Defaults**

The default cost is based on the reference bandwidth.

**Command Modes**

</table>

**Usage Information**

All neighboring routers in the same network must use the same password to exchange OSPF information.

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Usage Information

If this command is not configured, cost is based on the `auto-cost` command.

When you configure OSPF over multiple vendors, to ensure that all routers use the same cost, use the `ip ospf cost` command. Otherwise, OSPF routes improperly.

Related Commands

- `auto-cost` — control how the OSPF interface cost is calculated.

**ip ospf dead-interval**

Set the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

**Syntax**

```
ip ospf dead-interval seconds
```

To return to the default values, use the `no ip ospf dead-interval` command.

**Parameters**

- `seconds`  
  Enter the number of seconds for the interval. The range is from 1 to 65535. The default is **40 seconds**.

**Defaults**

40 seconds

**Command Modes**

INTERFACE

**Command History**

</tbody>
</table>
Usage Information

The time interval between the hello packets must be the same for routers in a network.

Related Commands

- `ip ospf dead-interval` — set the time interval before a router is declared dead.

### ip ospf message-digest-key

Enable OSPF MD5 authentication and send an OSPF message digest key on the interface.

**Syntax**

```
ip ospf message-digest-key keyid md5 key
```

To delete a key, use the `no ip ospf message-digest-key keyid` command.

**Parameters**

- `keyid` Enter a number as the key ID. The range is from 1 to 255.

- `key` Enter a continuous character string as the password.

**Defaults**

No MD5 authentication is configured.

**Command Modes**

INTERFACE

</tbody>
</table>
You can configure a maximum of six digest keys on an interface. Of the available six digest keys, the switches select the MD5 key that is common. The remaining MD5 keys are unused.

To change to a different key on the interface, enable the new key while the old key is still enabled. Dell Networking OS sends two packets: the first packet authenticated with the old key and the second packet authenticated with the new key. This process ensures that the neighbors learn the new key and communication is not disrupted by keeping the old key enabled.

After the reply is received and the new key is authenticated, delete the old key. Dell recommends keeping only one key per interface.

**NOTE:** The MD5 secret is stored as plain text in the configuration file with service password encryption. Write down or otherwise record the key. You cannot learn the key once it is configured. Use caution when changing the key.

**ip ospf mtu-ignore**

Disable OSPF MTU mismatch detection upon receipt of database description (DBD) packets.

**Syntax**

```
ip ospf mtu-ignore
```

To return to the default, use the `no ip ospf mtu-ignore` command.

**Defaults**

Enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
ip ospf network

Set the network type for the interface.

Syntax

ip ospf network {broadcast | point-to-point}

To return to the default, use the no ip ospf network command.

Parameters

- **broadcast**: Enter the keyword broadcast to designate the interface as part of a broadcast network.
- **point-to-point**: Enter the keywords point-to-point to designate the interface as part of a point-to-point network.

Defaults

Broadcast.

Command Modes

- ROUTER OSPF

</table>
**ip ospf priority**

To determine the designated router for the OSPF network, set the priority of the interface.

**Syntax**

```
ip ospf priority number
```

To return to the default setting, use the `no ip ospf priority` command.

**Parameters**

*number* Enter a number as the priority. The range is from 0 to 255. The default is 1.

**Defaults**

1

**Command Modes**

<tr>
<td>pre-6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

- Setting a priority of 0 makes the router ineligible for election as a designated router or backup designated router.

- Use this command for interfaces connected to multi-access networks, not point-to-point networks.
ip ospf retransmit-interval

Set the retransmission time between lost link state advertisements (LSAs) for adjacencies belonging to the interface.

Syntax

ip ospf retransmit-interval seconds

To return to the default values, use the no ip ospf retransmit-interval command.

Parameters

seconds  Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is 5 seconds.

This interval must be greater than the expected round-trip time for a packet to travel between two routers.

Defaults

5 seconds

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version  Description
9.10(0.0)  Introduced on the S3148.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
8.3.11.1   Introduced on the Z9000.
8.3.10    Introduced on the S4810.
7.6.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
pre-6.1.1.1 Introduced on the E-Series.

Usage Information

Set the time interval to a number large enough to prevent unnecessary retransmissions.
ip ospf transmit-delay

To send a link state update packet on the interface, set the estimated time elapsed.

Syntax

```
ip ospf transmit-delay seconds
```

To return to the default value, use the no ip ospf transmit-delay command.

Parameters

```
seconds
```
Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is 1 second.

This value must be greater than the transmission and propagation delays for the interface.

Defaults

```
1 second
```

Command Modes

```

```
**log-adjacency-changes**

To send a Syslog message about changes in the OSPF adjacency state, set Dell Networking OS.

**Syntax**

```
log-adjacency-changes
```

To disable the Syslog messages, use the `no log-adjacency-changes` command.

**Defaults**

Disabled.

**Command Modes**

ROUTER OSPF

**Command History**

**maximum-paths**

Enable the software to forward packets over multiple paths.

**Syntax**

```
maximum-paths number
```

Enable the software to forward packets over multiple paths.
To disable packet forwarding over multiple paths, use the `no maximum-paths` command.

**Parameters**
- **number**
  
  Specify the number of paths. The range for OSPFv2 is from 1 to 64. The default for OSPFv2 is `4 paths`. The range for OSPFv3 is from 1 to 64. The default for OSPFv3 is `8 paths`.

**Defaults**
- `4`

**Command Modes**
- **ROUTER OSPF** for OSPFv2
- **ROUTER OSPFv3** for OSPFv3

</tbody>
</table>

**network area**

Define which interfaces run OSPF and the OSPF area for those interfaces.

**Syntax**

```
network ip-address mask area area-id
```

To disable an OSPF area, use the `no network ip-address mask area area-id` command.
Parameters

- **ip-address**: Specify a primary or secondary address in dotted decimal format. The primary address is required before adding the secondary address.
- **mask**: Enter a network mask in /prefix format. (/x)
- **area-id**: Enter the OSPF area ID as either a decimal value or in a valid IP address. Decimal value range is from 0 to 65535. IP address format is dotted decimal format A.B.C.D.

**NOTE**: If the area ID is smaller than 65535, it is converted to a decimal value. For example, if you use an area ID of 0.0.0.1, it is converted to 1.

Command Modes

- **ROUTER OSPF**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre- 6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

To enable OSPF on an interface, the network area command must include, in its range of addresses, the primary IP address of an interface.

**NOTE**: An interface can be attached only to a single OSPF area.

If you delete all the network area commands for Area 0, the show ip ospf command output does not list Area 0.
passive-interface

Suppress both receiving and sending routing updates on an interface.

Syntax

```
passive-interface {default | interface}
```

To enable both the receiving and sending routing, use the `no passive-interface interface` command.

To return all OSPF interfaces (current and future) to active, use the `no passive-interface default` command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Enter the keyword <code>default</code> to make all OSPF interfaces (current and future) passive.</td>
</tr>
<tr>
<td>interface</td>
<td>Enter the following keywords and slot/port or number information:</td>
</tr>
<tr>
<td></td>
<td>- For a 1-GigabitEthernet interface, enter the keyword <code>GigabitEthernet</code> then the slot/port information.</td>

**Version** | **Description**
---|---
7.4.1.0 | Modified to include the keyword default.
pre- 6.1.1.1 | Introduced on the E-Series.

**Usage Information**

Although the passive interface does not send or receive routing updates, the network on that interface is still included in OSPF updates sent using other interfaces.

The `default` keyword sets all interfaces as passive. You can then configure individual interfaces, where adjacencies are desired, using the `no passive-interface interface` command. The no form of this command is inserted into the configuration for individual interfaces when the `no passive-interface interface` command is issued while `passive-interface default` is configured.

This command behavior has changed as follows:

- **passive-interface interface**
  - The previous `no passive-interface interface` is removed from the running configuration.
  - The ABR status for the router is updated.
  - Save `passive-interface interface` into the running configuration.

- **passive-interface default**
  - All present and future OSPF interfaces are marked as passive.
  - Any adjacency is explicitly terminated from all OSPF interfaces.
  - All previous `passive-interface interface` commands are removed from the running configuration.
  - All previous `no passive-interface interface` commands are removed from the running configuration.

- **no passive-interface interface**
  - Remove the interface from the passive list.
  - The ABR status for the router is updated.
  - If `passive-interface default` is specified, then save `no passive-interface interface` into the running configuration.

- **no passive-interface default**
  - Clear everything and revert to the default behavior.
  - All previously marked passive interfaces are removed.
  - May update ABR status.

On configuring suppression using the `passive-interface` command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.
**redistribute**

Redistribute information from another routing protocol throughout the OSPF process.

**Syntax**

```
redistribute {connected | isis | ospf | rip | static} [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]
```

To disable redistribution, use the `no redistribute {connected | isis | rip | static}` command.

**Parameters**

- **connected**
  - Enter the keyword `connected` to specify that information from active routes on interfaces is redistributed.

- **isis**
  - Enter the keyword `isis` to specify that ISO IS-IS information is redistributed.

- **ospf**
  - Enter the keyword `ospf` to specify that information corresponding to OSPF is redistributes.

- **rip**
  - Enter the keyword `rip` to specify that RIP routing information is redistributed.

- **static**
  - Enter the keyword `static` to specify that information from static routes is redistributed.

- **metric metric-value**
  - (OPTIONAL) Enter the keyword `metric` then a number. The range is from 0 (zero) to 16777214.

- **metric-type type-value**
  - (OPTIONAL) Enter the keywords `metric-type` then one of the following:
    - `1 = OSPF External type 1`
    - `2 = OSPF External type 2`

- **route-map map-name**
  - (OPTIONAL) Enter the keywords `route-map` then the name of the route map.

- **tag tag-value**
  - (OPTIONAL) Enter the keyword `tag` then a number. The range is from 0 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)
- 9.8(2.0)
- 9.8(1.0)
- 9.8(0.0P6)
- 9.8(0.0P2)
- 9.7(0.0)
- 9.2(1.0)

**Description**

- Introduced on the S3148.
- Introduced on the S3100 series.
- Introduced on the Z9100-ON.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the S6000-ON.
- Introduced on the Z9500.
### Version Description

- **9.0.2.0**
  - Introduced on the S6000.
- **8.3.19.0**
  - Introduced on the S4820T.
- **8.3.11.1**
  - Introduced on the Z9000.
- **8.3.7.0**
  - Introduced on the S4810.
- **7.8.1.0**
  - Added support for Multi-Process OSPF.
- **7.6.1.0**
  - Introduced on the S-Series.
- **7.5.1.0**
  - Introduced on the C-Series.
- **pre- 6.1.1.1**
  - Introduced on the E-Series.

### Usage Information

To redistribute the default route (0.0.0.0/0), configure the `default-information originate` command. Despite removing an OSPF process globally, the OSPF process is not completely removed from the BGP configuration.

### Related Commands
- `default-information originate` — generate a default route into the OSPF routing domain.

### redistribute bgp

Redistribute BGP routing information throughout the OSPF instance.

**Syntax**

```
redistribute bgp as number [metric metric-value] | [metric-type type-value] | [tag tag-value]
```

To disable redistribution, use the `no redistribute bgp as number [metric metric-value] | [metric-type type-value] | [route-map map-name] [tag tag-value]` command.

**Parameters**

- **as number**
  - Enter the autonomous system number. The range is from 1 to 65535.
- **metric metric-value**
  - (OPTIONAL) Enter the keyword `metric` then the metric-value number. The range is from 0 to 16777214.
- **metric-type type-value**
  - (OPTIONAL) Enter the keywords `metric-type` then one of the following:
    - 1 = for OSPF External type 1
    - 2 = for OSPF External type 2
- **route-map map-name**
  - (OPTIONAL) Enter the keywords `route-map` then the name of the route map.
- **tag tag-value**
  - (OPTIONAL) Enter the keyword `tag` to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.

**Defaults**

None

**Command Modes**

`ROUTER OSPF`
redistribute isis

Redistribute IS-IS routing information throughout the OSPF instance.

Syntax

redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]

To disable redistribution, use the no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value] command.

Parameters

tag

(OPTIONAL) Enter the name of the IS-IS routing process.

level-1

(OPTIONAL) Enter the keywords level-1 to redistribute only IS-IS Level-1 routes.

level-1-2

(OPTIONAL) Enter the keywords level-1-2 to redistribute both IS-IS Level-1 and Level-2 routes.

level-2

(OPTIONAL) Enter the keywords level-2 to redistribute only IS-IS Level-2 routes.

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique. If you use this command on an OSPF router process, which is already active (that is, has neighbors), a prompt reminding you that changing the router-id brings down the existing OSPF adjacency. The new router ID is effective at the next reload.

**Example**

```
Dell(conf)# router ospf 100
Dell(config-router_ospf)# router-id 1.1.1.1
Changing router-id will bring down existing OSPF adjacency [y/n]:
Dell(config-router_ospf)# show config
!
  router ospf 100
  router-id 1.1.1.1
Dell(config-router_ospf)# no router-id
Changing router-id will bring down existing OSPF adjacency [y/n]:
Dell#
```
**router ospf**

To configure an OSPF instance, enter ROUTER OSPF mode.

**Syntax**
```
router ospf process-id [vrf {vrf name}]
```

To clear an OSPF instance, use the `no router ospf process-id` command.

**Parameters**
- **process-id**
  - Enter a number for the OSPF instance. The range is from 1 to 65535.
- **vrf name**
  - (Optional) Enter the VRF process identifier to tie the OSPF instance to the VRF. All network commands under this OSPF instance are then tied to the VRF instance.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

</tr>
</tbody>
</table>

**Usage Information**
You must have an IP address assigned to an interface to enter ROUTER OSPF mode and configure OSPF. You can create only one OSPFv2 process per VRF.
**show config**

Display the non-default values in the current OSPF configuration.

**Syntax**

```
show config
```

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Example**

```
Dell(conf-router_ospf)# show config
!
router ospf 3
passive-interface 0 GigabitEthernet 1/1
Dell(conf-router_ospf)#
```
**show ip ospf**

Display information on the OSPF process configured on the switch.

### Syntax

```
show ip ospf [process-id | vrf vrf name]
```

### Parameters

- **process-id**
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- **vrf vrf name**
  - Show only the OSPF information tied to the VRF process.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.
The following describes the `show ip ospf` command shown in the following example.

<table>
<thead>
<tr>
<th>Line Beginning with</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Routing Process...”</td>
<td>Displays the OSPF process ID and the IP address associated with the process ID.</td>
</tr>
<tr>
<td>“Supports only...”</td>
<td>Displays the number of Type of Service (TOS) routes supported.</td>
</tr>
<tr>
<td>“SPF schedule...”</td>
<td>Displays the delay and hold time configured for this process ID.</td>
</tr>
<tr>
<td>“Convergence Level”</td>
<td></td>
</tr>
<tr>
<td>“Min LSA....”</td>
<td>Displays the intervals set for LSA transmission and acceptance.</td>
</tr>
<tr>
<td>“Number of...”</td>
<td>Displays the number and type of areas configured for this process ID.</td>
</tr>
</tbody>
</table>

**Example**

```
Dell# show ip ospf 10
Routing Process ospf 10 with ID 1.1.1.1 Virtual router default-vrf
Supports only single TOS (TOS0) routes
SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
  Area BACKBONE (0)
    Number of interface in this area is 1
    SPF algorithm executed 205 times
    Area ranges are
Dell#
```

**Related Commands**
- `show ip ospf database` — display information about the OSPF routes configured.
- `show ip ospf interface` — display the OSPF interfaces configured.
- `show ip ospf neighbor` — display the OSPF neighbors configured.

**show ip ospf asbr**

Display all autonomous system boundary router (ASBR) routers visible to OSPF.

**Syntax**

```
show ip ospf [process-id | vrf vrf-name] asbr
```

**Parameters**

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

To isolate problems with external routes, use this command. In OSPF, external routes are calculated by adding the LSA cost to the cost of reaching the ASBR router. If an external route does not have the correct cost, use this command to determine if the path to the originating router is correct. The display output is not sorted in any order.

**NOTE:** ASBRs that are not in directly connected areas are also displayed.

You can determine if an ASBR is in a directly connected area (or not) by the flags. For ASBRs in a directly connected area, E flags are set. In the following example, router 1.1.1.1 is in a directly connected area since the Flag is E/-/-/. For remote ASBRs, the E flag is clear (-/-/-/).

### Example

```
Dell# show ip ospf 1 asbr
RouterID Flags Cost Nexthop   Interface Area
3.3.3.3   -/-/-/  2   10.0.0.2   Gi 1/1    1
1.1.1.1   E/-/-/  0   0.0.0.0    -         1
Dell#
```

### show ip ospf database

Display all LSA information. If you do not enable OSPF on the switch, no output is generated.

**Syntax**

```
show ip ospf process-id [vrf vrf-name] database [database-summary]
```
### Parameters

- **process-id**
  Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- **vrf vrf-name**
  Enter the keyword vrf and then the name of the VRF to view LSA information on OSPF processes corresponding to that VRF.

- **database-summary**
  (OPTIONAL) Enter the keywords database-summary to display the number of LSA types in each area and the total number of LSAs.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

### Related Commands

- `show ip ospf database asbr-summary` — display only ASBR summary LSA information.

### show ip ospf database asbr-summary

Display information about autonomous system (AS) boundary LSAs.

#### Syntax

```
show ip ospf [process-id | vrf vrf-name] database asbr-summary [link-state-id] [adv-router ip-address]
```

#### Parameters

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- `link-state-id` (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network’s IP address for Type 3 LSAs or Type 5 LSAs
  - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
adv-router ip-address (OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes

- EXEC
- EXEC Privilege

Command History

<td>LS Type</td>
<td>Displays the LSA's type.</td>
</tr>
<tr>
<td>Link State ID</td>
<td>Displays the Link State ID.</td>
</tr>
<tr>
<td>Advertising Router</td>
<td>Identifies the advertising router's ID.</td>
</tr>
</tbody>
</table>
### Field Description

- **Checksum**: Displays the Fletcher checksum of the LSA's complete contents.
- **Length**: Displays the length in bytes of the LSA.
- **Network Mask**: Displays the network mask implemented on the area.
- **TOS**: Displays the Type of Service (TOS) options. Option 0 is the only option.
- **Metric**: Displays the LSA metric.

### Example

Dell# show ip ospf 100 database asbr-summary

```
OSPF Router with ID (1.1.1.10) (Process ID 100)
  Summary Asbr (Area 0.0.0.0)
  LS age: 1437
  Options: (No TOS-capability, No DC, E)
  LS type: Summary Asbr
  Link State ID: 103.1.50.1
  Advertising Router: 1.1.1.10
  LS Seq Number: 0x8000000f
  Checksum: 0x8221
  Length: 28
  Network Mask: /0
    TOS: 0 Metric: 2
LS age: 473
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 104.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000010
Checksum: 0x4198
Length: 28
--More--
```

### Related Commands

- `show ip ospf database` — display OSPF database information.

## show ip ospf database external

Display information on the AS external (type 5) LSAs.

### Syntax

```
show ip ospf [process-id | vrf vrf-name] database external [link-state-id] [adv-router ip-address]
```

### Parameters

- **process-id**: Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**: Enter the keyword vrf followed by the name of the VRF to view information on AS external LSAs corresponding to the OSPF processes that are tied to a specific VRF.
- **link-state-id**: (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
the network's IP address for Type 3 LSAs or Type 5 LSAs
- the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

```
adv-router ip-address
```

(OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Dell#
```
show ip ospf database network

Display the network (type 2) LSA information.

Syntax

show ip ospf [process-id] database network [link-state-id] [adv-router ip-address]

Parameters

process-id
Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

link-state-id
(Optional) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:

- the network’s IP address for Type 3 LSAs or Type 5 LSAs
- the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

adv-router ip-address
(Optional) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes

- EXEC
- EXEC Privilege

        LS Seq Number: 0x80000007

Open Shortest Path First (OSPFv2 and OSPFv3)  | 1159
show ip ospf database nssa-external

Display NSSA-External (type 7) LSA information.

Syntax
show ip ospf [process-id | vrf vrf-name] database nssa-external [link-state-id] [adv-router ip-address]

Parameters
- process-id: Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- vrf vrf-name: Enter the keyword vrf followed by the name of the VRF to view NSSA-External LSA information corresponding to the OSPF process that is tied to a specific VRF.
- link-state-id: (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network's IP address for Type 3 LSAs or Type 5 LSAs
  - the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- adv-router ip-address: (OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes
- EXEC
- EXEC Privilege

Command History

### show ip ospf database opaque-area

Display the opaque-area (type 10) LSA information.

**Syntax**

```
show ip ospf [process-id | vrf vrf-name] database opaque-area [link-state-id] [adv-router ip-address]
```

**Parameters**

- **process-id**
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to view opaque-area LSA information corresponding to the OSPF process that is tied to a specific VRF.

- **link-state-id**
  - (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
    - the network’s IP address for Type 3 LSAs or Type 5 LSAs
    - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
    - the default destination (0.0.0.0) for Type 5 LSAs

- **adv-router ip-address**
  - (OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version | Description
---|---
9.10(0.0) |Introduced on the S3148.
9.8(2.0) |Introduced on the S3100 series.
9.8(1.0) |Introduced on the Z9100-ON.
9.8(0.0P5) |Introduced on the S4048-ON.
9.8(0.0P2) |Introduced on the S3048-ON.
9.7(0.0) |Introduced on the S6000-ON.
9.2(1.0) |Introduced on the Z9500.
9.0.2.0 |Introduced on the S6000.
8.3.19.0 |Introduced on the S4820T.
8.3.11.1 |Introduced on the Z9000.
8.3.7.0 |Introduced on the S4810.
7.8.1.0 |Added support for Multi-Process OSPF.
7.6.1.0 |Introduced on the S-Series.
7.5.1.0 |Introduced on the C-Series.
pre-6.1.1.1 |Introduced on the E-Series.

Usage Information

The following describes the `show ip ospf process-id database opaque-area` command shown in the following example.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LS Age</td>
<td>Displays the LSA’s age.</td>
</tr>
<tr>
<td>Options</td>
<td>Displays the optional capabilities available on router. The following options can be found in this item:</td>
</tr>
<tr>
<td></td>
<td>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</td>
</tr>
<tr>
<td></td>
<td>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</td>
</tr>
<tr>
<td></td>
<td>• E or No E is displayed on whether the originating router can accept AS External LSAs.</td>
</tr>
<tr>
<td>LS Type</td>
<td>Displays the LSA’s type.</td>
</tr>
<tr>
<td>Link State ID</td>
<td>Displays the Link State ID.</td>
</tr>
<tr>
<td>Advertising Router</td>
<td>Identifies the advertising router’s ID.</td>
</tr>
<tr>
<td>Checksum</td>
<td>Displays the Fletcher checksum of the LSA’s complete contents.</td>
</tr>
<tr>
<td>Length</td>
<td>Displays the length in bytes of the LSA.</td>
</tr>
<tr>
<td>Opaque Type</td>
<td>Displays the Opaque type field (the first 8 bits of the Link State ID).</td>
</tr>
<tr>
<td>Opaque ID</td>
<td>Displays the Opaque type-specific ID (the remaining 24 bits of the Link State ID).</td>
</tr>
</tbody>
</table>

Example

Dell> show ip ospf 1 database opaque-area

OSPF Router with ID (3.3.3.3) (Process ID 1)
Type-10 Opaque Link Area (Area 0)
Related Commands

- `show ip ospf database` — display OSPF database information.

**show ip ospf database opaque-as**

Display the opaque-as (type 11) LSA information.

**Syntax**

```plaintext
show ip ospf process-id database opaque-as [link-state-id] [adv-router ip-address]
```

**Parameters**

- `process-id` (Required) Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- `link-state-id` (Optional) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network’s IP address for Type 3 LSAs or Type 5 LSAs
  - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- `adv-router ip-address` (Optional) Enter the keywords `adv-router` and the `ip-address` to display only the LSA information about that router.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell Networking OS Command Line Reference Guide**.

</table>
# show ip ospf database opaque-link

Display the opaque-link (type 9) LSA information.

## Syntax

```
show ip ospf [process-id | vrf vrf-name] database opaque-link [link-state-id] [adv-router ip-address]
```

## Parameters

- **process-id**: Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**: Enter the keyword `vrf` followed by the name of the VRF to view opaque-link LSA information corresponding to the OSPF process that is tied to a specific VRF.
- **link-state-id**: (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network’s IP address for Type 3 LSAs or Type 5 LSAs
  - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- **adv-router ip-address**: (OPTIONAL) Enter the keywords `adv-router` then the IP address of an Advertising Router to display only the LSA information about that router.

## Command Modes

- EXEC
- EXEC Privilege

## Related Commands

- `show ip ospf database` — display OSPF database information.

**Example**

```
Dell# show ip ospf 100 database router

OSPF Router with ID (1.1.1.10) (Process ID 100)

  Router (Area 0)

  LS age: 967
  Options: (No TOS-capability, No DC, E)
  LS type: Router
  Link State ID: 1.1.1.10
  Advertising Router: 1.1.1.10
  LS Seq Number: 0x8000012f
  Checksum: 0x3357
  Length: 144
  AS Boundary Router
  Area Border Router
  Number of Links: 10

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 192.68.129.1
    (Link Data) Router Interface address: 192.68.129.1
    Number of TOS metric: 0
    TOS 0 Metric: 1

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 192.68.130.1
    (Link Data) Router Interface address: 192.68.130.1
    Number of TOS metric: 0
    TOS 0 Metric: 1

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 192.68.142.2
    (Link Data) Router Interface address: 192.68.142.2
    Number of TOS metric: 0
    TOS 0 Metric: 1

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 192.68.141.2
    (Link Data) Router Interface address: 192.68.141.2
    Number of TOS metric: 0
    TOS 0 Metric: 1

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 192.68.140.2
```
Router Interface address: 192.68.140.2
Number of TOS metric: 0
TOS 0 Metric: 1

Link connected to: a Stub Network
(Link ID) Network/subnet number: 11.1.5.0

Related Commands
- show ip ospf database — display OSPF database information.

show ip ospf database summary

Display the network summary (type 3) LSA routing information.

Syntax
```
show ip ospf [process-id | vrf vrf-name] database summary [link-state-id]
[adv-router ip-address]
```

Parameters
- **process-id**
Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**
Enter the keyword vrf followed by the name of the VRF to view LSA routing information corresponding to the OSPF process that is tied to a specific VRF.
- **link-state-id**
(Optional) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network’s IP address for Type 3 LSAs or Type 5 LSAs
  - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- **adv-router ip-address**
(Optional) Enter the keywords adv-router then the IP address of an Advertising Router to display only the LSA information about that router.

Command Modes
- EXEC
- EXEC Privilege

<td>TOS</td>
<td>Displays the TOS options. Option 0 is the only option.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the LSA metrics.</td>
</tr>
</tbody>
</table>

### Example

Dell# show ip ospf 100 database summary

OSPF Router with ID (1.1.1.10) (Process ID 100)

Summary Network (Area 0.0.0.0)

LS age: 1551
Options: (No TOS-capability, DC, E)
LS type: Summary Network
Link State ID: 192.68.16.0
Advertising Router: 192.168.17.1
show ip ospf interface

Display the OSPF interfaces configured. If OSPF is not enabled on the switch, no output is generated.

Syntax

show ip ospf [process-id | vrf vrf-name] interface [interface]

Parameters

process-id

Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

vrf vrf-name

Enter the keyword vrf followed by the name of the VRF to show the OSPF processes that are tied to a specific VRF.

interface

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a Null interface, enter the keyword null then the Null interface number.
For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Example**

```
Dell> show ip ospf int

GigabitEthernet 1/7 is up, line protocol is up
  Internet Address 192.168.1.2/30, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DR, Priority 1
  Designated Router (ID) 192.168.253.2, Interface address 192.168.1.2
  Backup Designated Router (ID) 192.168.253.1, Interface address 192.168.1.1
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:02
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 192.168.253.1 (Backup Designated Router)

GigabitEthernet 1/8 is up, line protocol is up
  Internet Address 192.168.0.1/24, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DROTHER, Priority 1
  Designated Router (ID) 192.168.253.5, Interface address 192.168.0.4
  Backup Designated Router (ID) 192.168.253.3, Interface address 192.168.0.2
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:08
  Neighbor Count is 3, Adjacent neighbor count is 2
    Adjacent with neighbor 192.168.253.5 (Designated Router)
    Adjacent with neighbor 192.168.253.3 (Backup Designated Router)

Loopback 0 is up, line protocol is up
  Internet Address 192.168.253.2/32, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type LOOPBACK, Cost: 1
  Loopback interface is treated as a stub Host.
Dell>
```

## show ip ospf neighbor

Display the OSPF neighbors connected to the local router.

**Syntax**

```
show ip ospf [process-id | vrf vrf-name] neighbor
```

**Parameters**

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- `vrf vrf-name` Enter the keyword vrf followed by the name of the VRF to show information corresponding to the OSPF neighbors that are tied to a specific VRF.

**Command Modes** EXEC Privilege

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Added support for Multi-Process OSPF.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.1.1.1 Introduced on the E-Series.

Usage Information
The following describes the `show ip ospf process-id neighbor` command shown in the following example.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor ID</td>
<td>Displays the neighbor router ID.</td>
</tr>
<tr>
<td>Pri</td>
<td>Displays the priority assigned neighbor.</td>
</tr>
<tr>
<td>State</td>
<td>Displays the OSPF state of the neighbor.</td>
</tr>
<tr>
<td>Dead Time</td>
<td>Displays the expected time until the Dell OS declares the neighbor dead.</td>
</tr>
<tr>
<td>Address</td>
<td>Displays the IP address of the neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>Displays the interface type slot/port information.</td>
</tr>
<tr>
<td>Area</td>
<td>Displays the neighbor’s area (process ID).</td>
</tr>
</tbody>
</table>

Example
Dell# show ip ospf 34 neighbor

Neighbor ID Pri State   Dead Time Address  Interface Area
20.20.20.7   1 FULL/DR   00:00:32 182.10.10.3 Gi 1/1 0.0.0.2
192.10.10.2  1 FULL/DR   00:00:37 192.10.10.2 Gi 1/2 0.0.0.1
20.20.20.1   1 FULL/DROTHER00:00:36 192.10.10.4 Gi 1/3 0.0.0.1
Dell#
show ip ospf routes

Display routes OSPF calculates and stores in OSPF RIB.

Syntax

```
show ip ospf [process-id | vrf vrf-name] routes
```

Parameters

- **process-id**: Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**: Enter the keyword vrf followed by the name of the VRF to show the OSPF RIB information corresponding to the OSPF processes that are tied to a specific VRF.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series and E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command is useful in isolating routing problems between the OSPF and the RTM. For example, if a route is missing from the RTM/FIB but is visible from the display output of this command, the problem is with downloading the route to the RTM.

This command has the following limitations:
The display output is sorted by prefixes; intra-area ECMP routes are not displayed together.

For Type 2 external routes, Type 1 cost is not displayed.

**NOTE:** Starting with Version 9.4(0.0), the loopback IP address advertised to the neighbor is not displayed in the output because they are not accounted as inactive OSPF routes, whereas the loopback IP address is displayed until Dell Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the show ip ospf routes command displays the interface and area ID information of connected networks in addition to the other settings, whereas these details are not displayed until Dell Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the metric of E2 routes in the output is displayed as an external metric, whereas until Dell Networking OS Version 9.3(0.0), the number of hops to the ASBR for E2 routes are displayed in the output.

Example

```
Dell# show ip ospf 100 route

Prefix        Cost Nexthop   Interface Area  Type
1.1.1.1        1   0.0.0.0   Lo 0      0     Intra-Area
3.3.3.3        2   13.0.0.3  Gi 1/47   1     Intra-Area
13.0.0.0       1   0.0.0.0   Gi 1/47   0     Intra-Area
150.150.150.0  2   13.0.0.3  Gi 1/47   -     External
172.30.1.0     2   13.0.0.3  Gi 1/47   1     Intra-Area
Dell#
```

**show ip ospf statistics**

Display OSPF statistics.

`show ip ospf [process-id | vrf vrf-name] statistics global | [interface name (neighbor router-id)]`

**Parameters**

- **process-id**
  
  Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- **vrf vrf-name**

  Enter the keyword vrf followed by the name of the VRF to display statistics corresponding to the OSPF process that is tied to a specific VRF.

- **global**

  Enter the keyword global to display the packet counts received on all running OSPF interfaces and packet counts OSPF neighbors receive and transmit.

- **interface name**

  (OPTIONAL) Enter the keyword interface then one of the following interface keywords and slot/port or number information:

  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

- **neighbor router-id**

  (OPTIONAL) Enter the keyword neighbor then the neighbor’s router-id in dotted decimal format (A.B.C.D.).

**Defaults**

None
Command Modes

- EXEC
- EXEC Privilege

Open Shortest Path First (OSPFv2 and OSPFv3) | 1177
The show ip ospf process-id statistics command displays the error packet count received on each interface as:

- The hello-timer remaining value for each interface
- The wait-timer remaining value for each interface
- The grace-timer remaining value for each interface
- The packet count received and transmitted for each neighbor
- Dead timer remaining value for each neighbor
- Transmit timer remaining value for each neighbor
- The LSU Q length and its highest mark for each neighbor
- The LSR Q length and its highest mark for each neighbor

Example (Statistics)

Dell(conf-if-gi-1/6)# do show ip ospf statistics
Interface GigabitEthernet 1/6
Error packets (Receive statistics)
  Intf-Down 0 Non-Dr 0 Self-Org 0

  Hello 0 Wait 0 Grace 0
  Dead 39 Transmit 4
Queue Statistics
  LSU-Q-Len 0 LSU-Q-Wmark 1
  LSR-Q-Len 0 LSR-Q-Wmark 1

Dell(conf-if-gi-1/6)#

Related Commands

- clear ip ospf statistics — clear the packet statistics in all interfaces and neighbors.

show ip ospf timers rate-limit

Show the LSA currently in the queue waiting for timers to expire.

Syntax

show ip ospf [process-id] timers rate-limit
show ip ospf timers rate-limit

Display routers in directly connected areas.

Syntax

```
show ip ospf [process-id] topology
```

Parameters

`process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

</tr>
</tbody>
</table>

Usage Information

To isolate problems with inter-area and external routes, use this command. In OSPF inter-area and external routes are calculated by adding LSA cost to the cost of reaching the router. If an inter-area or external route is not of correct cost, the display can determine if the path to the originating router is correct or not.

Example

```
Dell# show ip ospf 1 topology
Router ID Flags Cost Nexthop   Interface Area
3.3.3.3    E/B/-/ 1  20.0.0.3  Gi 13/1   0
1.1.1.1    E/-/-/ 1  10.0.0.1  Gi 7/1    1
Dell#
```

**summary-address**

To advertise one external route, set the OSPF ASBR.

Syntax

```
summary-address ip-address mask [not-advertise] [tag tag-value]
```

To disable summary address, use the no summary-address ip-address mask command.

Parameters

- **ip-address** Specify the IP address in dotted decimal format of the address to summarize.
mask Specify the mask in dotted decimal format of the address to summarize.

not-advertise (OPTIONAL) Enter the keywords not-advertise to suppress that match the network prefix/mask pair.

tag tag-value (OPTIONAL) Enter the keyword tag then a value to match on routes redistributed through a route map. The range is from 0 to 4294967295.

Defaults Not configured.

Command Modes ROUTER OSPF

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>7.5(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information The area range command summarizes routes for the different areas.

With the not-advertise parameter configured, you can use this command to filter out some external routes. For example, if you want to redistribute static routes to OSPF, but you don't want OSPF to advertise routes with prefix 110.0, you can configure the summary-address 110.0 255.255.0.0 not-advertise to filter out all the routes fall in range 110.0/16.

Related Commands

- area range — summarize routes within an area.
timers spf

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

Syntax  
```
timers spf delay holdtime msec
```
To return to the default, use the `no timers spf` command.

Parameters

- **delay**
Enter a number as the delay. The range is from 0 to 2147483647. The default is 5 seconds.

- **holdtime**
Enter a number as the hold time. The range is from 0 to 2147483647. The default is 10 seconds.

- **msec**
Enter the keyword `msec` to specify the time interval value in milli seconds.

**NOTE:** If you do not specify the `msec` option, the timer values are considered as seconds.

Defaults

- delay = 5 seconds
- holdtime = 10 seconds

Command Modes

- ROUTER OSPFv2

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the keyword <code>msec</code>.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>

<tr>
<td>7.8.1.0</td>
<td>Added support for Multi-Process OSPF.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>
Version | Description
--- | ---
7.5.1.0 | Introduced on the C-Series.
pree-6.1.1.1 | Introduced on the E-Series.

**Usage Information**
Setting the delay and holdtime parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

**Example**
```
Dell# conf
Dell(conf)# router ospf 1
Dell(conf-router_ospf-1)# timer spf 2 5 msec
Dell(conf-router_ospf-1)# show config
!
router ospf 1
timers spf 2 5 msec
Dell(conf-router_ospf-1)# end
```

**timers throttle lsa all**
Configure LSA transmit intervals.

**Syntax**
```
timers throttle lsa all {start-interval | hold-interval | max-interval}
```
To return to the default, use the `no timers throttle lsa` command.

**Parameters**
- `start-interval`: Set the minimum interval between initial sending and resending the same LSA. The range is from 0 to 600,000 milliseconds.
- `hold-interval`: Set the next interval to send the same LSA. This interval is the time between sending the same LSA after the start-interval has been attempted. The range is from 1 to 600,000 milliseconds.
- `max-interval`: Set the maximum amount of time the system waits before sending the LSA. The range is from 1 to 600,000 milliseconds.

**Defaults**
- start-interval: 0 msec
- hold-interval: 5000 msec
- max-interval: 5000 msec

**Command Modes**
ROUTER OSPF

**Command History**

</tr>
</tbody>
</table>
LSAs are sent after the start-interval and then after hold-interval until the maximum interval is reached. In throttling, exponential backoff is used when sending same LSA, so that the interval is multiplied until the maximum time is reached. For example, if the start-interval 5000 and hold-interval 1000 and max-interval 100,000, the LSA is sent at 5000 msec, then 1000 msec, then 2000 msec, then 4000 until 100,000 msec is reached.

**timers throttle lsa arrival**

Configure the LSA acceptance intervals.

**Syntax**

```
timers throttle lsa arrival arrival-time
```

To return to the default, use the `no timers throttle lsa` command.

**Parameters**

- `arrival-time`
  
  Set the interval between receiving the same LSA repeatedly, to allow sufficient time for the system to accept the LSA. The range is from 0 to 600,000 milliseconds.

**Defaults**

```
1000 msec
```

**Command Modes**

- ROUTER OSPF

**Command History**

### OSPFv3 Commands

Open shortest path first version 3 (OSPFv3) for IPv6 is supported on the platform. The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) remain unchanged. However, OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis. Most changes were necessary to handle the increased address size of IPv6.

The Dell Networking implementation of OSPFv3 is based on IETF RFC 2740.

#### area authentication

Configure an IPsec authentication policy for OSPFv3 packets in an OFSPFv3 area.

**Syntax**

```plaintext
area area-id authentication ipsec spi number {MD5 | SHA1} [key-encryption-type] key
```

**Parameters**

- **area area-id**
  
  Area for which OSPFv3 traffic is to be authenticated. For area-id, you can enter a number. The range is from 0 to 4294967295.

- **ipsec spi number**
  
  Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.

- **MD5 | SHA1**
  
  Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).

- **key-encryption-type**
  
  (OPTIONAL) Specifies if the key is encrypted. The values are 0 (key is not encrypted) or 7 (key is encrypted).

- **key**

  Text string used in authentication.

  For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults**
Not configured.

**Command Modes**
ROUTER OSPFv3

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**
Before you enable IPsec authentication on an OSPFv3 area, you must first enable OSPFv3 globally on the router.
Configure the same authentication policy (same SPI and key) on each interface in an OSPFv3 link.
An SPI number must be unique to one IPsec security policy (authentication or encryption) on the router.

If you have enabled IPsec encryption in an OSPFv3 area with the area encryption command, you cannot use the area authentication command in the area at the same time.

The configuration of IPsec authentication on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area authentication policy that has been configured is applied to the interface.

To remove an IPsec authentication policy from an OSPFv3 area, enter the no area area-id authentication spi number command.

**Related Commands**
- ipv6 ospf authentication – configure an IPsec authentication policy on an OSPFv3 interface.
- show crypto ipsec policy – display the configuration of IPsec authentication policies.
area encryption

Configure an IPsec encryption policy for OSPFv3 packets in an OSPFv3 area.

Syntax

area area-id encryption ipsec spi number esp encryption-algorithm [key-encryption-type] key authentication-algorithm [key-encryption-type] key

Parameters

area area-id
Area for which OSPFv3 traffic is to be encrypted. For area-id, enter a number.
The range is from 0 to 4294967295.

ipsec spi number
Security Policy index (SPI) value that identifies an IPsec security policy.
The range is from 256 to 4294967295.

esp encryption-algorithm
Encryption algorithm used with ESP.
Valid values are: 3DES, DES, AES-CBC, and NULL.
For AES-CBC, only the AES-128 and AES-192 ciphers are supported.

key-encryption-algorithm
(OPTIONAL) Specifies if the key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in encryption.
The required lengths of a non-encrypted or encrypted key are:
3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC -32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.

authentication-algorithm
Specifies the authentication algorithm to use for encryption.
Valid values are MD5 or SHA1.

key-encryption-type
(OPTIONAL) Specifies if the authentication key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in authentication.
For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

null

Causes an encryption policy configured for the area to not be inherited on the interface.

**Defaults**
Not configured.

**Command Modes**
ROUTER OSPFv3

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

**Usage Information**
Before you enable IPsec encryption on an OSPFv3 interface, first enable OSPFv3 globally on the router. Configure the same encryption policy (same SPI and keys) on each interface in an OSPFv3 link.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router.

When you configure encryption for an OSPFv3 area with the `area encryption` command, you enable both IPsec encryption and authentication. However, when you enable authentication on an area with the `area authentication` command, you do not enable encryption at the same time.

If you have enabled IPsec authentication in an OSPFv3 area with the `area authentication` command, you cannot use the `area encryption` command in the area at the same time.

The configuration of IPsec encryption on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area encryption policy that has been configured is applied to the interface.

To remove an IPsec encryption policy from an interface, enter the `no area area-id encryption spi number` command.

**Related Commands**
- `ipv6 ospf encryption` — configure an IPsec encryption policy on an OSPFv3 interface.
- `show crypto ipsec policy` — display the configuration of IPsec encryption policies.
clear ipv6 ospf process

Reset an OSPFv3 router process without removing or re-configuring the process.

Syntax

```
clear ipv6 ospf [vrf vrf-name] process
```

Parameters

- `vrf vrf-name` (Optional) Enter the keyword vrf followed by the name of the VRF to clear IPv6 routes corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

debug ipv6 ospf bfd

Display debug information and interface types for bidirectional forwarding detection (BFD) on OSPF IPv6 packets.

Syntax

```
[no] debug ipv6 ospf bfd [interface]
```

Parameters

- `interface` (OPTIONAL) Enter one of the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

For a port channel interface, enter the keywords `port-channel` then a number.

For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

EXEC Privilege

**Command History**

**debug ipv6 ospf spf**

Display debug information for SPF timers on OSPF IPv6 packets.

**Syntax**

```
[no] debug ipv6 ospf spf
```

**Parameters**

`interface`

(OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
**default-information originate**

Configure the Dell Networking OS to generate a default external route into an OSPFv3 routing domain.

**Syntax**

```
default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]
```

To return to the default values, use the no default-information originate command.

**Parameters**

- **always**  
  (OPTIONAL) Enter the keyword always to specify that default route information must always be advertised.

- **metric metric-value**  
  (OPTIONAL) Enter the keyword metric then a number to configure a metric value for the route. The range is from 1 to 16777214.
metric-type type-value

(Optional) Enter the keywords metric-type then an OSPFv3 link state type of 1 or 2 for default routes. The values are:

- 1 = Type 1 external route
- 2 = Type 2 external route

route-map map-name

(Optional) Enter the keywords route-map then the name of an established route map.

Defaults

Disabled.

Command Modes

ROUTER OSPFv3

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1.(0.0) Introduced on the S4810 and Z9000.
8.3.19.0 Introduced on the S4820T.
7.8.1.0 Added support for C-Series.
7.4.1.0 Introduced on the E-Series.

Related Commands

- redistribute — redistribute routes from other routing protocols into OSPFv3.

graceful-restart grace-period

Enable OSPFv3 graceful restart globally by setting the grace period (in seconds) that an OSPFv3 router’s neighbors continues to advertise the router as adjacent during a graceful restart.

Syntax

graceful-restart grace-period seconds

To disable OSPFv3 graceful restart, enter no graceful-restart grace-period.

Parameters

seconds Time duration, in seconds, that specifies the duration of the restart process before OSPFv3 terminates the process. The range is from 40 to 1800 seconds.

Defaults

OSPFv3 graceful restart is disabled and functions in a helper-only role.
**Command Modes**

ROUTER OSPFv3

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(1.0) | Introduced on the Z9500.
9.1.(0.0) | Introduced on the S4810 and Z9000.
8.4.2.2 | Introduced on the E-Series.
8.3.19.0 | Introduced on the S4820T.

**Usage Information**

By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

To enable OSPFv3 graceful restart, enter the ipv6 router ospf command to enter OSPFv3 configuration mode and then configure a grace period using the graceful-restart grace-period command. The grace period is the length of time that OSPFv3 neighbors continue to advertise the restarting router as though it is fully adjacent. When graceful restart is enabled (restarting role), an OSPFv3 restarting expects its OSPFv3 neighbors to help when it restarts by not advertising the broken link.

When you enable the helper-reject role on an interface with the ipv6 ospf graceful-restart helper-reject command, you reconfigure OSPFv3 graceful restart to function in a “restarting-only” role. In a “restarting-only” role, OSPFv3 does not participate in the graceful restart of a neighbor.

**graceful-restart mode**

Specify the type of events that trigger an OSPFv3 graceful restart.

**Syntax**

graceful-restart mode {planned-only | unplanned-only}

To disable graceful restart mode, enter no graceful-restart mode.

**Parameters**

- **planned-only** *(OPTIONAL)* Enter the keywords planned-only to indicate graceful restart is supported in a planned restart condition only.
- **unplanned-only** *(OPTIONAL)* Enter the keywords unplanned-only to indicate graceful restart is supported in an unplanned restart condition only.

**Defaults**

OSPFv3 graceful restart supports both planned and unplanned failures.
Command Modes

Router OSPFv3

Usage Information

OSPFv3 graceful restart supports planned-only and/or unplanned-only restarts. The default is support for both planned and unplanned restarts.

- A planned restart occurs when you enter the redundancy force-failover rpm command to force the primary RPM to switch to the backup RPM. During a planned restart, OSPF sends out a Type-11 Grace LSA before the system switches over to the backup RPM.
- An unplanned restart occurs when an unplanned event causes the active RPM to switch to the backup RPM, such as when an active process crashes, the active RPM is removed, or a power failure happens. During an unplanned restart, OSPF sends out a Grace LSA when the backup RPM comes online.

By default, both planned and unplanned restarts trigger an OSPFv3 graceful restart. Selecting one or the other mode restricts OSPFv3 to the single selected mode.

ipv6 ospf area

Enable IPv6 OSPF on an interface.

Syntax

ipv6 ospf process-id area area-id

To disable OSPFv6 routing for an interface, use the no ipv6 ospf process-id area area-id command.

Parameters

process-id Enter the process identification number.
area area-id Specify the OSPF area. The range is from 0 to 65535.

Defaults

None

Command Modes

INTERFACE
ipv6 ospf authentication

Configure an IPsec authentication policy for OSPFv3 packets on an IPv6 interface.

Syntax
ipv6 ospf authentication {null | ipsec spi number (MD5 | SHA1) [key-encryption-type] key}

Parameters
- **null**: Causes an authentication policy configured for the area to not be inherited on the interface.
- **ipsec spi number**: Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.
- **MD5 | SHA1**: Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).
- **key-encryption-type**: (OPTIONAL) Specifies if the key is encrypted.
  - Valid values: 0 (key is not encrypted) or 7 (key is encrypted).
- **key**: Text string used in authentication.

For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).

For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

Defaults
Not configured.

Command Modes
INTERFACE
**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

**Usage Information**

Before you enable IPsec authentication on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same authentication policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec authentication policy from an interface, enter the no ipv6 ospf authentication spi number command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the no ipv6 ospf authentication null command.

**Related Commands**

- `area authentication` — configure an IPsec authentication policy for an OSPFv3 area.
- `show crypto ipsec policy` — display the configuration of IPsec authentication policies.
- `show crypto ipsec sa ipv6` — display the security associations set up for OSPFv3 interfaces in authentication policies.

**ipv6 ospf cost**

Explicitly specify the cost of sending a packet on an interface.

**Syntax**

```
ipv6 ospf interface-cost
```

**Parameters**

- `interface-cost` Enter a unsigned integer value expressed as the link-state metric. The range is from 1 to 65535.

**Defaults**

Default cost based on the bandwidth.

**Command Modes**

INTERFACE
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

Usage Information

In general, the path cost is calculated as:

\[10^8 / \text{bandwidth}\]

Using this formula, the default path cost is calculated as:

- GigabitEthernet — Default cost is 1
- TenGigabitEthernet — Default cost is 1
- Ethernet — Default cost is 10

ipv6 ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the time interval elapses, the neighboring routers declare the router down.

Syntax

ipv6 ospf dead-interval seconds

To return to the default time interval, use the no ipv6 ospf dead-interval command.

Parameters

- **seconds**
  
  Enter the time interval in seconds. The range is from 1 to 65535 seconds.

Defaults

40 seconds (Ethernet).

Command Modes

</tr>
</tbody>
</table>

**Usage Information**

By default, the dead interval is four times longer than the default hello-interval.

**Related Commands**

- `ipv6 ospf hello-interval` — specify the time interval between hello packets.

## `ipv6 ospf encryption`

Configure an IPsec encryption policy for OSPFv3 packets on an IPv6 interface.

**Syntax**

```
ipv6 ospf encryption {null | ipsec spi number esp encryption-algorithm [key-encryption-type] key authentication-algorithm [key-encryption-type] key}
```

**Parameters**

- `null` Causes an encryption policy configured for the area to not be inherited on the interface.
- `ipsec spi number` Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.
- `esp encryption-algorithm` Encryption algorithm used with ESP.
  
  Valid values are: 3DES, DES, AES-CBC, and NULL.
  
  For AES-CBC, only the AES-128 and AES-192 ciphers are supported.
- `key-encryption-type` (OPTIONAL) Specifies if the key is encrypted.
  
  Valid values: 0 (key is not encrypted) or 7 (key is encrypted).
- `key` Text string used in authentication.

The required lengths of a non-encrypted or encrypted key are:
3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC -32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.

**authentication-algorithm**

Specifies the authentication algorithm to use for encryption. Valid values are MD5 or SHA1.

**key-encryption-type** (OPTIONAL)

Specifies if the authentication key is encrypted.

Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

**key**

Text string used in authentication.

For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).

For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults**

Not configured.

**Command Modes**

INTERFACE

**Command History**

<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

**Usage Information**

Before you enable IPsec encryption on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same encryption policy (same SPI and key) on each OSPFV3 interface in a link.

To remove an IPsec encryption policy from an interface, enter the `no ipv6 ospf encryption spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFV3 area, enter the `no ipv6 ospf no ipv6 ospf encryption null` command.

**Related Commands**

- `area encryption` – configure an IPsec encryption policy for an OSPFV3 area.
- `show crypto ipsec policy` – display the configuration of IPsec encryption policies.
ipv6 ospf graceful-restart helper-reject

Configure an OSPFv3 interface to not act upon the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

Syntax
ipv6 ospf graceful-restart helper-reject

To disable the helper-reject role, enter no ipv6 ospf graceful-restart helper-reject.

Defaults
The helper-reject role is not configured.

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>

<td>8.4.2.2</td>
<td>Introduced on E-Series.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

Usage Information
By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

When configured in a helper-reject role, an OSPFV3 router ignores the Grace LSAs that it receives from a restarting OSPFV3 neighbor.

The graceful-restart role command is not supported in OSPFv3. When you enable the helper-reject role on an interface, you reconfigure an OSPFV3 router to function in a “restarting-only” role.
ipv6 ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

Syntax
ipv6 ospf hello-interval seconds
To return to the default time interval, enter no ipv6 ospf hello-interval.

Parameters
seconds
Enter the time interval in seconds as the time between hello packets. The range is from 1 to 65525 seconds.

Defaults
10 seconds (Ethernet).

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1(0.0) Introduced on the S4810 and Z9000.
7.8.1.0 Added support for the C-Series.
7.4.1.0 Introduced on the E-Series.
8.3.19.0 Introduced on the S4820T.

Usage Information
The time interval between hello packets must be the same for routers in a network.

Related Commands
- ipv6 ospf dead-interval — specify the time interval between hello packets was received from a router.
ipv6 ospf priority

To determine the Designated Router for the OSPFv3 network, set the priority of the interface.

Syntax
ipv6 ospf priority number
To return to the default time interval, use the no ipv6 ospf priority command.

Parameters
number Enter the number as the priority. The range is from 1 to 255.

Defaults
1

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.8.1.0</td>
<td>Added support for the C-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information
Setting a priority of 0 makes the router ineligible for election as a Designated Router or Backup Designated Router.
Use this command for interfaces connected to multi-access networks, not point-to-point networks.
ipv6 router ospf

Enable OSPF for IPv6 router configuration.

Syntax
ipv6 router ospf process-id [vrf vrf-name]
To exit OSPF for IPv6, use the no ipv6 router ospf process-id command.

Parameters

- **process-id**: Enter the process identification number. The range is from 1 to 65535.
- **vrf vrf-name**: (Optional) Enter the keyword vrf followed by the name of the VRF to install IPv6 routes in that VRF.

Defaults
None

</table>

maximum-paths

Enable the software to forward packets over multiple paths.

Syntax
maximum-paths number
To disable packet forwarding over multiple paths, use the `no maximum-paths` command.

**Parameters**

- `number` Specify the number of paths. The range is from 1 to 64. The default is 8 paths.

**Defaults**

- 8

**Command Modes**

- ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**passive-interface**

Disable (suppress) sending routing updates on an interface.

**Syntax**

`passive-interface interface`

To enable sending routing updates on an interface, use the `no passive-interface interface` command.

**Parameters**

- `interface` Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
**Defaults**

Enabled, that is sending of routing updates are enabled by default.

**Command Modes**

- ROUTER OSPF for OSPFv2
- ROUTER OSPFv3 for OSPFv3

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.1.(0.0)</td>
<td>Introduced support for OSPFv3 on the S4810 and Z9000.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Added support for the C-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

By default, no interfaces are passive. Routing updates are sent to all interfaces on which the routing protocol is enabled.

If you disable the sending of routing updates on an interface, the particular address prefix continues to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

OSPFv3 for IPv6 routing information is not sent or received through the specified router interface. The specified interface address appears as a stub network in the OSPFv3 for IPv6 domain.

On configuring suppression using the passive-interface command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

---

**redistribute**

Redistribute into OSPFv3.

**Syntax**

```
redistribute {bgp as number}{connected | static}[metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]
```

To disable redistribution, use the no redistribute {connected | static} command.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bgp as number</code></td>
<td>Enter the keyword <code>bgp</code> then the autonomous system number. The range is from 1 to 65535.</td>
</tr>
<tr>
<td><code>connected</code></td>
<td>Enter the keyword <code>connected</code> to redistribute routes from physically connected interfaces.</td>
</tr>
<tr>
<td><code>static</code></td>
<td>Enter the keyword <code>static</code> to redistribute manually configured routes.</td>
</tr>
<tr>
<td><code>metric metric-value</code></td>
<td>Enter the keyword <code>metric</code> then the metric value. The range is from 0 to 16777214. The default is 20.</td>
</tr>
</tbody>
</table>
| `metric-type type-value` | (OPTIONAL) Enter the keywords `metric-type` then the OSPFv3 link state type of 1 or 2 for default routes. The values are:  
  - 1 for a type 1 external route  
  - 2 for a type 2 external route  
  The default is 2. |
| `route-map map-name` | (OPTIONAL) Enter the keywords `route-map` then the name of an established route map. If the route map is not configured, the default is `deny` (to drop all routes). |
| `tag tag-value`    | (OPTIONAL) Enter the keyword `tag` to set the tag for routes redistributed into OSPFv3. The range is from 0 to 4294967295. The default is 0. |

### Defaults

Not configured.

### Command Modes

- ROUTER OSPF for OSPFv2
- ROUTER OSPFv3 for OSPFv3

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

### Usage Information

To redistribute the default route (x:x:x:x:x), use the `default-information originate` command.

### Related Commands

- `default-information originate` – configure default external route into OSPFv3.

---

### router-id

Designate a fixed router ID.

**Syntax**

```
router-id ip-address
```

To return to the previous router ID, use the `no router-id ip-address` command.

**Parameters**

- `ip-address`  
Enter the router ID in the dotted decimal format.

**Defaults**

The router ID is selected automatically from the set of IPv4 addresses configured on a router.

**Command Modes**

- ROUTER OSPF for OSPFv2
- ROUTER OSPFv3 for OSPFv3

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

- **Version**
  - 9.10(0.0) Introduced on the S3148.
  - 9.8(2.0) Introduced on the S3100 series.
  - 9.8(1.0) Introduced on the Z9100-ON.
  - 9.8(0.0P5) Introduced on the S4048-ON.
  - 9.8(0.0P2) Introduced on the S3048-ON.
  - 9.2(1.0) Introduced on the Z9500.
  - 9.1.(0.0) Introduced support for OSPFv3 on the S4810 and Z9000.
  - 8.3.19.0 Introduced on the S4820T.
  - 7.8.1.0 Added support for the C-Series.
show crypto ipsec policy

Display the configuration of IPsec authentication and encryption policies.

Syntax

show crypto ipsec policy [name name]

Parameters

name name (OPTIONAL) Displays configuration details about a specified policy.

Defaults

No default behavior or values.

Command Modes

EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1.(0.0) Introduced on the S4810 and Z9000.
8.4.2.0 Introduced on the E-Series.
8.3.19.0 Introduced on the S4820T.

Usage Information

The show crypto ipsec policy command output displays the AH and ESP parameters configured in IPsec security policies, including the SPI number, keys, and algorithms used.
When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

**Related Commands**

- `show crypto ipsec sa ipv6` - displays the IPsec security associations used on OSPFv3 interfaces.

**Example**

```
Dell# show crypto ipsec policy

Crypto IPSec client security policy data
Policy name : OSPFv3-1-502
Policy refcount : 1
Inbound ESP SPI : 502 (0x1F6)
Outbound ESP SPI : 502 (0x1F6)
Inbound ESP Auth Key : 123456789a123456789b123456789c12
Outbound ESP Auth Key : 123456789a123456789b123456789c12
Inbound ESP Cipher Key :
Outbound ESP Cipher Key :
Transform set : esp-3des esp-md5-hmac

Crypto IPSec client security policy data
Policy name : OSPFv3-0-501
Policy refcount : 1
Inbound ESP SPI : 501 (0x1F5)
Outbound ESP SPI : 501 (0x1F5)
Inbound ESP Auth Key :
Outbound ESP Auth Key :
Inbound ESP Cipher Key :
Outbound ESP Cipher Key :
Transform set : esp-128-aes esp-sha1-hmac
```

</table>
show crypto ipsec sa ipv6

Display the IPsec security associations (SAs) used on OSPFv3 interfaces.

Syntax

```
show crypto ipsec sa ipv6 [interface interface]
```

Parameters

- `interface interface` (OPTIONAL) Displays information about the SAs used on a specified OSPFv3 interface, where `interface` is one of the following values:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

No default behavior or values.

Command Modes

- EXEC
- EXEC Privilege

Command History

**show crypto ipsec sa ipv6 Command Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>IPv6 interface</td>
</tr>
<tr>
<td>Link local address</td>
<td>IPv6 address of interface</td>
</tr>
</tbody>
</table>
### Field Description

**IPSecv6 policy name**
Name of the IPsec security policy applied to the interface.

**inbound/outbound ah**
Authentication policy applied to inbound or outbound traffic.

**inbound/outbound esp**
Encryption policy applied to inbound or outbound traffic.

**spi**
Security policy index number used to identify the policy.

**transform**
Security algorithm that is used to provide authentication, integrity, and confidentiality.

**in use settings**
Transform that the SA uses (only transport mode is supported).

**replay detection support**
Y: An SA has enabled the replay detection feature.
N: The replay detection feature is not enabled.

**STATUS**
ACTIVE: The authentication or encryption policy is enabled on the interface.

### show ipv6 ospf database
Display information in the OSPFv3 database, including link-state advertisements (LSAs).

**Syntax**
```
show ipv6 ospf [process-number] [vrf vrf-name] database [database-summary | grace-lsa]
```

**Parameters**

**process-number**
Enter the OSPF process number.

**vrf vrf-name**
(Optional) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.

**database-summary**
(Optional) Enter the keywords database-summary to view a summary of database LSA information.

**grace-lsa**
(Optional): Enter the keywords grace-lsa to display the Type-11 Grace LSAs sent and received on an OSPFv3 router.

**Defaults**
None

**Command Modes**
EXEC

EXEC Privilege

**Command History**

show ipv6 ospf interface

View OSPFv3 interface information.

Syntax

```
show ipv6 ospf [process-number] [vrf vrf-name] [interface]
```

Parameters

- **process-number**
  - Enter the OSPF process number.

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.

  ✠ **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.

- **interface**
  - (OPTIONAL) Enter one of the following keywords and slot/port or number information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.
    - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

```
None
```

</tr>
</tbody>
</table>

Usage Information
If you enable BFD at the global level, show ipv6 ospf interface shows the BFD provisioning.

If you enable BFD at the interface level, show ipv6 ospf interface shows the BFD interval timers.

Example
Dell# show ipv6 ospf 3 interface gigabitethernet 1/2
GigabitEthernet 1/2 is up, line protocol is up
  Link Local Address fe80::201:e8ff:fe17:5bbd, Interface ID 67420217
  Area 0, Process ID 1, Instance ID 0, Router ID 11.1.1.1
  NetworkType BROADCAST, Cost: 1, Passive: No
  Transmit Delay is 100 sec, State DR, Priority 1
  Interface is using OSPF global mode BFD configuration.
  Designated router on this network is 11.1.1.1 (local)
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 1, Retransmit 5

Dell#

show ipv6 ospf neighbor
Display the OSPF neighbor information on a per-interface basis.

Syntax
show ipv6 ospf [process-number] [vrf vrf-name] neighbor [interface]

Parameters
process-number Enter the OSPF process number.
vrf vrf-name

(Optional) Enter the keyword vrf followed by the name of the VRF to display OSPF neighbors corresponding to that VRF.

NOTE: If you do not specify this option, neighbors corresponding to the default VRF are displayed.

interface

(Optional) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

None

Command Modes

EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.2(1.0) Introduced on the Z9500.

9.1.(0.0) Introduced support for OSPFv3 on the S4810 and Z9000.

8.3.19.0 Introduced on the S4820T.

7.8.1.0 Added support for the C-Series.

7.4.1.0 Introduced on the E-Series.

Example

Dell# show ipv6 ospf 3 neighbor gi 1/2

Neighbor ID Pri State Dead Time Interface ID Interface
63.114.8.36 1 FULL/DR 00:00:38 4 Gi 1/2

Dell#
**timers spf**

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

**Syntax**

```
timers spf delay holdtime msec
```

To return to the default, use the `no timers spf` command.

**Parameters**

- **delay**
  - Enter a number as the delay. The range is from 0 to 2147483647. The default is 5 seconds. When configured in milli seconds, 100 is the least value that is allowed to be configured.

- **holdtime**
  - Enter a number as the hold time. The range is from 0 to 2147483647. The default is 10 seconds. When configured in milli seconds, 200 is the least value that is allowed to be configured.

- **msec**
  - Enter the keyword `msec` to specify the time interval value in milli seconds.

  **NOTE:** If you do not specify the `msec` option, the timer values are considered as seconds.

**Defaults**

- delay = 5 seconds
- holdtime = 10 seconds

**Command Modes**

- ROUTER OSPFv3 for OSPFv3 and ROUTER OSPFv2 for OSPFv2

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the keyword <code>msec</code>.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.8(0.0)</td>
<td>Introduced on the S6000-ON, S6000, S4820T, S4810, S5000.</td>
</tr>
</tbody>
</table>

**Usage Information**

Setting the `delay` and `holdtime` parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

**Example**

```
Dell# conf
Dell(conf)# ipv6 router ospf 1
Dell(conf-ipv6-router_ospf)# timer spf 2 5 msec
Dell(conf-ipv6-router_ospf)# show config
```

ipv6 router ospf 1
 timers spf 2 5 msec
Dell(conf-ipv6-router_ospf)#
Dell(conf-ipv6-router_ospf)# end
Dell#
Policy-based Routing (PBR)

Policy-based routing (PBR) allows you to apply routing policies to specific interfaces. To enable PBR, create a redirect list and apply it to the interface. After the redirect list is applied to the interface, all traffic passing through the interface is subject to the rules defined in the redirect list. PBR is supported by the Dell Networking OS.

You can apply PBR to physical interfaces and logical interfaces (such as a link aggregation group [LAG] or virtual local area network [VLAN]). Trace lists and redirect lists do not function correctly when you configure both in the same configuration.

1. **NOTE:** Apply PBR to Layer 3 interfaces only.
2. **NOTE:** For more information, see Content Addressable Memory (CAM).

Topics:
- description
- ip redirect-group
- ip redirect-list
- permit
- redirect
- seq
- show cam pbr
- show ip redirect-list

### description

Add a description to this redirect list.

**Syntax**

```
description {description}
```

To remove the description, use the `no description {description}` command.

**Parameters**

- **description**
  
  Enter a description to identify the IP redirect list (16 characters maximum).

**Defaults**

None

**Command Modes**

REDIRECT-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
### ip redirect-group

Apply a redirect list (policy-based routing) on an interface. You can apply multiple redirect lists to an interface by entering this command multiple times.

#### Syntax

```
ip redirect-group redirect-list-name test [l2-switch]
```

To remove a redirect list from an interface, use the `no ip redirect-group name` command.

#### Parameters

- **redirect-list-name**: Enter the name of a configured redirect list.
- **l2-switch**: Enter the keyword `l2-switch` to enable PBR on Layer2 (switched) traffic.

#### Defaults

None

#### Command Modes

INTERFACE (conf-if-vl-)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version Description

- **9.11(2.0P2)**: Introduced the `l2-switch` attribute.
- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.

#### Related Commands

- `ip redirect-list` - enable an IP Redirect List.
**Usage Information**

You can apply any number of redirect-groups to an interface. A redirect list can contain any number of configured rules. These rules include the next-hop IP address where the incoming traffic is to be redirected.

If the next hop address is reachable, traffic is forwarded to the specified next hop. Otherwise, the normal routing table is used to forward traffic. When a redirect-group is applied to an interface and the next-hop is reachable, the rules are added into the PBR CAM region. When incoming traffic hits an entry in the CAM, the traffic is redirected to the corresponding next-hop IP address specified in the rule.

**NOTE:** Apply the redirect list to physical, VLAN, or LAG interfaces only.

The Layer2 PBR option matches the layer2 traffic flow. If you un-configure this option, then the Layer2 traffic is not matched. You can apply the `l2-switch` option to redirect Layer2 traffic only on a VLAN interface. This VLAN interface must be configured with an IP address for ARP resolution.

**NOTE:** The `l2-switch` option that redirects Layer2 traffic is applicable only on VLAN interfaces.

The Layer3 routing is not affected on the same interface on which Layer2 PBR is applied. The port from which Layer2 packets egress and the destination MAC are re-written from static ARP. Layer 2 packets with the re-written destination MAC are forwarded through the outgoing port on the same incoming VLAN interface. The `l2-switch` option ensures that the outgoing VLAN and MAC-SA are changed and TTL is not decremented.

**Related Commands**

- `show cam pbr` — display the content of the PBR CAM.
- `show ip redirect-list` — display the redirect-list configuration.

### ip redirect-list

Configure a redirect list and enter REDIRECT-LIST mode.

**Syntax**

```plaintext
ip redirect-list redirect-list-name
```

To remove a redirect list, use the `no ip redirect-list` command.

**Parameters**

- `redirect-list-name` Enter the name of a redirect list.

**Defaults**

None

**Command Modes**

permit

Configure a permit rule. A permit rule excludes the matching packets from PBR classification and routes them using conventional routing.

Syntax

```plaintext
permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]
```

To remove the rule, use one of the following:

- If you know the filter sequence number, use the `no seq sequence-number` syntax command.
- You can also use the `no permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]` command.

Parameters

- **ip-protocol-number**
  - Enter a number from 0 to 255 for the protocol identified in the IP protocol header.
- **protocol-type**
  - Enter one of the following keywords as the protocol type:
    - `icmp` for internet control message protocol
    - `ip` for any internet protocol
    - `tcp` for transmission control protocol
    - `udp` for user datagram protocol
- **source**
  - Enter the IP address of the network or host from which the packets were sent.
- **mask**
  - Enter a network mask in /prefix format (/x).
- **any**
  - Enter the keyword `any` to specify that all traffic is subject to the filter.
host ip-address

Enter the keyword host then the IP address to specify a host IP address.

destination

Enter the IP address of the network or host to which the packets are sent.

bit (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags:

- ack = acknowledgement
- fin = finish (no more data from the user)
- psh = push function
- rst = reset the connection
- syn = synchronize sequence number
- urg = urgent field

operator (OPTIONAL) For TCP and UDP parameters only. Enter one of the following logical operand:

- eq = equal to
- neq = not equal to
- gt = greater than
- lt = less than
- range = inclusive range of ports (you must specify two ports for the port command parameter.)

Defaults

None

</table>
**redirect**

Configure a rule for the redirect list.

**Syntax**

```
redirect {ip-address | slot/port} | tunnel tunnel-id}[track <obj-id>] {ip-protocol-number | protocol-type [bit]} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator]
```

To remove this filter, use one of the following:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- You can also use the `no redirect {ip-address | slot/port} | tunnel tunnel-id}[track <obj-id>] {ip-protocol-number [bit] | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator]` command.

**Parameters**

- **redirect**
  - Enter the keyword `redirect` to assign the sequence to the redirect list.
- **ip-address**
  - Enter the IP address of the forwarding router.
- **slot/port**
  - Enter the keyword `slot / port` followed by the slot/port information.
- **tunnel**
  - Enter the keyword `tunnel` to configure the tunnel setting.
- **tunnel-id**
  - Enter the keyword `tunnel-id` to redirect the traffic.
- **track**
  - Enter the keyword `track` to enable the tracking.
- **track <obj-id>**
  - Enter the keyword `track <obj-id>` to track `object-id`.
- **ip-protocol-number**
  - Enter a number from 0 to 255 for the protocol identified in the IP protocol header.
- **protocol-type**
  - Enter one of the following keywords as the protocol type:
    - `icmp` for internet control message protocol
    - `ip` for any internet protocol
    - `tcp` for transmission control protocol
    - `udp` for user datagram protocol
- **bit**
  - (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags:
    - `ack` = acknowledgement
    - `fin` = finish (no more data from the user)
    - `psh` = push function
    - `rst` = reset the connection
    - `syn` = synchronize sequence number
    - `urg` = urgent field
- **source**
  - Enter the IP address of the network or host from which the packets were sent.
- **mask**
  - Enter a network mask in /prefix format (/x).
Configure a filter with an assigned sequence number for the redirect list.

**Syntax**

```
seq sequence-number {permit | redirect {ip-address | tunnel tunnel-id}{track <obj-id>} } {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operator] {source-
```
port source-port| source-port-range start-port - end-port] {destination-port
destination-port| destination-port-range start-port - end-port}

To delete a filter, use the no seq sequence-number command.

Parameters

- **sequence-number**: Enter a number from 1 to 65535.
- **permit**: Enter the keyword permit assign the sequence to the permit list.
- **redirect**: Enter the keyword redirect to assign the sequence to the redirect list.
- **ip-address**: Enter the keyword IP address of the forwarding router.
- **tunnel**: Enter the keyword tunnel to configure the tunnel setting.
- **tunnel-id**: Enter the keyword tunnel-id to redirect the traffic.
- **track**: Enter the keyword track to enable the tracking.
- **track <obj-id>**: Enter the keyword track <obj-id> to track object-id.
- **ip-protocol-number**: Enter the keyword ip-protocol-number then the number from 0 to 255 for the protocol identified in the IP protocol header.
- **protocol-type**: Enter one of the following keywords as the protocol type:
  - icmp for internet control message protocol
  - ip for any internet protocol
  - tcp for transmission control protocol
  - udp for user datagram protocol
- **source**: Enter the IP address of the network or host from which the packets were sent.
- **mask**: Enter a network mask in /prefix format (/x).
- **any**: Enter the keyword any to specify that all traffic is subject to the filter.
- **host ip-address**: Enter the keyword host then the IP address to specify a host IP address.
- **destination**: Enter the IP address of the network or host to which the packets are sent.
- **bit**: (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags:
  - ack = acknowledgement
  - fin = finish (no more data from the user)
  - psh = push function
  - rst = reset the connection
  - syn = synchronize sequence number
  - urg = urgent field
- **operator**: (OPTIONAL) For the TCP and UDP parameters only. Enter one of the following logical operand:
  - eq = equal to
  - neq = not equal to
  - gt = greater than
  - lt = less than
- range = inclusive range of ports (you must specify two ports for the port command parameter.)

**source port**
Enter the keywords source-port then the port number to be matched in the ACL rule in the ICAP rule.

**destination-port**
Enter the keywords destination-port then the port number to be matched in the ACL rule in the ICAP rule.

**source-port-range**
Enter the keywords Source-port-range then the range of the start port to end port to be matched in the ACL rule in the ICAP rule.

**destination-port-range**
Enter the keywords destination-port-range then the range of the start port to end port to be matched in the ACL rule in the ICAP rule.

**show cam pbr**

Display the PBR CAM content.

**Syntax**

```
show cam pbr {interface interface | stack-unit slot-number port-set number [pipeline number]} [summary]
```

**Parameters**

- **interface interface**
Enter the keyword interface then the name of the interface.

- **stack-unit number**
Enter the keyword stack-unit then the slot number.

- **port-set number**
Enter the keywords port-set then the port-pipe number.

- **summary**
Enter the keyword summary to view only the total number of CAM entries.

**Defaults**

none
show cam pbr

The show cam pbr command displays the PBR CAM content.

Example

Dell# show cam pbr stack-unit 1 port-set 0
TCP Flag: Bit 5 = URG, Bit 4 = ACK, Bit 3 = PSH, Bit 2 = RST,

Related Commands
- `ip redirect-group` — applies a redirect group to an interface.
- `show ip redirect-list` — displays the redirect-list configuration.

show ip redirect-list

View the redirect list configuration and the interfaces it is applied to.

Syntax

```
show ip redirect-list redirect-list-name
```

Parameters

- `redirect-list-name` Enter the name of a configured Redirect list.

Command Modes

- EXEC
- EXEC Privilege

Command History

- Version 9.10(0.0) Introduced on the S3148.

Dell#
```
The protocol-independent multicast (PIM) commands are supported by the Dell Networking operating software on the platform.
The following describes the IPv4 PIM-SIM commands.

IPv4 PIM-Sparse Mode Commands

The following describes the IPv4 PIM-sparse mode (PIM-SM) commands.

clear ip pim rp-mapping

The bootstrap router (BSR) feature uses this command to remove all or particular rendezvous point (RP) advertisement.

Syntax

```
clear ip pim [vrf vrf-name] rp-mapping [rp-address]
```

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.

  ![](notes.png)

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **rp-address** (OPTIONAL) Enter the RP address in dotted decimal format (A.B.C.D).

Command Modes

- EXEC Privilege

Command History

</table>
This command re-applies the RP mapping logic for all the groups learnt by the node. Any stale information corresponding to the existing mapping configuration is updated. The existing BSR cache and the *G's are deleted only if these entries are stale.

**clear ip pim tib**

Clear PIM tree information from the PIM database.

**Syntax**

```plaintext
clear ip pim [vrf vrf-name] tib [group]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `group` (OPTIONAL) Enter the multicast group address in dotted decimal format (A.B.C.D).

**Command Modes**

- EXEC Privilege

**Command History**

</tbody>
</table>
Version Description
7.8.1.0 Introduced on the S-Series.

Usage Information
If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. The local VLT node sends a request to the peer VLT node to download multicast routes learned by the peer. Both local and synced routes are removed from the local VLT node multicast route table. The peer VLT node clears synced routes from the node.
If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.

debug ip pim

View IP PIM debugging messages.

Syntax
debug ip pim [vrf vrf-name] [bsr | events | group | packet [in | out] | register | state | timer [assert | hello | joinprune | register]]

To disable PIM debugging, use the no debug ip pim [vrf vrf-name] command or use the undebug all to disable all debugging command.

Parameters
vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.

NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

bsr (OPTIONAL) Enter the keyword bsr to view PIM Candidate RP/BSR activities.

events (OPTIONAL) Enter the keyword group to view PIM messages for a specific group.

group (OPTIONAL) Enter the keyword group to view PIM messages for a specific group.

packet [in | out] (OPTIONAL) Enter the keyword packet to view PIM packets. Enter one of the optional parameters:
  - in: to view incoming packets
  - out: to view outgoing packets

register (OPTIONAL) Enter the keyword register to view PIM register address in dotted decimal format (A.B.C.D).

state (OPTIONAL) Enter the keyword state to view PIM state changes.

timer [assert | hello | joinprune | register] (OPTIONAL) Enter the keyword timer to view PIM timers. Enter one of the optional parameters:
  - assert: to view the assertion timer
  - hello: to view the PIM neighbor keepalive timer
  - joinprune: to view the expiry timer (join/prune timer)
- register: to view the register suppression timer

**Defaults**
Disabled.

**ip pim bsr-border**

Define the border of PIM domain by filtering inbound and outbound PIM-BSR messages per interface.

**Syntax**
```
ip pim bsr-border
```

To return to the default value, use the `no ip pim bsr-border` command.

**Defaults**
Disabled.

**Command Modes**
INTERFACE

**Command History**

</tbody>
</table>

**Usage Information**

This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out. To clean the candidate RP advertisements, use the `clear ip pim rp-mapping` command.

**ip pim bsr-candidate**

To join the Bootstrap election process, configure the PIM router.

**Syntax**

```
ip pim [vrf vrf-name] bsr-candidate interface [hash-mask-length] [priority]
```

To return to the default value, use the `no ip pim bsr-candidate [vrf vrf-name]` command.

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure the PIM router on a VRF.
- **interface** Enter the following keywords and slot/port or number information:
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- **hash-mask-length** (OPTIONAL) Enter the hash mask length. The range is from zero (0) to 32. The default is 30.
- **priority** (OPTIONAL) Enter the priority used in Bootstrap election process. The range is from zero (0) to 255. The default is zero (0).

**Defaults**

Not configured.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant `Dell Networking OS Command Line Reference Guide`. 

---

**Note:**

- The `clear ip pim rp-mapping` command removes the RP mappings learned from a BSR. RP mappings that have been statically configured will not be removed by this command.
- If a PIM neighbor is up and the source DR has not sent a `Candidate RP List` message to the PIM neighbor, Dell Networking OS maintains the RP mapping information longer than expected. As a result, on a subsequent `show ip pim rp` command, the incorrect RP mapping information might be displayed. This issue is resolved in a subsequent Dell Networking OS release.
### ip pim dr-priority

Change the designated router (DR) priority for the interface.

**Syntax**

```
ip pim dr-priority priority-value
```

To remove the DR priority value assigned, use the `no ip pim dr-priority` command.

**Parameters**

- `priority-value` : Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is 1.

**Defaults**

1

</table>

### Usage Information

The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router.

### ip pim join-filter

Permit or deny PIM Join/Prune messages on an interface using an extended IP access list. This command prevents the PIM-SM router from creating state based on multicast source and/or group.

**Syntax**

```
ip pim [vrf vrf-name] join-filter ext-access-list [in | out]
```

To remove the access list, use the `no ip pim [vrf vrf-name] join-filter ext-access-list` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to permit or deny PIM join or prune messages on an interface associated with that VRF.
- `ext-access-list` Enter the name of an extended access list.

**Defaults**

none

**Command Modes**

INTERFACE

</tr>
</tbody>
</table>
Version Description
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.8.1.0 Introduced on the C-Series for the port-channels and the S-Series.
7.7.1.0 Introduced on the E-Series.

Usage Information
When you configure a join filter, it is applicable for both ingress and egress flows. There is no option to specify in or out parameters while configuring a join filter.

Example
Dell(conf)# ip access-list extended iptv-channels
Dell(config-ext-nacl)# permit ip 10.1.2.3/24 225.1.1.0/24
Dell(config-ext-nacl)# permit ip any 232.1.1.0/24
Dell(config-if-te-1/1)# ip pim join-filter iptv-channels
Dell(config-if-te-1/1)# ip pim join-filter iptv-channels

Related Commands
• ip access-list extended — configure an access list based on IP addresses or protocols.

ip pim ingress-interface-map

When the Dell Networking system is the RP, statically map potential incoming interfaces to (*,G) entries to create a lossless multicast forwarding environment.

Syntax
ip pim ingress-interface-map std-access-list

Parameters
std-access-list Enter the name of a standard access list.

Defaults
none

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.4.1.0 Introduced
Example

Dell(conf)# ip access-list standard map1
Dell(config-std-nacl)# permit 224.0.0.1/24
Dell(config-std-nacl)# exit
Dell(conf)# int gig 1/1
Dell(config-if-gi-1/1)# ip pim ingress-interface-map map1
Dell(config-if-gi-1/1)#

ip pim neighbor-filter

To prevent a router from participating in protocol independent multicast (PIM), configure this feature.

Syntax

ip pim [vrf vrf-name] neighbor-filter {access-list}

To remove the restriction, use the no ip pim [vrf vrf-name] neighbor-filter {access-list} command.

Parameters

vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to prevent that VRF from participating in PIM.

NOTE: Applies to specific VRF if input is provided, else applies to default VRF.

access-list Enter the name of a standard access list. Maximum 16 characters.

Defaults none

7.6.1.0 | Introduced on the E-Series.

**Usage Information**

Do not enter this command before creating the access-list.

### ip pim query-interval

Change the frequency of PIM Router-Query messages.

**Syntax**

```
ip pim query-interval seconds
```

To return to the default value, use the `no ip pim query-interval seconds` command.

**Parameters**

- `seconds`

Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is **30 seconds**.

**Defaults**

**30 seconds**

8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Introduced on the C-Series for the port-channels and the S-Series.
ip pim register-filter

To prevent a PIM source DR from sending register packets to an RP for the specified multicast source and group, use this feature.

Syntax

```
ip pim [vrf vrf-name] register-filter access-list
To return to the default, use the no ip pim [vrf vrf-name] register-filter access-list command.
```

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **access-list**

  Enter the name of an extended access list. Maximum 16 characters.

Defaults

Not configured.

Usage Information

The access name is an extended IP access list that denies PIM register packets to RP at the source DR based on the multicast and group addresses. Do not enter this command before creating the access-list.
**ip pim rp-address**

Configure a static PIM rendezvous point (RP) address for a group or access-list.

**Syntax**

```
ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]
```

To remove an RP address, use the `no ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `address` Enter the RP address in dotted decimal format (A.B.C.D).

- `group-address` Enter the keywords `group-address` then a group-address mask, in dotted decimal format (/xx), to assign that group address to the RP.

- `override` Enter the keyword `override` to override the BSR updates with static RP. The override takes effect immediately during enable/disable.
  - **NOTE:** This option is applicable to multicast group range.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

</table>
First-hop routers use this address by to send register packets on behalf of source multicast hosts. The RP addresses are stored in the order in which they are entered. The RP is chosen based on a longer prefix match for a group. The RP selection does not depend on dynamic or static RP assignments.

### ip pim rp-candidate

Configure a PIM router to send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR.

**Syntax**

```
ip pim [vrf vrf-name] rp-candidate {interface [priority] [acl-name]}
```

To return to the default value, use the `no ip pim [vrf vrf-name] rp-candidate {interface [priority]}` command.

**Parameters**

- **vrf vrf-name** *(OPTIONAL)* Enter the keyword `vrf` followed by the name of the VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **interface**

  Enter the following keywords and slot/port or number information:

  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

- **priority** *(OPTIONAL)* Enter the priority used in Bootstrap election process. The range is zero (0) to 255. The default is 192.

- **acl-name** *(OPTIONAL)* Enter the name of an ACL to configure a PIM router to act as an RP for a specific set of multicast group addresses that are defined in the ACL.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(0.0) | Introduced the `acl-name` parameter.
9.10(0.0) | Introduced on the S3148.
9.8(1.0) | Introduced on the Z9100-ON.
Version Description
9.7(0.0) Added support for VRF. Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.8.1.0 Introduced on the S-Series.
pre-6.1.1.1 Introduced on the E-Series.

Usage Information Priority is stored at BSR router when receiving a Candidate-RP-Advertisement.

ip pim sparse-mode

Enable PIM sparse mode and IGMP on the interface.

Syntax ip pim sparse-mode
To disable PIM sparse mode and IGMP, use the no ip pim sparse-mode command.

Defaults Disabled.

Command Modes INTERFACE

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.8.1.0 Introduced on the C-Series for the port-channels and the S-Series.
The interface must be enabled (the `no shutdown` command) and not have the `switchport` command configured. Multicast must also be enabled globally (using the `ip multicast-lag-hashing` command). PIM is supported on the port-channel interface.

**ip pim sparse-mode sg-expiry-timer**

Enable expiry timers globally for all sources.

**Syntax**

```
ip pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds [access-list-name]
```

To disable configured timers and return to default mode, use the `no ip pim [vrf vrf-name] sparse-mode sg-expiry-timer` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable expiry timer for all sources on that VRF.
  
  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `seconds` Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535.

- `access-list-name` (OPTIONAL) Enter the name of a previously configured Extended ACL to enable the expiry time to specified S.G entries.

**Defaults**

Disabled. The default expiry timer (with no times configured) is 210 sec.

**Command Modes**

This command configures an expiration timer for all S.G entries, unless they are assigned to an Extended ACL. Even though the FHR nodes act as RPs, these nodes still send Register encap messages to themselves and expect to receive a Register stop message (for Anycast RP support). As a result, if the DLT timer expires, SG is not deleted until the register state is deleted in the node. This register state expires 210 seconds after the last Null register is received.

**ip pim ssm-range**

Specify the SSM group range using an access list.

**Syntax**

```
ip pim [vrf vrf-name] ssm-range {access_list_name}
```

**Parameters**

<table>
<thead>
<tr>

</table>
Usage Information

Dell Networking OS supports standard access lists for the SSM range. You cannot use extended ACLs for configuring the SSM range. If you configure an extended ACL and then use in the `ip pim ssm-range {access list name}` configuration, an error is reported.

However, if you configure `ip pim ssm-range {access list name}` first and then configure the ACL as an Extended ACL, an error is not reported and the ACL is not applied to the SSM range.

Dell Networking OS-recommended best-practices are to configure the standard ACL, and then apply the ACL to the SSM range. After the SSM range is applied, the changes are applied internally without requiring clearing of the tree information base (TIB).

When the ACL rules change, the ACL and protocol-independent multicast (PIM) modules apply the new rules automatically.

When you configure the SSM range, Dell Networking OS supports SSM for configured group range as well as the default SSM range.

When you remove the SSM ACL, PIM SSM is supported for the default SSM range only.

### ip pim spt-threshold

To switch to the shortest path tree when the traffic reaches the specified threshold value, configure the PIM router.

**Syntax**
```
ip pim [vrf vrf-name] spt-threshold [value | infinity]
```

To return to the default value, use the `no ip pim [vrf vrf-name] spt-threshold [infinity]` command.

**Parameters**

- **value**
  
  (OPTIONAL) Enter the traffic value in kilobits per second. The default is 10 packets per second. A value of zero (0) causes a switchover on the first packet.

- **vrf vrf-name**
  
  (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure the PIM router on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **infinity**
  
  (OPTIONAL) Enter the keyword `infinity` to never switch to the source-tree.

**Defaults**

Not configured.

**Command Modes**

- **CONFIGURATION**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Usage Information

This command is applicable to last hop routers on the shared tree towards the rendezvous point (RP).

no ip pim snooping dr-flood

Disable the flooding of multicast packets to the PIM designated router.

Syntax

    no ip pim snooping dr-flood

To re-enable the flooding of multicast packets to the PIM designated router, use the ip pim snooping dr-flood command.

Defaults

Enabled.

Command Modes

    CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information

By default, when you enable PIM-SM snooping, a switch floods all multicast traffic to the PIM designated router (DR), including unnecessary multicast packets. To minimize the traffic sent over the network to the designated router, you can disable designated-router flooding.
When designated-router flooding is disabled, PIM-SM snooping only forwards the multicast traffic, which belongs to a multicast group for which the switch receives a join request, on the port connected towards the designated router.

If the PIM DR flood is not disabled (default setting):

- Multicast traffic is transmitted on the egress port towards the PIM DR if the port is not the incoming interface.
- Multicast traffic for an unknown group is sent on the port towards the PIM DR. When DR flooding is disabled, multicast traffic for an unknown group is dropped.

show ip pim bsr-router

View information on the Bootstrap router.

Syntax

show ip pim [vrf vrf-name] bsr-router

Parameters

vrf vrf-name

(Optional) Enter the keyword vrf followed by the name of the VRF to configure this setting on VRF.

NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History

</tbody>
</table>

The following describes the `show ip pim neighbor` command shown in the following example.

**Field** | **Description**
---|---
Neighbor address | Displays the IP address of the PIM neighbor.
Interface | List the interface type, with either slot/port information or ID (VLAN or Port Channel), on which the PIM neighbor was found.
Uptime/expires | Displays the amount of time the neighbor has been up then the amount of time until the neighbor is removed from the multicast routing table (that is, until the neighbor hold time expires).
Ver | Displays the PIM version number.
  - v2 = PIM version 2
DR prio/Mode | Displays the Designated Router priority and the mode.
  - 1 = default Designated Router priority (use the `ip pim dr-priority` command)
  - DR = Designated Router
  - S = Sparse mode

**Example**

```
Dell# show ip pim neighbor
Neighbor  Interface  Uptime/Expires  Ver  DR
Address   Prio/Mode
127.87.3.4 Gi 1/16   09:44:58/00:01:24  v2  1 / S
Dell#
```
show ip pim rp

View all multicast groups-to-RP mappings.

Syntax

```
show ip pim [vrf vrf-name] rp [mapping | group-address]
```

Parameters

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
- `mapping` (OPTIONAL) Enter the keyword `mapping` to display the multicast groups-to-RP mapping and information on how RP is learnt.
- `group-address` (OPTIONAL) Enter the multicast group address mask in dotted decimal format to view RP for a specific group.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

225.1.2.2      165.87.20.4
229.1.2.1      165.87.20.4
```

1254 | PIM-Sparse Mode (PIM-SM)
Example (Mapping)

Dell# show ip pim rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
 RP: 50.40.4.4, v2
Dell#

Example (Address)

Dell# show ip pim rp 229.1.2.1
Group RP
229.1.2.1 165.87.20.4
Dell#

show ip pim snooping interface

Display information on VLAN interfaces with PIM-SM snooping enabled.

Syntax

show ip pim snooping interface [vlan vlan-id]

Parameters

vlan vlan-id (OPTIONAL) Enter a VLAN ID to display information about a specified VLAN configured for PIM-SM snooping. The valid VLAN IDs range is from 1 to 4094.

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.5(0.1) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.4.1.1 Introduced on the E-Series.

Usage Information

The following describes the show ip pim snooping interface commands shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the VLAN interfaces with PIM-SM snooping enabled.</td>
</tr>
<tr>
<td>Ver/Mode</td>
<td>Displays the PIM version number for each VLAN interface with PIM-SM snooping enabled:</td>
</tr>
<tr>
<td></td>
<td>• v2 = PIM version 2</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
S | PIM Sparse mode
Nbr Count | Displays the number of neighbors learned through PIM-SM snooping on the interface.
DR Prio | Displays the Designated Router priority value configured on the interface (ip pim dr-priority command).
DR | Displays the IP address of the Designated Router for that interface.

**Example (#2)**
```
Dell# show ip pim snooping interface
Interface Ver Nbr Count DR Prio
Vlan 2 v2 3 1 165.87.32.2
Dell#
```

---

### show ip pim snooping neighbor

Display information on PIM neighbors learned through PIM-SM snooping.

**Syntax**
```
show ip pim snooping neighbor [vlan vlan-id]
```

**Parameters**
- **vlan vlan-id** (OPTIONAL) Enter a VLAN ID to display information about PIM neighbors that PIM-SM snooping discovered on a specified VLAN. The valid VLAN IDs range is from 1 to 4094.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
### show ip pim snooping neighbor

Display information about the PIM-SM-enabled neighbors discovered by the switch.

#### Syntax

```plaintext
show ip pim snooping neighbor
```

#### Parameters

- `vlan vlan-id` (OPTIONAL) Enter a VLAN ID to display neighbor information discovered on that VLAN. The valid VLAN IDs range is from 1 to 4094.
- `group-address` (OPTIONAL) Enter the group address in dotted decimal format to display information for a specified multicast group.
- `source-address` (OPTIONAL) Enter the source address in dotted decimal format to display information for a specified multicast source.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant `Dell Networking OS Command Line Reference Guide`.

<td>Displays the amount of time the entry has been in the PIM multicast route table.</td>
</tr>
<tr>
<td>expires</td>
<td>Displays the amount of time until the entry expires and is removed from the database.</td>
</tr>
<tr>
<td>RP</td>
<td>Displays the IP address of the RP/source for this entry.</td>
</tr>
<tr>
<td>flags</td>
<td>List the flags to define the entries:</td>
</tr>
<tr>
<td></td>
<td>• S = PIM Sparse Mode</td>
</tr>
<tr>
<td></td>
<td>• C = directly connected</td>
</tr>
<tr>
<td></td>
<td>• L = local to the multicast group</td>
</tr>
<tr>
<td></td>
<td>• P = route was pruned</td>
</tr>
<tr>
<td></td>
<td>• R = the forwarding entry is pointing toward the RP</td>
</tr>
<tr>
<td></td>
<td>• F = Dell Networking OS is registering this entry for a multicast source</td>
</tr>
<tr>
<td></td>
<td>• T = packets were received via Shortest Tree Path</td>
</tr>
<tr>
<td></td>
<td>• J = first packet from the last hop router is received and the entry is ready to switch to SPT</td>
</tr>
<tr>
<td></td>
<td>• K = acknowledge pending state</td>
</tr>
<tr>
<td>Incoming interface</td>
<td>Displays the reverse path forwarding (RPF) interface towards the RP/ source.</td>
</tr>
<tr>
<td>RPF neighbor</td>
<td>Displays the next hop from this interface towards the RP/source.</td>
</tr>
</tbody>
</table>

### Outgoing Interface List:
Lists the interfaces that meet one of the following criteria:
- a directly connect member of the Group
- statically configured member of the Group
- received a (*,G) Join message

### Example
```
Dell# show ip pim snooping tib

PIM Multicast Snooping Table
Flags: J/P - (*,G) Join/Prune, j/p - (S,G) Join/Prune
      SGR-P - (S,G,R) Prune
Timers: Uptime/Expires
*: Inherited port

(*, 225.1.2.1), uptime 00:00:01, expires 00:02:59, RP 165.87.70.1, flags: J
  Incoming interface: Vlan 2, RPF neighbor 0.0.0.0
  Outgoing interface list:
    GigabitEthernet 2/11 RPF 165.87.32.2 00:00:01/00:02:59
    GigabitEthernet 2/13 Upstream Port -/-

Dell# show ip pim snooping tib vlan 2 225.1.2.1 165.87.1.7
```
### PIM Multicast Snooping Table

Flags: J/P - (*,G) Join/Prune, j/p - (S,G) Join/Prune  
SGR-P - (S,G,R) Prune  
Timers: Uptime/Expires  
*: Inherited port

```
(165.87.1.7, 225.1.2.1), uptime 00:00:08, expires 00:02:52, flags: j

Outgoing interface list:  
GilabitEthernet 2/11 Upstream Port    -/-  
GilabitEthernet 2/13 DR Port          -/-  
GilabitEthernet 2/20 RPF 165.87.32.10 00:00:08/00:02:52
```

### show ip pim ssm-range

Display the non-default groups added using the SSM range feature.

#### Syntax

```
show ip pim [vrf vrf-name] ssm-range
```

#### Parameters

- **vrf vrf-name** *(OPTIONAL)* Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.

#### Defaults

none

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant **Dell Networking OS Command Line Reference Guide**.

</tr>
</tbody>
</table>
show ip pim summary

View information about PIM-SM operation.

Syntax

show ip pim [vrf vrf-name] summary

Parameters

vrf vrf-name

(Optional) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.

NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.5(0.1) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.4.1.1 Support for the display of PIM-SM snooping status was added on E-Series.
8.1.1.0 Introduced on the E-Series.
7.8.1.0 Introduced on the S-Series.

Dell#

**show ip pim tib**

View the PIM tree information base (TIB).

**Syntax**

```
show ip pim [vrf vrf-name] tib [group-address [source-address]]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  | NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

- `group-address` (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D).

- `source-address` (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D).
Command Modes

- EXEC
- EXEC Privilege

Command History

!
ip pim snooping enable
Dell#
```
Power over Ethernet (PoE)

Dell Networking OS supports Power over Ethernet (PoE) and Power over Ethernet Plus (PoE+) on S3100 series systems. Use the commands in this chapter to configure the Power over Ethernet (PoE) on the S3100 platforms.

Topics:
- advertise dot3-tlv
- advertise med power-via-mdi
- power budget global-threshold
- power inline
- power inline legacy
- power inline mode
- power inline restore
- power inline suspend
- show power detail
- show power inline

advertise dot3-tlv

Advertise dot3 TLVs (Type, Length, Value).

**S3100 series**

**Syntax**

advertise dot3-tlv {max-frame-size | power-via-mdi}

To remove advertised dot3-tlv, use the no advertise dot3-tlv {max-frame-size | power-via-mdi} command.

**Parameters**

- `max-frame-size` Enter the keywords max-frame-size to advertise the dot3 maximum frame size TLV.
- `power-via-mdi` Enter the keyword power-via-mdi to advertise IEEE 802.3 at power-via-mdi TLV.

**Defaults**

None

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
### Version Description

- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.7.1.0** Introduced on the S-Series.
- **7.6.1.0** Introduced on the C-Series.
- **7.4.1.0** Introduced on the E-Series.

### Usage Information

The `advertise dot3-tlv power-via-mdi` command enables the system to advertise IEEE 802.3 at power-via-mdi TLV to advertise its power negotiation capabilities with the powered devices via Link Layer Discovery Protocol (LLDP). You can configure this command either on a specific interface or globally.

### Example

```
Dell(conf)# int gigabitethernet 1/1
Dell(conf-if-gi-1/1)#protocol lldp
Dell(conf-if-gi-1/1-lldp)#advertise dot3-tlv power-via-mdi
Dell(conf-if-gi-1/1-lldp)#show config
!
protocol lldp
  advertise dot3-tlv power-via-mdi
Dell(conf-if-gi-1/1-lldp)#
```

### advertise med power-via-mdi

To advertise the Extended Power via MDI TLV, configure the system.

#### S3100 Series

**Syntax**

```
advertise med power-via-mdi
```

To return to the default, use the `no advertise med power-via-mdi` command.

**Defaults**

unconfigured.

**Command Modes**

CONFIGURATION (conf-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.7.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Advertise the Extended Power via MDI on all ports that are connected to an 802.3af powered, LLDP-MED endpoint device.

**Related Commands**

- `debug lldp interface` — debugs LLDP.
- `show lldp neighbors` — displays the LLDP neighbors.

**Example**

```
Dell(conf)#int gigabitethernet 1/1
Dell(conf-if-gi-1/1)#protocol lldp
Dell(conf-if-gi-1/1-lldp)#advertise med power-via-mdi
Dell(conf-if-gi-1/1-lldp)#show config
!
protocol lldp
   advertise med power-via-mdi
Dell(conf-if-gi-1/1-lldp)#
```

## power budget global-threshold

If the switch has an external power supply, this command allows the external power supply of the specified stack member to be used for powering PoE ports. Use this command to set a global threshold limit for the PoE power budget on a specified stack unit.

**Syntax**

```
power budget global-threshold stack-unit stack-unit-number threshold-value
```

**Parameters**

- `stack-unit stack-unit-number`  Enter the keyword `stack-unit` and the stack unit number. Range is from 1 to 12.
- `threshold-value`  Enter the power threshold limit value in percentage. Range is from 10 to 99. Default value is 99.

**Default**

None

<td>Increased the stacking range to 12 units in S3100 series.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

Usage Information

Configure a global threshold limit for the Power over Ethernet (PoE) power budget for a specified stack unit. A default power threshold value of 99% is configured when there is no threshold value configured.

Example

```
Dell(conf)#power budget global-threshold stack-unit 1 10
Dell(conf)#exit
Dell#show power detail stack-unit 1
```

Dell#

power inline

Use this command to enable inline power and configure maximum power allocation with priority for the powered device connected to an interface.

Syntax

```
power inline {max_milliwatts} | priority {critical | high | low}
```

To disable a device that has been enabled for PoE power supply, use the no power inline command.

Parameters

- **max_milliwatts** (OPTIONAL) Specify the maximum amount of inline power allocation to a powered device connected to the interface. Range is 440–30000 milliwatts (mWs). The default value is 30000 mWs.

  **NOTE:** The max_milliwatt configuration is effective only in Static mode.

- **priority** Enter the keyword priority to specify the PoE priority for the powered device connected to the interface. Default priority value is low.

  - **critical** Enter the keyword critical to set the PoE priority level as critical.
  - **high** Enter the keyword high to set the PoE priority level as high.
  - **low** Enter the keyword low to set the PoE priority as low.
The following is a list of the Dell Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

**Usage information**

The `power inline [max_milliwatts]` command enables inline power supply to an interface. You can specify the maximum amount of power allocation to a device in max-milliwatts from 440 to 30000 mW. If a specific power supply value is not configured, the default value 30,000 mW is configured as the maximum power for allocation to powered devices. You can disable the inline power supply to a port using the `no power inline` command.

The `power inline priority` command allows you to specify the power inline priority for an interface when a power shortage occurs. PoE is removed from ports configured with low priority first, then ports configured with high priority are disabled. The ports configured with critical priority are the last ports disabled during a power shortage. When two or more ports are configured with the same priority level, the ports with higher interface numbers are disabled first. For example, if ports 1, 2, 47, and 48 are all configured with a low priority and there is a shortage of inline power supply, PoE is first disabled on port 48, followed by port 47 and, then port 2. Port 1 (with the lowest interface number) takes precedence over all other ports and is disabled after all other ports are disabled.

**Example**

```plaintext
dell(conf)#interface gigabitethernet 1/1
dell(conf-if-gi-1/1)#power inline 30000
dell(conf-if-gi-1/1)#show power inline stack-unit 1
```

```plaintext
dell#show power inline stack-unit 1
Global inline power Threshold : 10
Power Reserved for inline Power: 95W
Total Inline Power Consumed: 0W
Remaining inline power Available: 95W
Power Management Mode: Static
Interface  Inline Power Max / Alloc  Inline Power Consumed  Class  Device  PoE Port  LLDP
Interface   (Watts)    (Watts)                Type  Priority  Support

Gi 1/1      -             30.00/0.00          0.00   NO_DEVICE   -       
Gi 1/1      high         -             -          -       -       -
Dell#
```

**power inline legacy**

Use this command to allocate inline power to the legacy devices on the specified stack unit.

**Syntax**

```
power inline legacy stack-unit unit number
```

**To disable the detection of legacy powered devices in a stack unit, use the `no power inline legacy stack-unit unit number` command.**

**Parameters**

- `stack-unit unit number` Enter the keyword `stack-unit` and the unit number. Range is 1 to 12.

**Defaults**

Enabled

**Command Modes**

CONFIGURATION
The following is a list of the Dell Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>

</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

Usage Information

The power inline legacy command allows the system to detect and allocate inline power to the legacy devices on a stack unit.

Example

```
Dell(conf)#power inline legacy stack-unit 1
```
power inline restore

You can use this command to enable the temporarily suspended PoE power supply to all the ports in a stack unit.

Syntax
power inline restore stack-unit unit number

Parameters
stack-unit unit Enter the keyword stack-unit and the stack-unit number. Range is from 1 to 12.
number

Defaults
None

Command Modes
EXEC

Command History
This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Increased the stacking range to 12 units in S3100 series.
Usage Information

The `power inline restore` command enables or restores the temporarily suspended PoE power supply to all the ports on a stack unit.

Example

Dell#power inline restore stack-unit 1

**power inline suspend**

You can use this command to disable PoE power supply to all the ports in a stack unit temporarily.

**Syntax**

```
power inline suspend stack-unit unit number
```

**Parameters**

- `stack-unit unit number`
  
Enter the keyword `stack-unit` and the stack unit number. Range is 1 to 12.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

<table>

<td>Increased the stacking range to 12 units in S3100 series.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>

Usage Information

The `power inline suspend` command temporarily disables PoE power supply to all the ports in the specified stack unit. You can use the `power inline restore` command to restore or enable the PoE power supply to the stack unit.

Example

Dell#power inline suspend stack-unit 1
Dell#show power inline stack-unit 1
% Error: Power to stack-unit 1 is in suspended state.
Dell#

**show power detail**

You can use this command to display the inline power consumption details for a specified stack unit.

**Syntax**

```
show power detail {stack-unit unit number}
```

**Parameters**

- `stack-unit unit number`
  
Enter the stack-unit keyword and the unit number. Range is 1 to 12.
show power inline

You can use this command to display the PoE power allocation on a specified stack unit or on an interface.

Syntax

show power inline 

Parameters

stack-unit number  Enter the keyword stack-unit and the stack unit number. Range is from 1 to 12.

interface interface SLOT/PORT[/SUBPORT]  Enter the interface keyword, and specify the interface type followed by the SLOT/PORT[/SUBPORT] numbers.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Dell#
```
Port Monitoring

The port monitoring feature allows you to monitor network traffic by forwarding a copy of each incoming or outgoing packet from one port to another port.

Important Points to Remember

- Port monitoring is supported on physical ports and logical interfaces, such as port channels and virtual local area networks (VLANs).
- The monitoring (destination, “MG”) and monitored (source, “MD”) ports must be on the same switch.
- In general, a monitoring port should have no ip address and no shutdown as the only configuration; Dell Networking OS permits a limited set of commands for monitoring ports; display them using the ? command. A monitoring port also may not be a member of a VLAN.
- A total of 4 MG may be configured in a single port-pipe.
- MG and MD ports can be reside anywhere across a port-pipe.
- The Dell Networking OS supports multiple source ports to be monitored by a single destination port in one monitor session.
- One monitor session can have only one MG port.

**NOTE:** The monitoring port should not be a part of any other configuration.

Topics:

- description
- erpm
- monitor multicast-queue
- monitor session
- rate-limit
- show config
- show monitor session
- show running-config
- source (port monitoring)

description

Enter a description of this monitoring session.

**Syntax**

description \{description\}

To remove the description, use the no description \{description\} command.

**Parameters**

- description
  
Enter a description regarding this session (80 characters maximum).

**Defaults**

- none

**Command Modes**

- CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Related Commands

- monitor session — enables a monitoring session.

### erpm

Configure the source and destination IP address for ERPM traffic.

**Syntax**

```
erpm source-ip ip-address dest-ip ip-address [gre-protocol value]
```

To remove the configuration, use the no erpm source-ip IP-address dest-ip IP-address [gre-protocol value] command.

**Parameters**

- `source-ip ip-address`
  - Enter the keywords source-ip then the source IP address in dotted decimal format.
- `destination-ip ip-address`
  - Enter the keywords dest-ip then the destination IP address in dotted decimal format.
- `gre-protocol value`
  - (OPTIONAL) Enter the keywords gre-protocol then the protocol type value for ERPM type monitor session. The range is from 1 to 65535.

**Command Modes**

- MONITOR SESSION (conf-mon-sess-session-ID)
monitor multicast-queue

Configure monitor QoS multicast queue ID.

Syntax

```
monitor multicast-queue queue-id
```

To remove the configuration, use the no monitor multicast-queue command.

Parameters

```
queue-id
```
Enter the QoS multicast queue ID. The range is from 0 to 9.

Defaults

```
queue-id: 0
```

Enable status: Disabled

Command Modes

CONFIGURATION

Example

```
Dell(conf)#monitor multicast-queue 7
```

Command History

Related Commands

`show running-config monitor session` — displays information about monitor configurations.
**monitor session**

Create a session for monitoring traffic with port monitoring.

**Syntax**

```
monitor session session-ID [type { rpm | erpm [set ip dscp dscp_value | set ip ttl ttl_value]}] [drop]
```

To delete a session, use the `no monitor session session-ID` command.

To delete all monitor sessions, use the `no monitor session all` command.

**Parameters**

- **session-ID**
  - Enter a session identification number. The range is from 0 to 65535.

- **type**
  - Specifies one of the following type:
    - rpm
    - erpm

- **rpm**
  - Creates a remote port monitoring (rpm) session.

- **erpm**
  - Creates an encapsulated remote port monitoring (erpm) session.

- **set ip dscp**
  - Configures the Differentiated Services Code Point (DSCP) value of the packets in the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default value, use the no form of this command.

  - **dscp_value**
    - DSCP value of the packets in the ERSPAN traffic. The range is from 0 to 63. The default value is 0.

- **set ip ttl**
  - Configures the IP time-to-live (TTL) value of the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default configuration, use the no form of this command.

  - **ttl_value**
    - IP TTL value of the ERSPAN traffic. The range is from 1 to 255. The default value is 255.

- **drop**
  - Monitors only the dropped packets in the Ingress.

**Defaults**

none

**Command Modes**

**rate-limit**

Configure the rate-limit to limit the mirrored packets.

**Syntax**

```
rate-limit  limit
```

To remove the limit, use the `no rate-limit  limit` command.

**Parameters**

- `limit`: Enter the rate-limit value. The range is from 0 to 40000 Megabits per second.

**Defaults**

60

7.4.1.0 Introduced on the E-Series.
```
Usage Information
The `monitoring` command is saved in the running configuration at the Monitor Session mode level and can be restored after a chassis reload.

Example
Dell# show running-config monitor session
! mon session 1
source GigabitEthernet 1/1 destination GigabitEthernet 1/2 direction rx
! monitor multicast-queue 7
Dell#

Related Commands
- `monitor session` — creates a monitoring session.
- `show monitor session` — displays a monitoring session.

source (port monitoring)
Configure a port monitor source.

Syntax
source {interface | range | any} destination interface direction (rx | tx | both)

To disable a monitor source, use the no source interface destination interface direction (rx | tx | both) command.

Parameters

source interface
Enter one of the following keywords and slot/port information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a VLAN interface enter the keyword VLAN followed by a number from 1 to 4094.
- For a port channel interface, enter the keywords port-channel then a number.

range
Enter the keyword range to specify the list of interfaces.

any
Enter the keyword any to specify all interfaces.

NOTE: This option is applicable only with drop monitor session.

destination
Enter the keyword destination to specify the destination interface.

interface
Enter one of the following keywords and slot/port information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
- For a port channel interface, enter the keywords port-channel then a number.

**direction (rx | tx | both)**

Enter the keyword direction then one of the packet directional indicators.

- **rx**: to monitor receiving packets only.
- **tx**: to monitor transmitting packets only.
- **both**: to monitor both transmitting and receiving packets.

**Defaults**

none

**Command Modes**

MONITOR SESSION (conf-mon-sess-session-ID)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Example**

```
Dell$ monitor session 0
source Port-channel 10 destination GigabitEthernet 1/3 direction tx
Dell$
```
The private VLAN (PVLAN) feature of the Dell Networking OS is supported on the platforms. Private VLANs extend the Dell Networking OS security suite by providing Layer 2 isolation between ports within the same private VLAN. A private VLAN partitions a traditional VLAN into subdomains identified by a primary and secondary VLAN pair. The Dell Networking OS private VLAN implementation is based on RFC 3069.

For more information, see the following commands. The command output is augmented in Dell Networking OS version 7.8.1.0 at later to provide PVLAN data:
- `show arp`
- `show vlan`

**Private VLAN Concepts**

**Primary VLAN:**
The primary VLAN is the base VLAN and can have multiple secondary VLANs. There are two types of secondary VLAN — community VLAN and isolated VLAN:
- A primary VLAN can have any number of community VLANs and isolated VLANs.
- Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports or trunk ports.

**Community VLAN:**
A community VLAN is a secondary VLAN of the primary VLAN:
- Ports in a community VLAN can talk to each other. Also, all ports in a community VLAN can talk to all promiscuous ports in the primary VLAN and vice versa.
- Devices on a community VLAN can communicate with each other using member ports, while devices in an isolated VLAN cannot.

**Isolated VLAN:**
An isolated VLAN is a secondary VLAN of the primary VLAN:
- Ports in an isolated VLAN cannot talk to each other. Servers would be mostly connected to isolated VLAN ports.
- Isolated ports can talk to promiscuous ports in the primary VLAN, and vice versa.

**Port Types:**
- *Community port* — a community port is a port that belongs to a community VLAN and is allowed to communicate with other ports in the same community VLAN and with promiscuous ports.
- *Isolated port* — an isolated port is a port that, in Layer 2, can only communicate with promiscuous ports that are in the same PVLAN.
- *Promiscuous port* — a promiscuous port is a port that is allowed to communicate with any other port type.
- *Trunk port* — a trunk port carries VLAN traffic across switches:
  - A trunk port in a PVLAN is always tagged.
  - A trunk port in Tagged mode carries primary or secondary VLAN traffic. The tag on the packet helps identify the VLAN to which the packet belongs.
A trunk port can also belong to a regular VLAN (non-private VLAN).

Topics:
- `ip local-proxy-arp`
- `private-vlan mode`
- `private-vlan mapping secondary-vlan`
- `switchport mode private-vlan`

## ip local-proxy-arp

Enable/disable Layer 3 communication between secondary VLANs in a private VLAN.

### Syntax

```
[no] ip local-proxy-arp
```

To disable Layer 3 communication between secondary VLANs in a private VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the primary VLAN.

To disable Layer 3 communication in a particular secondary VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the selected secondary VLAN.

**NOTE:** Even after you disable `ip-local-proxy-arp (use no ip-local-proxy-arp)` in a secondary VLAN, Layer 3 communication may happen between some secondary VLAN hosts, until the address resolution protocol (ARP) timeout happens on those secondary VLAN hosts.

### Defaults

Layer 3 communication is disabled between secondary VLANs in a private VLAN.

### Command Modes

INTERFACE VLAN

### Command History

**private-vlan mode**

Set PVLAN mode of the selected VLAN to community, isolated, or primary.

**Syntax**

```plaintext
[no] private-vlan mode {community | isolated | primary}
```

To remove the PVLAN configuration, use the `no private-vlan mode {community | isolated | primary}` command syntax.

**Parameters**

- **community**
  - Enter the keyword `community` to set the VLAN as a community VLAN.
- **isolated**
  - Enter the keyword `isolated` to configure the VLAN as an isolated VLAN.
- **primary**
  - Enter the keyword `primary` to configure the VLAN as a primary VLAN.

</tbody>
</table>
Version Description
7.8.1.0 Introduced on the C-Series and S-Series.

Usage Information
The VLAN:
- can be in only one mode, either community, isolated, or primary.
- mode to community or isolated even before associating it to a primary VLAN. This secondary VLAN continues to work normally as a normal VLAN even though it is not associated to a primary VLAN. (A syslog message indicates this.)
- must not have a port in it when VLAN mode is being set.

Only ports (and port channels) configured as promiscuous, host, or PVLAN trunk ports (as previously described) can be added to the PVLAN. No other regular ports can be added to the PVLAN.

After using this command to configure a VLAN as a primary VLAN, use the `private-vlan mapping secondary-vlan` command to map secondary VLANs to this VLAN.

Related Commands
- `private-vlan mapping secondary-vlan` — maps secondary VLANs to the selected primary VLAN.
- `switchport mode private-vlan` — sets PVLAN mode of the selected port.

private-vlan mapping secondary-vlan
Map secondary VLANs to the selected primary VLAN.

Syntax
```
[no] private-vlan mapping secondary-vlan vlan-list
```
To remove specific secondary VLANs from the configuration, use the `no private-vlan mapping secondary-vlan vlan-list` command syntax.

Parameters
- **vlan-list**
  Enter the list of secondary VLANs to associate with the selected primary VLAN. The list can be in comma-delimited or hyphenated-range format, following the convention for the range input.

Defaults
none

Command Modes
INTERFACE VLAN

Usage Information

The list of secondary VLANs can be:

- Specified in comma-delimited or hyphenated-range format.
- Specified with this command even before they have been created.
- Amended by specifying the new secondary VLAN to be added to the list.

Related Commands

- `private-vlan mode` — sets the mode of the selected VLAN to community, isolated, or primary.
- `switchport mode private-vlan` — sets PVLAN mode of the selected port.

**switchport mode private-vlan**

Set PVLAN mode of the selected port.

**Syntax**

```plaintext
[no] switchport mode private-vlan {host | promiscuous | trunk}
```

To remove PVLAN mode from the selected port, use the `no switchport mode private-vlan` command.

**Parameters**

- **host**
  - Enter the keyword `host` to configure the selected port or port channel as an isolated interface in a PVLAN.
- **promiscuous**
  - Enter the keyword `promiscuous` to configure the selected port or port channel as an promiscuous interface.
- **trunk**
  - Enter the keyword `trunk` to configure the selected port or port channel as a trunk port in a PVLAN.

**Defaults**

Disabled.

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

The assignment of the various PVLAN port types to port and port channel (LAG) interfaces is shown in the following example.

**Example**

```
Dell# conf
Dell(conf)# interface GigabitEthernet 2/1
Dell(conf-if-gi-2/1)# switchport mode private-vlan promiscuous

Dell(conf)# interface GigabitEthernet 2/2
Dell(conf-if-gi-2/2)# switchport mode private-vlan host

Dell(conf)# interface GigabitEthernet 2/3
Dell(conf-if-gi-2/3)# switchport mode private-vlan trunk

Dell(conf)# interface port-channel 10
Dell(conf-if-gi-2/3)# switchport mode private-vlan promiscuous
Dell(conf-if-gi-2/3)#
```

**Related Commands**

- `private-vlan mode` — sets the mode of the selected VLAN to community, isolated, or primary.
- `private-vlan mapping secondary-vlan` — sets the mode of the selected VLAN to primary and then associates the secondary VLANs to it.
Per-VLAN Spanning Tree Plus (PVST+)

The Dell Networking OS implementation of per-VLAN spanning tree plus (PVST+) is based on the IEEE 802.1w standard spanning tree protocol. Dell Networking OS supports PVST+ on the platform.

NOTE: For easier command line entry, the plus (+) sign is not used at the command line.

Topics:
- description
- disable
- extend system-id
- protocol spanning-tree pvst
- show spanning-tree pvst
- spanning-tree pvst
- spanning-tree pvst err-disable
- tc-flush-standard
- vlan bridge-priority
- vlan forward-delay
- vlan hello-time
- vlan max-age

description

Enter a description of the PVST+.

Syntax
description {description}

To remove the description, use the no description {description} command.

Parameters
- description

Enter a description to identify the spanning tree (80 characters maximum).

Defaults
none

Command Modes
- SPANNING TREE PVST+ (The prompt is ”config-pvst”)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **8.3.1.0**: Introduced.

### Example
```
Dell# conf
Dell(conf)# protocol spanning-tree pvst
Dell(conf-pvst)# no disable
Dell(conf-pvst)# vlan 2 bridge-priority 4096
Dell(conf-pvst)# vlan 3 bridge-priority 16384
Dell(conf-pvst)#
Dell(conf-pvst)# show config
!
protocol spanning-tree pvst
no disable
  vlan 2 bridge-priority 4096
  vlan 3 bridge-priority 16384
Dell#
```

### Usage Information
After you enable PVST+, the device runs an STP instance for each VLAN it supports.

### Related Commands
- `disable` — disables PVST+.
- `show spanning-tree pvst` — displays the PVST+ configuration.

### show spanning-tree pvst

View the Per-VLAN spanning tree configuration.

#### Syntax
```
show spanning-tree pvst [vlan vlan-id] [brief] [guard]
```

#### Parameters
- **vlan vlan-id** (OPTIONAL) Enter the keyword `vlan` then the VLAN ID. The range is 1 to 4094.
- **brief** (OPTIONAL) Enter the keyword `brief` to view a synopsis of the PVST+ configuration information.
- **interface** (OPTIONAL) Enter one of the interface keywords along with the slot/port information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Port Channel interface, enter the keyword `port-channel` then a number:
guard (OPTIONAL) Enter the keyword guard to display the type of guard enabled on a PVST interface and the current port state.

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Usage Information

The following describes the show spanning-tree pvst command shown in the following examples.

Field Description

**Interface Name** PVST interface.

**Instance** PVST instance.

**Sts** Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut).

**Guard Type** Type of STP guard configured (Root, Loop, or BPDU guard).

Example (Brief) Dell# show spanning-tree pvst vlan 3 brief

VLAN 3
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 4096, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 16384, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15

Interface | Designated
---|---
Name | PortID | Prio | Cost | Sts | Cost | Bridge ID | PortID
---|---|---|---|---|---|---|---
Gi 1/0 | 128.130 | 128 | 20000 | FWD | 20000 | 4096 | 0001.e801.6aa8 | 128.426

Gi 1/1 128.1223 128 20000 EDS 0 32768 0001.e800.a12b 128.1223

Example (Guard)  Dell# show spanning-tree pvst vlan 5 guard

Interface
Name   Instance Sts        Guard type
------------------------------
Gi 1/1 5       INCON (Root) Rootguard
Gi 1/2 5       FWD         Loopguard
Gi 1/3 5       EDS (Shut)  Bpdu guard

Related Commands  • spanning-tree pvst — configure PVST+ on an interface.

spanning-tree pvst

Configure a PVST+ interface with one of these settings: edge port with optional bridge port data unit (BPDU) guard, port disablement if an error condition occurs, port priority or cost for a VLAN range, loop guard, or root guard.

Syntax  spanning-tree pvst {edge-port [bpdu-guard [shutdown-on-violation]]} | err-disable | vlan vlan-range {cost number | priority value} | loopguard | rootguard

Parameters  edge-port
            Enter the keywords edge-port to configure the interface as a PVST+ edge port.

bpdu-guard
            Enter the keyword portfast to enable Portfast to move the interface into Forwarding mode immediately after the root fails.

            Enter the keyword bpdu-guard to disable the port when it receives a BPDU.
shutdown-on-violation  (OPTIONAL) Enter the keywords shutdown-on-violation to hardware disable an interface when a BPDU is received and the port is disabled.

err-disable  Enter the keywords err-disable to enable the port to be put into the error-disable state (EDS) if an error condition occurs.

vlan vlan-range  Enter the keyword vlan then the VLAN numbers. The range is from 1 to 4094.

cost number  Enter the keyword cost then the port cost value. The range is from 1 to 200000. Defaults:

  - 100 Mb/s Ethernet interface = 200000.
  - 1-Gigabit Ethernet interface = 20000.
  - 10-Gigabit Ethernet interface = 2000.
  - Port Channel interface with one 100 Mb/s Ethernet = 200000.
  - Port Channel interface with one 1 Gigabit Ethernet = 20000.
  - Port Channel interface with one 10 Gigabit Ethernet = 2000.
  - Port Channel with two 1 Gigabit Ethernet = 18000.
  - Port Channel with two 10 Gigabit Ethernet = 1800.
  - Port Channel with two 100 Mbps Ethernet = 180000.

priority value  Enter the keyword priority then the Port priority value in increments of 16. The range is from 0 to 240. The default is 128.

loopguard  (C-, S-, and E-Series only) Enter the keyword loopguard to enable loop guard on a PVST+ port or port-channel interface.

rootguard  (C-, S-, and E-Series only) Enter the keyword rootguard to enable root guard on a PVST+ port or port-channel interface.

Defaults  Not configured.

Command Modes  INTERFACE

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0)  Introduced on the S3148.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S6000-ON.
9.2(1.0)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.
8.4.2.1  Introduced the loopguard and rootguard options on the E-Series, C-Series, and S-Series.
The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into the Error Disable state if a BPDU appears, and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on a PVST switch, immediately transitions to the forwarding state. Only ports connected to end-hosts should be configured as an edge port. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable shutdown-on-violation, BPDUs are still sent to the route process module (RPM) CPU.

You cannot enable root guard and loop guard at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message is displayed: % Error: RootGuard is configured. Cannot configure LoopGuard.

When used in a PVST+ network, loop guard is performed per-port or per-port channel at a VLAN level. If no BPDUs are received on a VLAN interface, the port or port-channel transitions to a Loop-Inconsistent (blocking) state only for this VLAN.

Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

**Example**

```
Dell(conf-if-gi-1/1)# spanning-tree pvst vlan 3 cost 18000
Dell(conf-if-gi-1/1)# end
Dell(conf-if-gi-1/1)# show config
!
interface GigabitEthernet 1/1
   no ip address
   switchport
   spanning-tree pvst vlan 3 cost 18000
   no shutdown
Dell(conf-if-gi-1/1)#end

Dell#
```

**Related Commands**

- `show spanning-tree pvst` — views the PVST+ configuration.
spanning-tree pvst err-disable

Place ports in an Err-Disabled state if they receive a PVST+ BPDU when they are members an untagged VLAN.

Syntax

spanning-tree pvst err-disable cause invalid-pvst-bpdu

Defaults

Enabled; ports are placed in the Err-Disabled state if they receive a PVST+ BPDU when they are members of an untagged VLAN.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced.

Usage Information

Some non-Dell Networking systems which have hybrid ports participating in PVST+ transmit two kinds of BPDUs: an 802.1D BPDU and an untagged PVST+ BPDU. Dell Networking systems do not expect PVST+ BPDU on an untagged port. If this happens, Dell Networking OS places the port in the Error-Disable state. This behavior might result in the network not converging. To prevent Dell Networking OS from executing this action, use the no spanning-tree pvst err-disable command.

Related Commands

- show spanning-tree pvst — views the PVST+ configuration.
**tc-flush-standard**

Enable the MAC address flushing after receiving every topology change notification.

**Syntax**

tc-flush-standard

To disable, use the no tc-flush-standard command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

By default, Dell Networking OS implements an optimized flush mechanism for PVST+. This implementation helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn this knob command on to enable flushing MAC addresses after receiving every topology change notification.

**vlan bridge-priority**

Set the PVST+ bridge-priority for a VLAN or a set of VLANs.

**Syntax**

vlan vlan-range bridge-priority value
To return to the default value, use the no vlan bridge-priority command.

Parameters

Related Commands

- vlan forward-delay — changes the time interval before Dell Networking OS transitions to the Forwarding state.
- vlan hello-time — change the time interval between BPDUs.
- vlan max-age — changes the time interval before PVST+ refreshes.
- show spanning-tree pvst — displays the PVST+ configuration.

**vlan forward-delay**

Set the amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

**Syntax**

```
vlan vlan-range forward-delay seconds
```
To return to the default setting, use the `no vlan forward-delay` command.

**Parameters**

- `vlan vlan-range` Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.
- `forward-delay seconds` Enter the keywords `forward-delay` then the time interval, in seconds, that Dell Networking OS waits before transitioning PVST+ to the forwarding state. The range is from 4 to 30 seconds. The default is **15 seconds**.

**Defaults**

15 seconds

- `vlan max-age` — changes the time interval before PVST+ refreshes.
- `show spanning-tree pvst` — displays the PVST+ configuration.
**vlan max-age**

To maintain configuration information before refreshing that information, set the time interval for the PVST+ bridge.

Syntax

```
vlan vlan-range max-age seconds
```

To return to the default, use the `no vlan max-age` command.

Parameters

- `vlan vlan-range` Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.
- `max-age seconds` Enter the keywords `max-age` then the time interval, in seconds, that Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is **20 seconds**.

Defaults

**20 seconds**

- `vlan hello-time` — changes the time interval between BPDUs.
• `show spanning-tree pvst` — displays the PVST+ configuration.
The Dell Networking OS commands for quality of service (QoS) include traffic conditioning and congestion control. QoS commands are not universally supported on all Dell Networking products, platform.

Topics:
- Global Configuration Commands
- Per-Port QoS Commands
- Policy-Based QoS Commands
- DSCP Color Map Commands

## Global Configuration Commands

There is only one global configuration QoS command.

### qos-rate-adjust

By default, while rate limiting, policing, and shaping, Dell Networking OS does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations. You can optionally include overhead fields in rate metering calculations by enabling QoS Rate Adjustment.

**Syntax**

```
qos-rate-adjustment overhead-bytes
```

**Parameters**

- `overhead-bytes` Include a specified number of bytes of packet overhead to include in rate limiting, policing, and shaping calculations. The range is from 1 to 31.

**Defaults**

QoS rate adjustment is disabled by default.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
</tbody>
</table>
Usage Information

By default, when rate policing and shaping, the system does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations.

Per-Port QoS Commands

Per-port QoS (port-based QoS) allows you to define the QoS configuration on a per-physical-port basis.

dot1p-priority

Assign a value to the IEEE 802.1p bits on the traffic this interface receives.

Syntax

dot1p-priority priority-value

To delete the IEEE 802.1p configuration on the interface, use the no dot1p-priority command.

Defaults

none

</table>
Version | Description  
--- | ---  
8.3.7.0 | Introduced on the S4810.  
7.5.1.0 | Introduced on the C-Series.  
pre-6.1.1.1 | Introduced on the E-Series.  

Usage Information

The `dot1p-priority` command changes the priority of incoming traffic on the interface. The system places traffic marked with a priority in the correct queue and processes that traffic according to its queue.

When you set the priority for a port channel, the physical interfaces assigned to the port channel are configured with the same value. You cannot assign the `dot1p-priority` command to individual interfaces in a port channel.

rate police

Police the incoming traffic rate on the selected interface.

Syntax

```
rate police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]] [vlan vlan-id]
```

Parameters

- `kbps`: Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- `committed-rate`: Enter the bandwidth in Mbps. The range is from 0 to 40000.
- `burst-KB`: (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is 50.
- `peak peak-rate`: (OPTIONAL) Enter the keyword `peak` then a number to specify the peak rate in Mbps. The range is from 0 to 40000.
- `vlan vlan-id`: (OPTIONAL) Enter the keyword `vlan` then a VLAN ID to police traffic to those specific VLANs. The range is from 1 to 4094.

Defaults

Granularity for `committed-rate` and `peak-rate` is Mbps unless you use the `kbps` option.

</table>
rate-shape

Shape the traffic output on the selected interface.

Syntax

rate shape [kbps] rate [burst-KB]

Parameters

- **kbps**: Enter the keyword kbps to specify the rate limit in Kilobits per second (Kbps). Enter the value in multiples of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).

- **rate**: The range is from 10 to 40000.

- **burst-KB**: (OPTIONAL) Enter the burst size in KB. The range is from 0 to 10000. The default is 50.

Defaults

Granularity for rate is Mbps unless you use the kbps option.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

### Usage Information

If traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

**NOTE:** When packets of size greater than 7000 bytes are expected to be received from the network, Dell Networking recommends that you configure the burst value to be more than 175 KB if you configured the rate shape. Such a setting ensures proper bandwidth sharing across queues.

### Related Commands

- `rate-shape` — shapes traffic output as part of the designated policy.

## service-class dot1p-mapping

Configure a service-class criterion based on a dot1p value.

### Syntax

```
service-class dot1p-mapping {dot1p0 queue | dot1p1 queue | dot1p2 queue | dot1p3 queue | dot1p4 queue | dot1p5 queue | dot1p6 queue | dot1p7 queue}
```

### Parameters

- `queue` Enter a value from 0 to 7.

### Defaults

For each dot1p Priority, the default CoS queue value is:

- Dot1p Priority: 0 1 2 3 4 5 6 7

### Command Modes

- `CONFIGURATION`
### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Usage Information

To apply dot1p-queue-mapping, use the `service-class dynamic dot1p` command.

### Related Commands

- `show qos dot1p-queue-mapping` — displays the dot1p priority to queue mapping on the switch.

### service-class dynamic dot1p

Honor all 802.1p markings on incoming switched traffic on an interface (from INTERFACE mode) or on all interfaces (from CONFIGURATION mode). A CONFIGURATION mode entry supersedes an INTERFACE mode entry.

#### Syntax

```
service-class dynamic dot1p
```

To return to the default setting, use the `no service-class dynamic dot1p` command.

#### Defaults

All dot1p traffic is mapped to Queue 0 unless you enable the `service-class dynamic dot1p` command. The default mapping is as follows:

<table>
<thead>
<tr>
<th>dot1p</th>
<th>Queue ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>3</td>
</tr>
<tr>
<td>6</td>
<td>3</td>
</tr>
</tbody>
</table>

<td>Expanded the command to permit configuration on port channels.</td>
</tr>
<tr>
<td>6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

To honor all incoming 802.1p markings on incoming switched traffic on the interface, enter this command. By default, this facility is not enabled (that is, the 802.1p markings on incoming traffic are not honored).

You can apply this command on both physical interfaces and port channels. When you set the service-class dynamic for a port channel, the physical interfaces assigned to the port channel are automatically configured; you cannot assign the service-class dynamic command to individual interfaces in a port channel.

- All dot1p traffic is mapped to Queue 0 unless you enable the service-class dynamic dot1p command on an interface or globally.
- Layer 2 or Layer 3 service policies supersede dot1p service classes.
**strict-priority queue**

Configure a unicast queue as a strict-priority (SP) queue.

**Syntax**

```
strict-priority queue unicast number
```

**Parameters**

- `unicast number`: Enter the keyword `unicast` then the queue number. The range is from 1 to 3.

**Defaults**

None

**Command Modes**

Configuration

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

After you configure a unicast queue as strict-priority, that particular queue, on the entire chassis, is treated as a **strict-priority queue**. Traffic for a strict priority is scheduled before any other queues are serviced. For example, if you send 100% line rate traffic over the SP queue, it starves all other queues on the ports on which this traffic is flowing.

**Policy-Based QoS Commands**

Policy-based traffic classification is handled with class maps. These maps classify data traffic into one of eight classes. Dell Networking OS enables you to match multiple class maps and specify multiple match criteria. Policy-based QoS is not supported on logical interfaces, such as port-channels, VLANS, or loopbacks.
bandwidth-percentage

Assign a percentage of weight to the class/queue.

Syntax

```
bandwidth-percentage percentage
```

To remove the bandwidth percentage, use the no bandwidth-percentage command.

Parameters

- `percentage` Enter the percentage assignment of bandwidth to the class/queue. The range is from 1 to 100% (granularity 1%).

Defaults

none

Command Modes

CONFIGURATION (conf-qos-policy-out)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The unit of bandwidth percentage is 1%. If the sum of the bandwidth percentages given to all eight classes exceeds 100%, the bandwidth percentage automatically scales down to 100%.

Related Commands

- `qos-policy-output` — creates a QoS output policy.
class-map

Create/access a class map. Class maps differentiate traffic so that you can apply separate quality-of-service policies to each class.

Syntax

class-map {match-all | match-any} class-map-name [cpu-qos] [layer2]

Parameters

match-all

Determines how packets are evaluated when multiple match criteria exist. Enter the keywords match-all to determine that the packets must meet all the match criteria in order to be a member of the class.

match-any

Determines how packets are evaluated when multiple match criteria exist. Enter the keywords match-any to determine that the packets must meet at least one of the match criteria in order to be a member of the class.

class-map-name

Enter a name of the class for the class map in a character format (32 character maximum).

cpu-qos

Enter the keyword cpu-qos to assign this Class Map to control plane traffic only (CoPP).

layer2

Enter the keyword layer2 to specify a Layer 2 Class Map. The default is Layer 3.

Defaults

Layer 3

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Class-map names can be 32 characters. Layer2 available on the C-Series and S-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
Usage Information

Packets arriving at the input interface are checked against the match criteria and configured using this command to determine if the packet belongs to that class. This command accesses CLASS-MAP mode, where the configuration commands include the match ip and match mac options.

When you create a class map to filter protocol traffic for CoPP, you must enter the keyword cpu-qos.

Related Commands

- ip access-list extended — configures an extended IP ACL.
- ip access-list standard — configures a standard IP ACL.
- match ip access-group — configures the match criteria based on the access control list (ACL).
- match ip precedence — identifies the IP precedence values as match criteria.
- match ip dscp — configures the match criteria based on the DSCP value.
- match mac access-group — configures a match criterion for a class map based on the contents of the designated MAC ACL.
- match mac dot1p — configures a match criterion for a class map based on a dot1p value.
- match mac vlan — configures a match criterion for a class map based on VLAN ID.
- service-queue — assigns a class map and QoS policy to different queues.
- show qos class-map — views the current class map information.

**clear qos statistics**

Clear qos statistics clears statistics from show qos statistics.

**Syntax**

```plaintext
clear qos statistics interface-name
```

**Parameters**

- `interface-name` Enter one of the following keywords:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

**Defaults**

- none

**Command Modes**

- EXEC
- EXEC Privilege

### Related Commands
- `show qos statistics` — displays the QoS statistics.

### description

Add a description to the selected policy map or QoS policy.

**Syntax**

```
description {description}
```

To remove the description, use the `no description {description}` command.

**Parameters**

- `description` Enter a description to identify the policies (80 characters maximum).

**Defaults**

none

**Command Modes**

</tbody>
</table>
### match ip access-group

Configure match criteria for a class map, based on the access control list (ACL).

**NOTE:** IPv6 class-maps and IP-any class-maps do not match. This condition is true for IPv6 and IP-any class-maps on both ACLs as well as VLANs.

**Syntax**

```
match ip access-group access-group-name [set-ip-dscp value | set-color value]
```

To remove ACL match criteria from a class map, use the `no match ip access-group access-group-name [set-ip-dscp value | set-color value]` command.

**Parameters**

- **access-group-name**: Enter the ACL name whose contents are used as the match criteria in determining if packets belong to the class the class-map specifies.
- **set-ip-dscp value**: (OPTIONAL) Enter the keywords `set-ip-dscp` then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.
- **set-color value**: (Optional) Enter the keyword `set-color` followed by a color value. Traffic that fulfills the match criteria is marked with the color value that you specify. The default value is Yellow.

**Defaults**

- none

<td>Introduced on the C-Series; added support for the DSCP Marking option.</td>
</tr>
<tr>
<td>6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

To access this command, enter the class-map command. After the class map is identified, you can configure the match criteria. For class-map match-any, a maximum of five ACL match criteria are allowed. For class-map match-all, only one ACL match criteria is allowed.

Related Commands

- class-map — identifies the class map.

**match ip dscp**

Use a differentiated services code point (DSCP) value as a match criteria.

**Syntax**

```
match {ip | ipv6 | ip-any} dscp dscp-list [set-ip-dscp value]
```

To remove a DSCP value as a match criteria, use the no match {ip | ipv6 | ip-any} dscp dscp-list [[multicast] set-ip-dscp value] command.

**Parameters**

- **ip**
  
  Enter the keyword ip to support IPv4 traffic.

- **ipv6**
  
  Enter the keyword ipv6 to support IPv6 traffic.

- **ip-any**
  
  Enter the keyword ip-any to support IPv4 and IPv6 traffic.
**dscp-list**

Enter the IP DSCP values that is to be the match criteria. Separate values by commas — no spaces (1,2,3) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 63.

**set-ip-dscp value**

(OPTIONAL) Enter the keywords set-ip-dscp then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.

**Defaults**

none

**Command Modes**

<td>Introduced on the C-Series; added support for the DSCP Marking option.</td>
</tr>
<tr>
<td>6.2(1.1)</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

To access this command, enter the class-map command. After the class map is identified, you can configure the match criteria.

The match ip dscp and match ip precedence commands are mutually exclusive.

Up to 64 IP DSCP values can be matched in one match statement. For example, to indicate IP DCSP values 0 1 2 3 4 5 6 7, enter either the match ip dscp 0,1,2,3,4,5,6,7 or match ip dscp 0-7 command.

**NOTE:** Only one of the IP DSCP values must be a successful match criterion, not all of the specified IP DSCP values must match.

**Related Commands**

- class-map — identifies the class map.
**match ip precedence**

Use IP precedence values as a match criteria.

**Syntax**

```
match {ip | ipv6 | ip-any} precedence ip-precedence-list [set-ip-dscp value]
```

To remove IP precedence as a match criteria, use the `no match {ip | ipv6 | ip-any} precedence ip-precedence-list [[multicast] set-ip-dscp value]` command.

**Parameters**

- `ip` Enter the keyword `ip` to support IPv4 traffic.
- `ipv6` Enter the keyword `ipv6` to support IPv6 traffic.
- `ip-any` Enter the keyword `ip-any` to support IPv4 and IPv6 traffic.
- `ip-precedence-list` Enter the IP precedence value(s) as the match criteria. Separate values by commas — no spaces (1,2,3) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 7.
- `set-ip-dscp value` (OPTIONAL) Enter the keywords `set-ip-dscp` then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.

**Defaults**

```
none
```

**Command Modes**

```
CLASS-MAP CONFIGURATION (config-class-map)
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
Version Description
7.7.1.0 Added the keyword multicast. Added support for the DSCP Marking option for the S-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series. Added support for the DSCP Marking option.
6.1.1.1 Introduced on the E-Series.

Usage Information
To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

The `match ip precedence` command and the `match ip dscp` command are mutually exclusive.

Up to eight precedence values can be matched in one match statement. For example, to indicate the IP precedence values 0 1 2 3, enter either the `match ip precedence 0-3` or `match ip precedence 0,1,2,3` command.

**NOTE:** Only one of the IP precedence values must be a successful match criterion, not all of the specified IP precedence values must match.

Related Commands
- `class-map` — identifies the class map.

### match ip vlan

Uses a VLAN as the match criterion for an L3 class map.

**Syntax**
```
match ip vlan vlan-id
```

To remove VLAN as the match criterion, use the `no match ip vlan vlan-id` command.

**Parameters**
- `vlan vlan-id`
  
  Enter the keyword `vlan` and then the ID of the VLAN. The range is from 1 to 4094.

**Defaults**
None.

**Command Modes**
CONF-CLASS-MAP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
match ip vrf

Uses a VRF as the match criterion for an L3 class map.

Syntax

```
match ip vrf vrf-id
```

To remove VRF as the match criterion, use the `no match ip vrf vrf-id` command.

Parameters

- **vrf vlan-id**: Enter the keyword `vrf` and then the ID of the VRF. The range is from 1 to 63.

Defaults

- none

Command Modes

Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

Use this command to match an IP class-map against a single VLAN ID.

Related Commands

- **class-map** — identifies the class map.
match mac access-group

Configure a match criterion for a class map, based on the contents of the designated MAC ACL.

Syntax

match mac access-group {mac-acl-name}

Parameters

mac-acl-name Enter a MAC ACL name. Its contents is used as the match criteria in the class map.

Defaults

none

Command Modes

CLASS-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Available on the C-Series and S-Series.
7.5.1.0 Added support for the DSCP Marking option.
7.4.1.0 Introduced on the E-Series.

Usage Information

To access this command, enter the class-map command. After the class map is identified, you can configure the match criteria.

Related Commands

- class-map — identifies the class map.
match mac dot1p

Configure a match criterion for a class map based on a dot1p value.

Syntax

match mac dot1p \{dot1p-list\}

Parameters

dot1p-list Enter a dot1p value. The range is from 0 to 7.

Defaults

none

**Usage Information**

To access this command, enter the `class-map` command. You can match against only one VLAN ID.

**Related Commands**

- `class-map` — identifies the class map.
policy-aggregate

Allow an aggregate method of configuring per-port QoS via policy maps. An aggregate QoS policy is part of the policy map (output) applied on an interface.

Syntax

```
policy-aggregate qos-policy-name
```

To remove a policy aggregate configuration, use the no policy-aggregate qos-policy-name command.

Parameters

- `qos-policy-name` Enter the name of the policy map in character format (32 characters maximum).

Defaults

none

Command Modes

CONFIGURATION (policy-map-input and policy-map-output)

</tbody>
</table>

Usage Information

An aggregate output QoS policy applies to all outbound port traffic. An aggregate output QoS policy can coexist with per-queue output QoS policies. If the rate shape exists in both aggregate and per-queue qos-policy, minimum of 2 take effect. Some of all Queue-rate will not exceed aggregate.

Related Commands

- `policy-map-input` — creates an input policy map.
- `policy-map-output` — creates an output policy map.
**policy-map-input**

Create an input policy map.

**Syntax**

```
policy-map-input policy-map-name cpu-qos | [layer2] [cpu-qos]
```

To remove an input policy map, use the `no policy-map-input policy-map-name cpu-qos | [layer2] [cpu-qos]` command.

**Parameters**

- `policy-map-name` Enter the name of the policy map in character format (32 characters maximum).
- `cpu-qos` Enter the `cpu-qos` keyword to assign this ACL to control plane traffic only.
- `layer2` (OPTIONAL) Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is Layer 3.
- `cpu-qos` (OPTIONAL) Enter the keyword `cpu-qos` to create an input policy to be used to rate-limit control-plane traffic (CoPP).

**Defaults**

Layer 3

</tbody>
</table>
Usage Information
The input policy map is used to classify incoming traffic to different flows using class-map, QoS policy, or incoming packets DSCP. This command enables Policy-Map-Input Configuration mode (conf-policy-map-in). When you configure an input policy map for CoPP, you must enter the keyword cpu-qos.

Related Commands
• service-queue — assigns a class map and QoS policy to different queues.
• service-policy input — applies an input policy map to the selected interface.

policy-map-output
Create an output policy map.

Syntax
policy-map-output policy-map-name
To remove a policy map, use the no policy-map-output policy-map-name command.

Parameters
policy-map-name Enter the name for the policy map in character format (32 characters maximum).

Defaults
none

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Policy name character limit increased from 16 to 32.
7.6.1.0 Introduced on the C-Series and S-Series.
Version | Description
--------|------------------------
6.1.1.1  | Introduced on the E-Series.

Usage Information To assign traffic to different flows using QoS policy, use the Output Policy map. This command enables Policy-Map-Output Configuration mode (conf-policy-map-out).

Related Commands

- service-queue — assigns a class map and QoS policy to different queues.
- policy-aggregate — allows an aggregate method of configuring per-port QoS using policy maps.
- service-policy output — applies an output policy map to the selected interface.

qos-policy-input

Create a QoS input policy on the router.

Syntax

```
qos-policy-input qos-policy-name cpu-qos | layer2
```

To remove an existing input QoS policy from the router, use the no qos-policy-input qos-policy-name cpu-qos | layer2 command.

Parameters

- **qos-policy-name** Enter the name for the policy map in character format (32 characters maximum).
- **cpu-qos** (OPTIONAL) Enter the keyword cpu-qos keyword to assign this ACL to control plane traffic only.
- **layer2** (OPTIONAL) Enter the keyword layer2 to specify a Layer 2 Class Map. The default is Layer 3.

Defaults Layer 3

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--------|------------------------
9.10(0.0) | Introduced on the S3148.
9.8(2.0)  | Introduced on the S3100 series.
9.8(1.0)  | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0)  | Introduced on the S6000-ON.
9.2(1.0)  | Introduced on the Z9500.
9.0.2.0   | Introduced on the S6000.
8.3.19.0  | Introduced on the S4820T.
Version | Description
---|---
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Policy name character limit increased from 16 to 32.
7.6.1.0 | Introduced on the C-Series and S-Series.
7.5.1.0 | Introduced on the C-Series.
6.1.1.1 | Introduced on the E-Series.

Usage Information
Use this command to specify the name of the input QoS policy. Once input policy is specified, rate-police can be defined. This command enables the qos-policy-input configuration mode—(conf-qos-policy-in).

When changing a Service-Queue configuration in a QoS policy map, all QoS rules are deleted and re-added automatically to ensure that the order of the rules is maintained. As a result, the Matched Packets value shown in the show qos statistics command is reset.

If you create a QoS input policy to be used for CoPP, you must enter the keyword cpu-qos.

Related Commands
- rate police — incoming traffic policing function.

qos-policy-output
Create a QoS output policy.

Syntax
qos-policy-output qos-policy-name

To remove an existing output QoS policy, use the no qos-policy-output qos-policy-name command.

Parameters
qos-policy-name Enter your output QoS policy name in character format (32 characters maximum).

Defaults
none

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
---|---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P6) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
Usage Information
Use this command to specify the name of the output QoS policy. Once output policy is specified, rate-shape, scheduler strict, bandwidth-percentage, and WRED can be defined. This command enables the qos-policy-output configuration mode—(conf-qos-policy-out).

Related Commands
- bandwidth-percentage — assigns percentage of bandwidth to the class/queue.
- wred — assigns yellow or green drop precedence.

rate-police

Specify the policing functionality on incoming traffic.

Syntax
rate-police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]]

Parameters
- kbps
  Enter the keyword kbps to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- committed-rate
  Enter the bandwidth in Mbps. The range is from 0 to 40000.
- burst-KB
  (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is 100.
- peak peak-rate
  (OPTIONAL) Enter the keyword peak then a number to specify the peak rate in Mbps. The range is from 0 to 40000. The default is the same as designated for committed-rate.

Defaults
Burst size is 100KB. peak-rate is by default the same as committed-rate. Granularity for committed-rate and peak-rate is Mbps unless you use the kbps option.

Command Modes
QOS-POLICY-IN

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Usage Information**

The default burst size is 100Kb. If a different value is required, you must configure the burst size to the required value.

**Related Commands**

- `rate police` — specifies traffic policing on the selected interface.
- `qos-policy-input` — creates a QoS output policy.

---

**rate-shape**

Shape traffic output as part of the designated policy.

**Syntax**

```
```

**Parameters**

- `pps`  
  - Enter the keyword `pps` to specify the rate limit in packets per second (pps).
- `kbps`  
  - Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- `burst-kbps`  
  - (OPTIONAL) Enter the burst size in KB. The range is from 0 to 40000. The default is 100.
- `burst-packets`  
  - Enter the peak rate or committed rate burst size in packets per seconds.

**Defaults**

- Burst size is 10KB. Granularity for rate is Mbps unless you use the `kbps` option.
### Command Modes
- QOS-POLICY-OUT

</tbody>
</table>

### Usage Information
On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured. You must configure the peak rate and peak burst size using the same value: kilobits or packets per second. Similarly, you must configure the committed rate and committed burst size with the same measurement. Peak rate refers to the maximum rate for traffic arriving or exiting an interface under normal traffic conditions. Peak burst size indicates the maximum size of unused peak bandwidth that is aggregated. This aggregated bandwidth enables brief durations of burst traffic that exceeds the peak rate and committed burst. Committed rate refers to the guaranteed bandwidth for traffic entering or leaving the interface under normal network conditions. When traffic propagates at an average rate that is less than or equal to the committed rate, it is considered to be green-colored or coded. When the transmitted traffic falls below the committed rate, the bandwidth, which is not used by any traffic that is traversing the network, is aggregated to form the committed burst size. Traffic is considered to be green-colored up to the point at which the unused bandwidth does not exceed the committed burst size.

### Related Commands
- `rate shape` — shapes traffic output as part of the designated policy.
- `qos-policy-output` — creates a QoS output policy.
**service-policy input**

Apply an input policy map to the selected interface.

**Syntax**

```
service-policy input policy-map-name [layer2]
```

To remove the input policy map from the interface, use the `no service-policy input policy-map-name [layer2]` command.

**Parameters**

- **policy-map-name**: Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.
- **layer2** *(OPTIONAL)*: Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is Layer 3.

**Defaults**

Layer 3

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)

- 6.1.1.1

**Description**

- Introduced on the S3148.
- Introduced on the S3100 series.
- Introduced on the Z9100-ON.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the S6000-ON.
- Introduced on the Z9500.
- Introduced on the S6000.
- Introduced on the S4820T.
- Introduced on the Z9000.
- Introduced on the S4810.
- Introduced on the S-Series.
- Introduced on the C-Series.
- E-Series Only: Expanded to add support for Layer 2.
- Introduced on the E-Series.

**Usage Information**

You can attach a single policy-map to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.
NOTE: The service-policy commands are not allowed on a port channel. The service-policy input policy-map-name command and the service-class dynamic dot1p command are not allowed simultaneously on an interface. However, the service-policy input command (without the policy-map-name option) and the service-class dynamic dot1p command are allowed on an interface.

Related Commands
- `policy-map-input` — creates an input policy map.

---

**service-policy output**

Apply an output policy map to the selected interface.

**Syntax**
```plaintext
service-policy output policy-map-name
```

To remove the output policy map from the interface, use the `no service-policy output policy-map-name` command.

**Parameters**
- `policy-map-name` Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.

**Defaults**
none

**Command Modes**
INTERFACE

</table>
A single policy-map can be attached to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.

Related Commands

- `policy-map-output` — creates an output policy map.

### service-queue

Assign a class map and QoS policy to different queues.

**Syntax**

```
service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]
```

To remove the queue assignment, use the `no service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]` command.

**Parameters**

- `queue-id` Enter the value used to identify a queue. The range is from 0 to 7.
- `class-map class-map-name` (OPTIONAL) Enter the keyword `class-map` then the class map name assigned to the queue in character format (32 character maximum).
  
  **NOTE:** This option is available under `policy-map-input` only.

- `qos-policy qos-policy-name` (OPTIONAL) Enter the keywords `qos-policy` then the QoS policy name assigned to the queue in text format (32 characters maximum). This specifies the input QoS policy assigned to the queue under `policy-map-input` and output QoS policy under `policy-map-output` context.

**Defaults**

- none

**Command Modes**

- CONFIGURATION (conf-policy-map-in and conf-policy-map-out)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
Usage Information

There are eight queues per interface on the S6000 and four queues on the S-Series. This command assigns a class map or QoS policy to different queues.

Related Commands

- `class-map` — identifies the class map.
- `service-policy input` — applies an input policy map to the selected interface.
- `service-policy output` — applies an output policy map to the selected interface.

**set**

Mark outgoing traffic with a differentiated service code point (DSCP) or dot1p value.

**Syntax**

```
set {ip-dscp value | mac-dot1p value}
```

**Parameters**

- `ip-dscp value` (OPTIONAL) Enter the keywords `ip-dscp` then the IP DSCP value. The range is from 0 to 63.
- `mac-dot1p value` Enter the keywords `mac-dot1p` then the dot1p value. The range is from 0 to 7.

**Defaults**

none

8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
### show qos class-map

View the current class map information.

#### Syntax

```
show qos class-map [class-name]
```

#### Parameters

- `class-name` (Optional) Enter the name of a configured class map.

#### Defaults

none

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Usage Information

After the IP DSCP bit is set, other QoS services can then operate on the bit settings.
show qos dot1p-queue-mapping

Displays the dot1p priority to queue mapping on the switch.

Syntax

```
show qos dot1p-queue-mapping
```

Defaults

- dot1p Priority: 0 1 2 3 4 5 6 7
- Queue: 1 0 1 2 3 3

Command Modes

- EXEC Privilege

Command History

</tbody>
</table>

Usage Information

- trust dot1p, dot1p-priority, service-class dynamic dot1; all these features work over the mapping in this command output.

Related Commands

- `service-class dot1p-mapping` — Identifies the class map.
**show qos policy-map**

View the QoS policy map information.

**Syntax**

```
show qos policy-map {summary [interface] | detail}
```

**Parameters**

- **9.8(0.0P5)**  
  Introduced on the S4048-ON.

- **9.8(0.0P2)**  
  Introduced on the S3048-ON.

**summary interface**  
To view a policy map interface summary, enter the keyword `summary` and optionally one of the following keywords and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword `interface` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**detail**  
To view a policy map interface in detail, enter the keyword `detail` and optionally one of the following keywords and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword `interface` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

  2          CM2            q2
  3          CM3            q3
Dell#

Example (IPv6)

Example (Summary IPv4)  Dell# show qos policy-map summary
Interface policy-map-input policy-map-output
Gi 4/1     PM1                 -
Gi 4/2     PM2               PMOut
Dell#

show qos policy-map-input
View the input QoS policy map details.

Syntax
show qos policy-map-input [policy-map-name] [class class-map-name] [qos-policy-input qos-policy-name]

Parameters
- **policy-map-name**: Enter the policy map name.
- **class class-map-name**: Enter the keyword class then the class map name.
- **qos-policy-input qos-policy-name**: Enter the keyword qos-policy-input then the QoS policy name.

Defaults
- none

Command Modes
- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Example

Dell# show qos policy-map-input

```
Policy-map-input PolicyMapInput
Aggregate Qos-policy-name AggPolicyIn
Queue# Class-map-name  Qos-policy-name
  0  ClassMap1          qosPolicyInput
```

Dell#

Dell# show qos policy-map-input

```
Policy-map-input pmap1
Trust ipv6-diffserv
Queue#  Class-map-name Qos-policy-name
  0  c0              q0
  1  c1              q1
  2  c2              q2
  3  c3              q3
  4  c4              q4
  5  c5              -
  6  c6              q6
  7  c7              q7
```

Dell#
show qos policy-map-output

View the output QoS policy map details.

Syntax

show qos policy-map-output [policy-map-name] [qos-policy-output qos-policy-name]

Parameters

policy-map-name Enter the policy map name.
qos-policy-output Enter the keyword qos-policy-output then the QoS policy name.
qos-policy-name

Defaults

none

Command Modes

• EXEC
• EXEC Privilege

Qos-policy-input QosInput
  Rate-police 100 50 peak 100 50
  Dscp 32
Dell#
```
show qos qos-policy-output

View the output QoS policy details.

Syntax
show qos qos-policy-output [qos-policy-name]

Parameters
qos-policy-name Enter the QoS policy name.

Defaults
none

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the C-Series and S-Series.
6.1.1.1 Introduced on the E-Series.

Example
Dell# show qos qos-policy-output
Qos-policy-output qosOut
  Rate-limit 50 50 peak 50 50
  Wred yellow 1
  Wred green 1
Dell#
show qos statistics

View QoS statistics.

Syntax

    show qos statistics {egress-queue [interface]} | {wred-profile [interface]} | [interface]

Parameters

  egress-queue
  interface
    Enter the keyword egress-queue to display the egress-queue statistics and optionally one of
    the following keywords and slot/port or number information.
    
    • For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/
      port information.
    
    • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the
      slot/port information.

  wred-profile
  interface
    Enter the keywords wred-profile and optionally one of the following keywords and slot/port
    or number information:
    
    • For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/
      port information.
    
    • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the
      slot/port information.

  interface
    Enter one of the following keywords and slot/port or number information:
    
    • For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/
      port information.
    
    • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the
      slot/port information.

Defaults

  none

Command Modes

  • EXEC
  • EXEC Privilege

Command History

  This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

  Version  Description
  9.11(0.0)  Updated the show qos statistics egress-queue output to reflect per queue per port
            tx and drop rates.
  9.10(0.0)  Introduced on the S3148.
  9.8(2.0)   Introduced on the S3100 series.
  9.8(1.0)   Introduced on the Z9100-ON.
  9.8(0.0P5) Introduced on the S4048-ON.
### Version Description

9.8(0.0P2) Introduced on the S3048-ON.
9.8(0.0) Added the `egress-queue` keyword.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.7.1.1 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.1.1.1 Introduced on the E-Series.

### Example of `show qos statistics egress-queue gigabitethernet 1/10`

```plaintext
Dell#show qos statistics egress-queue gigabitethernet 1/10

Interface Gi 1/10
Unicast/Multicast Egress Queue Statistics
Queue# Q# Type  TxPkts  TxPkts/s  TxBytes  TxBytes/s  DroppedPkts DroppedPkts/s  DroppedBytes DroppedBytes/s
0  UCAST  2005191759  6102  1503896312254  4519906  0  0  0  0
1  UCAST  0  0  0  0  0  0  0  0

10 MCAST  0  0  0  0  0  0  0  0
11 MCAST  0  0  0  0  0  0  0  0
12 MCAST  0  0  0  0  0  0  0  0

Dell#
```

### Usage Information

In a dual homing setup, you can use this command only from the primary VLT peer.

The following list describes output of the `show qos statistics` command in the example:

- **Queue #** — Queue Number.
- **Queued Bytes** — Snapshot of the byte count in that queue.
- **Queued Pkts** — Cumulative packet count in that queue.
- **Matched Pkts** — The number of packets that matched the class-map criteria.

- **NOTE:** When you configure `trust`, matched packet counters are not incremented in this field.

- **Matched Bytes** — The number of bytes that matched the class-map criteria.

- **NOTE:** When you configure `trust`, matched byte counters are not incremented in this field.

- **Dropped Pkts** — The total of the number of packets dropped for green, yellow and out-of-profile.
show qos wred-profile

View the WRED profile details.

Syntax

```
show qos wred-profile wred-profile-name
```

Parameters

- `wred-profile-name` Enter the WRED profile name to view the profile details.

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Command History

Dell#
```
# test cam-usage

Check the Input Policy Map configuration for the CAM usage.

## Syntax

```
test cam-usage service-policy input policy-map stack-unit {([number port-set portpipe number] | [all])}
```

## Parameters

- **policy-map**: Enter the policy map name.
- **stack-unit number**: (OPTIONAL) Enter the keyword `stack-unit` then the stack-unit slot number.
- **port-set portpipe number**: Enter the keywords `port-set` then the stack-unit port pipe number. The range is from 0 or 1.
- **stack-unit all**: (OPTIONAL) Enter the keywords `stack-unit all` to indicate all stack-unit.

## Defaults

none

## Command Modes

EXEC

</tbody>
</table>

## Usage Information

This feature allows you to determine if the CAM has enough space available before applying the configuration on an interface.

An input policy map with both Trust and Class-map configuration, the Class-map rules are ignored and only the Trust rule is programmed in the CAM. In such an instance, the Estimated CAM output column contains the size of the CAM space required for the Trust rule and not the Class-map rule.

The following describes the `test cam-usage service-policy input policy-map stack-unit` command shown in the following example.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stack-unit</td>
<td>Indicates the stack-unit slot number.</td>
</tr>
<tr>
<td>Portpipe</td>
<td>Indicates the portpipe number.</td>
</tr>
<tr>
<td>CAM Partition</td>
<td>The CAM space where the rules are added.</td>
</tr>
<tr>
<td>Available CAM</td>
<td>Indicates the free CAM space, in the partition, for the classification rules.</td>
</tr>
</tbody>
</table>

**NOTE:** The CAM entries reserved for the default rules are not included in the Available CAM column; free entries, from the default rules space, cannot be used as a policy map for the classification rules.

<table>
<thead>
<tr>
<th>Estimated CAM per Port</th>
<th>Indicates the number of free CAM entries required (for the classification rules) to apply the input policy map on a single interface.</th>
</tr>
</thead>
</table>

**NOTE:** The CAM entries for the default rule are not included in this column; a CAM entry for the default rule is always dedicated to a port and is always available for that interface.

<table>
<thead>
<tr>
<th>Status (Allowed ports)</th>
<th>Indicates if the input policy map configuration on an interface belonging to a stack-unit/ port-pipe is successful — Allowed (n) — or not successful — Exception. The allowed number (n) indicates the number of ports in that port-pipe on which the Policy Map can be applied successfully.</th>
</tr>
</thead>
</table>

**NOTE:** In a Layer 2 Policy Map, IPv4/IPv6 rules are not allowed; therefore, the output contains only L2ACL CAM partition entries.

**Example**

```
Dell# test cam-usage service-policy input pmap_l2 stack-unit all
For a L2 Input Policy Map pmap_l2, the output must be as follows,

stack-unit|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port |Status (Allowed ports) |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>per Port</td>
<td></td>
</tr>
<tr>
<td>(Allowed ports)</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>L2ACL</td>
<td>500</td>
<td>200</td>
<td>Allowed (2)</td>
</tr>
<tr>
<td>Allowed (2)</td>
<td>0</td>
<td>L2ACL</td>
<td>100</td>
<td>200</td>
<td>Exception</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>L2ACL</td>
<td>1000</td>
<td>200</td>
<td>Allowed (5)</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>L2ACL</td>
<td>0</td>
<td>200</td>
<td>Exception</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>13</td>
<td>1</td>
<td>L2ACL</td>
<td>400</td>
<td>200</td>
<td>Allowed (2)</td>
</tr>
</tbody>
</table>

Dell#```

**threshold**

Specify the minimum and maximum threshold values for the configured WRED profiles.

**Syntax**

```
threshold min number max number max-drop-drop
```
To remove the threshold values, use the `no threshold min number max number` command.

**Parameters**

- **min number**
  - Enter the keyword `min` then the minimum threshold number for the WRED profile. The range is from 1 to 9360.

- **max number**
  - Enter the keyword `max` then the maximum threshold number for the WRED profile. The range is from 1 to 9360 KB.

- **max-drop-drop number**
  - Enter the keyword `max-drop-drop` followed by the maximum number of packets for the WRED profile. The range is from 0 to 100 KB.

**Defaults**

- none

**Command Modes**

- CONFIGURATION (config-wred)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>467</td>
<td>4671</td>
</tr>
</tbody>
</table>

**Related Commands**

- `wred-profile` — creates a WRED profile.
trust

Specify dynamic classification (DSCP) or dot1p to trust.

Syntax

trust {diffserv [fallback] | dot1p [fallback]}

Parameters

diffserv
Enter the keyword diffserv to specify trust of DSCP markings.
dot1p
Enter the keyword dot1p to specify trust dot1p configuration.
fallback
Enter the keyword fallback to classify packets according to their DSCP or dot1p value as a secondary option in case no match occurs against the configured class maps.

Defaults

none

Command Modes

CONFIGURATION (conf-policy-map-in)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0)  Introduced on the S3148.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
8.3.11.1   Introduced on the Z9000.
8.3.7.0    Introduced on the S4810.
8.3.1.0    Added fallback to the E-Series.
8.2.1.0    Added dot1p to the C-Series and S-Series.
7.8.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
7.4.1.0    Added dot1p and IPv6 DSCP.
6.1.1.1    Introduced on the E-Series.
Usage Information

When you configure trust, matched bytes/packets counters are not incremented in the show qos statistics command.

Dynamic mapping honors packets marked according to the standard definitions of DSCP. The following lists the default mapping.

### Table 3. Default Mapping

<table>
<thead>
<tr>

### wred

Designate the WRED profile to yellow or green traffic.

**Syntax**

```
wred {yellow | green} profile-name
```

To remove the WRED drop precedence, use the no wred {yellow | green} [profile-name] command.

**Parameters**

- **yellow | green**
  - Enter the keyword yellow for yellow traffic. A DSCP value of xxx110 and xxx100, xxx101 maps to yellow.
  - Enter the keyword green for green traffic. A DSCP value of xxx0xx are green and DSCP 111111 are red packets.

- **profile-name**
  - Enter your WRED profile name in character format (32 character maximum). Or use one of the five pre-defined WRED profile names.
  - Pre-defined Profiles: wred_drop, wred_ge_y, wred_ge_g, wred_teng_y, wred_teng_g.

**Defaults**

When WRED green is applied, default WRED yellow profiles take effect and vice-versa.
Command Modes

CONFIGURATION (conf-qos-policy-out)

Command History

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

To assign drop precedence to green or yellow traffic, use this command. If there is no honoring enabled on the input, all the traffic defaults to green drop precedence.

Related Commands

- `wred-profile` — creates a WRED profile and name that profile.
- `trust` — defines the dynamic classification to trust DSCP.

**wred ecn**

To indicate network congestion, rather than dropping packets, use explicit congestion notification (ECN).

Syntax

```
wred ecn
```

To stop marking packets, use the `no wred ecn` command.

Defaults

none

Command Modes

CONFIGURATION (conf-qos-policy-out)

</tbody>
</table>

### Usage Information

When you enable `wred ecn`, and the number of packets in the queue is below the minimum threshold, packets are transmitted per the usual WRED treatment.

When you enable `wred ecn`, and the number of packets in the queue is between the minimum threshold and the maximum threshold, one of the following two scenarios can occur:

- If the transmission endpoints are ECN-capable and traffic is congested, and the WRED algorithm determines that the packet should have been dropped based on the drop probability, the packet is transmitted and marked so the routers know the system is congested and can slow transmission rates.
- If neither endpoint is ECN-capable, the packet may be dropped based on the WRED drop probability. This behavior is the identical treatment a packet receives when WRED is enabled without ECN configured on the router.

When you enable `wred ecn`, and the number of packets in the queue is above the maximum threshold, packets are dropped based on the drop probability. This behavior is the identical treatment a packet receives when WRED is enabled without ECN configured on the router.

### Related Commands

- `wred-profile` — creates a WRED profile and name that profile.

### wred-profile

Create a WRED profile and name the profile.

**Syntax**

```
wred-profile  wred-profile-name
```

To remove an existing WRED profile, use the `no wred-profile` command.

**Parameters**

- `wred-profile-name`  
Enter your WRED profile name in character format (32 character maximum). Or use one of the pre-defined WRED profile names. You can configure up to 26 WRED profiles plus the five pre-defined profiles, for a total of 31 WRED profiles.

  Pre-defined Profiles: `wred_drop`, `wred_ge_y`, `wred_ge_g`, `wred_teng_y`, `wred_teng_g`. 
Defaults

The five pre-defined WRED profiles. When you configure a new profile, the minimum and maximum threshold defaults to predefined wred_ge_g values.

If green profile is applied, default yellow also take effect and vice-versa.

Command Modes

CONFIGURATION

Command History

<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Use the default pre-defined profiles or configure your own profile. You cannot delete the pre-defined profiles or their default values. This command enables WRED configuration mode — (conf-wred).

Related Commands

- threshold — specifies the minimum and maximum threshold values of the WRED profile.

DSCP Color Map Commands

The DSCP color map allows you to set the number of specific DSCP values to yellow or red. Traffic marked as yellow delivers traffic to the egress queue which will either transmit the packet if it has available bandwidth or drop the packet due to no ability to send. Traffic marked as red (high drop precedence) is dropped.

dscp

Sets the number of specific DSCP values for a color map profile to yellow or red.

Syntax

dscp {yellow | red} [list-dscp-values]

To remove a color policy map profile, use the no dscp {yellow | red} [dscp-list] command.
Parameters

Yellow
Enter the yellow keyword. Traffic marked as yellow delivers traffic to the egress queue which either transmits the packet if it has available bandwidth or drops the packet due to no ability to send.

Red
Enter the red keyword. Traffic marked as red is dropped.

dscp-list
Enter a list of IP DSCP values. The dscp-list parameter specifies the full list of IP DSCP value(s) for the specified color. Each DSCP value in a list is separate values by commas – no spaces (1,2,3) or indicates a list of values separated by a hyphen (1-3). Range is 0 to 63.

Defaults

None

Command Modes

CONFIG-COLOR-MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.5.0.0 Introduced on the Z9000, S6000, S4820T, S4810, and MXL.

Usage Information

If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).

The default setting for each DSCP value (0-63) is green (low drop precedence). This command allows setting the number of specific DSCP values to yellow or red.

Important Points to Remember

- All DSCP values that are not specified as yellow or red are colored green.
- A DSCP value cannot be in both the yellow and red lists. Setting the red or yellow list with any DSCP value that is already in the other list results in an error and no update to that list is made.
- Each color map can only have one list of DSCP values for each color; any DSCP values previously listed for that color that are not in the new DSCP list are colored green.

Example

Dell(conf-dscp-color-map)# dscp yellow 9,10,11,13,15,16

Related Commands

- qos dscp-color-map — configures the DSCP color map.
- qos dscp-color-policy — configures a DSCP color policy.
**qos dscp-color-map**

Configure the DSCP color map.

Syntax

```
qos dscp-color-map map-name
```

To remove a color map, use the no qos dscp-color-map map-name command.

Parameters

- `map-name` Enter the name of the DSCP color map. The map name can have a maximum of 32 characters.

Defaults

None

</tbody>
</table>

Usage Information

A color map outlines the codepoint mappings to the appropriate color mapping (green, yellow, red) for the traffic. The system uses this information to handle the traffic on the interface based on the traffic priority and places it into the appropriate shaping queue. You cannot delete a DSCP color map when it is configured on an interface. If you do, all the DSCP values are set to green (low drop precedence). To delete the DSCP color map that is being used by one or more interfaces, remove the DSCP map from each interface.

Example

```
Dell(conf)#qos dscp-color-map mymap
```

Related Commands

- `qos dscp-color-map` — associates the DSCP color map profile with an interface so that all IP packets received on it is given a color based on that color map.
- `dscp` — sets the number of specific DSCP values for color map profile to yellow or red.

**qos dscp-color-policy**

Associates the DSCP color map profile with an interface so that all IP packets received on it is given a color based on that color map.

Syntax

```
dscp-color-policy color-map-profile-name
```

Example

```
Dell(conf)#qos dscp-color-policy mymap
```
To remove a color policy map profile, use the `no dscp-color-policy color-map-profile-name` command.

### Parameters
- **color-map-profile-name**: Enter the color map profile name. The name can have a maximum of 32 characters.

### Defaults
None

### Command Modes
- **CONFIG-INTERFACE**

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>Version 9.5.0.0</td>
<td>Introduced on the Z9000, S6000, S4820T, S4810, and MXL.</td>
</tr>
</tbody>
</table>

### Usage Information
If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).

### Example
The following example assigns the color map, `bat-enclave-map`, to interface `gi 1/11`.
```
Dell(conf)# int gi 1/11
Dell(conf-if-gi-1/11)# qos dscp-color-policy bat-enclave-map
```

### Related Commands
- `dscp`— sets the number of specific DSCP values for color map profile to yellow or red.
- `qos dscp-color-map`— configures the DSCP color map.

### show qos dscp-color-policy
Display DSCP color policy configuration for one or all interfaces.

#### Syntax
```
show qos dscp-color-policy {summary [interface] | detail [interface]}
```

#### Parameters
- **summary**: Enter the `summary` keyword to display summary information about a color policy on one or more interfaces.
- **detail**: Enter the `detail` keyword to display detailed information about a color policy on one or more interfaces.
- **interface**: Enter the name of the interface that has color policy configured.

#### Defaults
None

</tr>
</tbody>
</table>

### Example

Display summary information about a color policy on one or more interfaces.

```
Dell# show qos dscp-color-policy summary
Interface     dscp-color-map
GI 1/10       mapONE
GI 1/11       mapTWO
```

Display summary information about a color policy on a specific interface.

```
Dell# show qos dscp-color-policy summary te 1/10/1
Interface     dscp-color-map
GI 1/10       mapONE
```

Displayed detailed color policy information on an interface.

```
Dell# show qos dscp-color-policy detail te 1/10
Interface GigabitEthernet 1/10
Dscp-color-map mapONE
  yellow 4,7
  red 20,30
```

### Related Commands

- `show qos dscp-color-map` — displays DSCP color maps.

### show qos dscp-color-map

Display the DSCP color map for one or all interfaces.

**Syntax**

```
show qos dscp-color-map map-name
```

**Parameters**

- `map-name` Enter the name of the color map.

**Defaults**

None

**Command Modes**

EXEC
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dell# show qos dscp-color-map
Dscp-color-map mapONE
  yellow 4,7
  red 20,30
Dscp-color-map mapTWO
  yellow 16,55

Display a specific DSCP color map.

Dell# show qos dscp-color-map mapTWO
Dscp-color-map mapTWO
  yellow 16,55
Dell#
Routing Information Protocol (RIP)

Routing information protocol (RIP) is a distance vector routing protocol. The Dell Networking OS supports both RIP version 1 (RIPv1) and RIP version 2 (RIPv2) on the platform.

The Dell Networking OS implementation of RIP is based on IETF RFCs 2453 and RFC 1058. For more information about configuring RIP, see the Dell Networking OS Configuration Guide.

Topics:
- auto-summary
- clear ip rip
- debug ip rip
- default-information originate
- default-metric
- description
- distance
- distribute-list in
- distribute-list out
- ip poison-reverse
- ip rip receive version
- ip rip send version
- ip split-horizon
- maximum-paths
- neighbor
- network
- offset-list
- output-delay
- passive-interface
- redistribute
- redistribute isis
- redistribute ospf
- router rip
- show config
- show ip rip database
- show running-config rip
- timers basic
- version
auto-summary

Restore the default behavior of automatic summarization of subnet routes into network routes. This command applies only to RIP version 2.

Syntax

```plaintext
auto-summary
```

To send sub-prefix routing information, use the `no auto-summary` command.

Defaults

Enabled.

Command Modes

- ROUTER RIP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

clear ip rip

Update all the RIP routes in the Dell Networking OS routing table.

Syntax

```plaintext
clear ip rip
```

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
pre- 6.2.1.1 Introduced on the E-Series.

Usage Information
This command triggers updates of the main RIP routing tables.

debug ip rip
Examine RIP routing information for troubleshooting.

Syntax
debug ip rip [interface | database | events [interface] | trigger]
To turn off debugging output, use the no debug ip rip command.

Parameters

interface (OPTIONAL) Enter the interface type and ID as one of the following:
- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the
  slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then
  the slot/port information.
- For a Port Channel interface, enter the keywords port-channel then a number.
- For a VLAN, enter the keyword vlan then a number from 1 to 4094.

database (OPTIONAL) Enter the keyword database to display messages when there is a change
to the RIP database.
events (OPTIONAL) Enter the keyword events to debug only RIP protocol changes.
trigger (OPTIONAL) Enter the keyword trigger to debug only RIP trigger extensions.
default-information originate

Generate a default route for the RIP traffic.

Syntax
default-information originate [always] [metric metric-value] [route-map map-name]

To return to the default values, use the no default-information originate command.

Parameters
- **always**: (OPTIONAL) Enter the keyword always to enable the switch software to always advertise the default route.
- **metric metric-value**: (OPTIONAL) Enter the keyword metric then a number as the metric value. The range is from 1 to 16. The default is 1.
- **route-map map-name**: (OPTIONAL) Enter the keywords route-map then the name of a configured route-map.

Defaults
default-metric

Change the default metric for routes. To ensure that all redistributed routes use the same metric value, use this command with the redistribute command.

Syntax

default-metric number

To return the default metric to the original values, use the no default-metric command.

Parameters

  number Specify a number. The range is from 1 to 16. The default is 1.

Defaults

  1

Command Modes

ROUTER RIP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5)Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
pre- 6.2.1.1 Introduced on the E-Series.

Usage Information

The default route must be present in the switch routing table for the default-information originate command to take effect.
Usage Information
This command ensures that route information being redistributed is converted to the same metric value.

Related Commands

- redistribute — allows you to redistribute routes learned by other methods.

```
description
```

Enter a description of the RIP routing protocol.

```
Syntax

description {description}

To remove the description, use the no description {description} command.

Parameters

description

Enter a description to identify the RIP protocol (80 characters maximum).

Defaults

none

Command Modes

ROUTE RIP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version     Description
9.10(0.0)   Introduced on the S3148.

9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Introduced on the S6000-ON.
9.2(1.0)    Introduced on the Z9500.
9.0.2.0      Introduced on the S6000.
8.3.19.0    Introduced on the S4820T.
8.3.11.1    Introduced on the S4810.
7.8.1.0      Introduced on the S-Series.
7.6.1.0      Introduced on the C-Series.
```

pre-6.2.1.1  Introduced on the E-Series.
### Version | Description
--- | ---
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.6.1.0 | Introduced on the C-Series.
pre-7.7.1.0 | Introduced on the E-Series.

### Related Commands
- `router rip` — enters ROUTER mode on the switch.

### distance

Assign a weight (for prioritization) to all routes in the RIP routing table or to a specific route. Lower weights ("administrative distance") are preferred.

**Syntax**
```
distance weight [ip-address mask [prefix-name]]
```

To return to the default values, use the `no distance weight [ip-address mask]` command.

**Parameters**
- **weight**
  - Enter a number from 1 to 255 for the weight (for prioritization). The default is 120.
- **ip-address**
  - (OPTIONAL) Enter the IP address, in dotted decimal format (A.B.C.D), of the host or network to receive the new distance metric.
- **mask**
  - If you enter an IP address, also enter a mask for that IP address, in either dotted decimal format or /prefix format (/x).
- **prefix-name**
  - (OPTIONAL) Enter a configured prefix list name.

**Defaults**
- weight = 120

**Command Modes**
- ROUTER RIP

Related Commands
- `default-metric` — assigns one distance metric to all routes learned using the `redistribute` command.

### distribute-list in

Configure a filter for incoming routing updates.

**Syntax**
```
distribute-list prefix-list-name in [interface]
```
To delete the filter, use the `no distribute-list prefix-list-name in` command.

**Parameters**
- `prefix-list-name` Enter the name of a configured prefix list.
- `interface` (OPTIONAL) Identifies the interface type slot/port as one of the following:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
- ROUTER RIP

**Command History**

**Related Commands**

- **ip prefix-list** — enters PREFIX-LIST mode and configures a prefix list.

**distribute-list out**

Configure a filter for outgoing routing updates.

**Syntax**

distribute-list prefix-list-name out [interface | bgp | connected | isis | ospf | static]

To delete the filter, use the no distribute-list prefix-list-name out command.

**Parameters**

- **prefix-list-name**
  - Enter the name of a configured prefix list.

- **interface**
  - (OPTIONAL) Identifies the interface type slot/port as one of the following:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a Port Channel interface, enter the keywords port-channel then a number.
    - For a VLAN, enter the keyword vlan then a number from 1 to 4094.

- **connected**
  - (OPTIONAL) Enter the keyword connected to filter only directly connected routes.
isis (OPTIONAL) Enter the keyword isis to filter only IS-IS routes.

ospf (OPTIONAL) Enter the keyword ospf to filter all OSPF routes.

static (OPTIONAL) Enter the keyword static to filter manually configured routes.

Defaults Not configured.

Related Commands

- **ip prefix-list** — enters PREFIX-LIST mode and configures a prefix list.

**ip poison-reverse**

Set the prefix of the RIP routing updates to the RIP infinity value.

Syntax

```
ip poison-reverse
```

To disable poison reverse, use the no ip poison-reverse command.

Defaults Disabled.

Related Commands

- `ip split-horizon` — sets the RIP routing updates to exclude routing prefixes.

**ip rip receive version**

To receive specific versions of RIP, set the interface. The RIP version you set on the interface overrides the version command in ROUTER RIP mode.

**Syntax**

```
ip rip receive version [1] [2]
```

To return to the default, use the `no ip rip receive version` command.

**Parameters**

- **1** (OPTIONAL) Enter the number 1 for RIP version 1.
- **2** (OPTIONAL) Enter the number 2 for RIP version 2.

**Defaults**

RIPv1 and RIPv2

**Command Modes**

INTERFACE

Usage Information
If you want the interface to receive both versions of RIP, use the `ip rip receive version 1 2` command.

Related Commands
- `ip rip send version` — sets the RIP version for sending RIP traffic on an interface.
- `version` — sets the RIP version the switch software uses.

**ip rip send version**
To send a specific version of RIP, set the interface. The version you set on the interface overrides the version command in ROUTER RIP mode.

Syntax
```
ip rip send version [1] [2]
```
To return to the default value, use the `no ip rip send version` command.

Parameters
- `1` (OPTIONAL) Enter the number 1 for RIP version 1. The default is RIP version 1.
- `2` (OPTIONAL) Enter the number 2 for RIP version 2.

Defaults
- RIPv1

Command Modes
- INTERFACE

Command History

Usage Information
To enable the interface to send both version of RIP packets, use the `ip rip send version 1 2` command.

Related Commands
- `ip rip receive version` — sets the RIP version for the interface to receive traffic.
- `version` — sets the RIP version for the switch software.

**ip split-horizon**

Enable split-horizon for RIP data on the interface. As described in RFC 2453, the split-horizon scheme prevents any routes learned over a specific interface to be sent back out that interface.

**Syntax**

```bash
ip split-horizon
```

To disable split-horizon, use the `no ip split-horizon` command.

**Defaults**

Enabled

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
### Related Commands

- `ip poison-reverse` — sets the prefix for RIP routing updates.

### maximum-paths

Set RIP to forward packets over multiple paths.

#### Syntax

```
maximum-paths number
```

To return to the default values, use the `no maximum-paths` commands.

#### Parameters

- `number`  
  Enter the number of paths. The range is from 1 to 16. The default is 4 paths.

#### Defaults

- 4

#### Command Modes

- `ROUTER RIP`

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### neighbor

Define a neighbor router with which to exchange RIP information.

**Syntax**

```
neighbor ip-address
```

To delete a neighbor setting, use the `no neighbor ip-address` command.

**Parameters**

- `ip-address`: Enter the IP address, in dotted decimal format, of a router with which to exchange information.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

When a neighbor router is identified, unicast data exchanges occur. Multiple neighbor routers are possible.

To ensure that only specific interfaces are receiving and sending data, use the `passive-interface` command with the `neighbor` command.

**Related Commands**

- `passive-interface` — sets the interface to only listen to RIP broadcasts.

---

**network**

Enable RIP for a specified network. To enable RIP on all networks connected to the switch, use this command.

**Syntax**

```
network ip-address
```

To disable RIP for a network, use the `no network ip-address` command.

**Parameters**

- `ip-address` 
  Specify an IP network address in dotted decimal format. You cannot specify a subnet.

**Defaults**

No RIP network is configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
offset-list

Specify a number to add to the incoming or outgoing route metrics learned using RIP.

Syntax

offset-list prefix-list-name {in | out} offset [interface]
To delete an offset list, use the no offset-list prefix-list-name {in | out} offset [interface] command.

Parameters

prefix-list-name Enter the name of an established Prefix list to determine which incoming routes are modified.
offset Enter a number from zero (0) to 16 to be applied to the incoming route metric matching the access list specified. If you set an offset value to zero (0), no action is taken.
interface (OPTIONAL) Enter the following keywords and slot/port or number information:
  • For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  • For a VLAN, enter the keyword vlan then a number from 1 to 4094.

Defaults

Not configured.

Command Modes

ROUTER RIP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.

Usage Information

You can enable an unlimited number of RIP networks.

RIP operates over interfaces configured with any address the network command specifies.
### Version Description
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.5.1.0**: Added support for 4-port 40G line cards.
- **8.3.7.0**: Introduced on the S4810.
- **7.8.1.0**: Introduced on the S-Series.
- **7.6.1.0**: Introduced on the C-Series.
- **pre-6.2.1.1**: Introduced on the E-Series.

### Usage Information
When the offset metric is applied to an interface, that value takes precedence over an offset value that is not extended to an interface.

### Related Commands
- `ip prefix-list` — enters PREFIX-LIST mode and configure a prefix list.

### output-delay

Set the interpacket delay of successive packets to the same neighbor.

**Syntax**
```
output-delay delay
```

To return to the switch software defaults for interpacket delay, use the `no output-delay` command.

**Parameters**
- `delay`: Specify a number of milliseconds as the delay interval. The range is from 8 to 50.

**Defaults**
Not configured.

**Command Modes**
- ROUTER RIP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
Usage Information

This command is intended for low-speed interfaces.

**passive-interface**

Suppress routing updates on a specified interface.

**Syntax**

```
passive-interface interface
```

To delete a passive interface, use the `no passive-interface interface` command.

**Parameters**

- `interface`
  
  Enter the following information:
  
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)
- 9.8(2.0)
- 9.8(1.0)

**Description**

- Introduced on the S3148.
- Introduced on the S3100 series.
- Introduced on the Z9100-ON.
### Version Description
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.5.1.0** Added support for 4-port 40G line cards on the E-Series.
- **8.3.7.0** Introduced on the S4810.
- **7.8.1.0** Introduced on the S-Series.
- **7.6.1.0** Introduced on the C-Series.
- **pre- 6.2.1.1** Introduced on the E-Series.

#### Usage Information
Although the passive interface does not send or receive routing updates, the network on that interface still includes in RIP updates sent using other interfaces.

#### Related Commands
- `neighbor` — enables RIP for a specified network.
- `network` — defines a neighbor.

---

### redistribute

Redistribute information from other routing instances.

**Syntax**

```
redistribute {connected | static}
```

To disable redistribution, use the no redistribute {connected | static} command.

**Parameters**

- **connected**: Enter the keyword connected to specify that information from active routes on interfaces is redistributed.
- **static**: Enter the keyword static to specify that information from static routes is redistributed.

**Defaults**
Not configured.

**Command Modes**
ROUTER RIP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.0)** Introduced on the S3148.

</tr>
</tbody>
</table>

**Usage Information**

To redistribute the default route (0.0.0.0/0), configure the `default-information originate` command.

**Related Commands**

- `default-information originate` — generates a default route for RIP traffic.

**redistribute isis**

Redistribute routing information from an IS-IS instance.

**Syntax**

```
redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value] [route-map map-name]
```

To disable redistribution, use the `no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value] [route-map map-name]` command.

**Parameters**

- **tag** (OPTIONAL) Enter the name of the IS-IS routing process.
- **level-1** (OPTIONAL) Enter the keywords `level-1` to redistribute only IS-IS Level-1 routes.
- **level-1-2** (OPTIONAL) Enter the keywords `level-1-2` to redistribute both IS-IS Level-1 and Level-2 routes.
- **level-2** (OPTIONAL) Enter the keywords `level-2` to redistribute only IS-IS Level-2 routes.
- **metric metric-value** (OPTIONAL) Enter the keyword `metric` then a number as the metric value. The range is from 0 to 16.
- **route-map map-name** (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.
Defaults
Not configured.

redistribute ospf

Redistribute routing information from an OSPF process.

Syntax
redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name]
To disable redistribution, use the no redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name] command.

Parameters

process-id
Enter a number that corresponds to the OSPF process ID to redistribute. The range is from 1 to 65535.

match external
Enter the keywords match external then the numbers 1 or 2 to indicated that external 1 routes or external 2 routes should be redistributed.

match internal
Enter the keywords match internal to indicate that internal routes should be redistributed.

metric
Enter the keyword metric then a number as the metric value. The range is from 0 to 16.

route-map
Enter the keywords route-map then the name of a configured route map.

Defaults
Not configured.
router rip

To configure and enable RIP, enter ROUTER RIP mode.

Syntax

```
router rip
```

To disable RIP, use the `no router rip` command.

Defaults

Disabled.

Usage Information

To enable RIP, assign a network address using the `network` command.

Example

```
Dell(conf)# router rip
Dell(conf-router_rip)#
```

Related Commands

- `network` — enables RIP.
- `exit` — returns to CONFIGURATION mode.

**show config**

Display the changes you made to the RIP configuration. The default values are not shown.

**Syntax**

```
show config
```

**Command Modes**

- ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
show ip rip database

Display the routes that RIP learns. If the switch learned no RIP routes, no output is generated.

Example

Dell(conf-router_rip)# show config
!
router rip
    network 172.31.0.0
    passive-interface GigabitEthernet 1/1
Dell(conf-router_rip)#

show ip rip database

Display the routes that RIP learns. If the switch learned no RIP routes, no output is generated.

Example

Dell(conf-router_rip)# show config
!
router rip
    network 172.31.0.0
    passive-interface GigabitEthernet 1/1
Dell(conf-router_rip)#
show running-config rip

Display the current RIP configuration.

Syntax

show running-config rip

Defaults

none
timers basic

Manipulate the RIP timers for routing updates, invalid, holddown times, and flush time.

**Syntax**

```
timers basic update invalid holddown flush
```

To return to the default settings, use the `no timers basic` command.

**Parameters**

- `update`

  Enter the number of seconds to specify the rate at which RIP routing updates are sent. The range is from zero (0) to 4294967295. The default is 30 seconds.
invalid

Enter the number of seconds to specify the time interval before routing updates are declared invalid or expired. The invalid value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is **180 seconds**.

holddown

Enter the number of seconds to specify a time interval during which the route is marked as unreachable but still sending RIP packets. The holddown value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is **180 seconds**.

flush

Enter the number of seconds to specify the time interval during which the route is advertised as unreachable. When this interval expires, the route is flushed from the routing table. The flush value should be greater than the update value. The range is from zero (0) to 4294967295. The default is **240 seconds**.

### Defaults

- **update** = **30 seconds**
- **invalid** = **180 seconds**
- **holddown** = **180 seconds**
- **flush** = **240 seconds**

### Usage Information

If you change the timers on one router, also synchronize the timers on all routers in the RIP domain.
version

Specify either RIP version 1 or RIP version 2.

Syntax

version {1 | 2}

To return to the default version setting, use the no version command.

Parameters

1 Enter the keyword 1 to specify RIP version 1.
2 Enter the keyword 2 to specify RIP version 2.

Defaults

The Dell Networking OS sends RIPv1 and receives RIPv1 and RIPv2.

Command Modes

ROUTER RIP

Related Commands

- ip rip receive version — sets the RIP version the interface receives.
- ip rip send version — sets the RIP version the interface sends.
Remote Monitoring (RMON)

The Dell Networking OS remote monitoring (RMON) is implemented on the platform. Dell Networking OS RMON is based on IEEE standards, providing both 32-bit and 64-bit monitoring and long-term statistics collection. Dell Networking OS RMON supports the following RMON groups, as defined in RFC-2819, RFC-3273, RFC-3434, and RFC-4502:

- Ethernet Statistics Table; RFC-2819
- Ethernet Statistics High-Capacity Table; RFC-3273, 64bits
- Ethernet History Control Table; RFC-2819
- Ethernet History Table; RFC-2819
- Ethernet History High-Capacity Table; RFC-3273, 64bits
- Alarm Table; RFC-2819
- High-Capacity Alarm Table (64bits); RFC-3434, 64bits
- Event Table; RFC-2819
- Log Table; RFC-2819
- User History; RFC-4502
- Probe Configuration (Capabilities, SoftwareRev, HardwareRev, DateTime and ResetControl); RFC-4502

Dell Networking OS RMON does not support the following statistics:

- etherStatsCollisions
- etherHistoryCollisions
- etherHistoryUtilization

**NOTE:** Only SNMP GET/GETNEXT access is supported. Configure RMON using the RMON commands. Collected data is lost during a chassis reboot.

Topics:

- rmon alarm
- rmon collection history
- rmon collection statistics
- rmon event
- rmon hc-alarm
- show rmon
- show rmon alarms
- show rmon events
- show rmon hc-alarm
- show rmon history
- show rmon log
- show rmon statistics
rmon alarm

Set an alarm on any MIB object.

Syntax

```
rmon alarm number variable interval {delta | absolute} rising-threshold value event-number falling-threshold value event-number [owner string]
```

To disable the alarm, use the `no rmon alarm number` command.

Parameters

- **number**: Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.
- **variable**: Enter the MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3. The object type must be a 32-bit integer.
- **interval**: Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds.
- **delta**: Enter the keyword `delta` to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.
- **absolute**: Enter the keyword `absolute` to test each MIB variable directly. This is the alarmSampleType in the RMON alarm table.
- **rising-threshold**: Enter the keywords `rising-threshold` then the value (32 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the alarmRisingEventIndex or alarmTable of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.
- **falling-threshold**: Enter the keywords `falling-threshold` then the value (32 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the alarmFallingEventIndex or the alarmTable of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero.
- **owner string**: (OPTIONAL) Enter the keyword `owner` then the owner name to specify an owner for the alarm. This is the alarmOwner object in the alarmTable of the RMON MIB.

Defaults

- `owner`:

### rmon collection history

Enable the RMON MIB history group of statistics collection on an interface.

**Syntax**
```
rmon collection history {controlEntry integer} [owner name] [buckets number] [interval seconds]
```

To remove a specified RMON history group of statistics collection, use the `no rmon collection history {controlEntry integer}` command.

**Parameters**
- **controlEntry integer**: Enter the keyword `controlEntry` to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON group of statistics. The integer value must be a unique index in the RMON history table.
- **owner name**: (OPTIONAL) Enter the keyword `owner` then the owner name to record the owner of the RMON group of statistics.
- **buckets number**: (OPTIONAL) Enter the keyword `buckets` then the number of buckets for the RMON collection history group of statistics. The bucket range is from 1 to 1000. The default is **50**.
- **interval seconds**: (OPTIONAL) Enter the keyword `interval` then the number of seconds in each polling cycle. The range is from 5 to 3600 seconds. The default is **1800 seconds**.

**Defaults**
- none

**Command Modes**
- CONFIGURATION INTERFACE (config-if)

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
rmon collection statistics

Enable RMON MIB statistics collection on an interface.

Syntax

rmon collection statistics {controlEntry integer} [owner name]

To remove RMON MIB statistics collection on an interface, use the no rmon collection statistics {controlEntry integer} command.

Parameters

controlEntry integer  Enter the keyword controlEntry to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON Statistic Table. The integer value must be a unique in the RMON statistic table.

owner name            (OPTIONAL) Enter the keyword owner then the owner name to record the owner of the RMON group of statistics.

Defaults

none

Command Modes

CONFIGURATION INTERFACE (config-if)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version   Description
9.10(0.0)  Introduced on the S3148.
# rmon event

Add an event in the RMON event table.

## Syntax

```
rmon event number [log] [trap community] [description string]
```

To disable RMON on an interface, use the no rmon event number command.

## Parameters

- **number**: Assign an event number in integer format. The range is from 1 to 65535. You must ensure that the value you enter is unique in the RMON event table.

- **log** *(OPTIONAL)*: Enter the keyword log to generate an RMON event log. This option sets the eventType to either log or log-and-snmptrap in the RMON event table. The default is None.

- **trap community** *(OPTIONAL)*: Enter the keyword trap followed by the SNMP community string to generate SNMP traps for an RMON event entry. This option sets the eventType to either snmptrap or log-and-snmptrap in the RMON event table. In addition to the SNMP traps, this option also generates a syslog.

- **description string** *(OPTIONAL)*: Enter the keyword description then a string describing the event.

- **owner name** *(OPTIONAL)*: Enter the keyword owner then the name of the owner of this event.

## Defaults

As noted in the Parameters section.

## Command Modes

- **CONFIGURATION**
rmon hc-alarm

Set an alarm on any MIB object.

Syntax

```
 rmon hc-alarm number variable interval {delta | absolute} rising-threshold value event-number [owner string]
 falling-threshold value event-number [owner string]
```

To disable the alarm, use the `no rmon hc-alarm number` command.

Parameters

- **number**: Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.
- **variable**: The MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3. The object type must be a 64-bit integer.
- **interval**: Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds.
- **delta**: Enter the keyword `delta` to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.
- **absolute**: Enter the keyword `absolute` to test each MIB variable directly. This is the alarmSampleType in the RMON alarm table.
Enter the keywords rising-threshold then the value (64 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the alarmRisingEventIndex or alarmTable of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.

Enter the keywords falling-threshold then the value (64 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the alarmFallingEventIndex or the alarmTable of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero.

(Optional) Enter the keyword owner then the owner name to specify an owner for the alarm. This is the alarmOwner object in the alarmTable of the RMON MIB.

Defaults
owner

</tbody>
</table>
show rmon log

Display the contents of the RMON log table.

Syntax

```
show rmon log [index] [brief]
```

Parameters

- **index**  
  (OPTIONAL) Enter the table index number to display just that entry.

- **brief**  
  (OPTIONAL) Enter the keyword `brief` to display the RMON log table in an easy-to-read format.

Defaults

none

Command Modes

EXEC

### Usage Information

The log table has a maximum of 500 entries. If the log exceeds that maximum, the oldest log entry is purged to allow room for the new entry.

### Example (Index)

```
Dell# show rmon log 2
RMON log entry, alarm table index 2, log index 1
  log time: 14638 (THU AUG 12 22:10:40 2004)
  description: 2
Dell#
```

### Example (Brief)

```
Dell# show rmon log br
eventIndex description
--------------------
 2              2
 4              4
Dell#
```

### show rmon statistics

Display the contents of RMON Ethernet statistics table.

#### Syntax

```
show rmon statistics [index] [brief]
```

#### Parameters

- **index**
  - (OPTIONAL) Enter the table index number to display just that entry.

- **brief**
  - (OPTIONAL) Enter the keyword brief to display the RMON Ethernet statistics table in an easy-to-read format.

#### Defaults

```
none
```

#### Command Modes

```
EXEC
```
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dell#
```
Rapid Spanning Tree Protocol (RSTP)

The Dell Networking OS implementation of rapid spanning tree protocol (RSTP) is based on the IEEE 802.1w standard spanning-tree protocol. The RSTP algorithm configures connectivity throughout a bridged local area network (LAN) that is comprised of LANs interconnected by bridges.
Dell Networking OS supports RSTP.

Topics:
- bridge-priority
- debug spanning-tree rstp
- description
- disable
- forward-delay
- hello-time
- max-age
- protocol spanning-tree rstp
- show config
- show spanning-tree rstp
- spanning-tree rstp
- tc-flush-standard

bridge-priority

Set the bridge priority for RSTP.

Syntax
bridge-priority priority-value

To return to the default value, use the no bridge-priority command.

Parameters
priority-value Enter a number as the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is 32768.

Defaults
32768

Command Modes
CONFIGURATION RSTP (conf-rstp)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.

</tbody>
</table>

Related Commands

- `protocol spanning-tree rstp` — enters rapid spanning tree mode.

### debug spanning-tree rstp

Enable debugging of RSTP and view information on the protocol.

**Syntax**

```plaintext
debug spanning-tree rstp [all | bpdu interface {in | out} | events]
```

To disable debugging, use the `no debug spanning-tree rstp` command.

**Parameters**

- `all` *(OPTIONAL)* Enter the keyword `all` to debug all spanning tree operations.
- `bpdu interface {in | out}` *(OPTIONAL)* Enter the keyword `bpdu` to debug the bridge protocol data units. Enter the keyword `interface` along with the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

  Optionally, enter an in or out parameter with the optional interface:
  - For Receive, enter `in`.
  - For Transmit, enter `out`.

- `events` *(OPTIONAL)* Enter the keyword `events` to debug RSTP events.

**Command Modes**

- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

### Example

```
Dell# debug spanning-tree rstp bpdu gigabitethernet 2/1 ?
in Receive (in)
out Transmit (out)
```

### description

Enter a description of the rapid spanning tree.

#### Syntax

```
description {description}
```

To remove the description, use the `no description {description}` command.

#### Parameters

- **description**
  
Enter a description to identify the rapid spanning tree (80 characters maximum).

#### Defaults

none

#### Command Modes

SPANNING TREE (The prompt is “config-rstp”)

#### Command History

**Related Commands**

- protocol spanning-tree rstp — enters SPANNING TREE mode on the switch.

---

**forward-delay**

Configure the amount of time the interface waits in the Listening State and the Learning State before transitioning to the Forwarding State.

**Syntax**

```
forward-delay seconds
```

To return to the default setting, use the `no forward-delay` command.

**Parameters**

- **seconds**
  
Enter the number of seconds that Dell Networking OS waits before transitioning RSTP to the forwarding state. The range is from 4 to 30. The default is **15 seconds**.

**Defaults**

**15 seconds**

**Command Modes**

CONFIGURATION RSTP (conf-rstp)

7.5.1.0    | Introduced on the C-Series. 
6.2.1.1    | Introduced on the E-Series.

**Related Commands**

- **hello-time** — changes the time interval between BPDUs.
- **max-age** — changes the wait time before RSTP refreshes the protocol configuration information.
hello-time

Set the time interval between the generation of the RSTP bridge protocol data units (BPDUs).

Syntax

hello-time [milli-second] seconds

To return to the default value, use the no hello-time command.

Parameters

- **seconds**: Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10 seconds. The default is **2 seconds**.
- **milli-second**: Enter the keywords milli-second to configure a hello time on the order of milliseconds. The range is from 50 to 950 milliseconds.

Defaults

**2 seconds**

Command Modes

CONFIGURATION RSTP (conf-rstp)

Command History

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The hello time is encoded in BPDUs in increments of 1/256ths of a second. The standard minimum hello time in seconds is 1 second, which is encoded as 256. Millisecond hello times are encoded using values less than 256; the millisecond hello time equals (x/1000)*256.

When you configure millisecond hellos, the default hello interval of 2 seconds is still used for edge ports; the millisecond hello interval is not used.
max-age

To maintain configuration information before refreshing that information, set the time interval for the RSTP bridge.

Syntax

```
max-age seconds
```

To return to the default values, use the `no max-age` command.

Parameters

- **max-age**
  - Enter a number of seconds the Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is **20 seconds**.

Defaults

**20 seconds**

Command Modes

- **CONFIGURATION RSTP (conf-rstp)**

<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

RSTP is not enabled when you enter RSTP mode. To enable RSTP globally on the system, use the `no disable` command from RSTP mode.

**Example**

```
Dell(conf)# protocol spanning-tree rstp
Dell(config-rstp)# no disable
```

**Related Commands**

- `disable` — disables RSTP globally on the system.

---

**show config**

View the current configuration for the mode. Only non-default values are displayed.

**Syntax**

```
show config
```
show spanning-tree rstp

Display the RSTP configuration.

Syntax
show spanning-tree rstp [brief] [guard]

Parameters
brief (OPTIONAL) Enter the keyword brief to view a synopsis of the RSTP configuration information.

guard (OPTIONAL) Enter the keyword guard to display the type of guard enabled on an RSTP interface and the current port state.

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Version Description
- **9.10(0.0)** Introduced on the S3148.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.4.2.1** Added support for the optional `guard` keyword on the C-Series, S-Series, and E-Series.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.4.1.0** Expanded to display the port error disable state (EDS) caused by loopback BPDU inconsistency.
- **6.2.1.1** Introduced on the E-Series.

### Usage Information
The following describes the `show spanning-tree rstp guard` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Name</td>
<td>RSTP interface.</td>
</tr>
<tr>
<td>Instance</td>
<td>RSTP instance.</td>
</tr>
<tr>
<td>Sts</td>
<td>Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), disabled (DIS), or shut down (EDS Shut).</td>
</tr>
<tr>
<td>Guard Type</td>
<td>Types of STP guard configured (Root, Loop, or BPDU guard)</td>
</tr>
</tbody>
</table>

### Example (Brief)
```
Dell# show spanning-tree rstp brief
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 8192, Address 0001.e805.e306
Root Bridge hello time 4, max age 20, forward delay 15

</tbody>
</table>

### spanning-tree rstp

Configure an RSTP interface with one of these settings: port cost, edge port with optional bridge port data unit (BPDU) guard, port priority, loop guard, or root guard.

**Syntax**

```
spanning-tree rstp {cost port-cost | edge-port [bpduguard [shutdown-on-violation]] | priority priority | {loopguard | rootguard}}
```

**Parameters**

- `cost port-cost`: Enter the keyword `cost` then the port cost value. The range is from 1 to 200000. The defaults are:
  - 100 Mb/s Ethernet interface = 200000
  - 1-Gigabit Ethernet interface = 20000
  - 10-Gigabit Ethernet interface = 2000
Port Channel interface with one 100 Mb/s Ethernet = 200000
Port Channel interface with one 1 Gigabit Ethernet = 20000
Port Channel interface with one 10 Gigabit Ethernet = 2000
Port Channel with two 1 Gigabit Ethernet = 18000
Port Channel with two 10 Gigabit Ethernet = 1800
Port Channel with two 100 Mbps Ethernet = 180000

edge-port

Enter the keywords edge-port to configure the interface as a rapid spanning tree edge port.

bpduguard

(OPTIONAL) Enter the keyword portfast to enable Portfast to move the interface into Forwarding mode immediately after the root fails.

Enter the keyword bpduguard to disable the port when it receives a BPDU.

shutdown-on-violation

(OPTIONAL) Enter the keywords shutdown-on-violation to hardware disable an interface when a BPDU is received and the port is disabled.

priority priority

Enter keyword priority then a value in increments of 16 as the priority. The range is from 0 to 240. The default is 128.

loopguard

Enter the keyword loopguard to enable loop guard on an RSTP port or port-channel interface.

rootguard

Enter the keyword rootguard to enable root guard on an RSTP port or port-channel interface.

Defaults
Not configured.

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.4.2.1 Added support for the optional guard keyword on the C-Series, S-Series, and E-Series.
8.3.70 Introduced on the S4810.
8.2.1.0 Introduced the hardware shutdown-on-violation options.
Usage Information

The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into an Error Disable state if a BPDU appears and a message is logged so that the administrator can take corrective action.

NOTE: A port configured as an edge port, on an RSTP switch, immediately transitions to the Forwarding state. Only configure ports connected to end-hosts as edge ports. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable shutdown-on-violation, BPDUs are still sent to the RPM CPU.

You cannot enable STP root guard and loop guard at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message displays: % Error: RootGuard is configured. Cannot configure LoopGuard.

Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

• If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
• If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

Example

Dell(conf)# interface gigabitethernet 4/1
Dell(conf-if-gi-4/0)# spanning-tree rstp edge-port
Dell(conf-if-gi-4/0)# show config
!
interface GigabitEthernet 4/1
   no ip address
   switchport
   spanning-tree rstp edge-port
   no shutdown
Dell#

tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

Syntax

tc-flush-standard
To disable, use the no tc-flush-standard command.

Defaults

Disabled

Command Modes

CONFIGURATION (conf-rstp)

Command History

</table>

**Usage Information**

By default, Dell Networking OS implements an optimized flush mechanism for RSTP. This implementation helps in flushing MAC addresses only when necessary (and less often), allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn on this knob command to enable flushing MAC addresses after receiving every topology change notification.
The Dell Networking OS supports software-defined networking (SDN). For more information, see the SDN Deployment Guide.
The commands in this chapter are available on Dell Networking OS. For configuration details, see the Security section in the Dell Networking OS Configuration Guide.

**NOTE:** Dell Networking OS implements LEAP with MSCHAP v2 supplicant.

Topics:
- AAA Accounting Commands
- Authorization and Privilege Commands
- Obscure Password Commands
- Authentication and Password Commands
- RADIUS Commands
- TACACS+ Commands
- Port Authentication (802.1X) Commands
- SSH and SCP Commands
- Secure DHCP Commands
- Role-Based Access Control Commands
- ICMP Vulnerabilities

## AAA Accounting Commands

AAA Accounting enables tracking of services that users are accessing and the amount of network resources being consumed by those services. When you enable AAA Accounting, the network server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record is comprised of accounting AV pairs and is stored on the access control server.

As with authentication and authorization, you must configure AAA Accounting by defining a named list of accounting methods, and then applying that list to various interfaces.

### aaa accounting

Enable AAA Accounting and create a record for monitoring the accounting function.

**Syntax**

```
aaa accounting {system | exec | commands level | role role-name} {name | default}{start-stop | wait-start | stop-only} {tacacs+}
```

To disable AAA Accounting, use the `no aaa accounting {system | exec | command level} {name | default}{start-stop | wait-start | stop-only} {tacacs+} command.`
Parameters

- **system**: Enter the keyword `system` to send accounting information of any other AAA configuration.

- **exec**: Enter the keyword `exec` to send accounting information when a user has logged in to EXEC mode.

- **commands (level | role role-name)**: Enter the keyword `command` then a privilege level for accounting of commands executed at that privilege level or enter the keyword `role` then the role name for accounting of commands executed by a user with that user role.

- **name | default**: Enter one of the following:
  - For `name`, enter a user-defined name of a list of accounting methods.
  - For `default`, the default accounting methods used.

- **start-stop**: Enter the keywords `start-stop` to send a “start accounting” notice at the beginning of the requested event and a “stop accounting” notice at the end of the event.

- **wait-start**: Enter the keywords `wait-start` to ensure that the TACACS+ security server acknowledges the start notice before granting the user’s process request.

- **stop-only**: Enter the keywords `stop-only` to instruct the TACACS+ security server to send a “stop record accounting” notice at the end of the requested user process.

- **tacacs+**: Enter the keyword `tacacs+` to use TACACS+ data for accounting. The Dell Networking OS currently only supports TACACS+ accounting.

Defaults

- `none`

</table>
Version | Description
--- | ---
6.3.1.0 | Introduced on the E-Series.

Usage Information

In the example above, TACACS+ accounting is used to track all usage of EXEC command and commands on privilege level 15.

Privilege level 15 is the default. If you want to track usage at privilege level 1 for example, use the `aaa accounting` command 1 command.

Example

Dell(conf)# aaa accounting exec default start-stop tacacs+
Dell(conf)# aaa accounting command 15 default start-stop tacacs+
Dell(conf)# aaa accounting command role secaadmin default start-stop tacacs+

Related Commands

- `enable password` — changes the password for the `enable` command.
- `login authentication` — enables AAA login authentication on the terminal lines.
- `password` — creates a password.
- `tacacs-server host` — specifies a TACACS+ server host.

accounting

Apply an accounting method list to terminal lines.

Syntax

```
accounting {exec | commands {level | role role-name}} method-list
```

Parameters

- **exec**
  
Enter the keyword `exec` to apply an EXEC level accounting method list.

- **commands {level | role role-name}**
  
Enter the keywords `commands level` to apply an EXEC and CONFIGURATION level accounting method list or enter the keyword `role` and then the role name for accounting of commands executed by a user with that user role.

- **method-list**
  
Enter a method list that you defined using the `aaa accounting exec` or `aaa accounting commands` commands.

Defaults

none

**Related Commands**

- `aaa accounting` — enables AAA Accounting and creates a record for monitoring the accounting function.

### aaa accounting suppress

Prevent the generation of accounting records of users with the user name value of NULL.

**Syntax**

```plaintext
aaa accounting suppress null-username
```

To permit accounting records to users with user name value of NULL, use the `no aaa accounting suppress null-username` command.

**Defaults**

Accounting records are recorded for all users.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
Dell Networking OS issues accounting records for all users on the system, including users whose username string, due to protocol translation, is NULL. For example, a user who comes on line with the `aaa authentication login method-list none` command is applied. To prevent the accounting records from being generated for sessions that do not have user names associated to them, use the `aaa accounting suppress` command.

### aaa radius group

Configure the RADIUS server group that is used for Authentication, Authorization and Accounting.

**Syntax**

```
aaa radius group group-name
```

To remove the RADIUS group configuration, use the `no aaa radius group group-name` command.

**Parameters**

- `group-name` Enter the name of the RADIUS server group.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version

- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000–ON.
- 9.4.(0.0) Introduced on the S-Series and Z-Series.

#### Usage Information

You can use this command to configure the group of Radius servers used for Authentication, Authorization, and Accounting purposes.

If the RADIUS group is not configured for Authentication, Authorization, and Accounting, then globally configured Radius servers are used for the purposes.

When the RADIUS group is removed, the AAA configuration is also removed.
Example

Dell(conf)# radius-server group group1
Dell(conf-radius-group)# radius-server host 1.1.1.1 key secret
Dell(conf-radius-group)# radius-server host 2.2.2.2 key secret
Dell(conf-radius-group)# radius-server vrf vrf1 source-interface gigabitethernet 1/36
Dell(conf)# exit
Dell(conf)# aaa radius group group1

show accounting

Display the active accounting sessions for each online user.

Syntax

show accounting

Defaults

none

Command Modes

EXEC

Command History

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command steps through all active sessions and then displays the accounting records for the active account functions.

Example

Dell# show accounting
Active accounted actions on tty2, User admin Priv 1 Role
  Task ID 2, EXEC Accounting record, 00:02:03 Elapsed, service=shell
Active accounted actions on tty3, User ad Priv 15 Role
  Task ID 7, EXEC Accounting record, 00:01:22 Elapsed, service=shell
Active accounted actions on tty4, User ad Priv 15 Role
Related Commands

- aaa accounting — enables AAA Accounting and creates a record for monitoring the accounting function.

Authorization and Privilege Commands

To set command line authorization and privilege levels, use the following commands.

authorization

Apply an authorization method list to terminal lines.

Syntax

authorization {exec | commands {level | role role-name}} method-list

Parameters

- **exec**: Enter the keyword `exec` to apply an EXEC level authorization method list.
- **commands** *(level | role role-name)*: Enter the keyword `commands` followed by either a privilege level for accounting of commands executed at that privilege level, or enter the keyword `role` then the role name for authorization of commands executed by a user with that user role.
- **method-list**: Enter a method list that you defined using the `aaa accounting exec` or `aaa accounting commands` commands.

Defaults

none

</tbody>
</table>
aaa authorization commands

Set parameters that restrict (or permit) a user’s access to EXEC and CONFIGURATION level commands.

**Syntax**

```
aaa authorization commands {level | role role-name}{name|default} {local | tacacs+ | none}
undo a configuration with the no aaa authorization commands {level | role role-name}{name|default} {local | tacacs+ | none} command.
```

**Parameters**

- `commands level`
  - Enter the keyword `commands` then the command privilege level for command level authorization.
- `role role-name`
  - Enter the keyword `role` then the role name.
- `name`
  - Define a name for the list of authorization methods.
- `default`
  - Define the default list of authorization methods.
- `local`
  - Use the authorization parameters on the system to perform authorization.
- `tacacs+`
  - Use the TACACS+ protocol to perform authorization.
- `none`
  - Enter the keyword `none` to apply no authorization.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.

**Related Commands**

- `aaa authorization commands` — sets the parameters that restrict (or permit) a user’s access to EXEC and CONFIGURATION level commands.
- `aaa authorization exec` — sets the parameters that restrict (or permit) a user’s access to EXEC level commands.
Version Description
9.7(0.0) Introduced on the S6000-ON.
9.5(0.0) Added support for roles on the Z9000, S6000, S4820T, S4810, MXL.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.1.1.0 Added support for RADIUS.

Usage Information
Certain TACACS+ servers do not authenticate the device if you use the `aaa authorization commands level default local tacacs+` command. To resolve the issue, use the `aaa authorization commands level default tacacs+ local` command.

**aaa authorization config-commands**

Set parameters that restrict (or permit) a user’s access to EXEC level commands.

**Syntax**

```
aaa authorization config-commands
```

Disable authorization checking for CONFIGURATION level commands using the `no aaa authorization config-commands` command.

**Defaults**

Enabled when you configure `aaa authorization commands command`.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

aaa authorization exec

Set parameters that restrict (or permit) a user’s access to EXEC-level commands.

Syntax

```
aaa authorization exec {name | default} {local || tacacs+ || if-authenticated || none}
```

To disable authorization checking for EXEC level commands, use the `no aaa authorization exec` command.

Parameters

- **name**: Define a name for the list of authorization methods.
- **default**: Define the default list of authorization methods.
- **local**: Use the authorization parameters on the system to perform authorization.
- **tacacs+**: Use the TACACS+ protocol to perform authorization.
- **none**: Enter the keyword `none` to apply no authorization.

Defaults

`none`

- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
privilege level (CONFIGURATION mode)

Change the access or privilege level of one or more commands.

Syntax

```
privilege mode {level level command | reset command}
```

To delete access to a level and command, use the no privilege mode level level command command.

Parameters

- **mode**
  - Enter one of the following keywords as the mode for which you are controlling access:
    - configure for CONFIGURATION mode
    - exec for EXEC mode
    - interface for INTERFACE modes
    - line for LINE mode
    - route-map for ROUTE-MAP mode
    - router for ROUTER OSPF, ROUTER RIP, ROUTER ISIS and ROUTER BGP modes

- **level level**
  - Enter the keyword level then a number for the access level. The range is from 0 to 15.
  - Level 1 is EXEC mode and Level 15 allows access to all CLI modes and commands.

- **reset**
  - Enter the keyword reset to return the security level to the default setting.

- **command**
  - Enter the command’s keywords to assign the command to a certain access level. You can enter one or all of the keywords.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

6.1.1.0 Introduced support for RADIUS.

9.10(0.0) Introduced on the S3148.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000–ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.
privilege level (LINE mode)

Change the access level for users on the terminal lines.

**Syntax**

```
privilege level level
```

To delete access to a terminal line, use the `no privilege level level` command.

**Parameters**

- `level level`
  - Enter the keyword `level` then a number for the access level. The range is from 0 to 15.
  - Level 1 is EXEC mode and Level 15 allows access to all CLI modes.

**Defaults**

```
level = 15
```

**Command Modes**

```
LINE
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.

8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
Obscure Password Commands

To enable the obscure password, use the following commands.

**service obscure-passwords**

Enable the obscuring of passwords and keys.

**Syntax**

```
service obscure-passwords
```

Enable the obscuring of passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication, use the `service obscure-passwords` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.6(0.0) | Introduced on the S4810, S4820T, S5000, S6000, Z9000, Z9500, MXL

**Usage Information**

By default, the `service password-encryption` command stores encrypted passwords. For greater security, you can also use the `service obscure-passwords` command to prevent a user from reading the passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication by obscuring this information. Passwords and keys are stored encrypted in the configuration file and by default are displayed in the encrypted form when the configuration is displayed. Enabling the `service obscure-passwords` command displays asterisks instead of the encrypted passwords and keys. This command prevents a user from reading these passwords and keys by obscuring this information with asterisks.

Password obscuring masks the password and keys for display only but does not change the contents of the file. The string of asterisks is the same length as the encrypted string for that line of configuration. To verify that you have successfully obscured passwords and keys, use the `show running-config` command or `show startup-config` command.

If you are using role-based access control (RBAC), only the system administrator and security administrator roles can enable the `service obscure-password command`.
Related Commands
• `show running-config` — Display the current configuration and display changes from the default values.
• `service password-encryption` — Encrypts all passwords configured in the system.

## Authentication and Password Commands

To manage access to the system, use the following the commands.

### aaa authentication enable

Configure AAA Authentication method lists for user access to EXEC privilege mode (the “Enable” access).

**Syntax**
```
aaa authentication enable {default | method-list-name} method [... method2]
```

To return to the default setting, use the `no aaa authentication enable {default | method-list-name} method [... method2]` command.

**Parameters**
- `default` Enter the keyword `default` then the authentication methods to use as the default sequence of methods for the Enable login. The default is `default enable`.
- `method-list-name` Enter a text string (up to 16 characters long) to name the list of enabled authentication methods activated at login.
- `method` Enter one of the following methods:
  - `enable`: use the password the `enable password` command defines in CONFIGURATION mode.
  - `line`: use the password the `password` command defines in LINE mode.
  - `none`: no authentication.
  - `radius`: use the RADIUS servers configured with the `radius-server host` command.
  - `tacacs+`: use the TACACS+ server(s) configured with the `tacacs-server host` command.

- `... method2` (OPTIONAL) In the event of a “no response” from the first method, Dell Networking OS applies the next configured method.

**Defaults**
Use the `enable` password.

**Command Modes**
- `CONFIGURATION`

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

By default, the Enable password is used. If you configure `aaa authentication enable default`, Dell Networking OS uses the methods defined for Enable access instead.

Methods configured with the `aaa authentication enable` command are evaluated in the order they are configured. If authentication fails using the primary method, Dell Networking OS employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell Networking OS proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

### Related Commands

- `enable password` — changes the password for the `enable` command.
- `login authentication` — enables AAA login authentication on the terminal lines.
- `password` — creates a password.
- `radius-server host` — specifies a RADIUS server host.
- `tacacs-server host` — specifies a TACACS+ server host.

## aaa authentication login

Configure AAA Authentication method lists for user access to EXEC mode (Enable log-in).

### Syntax

```
aaa authentication login {method-list-name | default} method [... method4]
```

To return to the default setting, use the `no aaa authentication login {method-list-name | default} method [... method4]` command.

### Parameters

- **method-list-name**
  - Enter a text string (up to 16 characters long) as the name of a user-configured method list that can be applied to different lines.

- **default**
  - Enter the keyword `default` to specify that the method list specified is the default method for all terminal lines.

- **method**
  - Enter one of the following methods:
• enable: use the password the `enable password` command defines in CONFIGURATION mode. Not available if role-only is in use.
• line: use the password the `password` command defines in LINE mode. Not available if role-only is in use.
• local: use the password for the userid contained in the local password database.
• none: no authentication. Not available if role-only is in use.
• radius: use the RADIUS servers configured with the `radius-server host` command.
• tacacs+: use the TACACS+ servers configured with the `tacacs-server host` command.

... method4 (OPTIONAL) Enter up to four additional methods. In the event of a “no response” from the first method, the system applies the next configured method (up to four configured methods).

Defaults
Not configured (that is, no authentication is performed).

</tbody>
</table>
Usage Information

By default, the locally configured username password is used. If you configure `aaa authentication login default`, Dell Networking OS uses the methods this command defines for login instead.

Methods configured with the `aaa authentication login` command are evaluated in the order they are configured. If users encounter an error with the first method listed, Dell Networking OS applies the next method configured. If users fail the first method listed, no other methods are applied. The only exception is the local method. If the user’s name is not listed in the local database, the next method is applied. If the correct user name/password combination is not entered, the user is not allowed access to the switch.

**NOTE:** If authentication fails using the primary method, Dell Networking OS employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell Networking OS proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

After configuring the `aaa authentication login` command, configure the `login authentication` command to enable the authentication scheme on terminal lines.

Connections to the SSH server work with the following login mechanisms: local, radius, and tacacs.

Related Commands

- `login authentication` — enables AAA login authentication on the terminal lines.
- `password` — creates a password.
- `radius-server host` — specifies a RADIUS server host.
- `tacacs-server host` — specifies a TACACS+ server host.

**access-class**

Restrict incoming connections to a particular IP address in a defined IP access control list (ACL).

**Syntax**

```
access-class access-list-name
```

To delete a setting, use the `no access-class` command.

**Parameters**

- `access-list-name` Enter the name of an established IP Standard ACL.

**Defaults**

Not configured.

**Command Modes**

LINE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Related Commands**
- `line` — applies an authentication method list to the designated terminal lines.
- `ip access-list standard` — names (or selects) a standard access list to filter based on the IP address.
- `ip access-list extended` — names (or selects) an extended access list based on the IP addresses or protocols.

### aaa reauthenticate enable

Enable re-authentication of user whenever there is a change in the authenticators.

**Syntax**

```plaintext
aaa reauthenticate enable
```

To disable the re-authentication option, use the `no aaa reauthenticate enable` command.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced this command.</td>
</tr>
</tbody>
</table>

**Usage Information**

When an operating system enables to change the user authenticators, the users might access resources and perform tasks that they do not have authorization.

Once re-authentication is enabled, Dell Networking OS prompts the users to re-authenticate whenever there is a change in authenticators.

The change in authentication happens when:

- Add or remove an authentication server (RADIUS/TACACS+)
- Modify an AAA authentication/authorization list
- Change to role-only (RBAC) mode

The re-authentication is also applicable for authenticated 802.1x devices. When there is a change in the authentication servers, the supplicants connected to all the ports are forced to re-authenticate.
enable password

Change the password for the enable command.

Syntax

```
enable password [level level] [encryption-type] password
```

To delete a password, use the no enable password [encryption-type] password [level level] command.

Parameters

- **level level**
  - (OPTIONAL) Enter the keyword level then a number as the level of access. The range is from 1 to 15.

- **encryption-type**
  - (OPTIONAL) Enter the number 7 or 0 as the encryption type.

  Enter a 7 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

  Use this parameter only with a password that you copied from the show running-config file of another Dell Networking router.

  - **password**

  Enter a text string, up to 32 characters long, as the clear text password.

Defaults

No password is configured. level = 15.

Usage Information

To control access to command modes, use this command to define a password for a level and use the `privilege level (CONFIGURATION mode)` command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password `abcd\]e`, you type `"abcd CNTL v \]e"`. When the password is created, you do not use the CNTL + v key combination and enter `"abcd\]e"`.

```
NOTE: The question mark (?) is not a supported character.
```

Related Commands

- `show running-config` — views the current configuration.
- `privilege level (CONFIGURATION mode)` — controls access to the command modes within the switch.

### enable sha256-password

Configure SHA-256 based password for the `enable` command.

**Syntax**

```
enable sha256-password [level level] [encryption-type] password
```

To delete a password, use the `no enable sha256-password [encryption-type] password [level level]` command.

**Parameters**

- **sha256-password**
  - Enter the keyword `sha256-password` then the encryption-type or the password.
- **level level**
  - (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.
- **encryption-type**
  - (OPTIONAL) Enter the number 8 or 0 as the encryption type.
  - Enter 8 to enter the sha256-based hashed password.
- **password**
  - Enter a text string, up to 32 characters long, as the clear text password.

**Defaults**

No password is configured. `level = 15`.

**Command Modes**

enable restricted

Allows Dell Networking technical support to access restricted commands.

Syntax

```
enable restricted [encryption-type] password
```

To disallow access to restricted commands, use the `no enable restricted` command.

Parameters

- **encryption-type**
  - (OPTIONAL) Enter the number 7 as the encryption type.

  Enter 7 followed a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

  Use this parameter only with a password that you copied from the `show running-config` file of another Dell Networking router.

- **password**
  - Enter a text string, up to 32 characters long, as the clear text password.

Defaults

Not configured.

enable secret

Change the password for the enable command.

**Syntax**

```
enable secret [level level] [encryption-type] password
```

To delete a password, use the `no enable secret [encryption-type] password` command.

**Parameters**

- `level level` (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.
- `encryption-type` (OPTIONAL) Enter the number 5 or 0 as the encryption type.
  
  Enter a 5 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

  Use this parameter only with a password that you copied from the `show running-config` file of another Dell Networking router.

- `password` Enter a text string, up to 32 characters long, as the clear text password.

**Defaults**

No password is configured. `level` = 15.

</tbody>
</table>
Usage Information

To control access to command modes, use this command to define a password for a level and use the privilege level (CONFIGURATION mode) command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password abcd\]e, you type "abcd CNTL v \]e". When the password is created, you do not use the CNTL + v key combination and enter "abcd\]e".

![NOTE: The question mark (?) is not a supported character.](image)

Related Commands

- **show running-config** — views the current configuration.
- **privilege level (CONFIGURATION mode)** — controls access to the command modes within the switch.

### login authentication

To configure authentication for console or remote access, apply an authentication method list.

#### Syntax

```
login authentication {method-list-name | default}
```

To use the local user/password database for login authentication, use the `no login authentication` command.

#### Parameters

- **method-list-name**
  - Enter the keywords method-list-name to specify that method list, created in the `aaa authentication login` command, to be applied to the designated terminal line.

- **default**
  - Enter the keyword default to specify that the default method list, created in the `aaa authentication login` command, is applied to the terminal line.

#### Defaults

No authentication is performed on the console lines. Local authentication is performed on the virtual terminal and auxiliary lines.

#### Command Modes

LINE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

#### Version

- 9.10(0.0)  
  Introduced on the S3148.
- 9.8(2.0)  
  Introduced on the S3100 series.
- 9.8(1.0)  
  Introduced on the Z9100-ON.
- 9.8(0.0P5)  
  Introduced on the S4048-ON.
Version | Description
---|---
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.6.0.0 | Revised introductory and usage guidelines description.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.2.1.0 | Introduced on the E-Series.

**Usage Information**

If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.

When configuring authentication, consider the following:

- If you configure the default authentication list using the `default` keyword, the list applies it to all the local and remote connections globally, unless you have specified some another authentication list for a specific connection.
- If you configure an authentication list other than default, you must apply those authentication lists to each connection.
- If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.

**Related Commands**

- `aaa authentication login` — selects the login authentication methods.

**password**

Specify a password for users on terminal lines.

**Syntax**

```
password [encryption-type] password
```

To delete a password, use the `no password password` command.

**Parameters**

- `encryption-type` (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the password entered. The options are
  - 0 is the default and means the password is not encrypted and stored as clear text.
  - 7 means that the password is encrypted and hidden.
- `password` Enter a text string up to 32 characters long. The first character of the password must be a letter. You cannot use spaces in the password.
Defaults
No password is configured.

</tbody>
</table>

Usage Information
Dell Networking OS prompts users for these passwords when the method for authentication or authorization used is "line".

Related Commands
- enable password — sets the password for the enable command.
- login authentication — configures an authentication method to log in to the switch.
- service password-encryption — encrypts all passwords configured in Dell Networking OS.
- radius-server key — configures a key for all RADIUS communications between the switch and the RADIUS host server.
- tacacs-server key — configures a key for communication between a TACACS+ server and client.
- username — establishes an authentication system based on user names.

password-attributes
Configure the password attributes (strong password).

Syntax
password-attributes [min-length number] [max-retry number] [lockout-period minutes] [character-restriction [upper number] [lower number] [numeric number] [special-char number]]

To return to the default, use the no password-attributes [min-length number] [max-retry number] [lockout-period minutes] [character-restriction [upper number] [lower number] [numeric number] [special-char number]] command.
Parameters

min-length number  (OPTIONAL) Enter the keywords min-length then the number of characters. The range is from 0 to 32 characters.

max-retry number   (OPTIONAL) Enter the keywords max-retry then the number of maximum password retries. The range is from 0 to 16.

lockout-period minutes  (OPTIONAL) Enter the keyword lockout-period then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out sessions on the Telnet or SSH sessions for which there has been a consecutive failed login attempts. The console is not locked out.

character-restriction  (OPTIONAL) Enter the keywords character-restriction to indicate a character restriction for the password.

upper number   (OPTIONAL) Enter the keyword upper then the upper number. The range is from 0 to 31.

lower number   (OPTIONAL) Enter the keyword lower then the lower number. The range is from 0 to 31.

numeric number  (OPTIONAL) Enter the keyword numeric then the numeric number. The range is from 0 to 31.

special-char number  (OPTIONAL) Enter the keywords special-char then the number of special characters permitted. The range is from 0 to 31.

The following special characters are supported:

! " # % & ' ( ) ; < = > ? [ \ ] * + , - . / : ^ _ { | } ~ @ $

Defaults

none

</tbody>
</table>

**Example**

In the following example, after 5 un-successful login attempts, the session (SSH/TELNET) goes into a locked state for 5 minutes. If all the 10 sessions are locked out with 5 un-successful attempts in each session, no users can login during the lockout-period.

```
Dell(conf)# password-attributes max-retry 5 lockout-period 5
```

**Related Commands**

- `password` — specifies a password for users on terminal lines.

---

### secure-cli enable

Enable the secured CLI mode.

**Syntax**

```
secure-cli enable
```

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```
Version     Description
----------   -----------------------------------------------------
9.11(0.0)    Introduced this command.
```

**Usage Information**

The secured CLI mode prevents the users from enhancing the permissions or promoting the privilege levels. After entering the command, save the running-configuration.

Once you save the running-configuration, the secured CLI mode is enabled. If you do not want to enter the secured mode, do not save the running-configuration.

Once saved, to disable the secured CLI mode, you need to manually edit the startup-configuration file and reboot the system.

---

### service password-encryption

Encrypt all passwords configured in Dell Networking OS.

**Syntax**

```
service password-encryption
```

To store new passwords as clear text, use the `no service password-encryption` command.

**Defaults**

Enabled.

**Command Modes**

CONFIGURATION
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

⚠️ CAUTION: Encrypting passwords with this command does not provide a high level of security. When the passwords are encrypted, you cannot return them to plain text unless you re-configure them. To remove an encrypted password, use the no password password command.

To keep unauthorized people from viewing passwords in the switch configuration file, use the service password-encryption command. This command encrypts the clear-text passwords created for user name passwords, authentication key passwords, the privileged command password, and console and virtual terminal line access passwords.

To view passwords, use the show running-config command.

show privilege

View your access level.

Syntax

```
show privilege
```

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>User</td>
<td>Displays the user name of all users logged in.</td>
</tr>
<tr>
<td>Host(s)</td>
<td>Displays the terminal line status.</td>
</tr>
<tr>
<td>Location</td>
<td>Displays the IP address of the user.</td>
</tr>
</tbody>
</table>

### Example
```
Dell# show users
Authorization Mode: role or privilege
Line          User          Role           Priv
Host(s)   Location
*   0  console 0                                unassigned         1  idle
  2  vty 0          admin                     unassigned         1
     idle       10.16.127.35
  3  vty 1          ad                         unassigned        15
     idle       10.16.127.145
  4  vty 2          adl                        sysadmin           1
     idle       10.16.127.141
  5  vty 3          adl                        sysadmin           1
     idle       10.16.127.145
  6  vty 4          admin                      unassigned         1
     idle       10.16.127.141
  7  vty 5          ad                         unassigned        15
     idle       10.16.127.141

Dell#`
```

### Related Commands
- `username` — enables a user.
timeout login response

Specify how long the software waits for the login input (for example, the user name and password) before timing out.

Syntax

```
timeout login response seconds
```

To return to the default values, use the no timeout login response command.

Parameters

- **seconds**
  - Enter a number of seconds the software waits before logging you out. The range is:
    - VTY — range is from 1 to 30 seconds, the default is **30 seconds**.
    - Console — range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).
    - AUX — range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).

Defaults

See Parameters.

</tbody>
</table>

Usage Information

The software measures the period of inactivity defined in this command as the period between consecutive keystrokes. For example, if your password is “password” you can enter “p” and wait 29 seconds to enter the next letter.
username

Establish an authentication system based on user names.

Syntax

username name [access-class access-list-name] [nopassword | (password | secret | sha256-password) [encryption-type] password] [privilege level] [role role-name]

If you do not want a specific user to enter a password, use the nopassword option.

To delete authentication for a user, use the no username name command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Enter a text string for the name of the user up to 63 characters.</td>
</tr>
<tr>
<td>access-class</td>
<td>Enter the keywords access-class then the name of a configured access control list (either an IP access control list or MAC access control list).</td>
</tr>
<tr>
<td>access-list-name</td>
<td></td>
</tr>
<tr>
<td>nopassword</td>
<td>Enter the keyword nopassword to specify that the user should not enter a password.</td>
</tr>
<tr>
<td>password</td>
<td>Enter the keyword password then the encryption-type or the password.</td>
</tr>
<tr>
<td>encryption-type</td>
<td>Enter an encryption type for the password that you enter.</td>
</tr>
<tr>
<td>password</td>
<td>- 0 directs the system to store the password as clear text. It is the default encryption type when using the password option.</td>
</tr>
<tr>
<td></td>
<td>- 8 to indicate that a password encrypted using a sha256 hashing algorithm follows. This encryption type is available with the sha256-password option only, and is the default encryption type for this option.</td>
</tr>
<tr>
<td></td>
<td>- 7 to indicate that a password encrypted using a DES hashing algorithm follows. This encryption type is available with the password option only.</td>
</tr>
<tr>
<td>password</td>
<td>- 5 to indicate that a password encrypted using an MD5 hashing algorithm follows. This encryption type is available with the secret option only, and is the default encryption type for this option.</td>
</tr>
<tr>
<td>privilege level</td>
<td>Enter the keyword privilege then a number from zero (0) to 15.</td>
</tr>
<tr>
<td>role role-name</td>
<td>Enter the keyword role followed by the role name to associate with that user ID.</td>
</tr>
<tr>
<td>secret</td>
<td>Enter the keyword secret then the encryption type.</td>
</tr>
<tr>
<td>sha256-password</td>
<td>Enter the keyword sha256-password then the encryption-type or the password.</td>
</tr>
</tbody>
</table>

Defaults

The default encryption type for password option is 0. The default encryption type for secret option is 5. The default encryption type for sha256-password option is 8. The default value of privilege level is 1.

### Usage Information
To view the defined user names, use the `show running-config user` command.

### Related Commands
- `password` — specifies a password for users on terminal lines.
- `show running-config` — views the current configuration.

### RADIUS Commands

The following RADIUS commands are supported by Dell Networking OS.

#### aaa radius auth-method

Configure the authentication method to use with RADIUS for user access.

**Syntax**

```plaintext
aaa radius auth-method {pap | mschapv2}
```

To undo the RADIUS authentication method configuration, use the `no aaa radius auth-method` command.

**Parameters**

- `pap`  
  Enter the keyword `pap` to use the Password Authentication Protocol (PAP) for RADIUS authentication. This protocol uses the username and password attributes in the access-request message sent to the RADIUS server.

- `mschapv2`  
  Enter the keyword `mschapv2` to use the Microsoft Challenge-Handshake Authentication Protocol (MS-CHAPv2) for RADIUS authentication. This protocol is considered to be more secure than PAP and uses mutual authentication based on a random challenge and challenge response.
**debug radius**

View RADIUS transactions to assist with troubleshooting.

**Syntax**

```plaintext
debug radius
```

To disable debugging of RADIUS, use the `no debug radius` command.

**Defaults**

Disabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

You can configure the RADIUS authentication method to access the switch using the following applications: Console, Telnet, SSH, REST, and OMI.
**ip radius source-interface**

Specify an interface’s IP address as the source IP address for RADIUS connections.

**Syntax**

```
ip radius source-interface interface
```

To delete a source interface, use the `no ip radius source-interface` command.

**Parameters**

- **interface**

  Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

radius-server deadtime

Configure a time interval during which non-responsive RADIUS servers to authentication requests are skipped.

Syntax

```
radius-server deadtime seconds
```

To disable this function or return to the default value, use the `no radius-server deadtime` command.

Parameters

- **seconds**: Enter a number of seconds during which non-responsive RADIUS servers are skipped. The range is from 0 to 2147483647 seconds. The default is 0 seconds.

Defaults

0 seconds

</table>

radius-server group

Creates or deletes a group of radius servers.

Syntax

```
radius-server group group-name
```

Parameters

- **group-name**: Enter the group name that denotes the group of RADIUS servers.

Defaults

Not configured.
radius-server host

Configure a RADIUS server host.

Syntax

radius-server host {hostname | ipv4-address | ipv6-address} [auth-port port-number] [retransmit retries] [timeout seconds] [key [encryption-type] key]

Parameters

- **hostname**: Enter the name of the RADIUS server host.
- **ipv4-address | ipv6-address**: Enter the IPv4 address (A.B.C.D) or IPv6 address (X::X::X::X) of the RADIUS server host.
- **auth-port port-number**: (OPTIONAL) Enter the keywords auth-port then a number as the port number. The range is from zero (0) to 65535. The default port-number is 1812.
- **retransmit retries**: (OPTIONAL) Enter the keyword retransmit then a number as the number of attempts. This parameter overwrites the radius-server retransmit command. The range is from zero (0) to 100. The default is 3 attempts.
timeout seconds

(OPTIONAL) Enter the keyword timeout then the seconds the time interval the switch waits for a reply from the RADIUS server. This parameter overwrites the radius-server timeout command. The range is from 0 to 1000. The default is 5 seconds.

key [encryption-type] key

(OPTIONAL) Enter the keyword key then an optional encryption-type and a string up to 42 characters long as the authentication key. The RADIUS host server uses this authentication key and the RADIUS daemon operating on this switch.

For the encryption-type, enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the password is not encrypted and stored as clear text.
- 7 means that the password is encrypted and hidden.

Configure this parameter last because leading spaces are ignored.

Defaults

Not configured.

</tr>
</tbody>
</table>
Version | Description
--- | ---
pre-6.2.1.0 | Introduced on the E-Series.

Usage Information
To configure any number of RADIUS server hosts for each server host that is configured, use this command. Dell Networking OS searches for the RADIUS hosts in the order they are configured in the software.

The global default values for the timeout, retransmit, and key optional parameters are applied, unless those values are specified in the radius-server host or other commands. To return to the global default values, if you configure the timeout, retransmit, or key values, include those keywords when using the no radius-server host command syntax.

You can use duplicate host names or IP addresses among RADIUS groups. However, you cannot use duplicate host names or IP addresses within the same RADIUS group. If a VRF is not configured on the RADIUS group, then servers configured in the group are considered to be on the default VRF. RADIUS servers that are configured in the CONFIGURATION mode are also considered to be on the default VRF.

You must configure the RADIUS group explicitly with the aaa radius group command in order for the AAA servers to use the group of RADIUS servers. The 802.1x servers use the group of RADIUS servers based on the VRF where the 802.1x request is received. As a result, it is possible that both globally configured RADIUS servers as well as the group-configured RADIUS servers (without VRF or default VRF) are used for processing the 802.1x requests that are received at the default VRF. The order in which the RADIUS servers are tried depends on the order in which the RADIUS servers are configured.

Example
Dell(config)#radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?

Dell(config)#no radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?

Related Commands
- login authentication — sets the database to be checked when a user logs in.
- radius-server key — sets an authentication key for RADIUS communications.
- radius-server retransmit — sets the number of times the RADIUS server attempts to send information.
- radius-server timeout — sets the time interval before the RADIUS server times out.

radius-server vrf
Create an association between a RADIUS server group and a VRF and source interface.

Syntax
radius-server vrf vrf-name [source-interface interface]

To delete the association between a RADIUS server group and a VRF and source interface, use the no radius-server vrf vrf-name [source-interface interface] command.

Parameters
- vrf vrf-name: Enter the keyword vrf and then the name of the VRF to associate a RADIUS server group with that VRF.
- interface: Enter the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

RADIUS SERVER GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S-Series and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can use this command to associate a group of RADIUS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the RADIUS group, then the group is considered to be on the default VRF. It is possible to use the default VRF name; however, you cannot configure the source interface with the default VRF as such a configuration results in conflicts between the source interfaces corresponding to the 802.1x supplicants on that default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

**Example**

```bash
Dell(conf)#radius-server group group1
Dell(conf-radius-group)#radius-server vrf vrf1 source-interface gigabitethernet 1/42

Dell(conf)#radius-server group group2
Dell(conf-radius-group)#radius-server vrf default
```
radius-server key

Configure a key for all RADIUS communications between the switch and the RADIUS host server.

Syntax

```
radius-server key [encryption-type] key
```

To delete a password, use the `no radius-server key` command.

Parameters

- **encryption-type** (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:
  - 0 is the default and means the key is not encrypted and stored as clear text.
  - 7 means that the key is encrypted and hidden.

- **key** Enter a string that is the key to be exchanged between the switch and RADIUS servers. It can be up to 42 characters long.

Defaults

Not configured.

</tr>
</tbody>
</table>

Usage Information

The key configured on the switch must match the key configured on the RADIUS server daemon.
If you configure the `key` parameter in the `radius-server host` command, the key configured with the `radius-server key` command is the default key for all RADIUS communications.

**Related Commands**

- `radius-server host` — configures a RADIUS host.

---

**radius-server retransmit**

Configure the number of times the switch attempts to connect with the configured RADIUS host server before declaring the RADIUS host server unreachable.

**Syntax**

```
radius-server retransmit retries
```

To configure zero retransmit attempts, use the `no radius-server retransmit` command.

To return to the default setting, use the `radius-server retransmit 3` command.

**Parameters**

- `retries`  
  Enter a number of attempts that the Dell OS tries to locate a RADIUS server. The range is from zero (0) to 100. The default is `3 retries`.

**Defaults**

`3 retries`

**Related Commands**

- `radius-server host` — configures a RADIUS host.
radius-server timeout

To reply to a request, configure the amount of time the RADIUS client (the switch) waits for a RADIUS host server.

Syntax

radius-server timeout seconds

To return to the default value, use the no radius-server timeout command.

Parameters

seconds Enter the number of seconds between an unsuccessful attempt and the Dell Networking OS times out. The range is from zero (0) to 1000 seconds. The default is 5 seconds.

Defaults

5 seconds

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000–ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.2.1.0 Introduced on the E-Series.

Related Commands

- radius-server host — configure a RADIUS host.
TACACS+ Commands

Dell Networking OS supports TACACS+ as an alternate method for login authentication.

**tacacs-server group**

Creates a group of TACACS servers to be used for Authentication, Authorization, and Accounting.

**Syntax**

`aaa tacacsgroup group-name`

To delete a group of TACACS servers, use the `no tacacs-server group group-name` command.

**Parameters**

- `group-name`: Enter the name of the TACACS server group.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

If the TACACS group is not configured for Authentication, Authorization, and Accounting, then globally configured TACACS servers are used for the purposes. When the TACACS group is removed, the AAA configuration is also removed.

**Example**

```
Dell(conf)# tacacs-server group group1
Dell(conf-tacacsgroup)# tacacs-server host 1.1.1.1 key secret
Dell(conf-tacacsgroup)# tacacs-server host 2.2.2.2 key secret
Dell(conf-tacacsgroup)# tacacs-server vrf vrf1 source-interface gigabitethernet 1/40
Dell(conf)# exit
Dell(conf)# aaa tacacsgroup group1
```

**Related Commands**

- `aaa authentication login` — specifies the login authentication method.
- `tacacs-server key` — configures a TACACS+ key for the TACACS server.
**debug tacacs+**

To assist with troubleshooting, view TACACS+ transactions.

**Syntax**

```
debug tacacs+
```

To disable debugging of TACACS+, use the **no debug tacacs+** command.

**Defaults**

Disabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**ip tacacs source-interface**

Specify an interface’s IP address as the source IP address for TACACS+ connections.

**Syntax**

```
ip tacacs source-interface interface
```

To delete a source interface, use the **no ip tacacs source-interface** command.

**Parameters**

- **interface**
  - Enter the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
• For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
• For a port channel interface, enter the keywords `port-channel` then a number.
• For a Null interface, enter the keyword `null` then the Null interface number.
• For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Defaults
Not configured.

**tacacs-server group**

Creates a group of TACACS servers.

**Syntax**
```
tacacs-server group group-name
```
To delete a group of TACACS servers, use the `no tacacs-server group group-name` command.

**Parameters**
- **group-name** Enter the name of the TACACS server group.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Command History

**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.4(0.0) | Introduced on the S-Series and Z-Series.

### Usage Information

You can associate a TACACS server group with a VRF.

### Example

```
Dell(conf)# tacacs-server group group1
Dell(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secret
Dell(conf-tacacs-group)# tacacs-server host 2.2.2.2 key secret
Dell(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface gigabitethernet 1/40
Dell(conf-tacacs-group)# show config
!
tacacs-server group group1
tacacs-server vrf vrf1 source-interface GigabitEthernet 1/40
tacacs-server host 1.1.1.1 key 7 9a2f3ec0c65c6f41
tacacs-server host 2.2.2.2 key 7 9a2f3ec0c65c6f41
Dell(conf-tacacs-group)#
```

### Related Commands

- `aaa authentication login` — specifies the login authentication method.
- `tacacs-server key` — configures a TACACS+ key for the TACACS server.

---

### tacacs-server host

Specify a TACACS+ host.

**Syntax**

```
tacacs-server host {hostname | ipv4-address | ipv6-address} [port number] [timeout seconds] [key key]
```

**Parameters**

- `hostname` | Enter the name of the TACACS+ server host.
- `ipv4-address | ipv6-address` | Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X::X) of the TACACS+ server host.
- `port number` | (OPTIONAL) Enter the keyword port then a number as the port to be used by the TACACS+ server. The range is from zero (0) to 65535. The default is 49.
- `timeout seconds` | (OPTIONAL) Enter the keyword timeout then the number of seconds the switch waits for a reply from the TACACS+ server. The range is from 0 to 1000. The default is 10 seconds.
(OPTIONAL) Enter the keyword key then a string up to 42 characters long as the authentication key. This authentication key must match the key specified in the tacacs-server key for the TACACS+ daemon.

Defaults
Not configured.

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information
To list multiple TACACS+ servers to be used by the aaa authentication login command, configure this command multiple times.

If you are not configuring the switch as a TACACS+ server, you do not need to configure the port, timeout and key optional parameters. If you do not configure a key, the key assigned in the tacacs-server key command is used.

You can use duplicate host names or IP addresses among TACACS groups. However, you cannot use duplicate host names or IP addresses within the same TACACS group.

If a VRF is not configured on the TACACS group, then servers configured in the group are considered to be on the default VRF. TACACS servers that are configured in the CONFIGURATION mode are also considered to be on the default VRF.
For AAA servers to use a group of TACACS servers, you must explicitly configure the group using the `aaa tacacs group group-name` command. The order in which the TACACS servers are tried depends on the order in which they are configured.

**Example**

```
Dell(conf)# tacacs-server group group1
Dell(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secr-et
Dell(conf-tacacs-group)# no tacacs-server host 1.1.1.1
Dell(conf-tacacs-group)#
```

**Related Commands**

- `aaa authentication login` — specifies the login authentication method.
- `tacacs-server key` — configures a TACACS+ key for the TACACS server.

## tacacs-server key

Configure a key for communication between a TACACS+ server and a client.

**Syntax**

```
tacacs-server key [encryption-type] key
```

To delete a key, use the `no tacacs-server key key` command.

**Parameters**

- `encryption-type` (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:
  - 0 is the default and means the key is not encrypted and stored as clear text.
  - 7 means that the key is encrypted and hidden.
- `key` Enter a text string, up to 42 characters long, as the clear text password. Leading spaces are ignored.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
tacacs-server vrf

Create an association between a TACACS server group and a VRF and source interface.

Syntax
tacacs-server vrf vrf-name [source-interface interface]

To delete the association between a TACACS server group and a VRF and source interface, use the no tacacs-server vrf vrf-name [source-interface interface] command.

Parameters

vrf vrf-name

Enter the keyword vrf and then the name of the VRF to associate a TACACS server group with that VRF.

interface

Enter the following keywords and slot/port or number information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a Null interface, enter the keyword null then the Null interface number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults
Not configured.

Command Modes
TACACS SERVER GROUP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
### Version Description

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S-Series and Z-Series.</td>
</tr>
</tbody>
</table>

### Usage Information

You can use this command to associate a group of TACACS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the TACACS group, then the group is considered to be on the default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

### Example

```plaintext
Dell(conf)# tacacs-server group group1
Dell(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface gigabitethernet 1/36
Dell(conf)# tacacs-server group group2
Dell(conf-tacacs-group)# tacacs-server vrf default
```

### Port Authentication (802.1X) Commands

An authentication server must authenticate a client connected to an 802.1X switch port. Until the authentication, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

Dell Networking OS supports RADIUS and Active Directory environments using 802.1X Port Authentication.

### Important Points to Remember

Dell Networking OS limits network access for certain users by using VLAN assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- 802.1X is supported on Dell Networking OS.
- 802.1X is not supported on the LAG or the channel members of a LAG.
- If no VLAN is supplied by the RADIUS server or if 802.1X authorization is disabled, the port is configured in its access VLAN after successful authentication.
- If 802.1X authorization is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If 802.1X authorization is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If port security is enabled on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If 802.1X is disabled on the port, it is returned to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.
**dot1x authentication (Configuration)**

Enable dot1x globally; dot1x must be enabled both globally and at the interface level.

**Syntax**

```
dot1x authentication
```

To disable dot1x on globally, use the `no dot1x authentication` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

**Related Commands**

- `dot1x authentication (Interface)` — enable dot1x on an interface.

---

**dot1x authentication (Interface)**

Enable dot1x on an interface; dot1x must be enabled both globally and at the interface level.

**Syntax**

```
dot1x authentication
```

To disable dot1x on an interface, use the `no dot1x authentication` command.

**Defaults**

Disabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Related Commands
- `dot1x authentication (Configuration)` — enable dot1x globally.

## `dot1x auth-fail-vlan` Command

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

**Syntax**
```
dot1x auth-fail-vlan vlan-id [max-attempts number]
```

To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

**Parameters**
- `vlan-id` (Required) Enter the VLAN Identifier. The range is from 1 to 4094.
- `max-attempts number` (Optional) Enter the keywords `max-attempts` then number of attempts desired before authentication fails. The range is from 1 to 5. The default is 3.

**Defaults**
- **3 attempts**

**Command Modes**
- `CONFIGURATION (conf-if-interface-slot/port)`

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description
- **9.10(0.0)**: Introduced on the S3148.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **7.6.1.0**: Introduced on the C-Series and S-Series.
- **7.4.1.0**: Introduced on the E-Series.
Usage Information
If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to
authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed
attempts, the interface is moved to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication
occurs at the next re-authentication interval (dot1x reauthentication).

Related Commands
- `dot1x port-control` — enables port-control on an interface.
- `dot1x guest-vlan` — configures a guest VLAN for non-dot1x devices.
- `show dot1x interface` — displays the 802.1X information on an interface.

dot1x auth-server

Configure the authentication server to RADIUS.

Syntax
`dot1x auth-server radius`

Defaults
none

</table>

**Usage Information**

802.1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication for the device occurs at the next re-authentication interval (dot1x reauthentication).
If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

NOTE: The layer 3 portion of guest VLAN and authentication fail VLANs can be created regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

Related Commands
- `dot1x auth-fail-vlan` — configures a VLAN for authentication failures.
- `dot1x reauthentication` — enables periodic re-authentication.
- `show dot1x interface` — displays the 802.1X information on an interface.

**dot1x mac-auth-bypass**

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell Networking OS attempts to authenticate the host based on its MAC address.

**Syntax**

```
[no] dot1x mac-auth-bypass
```

**Defaults**

Disabled

**Usage Information**

To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.
dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

Syntax

```
dot1x max-eap-req number
```

To return to the default, use the `no dot1x max-eap-req` command.

Parameters

- **number**: Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is 2.

Defaults

2

Related Commands

- `interface range` — configure a range of interfaces.

---

dot1x port-control

Enable port control on an interface.

Syntax

```
dot1x port-control {force-authorized | auto | force-unauthorized}
```

Parameters

- **force-authorized**: Enter the keywords force-authorized to forcibly authorize a port.
- **auto**: Enter the keyword auto to authorize a port based on the 802.1X operation result.
force-unauthorized Enter the keywords force-unauthorized to forcibly de-authorize a port.

Defaults none

Usage Information The authenticator performs authentication only when port-control is set to auto.

**dot1x quiet-period**

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

Syntax dot1x quiet-period seconds

To disable quiet time, use the no dot1x quiet-time command.

Parameters

- **seconds** Enter the number of seconds. The range is from 1 to 65535. The default is 30.

Defaults 30 seconds

**dot1x supplicant-timeout**

Configure the amount of time after which exchanges with the supplicant time-out.

**Syntax**

```
dot1x supplicant-timeout seconds
```

To return to the default, use the `no dot1x supplicant-timeout` command.

**Parameters**

- `seconds`
  
  Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.
dot1x tx-period

Configure the intervals at which EAPOL PDUs are transmitted by the Authenticator PAE.

Syntax  
dot1x tx-period seconds

To return to the default, use the no dot1x tx-period command.

Parameters

seconds  Enter the interval time, in seconds, that EAPOL PDUs are transmitted. The range is from 1 to 65535 (1 year). The default is 30.

Defaults  30 seconds

show dot1x interface

Display the 802.1X information on an interface.

Syntax

```
show dot1x interface
```

Parameters

- `interface`
  Enter one of the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

Defaults

- none

Command Modes

- EXEC
- EXEC privilege

SSH and SCP Commands

Dell Networking OS supports secure shell (SSH) protocol versions 1.5 and 2.0. SSH is a protocol for secure remote login over an insecure network. SSH sessions are encrypted and use authentication.

crypto key generate

Generate keys for the SSH server.

Syntax

```
crypto key generate {rsa | rsa1}
```

Parameters

rsa

Enter the keyword rsa then the key size to generate a SSHv2 RSA host keys. The range is from 1024 to 2048 if you did not enable FIPS mode; if you enabled FIPS mode, you can only generate a 2048-bit key. The default is 1024.

```
NOTE: You must have a license to access the FIPS mode. For more information, contact your Dell Networking representative.
```

rsa1

Enter the keyword rsa1 then the key size to generate a SSHv1 RSA host keys. The range is from 1024 to 2048. The default is 1024.

```
NOTE: This option is not available in FIPS mode.
```

Defaults

Key size 1024; if you enable FIPS mode, the key size is 2048.

<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>
### Version Description
- **8.3.12.0**: Added support for FIPS mode on the S4810.
- **8.3.7.0**: Introduced on the S4810.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **pre-6.1.1.0**: Introduced on the E-Series.

### Usage Information
The host keys are required for key-exchange by the SSH server. If the keys are not found when you enable the server (`ip ssh server enable`), the keys are automatically generated.

This command requires user interaction and generates a prompt prior to overwriting any existing host keys.

| NOTE | Only a user with superuser permissions should generate host-keys. |

### Example
```
Dell(conf)# crypto key generate rsa
Enter key size <1024-2048>. Default<1024> : Enter key size <1024-2048>. Default<1024> :
Host key already exists. Overwrite (y/n)?y  Generating 1024-bit SSHv2 RSA key.
Dell(conf)#
Dell(conf)# crypto key generate rsa
Enter key size <1024-2048>. Default<1024> : Enter key size <1024-2048>. Default<1024> :
Host key already exists. Overwrite (y/n)?y  Generating 1024-bit SSHv1 RSA key.
Dell(conf)#
```

### Related Commands
- `ip ssh server` — enables the SSH server.
- `show crypto` — displays the SSH host public keys.

### crypto key zeroize rsa
Removes the generated RSA host keys and zeroize the key storage location.

#### Syntax
```
crypto key zeroize rsa
```

#### Defaults
none

</tr>
</tbody>
</table>

**Usage Information**

Debug information includes details for key-exchange, authentication, and established session for each connection.
ip scp topdir

 Identify a location for files used in secure copy transfer.

 Syntax

 ip scp topdir directory

 To return to the default setting, use the no ip scp topdir command.

 Parameters

 directory Enter a directory name.

 Defaults

 The internal flash (flash:) is the default directory.

 Usage Information

 To configure the switch as an SCP server, use the ip ssh server command.

 Related Commands

 - ip ssh server — enables the SSH and SCP server on the switch.

 ip ssh authentication-retries

 Configure the maximum number of attempts that should be used to authenticate a user.

 Syntax

 ip ssh authentication-retries 1-10
Parameters

1-10
Enter the number of maximum retries to authenticate a user. The range is from 1 to 10. The default is 3.

Defaults

3

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command specifies the maximum number of attempts to authenticate a user on an SSH connection with the remote host for password authentication. SSH disconnects when the number of password failures exceeds authentication-retries.

**ip ssh challenge-response-authentication**

Enable challenge response authentication for SSHv2.

**Syntax**

```
ip ssh challenge-response-authentication enable
```

To disable the challenge response authentication, use the `no ip ssh challenge-response-authentication enable` command.

**Parameters**

- **enable**
  Enter the keyword `enable` to enable the challenge response authentication for SSHv2.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION
ip ssh cipher

Configure the list of ciphers supported on both SSH client and SCP.

Syntax

ip ssh cipher cipher-list

Parameters

cipher cipher-list  Enter the keyword cipher and then a space-delimited list of ciphers that the SSH client supports. The following ciphers are available.

- aes256-ctr
- aes256-cbc
- aes192-ctr
- aes192-cbc
- aes128-ctr
- aes128-cbc
- 3des-cbc

Defaults

The default list of ciphers is in the order as shown below:

- aes256-ctr
- aes256-cbc
- aes192-ctr
- aes192-cbc
- aes128-ctr
- aes128-cbc
- 3des-cbc

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version  Description
9.10(0.0)   Introduced on the S3148.
### Version Description
9.10(0.0) Introduced on the S6100-ON, S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, MXL, C9010, S3100 series, and Z9100-ON.

**Usage Information**

- You can select one or more ciphers from the list.
- The default list of supported ciphers is same irrespective of whether FIPS mode is enabled or disabled.
- Client-supported cipher list gets preference over the server-supported cipher list in selecting the cipher for the SSH session.
- When the `cipher (-c)` option is used with the SSH CLI, it overrides the configured or default cipher list.
- When FIPS is enabled or disabled, the client ciphers get default configuration.

### ip ssh connection-rate-limit

Configure the maximum number of incoming SSH connections per minute.

**Syntax**

```plaintext
ip ssh connection-rate-limit 1-60
```

**Parameters**

- `1-60` Enter the number of maximum numbers of incoming SSH connections allowed per minute. The range is from 1 to 60 per minute. The default is `10 per minute`.

**Defaults**

- `10 per minute`

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- **9.11(0.0)** Increased the SSH rate-limit range.
- **9.10(0.0)** Introduced on the S3148.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P6)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **pre-6.1.1.0** Introduced on the E-Series.
**ip ssh hostbased-authentication**

Enable hostbased-authentication for the SSHv2 server.

**Syntax**

```
ip ssh hostbased-authentication enable
```

To disable hostbased-authentication for SSHv2 server, use the `no ip ssh hostbased-authentication enable` command.

**Parameters**

```
enable
```

Enter the keyword `enable` to enable hostbased-authentication for SSHv2 server.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you enable this command, clients can log in without a password prompt. This command provides two levels of authentication:

- rhost-authentication is done with the file specified in the `ip ssh rhostfile` command.
- checking client host-keys is done with the file specified in the `ip ssh pub-key-file` command.

**NOTE:** Administrators must specify the two files (`rhosts` and `pub-key-file`) to configure host-based authentication.

**Related Commands**

- `ip ssh pub-key-file` — public keys of trusted hosts from a file.
- `ip ssh rhostsfile` — trusted hosts and users for rhost authentication.

### ip ssh key-size

Configure the size of the server-generated RSA SSHv1 key.

**Syntax**

```
ip ssh key-size 512-869
```

**Parameters**

- `512-869` Enter the key-size number for the server-generated RSA SSHv1 key. The range is from 512 to 869. The default is 768.

**Defaults**

- Key size 768

**Command Modes**

- CONFIGURATION

**Command History**

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The server-generated key is used for SSHv1 key-exchange.

### ip ssh password-authentication

Enable password authentication for the SSH server.

**Syntax**

```
ip ssh password-authentication enable
```

To disable password-authentication, use the `no ip ssh password-authentication enable` command.
Parameters

**enable**

Enter the keyword `enable` to enable password-authentication for the SSH server.

Defaults

Enabled

<tr>
<td>pre-6.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

With password authentication enabled, you can authenticate using the local, RADIUS, or TACACS+ password fallback order as configured.

**ip ssh pub-key-file**

Specify the file used for host-based authentication.

**Syntax**

```
ip ssh pub-key-file {WORD}
```

**Parameters**

WORD

Enter the file name for the host-based authentication.

**Defaults**

none

**Command Modes**

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command specifies the file used for the host-based authentication. The creates/ file overwrites the `flash://ADMIN_DIR/ssh/knownhosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

The file contains the OpenSSH-compatible public keys of the host for which host-based authentication is allowed. An example known host file format:

```
poclab4,123.12.1.123 ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAcox/QOq8xYhz0xn07yh4VGPgOufgKolhTH09G4aSV+ui+DWEc3cgYAcU5Lai1MU20DrzhCwyDNp5tKBU3tReGlo8AxLi6+S4hyEMqHzkzBFNVqHzpQc+Rs4p2urzV0F4pRKnaXdhf3Lk4D460HZRhVrxqeNxPdpEn WIMPJi0ds= ashwani@poclab4
```

**NOTE:** For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the chassis.

**Example**

```
Dell# conf
Dell(conf)# ip ssh pub-key-file flash://knownhosts
Dell(conf)#
```

**Related Commands**

- `show ip ssh client-pub-keys` — displays the client-public keys used for the host-based authentication.

---

**ip ssh mac**

Configure the list of MAC algorithms supported on both SSH client and SCP.

**Syntax**

```
ip ssh mac mac-list
```
Parameters

mac mac-list

Enter the keyword mac then a space-delimited list of message authentication code (MAC) algorithms supported by the SSH client. The following MAC algorithms are available.

When FIPS mode is enabled:

• hmac-sha2-256
• hmac-shal
• hmac-shal-96

When FIPS mode is disabled:

• hmac-sha2-256
• hmac-shal
• hmac-shal-96
• hmac-md5
• hmac-md5-96

Defaults

The default list of MAC algorithm is in the order as shown below:

When FIPS mode is enabled:

• hmac-sha2-256
• hmac-shal
• hmac-shal-96

When FIPS mode is disabled:

• hmac-sha2-256
• hmac-shal
• hmac-shal-96
• hmac-md5
• hmac-md5-96

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON, S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, MXL, C9010, S3100 series, and Z9100-ON.

Usage Information

• You can select one or more MAC algorithms from the list.
• Client-supported MAC list gets preference over the server-supported MAC list in selecting the MAC algorithm for the SSH session.
• When the MAC (-m) option is used with the SSH CLI, it overrides the configured or default MAC list.
• When FIPS is enabled or disabled, the client MACs get default configuration.
ip ssh rekey

Configures the time rekey-interval or volume rekey-limit threshold at which to re-generate the SSH key during an SSH session.

Syntax

ip ssh rekey [time rekey-interval] [volume rekey-limit]

To reset to the default, use no ip ssh rekey [time rekey-interval] [volume rekey-limit] command.

Parameters

- **time minutes**: Enter the keywords `time` then the amount of time in minutes. The range is from 10 to 1440 minutes. The default is **60 minutes**.
- **volume rekey-limit**: Enter the keywords `volume` then the amount of volume in megabytes. The range is from 1 to 4096 megabytes. The default is **1024 megabytes**.

Defaults

The default time is **60 minutes**. The default volume is **1024 megabytes**.

**Example**

```
Dell#conf
Dell(conf)# ip ssh rhostsfile flash://shosts
Dell(conf)#
```

**Usage Information**

This command specifies the rhost file used for host-based authentication. This creates/ file overwrites the flash:/ADMIN_DIR/ssh/shosts file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

This file contains hostnames and usernames, for which hosts and users, rhost-authentication can be allowed.

**NOTE:** For rhostfile and pub-key-file, the administrator must FTP the file to the switch.

**ip ssh rsa-authentication (Config)**

Enable RSA authentication for the SSHv2 server.

**Syntax**

```
ip ssh rsa-authentication enable
```

To disable RSA authentication, use the `no ip ssh rsa-authentication enable` command.

**Parameters**

- **enable**
  - Enter the keyword `enable` to enable RSA authentication for the SSHv2 server.

**Defaults**

Disabled.

Enabling RSA authentication allows the user to log in without being prompted for a password. In addition, the OpenSSH compatible SSHv2 RSA public key must be added to the list of authorized keys (ip ssh rsa-authentication my-authorized-keys device://filename command).

**ip ssh server**

Configure an SSH server. SSH server is enabled by default.

**Syntax**

```plaintext
ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version {1 | 2}]
```

To disable SSH server functions, use the no ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version {1 | 2}] command.

**Parameters**

- **enable**
  - Enter the key word enable to start the SSH server.

- **ciphers cipher-list**
  - Enter the keyword ciphers and then a space-delimited list of ciphers that the SSH server supports. The following ciphers are available.
    - 3des-cbc
    - aes128-cbc
aes192-cbc
aes256-cbc
aes128-ctr
aes192-ctr
aes256-ctr

The default cipher list is used.

3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
aes128-ctr
aes192-ctr
aes256-ctr

mac hmac-algorithm

 Enter the keyword mac then a space-delimited list of hash message authentication code (HMAC) algorithms supported by the SSH server for keying hashing for the message authentication.

The following HMAC algorithms are available:

• hmac-sha1
• hmac-sha1-96
• hmac-sha2-256

When FIPS is enabled, the default HMAC algorithm is hmac-sha1-96.

When FIPS is not enabled, the default HMAC algorithms are the following:

• hmac-md5
• hmac-md5-96
• hmac-shal
• hmac-sha1-96
• hmac-sha2-256

kex key-exchange-algorithm

 Enter the keyword kex and then a space-delimited list of key exchange algorithms supported by the SSH server.

The following key exchange algorithms are available:

• diffie-hellman-group-exchange-shal
• diffie-hellman-group1-shal
• diffie-hellman-group14-shal

When FIPS is enabled, the default key-exchange-algorithm is diffie-hellman-group14-shal.

When FIPS is not enabled, the default key-exchange-algorithms are the following:
• diffie-hellman-group-exchange-sha1
• diffie-hellman-group1-shal
• diffie-hellman-group14-shal

port port-number  (OPTIONAL) Enter the keyword port then the port number of the listening port of the SSH server. The range is from 1 to 65535. The default is 22.

[version {1 | 2}]  (OPTIONAL) Enter the keyword version then the SSH version 1 or 2 to specify only SSHv1 or SSHv2.

| NOTE: If you enable FIPS mode, you can only select version 2.

Defaults

• Default listening port is 22.
• Default cipher list is 3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.
• When FIPS is enabled, the default is hmac-sha1-96.
• When FIPS is not enabled, the default is hmac-md5,hmac-md5-96,hmac-sha1,hmac-sha1-96,hmac-sha2-256.
• When FIPS is enabled, the default is diffie-hellman-group14-sha1.
• When FIPS is not enabled, the default is diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1.

**ip ssh server vrf**

Configure an SSH server on either a specific VRF or a management VRF.

**Syntax**

```
ip ssh server vrf {any | management | vrf-name}
```

To disable the SSH server configuration, use the `no ip ssh server vrf {management | vrf-name}` command.

**Parameters**

- **any**
  
Enter the keyword `any` to enable access to the server from any VRF.

- **vrf management**
  
Enter the keyword `vrf` followed by the keyword `management` to configure an SSH server on a management VRF.

- **vrf vrf-name**
  
Enter the keyword `vrf` followed by the VRF name to configure an SSH server on that VRF.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.

---

**Usage Information**

This command enables the SSH server and begins listening on a port. If a port is not specified, listening is on SSH default port 22.

**NOTE:** Starting with Dell Networking OS Release 9.2(0.0), SSH server is enabled by default.

**Example**

```markdown
Dell# conf
Dell(conf)# ip ssh server port 45
Dell(conf)# ip ssh server enable
Dell#
```
ip ssh source-interface

Specifies an interface’s IP address as the source IP address for an outgoing SSH connections.

Syntax  
ip ssh source-interface interface

Parameters
default

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then
  the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to
  16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a Null interface, enter the keyword null then the Null interface number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
The `source-interface` attribute is applicable for both the SSH client as well as the COPY (SCP) commands. Using these attributes the client session tags an error to the user during run time, in case there is a mismatch between this command and the `ip ssh vrf` command.

**Example**

```plaintext
Dell(conf)#ip ssh source-interface gigabitethernet 1/47
Dell(conf)#do ssh 10.10.10.2 -l admin
Dell(conf)#no ip ssh source-interface
```

### ip ssh vrf

Specify a VRF for an outgoing SSH connections.

**Syntax**

```plaintext
ip ssh vrf vrf-name
```

To delete a VRF for an outgoing SSH connection, use the `no ip ssh vrf vrf-name` command.

**Parameters**

- `vrf vrf-name`  
  Enter the keyword `vrf` and then the name of the VRF to configure that VRF for an outgoing SSH session.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S-Series and Z9000.</td>
</tr>
</tbody>
</table>
Usage Information

If you configure a VRF for an SSH session, then you need not explicitly mention the same VRF for the SSH client sessions intended for that VRF. The vrf attribute in the ip ssh vrf command is applicable for both the SSH client as well as the COPY (SCP) commands.

Example

Dell(conf)#ip ssh vrf vrf1
Dell(conf)#do ssh 10.10.10.2 -l admin
Dell(conf)#no ip ssh vrf vrf1

show crypto

Display the public part of the SSH host-keys.

Syntax

```
show crypto key mypubkey {rsa | rsa1}
```

Parameters

- **Key**
  - Enter the keyword key to display the host public key.
- **mypubkey**
  - Enter the keyword mypubkey to display the host public key.
- **rsa**
  - Enter the keyword rsa to display the host SSHv2 RSA public key.
- **rsa1**
  - Enter the keyword rsa1 to display the host SSHv1 RSA public key.

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

Defaults

- none

Command Modes

- EXEC

## show ip ssh rsa-authentication

Display the authorized-keys for the RSA authentication.

### Syntax

```
show ip ssh rsa-authentication {my-authorized-keys}
```

### Parameters

- **my-authorized-keys**: Display the RSA authorized keys.

### Defaults

none

### Command Modes

EXEC

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version | Description
---|---
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.

### Related Commands

- `ip ssh pub-key-file` — configures the filename for the host-based authentication.
### Version Description

- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **pre-6.1.1.0** Introduced on the E-Series.

### Usage Information

This command displays the contents of the `flash:/ADMIN_DIR/ssh/authorized-keys.username` file.

### Example

```bash
Dell# show ip ssh rsa-authentication my-authorized-keys
ssh-rsa
AAAAB3NzaC1yc2EAAAABIAIwAAAIEAyB17l4gFp4r2DRIHvMclV2
d0Sg5QQxRV1yi1XlJOMeO6Nd0YuYzrQMM

zCMnCF0+qVTd1oofsea5r09kS0h2p0CNfHXZ3NuGCq90v33m9+
U9tMwhS8vy8AVxH4x4km3c3t5Jv= =
freedom@poclab4

Dell#
```

### Related Commands

- `ip ssh rsa-authentication (Config)` — configures the RSA authorized keys.

---

### ssh

Open an SSH connection specifying the hostname, username, encryption cipher, HMAC algorithm, port number, and version of the SSH client.

#### Syntax

```bash
ssh [vrf vrf-name] {hostname | ipv4 address | ipv6 address} [-c encryption cipher | -l username | -m HMAC algorithm | -p port-number | -v (1 | 2)]
```

#### Parameters

- **vrf vrf-name** *(OPTIONAL)* Enter the keyword `vrf` and then the name of the VRF to specify the VRF used with the SSH session.
NOTE: The VRF configured using this command has a higher precedence than the VRF configured using the `ip ssh vrf vrf-name` command. If you do not configure a VRF using this command, then the SSH client uses the configured VRF (if any). If there is a mismatch between VRFs that are configured using the `ip ssh source-interface` command and the `ssh vrf vrf-name` command, then an error is reported.

hostname

(OPTIONAL) Enter the IP address or the host name of the remote device.

vrf instance

(OPTIONAL) E-Series Only: Enter the keyword `vrf` then the VRF Instance name to open an SSH connection to that instance.

ipv4 address

(OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.

ipv6-address prefix-length

(OPTIONAL) Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

-c encryption_cipher

Enable the "FIPS mode enable", this mode will support only v2 client.

"no fips mode enable"(disable) will support v1 & v2 client. This comment is applicable for both ciphers & HMAC algorithms:

- 3des-cbc: Force ssh to use 3des-cbc encryption cipher.
- aes128-cbc: Force ssh to use aes128-cbc encryption cipher
- aes192-cbc: Force ssh to use aes192-cbc encryption cipher
- aes256-cbc: Force ssh to use aes256-cbc encryption cipher
- aes128-ctr: Force ssh to use aes128-ctr encryption cipher
- aes192-ctr: Force ssh to use aes192-ctr encryption cipher
- aes256-ctr: Force ssh to use aes256-ctr encryption cipher

-l username

(OPTIONAL) Enter the keyword `-l` then the user name used in this SSH session. The default is the user name of the user associated with the terminal.

-m HMAC algorithm

Enter one of the following HMAC algorithms to use. (For v2 clients only):

"no fips mode enable"(disable) will support v1 & v2 client.

- hmac-md5: Force ssh to use hmac-md5 HMAC algorithm.
- hmac-md5-96: Force ssh to use hmac-md5-96 HMAC algorithm.
- hmac-sha1: Force ssh to use hmac-sha1 HMAC algorithm.
- hmac-sha1-96: Force ssh to use hmac-sha1-96 HMAC algorithm.
- hmac-sha2-256: Force ssh to use hmac-sha2-256 HMAC algorithm.

-p port-number

(OPTIONAL) Enter the keyword `-p` then the port number. The range is from 1 to 65535. The default is 22.

-v {1 | 2}

(OPTIONAL) Enter the keyword `v` then the SSH version 1 or 2. The default is the version from the protocol negotiation.

Defaults

As shown in the Parameters section.

Command Modes

EXEC Privilege

</table>

## Usage Information

Dell Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

## Example

```bash
Dell#ssh 10.16.151.48 -l anvltest

Trying 10.16.151.48...
01:18:16: %STKUNIT0-M:CP %SEC-5-SSH_USAGE: Initiated SSH Client v2 (FIPS Disabled) to anvltest@10.16.151.48 by default from console anvltest@10.16.151.48's password:
Last login: Thu Jan  5 00:17:47 2012 from login-maa-101 [anvltest@dt-maa-linux-1 ~]# exit
```
Secure DHCP Commands

DHCP as defined by RFC 2131 provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

clear ip dhcp snooping

Clear the DHCP binding table.

Syntax

```
clear ip dhcp snooping binding
```

Defaults

none

```

Related Commands

- `show ip dhcp snooping` — display the contents of the DHCP binding table.

ip dhcp relay

Enable Option 82.

Syntax

```
ip dhcp relay information-option [trust-downstream | vrf]
```

Parameters

- `trust-downstream` — Configure the system to trust Option 82 when it is received from the previous-hop router.
vrf

Enter the keyword vrf to include VRF related information in the Option 82. This configuration enables the relay agent to include VRF related information when it forwards the broadcasts from client to DHCP server.

**Defaults**

Disabled.

### Version Description

- **9.7(0.0)**
  Introduced on the S6000-ON.
- **9.2(1.0)**
  Introduced on the Z9500.
- **9.0.2.0**
  Introduced on the S6000.
- **8.3.19.0**
  Introduced on the S4820T.
- **8.3.11.1**
  Introduced on the Z9000.
- **8.3.7.0**
  Introduced on the S4810.
- **7.8.1.0**
  Introduced on the C-Series and S-Series.

#### Usage Information

When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP Snooping, the binding table is deleted and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

#### Related Commands

- `ip dhcp snooping vlan` — enable DHCP Snooping on one or more VLANs.

### ip dhcp snooping binding

Create a static entry in the DHCP binding table.

**Syntax**

```plaintext
[no] ip dhcp snooping binding mac address vlan-id vlan-id interface type slot/port lease number
```

**Parameters**

- **mac address**
  Enter the keyword `mac` then the MAC address of the host to which the server is leasing the IP address.
- **vlan-id**
  Enter the keywords `vlan-id` then the VLAN to which the host belongs. The range is from 2 to 4094.
- **ip ip-address**
  Enter the keyword `ip` then the IP address that the server is leasing.
- **interface type**
  Enter the keyword `interface` then the type of interface to which the host is connected.
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- **slot/port**
  Enter the slot and port number of the interface.
- **lease time**
  Enter the keyword `lease` then the amount of time the IP address is leased. The range is from 1 to 4294967295.

**Defaults**

- none

**Command Modes**

- EXEC
- EXEC Privilege

8.3(7.0) Introduced on the S4810.
7.8(1.0) Introduced on the C-Series and S-Series.

ip dhcp snooping trust

Configure an interface as trusted.

Syntax
[no] ip dhcp snooping trust

Defaults
Untrusted
ip dhcp source-address-validation

Enable IP source guard.

Syntax: [no] ip dhcp source-address-validation

Defaults: Disabled.

Command Modes: INTERFACE

Command History: This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

ip dhcp snooping vlan

Enable DHCP Snooping on one or more VLANs.

Syntax

[no] ip dhcp snooping vlan name

Parameters

name

Enter the name of a VLAN on which to enable DHCP Snooping.

Defaults

Disabled.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000--ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the C-Series and S-Series.

Usage Information

When enabled, the system begins creating entries in the binding table for the specified VLANs.

NOTE: Learning only happens if there is a trusted port in the VLAN.

Related Commands

- ip dhcp snooping trust — configure an interface as trusted.
show ip dhcp snooping

Display the contents of the DHCP binding table.

Syntax

```
show ip dhcp snooping binding
```

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Command History

Related Commands

- `clear ip dhcp snooping` — clear the contents of the DHCP binding table.

Role-Based Access Control Commands

With Role-Based Access Control (RBAC), access and authorization is controlled based on a user’s role. Users are granted permissions based on their user roles, not on their individual user ID. User roles are created for job functions and through those roles they acquire the permissions to perform their associated job function.

This section describes the syntax and usage of RBAC-specific commands. You can find information on other related security commands in this chapter:

- `aaa accounting`
- `aaa authentication login`
- `aaa authorization commands`
- `authorization`
- `show accounting`
aaa authorization role-only

Configure authentication to use the user’s role only when determining if access to commands is permitted.

Syntax

```
aaa authorization role-only
```

To return to the default setting, use the `no aaa authentication role-only` command.

Parameters

- **name**: Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator).
- **inherit existing-role-name**: Enter the `inherit` keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).

 Defaults

none

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tr>
<tr>
<td>9.5(0.0)</td>
<td>Introduced on the Z9000, S6000, S4820T, S4810, and MXL.</td>
</tr>
</tbody>
</table>

Usage Information

By default, access to commands are determined by the user’s role (if defined) or by the user’s privilege level. If the `aaa authorization role-only` command is enabled, then only the user’s role is used.

Before you enable role-based only AAA authorization:

1. Locally define a system administrator user role. This will give you access to login with full permissions even if network connectivity to remote authentication servers is not available.
2. Configure login authentication on the console. This ensures that all users are properly identified through authentication no matter the access point.
3. Specify an authentication method (RADIUS, TACACS+, or Local).
4. Specify authorization method (RADIUS, TACACS+ or Local).
5. Verify the configuration has been applied to the console or VTY line.

Related Commands

- `login authentication`, `password`, `radius-server host`, `tacacs-server host`
enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

Syntax

```
enable [level]
```

Parameters

- **level** (OPTIONAL) Enter a number for a privilege level of Dell Networking OS. The range is from 0 to 15.

Defaults

- 15

Command Modes

- EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Usage Information

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the enable password command to configure a password for the enable command at a specific privilege level. If no privilege level is specified, the default is privilege level 15.

**NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an enable password.

Related Commands

-  `enable password` — configures a password for the enable command and to access a privilege level.
Changes command permissions for roles.

Syntax

```
role mode [{ { addrole | deleterole } role-name } | reset} command
```

To delete access to a command, use the `no role mode role-name`

Parameters

- **mode**
  Enter one of the following keywords as the mode for which you are controlling access:
  - `configure` for CONFIGURATION mode
  - `exec` for EXEC mode
  - `interface` for INTERFACE modes
  - `line` for LINE mode
  - `route-map` for Route-map mode
  - `router` for Router mode

- **addrole**
  Enter the keyword `addrole` to add permission to the command. You cannot add or delete rights for the sysadmin role.

- **deleterole**
  Enter the keyword `deleterole` to remove access to the command. You cannot add or delete rights for the sysadmin role.

- **role-name**
  Enter a text string for the name of the user role up to 63 characters. These are 3 system defined roles you can modify: secadmin, netadmin, and netoperator.

- **reset**
  Enter the keyword `reset` to reset all roles back to default for that command.

- **command**
  Enter the command’s keywords to assign the command to a certain access level. You can enter one or more keywords.

Defaults

```
none
```

Command Modes

```
CONFIGURATION
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking
OS Command Line Reference Guide.

Security 1527
show role

Display information on permissions assigned to a command, including user role and/or permission level.

Syntax

```
show role mode {mode} {command}
```

Parameters

- **command**: Enter the command’s keywords to assign the command to a certain access level. You can enter one or all of the keywords.
- **mode mode**: Enter keyword then one of the following modes.
  - configure
  - exec
  - interface
  - line
  - route-map
  - router

Defaults

```
none
```

Command Modes

```
EXEC Privilege
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.5(0.0) Introduced on the Z9000, S6000, S4820T, S4810, MXL

Examples

```
Dell# show role mode configure username
Role access: sysadmin

Dell# show role mode configure management route
Role access: netadmin, sysadmin
```
show role mode configure management crypto-policy
Role access: secadmin, sysadmin

Related Commands
  * `userrole` — create user roles.

show userroles

Display information on all defined user roles.

Syntax
show userroles

Example
Dell# show userroles
Role          Inheritance  Modes
netoperator                Exec
netadmin                   Exec Config Interface Line Router IP
                         Route-map Protocol MAC
secadmin                   Exec Config

sysadmin                   Exec Config Interface Line Router IP
                         Route-map Protocol MAC
netoperator
netadmin  testadmin     netadmin     Exec Config Interface Line Router IP
                         Route-map Protocol MAC
Related Commands

• `userrole` — create user roles.

**userrole**

Create user roles for the role-based security model.

**Syntax**

```
userrole name inherit existing-role-name
```

To delete a role name, use the `no userrole name` command. Note that the reserved role names may not be deleted.

**Parameters**

- `name` Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator).

- `inherit existing-role-name` Enter the `inherit` keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).

**Defaults**

none

</tbody>
</table>

**Usage Information**

Instead of using the system defined user roles, you can create a new user role that best matches your organization. When you create a new user role, you first inherit permissions from one of the system defined roles. Otherwise you would have to create a user role from scratch. You then restrict commands or add commands to that role. For information about this topic, see **Modifying Command Permissions for Roles**.

**NOTE:** You can change user role permissions on system pre-defined user roles or user-defined user roles.

**Important Points to Remember**

Consider the following when creating a user role:

- Only the system administrator and user-defined roles inherited from the system administrator can create roles and usernames. Only the system administrator, security administrator, and roles inherited from these can use the `role` command to modify command permissions. The security administrator and roles inherited by security administrator can only modify permissions for commands they already have access to.
• Make sure you select the correct role you want to inherit.

**NOTE:** If you inherit a user role, you cannot modify or delete the inheritance. If you want to change or remove the inheritance, delete the user role and create it again. If the user role is in use, you cannot delete the user role.

```
role mode { { { addrole | deleterole } role-name } | reset } command – Modifies (adds or deletes) command permissions for newly created user roles and system defined roles.
```

**Related Commands**

• `role mode { { addrole | deleterole } role-name } | reset } command` — modifies (adds or deletes) command permissions for newly created user roles and system defined roles.

## ICMP Vulnerabilities

The internet control message protocol (ICMP) is a network-layer internet protocol that provides message packets to report errors and other information regarding IP packet processing back to the source. Dell Networking OS mainly addresses the following ICMP vulnerabilities:

- ICMP Mask Reply
- ICMP Timestamp Request
- ICMP Replies
- IP ID Values Randomness

You can configure the Dell Networking OS to drop ICMP reply messages. When you configure the `drop icmp` command, the system drops the ICMP reply messages from the front end and management interfaces. By default, the Dell Networking OS responds to all the ICMP messages. You can configure the Dell Networking OS to suppress the following ICMPv4 and ICMPv6 message types:

**Table 4. Suppressed ICMPv4 message types**

### ICMPv4 Message Types

<table>
<thead>
<tr>
<th>ICMPv4 Message Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Echo reply (0)</td>
</tr>
<tr>
<td>All sub types of destination unreachable (3)</td>
</tr>
<tr>
<td>Source quench (4)</td>
</tr>
<tr>
<td>Redirect (5)</td>
</tr>
<tr>
<td>Router advertisement (9)</td>
</tr>
<tr>
<td>Router solicitation (10)</td>
</tr>
<tr>
<td>Time exceeded (11)</td>
</tr>
<tr>
<td>IP header bad (12)</td>

</tr>
<tr>
<td>Information reply (16)</td>
</tr>
<tr>
<td>Address mask request (17)</td>
</tr>
<tr>
<td>Address mask reply (18)</td>
</tr>
</tbody>
</table>
**NOTE:** The Dell Networking OS does not suppress the ICMPv4 message type Echo request (8).

### Table 5. Suppressed ICMPv6 message types

<table>
<thead>
<tr>
<th>ICMPv6 Message Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination unreachable (1)</td>
</tr>
<tr>
<td>Time exceeded (3)</td>
</tr>
<tr>
<td>IPv6 header bad (4)</td>
</tr>
<tr>
<td>Echo reply (129)</td>

</tr>
<tr>
<td>Who are you reply (140)</td>
</tr>
<tr>
<td>Mtrace response (200)</td>
</tr>
<tr>
<td>Mtrace messages (201)</td>
</tr>
</tbody>
</table>

**NOTE:**

The Dell Networking OS does not suppress the following ICMPv6 message types:

- Packet too big (2)
- Echo request (128)
- Multicast listener query (130)
- Multicast listener report (131)
- Multicast listener done (132)
- Router solicitation (133)
- Router advertisement (134)
- Neighbor solicitation (135)
- Neighbor advertisement (136)
- Redirect (137)
- Router renumbering (138)
- MLD v2 listener report (143)
- Duplicate Address Request (157)
- Duplicate Address Confirmation (158)

### drop icmp

Drops the ICMPv4 and ICMPv6 packets.

**Syntax**

```
drop {icmp | icmp6}
```

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other Platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced on the S4810, S4820T, S3048–ON, S3100 Series, S4048–ON, S5000, S6000, S6000–ON, Z9500, Z9100–ON, S6100–ON, S6010–ON, S4048T–ON, C9000, and MXL.</td>
</tr>
</tbody>
</table>
Usage Information

When the drop icmp feature is configured, the system drops the ICMP reply messages on the front end and management interfaces. By default, the Dell Networking OS responds to all the ICMP messages.

NOTE: There is no separate CLI to enable IP ID randomness. By default, the IP ID in the kernel is randomized.

For more information on the ICMP message types, see the ICMP Commands section.
Service Provider Bridging

Service provider bridging is composed of virtual local area network (VLAN) Stacking, Layer 2 Protocol Tunneling, and Provider Backbone Bridging as described in the Dell Networking OS Configuration Guide Service Provider Bridging section.

This section includes command line information (CLI) for the Dell Networking OS Layer 2 Protocol Tunneling (L2PT). L2PT enables protocols to tunnel through an 802.1q tunnel.

Dell Networking OS supports L2PT on Dell Networking OS.

For more information, see VLAN Stacking, Spanning Tree Protocol (STP), and GARP VLAN Registration (GVRP).

Important Points to Remember

- L2PT is enabled at the interface VLAN-Stack VLAN level. For more information about Stackable VLAN (VLAN-Stacking) commands, see VLAN Stacking.
- The default behavior is to disable protocol packet tunneling through the 802.1q tunnel.
- Rate-limiting is required to protect against bridge protocol data units (BPDU) attacks.
- A port channel (including through link aggregation control protocol [LACP]) can be configured as a VLAN-Stack access or trunk port.
- Address resolution protocol (ARP) packets work as expected across the tunnel.
- Far-end failure detection (FEFD) works the same as with Layer 2 links.
- Protocols that use Multicast MAC addresses (for example, open shortest path first [OSPF]) work as expected and carry over to the other end of the VLAN-Stack VLAN.

Topics:
- debug protocol-tunnel
- protocol-tunnel
- protocol-tunnel destination-mac
- protocol-tunnel enable
- protocol-tunnel rate-limit
- show protocol-tunnel

ddebug protocol-tunnel

Enable debugging to ensure incoming packets are received and rewritten to a new MAC address.

**Syntax**

ddebug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]

To disable debugging, use the no debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value] command.

**Parameters**

- **interface**
  - Enter one of the following interfaces and the interface information:
For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.

For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.

For a port-channel interface, enter the keywords port-channel then the port-channel ID.

in | out | both  Enter the keyword in, out, or both to debug incoming interfaces, outgoing interfaces, or both incoming and outgoing interfaces.

vlan vlan-id  Enter the keyword vlan then the VLAN ID. The range is from 1 to 4094.

count value  Enter the keyword count then the number of debug outputs. The range is from 1 to 100.

Defaults  Debug disabled.

Command Modes  EXEC Privilege

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version  Description
9.10(0.0)  Introduced on the S3148.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S6000-ON.
9.2(1.0)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.
8.5.1.0  Added support for 4-port 40G line cards.
8.3.7.0  Introduced on the S4810.
8.2.1.0  Introduced on the C-Series, and E-Series.
7.4.1.0  Introduced

protocol-tunnel

Enable protocol tunneling on a stacked (Q-in-Q) VLAN for specified protocol packets.

Syntax  protocol-tunnel {rate-limit rate| stp}

To disable protocol tunneling for a Layer 2 protocol, use the no protocol-tunnel command.
**Parameters**

- **rate-limit**
  - Enter the keyword `rate-limit` followed by a number for the rate-limit for tunneled packets on the VMAN. The range is from 64 to 320.

- **stp**
  - Enter the keyword `stp` to enable protocol tunneling on a spanning tree, including STP, MSTP, RSTP, and PVST.

**Defaults**

- `none`

**Command Modes**

- `CONF-IF-VLAN`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Example**

```
Dell# conf
Dell(conf)#interface vlan 2
Dell(conf-if-vl-2)#vlan-stack compatible
Dell(conf-if-vl-2)#member Gi1/2-3
Dell(conf-if-vl-2)#protocol-tunnel stp
Dell(conf-if-vl-2)#protocol-tunnel enable
```

**Related Command**

- `show protocol-tunnel` — displays tunneling information for all VLANs.

---

**protocol-tunnel destination-mac**

Overwrite the BPDU destination MAC address with a specific value.

**Syntax**

```
protocol-tunnel destination-mac stp address
```

**Parameters**

- **stp**
  - Change the default destination MAC address used for L2PT to another value.

**Defaults**

- The default destination MAC is 01:01:e8:00:00:00.
**Command Modes**

<tr>
<td>7.4.1.0</td>
<td>Introduced</td>
</tr>
</tbody>
</table>

**Usage Information**

When you enable VLAN-Stacking, no protocol packets are tunneled.

**Related Command**

- `show protocol-tunnel` — displays tunneling information for all VLANs.

---

**protocol-tunnel enable**

Enable protocol tunneling globally on the system.

**Syntax**

```
protocol-tunnel enable
```

To disable protocol tunneling, use the `no protocol-tunnel enable` command.

**Defaults**

Disabled.

</tr>
</tbody>
</table>

**Usage Information**

Dell Networking OS must have the default CAM profile with the default microcode before you enable L2PT.

### protocol-tunnel rate-limit

Enable traffic rate limiting per box.

**Syntax**

```plaintext
protocol-tunnel rate-limit rate
```

To reset the rate limit to the default, use the `no protocol-tunnel rate-limit rate` command.

**Parameters**

- **rate**
  
  Enter the rate in frames per second. The range is from 75 to 3000. The default is **75**.

**Defaults**

75 frames per second.

**Command Modes**

CONF-IF-VLAN-STACK

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
Example

Dell(conf-if-vl-2)# vlan-stack compatible
Dell(conf-if-vl-2-stack)# protocol-tunnel rate-limit 100
Dell(conf-if-vl-2-stack)# show config

interface Vlan 2
no ip address
mtu 1000
vlan-stack compatible
protocol-tunnel rate-limit 100
shutdown

Related Commands

- show protocol-tunnel — displays tunneling information for all VLANs.
- show running-config — displays the current configuration.

show protocol-tunnel

Display protocol tunnel information for all or a specified VLAN-Stack VLAN.

Syntax

show protocol-tunnel [vlan vlan-id]

Parameters

vlan vlan-id  (OPTIONAL) Enter the keyword vlan then the VLAN ID to display information for the one VLAN. The range is from 1 to 4094.

Defaults

none

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

**Example (Specific VLAN)**

```bash
Dell# show protocol-tunnel vlan 2
System Rate-Limit: 1000 Frames/second
Interface  Vlan  Protocol(s)
Gi1/2      2     STP, PVST

Dell#
```

**Related Commands**

- `show running-config` — displays the current configuration.
The Dell Networking OS supports sFlow commands.

The Dell Networking OS sFlow monitoring system includes an sFlow Agent and an sFlow Collector.

- The sFlow Agent combines the flow samples and interface counters into sFlow datagrams and forwards them to the sFlow Collector.
- The sFlow Collector analyses the sFlow Datagrams received from the different devices and produces a network-wide view of traffic flows.

### Important Points to Remember

- Dell Networking recommends that the sFlow Collector be connected to the Dell Networking chassis through a line card port rather than the route processor module (RPM) Management Ethernet port.
- Dell Networking OS exports all sFlow packets to the sFlow Collector. A small sampling rate can equate to many exported packets. A backoff mechanism is automatically applied to reduce this amount. Some sampled packets may be dropped when the exported packet rate is high and the backoff mechanism is about to or is starting to take effect. The dropEvent counter, in the sFlow packet, is always zero.
- sFlow sampling is done on a per-port basis.
- Community list and local preference fields are not filled up in the extended gateway element in the sFlow datagram.
- The 802.1P source priority field is not filled up in the extended switch element in the sFlow datagram.
- Only Destination and Destination Peer AS numbers are packed in the dst-as-path field in the extended gateway element.
- If the packet being sampled is redirected using policy-based routing (PBR), the sFlow datagram may contain incorrect extended gateway/router information.
- sFlow does not support packing extended information for IPv6 packets. Only the first 128 bytes of the IPv6 packet is shipped in the datagram.
- The source virtual local area network (VLAN) field in the extended switch element is not packed if there is a routed packet.
- The destination VLAN field in the extended switch element is not packed if there is a multicast packet.
- The sFlow sampling functionality is supported only for egress traffic and not for ingress traffic.
- The maximum number of packets that can be sampled and processed per second is:
  - 7500 packets when no extended information packing is enabled.
  - 7500 packets when only extended-switch information packing is enabled (see `sflow extended-switch enable`).

### Topics:

- sflow collector
- sflow enable (Global)
- sflow ingress-enable
- sflow extended-switch enable
- sflow max-header-size extended
- sflow polling-interval (Global)
- sflow polling-interval (Interface)
- sflow sample-rate (Global)
- sflow sample-rate (Interface)
- show sflow
sflow collector

Configure a collector device to which sFlow datagrams are forwarded.

Syntax

```
sflow collector {ip-address | ipv6-address} agent-addr {ip-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]
```

To delete a configured collector, use the no sflow collector {ip-address | ipv6-address} agent-addr {ipv4-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management] command.

Parameters

- **sflow collector ip-address | ipv6-address**
  - Enter the IP address of the collector in dotted decimal format for IPv4 or x:x:x::x format for IPv6.
  - **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **agent-addr ip-address | ipv6-address**
  - Enter the keyword agent-addr followed by the sFlow agent IP address in dotted decimal format for IPv4 or x:x:x::x format for IPv6.
  - **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **number**
  - (OPTIONAL) Enter the user datagram protocol (UDP) port number. The range is from 0 to 65535. The default is 6343.

- **max-datagram-size number**
  - (OPTIONAL) Enter the keyword max-datagram-size then the size number in bytes. The range is from 400 to 1500. The default is 1400.

- **vrf management**
  - (OPTIONAL) Enter the keyword vrf followed by the keyword management to configure the collector device corresponding to the default VRF and the management VRF respectively.

Defaults

Not configured.

### Version Description

8.3.19.0  
Introduced on the S4820T.

8.3.11.1  
Introduced on the Z9000.

8.4.2.3  
Added support for IPv6 sFlow collectors and agents on the E-series, C-Series, and S-Series.

8.4.1.1  
Added support for IPv6 sFlow collectors and agents on the E-series.

8.3.7.0  
Introduced on the S4810.

8.2.1.0  
Introduced S-Series Stacking.

8.1.1.0  
Introduced on the E-Series.

7.7.1.0  
Introduced on the S-Series.

7.6.1.0  
Introduced on the C-Series.

6.5.1.0  
Expanded the no form of the command to mirror the syntax used to configure.

6.2.1.1  
Introduced on the E-Series.

### Usage Information

You can configure up to two sFlow collectors (IPv4 or IPv6). If two collectors are configured, traffic samples are sent to both.

The sFlow agent address is carried in a field in SFlow packets and is used by the collector to identify the sFlow agent.

In sFlow, the agent address is a single invariant IPv4 or IPv6 address used to identify the agent to the collector. It is usually assigned the address of a loopback interface on the agent, which provides invariance. The agent address is carried as a field in the payload of the sFlow packets.

As part of the sFlow-MIB, if the SNMP request originates from a configured collector, Dell Networking OS returns the corresponding configured agent IP in the MIB requests. Dell Networking OS checks to ensure that two entries are not configured for the same collector IP with a different agent IP. Should that happen, Dell Networking OS generates the following error: %Error: Different agent-addr attempted for an existing collector.

### Example

```bash
Dell(conf)# sflow collector 10.1.1.25 agent-addr 10.1.1.10 vrf management
```

### sflow enable (Global)

Enable sFlow globally.

**Syntax**

```bash
sflow enable
```

To disable sFlow, use the `no sflow enable` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
sFlow is disabled by default. In addition to this command, sFlow needs to be enable on individual interfaces where sFlow sampling is desired.

Related Commands
- `sflow enable (Interface)` — enable sFlow on interfaces.

sflow ingress-enable

Enable sFlow ingress on interfaces.

Syntax
```
sflow ingress-enable
```
To disable sFlow, use the `no sflow ingress enable` command.

Defaults
Disabled.

Command Modes
- INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced S-Series Stacking.
8.1.1.0 Introduced on the E-Series.
7.7.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
6.2.1.1 Introduced on the E-Series.
When you enable ingress sFlow on an interface, flow sampling is done on any incoming traffic.

**NOTE:** After a physical port is a member of a LAG, it inherits the sFlow configuration from the LAG port.

### Related Commands
- `sflow enable` (Global) — turn sFlow globally.

### sflow extended-switch enable

Enable packing information on a switch only.

**Syntax**

```plaintext
sflow extended-switch enable
```

To disable packing information, use the `no sflow extended-switch [enable]` command.

**Parameters**

- **enable**
  
  Enter the keyword `enable` to enable global extended information.

**Defaults**

Disabled.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dell Networking OS enhances the sflow implementation for real time traffic analysis on the E-Series to provide extended gateway information in cases where the destination IP addresses are learned by different routing protocols and for cases where the destination is reachable over ECMP.

Related Commands

- `show sflow` — displays the sFlow configuration.

### sflow max-header-size extended

Set the maximum header size of a packet to 256 bytes.

**Syntax**

```
sflow max-header-size extended
```

To reset the maximum header size of a packet, use the `no sflow max-header-size extended` command.

**Parameters**

- `extended` Enter the keyword `extended` to copy 256 bytes from the sample packets to sFlow datagram.

**Defaults**

- `128` bytes

**Command Modes**

- `CONFIGURATION`
- `INTERFACE`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

- 9.7(0.0) Introduced on the S6000-ON.
- 9.7(0.0) Introduced on the S Series and Z Series switches.

**Example**

```
Dell(conf)# sflow max-header-size extended
```
sflow polling-interval (Global)

Set the sFlow polling interval at a global level.

**Syntax**

```
sflow polling-interval interval value
```

To return to the default, use the no sflow polling-interval interval command.

**Parameters**

- **interval value**
  - Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is 20 seconds.

**Defaults**

- **20 seconds**

**Usage Information**

The polling interval for an interface is the maximum number of seconds between successive samples of counters sent to the collector. This command changes the global default counter polling (20 seconds) interval. You can configure an interface to use a different polling interval.

**Related Commands**

- `sflow polling-interval (Interface)` — sets the polling interval for an interface.
sflow polling-interval (Interface)

Set the sFlow polling interval at an interface (overrides the global-level setting.)

Syntax

sflow polling-interval interval value

To return to the default, use the no sflow polling-interval interval command.

Parameters

- **interval value**: Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is the global counter polling interval.

Defaults

The same value as the current global default counter polling interval.

Command Modes

INTERFACE

Command History

Usage Information

This command sets the counter polling interval for an interface.

Related Commands

- sflow polling-interval (Global) — globally sets the polling interval.
sflow sample-rate (Global)

Change the global default sampling rate.

Syntax

sflow sample-rate value

To return to the default sampling rate, use the no sflow sample-rate command.

Parameters

value

Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, and so on. The default is 32768 packets.

Defaults

32768 packets

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced on S-Series Stacking.
8.1.1.0 Introduced on the E-Series.
7.7.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
7.4.1.0 Introduced on the E-Series.

Usage Information

Sample-rate is the average number of packets skipped before the sample is taken. This command changes the global default sampling rate. You can configure an interface to use a different sampling rate than the global sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power of 2 value. Select one of these two packet numbers and re-enter the command.

Related Commands

- sflow sample-rate (Interface) — changes the interface sampling rate.
sflow sample-rate (Interface)

Change the interface default sampling rate.

Syntax

```
sflow sample-rate value
```

To return to the default sampling rate, use the `no sflow sample-rate` command.

Parameters

- **value**: Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, etc. The default is **32768** packets.

Defaults

The Global default sampling.

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command changes the sampling rate for an interface. By default, the sampling rate of an interface is set to the same value as the current global default sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power-of-2 value. Select one of these two number and re-enter the command.

Related Commands

- `sflow sample-rate (Global)` — changes the sampling rate globally.
**show sflow**

Display the current sFlow configuration.

**Syntax**

```
show sflow [interface]
```

**Parameters**

- `interface` (OPTIONAL) Enter the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For the Management interface on the, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

Usage Information

The dropEvent counter (sFlow samples dropped due to sub-sampling) shown in the following example always displays a value of zero.

Example

Dell#show sflow
sFlow services are enabled
Egress Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 20
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collectors configured
Collector IP addr: 100.1.1.1, Agent IP addr: 1.1.1.2, UDP port: 6343 VRF: Default
0 UDP packets exported
0 UDP packets dropped
0 sFlow samples collected

stack-unit 1 Port set 1
   Gi 1/1: configured rate 16384, actual rate 16384 <<< sampling rate based on line speed if global sampling rate is default
Dell#
Simple Network Management Protocol (SNMP) and Syslog

This section contains commands to configure and monitor the simple network management protocol (SNMP) v1/v2/v3 and Syslog. Both features are supported on Dell Networking OS.

Topics:
- **SNMP Commands**
- **Syslog Commands**

### SNMP Commands

The following SNMP commands are available in the Dell Networking OS.

The simple network management protocol (SNMP) is used to communicate management information between the network management stations and the agents in the network elements. Dell Networking OS supports SNMP versions 1, 2c, and 3, supporting both read-only and read-write modes. Dell Networking OS sends SNMP traps, which are messages informing an SNMP management system about the network. Dell Networking OS supports up to 16 SNMP trap receivers.

#### Important Points to Remember

- Typically, 5-second timeout and 3-second retry values on an SNMP server are sufficient for both LAN and WAN applications. If you experience a timeout with these values, the recommended best practice on Dell Networking switches (to accommodate their high port density) is to increase the timeout and retry values on your SNMP server to the following:
  - **SNMP Timeout** — greater than 3 seconds.
  - **SNMP Retry count** — greater than 2 seconds.
- If you want to query an E-Series switch using SNMP v1/v2/v3 with an IPv6 address, configure the IPv6 address on a non-management port on the switch.
- If you want to send SNMP v1/v2/v3 traps from an E-Series using an IPv6 address, use a non-management port.
- SNMP v3 informs are not currently supported with IPv6 addresses.
- If you are using access control lists (ACLs) in an SNMP v3 configuration, group ACL overrides user ACL if the user is part of that group.
- SNMP operations are not supported on a virtual local area network (VLAN).

#### show snmp

Display the status of SNMP network elements.

**Syntax**

```
show snmp
```

**Command Modes**

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

E-Series legacy command

Usage Information

The following Example displays a group named ngroup. The ngroup has a security model of version 3 (v3) with authentication (auth), the read and notify name is nview with no write view name specified, and finally the row status is active.

Example

Dell# show snmp group
  groupname: v1v2creadg     security model: v1
  readview : v1v2cdefault   writeview: no write view specified
  notifyview: v1v2cdefault  context: no context specified
  row status: active
Dell#

Related Commands

- `snmp-server group` — configures an SNMP server group.

**show snmp user**

Display the information configured on each SNMP user name.

**Syntax**

```
show snmp user
```

**Command Modes**

- EXEC
snmp ifmib ifalias long

Display the entire description string through the Interface MIB, which would be truncated otherwise to 63 characters.

Syntax

```
snmp ifmib ifalias long
```

Defaults

Interface description truncated beyond 63 characters.

Example

```
Dell#show snmp user
User name: v1v2creadu
Engine ID: 0000178B02000001E80214A8
storage-type: nonvolatile    active
Authentication Protocol: None
Privacy Protocol: None

Dell#
```
### snmp-server community

Configure a new community string access for SNMPv1 v2 and v3.

**Syntax**

```
snmp-server community community-name \{ro | rw\} [ipv6 ipv6-access-list-name | ipv6 access-list-name | access-list-name | security-name name] | security-name name [ipv6 ipv6-access-list-name | access-list-name | security-name name] | access-list-name [ipv6 ipv6-access-list-name | access-list-name | security-name name]]
```

To remove access to a community, use the `no snmp-server community community-string \{ro | rw\} [security-name name [access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]]` command.

**Parameters**

- `community-name`: Enter a text string (up to 20 characters long) to act as a password for SNMP.
Enter the keyword **ro** to specify read-only permission.

Enter the keyword **rw** to specify read-write permission.

**(Optional) Enter the keyword ipv6 then an IPv6 ACL name (a string up to 16 characters long).**

**(Optional) Enter the keywords security-name then the security name as defined by the community MIB.**

**(Optional) Enter a standard IPv4 access list name (a string up to 16 characters long).**

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The following example configures a community named `public` that is mapped to the security named `guestuser` with Read Only (ro) permissions.

The `security-name` parameter maps the community string to an SNMPv3 user/security name as defined by the community MIB.

If a community string is configured without a `security-name` (for example, `snmp-server community public ro`), the community is mapped to a default security-name/group:

- `v1v2creadu / v1v2creadg` — maps to a community with ro (read-only) permissions.
- `v1v2cwriteu / v1v2cwriteg` — maps to a community with rw (read-write) permissions.

The `community-name` parameter indexes this command.
If you do not configure the `snmp-server community` command, you cannot query SNMP data. Only Standard IPv4 ACL and IPv6 ACL is supported in the optional `access-list-name`.

The command options `ipv6`, `security-name`, and `access-list-name` are recursive. In other words, each option can, in turn, accept any of the three options as a sub-option, and each of those sub-options can accept any of the three sub-options as a sub-option, and so forth. The second Example shows the creation of a standard IPv4 ACL called `snmp-ro-acl` and then assigning it to the SNMP community `guest`.

```plaintext
NOTE: For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP; TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs, port rules are not valid for SNMP.
```

Example
---
```
Dell# config
Dell(config)# snmp-server community public ro
Dell(config)# snmp-server community guest ro security-name guestuser
Dell(config)#
```

Example
---
```
Dell(config)# ip access-list standard snmp-ro-acl
Dell(config-standard-nacl)#seq 5 permit host 10.10.10.224
Dell(config-standard-nacl)#seq 10 deny any count
!
Dell(config)# snmp-server community guest ro snmp-ro-acl
Dell(config)#
```

Related Commands
---
- `ip access-list standard` — names (or selects) a standard access list to filter based on IP address.
- `ipv6 access-list` — configures an access list based on IPv6 addresses or protocols.
- `show running-config` — displays the current SNMP configuration and defaults.

### snmp-server contact

Configure contact information for troubleshooting this SNMP node.

**Syntax**
```
snmp-server contact text
```

To delete the SNMP server contact information, use the `no snmp-server contact` command.

**Parameters**
- `text` Enter an alphanumeric text string, up to 55 characters long.

**Defaults**
- none

**Command Modes**
- CONFIGURATION

snmp-server enable traps

Enable SNMP traps.

Syntax

```
snmp-server enable traps [notification-type] [notification-option]
```

To disable traps, use the `no snmp-server enable traps [notification-type] [notification-option]` command.

Parameters

- **notification-type**: Enter the type of notification from the following list:
  - bgp — Notification of changes in the BGP process.
  - config — Notification of changes to the startup or running configuration.
  - ecfm — Notification of changes to ECFM.
  - ecmp — Enable an ECMP trap to notify of ECMP or link bundle traffic imbalances.
  - envmon — For Dell Networking device notifications when an environmental threshold is exceeded.
  - isis — Notification of intermediate service traps.
  - lacp — Notification of changes.
  - snmp — Notification of RFC 1157 traps.
  - stp — Notification of a state change in the spanning tree protocol (RFC 1493).
  - vlt — Notification of virtual link trunking.
  - vrrp — Notification of a state change in a VRRP group.
  - xstp — Notification of a state change in MSTP (802.1s), RSTP (802.1w), and PVST +.

- **notification-option**: For the `envmon` notification-type, enter one of the following optional parameters:
  - cam-utilization
  - fan
  - supply
For the `snmp` notification-type, enter one of the following optional parameters:

- `temperature`
- `authentication`
- `coldstart`
- `linkdown`
- `linkup`
- `syslog-reachable`
- `syslog-unreachable`

**Defaults**
Not enabled.

</tr>
</tbody>
</table>

**Usage Information**
Dell Networking OS supports up to 16 SNMP trap receivers.
If you do not configure this command, traps that controlled by this command are not sent. If you do not specify a notification-type and notification-option, all traps are enabled.

Related Commands

- `snmp-server community` — enables SNMP and sets the community string.

### snmp-server engineID

Configure the name for both the local and remote SNMP engines on the router.

**Syntax**

```
snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]
```

To return to the default, use the `no snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]` command.

**Parameters**

- `local engineID`  
  Enter the keyword `local` followed by the engine ID number that identifies the copy of the SNMP on the local device.  
  
  **Format (as specified in RFC 3411):** 12 octets.  
  
  - The first four octets are set to the private enterprise number.  
  - The remaining eight octets are the MAC address of the chassis.

- `remote ip-address`  
  Enter the keyword `remote` followed by the IP address that identifies the copy of the SNMP on the remote device.

- `vrf vrf-name`  
  Enter the keyword `vrf` followed by the name of the VRF that is used to reach the device.  
  
  **NOTE:** Use this attribute to specify the VRF that is used by the SNMP engine to reach the device. If no VRF is specified, then the default VRF is used.

- `udp-port port-number engineID`  
  Enter the keywords `udp-port` followed by the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is 162.

**Defaults**

As above.

**Command Modes**

CONFIGURATION

**Command History**

</tr>
</tbody>
</table>
**Version** | **Description**
--- | ---
9.4.(0.0) | Added support for VRF.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.

**E-Series legacy command**

**Usage Information**
Changing the value of the SNMP Engine ID has important side effects. A user's password (entered on the command line) is converted to a message digest algorithm (MD5) or secure hash algorithm (SHA) security digest. This digest is based on both the password and the local Engine ID. The command line password is then destroyed, as required by RFC 2274. Because of this deletion, if the local value of the Engine ID changes, the security digests of SNMPv3 users is invalid and the users will have to be reconfigured.

For the remote Engine ID, the host IP and UDP port are the indexes to the command that are matched to either overwrite or remove the configuration.

**Related Commands**
- `show snmp engineID` — displays the SNMP engine and all the remote engines that are configured on the router.
- `show running-config snmp` — displays the SNMP running configuration.

### snmp-server group

Configure a new SNMP group or a table that maps SNMP users to SNMP views.

**Syntax**

```
snmp-server group {group_name {1 | 2c | 3 {auth | noauth | priv}}} [read name [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]]
```

To remove a specified group, use the `no snmp-server group {group_name {v1 | v2c | v3 {auth | noauth | priv}}} [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

**Parameters**

- **group_name**
  - Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults):
    - `v1v2creadg` — maps to a community/security-name with ro permissions.
    - `v1v2cwriteg` — maps to a community/security-name rw permissions.

- **1 | 2c | 3**
  - (OPTIONAL) Enter the security model version number (1, 2c, or 3):
    - 1 is the least secure version.
- 3 is the most secure of the security modes.
- 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.

The default is 1.

auth
(OPTIONAL) Enter the keyword auth to specify authentication of a packet without encryption.

noauth
(OPTIONAL) Enter the keyword noauth to specify no authentication of a packet.

priv
(OPTIONAL) Enter the keyword priv to specify both authentication and then scrambling of the packet.

read name
(OPTIONAL) Enter the keyword read then a name (a string of up to 20 characters long) as the read view name. The default is GlobalView and is assumed to be every object belonging to the internet (1.3.6.1) OID space.

write name
(OPTIONAL) Enter the keyword write then a name (a string of up to 20 characters long) as the write view name.

notify name
(OPTIONAL) Enter the keyword notify then a name (a string of up to 20 characters long) as the notify view name.

access access-list-name
(Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).

ipv6 access-list-name
(Optional) Enter the keyword ipv6 then the IPv6 access list name (a string up to 16 characters long).

access-list-name
ipv6 access-list-name
(Optional) Enter both an IPv4 and IPv6 access list name.

Defaults
As above.

Command Modes

</tbody>
</table>
### snmp-server host

Configure the recipient of an SNMP trap operation.

**Syntax**

```
snmp-server host ip-address | ipv6-address [vrf vrf-name] traps | informs [version 1 | 2c | 3] [auth | no auth | priv] [community-string] [udp-port port-number] [notification-type]
```

To remove the SNMP host, use the `no snmp-server host ip-address | ipv6-address [vrf vrf-name] traps | informs [version 1 | 2c | 3] [auth | noauth | priv] [community-string] [udp-port number] [notification-type]` command.

**Parameters**

- `ip-address`
  - Enter the keyword `host` then the IP address of the host (configurable hosts is limited to 16).

- `ipv6-address`
  - Enter the keyword host then the IPv6 address of the host in the x:x:x:x::x format.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zero.

- `vrf vrf-name`
  - Enter the keyword `vrf` and then the name of the VRF that the SNMP server uses to connect to the host.

  **NOTE:** You can use this attribute to inform the SNMP engine about the vrf instance to be used to reach the corresponding remote host to send Trap or Inform message. If no VRF is specified, then the default VRF is used.

- `traps`
  - (OPTIONAL) Enter the keyword `traps` to send trap notifications to the specified host. The default is `traps`.

---

### Usage Information

The following example specifies the group named `harig` as a version 3 user requiring both authentication and encryption and read access limited to the read named `rview`.

**Example**

```
Dell# conf
Dell(conf)# snmp-server group harig 3 priv read rview
Dell#
```

**Related Commands**

- `show snmp group` — displays the group name, security model, view status, and storage type of each group.
- `show running-config` — displays the SNMP running configuration.
informs (OPTIONAL) Enter the keyword informs to send inform notifications to the specified host. The default is traps.

version 1 | 2c | 3 (OPTIONAL) Enter the keyword version to specify the security model then the security model version number 1, 2c, or 3:

- Version 1 is the least secure version.
- Version 3 is the most secure of the security modes.
- Version 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.

The default is version 1.

auth (OPTIONAL) Enter the keyword auth to specify authentication of a packet without encryption.

noauth (OPTIONAL) Enter the keyword noauth to specify no authentication of a packet.

priv (OPTIONAL) Enter the keyword priv to specify both authentication and then scrambling of the packet.

community-string Enter a text string (up to 20 characters long) as the name of the SNMP community.

NOTE: For version 1 and version 2c security models, this string represents the name of the SNMP community. The string can be set using this command; however, Dell Networking OS recommends setting the community string using the snmp-server community command before executing this command. For version 3 security model, this string is the USM user security name.

udp-port port-number (OPTIONAL) Enter the keywords udp-port followed by the port number of the remote host to use. The range is from 0 to 65535. The default is 162.

notification-type (OPTIONAL) Enter one of the following keywords for the type of trap to be sent to the host:

- bgp — Enable BGP state change traps.
- ecfm — Enable ECFM state change traps.
- entity — Enable entity change traps.
- envmon — Enable SNMP environmental monitor traps.
- eoam — Enable EOAM state change traps
- ets — Enable ets traps
- fips — Enable FIP Snooping state change traps
- lacp — Enable LACP state change traps.
- isis — Enable ISIS adjacency change traps
- pfc — Enable pfc traps
- snmp — Enable SNMP trap
- stp — Enable 802.1d state change traps
- vlt — Enable VLT traps
- vrrp — Enable VRRP state change traps
- xstp — Enable 802.1s, 802.1w, and PVST+ state change traps

The default is all trap types are sent to host.
**Defaults**
As above.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
To configure the router to send SNMP notifications, enter at least one `snmp-server host` command. If you enter the command with no keywords, all trap types are enabled for the host. If you do not enter an `snmp-server host` command, no notifications are sent.

In order to enable multiple hosts, issue a separate `snmp-server host` command for each host. You can specify multiple notification types in the command for each host.

When multiple `snmp-server host` commands are given for the same host and type of notification (trap or inform), each succeeding command overwrites the previous command. Only the last `snmp-server host` command will be in effect. For example, if you enter an `snmp-server host inform` command for a host and then enter another `snmp-server host inform` command for the same host, the second command replaces the first command.

The `snmp-server host` command is used with the `snmp-server enable` command. Use the `snmp-server enable` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server enable` command and the `snmp-server host` command for that host must be enabled.
NOTE: For v1 / v2c trap configuration, if the community-string is not defined using the `snmp-server community` command prior to using this command, the default form of the `snmp-server community` command automatically is configured with the community-name the same as specified in the `snmp-server host` command.

Configuring Informs

To send an inform, use the following steps:

1. Configure a remote engine ID.
2. Configure a remote user.
3. Configure a group for this user with access rights.
4. Enable traps.
5. Configure a host to receive informs.

Related Commands

- `snmp-server enable traps` — enables SNMP traps.
- `snmp-server community` — configures a new community SNMPv1 or SNMPv2c.

**snmp-server location**

Configure the location of the SNMP server.

Syntax

```
snmp-server location text
```

To delete the SNMP location, use the `no snmp-server location` command.

Parameters

- `text` Enter an alpha-numeric text string, up to 55 characters long.

Defaults

Not configured.

Command Modes

- `CONFIGURATION`

Command History

snmp-server packetsize

Set the largest SNMP packet size permitted. When the SNMP server is receiving a request or generating a reply, use the snmp-server packetsize global configuration command.

Syntax

```
snmp-server packetsize byte-count
```

Parameters

- `byte-count`: Enter one of the following values 8, 16, 24 or 32. Packet sizes are 8000 bytes, 16000 bytes, 32000 bytes, and 64000 bytes.

Defaults

8

E-Series legacy command
snmp-server trap-source

Configure a specific interface as the source for SNMP traffic.

**Syntax**

```
snmp-server trap-source interface
```

To disable sending traps out a specific interface, use the `no snmp trap-source` command.

**Parameters**

- `interface`
  - Enter the following keywords and slot/port or number information:
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a Null interface, enter the keyword `null` then the Null interface number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

The IP address assigned to the management interface is the default.

**Command Modes**

- `CONFIGURATION`

**Command History**

</tbody>
</table>
### Version Description

| E-Series legacy command |

### Usage Information
To enable this `snmp-server trap-source` command, configure an IP address on the interface and enable the interface configured as an SNMP trap source.

### Related Commands
- `snmp-server community` — sets the community string.

---

## `snmp-server user`

Configure a new user to an SNMP group.

**Syntax**
```
snmp-server user name {group_name remote ip-address vrf vrf-name udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128} priv password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a user from the SNMP group, use the `no snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128} priv password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>Enter the name of the user (not to exceed 20 characters), on the host that connects to the agent.</td>
</tr>
</tbody>
</table>
| `group_name`     | Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults):
  - `v1v2creadu` — maps to a community with `ro` permissions.
  - `v1v2cwriteu` — maps to a community `rw` permissions. |
| `remote ip-address` | Enter the keywords `udp-port` then the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is 162. |
| `vrf vrf-name`   | Enter the keywords `vrf` and then the name of the VRF this is used to connect to the SNMP server. |

**NOTE:** Use this attribute to specify a VRF name that is used to connect to the remote host. If no VRF is specified, then the default VRF is used.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>udp-port port-number</code></td>
<td>Enter the keywords <code>udp-port</code> then the UDP (User Datagram Protocol) port number on the remote device. The range is from 0 to 65535. The default is 162.</td>
</tr>
</tbody>
</table>

| `1 | 2c | 3` |
|------------------|-------------|

(Optional) Enter the security model version number (`1`, `2c`, or `3`):

- `1` is the least secure version.
- `3` is the most secure of the security modes.
- `2c` allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.

The default is 1.
**encrypted** (OPTIONAL) Enter the keyword `encrypted` to specify the password appear in encrypted format (a series of digits, masking the true characters of the string).

**auth** (OPTIONAL) Enter the keyword `auth` to specify authentication of a packet without encryption.

**md5 | sha** (OPTIONAL) Enter the keyword `md5` or `sha` to designate the authentication level.
- `md5` — Message Digest Algorithm
- `sha` — Secure Hash Algorithm

**auth-password** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host. Minimum: eight characters long.

**priv** (OPTIONAL) Enter the keywords `priv` to initiate a privacy authentication level setting.

**des56 | aes128** (OPTIONAL) Enter the keyword `des56` or `aes128` to specify the encryption mode.
- `aes128` — Use 128 bit AES algorithm in CFB mode for encryption.
- `des56` — Use 56 bit DES algorithm in CBC mode for encryption.

**priv password** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent. Minimum: eight characters long.

**access access-list-name** (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).

**ipv6 access-list-name** (Optional) Enter the keyword `ipv6` then the IPv6 access list name (a string up to 16 characters long).

**access-list-name**

**ipv6 access-list-name** (Optional) Enter both an IPv4 and IPv6 access list name.

**Defaults**
As above.

**Command Modes**
CONFIGURATION

</tbody>
</table>
### snmp-server user (for AES128-CFB Encryption)

Specify that AES128-CFB encryption algorithm needs to be used for transmission of SNMP information. The Advanced Encryption Standard (AES) Cipher Feedback (CFB) 128-bit encryption algorithm is in compliance with RFC 3826. RFCs for SNMPv3 define two authentication hash algorithms, namely, HMAC-MD5-96 and HMAC-SHA1-96. These are the full forms or editions of the truncated versions, namely, HMAC-MD5 and HMAC-SHA1 authentication algorithms.
The `snmp-server user` command is used to configure a new user for the Simple Network Management Protocol (SNMP) on a Dell Networking switch. This command allows you to specify the name, group, remote IP address, UDP port, encryption, authentication, and access list for the SNMP user. The command syntax is as follows:

```
Syntax
snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128-cfb} priv-password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a user from the SNMP group, use the `no snmp-server user` command with the appropriate parameters.

### Parameters
- **auth-password** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host and to send packets to the host. Minimum: eight characters long.
- **aes128** (OPTIONAL) Enter the keyword `aes128` to initiate the AES128-CFB encryption algorithm for transmission of SNMP packets.
- **priv-password** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent and to decrypt the contents of the message it receives from the agent. Minimum: eight characters long.

### Defaults
If no authentication or privacy option is configured, then the messages are exchanged (attempted anyway) without any authentication or encryption.

### Command Modes
- **CONFIGURATION**

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.3(0.0)** Added support for the AES128-CFB encryption algorithm on the S4820T, S4810, S6000 and Z-Series platforms

### Usage Information
To enable robust, effective protection and security for SNMP packets transferred between the server and the client, you can use the `snmp-server user username group groupname 3 auth authentication-type auth-password priv aes128 priv-password` command to specify that AES128-CFB encryption algorithm needs to be used.

You cannot modify the FIPS mode if SNMPv3 users are already configured and present in the system. An error message is displayed if you attempt to change the FIPS mode by using the `fips mode enable` command.
Global Configuration mode. You can enable or disable FIPS mode only if SNMPv3 users are not previously set up. Otherwise, you must remove the previously configured users before you change the FIPS mode.

Example

Dell# snmp-server user privuser v3group v3 encrypted auth md5 9fc53d9d908118b2804fe80e3ba8763d priv aes128 d0452401a8c3ce42804fe80e3ba8763d

Related Commands

- `show snmp user` — Displays the information configured on each SNMP user name.

### snmp-server view

Configure an SNMPv3 view.

**Syntax**

```
snmp-server view view-name oid-tree {included | excluded}
```

To remove an SNMPv3 view, use the `no snmp-server view view-name oid-tree {included | excluded}` command.

**Parameters**

- `view-name` Enter the name of the view (not to exceed 20 characters).
- `oid-tree` Enter the OID sub tree for the view (not to exceed 20 characters).
- `included` (OPTIONAL) Enter the keyword `included` to include the MIB family in the view.
- `excluded` (OPTIONAL) Enter the keyword `excluded` to exclude the MIB family in the view.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
Usage Information
The oid-tree variable is a full sub-tree starting from 1.3.6 and cannot specify the name of a sub-tree or a MIB. The following Example configures a view named rview that allows access to all objects under 1.3.6.1.

Example
Dell# conf
Dell#(conf) snmp-server view rview 1.3.6.1 included

Related Commands
- `show running-config snmp` — displays the SNMP running configuration.

**snmp-server vrf**

Configures an SNMP agent to bind to a specific VRF.

**Syntax**

```
snmp-server vrf vrf-name
```

To undo the SNMP agent configuration, use the `no snmp-server vrf vrf-name` command.

**Parameters**

- `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to associate an SNMP agent with that VRF.

**Defaults**
Not Enabled.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P6) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.4(0.0) | Introduced on the S-Series and Z9000.

**Usage Information**
Use this command to bind an SNMP agent to a VRF. The SNMP agent processes the requests from the interfaces that belong to the specified VRF. If no VRF is specified, then the default VRF is used.
Related Commands

- `show snmp user` — display the information configured on each SNMP user name.

**snmp trap link-status**

Enable the interface to send SNMP link traps, which indicate whether the interface is up or down.

**Syntax**

```
snmp trap link-status
```

To disable sending link trap messages, use the `no snmp trap link-status` command.

**Defaults**

Enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### default logging console

Return the default settings for messages logged to the console.

**Syntax**

```
default logging console
```

**Defaults**

```
level = 7 or debugging
```

**Command Modes**

- CONFIGURATION

**Command History**

**E-Series legacy command**

#### Related Commands

- `logging trap` — limit messages logged to the Syslog servers based on severity.

---

**logging**

Configure an IP address or host name of a Syslog server where logging messages are sent. Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Syntax**

```
logging {ip-address | ipv6-address | hostname} {{udp {port}} | {tcp {port}}} [vrf vrf-name]
```

To disable logging, use the `no logging` command.

**Parameters**

- `ip-address`: Enter the IPv4 address in dotted decimal format.
- `ipv6-address`: Enter the IPv6 address in the x:x:x:x::X format.
  
  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.
- `hostname`: Enter the name of a host already configured and recognized by the switch.
- `udp`: Enter the keyword `udp` to enable transmission of log message over UDP followed by port number. The default port is 514.
**tcp**

Enter the keyword `tcp` to enable transmission of log message over TCP followed by port number.

**vrf vrf-name**

(Optional) Enter the keyword `vrf` and then the name of the VRF to enable the logging process in VRF mode.

**NOTE:** Use this attribute to specify the VRF that is used to contact the host. By default, the default VRF is used.

</tbody>
</table>

**Usage Information**

Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Related Commands**

- `logging on` — enables the logging asynchronously to logging buffer, console, Syslog server, and terminal lines.
- `logging trap` — enables logging to the Syslog server based on severity.
logging buffered

Enable logging and specify which messages are logged to an internal buffer. By default, all messages are logged to the internal buffer.

**Syntax**

```
logging buffered [level] [size]
```

To return to the default values, use the `default logging buffered` command.

To disable logging stored to an internal buffer, use the `no logging buffered` command.

**Parameters**

- **level**
  - (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following equivalent words: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is 7 or `debugging`.

- **size**
  - (OPTIONAL) Indicate the size, in bytes, of the logging buffer. The number of messages buffered depends on the size of each message. The range is from 40960 to 524288. The default is 40960 bytes.

**Defaults**

- `level = 7`
- `size = 40960 bytes`

**Command Modes**

- CONFIGURATION

</tr>
</tbody>
</table>

Simple Network Management Protocol (SNMP) and Syslog  | 1585
Usage Information
When you decrease the buffer size, all messages stored in the buffer are lost. Increasing the buffer size does not affect messages stored in the buffer.

Related Commands
- clear logging — clears the logging buffer.
- default logging buffered — returns the logging buffered parameters to the default setting.
- show logging — displays the logging setting and system messages in the internal buffer.

logging console

Specify which messages are logged to the console.

Syntax
logging console [level]

To return to the default values, use the default logging console command.

To disable logging to the console, use the no logging console command.

Parameters
level (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following parameters: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is 7 or debugging.

Defaults
level = 7; size = debugging

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.2(0.0) Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
logging extended
Logs security and audit events to a system log server.

Syntax
logging extended

Defaults
none

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.5(0.0) Introduced on the S4810, S4820T, S6000, Z9000, and MXL.

Usage Information
This command is available with or without RBAC enabled. When RBAC is enabled you can restrict access to audit and security logs based on the CLI sessions’ user roles. If extended logging is disabled, you can only view system events, regardless of RBAC user role.

When you enabled RBAC and extended logging:

- Only the system administrator role can execute this command.
- The system administrator and system security administrator roles can view security events and system events.
- The system administrator role can view audit, security, and system events.
- The network administrator and network operator roles can view system events.

Examples
Dell(conf)#logging extended
Related Commands

- `show logging auditlog` — display the audit log.
- `clear logging auditlog` — clear the audit log.

logging facility

Configure the Syslog facility used for error messages sent to Syslog servers.

Syntax

```
logging facility [facility-type]
```

To return to the default values, use the `no logging facility` command.

Parameters

- `facility-type` (OPTIONAL) Enter one of the following parameters:
  - `auth` (authorization system)
  - `cron` (Cron/at facility)
  - `deamon` (system daemons)
  - `kern` (kernel)
  - `local0` (local use)
  - `local1` (local use)
  - `local2` (local use)
  - `local3` (local use)
  - `local4` (local use)
  - `local5` (local use)
  - `local6` (local use)
  - `local7` (local use)
  - `lpr` (line printer system)
  - `mail` (mail system)
  - `news` (USENET news)
  - `sys9` (system use)
  - `sys10` (system use)
  - `sys11` (system use)
  - `sys12` (system use)
  - `sys13` (system use)
  - `sys14` (system use)
  - `syslog` (Syslog process)
  - `user` (user process)
  - `uucp` (Unix to Unix copy process)

The default is `local7`.

Defaults

- `local7`

Command Modes

- `CONFIGURATION`

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
logging history

Specify which messages are logged to the history table of the switch and the SNMP network management station (if configured).

Syntax

logging history level

To return to the default values, use the no logging history command.

Parameters

level

Indicate a value from 0 to 7 or enter one of the following equivalent words: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is 4 or warnings.

Defaults

warnings or 4

Command Modes

CONFIGURATION

Command History

</tr>
</tbody>
</table>

**E-Series legacy command**

**Usage Information**

When you configure the `snmp-server trap-source` command, the system messages logged to the history table are also sent to the SNMP network management station.

**Related Commands**

- `show logging` — displays information logged to the history buffer.

## logging history size

Specify the number of messages stored in the Dell Networking logging history table.

**Syntax**

```
logging history size size
```

To return to the default values, use the `no logging history size` command.

**Parameters**

- `size`
  
  Indicate a value as the number of messages to be stored. The range is from 0 to 500. The default is 1 message.

**Defaults**

1 message

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>
</tr>
</tbody>
</table>
When the number of messages reach the limit you set with the `logging history size` command, older messages are deleted as newer ones are added to the table.

Related Commands

- `show logging` — displays information logged to the history buffer.

### logging monitor

Specify which messages are logged to Telnet applications.

**Syntax**

```plaintext
logging monitor [level]
```

To disable logging to terminal connections, use the `no logging monitor` command.

**Parameters**

`level`  
Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is 7 or `debugging`.

**Defaults**

7 or `debugging`

### Version Description

- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.

**E-Series legacy command**

#### Usage Information
When you use the `no logging on` command, messages are logged only to the console.

#### Related Commands
- `logging` — enable logging to the Syslog server.
- `logging buffered` — set the logging buffered parameters.
- `logging console` — set the logging console parameters.
- `logging monitor` — set the logging parameters for the terminal connections.

---

### logging source-interface

Specify that the IP address of an interface is the source IP address of Syslog packets sent to the Syslog server.

**Syntax**

```
logging source-interface interface
```

To disable this command and return to the default setting, use the `no logging source-interface` command.

**Parameters**

- **interface**

  Enter the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For the Management interface, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.

E-Series legacy command

Usage Information Syslog messages contain the IP address of the interface used to egress the router. By configuring the `logging source-interface` command, the Syslog packets contain the IP address of the interface configured.

Related Commands

- `logging` — enables logging to the Syslog server.

**logging synchronous**

Synchronize unsolicited messages and Dell Networking OS output.

```
logging synchronous [level level | all] [limit number-of-buffers]
```

To disable message synchronization, use the `no logging synchronous [level level | all] [limit number-of-buffers]` command.

Parameters

- **all**
  - Enter the keyword all to ensure that all levels are printed asynchronously.

- **level level**
  - Enter the keyword level then a number as the severity level. A high number indicates a low severity level and vice versa. The range is from 0 to 7. The default is 2.

- **all**
  - Enter the keyword all to turn off all.

- **limit number-of-buffers**
  - Enter the keyword limit then the number of buffers to be queued for the terminal after which new messages are dropped. The range is from 20 to 300. The default is 20.
Defaults Disabled. If enabled without the level or number-of-buffers options specified, level = 2 and number-of-buffers = 20 are the defaults.

Command Modes LINE

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

E-Series legacy command

Usage Information When you enable logging synchronous, unsolicited messages appear between software prompts and outputs. Only the messages with a severity at or below the set level are sent to the console.

If the message queue limit is reached on a terminal line and messages are discarded, a system message appears on that terminal line. Messages may continue to appear on other terminal lines.

Related Commands

- logging on — enables logging.

logging trap

Specify which messages are logged to the Syslog server based the message severity.

Syntax

logging trap [level]

To return to the default values, use the default logging trap command.

To disable logging, use the no logging trap command.
**Parameters**

- **level**
  Indicate a value from 0 to 7 or enter one of the following parameters: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is 6 or informational.

**Defaults**

6 or informational

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series, S55.
7.5.1.0 | Introduced on the C-Series.

**E-Series legacy command**

**Usage Information**

To block a type of message parameter, set the logging trap level to a lower number. For example, to block severity messages at level 6, set the level to 5.

**Related Commands**

- logging — enables the logging to another device.
- logging on — enables logging.

---

**logging version**

Displays syslog messages in a RFC 3164 or RFC 5424 format.

**Syntax**

logging version {0|1}

**Defaults**

0

**Usage Information**

To display syslog messages in a RFC 3164 or RFC 5424 format, use the `log version` command in configuration mode. By default, the system log version is set to 0.

The following describes the two supported log messages formats:

- **0** – Displays syslog messages format as described in RFC 3164, The BSD syslog Protocol
- **1** – Displays SYSLOG message format as described in RFC 5424, The Syslog Protocol

**Example**

Dell(conf)#logging version ?
<0-1> Select syslog version (default = 0)
Dell(conf)#logging version 1

**show logging**

Display the logging settings and system messages logged to the internal buffer of the switch.

**Syntax**

```
show logging [number | history [reverse][number] | reverse [number] | summary]
```

**Parameters**

- **number** (OPTIONAL) Enter the number of messages displayed in the output. The range is from 1 to 65535.
- **history** (OPTIONAL) Enter the keyword `history` to view only information in the Syslog history table.
- **reverse** (OPTIONAL) Enter the keyword `reverse` to view the Syslog messages in FIFO (first in, first out) order.
- **summary** (OPTIONAL) Enter the keyword `summary` to view a table showing the number of messages per type and per slot. Slots *7* and *8* represent RPMs.

**Command Modes**

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.5(0.0) Introduced on the S4810, S4820T, S6000, Z9000, and MXL.

Example

Dell(conf)# show logging auditlog

Related Commands
• clear logging auditlog — clear the audit log.

show logging driverlog stack-unit

Display the driver log for the specified hardware component.

Syntax
show logging driverlog stack-unit stack-unit-number

Parameters
stack-unit stack-unit-number Enter the keywords stack-unit followed by the stack member ID of the switch for which you want to display the driver log.
defaults
none

Command Modes
• EXEC
• EXEC Privilege

Usage Information

This command displays internal software driver information, which may be useful during troubleshooting switch initialization errors, such as a downed Port-Pipe.

**terminal monitor**

Configure the Dell Networking OS to display messages on the monitor/terminal.

**Syntax**

```
terminal monitor
```

To return to default settings, use the `terminal no monitor` command.

**defaults**

Disabled.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Spanning Tree Protocol (STP)

The commands in this section configure and monitor the IEEE 802.1d spanning tree protocol (STP) and are supported on the Dell Networking switch/routing platform.

Topics:
- bridge-priority
- bpdu-destination-mac-address
- debug spanning-tree
- description
- disable
- forward-delay
- hello-time
- max-age
- protocol spanning-tree
- show config
- show spanning-tree 0
- spanning-tree

bridge-priority

Set the bridge priority of the switch in an IEEE 802.1D spanning tree.

**Syntax**

```
bridge-priority 
```

To return to the default value, use the `no bridge-priority` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>priority-value</code></td>
<td>Enter a number as the bridge priority value. The range is from 0 to 65535. The default is 32768.</td>
</tr>
<tr>
<td><code>primary</code></td>
<td>Enter the keyword <code>primary</code> to designate the bridge as the root bridge.</td>
</tr>
<tr>
<td><code>secondary</code></td>
<td>Enter the keyword <code>secondary</code> to designate the bridge as a secondary root bridge.</td>
</tr>
</tbody>
</table>

**Defaults**

priority-value = 32768

**Command Modes**

SPANNING TREE (The prompt is “config-stp”)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

</tbody>
</table>

**bpdu-destination-mac-address**

Use the Provider Bridge Group address in Spanning Tree or GVRP PDUs.

**Syntax**

```
bpdu-destination-mac-address [stp | gvrp] provider-bridge-group
```

**Parameters**

- **xstp**: Force STP, RSTP, and MSTP to use the Provider Bridge Group address as the destination MAC address in its BPDUs.
- **gvrp**: Forces GVRP to use the Provider Bridge GVRP Address as the destination MAC address in its PDUs.

**Defaults**

The destination MAC address for BPDUs is the Bridge Group Address.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
debug spanning-tree

Enable debugging of the spanning tree protocol and view information on the protocol.

Syntax
debug spanning-tree {stp-id [all | bpdu | config | events | exceptions | general | root] | protocol}
To disable debugging, use the no debug spanning-tree command.

Parameters
stp-id
Enter zero (0). The switch supports one spanning tree group with a group ID of 0.

protocol
Enter the keyword for the type of STP to debug, either mstp, pvst, or rstp.

all
(Optional) Enter the keyword all to debug all spanning tree operations.

bpdu
(Optional) Enter the keyword bpdu to debug bridge protocol data units.

cfg
(Optional) Enter the keyword config to debug configuration information.

events
(Optional) Enter the keyword events to debug STP events.

general
(Optional) Enter the keyword general to debug general STP operations.

root
(Optional) Enter the keyword root to debug STP root transactions.

Command Modes EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
When you enable debug spanning-tree bpdu for multiple interfaces, the software only sends information on BPDUs for the last interface specified.

Related Commands

- protocol spanning-tree — enters SPANNING TREE mode on the switch.

description

Enter a description of the spanning tree.

Syntax
description {description}

To remove the description from the spanning tree, use the no description {description} command.

Parameters

- **description**
  - Enter a description to identify the spanning tree (80 characters maximum).

Defaults

- none

Command Modes

- SPANNING TREE (The prompt is “config-stp”.)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
disable

Disable the spanning tree protocol globally on the switch.

Syntax
disable

To enable Spanning Tree Protocol, use the no disable command.

Defaults
Enabled (that is, the spanning tree protocol is disabled.)

Command Modes
SPANNING TREE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Related Commands

- protocol spanning-tree — enter SPANNING TREE mode on the switch.

forward-delay

The amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

Syntax
forward-delay seconds

To return to the default setting, use the no forward-delay command.
Parameters

seconds

Enter the number of seconds the Dell Networking OS waits before transitioning STP to the Forwarding state. The range is from 4 to 30. The default is **15 seconds**.

**Defaults**

**15 seconds**

**Command Modes**

SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Related Commands**

- **max-age** — changes the wait time before STP refreshes protocol configuration information.
- **hello-time** — changes the time interval between BPDUs.

**hello-time**

Set the time interval between generation of the spanning tree bridge protocol data units (BPDUs).

**Syntax**

```
hello-time seconds
```

To return to the default value, use the no hello-time command.

**Parameters**

- **seconds**

Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is **2 seconds**.

**Defaults**

**2 seconds**

**Command Modes**

SPANNING TREE
max-age

To maintain configuration information before refreshing that information, set the time interval for the spanning tree bridge.

Syntax

    max-age seconds

To return to the default values, use the no max-age command.

Parameters

    seconds

Enter a number of seconds the Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is 20 seconds.

Defaults

    20 seconds

Command Modes

    SPANNING TREE

Command History

    This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

    Version  Description
    9.10(0.0)  Introduced on the S3148.

Related Commands

    • forward-delay — changes the wait time before STP transitions to the Forwarding state.
    • max-age — changes the wait time before STP refreshes protocol configuration information.
Related Commands
- forward-delay — changes the wait time before STP transitions to the Forwarding state.
- hello-time — changes the time interval between BPDUs.

**protocol spanning-tree**

To enable and configure the spanning tree group, enter SPANNING TREE mode.

**Syntax**

```
protocol spanning-tree stp-id
```

To disable the Spanning Tree group, use the `no protocol spanning-tree stp-id` command.

**Parameters**

- **stp-id**
  
  Enter zero (0). Dell Networking OS supports one spanning tree group, group 0.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)

  Introduced on the S3148.

- 9.10(0.0)

  Introduced on the S6100–ON.

- 9.8(2.0)

  Introduced on the S3100 series.

- 9.8(1.0)

  Introduced on the Z9100–ON.

- 9.8(0.0P5)

  Introduced on the S4048-ON.

- 9.8(0.0P2)

  Introduced on the S3048-ON.

- 9.7(0.0)

  Introduced on the S6000-ON.

- 9.2(1.0)

  Introduced on the Z9500.

- 9.0.2.0

  Introduced on the S6000.

- 8.3.19.0

  Introduced on the S4820T.

- 8.3.11.1

  Introduced on the Z9000.

- 8.3.7.0

  Introduced on the S4810.

- 7.7.1.0

  Introduced on the S-Series.

- 7.5.1.0

  Introduced on the C-Series.

- 6.2.1.1

  Introduced on the E-Series.

- 9.10(0.0)

  Introduced on the S6100–ON.

- 9.10(0.0)

  Introduced on the S6100–ON.

- 7.7.1.0

  Introduced on the S-Series.
### Version Description
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.7.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.2.1.1** Introduced on the E-Series.

### Usage Information
STP is not enabled when you enter SPANNING TREE mode. To enable STP globally on the switch, use the `no disable` command from SPANNING TREE mode.

### Example
```
Dell(conf)# protocol spanning-tree 0
Dell(config-stp)#
```

### Related Commands
- `disable` — disables spanning tree group 0. To enable spanning tree group 0, use the `no disable` command.

### show config
Display the current configuration for the mode. Only non-default values display.

#### Syntax
```
show config
```

#### Command Modes
SPANNING TREE

#### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### show spanning-tree 0

Display the spanning tree group configuration and status of interfaces in the spanning tree group.

#### Syntax

```
show spanning-tree 0 [active | brief | guard | interface interface | root | summary]
```

#### Parameters

- **0**
  - Enter 0 (zero) to display information about that specific spanning tree group.
- **active**
  - (OPTIONAL) Enter the keyword active to display only active interfaces in spanning tree group 0.
- **brief**
  - (OPTIONAL) Enter the keyword brief to display a synopsis of the spanning tree group configuration information.
- **guard**
  - (OPTIONAL) Enter the keyword guard to display the type of guard enabled on an STP interface and the current port state.
- **interface interface**
  - (OPTIONAL) Enter the keyword interface and the type slot/port of the interface you want displayed. Type slot/port options are the following:
    - For a port-channel interface, enter the keywords port-channel then the port-channel ID.
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- **root**
  - (OPTIONAL) Enter the keyword root to display configuration information on the spanning tree group root.
- **summary**
  - (OPTIONAL) Enter the keyword summary to only display the number of ports in the spanning tree group and their state.

#### Command Modes

- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Version Description

9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.5.1.0 Added support for 4-port 40G line cards on the E-Series.
8.4.2.1 Added support for the optional **guard** keyword on the C-Series, S-Series, and E-Series.
8.3.7.0 Introduced on the S4810.
7.7.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.2.1.1 Introduced on the E-Series.

### Usage Information

Enable spanning tree group 0 prior to using this command.

The following describes the **show spanning-tree 0** command shown in the example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Bridge Identifier...&quot;</td>
<td>Lists the bridge priority and the MAC address for this STP bridge.</td>
</tr>
<tr>
<td>&quot;Configured hello...&quot;</td>
<td>Displays the settings for hello time, max age, and forward delay.</td>
</tr>
<tr>
<td>&quot;We are...&quot;</td>
<td>States whether this bridge is the root bridge for the STG.</td>
</tr>
<tr>
<td>&quot;Current root...&quot;</td>
<td>Lists the bridge priority and MAC address for the root bridge.</td>
</tr>
<tr>
<td>&quot;Topology flag...&quot;</td>
<td>States whether the topology flag and the detected flag were set.</td>
</tr>
<tr>
<td>&quot;Number of...&quot;</td>
<td>Displays the number of topology changes, the time of the last topology change, and on what interface the topology change occurred.</td>
</tr>
<tr>
<td>&quot;Timers&quot;</td>
<td>Lists the values for the following bridge timers: hold time, topology change, hello time, max age, and forward delay.</td>
</tr>
<tr>
<td>&quot;Times&quot;</td>
<td>List the number of seconds since the last:</td>
</tr>
<tr>
<td></td>
<td>- hello time</td>

<tr>
<td></td>
<td>- notification</td>
</tr>
<tr>
<td></td>
<td>- aging</td>
</tr>
<tr>
<td>&quot;Port 1...&quot;</td>
<td>Displays the Interface type slot/port information and the status of the interface (Disabled or Enabled).</td>
</tr>
</tbody>
</table>
### Field Description

**“Port path...”** Displays the path cost, priority, and identifier for the interface.

**“Designated root...”** Displays the priority and MAC address of the root bridge of the STG that the interface belongs.

**“Designated port...”** Displays the designated port ID.

### Example

```
Dell# show spann 0

Executing IEEE compatible Spanning Tree Protocol
Bridge Identifier has priority 32768, Address 0001.e800.0a56
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Current root has priority 32768 address 0001.e800.0a56
Topology change flag set, detected flag set
  Number of topology changes 1 last change occurred 0:00:05 ago from GigabitEthernet 1/3
Timers:hold 1, topology change 35
  hello 2, max age 20, forward delay 15
Times:hello 1, topology change 1, notification 0, aging 2

Port 26 (GigabitEthernet 1/1) is Forwarding
  Port path cost 4, Port priority 8, Port Identifier 8.26
  Designated root has priority 32768, address 0001.e800.0a56
  Designated bridge has priority 32768, address 0001.e800.0a56
  Designated port id is 8.26, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state 1
  BPDU: sent:18, received 0
  The port is not in the portfast mode

Port 27 (GigabitEthernet 1/2) is Forwarding
  Port path cost 4, Port priority 8, Port Identifier 8.27
  Designated root has priority 32768, address 0001.e800.0a56
  Designated bridge has priority 32768, address 0001.e800.0a56
  Designated port id is 8.27, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state 1
  BPDU: sent:18, received 0
  The port is not in the portfast mode

Port 28 (GigabitEthernet 1/3) is Forwarding
  Port path cost 4, Port priority 8, Port Identifier 8.28
  Designated root has priority 32768, address 0001.e800.0a56
  Designated bridge has priority 32768, address 0001.e800.0a56
  Designated port id is 8.28, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state 1
  BPDU: sent:31, received 0
  The port is not in the portfast mode

Dell#
```

### Example (Brief)

```
Dell# show span 0 brief

Executing IEEE compatible Spanning Tree Protocol
  Root ID Priority 32768
    Address 0001.e800.0a56
  Root Bridge hello time 2, max age 20, forward delay 15
  Bridge ID Priority 32768,
    Address 0001.e800.0a56
  Configured hello time 2, max age 20, forward delay 15

<td></td>
<td>0</td>
<td>LIS</td>
<td>Loopguard</td>
</tr>
<tr>
<td>Gi 1/3</td>
<td></td>
<td>0</td>
<td>EDS (Shut)</td>
<td>Bpduguard</td>
</tr>
</tbody>
</table>
```

spanning-tree

Assigns a Layer 2 interface to STP instance 0 and configures a port cost or port priority, or enables loop guard, root guard, or the Portfast feature on the interface.

Syntax

```
spanning-tree stp-id {cost cost | {loopguard | rootguard} | portfast [bpduguard [shutdown-on-violation]] | priority priority}
```

To disable Spanning Tree group on an interface, use the `no spanning-tree stp-id {cost cost | {loopguard | rootguard} | portfast [bpduguard [shutdown-on-violation]] | priority priority} command.

Parameters

- **stp-id**: Enter the STP instance ID. The range is 0.
- **cost cost**: Enter the keyword `cost` then a number as the cost. The range is from 1 to 65535. The defaults are:
  - 1-Gigabit Ethernet interface = 4.
  - 10-Gigabit Ethernet interface = 2.
  - Port Channel interface with 100 Mb/s Ethernet = 18.
  - Port Channel interface with 1 Gigabit Ethernet = 3.
  - Port Channel interface with 10 Gigabit Ethernet = 1.
- **loopguard**: Enter the keyword `loopguard` to enable STP loop guard on a port or port-channel interface.
- **rootguard**: Enter the keyword `rootguard` to enable STP root guard on a port or port-channel interface.
- **portfast [bpduguard [shutdown-on-violation]]**: Enter the keyword `portfast` to enable Portfast to move the interface into Forwarding mode immediately after the root fails.
Enter the optional keyword `bpduguard` to disable the port when it receives a BPDU.

Enter the optional keyword `shutdown-on-violation` to hardware disable an interface when a BPDU is received and the port is disabled.

```
priority priority
```
Enter keyword `priority` then a number as the priority. The range is from zero (0) to 15. The default is 8.

**Defaults**
cost = depends on the interface type; priority = 8

**Command Modes**

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
If you enable `portfast bpduguard` on an interface and the interface receives a BPDU, the software disables the interface and sends a message stating that fact. The port is in ERR_DISABLE mode, yet appears in the `show interface` commands as enabled. If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

STP loop guard and root guard are supported on a port or port-channel enabled in any Spanning Tree mode: Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and Per-VLAN Spanning Tree Plus (PVST+).
Root guard is supported on any STP-enabled port or port-channel except when used as a stacking port. When enabled on a port, root guard applies to all VLANs configured on the port.

STP root guard and loop guard cannot be enabled at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message is displayed: % Error: RootGuard is configured. Cannot configure LoopGuard.

Do not enable Portfast BPDU guard and loop guard at the same time on a port. Enabling both features may result in a port that remains in a blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

To display the type of STP guard (Portfast BPDU, root, or loop guard) enabled on a port, enter the `show spanning-tree 0` command.
All commands in this chapter are specific to the Dell Networking OS.
You can use the commands to pre-configure a switch, so that the configuration settings are invoked when the switch is attached to other S-Series units.

For information about using the S-Series stacking feature, see the Stacking S-Series Switches section in the Dell Networking OS Configuration Guide.

Topics:
- redundancy disable-auto-reboot
- redundancy force-failover stack-unit
- redundancy protocol
- reset stack-unit
- show redundancy
- show system stack-ports
- stack-unit priority
- stack-unit provision
- upgrade system stack-unit

redundancy disable-auto-reboot

Prevent the S-Series stack management unit, stack member unit, and standby unit from rebooting if they fail.

Syntax

redeundance disable-auto-reboot stack-unit [1-6 | members]

To return to the default, use the no redundancy disable-auto-reboot stack-unit command.

Parameters

stack-unit Enter the stack-unit number. The range is from 1 to 12.

members Enter the keyword members for all stack-units.

Defaults

Disabled (the failed switch is automatically rebooted).

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.3.1.0</td>
<td>Added the members option.</td>
</tr>
</tbody>
</table>

**Usage Information**
Executing this command on the master unit reboots the master unit and the standby unit becomes the new master. A new standby unit is elected depending on the priority and MAC address.
**Example**

Dell# redundancy force-failover stack-unit
System configuration has been modified. Save? [yes/no]: yes

Apr 20 11:44:03: %STKUNIT1-M:CP %FILEMGR-5-FILESAVED: Copied running-config to
startup-config in flash by default
Synchronizing data to peer stack-unit
!!!

... Proceed with stack-unit hot failover [confirm yes/no]: yes

---

**redundancy protocol**

Enable hitless failover for a protocol.

**Syntax**

redundancy protocol

**Protocols**

- lacp
  - Enter the LACP protocol
- xstp
  - Enter one of the following protocols: STP, RSTP, MSTP, PVST.

**Defaults**

Not enabled.

</tr>
</tbody>
</table>

Usage Information
Resetting the management unit is not allowed, and an error message displays if you try to do so. Resetting is a soft reboot, including flushing the forwarding tables.

Starting with Dell Networking OS version 7.8.1.0, you can run this command directly on the stack standby unit (standby master) to reset the standby. You cannot reset any other unit from the standby unit.

Example
Dell#reset stack-unit 4

## Usage Information

To modify your results, use the `show redundancy [pipe]` command, as follows:

- `except` — show only text that does not match a pattern.
- `find` — search for the first occurrence of a pattern.
- `grep` — show only text that matches a pattern.
- `no-more` — do not paginate the output.
- `save` — save the output to a file.

## Example

```
Dell#show redundancy

-- Stack-unit Status --
---------------------------------------------
Mgmt ID:                          1
Stack-unit ID:                    12

Last failover timestamp:          None
```
show system stack-ports

Display information about the stacking ports on all switches in the stack.

Syntax

```
show system stack-ports [status | topology]
```

Parameters

- **status** (OPTIONAL) Enter the keyword status to display the command output without the Connection field.
- **topology** (OPTIONAL) Enter the keyword topology to limit the table to just the Interface and Connection fields.

Defaults

none

Usage Information

The following describes the show system stack-ports command shown in the following example.
## Field Description

**Topology**
Lists the topology of stack ports connected: Ring, Daisy chain, or Standalone.

**Interface**
The unit/port ID of the connected stack port on this unit.

**Link Speed**
Link Speed of the stack port (10 or 40) in Gb/s.

**Admin Status**
The only currently listed status is Up.

**Connection**
The stack port ID to which this unit’s stack port is connected.

### Example

Dell\#show system stack-ports

Related Commands

- reset stack-unit – resets the designated stack member.
- show hardware stack-unit – displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- show system – displays the current status of all stack members or a specific member.

stack-unit priority

Configure the ability of a switch to become the management unit of a stack.

Syntax

    stack-unit stack-number priority priority-value

Parameters

- **stack-number**
  
Enter the stack member unit identifier.

- **priority-value**
  
  This preference parameter allows you to specify the management priority of one backup switch over another, with 1 as the lowest priority and 14 being the highest. The switch with the highest priority value is chosen to become the management unit if the active management unit fails or on the next reload.

Defaults

    1

Command Modes

    CONFIGURATION
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.

Related Commands

• reload — reboots Dell Networking OS.

stack-unit provision

Preconfigure a logical stacking ID of a switch that joins the stack. This is an optional command that is executed on the management unit.

Syntax

stack-unit [stack-number] provision {model-identifier}

Parameters

stack-number Enter a stack member identifier of the switch that you want to add to the stack.

model-identifier Enter the model identifier of the switch to be added as a stack member. This identifier is also referred to as the provision type.

Defaults

When this value is not set, a switch joining the stack is given the next available sequential stack member identifier.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
upgrade system stack-unit

Copy the boot image or Dell Networking OS from the management unit to one or more stack members.

Syntax

```
upgrade {boot | system} stack-unit {all | stack-unit-number | A | B}
```

Parameters

- **boot**
  - Enter the keyword boot to copy the boot image from the management unit to the designated stack members.

- **system**
  - Enter the keyword system to copy the Dell Networking OS image from the management unit to the designated stack members.

- **stack-unit**
  - Enter the stack-unit number. The range is from 1 to 12.

- **all**
  - Enter the keyword all to copy the designated image to all stack members.

- **A**
  - Enter the keyword A to upgrade all stacked units in System A (only).

- **B**
  - Enter the keyword B to upgrade all stacked units in System B (only).

Defaults

none

Command Modes

- EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

To reboot using the new image, use the `upgrade boot system stack-unit` command.

Related Commands

- **reload** — reboots Dell Networking OS.
- **reset stack-unit** — resets the designated stack member.
- **show system** — displays the status of all stack members or a specific member.
- `show version` — displays the current Dell Networking OS version information on the system.
The Dell Networking OS storm control feature allows you to limit or suppress traffic during a traffic storm (Broadcast/Unknown Unicast Rate Limiting or Multicast on the C-Series and S-Series).

Storm control is supported on Dell Networking OS.

**Important Points to Remember**

- Interface commands can only be applied on physical interfaces (virtual local area networks [VLANs] and link aggregation group [LAG] interfaces are not supported).
- An INTERFACE-level command only supports storm control configuration on ingress.
- An INTERFACE-level command overrides any CONFIGURATION-level ingress command for that physical interface, if both are configured.
- You can apply the CONFIGURATION-level storm control commands at ingress or egress and are supported on all physical interfaces.
- When storm control is applied on an interface, the percentage of storm control applied is calculated based on the advertised rate of the line card. It is not based on the speed setting for the line card.
- Do not apply per-VLAN quality of service (QoS) on an interface that has storm control enabled (either on an interface or globally).
- When you enable broadcast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 1 is configured for the data traffic, the traffic goes to queue 1 instead of queue 0.
- Similarly, if you enable unicast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 2 is configured for the data traffic, the traffic goes to queue 2 instead of queue 0.

**NOTE:** Bi-directional traffic (unknown unicast and broadcast) along with egress storm control causes the configured traffic rates split between the involved ports. The percentage of traffic that each port receives after the split is not predictable. These ports can be in the same/different port pipes or the same/different line cards.

**NOTE:** The policy discard drop counters are common across storm-control drops, ACL drops and QoS drops. If your configuration includes ACL and GoS, those drops are also computed and displayed in the policy discard drops counter field along with storm-control drops. The packets dropped by the storm control feature can be monitored by viewing the value of the Policy Discard Drops field of the output of the show hardware stack-unit stack-unit-number drops command.
show storm-control broadcast

Display the storm control broadcast configuration.

Syntax

show storm-control broadcast [interface]

Parameters

interface (OPTIONAL) Enter one of the following interfaces to display the interface-specific storm control configuration:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.

Defaults

none

Command Modes

- EXEC
- EXEC Privilege

Command History

storm-control broadcast (Configuration)

Configure the percentage of broadcast traffic allowed in the network.

Syntax

```
storm-control broadcast [packets_per_second in]
```

To disable broadcast rate-limiting, use the `no storm-control broadcast [packets_per_second in]` command.

```
storm-control broadcast [percentage decimal_value in | out] [wred-profile name]
[packets_per_second in]
```

To disable broadcast rate-limiting, use the `storm-control broadcast [percentage decimal_value in | out] [wred-profile name] [packets_per_second in]` command.

Parameters

- **percentage decimal_value in | out**: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%. The decimal range is from .1 to .9.
- **wred-profile name**: Enter the keyword `wred-profile` followed by the profile name to designate a wred-profile.
- **packets_per_second in**: Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

Defaults

```
none
```

Command Modes

```
CONFIGURATION (conf)
```

Version | Description
--- | ---
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
7.4.1.0 | E-Series Only: Added the percentage decimal value option.
6.5.1.0 | Introduced on the E-Series.

**Usage Information**

Broadcast storm control is valid on Layer 2/Layer 3 interfaces only. Layer 2 broadcast traffic is treated as unknown-unicast traffic.

**storm-control broadcast (Interface)**

Configure the percentage of broadcast traffic allowed on an interface (ingress only).

**Syntax**

```
storm-control broadcast [packets_per_second in]
```

To disable broadcast storm control on the interface, use the `no storm-control broadcast [packets_per_second in]` command.

**Parameters**

- `packets_per_second in` Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults**

none

**Command Modes**

INTERFACE (conf-if-interface-slot/port)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
storm-control multicast (Configuration)

Configure the packets per second (pps) of multicast traffic allowed into the C-Series and S-Series networks only.

Syntax

```
storm-control multicast packets_per_second in
```

To disable storm-control for multicast traffic into the network, use the no storm-control multicast packets_per_second in command.

Parameters

- `packets_per_second` Enter the packets per second of multicast traffic allowed into the network. The range is from 0 to 33554368.

Defaults

```
none
```

Command Modes

```
CONFIGURATION (conf)
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

### Version Description

- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100–ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **9.2(0.0)** Introduced on the M I/O Aggregator. This command is supported in Programmable-MUX (PMUX) mode only.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the C-series and S-Series.

Usage Information

Broadcast traffic (all 0xFs) should be counted against the broadcast storm control meter, not against the multicast storm control meter. It is possible, however, that some multicast control traffic may get dropped when storm control thresholds are exceeded.
**storm-control multicast (Interface)**

Configure the percentage of multicast traffic allowed on an C-Series or S-Series interface (ingress only) network only.

**Syntax**

```
storm-control multicast packets_per_second in
```

To disable multicast storm control on the interface, use the `no storm-control multicast packets_per_second in` command.

**Parameters**

- `packets_per_second in`
Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults**

none

**Command Modes**

INTERFACE (conf-if-interface-slot/port)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**storm-control unknown-unicast (Configuration)**

Configure the percentage of unknown-unicast traffic allowed in or out of the network.

**Syntax**

```
storm-control unknown-unicast [packets_per_second in]
```

To disable storm control for unknown-unicast traffic, use the `no storm-control unknown-unicast [packets_per_second in]` command.
storm-control unknown-unicast (Interface)

Configure percentage of unknown-unicast traffic allowed on an interface (ingress only).

Syntax

storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]

To disable unknown-unicast storm control on the interface, use the no storm-control unknown-unicast
[percentage decimal_value in] | [wred-profile name]] [packets_per_second in] command.

Parameters

percentage decimal_value [in | out]  E-Series Only: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%.
The percentage is from 0 to 100:
- 0% blocks all related traffic.
- 100% allows all traffic into the interface.

The decimal range is from 0.1 to 0.9.

```
wred-profile name  
```

E-Series Only: (Optionally) Enter the keywords `wred-profile` followed by the profile name to designate a `wred-profile`.

```
packets_per_second  
```

C-Series and S-Series Only: Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554431.

**Defaults**

```
none
```

**Command Modes**

```
INTERFACE (conf-if-interface-slot/port)

SupportAssist

SupportAssist sends troubleshooting data securely to Dell. SupportAssist in this Dell Networking OS release does not support automated email notification at the time of hardware fault alert, automatic case creation, automatic part dispatch, or reports. SupportAssist requires Dell Networking OS 9.9(0.0) and SmartScripts 9.7 or later to be installed on the Dell Networking device. For more information on SmartScripts, see Dell Networking Open Automation guide.

NOTE: SupportAssist is enabled by default on the system. To disable SupportAssist, enter the eula-consent support-assist reject command in Global Configuration mode and save the configuration.

Topics:
- eula-consent
- support-assist
- support-assist activate
- support-assist activity
- SupportAssist Commands
- SupportAssist Activity Commands
- SupportAssist Company Commands
- SupportAssist Person Commands
- SupportAssist Server Commands
- show eula-consent
- show running-config
- show support-assist status

eula-consent

Accept or reject the end user license agreement (EULA).

Syntax  
```
eula-consent {support-assist} {accept | reject}
```

Parameters

- **support-assist**  
Enter the keywords support-assist to either accept or reject the EULA for the specified service.

- **accept**  
Enter the keyword accept to accept the EULA for the specified service.

- **reject**  
Enter the keyword reject to reject the EULA for the specified service.

Defaults  
None

Command Modes  
CONFIGURATION

Command History  
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version | Description
---|---
9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) | Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

- When you run the command, the system displays a message with the information directing to the URL for further information.
- Even before you accept or reject the EULA, the configuration data is sent to the default centrally deployed SupportAssist Server. If you reject the EULA, the configuration data is not transmitted to the SupportAssist server.
- If there is an existing SupportAssist configuration, the configuration is not removed and the feature is disabled.

Example

Accept the EULA:

Dell(conf)# eula-consent support-assist accept
I accept the terms of the license agreement. You can reject the license agreement by configuring this command 'eula-consent support-assist reject'.

By installing SupportAssist, you allow Dell to save your contact information (e.g. name, phone number and/or email address) which would be used to provide technical support for your Dell products and services. Dell may use the information for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic information, which may include but is not limited to configuration information, user supplied contact information, names of data volumes, IP addresses, access control lists, diagnostics & performance information, network configuration information, host/server configuration & performance information and related data ("Collected Data") and transmits this information to Dell. By downloading SupportAssist and agreeing to be bound by these terms and the Dell end user license agreement, available at: www.dell.com/aeula, you agree to allow Dell to provide remote monitoring services of your IT environment and you give Dell the right to collect the Collected Data in accordance with Dells Privacy Policy, available at: www.dell.com/privacypolicycountryspecific, in order to enable the performance of all of the various functions of SupportAssist during your entitlement to receive related repair services from Dell. You further agree to allow Dell to transmit and store the Collected Data from SupportAssist in accordance with these terms. You agree that the provision of SupportAssist may involve international transfers of data from you to Dell and/or to Dells affiliates, subcontractors or business partners. When making such transfers, Dell shall ensure appropriate protection is in place to safeguard the Collected Data being transferred in connection with SupportAssist. If you are downloading SupportAssist on behalf of a company or other legal entity, you are further certifying to Dell that you have appropriate authority to provide this consent on behalf of that entity. If you do not consent to the collection, transmission and/or use of the Collected Data, you may not download, install or otherwise use SupportAssist.
Reject the EULA:

Dell(conf)#eula-consent support-assist reject
Aug 24 22:35:38: %STKUNIT1-M:CP %SUPPORT_ASSIST-6-SUPASSIST_EVT: Event monitor service stopped
I do not accept the terms of the license agreement. The SupportAssist feature has been deactivated and can no longer be used.
To enable SupportAssist configurations, accept the terms of the license agreement by configuring this command 'eula-consent support-assist accept'.
Dell(conf)#
Dell(conf)#
Dell(conf)#

Related Commands
  • support-assist — moves to the SupportAssist Configuration mode.

support-assist

Move to the SupportAssist configuration mode.

Syntax
  support-assist

To remove all the configuration of the SupportAssist service, use the no support-assist command.

</tr>
</tbody>
</table>

**Usage Information**

You are guided through a series of queries to configure SupportAssist. The generated commands are added to the running configuration, including the DNS resolve commands, if configured.

This command starts the configuration wizard for the SupportAssist. At any time, you can exit by entering Ctrl-C. If necessary, you can skip some data entry.

Once you exit the wizard, the Dell Networking OS starts a full transfer.

### support-assist activity

**Trigger an activity event immediately.**

**Syntax**

```
support-assist activity {full-transfer | core-transfer} start now
```

**Parameters**

- **full-transfer**: Enter the keyword full-transfer to specify transfer of configuration, inventory, logs, and other information.
- **core-transfer**: Enter the keyword core-transfer to specify transfer of core files.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Use the command to trigger the activity that enables transfer of information. You can choose a full transfer that includes all the details or core transfer that includes only the core files.

**NOTE**: The full transfer includes the core files as well in the information sent. The core transfer does not send core files that are older than 30 days.
SupportAssist Commands

Dell Networking OS supports the following SupportAssist mode commands.

activity

Move to the SupportAssist Activity mode for an activity. Allow the user to configure customized details for a specific activity.

Syntax

activity {activity-name}

To remove all customized detail for a specific activity, use the no activity {activity-name} command.

Parameters

activity-name

Enter one of the following keywords:

- Enter the keyword full-transfer to enable or disable full transfer. You can create a custom file to transfer the outputs from a set of show commands. By default, the full transfer runs once in every 30 days.
- Enter the keyword core-transfer to enable or disable core transfer.
- Enter the keyword event-transfer to enable or disable event transfer. You can create a custom file to monitor a set of events.

Command Modes

SUPPORTASSIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.

Introduced the core-transfer and event-transfer parameters.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.

9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

By default, each activity follows a set of default actions using a default schedule. Using this command, you can customize the set of actions and disable a certain activity.

contact-company

Configure the contact information for the company.

Syntax

contact-company name {company-name}[company-next-name] ... [company-next-name]

To remove the contact company information, use the no contact-company command.
**Parameters**

- **company-name**
  Enter the name for the company. If there are multiple words in the name, use optional additional fields.

- **company-next-name**
  (OPTIONAL) Enter the next components of the company name, up to 5 components are allowed.

**Command Modes**

SUPPORTASSIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**Usage Information**

- You can configure only one contact-company.
- It is not possible to remove the components of the company name. The no form of the command removes the entire contact-company entry.
- This command is optional for SupportAssist service configuration.

**contact-person**

Configure the contact name for an individual.

**Syntax**

```
contact-person [first <first-name>] last <last-name>
```

To remove the contact person and all their details, use the no contact-person [first <first-name>] last <last-name> command.

**Parameters**

- **first-name**
  (Optional) Enter the first name for the contact person. This is optional provided each contact person name is unique. To include a space, enter a space within double quotes.

- **last-name**
  Enter the last name for the contact person. To include a space, enter a space within double quotes.

**Usage Information**

Each contact person must be unique by their name.

You can configure only one contact person.

It is not possible to remove the first name or last name. The no form of the command removes the entire contact-person entry.

This command is optional for SupportAssist service configuration.

---

### enable

Enable all activities and servers for the SupportAssist service.

**Syntax**

```
enable all
```

To disable the SupportAssist activities temporarily, use the `no enable all` command.

**Parameters**

- **all**
  
Enter the keyword `all` to enable all SupportAssist service activities.

**Defaults**

Enabled or All Enabled

**Command Modes**

- 9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.
- 9.10(0.0) Introduced on the S3148.
- 9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
- 9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

---

### server

Configure the name of the remote SupportAssist Server and move to SupportAssist Server mode.

**Syntax**

```
server {default | server-name}
```

To delete a server, use the `no server server-name` command.

**Parameters**

- **default**
  
Enter the keyword `default` for the default server.
server-name

Enter the name of the custom server to which the logs would be transferred. To include a space, enter a space within double quotes.

Defaults

Default server has URL stor.g3.ph.dell.com

Command Modes

SUPPORTASSIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

The server-name is used as a reference only and is not required to be used as part of a URL definition.

There is a reserved name of default for the default server at stor.g3.ph.dell.com. You can customize the defaults for this server by entering the server default command and use the custom commands.

You can configure one additional server.

SupportAssist Activity Commands

Dell Networking OS supports the following SupportAssist Activity mode commands.

action-manifest get

Copy an action-manifest file for an activity to the system.

Syntax

```
action-manifest get tftp | ftp | flash <file-specification> <local-file-name>
```

Parameters

- **file-specification**
  - Enter the full file specification for the action-manifest file. For example:
    - `tftp://hostip/filepath`
    - `ftp://userid:password@hostip/filepath`
    - `scp://userid:password@hostip/filepath`

- **local-file-name**
  - Enter the name of the local action-manifest file, up to 32 characters long. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space.

Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER
SUPPORTASSIST ACTIVITY EVENT-TRANSFER
### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information
The remote file specification for full transfer includes the protocol that is used to copy the file from the remote system.

The default Manifest-file for full transfer includes records like alarms, logs, operational, and configuration data.

### Related Commands
- `action-manifest install` — configure the action-manifest to use for a specific activity.
- `action-manifest show` — view the list of action-manifest for a specific activity.
- `action-manifest remove` — remove the action-manifest file for an activity.

## action-manifest install

Configure action-manifest to transfer a set of customized records for full transfer and to monitor a set of specified events for event transfer.

### Syntax
```
action-manifest install {default | <local-file-name>}
```

To revert to the default action-manifest file, use the `action-manifest install default` command.

### Parameters
- **default**
  - Enter the keyword `default` to revert back to the default set of actions for an activity.
- **local-file-name**
  - Enter the name of the local action-manifest file. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space.

### Defaults
- Default

### Command Modes
- SUPPORTASSIST ACTIVITY FULL-TRANSFER
- SUPPORTASSIST ACTIVITY EVENT-TRANSFER

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>
Version Description
9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information To replace the default action-manifest with a customized one, copy the action-manifest file to the system using the action-manifest get command and then use the action-manifest install command. To revert to the default action-manifest file, use the action-manifest install default command.

Related Commands
- action-manifest get — copy an action-manifest file for an activity to the system.
- action-manifest show — view the list of action-manifest for a specific activity.
- action-manifest remove — remove the action-manifest file for an activity.

action-manifest remove

Remove the action-manifest file from Dell Networking OS.

Syntax
action-manifest remove <local-file-name>

Parameters
local-file-name Enter the name of the local action-manifest file. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space.

Command Modes
SUPPORTASSIST ACTIVITY FULL-TRANSFER
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information
To revert to the default action-manifest file, use the action-manifest install command. If necessary, you can then remove the custom action-manifest file.

Related Commands
- action-manifest get — copy an action-manifest file for an activity to the system.
- action-manifest install — configure the action-manifest to use for a specific activity.
- action-manifest show — view the list of action-manifest for a specific activity.
action-manifest show

View the list of action-manifest for a specific activity.

Syntax

    action-manifest show {all}

Parameters

    all          Enter the keyword all to view the entire list of action-manifests that are available for an activity.

Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER

SUPPORTASSIST ACTIVITY EVENT-TRANSFER

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version  Description
9.11(0.0)  Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0)   Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Related Commands

- action-manifest get — copy an action-manifest file for an activity to the system.
- action-manifest install — configure the action-manifest to use for a specific activity.
- action-manifest remove — remove the action-manifest file for an activity.

enable

Enable a specific SupportAssist activity.

Syntax

    enable

To disable a particular SupportAssist activity, use the no enable command.

Defaults

Enabled

Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER

SUPPORTASSIST ACTIVITY CORE-TRANSFER

SUPPORTASSIST ACTIVITY EVENT-TRANSFER

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version                Description
9.11(0.0)              Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0)              Introduced on the S3148.
9.10(0.0)              Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0)               Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

Enter the specific SupportAssist activity mode and then enable it.

**NOTE:** By default, the full transfer includes the core files. When you disable the core transfer activity, the full transfer excludes the core files.

Related Commands

- activity — move user to the SupportAssist Activity mode for that activity.

**SupportAssist Company Commands**

Dell Networking OS supports the following SupportAssist Company mode commands.

**address**

Configure the address information for the company.

**Syntax**

```
address [city company-city] [{province | region | state} name] [country company-country] [{postalcode | zipcode} company-code]  
```

To remove a portion of the company address information, use the no address [city | province | region | state | country | postalcode | zipcode] command. For example, to remove the city alone, use the no address city command.

To remove the complete company contact information, use the no address command.

**Parameters**

- **city company-city** (OPTIONAL) Enter the keyword city then the city or town for the company site. To include a space, enter a space within double quotes.
- **province | region | state name** (OPTIONAL) Enter the keyword province, region or state then the name of province, region or state for the company site. To include a space, enter a space within double quotes.
- **country company-country** (OPTIONAL) Enter the keyword country then the country for the company site. To include a space, enter a space within double quotes.
- **postalcode | zipcode company-code** (OPTIONAL) Enter the keyword postalcode or zipcode then the postal code or zip code for the company site, as one string with no spaces.

**Command Modes**

SUPPORTASSIST COMPANY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Version | Description
--- | ---
9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) | Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information
The optional parameters must be provided in the following order: city state country postalcode. If specified in a different order, the command returns an error as follows:
Dell(conf-supportassist-cmpy-test)# address city Minneapolis postalcode 55344 country USA state Minnesota
^%
% Error: Invalid input at "^" marker.

This command is optional for SupportAssist service configuration.

Example
Dell(conf-supportassist-cmpy-test)# address city Minneapolis state Minnesota country USA postalcode 55344

street-address

Configure the street address information for the company.

Syntax
```
street-address {address1} [address2]...[address8]
```
To remove the street address, use the no street-address command.

Parameters
- **address1**
  - Enter the street address for the company.
- **address2..address8**
  - (OPTIONAL) Enter the street address of the company site. Up to 8 fields are allowed.

Command Modes
- SUPPORTASSIST COMPANY

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) | Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information
This command is optional for SupportAssist service configuration.
**territory**

Configure the territory and set the coverage for the company site.

**Syntax**

```plaintext
territory company-territory
```

To remove the company territory information, use the `no territory` command.

**Parameters**

- `company-territory` Enter the territory name for the company. To include a space, enter a space within double quotes. Use three-letter country codes like USA, IND, FRA, GER and so on.

**Command Modes**

SUPPORTASSIST COMPANY

**Command History**

**SupportAssist Person Commands**

Dell Networking OS supports the following SupportAssist Person mode commands.

**email-address**

Configure the email addresses to reach the contact person.

**Syntax**

```plaintext
e-mail-address primary e-mail-address [alternate e-mail-address]
```

To remove an email address, use the `no email-address` command. To remove the primary and the alternate email addresses, use the `no email-address primary` and `no email-address alternate` commands respectively.

**Parameters**

- `primary e-mail-address` Enter the keyword `primary` then the primary email address for the person.
- `alternate e-mail-address` Enter the keyword `alternate` then the alternate email address for the person.

**Command Modes**

SUPPORTASSIST PERSON
phone

Configure phone numbers to reach the contact person.

Syntax

phone primary phone [alternate phone]

To remove a phone number, use the no phone command. To remove the primary and alternate phone numbers, use the no phone primary and no phone alternate commands respectively.

Parameters

- **primary phone**: Enter the keyword primary then the primary phone number for the person.
- **alternate phone**: Enter the keyword alternate then the alternate phone number for the person.

Command Modes

SUPPORTASSIST PERSON

Command History

</tbody>
</table>

Usage Information

The phone numbers may contain country codes, area codes and extensions, if necessary. Allowable characters are 0 to 9, x, (, ), - and +.

This command is optional for SupportAssist service configuration.
**preferred-method**

Configure the preferred method for contacting the person.

**Syntax**

```plaintext
preferred-method {email | no-contact | phone}
```

**Parameters**

- `email` 
  Enter the keyword `email` to specify email as preferred method.

- `no-contact` 
  Enter the keywords `no-contact` to specify that there is no preferred method.

- `phone` 
  Enter the keyword `phone` to specify phone as preferred method.

**Defaults**

`no-contact`

**Command Modes**

SUPPORTASSIST PERSON

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- **9.11(0.0)**
  Introduced on the M I/O Aggregator and FN IOM.

- **9.10(0.0)**
  Introduced on the S3148.

- **9.10(0.0)**
  Introduced on the C9010, Z9100-ON, S6100-ON, and S3100 series.

- **9.9(0.0)**
  Introduced on the S4810, S4820T, S3048-ON, S4048-ON, S5000, S6000, S6000-ON, Z9500, MXL.

**Related Commands**

- `email-address` — configure email addresses to reach the contact person.
- `phone` — configure phone numbers to reach the contact person.

**time-zone**

Configure the time zone for contacting the person.

**Syntax**

```plaintext
time-zone zone +HH:MM [start-time HH:MM] [end-time HH:MM]
```

To remove the time zone, use the `no time-zone [zone | start-time | end-time]` command.

**Parameters**

- `zone +HH:MM` 
  Enter the keyword `zone` then a time difference from GMT expressed as HH:MM. This number may be preceded by either a `+` or `−` sign.

- `start-time HH:MM` 
  Enter the keywords `start-time` then a starting time expressed as HH:MM. Use the 24-hour clock format.

- `stop-time HH:MM` 
  Enter the keywords `stop-time` then a stopping time expressed as HH:MM. Use the 24-hour clock format.

SUPPORTASSIST PERSON

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information
This command is optional for SupportAssist service configuration.

SupportAssist Server Commands
Dell Networking OS supports the following SupportAssist Server mode commands.

proxy-ip-address
Configure a proxy for reaching the SupportAssist remote server.

Syntax
proxy-ip-address {ipv4-address | ipv6-address} port port-number [ username userid password [encryption-type] password ]

To remove the proxy, use the no proxy-ip-address command.

Parameters
ipv4-address Enter the IP address of the proxy server in a dotted decimal format (A.B.C.D).
ipv6-address Enter the IPv6 address of the proxy server in the x:x:x:x::x format.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

NOTE: To use the IPv6 address, the Open Automation package should also support IPv6 communications. For this purpose, SupportAssist requires Dell Networking Open Automation 9.10(0.0) package or later.

port port-number Enter the keyword port then the TCP/IP port number. The port number range is from 80 to 100000.

username userid (OPTIONAL) Enter the keyword username then the user ID used for the proxy server.

password Enter the keyword password then the encryption-type or the user password.

encryption-type (OPTIONAL) Enter an encryption type for the password you enter.

- 0 directs the system to interpret the password as clear text.
- 7 indicates that the password is encrypted using a DES hashing algorithm.

password Enter a string up to 32 characters long.

Defaults encryption-type for the password is 0.

Related Commands  
- server — configure the name of the remote SupportAssist server.

url

Configure the URL to reach the SupportAssist remote server.

Syntax  
url uniform-resource-locator

To delete the URL for the server, use the no url command.
Parameters

**uniform-resource-locator**

Enter a text string for the URL using one of the following formats:

- `http://[username:password@]<hostip>:<portNum>/<filepath>`
- `https://[username:password@]<hostip>:<portNum>/<filepath>`

**NOTE:** The host IP for the server may be specified as an IPv4 address, an IPv6 address or as a DNS hostname. If using the DNS hostname, the DNS resolver will need to be configured and enabled.

Dell# show eula-consent support-assist
SupportAssist EULA has been: Accepted
Additional information about the SupportAssist EULA is as follows:
By installing SupportAssist, you allow Dell to save your contact information (e.g. name, phone number and/or email address) which would be used to provide technical support for your Dell products and services. Dell may use the information for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic information, which may include but is not limited to configuration information, user supplied contact information, names of data volumes, IP addresses, access control lists, diagnostics & performance information, network configuration information, host/server configuration & performance information and related data (Collected Data) and transmits this information to Dell. By downloading SupportAssist and agreeing to be bound by these terms and the Dell end user license agreement, available at: www.dell.com/aeula, you agree to allow Dell to provide remote monitoring services of your IT environment and you give Dell the right to collect the Collected Data in accordance with Dell's Privacy Policy, available at: www.dell.com/privacypolicycountryparticular, in order to enable the performance of all of the various functions of SupportAssist during your entitlement to receive related repair services from Dell,. You further agree to allow Dell to transmit and store the Collected Data in accordance with these terms. You agree that the provision of SupportAssist may involve international transfers of data from you to Dell and/or to Dell's affiliates, subcontractors or business partners. When making such transfers, Dell shall ensure appropriate protection is in place to safeguard the Collected Data being transferred in connection with SupportAssist. If you are downloading SupportAssist on behalf of a company or other legal entity, you are further certifying to Dell that you have appropriate authority to provide this consent on behalf of that entity. If you do not consent to the collection, transmission and/or use of the Collected Data, you may not download, install or otherwise use SupportAssist.

Dell#

**show running-config**

Display the current configuration and changes from the default values.

**Syntax**

```
show running-config support-assist
```

**Parameters**

- `support-assist`: Enter the keyword `support-assist` to view the detailed configuration for the feature.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Dell#
The commands in this section configure time values on the system, either using the Dell Networking OS, or the hardware, or using the network time protocol (NTP). With NTP, the switch can act only as a client to an NTP clock host. For more information, see “Network Time Protocol” of the Management section in the Dell Networking OS Configuration Guide.

The commands in this chapter are generally supported on Dell Networking OS with some exceptions, as notes in the Command History fields.

Topics:

- clock summer-time date
- clock summer-time recurring
- clock timezone
- debug ntp
- ntp authenticate
- ntp authentication-key
- ntp broadcast client
- ntp disable
- ntp multicast client
- ntp master <stratum>
- ntp offset-threshold
- ntp server
- ntp source
- ntp trusted-key
- show clock
- show ntp associations
- show ntp vrf associations
- show ntp status

**clock summer-time date**

Set a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.

**Syntax**

```
clock summer-time time-zone date start-month start-day start-year start-time end-month end-day end-year end-time [offset]
```

To delete a daylight saving time zone configuration, use the no clock summer-time command.

**Parameters**

- **time-zone**
  
Enter the three-letter name for the time zone. This name is displayed in the show clock output.

- **start-month**
  
Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year.
start-day
Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year.

start-year
Enter a four-digit number as the year. The range is from 1993 to 2035.

start-time
Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

end-day
Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year.

end-month
Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year.

end-time
Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

end-year
Enter a four-digit number as the year. The range is from 1993 to 2035.

offset
(Optional) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is 60 minutes.

Defaults
Not configured.

Related Commands
- clock summer-time recurring — sets a date (and time zone) on which to convert the switch to daylight saving time each year.
- show clock — displays the current clock settings.
clock summer-time recurring

Set the software clock to convert to daylight saving time on a specific day each year.

Syntax

```
clock summer-time time-zone recurring [start-week start-day start-month start-time end-week end-day end-month end-time [offset]]
```

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

Parameters

- **time-zone**: Enter the three-letter name for the time zone. This name is displayed in the show clock output. You can enter up to eight characters.

- **start-week**: (OPTIONAL) Enter one of the following as the week that daylight saving begins and then enter values for start-day through end-time:
  - **week-number**: Enter a number from 1 to 4 as the number of the week in the month to start daylight saving time.
  - **first**: Enter this keyword to start daylight saving time in the first week of the month.
  - **last**: Enter this keyword to start daylight saving time in the last week of the month.

- **start-day**: Enter the name of the day that you want daylight saving time to begin. Use English three letter abbreviations; for example, Sun, Sat, Mon, and so on. The range is from Sun to Sat.

- **start-month**: Enter the name of one of the 12 months in English.

- **start-time**: Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

- **end-week**: Enter the one of the following as the week that daylight saving ends:
  - **week-number**: enter a number from 1 to 4 as the number of the week to end daylight saving time.
  - **first**: enter the keyword `first` to end daylight saving time in the first week of the month.
  - **last**: enter the keyword `last` to end daylight saving time in the last week of the month.

- **end-day**: Enter the weekday name that you want daylight saving time to end. Enter the weekdays using the three letter abbreviations; for example Sun, Sat, Mon, and so on. The range is from Sun to Sat.

- **end-month**: Enter the name of one of the 12 months in English.

- **end-time**: Enter the time in hours:minutes:seconds. For the hour variable, use the 24-hour format; example, 17:15:00 is 5:15 pm.

- **offset**: (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is 60 minutes.

Defaults

Not configured.

**Related Commands**

- `ntp trusted-key` — configures a trusted key.
- `clock summer-time date` — sets a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.
- `show clock` — displays the current clock settings.

---

**clock timezone**

Configure a timezone for the switch.

**Syntax**

```
clock timezone timezone-name offset
```

To delete a timezone configuration, use the `no clock timezone` command.

**Parameters**

- `timezone-name` Enter the name of the timezone. You cannot use spaces.
- `offset` Enter one of the following:
  - a number from 1 to 23 as the number of hours in addition to universal time coordinated (UTC) for the timezone.
  - a minus sign (-) then a number from 1 to 23 as the number of hours.

**Defaults**

Not configured.

## Usage Information

Coordinated universal time (UTC) is the time standard based on the International Atomic Time standard, commonly known as Greenwich Mean time. When determining system time, include the differentiator between UTC and your local timezone. For example, San Jose, CA is the Pacific Timezone with a UTC offset of -8.

### debug ntp

Display network time protocol (NTP) transactions and protocol messages for troubleshooting.

**Syntax**

ddebug ntp {adjust | all | authentication | events | loopfilter | packets | select | sync}

To disable debugging of NTP transactions, use the no debug ntp {adjust | all | authentication | events | loopfilter | packets | select | sync} command.

**Parameters**

- **adjust**
  - Enter the keyword adjust to display information on NTP clock adjustments.
- **all**
  - Enter the keyword all to display information on all NTP transactions.
- **authentication**
  - Enter the keyword authentication to display information on NTP authentication transactions.
- **events**
  - Enter the keyword events to display information on NTP events.
- **loopfilter**
  - Enter the keyword loopfilter to display information on NTP local clock frequency.
- **packets**
  - Enter the keyword packets to display information on NTP packets.
- **select**
  - Enter the keyword select to display information on the NTP clock selection.
**sync**

Enter the keyword `sync` to display information on the NTP clock synchronization.

**Command Modes**

- EXEC Privilege

**Command History**

</tr>
</tbody>
</table>
You also must configure an authentication key for NTP traffic using the `ntp authentication-key` command.

### ntp authentication-key

Specify a key for authenticating the NTP server.

**Syntax**

```
ntp authentication-key number md5 [0 | 7] key
```

**Parameters**

- `number`
  
  Specify a number for the authentication key. The range is from 1 to 4294967295.
  
  This number must be the same as the `number` parameter configured in the `ntp trusted-key` command.

- `md5`
  
  Specify that the authentication key is encrypted using MD5 encryption algorithm.

- `0`
  
  Specify that authentication key is entered in an unencrypted format (default).

- `7`
  
  Specify that the authentication key is entered in DES encrypted format.

- `key`
  
  Enter the authentication key in the previously specified format.

**Defaults**

NTP authentication is not configured by default. If you do not specify the option `[0 | 7]`, `0` is selected by default.

<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

After configuring the `ntp authentication-key` command, configure the `ntp trusted-key` command to complete NTP authentication.

Dell Networking OS versions 8.2.1.0 and later use an encryption algorithm to store the authentication key that is different from previous Dell Networking OS versions; beginning in version 8.2.1.0, Dell Networking OS uses DES encryption to store the key in the startup-config when you enter the `ntp authentication-key` command. Therefore, if your system boots with a startup-configuration from an Dell Networking OS versions prior to 8.2.1.0 in which you have configured `ntp authentication-key`, the system cannot correctly decrypt the key, and cannot authenticate NTP packets. In this case you must re-enter this command and save the running-config to the startup-config.

**Related Commands**

- `ntp authenticate` — enables NTP authentication.
- `ntp trusted-key` — configures a trusted key.

### ntp broadcast client

Set up the interface to receive NTP broadcasts from an NTP server.

**Syntax**

```plaintext
ntp broadcast client
```

To disable broadcast, use the `no ntp broadcast client` command.

**Defaults**

Disabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
</tbody>
</table>
## ntp disable

Prevent an interface from receiving NTP packets.

**Syntax**

```
ntp disable
```

To re-enable NTP on an interface, use the `no ntp disable` command.

**Defaults**

Disabled (that is, if you configure an NTP host, all interfaces receive NTP packets)

**Command Modes**

INTERFACE

**Command History**

### ntp multicast client

To receive NTP information from the network via multicast, configure the switch.

**Syntax**

```
ntp multicast client [multicast-address]
```

To disable multicast reception, use the `no ntp multicast client [multicast-address]` command.

**Parameters**

- `multicast-address` (OPTIONAL) Enter a multicast address. Enter either an IPv4 address in dotted decimal format or an IPv6 address in `X:XX:XX::X` format. If you do not enter a multicast address, the address:
  - `224.0.1.1` is configured if the interface address is IPv4
  - `ff05::101` is configured if the interface address is IPv6

**Defaults**

Not configured.

</tbody>
</table>
**ntp master <stratum>**

Configure the switch as NTP Server.

**Syntax**

```
ntp master <stratum>
```

**Parameters**

- `ntp master <stratum>`
  
  Enter the `stratum` number to identify the NTP Server's hierarchy.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**ntp offset-threshold**

Configure the threshold time interval before which the system generates an NTP audit log message if the time difference from the NTP server is greater than a threshold value (offset-threshold).

**Syntax**

```
ntp offset-threshold threshold-value
```

To disable the threshold value, use the `no ntp offset-threshold` command.

**Parameters**

- `offset-threshold threshold-value`
  
  (Optional) Enter the keyword `offset-threshold` and then the threshold value. The range is from 0 to 999.

**Defaults**

Not enabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
Usage Information

The ntp offset-threshold command does not time synchronization.

Example

Dell(config)# ntp offset-threshold 4

ntp server

Configure an NTP time-serving host.

Syntax

ntp server[vrf vrf-name] {hostname | ipv4-address | ipv6-address} [key keyid] [prefer] [version number]

Parameters

- vrf vrf-name: (Optional) Enter the keyword vrf and then the name of the VRF to configure an NTP time-serving host corresponding to that VRF.
- ipv4-address | ipv6-address: Enter an IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X::X) of NTP server.
- hostname: Enter the host name of the server.
- key keyid: (OPTIONAL) Enter the keyword key and a number as the NTP peer key. The range is from 1 to 4294967295.
- prefer: (OPTIONAL) Enter the keyword prefer to indicate that this peer has priority over other servers.
- version number: (OPTIONAL) Enter the keyword version and a number to correspond to the NTP version used on the server. The range is from 1 to 4.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S3038–ON, S4048-ON, S3100 Series, S4810P, S4820T, S5000, S6000, S6000–ON, S6100–ON, Z9500, and Z9100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.6(0.0) | Added support for VRF.
9.4(0.0) | Added support for VRF.
<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can configure multiple time-serving hosts. From these time-serving hosts, the Dell Networking OS chooses one NTP host with which to synchronize. To determine which server is selected, use the show ntp associations command.

Because many polls to NTP hosts can affect network performance, Dell Networking recommends limiting the number of hosts configured.

By default, the system performs a time synchronization if the time difference from the time source is greater than one second.

**Related Commands**

- `show ntp associations` — displays the NTP servers configured and their status.

### ntp source

Specify an interface's IP address to be included in the NTP packets.

**Syntax**

```
ntp source interface
```

To delete the configuration, use the `no ntp source` command.

**Parameters**

- `interface`
  
  Enter the following keywords and slot/port or number information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
  - For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

- Not configured.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**ntp trusted-key**

Set a key to authenticate the system to which NTP synchronizes.

**Syntax**

```
ntp trusted-key number
```

To delete the key, use the no ntp trusted-key number command.

**Parameters**

- `number` Enter a number as the trusted key ID. The range is from 1 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

</table>

**Usage Information**

The number parameter in the `ntp trusted-key` command must be the same number as the number parameter in the `ntp authentication-key` command. If you change the `ntp authentication-key` command, you must also change the `ntp trusted-key` command.

**Related Commands**

- `ntp authentication-key` — sets an authentication key for NTP.
- `ntp authenticate` — enables the NTP authentication parameters you set.

### show clock

Display the current clock settings.

**Syntax**

```
show clock [detail]
```

**Parameters**

- `detail` (OPTIONAL) Enter the keyword `detail` to view the source information of the clock.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

</tbody>
</table>
### Version Description
- **7.5.1.0**: Introduced on the C-Series.
- **6.1.1.0**: Introduced on the E-Series.

### Usage Information
The following describes the `show ntp associations` command shown in the Example below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(none)</td>
<td>One or more of the following symbols could be displayed:</td>
</tr>
<tr>
<td></td>
<td>• * means synchronized to this peer.</td>
</tr>
<tr>
<td></td>
<td>• # means almost synchronized to this peer.</td>
</tr>
<tr>
<td></td>
<td>• + means the peer was selected for possible synchronization.</td>
</tr>
<tr>
<td></td>
<td>• - means the peer is a candidate for selection.</td>
</tr>
<tr>
<td></td>
<td>• ~ means the peer is statically configured.</td>
</tr>
</tbody>
</table>

- **remote**: Displays the remote IP address of the NTP peer.
- **ref clock**: Displays the IP address of the remote peer’s reference clock.
- **st**: Displays the peer’s stratum, that is, the number of hops away from the external time source. A 16 in this column means the NTP peer cannot reach the time source.
- **when**: Displays the last time the switch received an NTP packet.
- **poll**: Displays the polling interval (in seconds).
- **reach**: Displays the reachability to the peer (in octal bitstream).
- **delay**: Displays the time interval or delay for a packet to complete a round-trip to the NTP time source (in milliseconds).
- **offset**: Displays the relative time of the NTP peer’s clock to the switch clock (in milliseconds).
- **disp**: Displays the dispersion.

### Example
```
Dell# show ntp associations
remote      ref clock  st when poll reach delay  offset disp
=============================================================
10.10.120.5 0.0.0.0     16 - 256        0 0.00 0.000 16000.0
*172.16.1.33 127.127.1.0 11 6 16         377   -0.08 -1499.9 104.16
172.31.1.33 0.0.0.0     16 - 256        0 0.00 0.000 16000.0
192.200.0.2 0.0.0.0     16 - 256        0 0.00 0.000 16000.0
* master (synced), # master (unsynced), + selected, - candidate
```

### Related Commands
- `show ntp status` — displays the current NTP status.

### show ntp vrf associations

Displays the NTP servers configured for the VRF instance `<vrf-name>`.

**Syntax**
```
show ntp [vrf] <vrf-name> associations.
```

**Command Modes**
- EXEC
- EXEC Privilege
Command History

- **7.5.1.0**: Introduced on the C-Series.
- **6.1.1.0**: Introduced on the E-Series.

### Usage Information
The following describes the `show ntp status` command shown in the Example below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Clock is...”</td>
<td>States whether or not the switch clock is synchronized, which NTP stratum the system is assigned and the IP address of the NTP peer.</td>
</tr>
<tr>
<td>“frequency is...”</td>
<td>Displays the frequency (in ppm), stability (in ppm) and precision (in Hertz) of the clock in this system.</td>
</tr>
<tr>
<td>“reference time is...”</td>
<td>Displays the reference time stamp.</td>
</tr>
<tr>
<td>“clock offset is...”</td>
<td>Displays the system offset to the synchronized peer and the time delay on the path to the NTP root clock.</td>
</tr>
<tr>
<td>“root dispersion is...”</td>
<td>Displays the root and path dispersion.</td>
</tr>
<tr>
<td>“peer mode is...”</td>
<td>State what NTP mode the switch is. This should be Client mode.</td>
</tr>
</tbody>
</table>

### Example
```
Dell# show ntp status
Clock is synchronized, stratum 2, reference is 100.10.10.10
frequency is -32.000 ppm, stability is 15.156 ppm, precision is 4294967290
reference time is BC242FD5.C7C5C000 (10:15:49.780 UTC Mon Jan 10 2000)
clock offset is clock offset msec, root delay is 0.01656 sec
root dispersion is 0.39694 sec, peer dispersion is peer dispersion msec
peer mode is client
Dell#
```

### Related Commands
- `show ntp associations` — displays information on the NTP master and peer configurations.
Tunneling is supported on Dell Networking OS.

Topics:

- ip unnumbered
- ipv6 unnumbered
- tunnel allow-remote
- tunnel destination
- tunnel dscp
- tunnel flow-label
- tunnel hop-limit
- tunnel keepalive
- tunnel-mode
- tunnel source

ip unnumbered

Configure a tunnel interface to operate without a unique IPv4 address and select the interface from which the tunnel borrows its address.

Syntax

```
ip unnumbered interface-type
```

To set the tunnel back to default logical address use the `no ip unnumbered` command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv6 address.

Parameters

- **interface-type**
  
  Enter the interface type, followed by a slot/port/subport number.

Defaults

None

Command Modes

INTERFACE TUNNEL

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100-ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>

<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-OF.</td>
</tr>
</tbody>
</table>
The ip unnumbered command fails in two conditions:

- If the logical ip address is configured.
- If Tunnel mode is ipv6ip (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ip unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical IP address is identified from one of the address family.

**ipv6 unnumbered**

Configure a tunnel interface to operate without a unique IPv6 address and select the interface from which the tunnel borrows its address.

**Syntax**

```
ipv6 unnumbered {interface-type interface-number}
```

**Parameters**

- `interface-type interface-number` Enter the interface type, followed by the type, and then the slot/port/subport information.

**Defaults**

None.

**Command Modes**

INTERFACE TUNNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant [Dell Networking OS Command Line Reference Guide](https://www.dell.com/support).
The `ipv6 unnumbered` command fails in two conditions:

- If the logical IP address is configured.
- If Tunnel mode is `ipv6ip` (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ipv6 unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical IP address is identified from one of the address family.

### tunnel allow-remote

Configure an IPv4 or IPv6 address or prefix whose tunneled packets are accepted for decapsulation. If you do not configure allow-remote entries, tunneled packets from any remote peer address is accepted.

This feature is supported on Dell Networking OS.

**Syntax**

```
tunnel allow-remote {ip-address | ipv6-address} [mask]
```

To delete a configured allow-remote entry use the `no tunnel allow-remote` command. Any specified address/mask values must match an existing entry for the delete to succeed. If the address and mask are not specified, this command deletes all allow-remote entries.

**Parameters**

- `ip-address`: Enter the source IPv4 address in A.B.C.D format.
- `ipv6-address`: Enter the source IPv6 address in X:X:X::X format.
- `mask`: (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D to match a range of remote addresses. The default mask is /32 for IPv4 addresses and /128 for IPv6 addresses, which match only the specified address.

**Defaults**

If you do not configure `tunnel allow remote`, all traffic which is destined to tunnel source address is decapsulated.

**Command Modes**

INTERFACE TUNNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
tunnel destination

Set a destination endpoint for the tunnel.

Syntax

tunnel destination {ip-address | ipv6-address}

To delete a tunnel destination address, use the no tunnel destination {ip-address | ipv6-address} command.

Parameters

- **ip-address**: Enter the destination IPv4 address for the tunnel.
- **ipv6-address**: Enter the destination IPv6 address for the tunnel.

Defaults

none

Command Modes

INTERFACE TUNNEL (conf-if-tu)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

The tunnel interface is inoperable without a valid tunnel destination address for the configured Tunnel mode.
To establish a logical tunnel to the particular destination address, use the destination address of the outer tunnel header. If you configure a tunnel interface or source address, the tunnel destination must be compatible.

**tunnel dscp**

Configure the method to set the DSCP in the outer tunnel header.

### C9000 Series

**Syntax**

```
tunnel dscp {mapped | value}
```

To use the default tunnel mapping behavior, use the `no tunnel dscp value` command.

**Parameters**

- **mapped**
  
Enter the keyword `mapped` to map the original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.

- **value**
  
Enter a value to set the DSCP value in the tunnel header. The range is from 0 to 63. The default value of 0 denotes mapping of original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.

**Defaults**

0 (Mapped)

**Command Modes**

```
INTERFACE TUNNEL (conf-if-tu)
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S6000, S4810, S4820T, Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command configure the method used to set the high 6 bits (the differentiated services codepoint) of the IPv4 TOS or the IPv6 traffic class in the outer IP header.

A value of 0 copies original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.
**tunnel flow-label**

Configure the method to set the IPv6 flow label value in the outer tunnel header.

Syntax

```plaintext
tunnel flow-label value
```

To return to the default value of 0, use the `no tunnel flow-label value` command.

Parameters

- **value**
  - Enter a value to set the IPv6 flow label value in the tunnel header. The range is from 0 to 1048575. The default value is 0.

Defaults

- 0 (Mapped original packet flow-label value to tunnel header flow-label value)

Command Modes

- INTERFACE TUNNEL (conf-if-tu)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S6000, S4810, S4820T, Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

This command is only valid for tunnel interfaces with an IPv6 outer header.

**tunnel hop-limit**

Configure the method to set the IPv4 time-to-live or the IPv6 hop limit value in the outer tunnel header.

Syntax

```plaintext
tunnel hop-limit value
```

To restore the default tunnel hop-limit, use the `no tunnel hop-limit` command.

Parameters

- **value**
  - Enter the hop limit (ipv6) or time-to-live (ipv4) value to include in the tunnel header. The range is from 0 to 255. The default is 64.

Defaults

- 64 (Time-to-live for IPv4 outer tunnel header or hop limit for IPv6 outer tunnel header)

Command Modes

- INTERFACE TUNNEL (conf-if-tu)
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S6000, S4810, S4820T, Z9000.</td>
</tr>
</tbody>
</table>

### Usage Information

A value of 0 copies the inner packet hop limit (ipv6) or time-to-live (ipv4) in the encapsulated packet to the tunnel header hop limit (ipv6) or time-to-live (ipv4) value.

tunnel keepalive

Configure the tunnel keepalive target, interval and attempts.

**Syntax**

```
tunnel keepalive {ip-address | ipv6-address}[interval {seconds}] [attempts {count | unlimited}]
```

To disable the tunnel keepalive probes use the **no tunnel keepalive** command.

**Parameters**

- **ip-address ipv6 address**
  - Enter the IPv4 or IPv6 address of the peer to which the keepalive probes will be sent.

- **interval seconds**
  - Enter the keyword interval then the interval time, in seconds, after which the restart process to keepalive probe packets.
  - The range is from 5 to 255. The default is 5.

- **count**
  - (OPTIONAL) Enter the keyword count to count packets processed by the filter.
  - The range is from 3 to 10. The default is 3.

- **unlimited**
  - Enter the keyword unlimited to specify the unlimited number of keepalive probe packets.

**Defaults**

Tunnel keepalive is disabled.

**Command Modes**

- INTERFACE TUNNEL
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

Enabling tunnel keepalive causes ICMP echo packets to be sent to the keepalive target. The ICMP echo will be sourced from the tunnel interface logical IPv4 or IPv6 address and will be tunnel encapsulated. The response will be accepted whether it returns tunnel encapsulated or not.

When configuring tunnel keepalive at both end points of a tunnel interface it is recommended to set the tunnel keepalive target to the logical IPv4 or IPv6 address of the far end tunnel peer, rather than to the tunnel destination. This reduces the chance of both ends of the tunnel staying in keepalive down state. If both ends get into a keepalive down state that does not clear in a few seconds, then performing shutdown - no shutdown sequence on one end should bring both ends back up.

## tunnel-mode

Enable a tunnel interface.

### Syntax

```
tunnel mode {ipip | ipv6 | ipv6ip}[decapsulate-any]
```

To disable an active tunnel interface, use the `no tunnel mode` command.

### Parameters

- **ipip**: Enable tunnel in RFC 2003 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv4 tunnel.
- **ipv6**: Enable tunnel in RFC 2473 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv6 tunnel.
- **ipv6ip**: Enable tunnel in RFC 4213 mode and encapsulate IPv6 datagrams inside an IPv4 tunnel.
- **decapsulate-any**: (Optional) Enable tunnel in multipoint receive-only mode.

### Defaults

There is no default tunnel mode.

### Command Modes

INTERFACE TUNNEL
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>

<tr>
<td>9.4(0.0)</td>
<td>Added the decapsulate-any command.</td>
</tr>
<tr>
<td>9.3(0.1)</td>
<td>Introduced on the S6000 and Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

To enable a tunnel interface, use this command. You must define a tunnel mode for the tunnel to function. If you previously defined the tunnel destination or source address, the tunnel mode must be compatible.

Including the decapsulate-any option causes the command to fail if any of the following tunnel transmit options are configured: tunnel destination, tunnel dscp, tunnel flow-label, tunnel hop-limit, or tunnel keepalive. Conversely, if you configure any tunnel allow-remote entries, the tunnel-mode command fails unless the decapsulate-any option is included.

Configuration of IPv6 commands over decapsulate-any tunnel causes an error.

tunnel source

Set a source address for the tunnel.

Syntax

```
tunnel source {ip-address | ipv6-address | interface-type-number | anylocal}
```

To delete the current tunnel source address, use the no tunnel source command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>Enter the source IPv4 address in A.B.C.D format.</td>
</tr>
<tr>

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000 and Z9000.</td>
</tr>
</tbody>
</table>

### Usage Information

Added an optional keyword **anylocal** to the tunnel source command. The anylocal argument can be used in place of the ip address or interface, but only with the multipoint receive-only mode tunnels. The tunnel source anylocal command allows the multipoint receive-only tunnel to decapsulate tunnel packets addressed to any IPv4 or IPv6 (depending on the tunnel mode) address configured on the switch that is operationally **Up**.
Uplink Failure Detection (UFD) provides detection of the loss of upstream connectivity and, if you use this with NIC teaming, automatic recovery from a failed link.

Topics:
- clear ufd-disable
- debug uplink-state-group
- description
- downstream
- downstream auto-recover
- downstream disable links
- enable
- show running-config uplink-state-group
- show uplink-state-group
- uplink-state-group
- upstream

**clear ufd-disable**

Re-enable one or more downstream interfaces on the switch/router that are in a UFD-Disabled Error state so that an interface can send and receive traffic.

**Syntax**

```plaintext
clear ufd-disable {interface interface | uplink-state-group group-id}
```

**Parameters**

- `interface interface` Specify one or more downstream interfaces. For interface, enter one of the following interface types:
  - 1 Gigabit Ethernet: `gigabitethernet {slot/port | slot/port-range}`
  - 10 Gigabit Ethernet: `tengigabitethernet {slot/port | slot/port-range}`
  - Port channel: `port-channel {1-128 | port-channel-range}`

  Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: `gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5`. A comma is required to separate each port and port-range entry.

- `uplink-state-group group-id` Re-enables all UFD-disabled downstream interfaces in the group. The valid group-id values are from 1 to 16.

**Defaults**

A downstream interface in a UFD-disabled uplink-state group is also disabled and is in a UFD-Disabled Error state.

**Command Modes**

CONFIGURATION

Related Commands

- **downstream** — assigns a port or port-channel to the uplink-state group as a downstream interface.
- **uplink-state-group** — creates an uplink-state group and enables the tracking of upstream links.

**debug uplink-state-group**

Enable debug messages for events related to a specified uplink-state group or all groups.

**Syntax**

d debug uplink-state-group [group-id]

To turn off debugging event messages, enter the no debug uplink-state-group [group-id] command.

**Parameters**

- **group-id**

  Enables debugging on the specified uplink-state group. The valid group-id values are from 1 to 16.

**Defaults**

none

**Command Modes**

EXEC Privilege

```
Related Commands

- **uplink-state-group** — create an uplink-state group and enables the tracking of upstream links.

**downstream**

Assign a port or port-channel to the uplink-state group as a downstream interface.

**Syntax**

```plaintext
downstream interface
```

To delete an uplink-state group, enter the `no downstream interface` command.

**Parameters**

- **interface**
  - Enter one of the following interface types:
    - 1 Gigabit Ethernet: `gigabitethernet {slot/port | slot/port-range}`
    - 10 Gigabit Ethernet: `tengigabitethernet {slot/port | slot/port-range}`
    - Port channel: `port-channel {1-128 | port-channel-range}`

Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order, for example:

```
gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5
```

A comma is required to separate each port and port-range entry.

**Defaults**

none

**Command Modes**

UPLINK-STATE-GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.
You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

Related Commands
- `upstream` — assigns a port or port-channel to the uplink-state group as an upstream interface.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

**downstream auto-recover**

Enable auto-recovery so that UFD-disabled downstream ports in an uplink-state group automatically come up when a disabled upstream port in the group comes back up.

**Syntax**
```
downstream auto-recover
```
To disable auto-recovery on downstream links, use the `no downstream auto-recover` command.

**Defaults**
The auto-recovery of UFD-disabled downstream ports is enabled.

**Command Modes**
UPLINK-STATE-GROUP

**Related Commands**
- `downstream` — assign a port or port-channel to the uplink-state group as a downstream interface.
- `uplink-state-group` — create an uplink-state group and enables the tracking of upstream links.

**downstream disable links**

Configure the number of downstream links in the uplink-state group that are disabled if one upstream link in an uplink-state group goes down.

**Syntax**
```
downstream disable links {number | all}
```

**Usage Information**
You can configure the number of downstream links to disable in an uplink-state group if one upstream link in the group goes down. If you enter `all`, all downstream links in the group are disabled regardless of the status of upstream links. If you enter `number`, the specified number of downstream links are disabled if the configured upstream link goes down.

**Related Commands**
- `downstream` — assign a port or port-channel to the uplink-state group as a downstream interface.
- `uplink-state-group` — create an uplink-state group and enables the tracking of upstream links.
To revert to the default setting, use the `no downstream disable links` command.

**Parameters**

- **number**: Enter the number of downstream links the UFD brings down. The range is from 1 to 1024.
- **all**: Brings down all downstream links in the group.

**Defaults**

No downstream links are disabled when an upstream link in an uplink-state group goes down.

**Command Modes**

- UPLINK-STATE-GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.4.2.3</td>
<td>Introduced on the S-Series S50.</td>
</tr>
</tbody>
</table>

**Usage Information**

When one upstream interface in an uplink-state group goes down, you can configure the number of downstream interfaces in an uplink-state group are put into a link-down state with an UFD-Disabled error message.

If all upstream interfaces in an uplink-state group go down, all downstream interfaces in the same uplink-state group are put into a link-down state.

**Related Commands**

- `downstream` — assigns a port or port-channel to the uplink-state group as a downstream interface.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

---

**enable**

Enable uplink state group tracking for a specific UFD group.

**Syntax**

```
enable
```

To disable upstream-link tracking without deleting the uplink-state group, use the `no enable` command.

**Defaults**

Upstream-link tracking is automatically enabled in an uplink-state group.

**Command Modes**

- UPLINK-STATE-GROUP
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

```

### Related Commands
- `show running-config uplink-state-group` — displays the current configuration of one or more uplink-state groups.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

### uplink-state-group

Create an uplink-state group and enable the tracking of upstream links on a switch or router.

**Syntax**
```
uplink-state-group group-id
```
To delete an uplink-state group, enter the **no uplink-state-group group-id** command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group-id</td>
<td>Enter the ID number of an uplink-state group. The range is from 1 to 16.</td>
</tr>
</tbody>
</table>

**Defaults**

none

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.4.2.3</td>
<td>Introduced on the S-Series S50.</td>
</tr>
</tbody>
</table>

**Usage Information**

After you enter the command, to assign upstream and downstream interfaces to the group, enter Uplink-State-Group Configuration mode.

An uplink-state group is considered operationally up if at least one upstream interface in the group is in the Link-Up state.

An uplink-state group is considered operationally down if no upstream interfaces in the group are in the Link-Up state. No uplink-state tracking is performed when a group is disabled or in an operationally down state.

To disable upstream-link tracking without deleting the uplink-state group, use the **no enable** command in uplink-state-group configuration mode.

**Example**

```
Dell(conf)# uplink-state-group 16
Dell(conf)#
02:23:17: %RPM0-P:CP %IFMGR-5-ASTATE_UP: Changed uplink state group Admin state to up: Group 16
Dell(conf)#
```

**Related Commands**

-  `show running-config uplink-state-group` — displays the current configuration of one or more uplink-state groups.
-  `show uplink-state-group` — displays the status information on a specified uplink-state group or all groups.
**upstream**

Assign a port or port-channel to the uplink-state group as an upstream interface.

**Syntax**

upstream interface
typle

To delete an uplink-state group, use the *no* upstream interface command.

**Parameters**

**interface**

Enter one of the following interface types:

- 1 Gigabit Ethernet: `gigabitethernet {slot/port | slot/port-range}`
- 10 Gigabit Ethernet: `tengigabitethernet {slot/port | slot/port-range}`
- Port channel: `port-channel {1–128 | port-channel-range}`

Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: `gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5`. A comma is required to separate each port and port-range entry.

**Defaults**

none

**Command Modes**

UPLINK-STATE-GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<tr>
<td>8.4.2.3</td>
<td>Introduced on the S-Series S50.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.
Example

Dell(conf-uplink-state-group-16)# upstream gigabitethernet 1/10-15
Dell(conf-uplink-state-group-16)#

Related Commands

- **downstream** — assigns a port or port-channel to the uplink-state group as a downstream interface.
- **uplink-state-group** — creates an uplink-state group and enables the tracking of upstream links.
With the virtual local area network (VLAN)-stacking feature (also called stackable VLANs and QinQ), you can “stack” VLANs into one tunnel and switch them through the network transparently. The Dell Networking OS supports this feature.

For more information about basic VLAN commands, see the Virtual LAN (VLAN) Commands section in Layer 2.

**Important Points to Remember**

- If you do not enable the spanning tree protocol (STP) across the stackable VLAN network, STP bridge protocol data units (BPDUs) from the customer’s networks are tunneled across the stackable VLAN network.
- If you do enable STP across the stackable VLAN network, STP BPDUs from the customer’s networks are consumed and not tunneled across the stackable VLAN network unless you enable protocol tunneling.

  **NOTE:** For more information about protocol tunneling on the E-Series, see Service Provider Bridging.

- Layer 3 protocols are not supported on a stackable VLAN network.
- Assigning an IP address to a stackable VLAN is supported when all the members are only stackable VLAN trunk ports. IP addresses on a stackable VLAN-enabled VLAN are not supported if the VLAN contains stackable VLAN access ports. This facility is provided for the simple network management protocol (SNMP) management over a stackable VLAN-enabled VLAN containing only stackable VLAN trunk interfaces. Layer 3 routing protocols on such a VLAN are not supported.
- Dell Networking recommends that you do not use the same MAC address, on different customer VLANs, on the same stackable VLAN.
- Interfaces configured using stackable VLAN access or stackable VLAN trunk commands do not switch traffic for the default VLAN. These interfaces are switch traffic only when they are added to a non-default VLAN.
- Starting with Dell Networking OS version 7.8.1 for C-Series and S-Series (Dell Networking OS version 7.7.1 for E-Series, 8.2.1.0 for E-Series ExaScale), a vlan-stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the vlan-stack trunk port is also a member of an untagged vlan, the port must be in Hybrid mode. For more information, see portmode hybrid.

**Topics:**

- dei honor
- dei mark
- member
- stack-unit stack-group
- vlan-stack access
- vlan-stack compatible
- vlan-stack dot1p-mapping
- vlan-stack protocol-type
- vlan-stack trunk
**dei honor**

Honor the incoming DEI value by mapping it to a Dell Networking OS drop precedence. Enter the command once for 0 and once for 1.

**Syntax**

```
dei honor {0 | 1} {green | red | yellow}
```

**Parameters**

- `0 | 1`: Enter the bit value you want to map to a color.
- `green | red | yellow`: Choose a color:
  - `green`: High priority packets that are the least preferred to be dropped.
  - `red`: Lowest priority packets that are always dropped (regardless of congestion status).
  - `yellow`: Lower priority packets that are treated as best-effort.

**Defaults**

Disabled; Packets with an unmapped DEI value are colored green.

**Command Modes**

`INTERFACE`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</tbody>
</table>

**Usage Information**

Enable DEI before using this command.
**dei mark**

Set the DEI value on egress according to the color currently assigned to the packet.

**Syntax**

dei mark {green | yellow} {0 | 1}

**Parameters**

- **0 | 1**: Enter the bit value you want to map to a color.
- **green | red | yellow**: Choose a color:
  - **Green**: High priority packets that are the least preferred to be dropped.
  - **Yellow**: Lower priority packets that are treated as best-effort.

**Defaults**

All the packets on egress are marked with DEI 0.

**Command Modes**

**Usage Information**

Enable DEI before using this command.

**member**

Assign a stackable VLAN access or trunk port to a VLAN. The VLAN must contain the vlan-stack compatible command in its configuration.

**Syntax**

member interface
To remove an interface from a Stackable VLAN, use the `no member interface` command.

**Parameters**

`interface` Enter the following keywords and the interface information:

- For a Port Channel interface, enter the keywords `port-channel`, and then a number.
- For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

**Defaults**

Not configured.

**Command Modes**

CONF-IF-VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>

**Usage Information**

Enable the stackable VLAN (using the `vlan-stack compatible` command) on the VLAN prior to adding a member to the VLAN.

**Related Commands**

- `vlan-stack compatible` — enables stackable VLAN on a VLAN.

### stack-unit stack-group

Configure a stacking group specified by an ID.

**Syntax**

```
[no] stack-unit unit-id stack-group stack-group-id
```

To remove the current stack group configuration, use the `no stack-unit unit-id stack-group stack-group-id` command.
### Parameters

- **unit-id**: Enter the stack unit ID.
- **stack-group-id**: Enter the stack group ID. The range is from 0 to 16.

### Command Modes

- **CONFIGURATION**

### Command History

</tbody>
</table>

### Usage Information

**WARNING**: The following message displays to confirm the command: All non-default configurations on the related member ports ports (ports listed here) will be removed. Do you want to continue (y/n)? If you enter “y”, all non-default configurations on any member ports of the current stack group are removed when you reboot the unit.

### vlan-stack access

Specify a Layer 2 port or port channel as an access port to the stackable VLAN network.

**Syntax**

```plaintext
vlan-stack access
```

To remove access port designation, use the no vlan-stack access command.

**Defaults**

- Not configured.

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**E-Series original Command**

**Usage Information**

Prior to enabling this command, to place the interface in Layer 2 mode, enter the `switchport` command.

To remove the access port designation, remove the port (using the `no member interface` command) from all stackable VLAN-enabled VLANs.

**vlan-stack compatible**

Enable the stackable VLAN feature on a VLAN.

**Syntax**

```
vlan-stack compatible
```

To disable the Stackable VLAN feature on a VLAN, use the `no vlan-stack compatible` command.

**Defaults**

Not configured.

**Command Modes**

- CONF-IF-VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the C-Series and S-Series.

**E-Series original Command**

**Usage Information**
Prior to disabling the stackable VLAN feature, remove the members.

To view the stackable VLANs, use the `show vlan` command in EXEC Privilege mode. Stackable VLANs contain members, designated by the M in the Q column of the command output.

If you enabled VRF, you cannot enable the stacked VLAN feature using this command.

If you enabled IGMP snooping, you cannot enable the stacked VLAN feature using this command.

**Example**
```plaintext
Dell# show vlan
Codes: * - Default VLAN, G - GVRP VLANs

NUM  Status    Q Ports
*  1    Inactive
  2    Active    M Gi 1/13   M Gi 1/1-3
  3    Active    M Po1(Gi 1/14-15) M Gi 1/18   M Gi 1/4
  4    Active    M Po1(Gi 1/14-15) M Gi 1/18   M Gi 1/5
  5    Active    M Po1(Gi 1/14-15) M Gi 1/18   M Gi 1/6

Dell#
```

**vlan-stack dot1p-mapping**

Map C-Tag dot1p values to an S-Tag dot1p value.

**Syntax**
```
vlan-stack dot1p-mapping c-tag-dot1p values sp-tag-dot1p value
```

**Parameters**
- `c-tag-dot1p value`: Enter the keyword `c-tag-dot1p` then the customer dot1p value that is mapped to a service provider dot1p value. The range is from 0 to 7.
- `sp-tag-dot1p value`: Enter the keyword `sp-tag-dot1p` then the service provider dot1p value. The range is from 0 to 7.

**Defaults**
none

Usage Information

You can separate the C-Tag values by commas or dashed ranges. In the case of conflicts, dynamic mode CoS overrides any Layer 2 QoS configuration.

```
vlan-stack protocol-type
```

Define the stackable VLAN tag protocol identifier (TPID) for the outer VLAN tag (also called the VMAN tag). If you do not configure this command, the Dell Networking OS assigns the value 0x9100.

**Syntax**

```plaintext
vlan-stack protocol-type number
```

**Parameters**

- `number`
  
  Enter the hexadecimal number as the stackable VLAN tag.

  You may specify both bytes of the 2-byte S-Tag TPID. The range is from 0 to FFFF. The default is 9100.

**Defaults**

0x9100

### Version Description

- **9.8(0.0P5)**
  Introduced on the S4048-ON.

- **9.8(0.0P2)**
  Introduced on the S3048-ON.

- **9.7(0.0)**
  Introduced on the S6000-ON.

- **9.2(1.0)**
  Introduced on the Z9500.

- **9.0.2.0**
  Introduced on the S6000.

- **8.3.19.0**
  Introduced on the S4820.

- **8.3.7.0**
  Introduced on the S4810.

- **8.2.1.0**
  Introduced on the E-Series. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID.

- **8.2.1.0**
  Introduced on the E-Series.

- **7.6.1.0**
  Introduced on the C-Series and S-Series.

**E-Series original Command**

For specific interoperability limitations regarding the S-Tag TPID, see the Dell Networking OS Configuration Guide.

The four characters you may enter are shown in the following table.

<table>
<thead>
<tr>
<th>Number</th>
<th>Resulting TPID</th>
</tr>
</thead>

</tr>
</tbody>
</table>

**E-Series original Command**

**Usage Information**

Prior to using this command, to place the interface in Layer 2 mode, use the `switchport` command.

To remove the trunk port designation, first remove the port (using the `no member interface` command) from all stackable VLAN-enabled VLANs.

In Example 1, a VLAN-Stack trunk port is configured and then made part of a single-tagged VLAN.

In Example 2, the tag protocol identifier (TPID) is set to `88A8`. The Gi 3/10 port is configured to act as a VLAN-Stack access port; the Gi 5/1 port acts as a VLAN-Stack trunk port, switching stackable VLAN traffic for VLAN 10, while also switching untagged traffic for VLAN 30 and tagged traffic for VLAN 40. (To allow VLAN 30 traffic, you need the native VLAN feature. Use the `portmode hybrid` command. For more information, see the `portmode hybrid` command.

**Example 1**

```bash
Dell(conf-if-gi-1/42)# switchport
Dell(conf-if-gi-1/42)# vlan-stack trunk
Dell(conf-if-gi-1/42)# show config

Virtual Routing and Forwarding (VRF)

Virtual routing and forwarding (VRF) allows multiple instances of a routing table to coexist on the same router at the same time.

Topics:
- ip vrf
- description
- ip vrf forwarding
- ip route-export
- ip route-import
- ipv6 route-export
- ipv6 route-import
- match source-protocol
- redistribute
- interface management
- maximum dynamic-routes
- show ip vrf
- show run vrf

**ip vrf**

Create or delete a customer VRF.

**Syntax**

```
ip vrf {vrf-name | management} [vrf_id]
```

To delete a customer VRF, use the `no ip vrf {vrf-name | management} [vrf_id]` command.

**Parameters**

- **vrf-name**: Enter the name of the VRF that you create.
- **management**: Enter the keyword management to create the management VRF.
- **vrf_id**: (Optional) Enter the ID of the VRF that you create.

**Defaults**

Available by default for management VRF. For creating other customer VRFs, enable the `feature vrf` option in Configuration mode.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.8(2.0) | Introduced on the S3100 series.
9.10(0.0) | Introduced on the S3148.
You cannot use the keyword `default` as a VRF name as this name indicates a special VRF.

To create a management VRF, use the keyword `management`.

The VRF ID is optional.

description

Specify a name for a customer VRF.

**Syntax**

```
description string
```

To delete the descriptive name for a customer VRF, use the `no description string` command.

**Parameters**

- `string`: Enter a descriptive name for the VRF.

**Defaults**

None.

**Command Modes**

VRF MODE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

ip vrf forwarding

Attach an interface to a VRF.

Syntax

```
ip vrf forwarding {vrf-name | management}
```

To delete an interface associated with a configured VRF, use the `no ip vrf forwarding {vrf-name | management}` command.

Parameters

- **vrf-name**: Enter name of the VRF that you want to associate the interface to.
- **management**: Enter the keyword `management` to associate an interface to the management VRF.

Defaults

`none`

Command Modes

`INTERFACE-CONFIG`

</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S-Series and Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

You can attach an interface to either a nondefault VRF or a management VRF.

To assign a port-back to a default VRF, remove the VRF association from the interface. You can use this only if there is no IP address configured on the interface.

There must be no prior Layer 3 configuration on the interface when configuring VRF.

You must enable VRF before using this command.

You can configure an IP subnet or address on a physical or VLAN interface that overlaps the same IP subnet or address configured on another interface only if the interfaces are assigned to different VRFs. If you assign two interfaces to the same VRF, you cannot configure overlapping IP subnets or the same IP address to them.

Example

```
Dell# configure terminal
Dell(conf)# ip vrf red
Dell(conf-vrf)# description "Red Network"
Dell(conf-vrf)# show config
!
ip vrf red 4
 description "Red Network"
Dell(conf-vrf)#
```
Dell(conf-if-gi-1/45)# int gi 1/46
Dell(conf-if-gi-1/46)# no shut
Dell(conf-if-gi-1/46)# ip vrf forwarding red
Dell(conf-if-gi-1/46)# ip add 100.1.1.1/24
Dell(conf-if-gi-1/46)#
Dell(conf-if-gi-1/46) # show config

interface GigabitEthernet 1/46
  ip vrf forwarding red
  ip address 100.1.1.1/24
  no shutdown
Dell(conf-if-gi-1/46)#

**ip route-export**

Enables route leaking between VRFs. This command exports or shares IPv4 routes corresponding to one VRF with other nondefault VRFs.

**Syntax**

```
ip route-export tag [route-map-name]
```

**Parameters**

- **route-export**
  Enter the keywords route-export to leak or share routes between VRFs.
- **tag**
  Enter a tag (export route target) to expose routes to other VRFs. This tag acts as an identifier for exported routes. Use this identifier while importing these routes into another nondefault VRF.
- **route-map-name**
  (Optional) Enter the name of the route-map to filter the exported routes.

You can leak global routes to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF's RTM. It is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs.

**Command Modes**

- VRP mode
- CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S4810, S4820T, S5000, S6000, S6000–ON, and Z9500.</td>
</tr>
</tbody>
</table>
Usage Information

To export all the routes corresponding to a source VRF, you can use the `ip route-export tag` command without specifying the route-map attribute. This action exposes source VRF routes to various other VRFs, which then import these routes using the `ip route-import tag` command.

In Dell Networking OS, you can configure one route-export per VRF as you can only expose one set of routes for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.

You can expose a unique set of routes from the source VRF for leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. For example, you cannot import one set of routes from one VRF and another set of routes from another VRF.

Only active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the Source VRF.

Related Commands

- `ip route-import` — imports routes from another VRF.

**ip route-import**

Imports IPv4 routes that another VRF leaks using the VRF tag during the export of these routes.

**Syntax**

```
ip route-import tag [route-map-name]
```

**Parameters**

- `route-import` Enter the keywords `route-import` to import routes into the VRF.
- `tag` Enter a tag (ASN number) to specify an import route target for importing routes from another VRF.
  
  To import leaked routes from another VRF, use the same ASN number that is specified as the export route target at the source VRF.
- `route-map-name` Enter the name of the route-map to filter the imported routes.

**NOTE:** Use the route-map attribute while importing routes from the global RTM. Route-maps allow you to filter routes at the import end based on the matching criteria that you define in the route-map.

**Command Modes**

- CONFIGURATION
- VRF mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
</tbody>
</table>
### Usage Information

It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.

### Related Commands

- `ip route-export` — exports routes to another VRF.

### ipv6 route-export

Enables route leaking between VRFs. This command exports or shares IPv6 routes corresponding to one VRF with other nondefault VRFs.

**Syntax**

```
ipv6 route-export tag [route-map-name]
```

**Parameters**

- `route-export` Enter the keywords route-export to leak or share routes between VRFs.
- `tag` Enter a tag (ASN number) as the export route target to expose routes to other VRFs. This tag acts as an identifier for exported routes. Use this identifier while importing these routes into another nondefault VRF.
- `route-map-name` (Optional) Enter the name of the route-map to filter the exported routes. You can leak global routes to be made available to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF's RTM. It is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs.

**Defaults**

N/A

**Command Modes**

- VRF mode
- CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell Networking OS Command Line Reference Guide**.

</tbody>
</table>
To export all the routes corresponding to a source VRF, use the `ip route-export tag` command without specifying the route-map attribute. This action exposes source VRF routes to other VRFs, which then import these routes using the `ip route-import tag` command.

In Dell Networking OS, you can configure one route-export per VRF as you can only expose one set of routes for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.

You can expose a unique set of routes from the source VRF for leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. For example, you cannot import one set of routes from one VRF and another set of routes from another VRF.

Only active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the source VRF.

Related Commands

- `ipv6 route-import` — imports IPv6 routes from another VRF.

**ipv6 route-import**

Imports IPv6 routes that another VRF leaks using the tag that VRF specifies during export of these routes.

**Syntax**

```
ipv6 route-import tag [route-map-name]
```

**Parameters**

- `route-import` Enter the keywords `route-import` to import IPv6 routes into the VRF.
- `tag` Enter a tag (ASN number) to specify an import route target for importing routes from another VRF. To import leaked routes from another VRF, use the same ASN number that is specified as the export route target at the source VRF.
- `route-map-name` Enter the name of the route-map to filter the imported routes.

**Defaults**

N/A

**Command Modes**

- VRF mode
- CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)
- 9.10(0.0)
- 9.8(2.0)
- 9.8(1.0)

**Description**

- Introduced on the S3148.
- Introduced on the S6100–ON.
- Introduced on the S3100 series.
- Introduced on the Z9100–ON.
Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.

Usage Information

It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match the protocol and prefix-list options. Other options that you configure in the route-maps are ignored.

Related Commands

• ipv6 route-export — exports IPv6 routes to another VRF.

match source-protocol

Specify matching source-protocol criteria while exporting or importing routes.

Syntax

match source-protocol {bgp | isis | ospf | connected | static}

Parameters

bgp
isis
ospf
connected
static

Command Modes

ROUTE MAP MODE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.

Usage Information

Specify the matching criteria only after defining a route-map. Before using this command, you must enter Route Map mode using the route-map route-map-name command. The match criteria that you specify is associated with the route-map that you define.
The export-target and import-target options support only the match protocol and match prefix-list options. Other options that you configure in the route-maps are ignored.

Related Commands

- `ipv6 route-import` — imports IPv6 routes from another VRF.

**redistribute**

Redistributes leaked or exported routes corresponding to specific protocols.

**Syntax**

redistribute {imported-bgp | import-ospf | import-isis}

**Parameters**

- **imported-bgp**: Enter the keywords `imported-bgp` to redistribute leaked routes that are learned using the BGP protocol.
- **imported-ospf**: Enter the keywords `imported-ospf` to redistribute leaked routes that are learned using the OSPF protocol.
- **imported-isis**: Enter the keywords `imported-isis` to redistribute leaked routes that are learned using the ISIS protocol.
- **route-map**: Enter the name of the route-map to specify the filtering criteria for imported routes.

**Command Modes**

CONFIGURATION

**Related Commands**

- `ip route-import` — import routes from another VRF.

**interface management**

Associates a management port with a management VRF.

**Syntax**

interface management

**Usage Information**

To delete the association between a management port and a management VRF, use the `no interface management` command.
maximum dynamic-routes

Specify the maximum number of dynamic (protocol) routes a VRF can have.

Syntax

```
maximum dynamic-routes limit {warn-threshold threshold-value | warning-only}
```

To remove the limit on the maximum number of routes used, use the no maximum dynamic-routes command.

Parameters

- **limit**: Maximum number of routes allowed in a VRF. The valid range is from 1 to 16,000 (or maximum allowable for that platform if a smaller value).
- **warning-threshold**: The warning threshold value is a percentage of the limit value. When the number of routes reaches the specified percentage of the limit, a warning message appears. The valid range is from 1 to 100.
  - After the limit is reached, additional dynamic routes are not allowed.
- **warning-only**: When you use the warning-only option, when the maximum number of dynamic routes reaches the limit, a warning message appears.
  - After the limit is reached, additional dynamic routes are still allowed.

Defaults

No limit is set on the maximum number of dynamic routes for a VRF.

Command Modes

CONFIGURATION-VRF
**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

If you do not specify the maximum route limit for a VRF, the VRF has unlimited space that extends to the maximum number of entries allowed for the system.

**show ip vrf**

Displays information corresponding to the VRFs that you configure in the system.

**Syntax**

```
show ip [vrf vrf-name]
```

**Parameters**

- `vrf vrf-name`: Enter the keyword `vrf` then the name of the VRF to display information corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

</tr>
</tbody>
</table>

Usage Information

This command displays information from the running-config corresponding to either a specific VRF or all the VRFs in the system.
Example

Dell# show run vrf test3
!
ip vrf test3
description "Banking Customer Chennai"
Dell#
The virtual link trucking (VLT) proxy gateway feature allows a VLT domain to locally terminate and route L3 packets that are destined to a Layer 3 (L3) end point in another VLT domain. Enable the VLT proxy gateway using the link layer discover protocol (LLDP) method or the static configuration. For more information, see the Dell Networking OS Command Line Reference Guide.

Topics:
- proxy-gateway lldp
- proxy-gateway static
- remote-mac-address exclude-vlan
- peer-domain-link port-channel exclude-vlan
- proxy-gateway peer-timeout
- vlt-peer-mac transmit
- show vlt-proxy-gateway

```
proxy-gateway lldp
```

Enables the proxy-gateway feature using the LLDP protocol.

**Syntax**

```
[no] proxy-gateway lldp
```

**Command Modes**

VLT DOMAIN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100–ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>
</tr>
<tr>
<td>9.8(0.0P6)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

The configuration is cached and sent to LLDP only in one of the following conditions:
The port-channel connecting the two VLT domains, across the DC, is a VLT LAG.

The protocol lldp command is globally enabled.

The proxy-gateway LLDP configuration is applied.

Example

```
Dell(conf)# vlt-domain 1
Dell(conf-vlt-domain)# proxy-gateway lldp
Dell(conf-vlt-domain)#
```

**proxy-gateway static**

Enables the proxy-gateway feature using static configurations.

**Syntax**

```
[no] proxy-gateway static
```

**Command Modes**

VLT DOMAIN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you add a proxy-gateway static configuration, the setting is saved in the Layer 2 module. When you remove the static proxy gateway configuration, each proxy-gateway static MAC configured is deleted from the Layer 2 module.

**Example**

```
Dell(conf)# vlt-domain 1
Dell(conf-vlt-domain)# proxy-gateway static
Dell(conf-vlt-domain)#
```
remote-mac-address exclude-vlan

Configure the proxy-gateway static entry and exclude a VLAN or a range of VLANs from proxy routing.

Syntax

```
[no] remote-mac-address mac-address [exclude-vlan vlan-range]
```

Parameters

- **remote-mac-address**: Specify the mac-addresses of the VLT peers which are in the remote VLT domain.
- **mac-address**: Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.
- **vlan-range**: Enter the VLAN IDs in which proxy gateway is not needed. The VLANs are excluded from doing proxy gateway. The value can be a single VLAN ID, comma-separated VLAN IDs, a range of VLAN IDs, or a combination. For example:
  - Comma-separated: 3, 4, 6
  - Range: 5-10
  - Combination: 3, 4, 5-10, 8

Command Modes

VLT DOMAIN PROXY GW STATIC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000.

Usage Information

You can configure the MAC address of a VLT peer in a remote VLT domain to associate with the static VLT proxy gateway and exclude a VLAN, or a range of VLANs, from proxy routing.

Example

```
Dell(conf)# vlt-domain 1
Dell(conf-vlt-domain)#proxy-gateway static
Dell(conf-vlt-domain-proxy-gw-static)# remote-mac-address 00:01:e8:06:95:ac
Dell(conf-vlt-domain-proxy-gw-static)# exclude-vlan 3
Dell(conf-vlt-domain-proxy-gw-static)#
```
### peer-domain-link port-channel exclude-vlan

Configure the VLT port channel, which is connected to the remote VLT domain, for the proxy gateway or configure the VLANs you want to exclude from VLT proxy gateway.

**Syntax**

```
[no] peer-domain-link port-channel interface-identifier exclude-vlan vlan-range
```

**Parameters**

- `port-channel`
  - Configure the proxy-gateway interface port-channel.

- `interface-identifier`
  - Enter the interface type.

- `vlan-range`
  - Enter the VLAN IDs that you want to exclude from the proxy gateway. The value can be a single VLAN ID, comma-separated VLAN IDs, a range of VLAN IDs, or a combination. For example:
    - Comma-separated: 3, 4, 6
    - Range: 5-10
    - Combination: 3, 4, 5-10, 8

**Command Modes**

- VLT DOMAIN PROXY GW LLDP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>

<td>Introduced on the S6100–ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.5(0.1)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You must configure the VLT port channel interface which is connecting to the remote VLT domain as peer-domain-link. You can also configure the VLANs you want to exclude from the VLT proxy gateway.

**Example**

```
Dell(conf)#vlt-domain 1
Dell(conf-vlt-domain)#proxy-gateway lldp
Dell(conf-vlt-domain-proxy-gw-lldp)#peer-domain-link port-channel 20 exclude-vlan 3
```
proxy-gateway peer-timeout

Enables the VLT node to timeout the transmission of the peer MAC address when the VLT peer is down.

Syntax

[no] peer-timeout value

Parameters

value

Enter the timeout value (in seconds). The range is from 1 to 65535. The default is infinity.

Default

Infinity

Command Modes

VLT DOMAIN PROXY GW LLDP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.P6) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.7(0.0) Removed the default value on the S-Series and Z-Series.

9.4(0.0) Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch.

Usage Information

When a VLT peer goes down, the local VLT node stops sending its peer’s MAC address. If you configure this timeout, the local VLT node sends its peer’s MAC address until the timer expires.

Use this timer when you enable vlt-peer-mac transmit. A typical use example is a square VLT topology with a single link connecting to the remote peers.

Example

Dell(conf-vlt-domain-proxy-gw-lldp)# peer-timeout 5

vlt-peer-mac transmit

Enables the device to transmit the peer MAC address along with its own MAC address in LLDP TLV packets to the remote VLT domain.

Syntax

[no] vlt-peer-mac transmit

Command Modes

VLT DOMAIN PROXY GW LLDP
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

This command enables the device to transmit its VLT peer MAC address along with its own MAC address to the remote VLT domain. By default, a node sends only its own MAC address to the remote VLT domain.

This configuration is applicable only for an LLDP proxy gateway. A typical use example is a square VLT topology with single link connecting to the remote peers.

**Example**

```
Dell(conf-vlt-domain-proxy-gw-lldp)# vlt-peer-mac transmit
```

### show vlt-proxy-gateway

Displays the VLT proxy gateway configuration.

**Syntax**

```
show vlt-proxy-gateway {info} {lldp | static}
```

**Parameters**

- **lldp**
  - Enter the keyword lldp to display details about the LLDP VLT proxy gateway configuration.

- **static**
  - Enter the keyword static to display details about the static VLT proxy gateway configuration.

**Command Modes**

- EXEC
- EXEC Privilege

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

### Usage Information

The proxy-gateway feature may go operationally down for any of the following reasons:

- LLDP is globally disabled.
- LDP is disabled per port.
- VLT port-channel is down.
- LLDP neighbor is down.

If any of these conditions is true, the proxy-gateway feature could be operationally down. If so, it is shown in the `show` command output.

When more than one VLT port-channel terminates on the same ToR, the `show VLT proxy-gateway info lldp` command output may show the port-channel ID incorrectly.

### Example

```
Dell#show vlt proxy-gateway
VLT Proxy Gateway Brief
-------------------------
Config Mode:                  LLDP
Global LLDP Config Status:    Enabled
peer-mac-transmit Status:     Disabled

----- -----------     ------------
Po 55 00:01:e8:8a:e8:f7 3,7-8 << Macs learnt via port-channel 55
Po 55 00:01:e8:8b:1c:c0 3,7-8
```
Virtual Link Trunking (VLT)

Virtual link trunking (VLT) allows physical links between two chassis to appear as a single virtual link to the network core. VLT eliminates the requirement for Spanning Tree protocols by allowing link aggregation group (LAG) terminations on two separate distribution or core switches, and by supporting a loop-free topology.

VLT provides Layer 2 multipathing, creating redundancy through increased bandwidth and enabling multiple parallel paths between nodes and load-balancing traffic where alternative paths exist.

**NOTE:** When you launch the VLT link, the VLT peer-ship is not established if any of the following is TRUE:

- The VLT System-MAC configured on both the VLT peers do not match.
- The VLT Unit-Id configured on both the VLT peers are identical.
- The VLT System-MAC or Unit-Id is configured only on one of the VLT peers.
- The VLT domain ID is not the same on both peers.

If the VLT peer-ship is already established, changing the System-MAC or Unit-Id does not cause VLT peer-ship to go down.

Also, if the VLT peer-ship is already established and the VLT Unit-Id or System-MAC are configured on both peers, then changing the CLI configurations on the VLT Unit-Id or System-MAC is rejected if any of the following become TRUE:

- After making the CLI configuration change, the VLT Unit-Id becomes identical on both peers.
- After making the CLI configuration change, the VLT System-MAC do not match on both peers.

When the VLT peer-ship is already established, you can remove the VLT Unit-Id or System-MAC configuration from either or both peers. However, removing configuration settings can cause the VLT ports to go down if you configure the Unit-Id or System-MAC on only one of the VLT peers.

back-up destination

Configure the IPv4 or IPv6 address of the management interface on the remote VLT peer used as the VLT backup link endpoint for sending out-of-band (OOB) hello messages.

```
Syntax
back-up destination {ipv4-address | [ipv6 ipv6-address] [interval seconds]}
```

```
Parameters
ipv4-address
  Enter the IPv4 address of the backup destination.

ipv6
  Enter the keyword ipv6 then an IPv6 address in the X:X:X:X::X format.

interval seconds
  Enter the keyword interval to specify the time interval to send hello messages. The range is from 1 to 5 seconds. The default is 1 second.
```

```
Defaults
1 second

clear vlt statistics

Clear the VLT operation statistics.

Syntax

```plaintext
clear vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]
```

Parameters

- **domain**: Clear the VLT statistics for the domain.
- **multicast**: Clear the VLT statistics for multicast.
- **mac**: Clear the VLT statistics for the MAC address.
- **arp**: Clear the VLT statistics for ARP.
- **igmp-snoop**: Clear the VLT statistics for IGMP snooping.
- **ndp**: Clear the VLT statistics for NDP.

### `delay-restore`

Configure the delay in bringing up VLT ports after reload or peer-link restoration between the VLT peer switches.

**Syntax**

delay-restore

**Parameters**

delay-restore Enter the amount of time, in seconds, to delay bringing up the VLT ports after the VLT device reloads or after the peer-link restores between VLT peer switches. The range from 1 to 1200. The default is **90 seconds**.

**Defaults**

Not configured.

**Command Modes**

VLT DOMAIN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S8420T.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

To delay the system from bringing up the VLT port for a brief period to allow IGMP snooping and Layer 3 routing protocols to converge, use the `delay-restore` command. Use this command:

- after a VLT device reloads.
- if the peer VLT device was up at the time the VLTI link failed.

**Related Commands**

- `show vlt statistics` — displays statistics on VLT operations.
**delay-restore abort-threshold**

Increase the boot up timer to a value greater than 60 seconds.

**Syntax**

delay-restore abort-threshold <interval>
To remove the boot up timer value, use the no delay-restore abort-threshold command.

**Parameters**

- **interval**
  
Enter the interval value (in seconds) for the delay restore timer to abort. The range is from 1 to 1800 seconds. The default is **60 seconds**.
  
  This delay restore timer applies only during reload/boot-up and not in other scenarios (for example, during ICL flap).

**Defaults**

60 seconds

**Command Modes**

VLT DOMAIN

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

To abort the VLT delay restore timer value as the maximum threshold, during reload, apply the maximum time interval to the hold-down ICL peer-up in the start-up configurations.

**lacp ungroup member-independent**

Prevent possible loop during the VLT peer switch bootup or on a device that accesses the VLT domain.

**Syntax**

lacp ungroup member-independent {vlt | port-channel}

**Parameters**

- **vlt**
  
  Force all VLT LACP members to become switchports.

- **port-channel**
  
  Force all LACP port-channel members to become switchports.

**Defaults**

Not configured.

- **9.0.0.0** Introduced on the Z9000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.12.0** Added port-channel parameter on the S4810.
- **8.3.8.0** Introduced on the S4810.

#### Usage Information

LACP on the VLT ports (on a VLT switch or access device), which are members of the VLT, are not brought up until the VLT domain is recognized on the access device.

During boot-up in a stacking configuration, the system must be able to reach the DHCP server with the boot image and configuration image. To receive an offer on static LAGs between switches, only untagged DHCP requests are sent to the DHCP server. Configure the DHCP server to start in BMP mode.

If the switches are connected using LACP port-channels (for example, the VLT peer and top of rack [ToR]), use the port-channel option on the ToR-side configuration to allow member ports of an ungrouped LACP port-channel to inherit VLAN membership of that port channel. This ensures untagged VLT peer device packets reach the DHCP server on the ToR.

To ungroup the VLT and port-channel configurations, use the `no lacp ungroup member independent` command on a VLT port channel.

#### Example

```
Dell(conf)#lacp ungroup member-independent ?
port-channel LACP port-channel members become switchports
vlt All VLT LACP members become switchports
```

### multicast peer-routing timeout

To retain synced multicast routes or synced multicast outgoing interface (OIF) after a VLT peer node failure, configure the timeout value for a VLT node.

#### Syntax

```
multicast peer-routing timeout value
```

To restore the default value, use the `no multicast peer-routing timeout` command.
peer-link port-channel

Configure the specified port channel as the chassis interconnect trunk between VLT peers in the domain.

Syntax

```
peer-link port-channel port-channel-number {peer-down-vlan vlan id}
```

Parameters

- **port-channel-number**
  - Enter the port-channel number that acts as the interconnect trunk. The range is from 1 to 128.
- **peer-down-vlan vlan id**
  - Enter the keywords peer-down-vlan then a VLAN ID to configure the VLAN that the VLT peer link uses when the VLT peer is down.

Defaults

Not configured.

</tbody>
</table>
Usage Information
To configure the VLAN from where the VLT peer forwards packets received over the VLTi from an adjacent VLT peer that is down, use the peer-down-vlan option. When a VLT peer with bare metal provisioning (BMP) is booting up, it sends untagged DHCP discover packets to its peer over the VLTi. To ensure that the DHCP discover packets are forwarded to the VLAN that has the DHCP server, use this configuration.

**peer-routing**

Enable Layer 3 (L3) VLT peer-routing. This command is applicable for both IPv6 and IPv4 interfaces.

`peer-routing`

To disable L3 VLT peer-routing, use the `no peer-routing` command.

**Defaults**
Disabled.

**Command Modes**

</table>
| 9.4(0.0)  | Added the support for IPV6 / IPV4.
peer-routing-timeout

Configure the delay after which peer routing disables when the peer is unavailable. This command is applicable for both IPv6 and IPv4.

Syntax

```
peer-routing-timeout value
```

To restore the default value, use the `no peer-routing-timeout` command.

Parameters

- `value`: Enter the timeout value (in seconds). The range is from 1 to 65535. The default value is `infinity`.

Command Modes

- **VLT DOMAIN (conf-vlt-domain)**

Default

Infinity

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version | Description
------- | ------------
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.7(0.0) | Added support for default value on the S-Series and Z-Series.
9.5(0.1) | Introduced on the Z9500.
9.4(0.0) | Added the support for IPV6 / IPV4.
9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.
9.0.2.0 | Introduced on the S6000.

Usage Information

When the timer expires, the software checks to see if the VLT peer is available. If the VLT peer is not available, peer-routing disables on that peer.

If you do not configure this delay value, peer-routing is not disabled even when the peer is unavailable.
primary-priority

Assign the priority for master election among VLT peers.

Syntax

[no] primary-priority

Parameters

value

To configure the primary role on a VLT peer, enter a lower value than the priority value of the remote peer. The range is from 1 to 65535. The default value is 32768.

Default

32768

Command Modes

VLT DOMAIN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100–ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.5(0.1) Introduced on the Z9500.

9.2(0.0) Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.8.0 Introduced on the S4810.

Usage Information

After you configure a VLT domain on each peer switch and connect (cable) the two VLT peers on each side of the VLT interconnect, the system elects a primary and secondary VLT peer device. To configure the primary and secondary roles before the election process, use the primary-priority command. Enter a lower value on the primary peer and a higher value on the secondary peer.

If the primary peer fails, the secondary peer (with the higher priority) takes the primary role. If the primary peer (with the lower priority) later comes back online, it is assigned the secondary role (there is no preemption).

show vlt brief

Displays summarized status information about VLT domains configured on the switch.

Syntax

show vlt brief

Default

Not configured.
Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.8.0 Introduced on the S4810.

Usage Information

The version shown in the show vlt brief output command displays the VLT version number which is different from the Dell Networking OS version number. VLT version numbers begin with odd numbers.

Example (Brief)

Dell#show vlt brief
VLT Domain Brief
--------------
Domain ID : 1
Role : Secondary
Role Priority : 32768
ICL Link Status : Up
HeartBeat Status : Up

Dell#

show vlt backup-link

Displays information about the backup link operation.

Syntax

show vlt backup-link

Default

Not configured.

Command Modes

EXEC
show vlt backup-link

Displays counter information.

Syntax

```
show vlt counters [arp | igmp-snoop | interface | mac | ndp]
```

Parameters

**arp**
Enter the keyword arp to display the ARP counter information for the VLT.

**igmp-snoop**
Enter the keywords igmp-snoop to display the igmp-snooping counter information for the VLT.

**interface**
Enter the keyword interface to display the interface counter information for the VLT.

**mac**
Enter the keyword mac to display the MAC address counter information for the VLT.

**ndp**
Enter the keyword ndp to display the VLT counter information for NDP.

Default

Not configured.

Command Modes

EXEC

Example

```
Dell_VLTpeer1# show vlt backup-link
VLT Backup Link
-----------------
Destination: 10.11.200.18
Peer HeartBeat status: Up
HeartBeat Timer Interval: 1
HeartBeat Timeout: 3
UDP Port: 34998
HeartBeat Messages Sent: 1026
HeartBeat Messages Received: 1025
```
### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

### Usage Information

If you do not add a parameter such as `arp` or `mac`, the output displays all the counters.

### Example

```
Dell# show vlt counter
Total VLT counters
-------------------------
L2 Total MAC-Address Count :
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
ARP entries count :
```

### Example (igmp-snoop)

```
Dell# show vlt counter igmp-snoop
Total IGMP VLT counters
--------------------
IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 5
```

### Example (igmp-snoop interface port-channel)

```
Dell# show vlt counter igmp-snoop interface port-channel 2
VLT Port-ID: 2 IGMP Counter
--------------------
IGMP MRouter Vlans count : 0
IGMP Mcast Groups count : 5
```

### Example (NDP and Non-VLT ARP)

```
Dell#show vlt counters
Total VLT Counters
-------------------
L2 Total MAC-Address Count: 2
Total Arp Entries Learnt : 0
Total Arp Entries Synced : 0
Total Non-VLT Arp entries Learnt: 0
Total Non-VLT Arp Entries Synced 0
```
**show vlt detail**

Displays detailed status information about VLT domains configured on the switch.

**Syntax**

```
show vlt detail
```

**Default**
Not configured.

**Command Modes**
EXEC

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Local System MAC address: 00:01:e8:8a:df:bc
Local System Role Priority: 32768

Dell_VLTpeer2# show vlt role

VLT Role
--------
VLT Role: Secondary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
show vlt statistics

Displays VLT operations statistics.

Syntax

```text
show vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]
```

Parameters

- **arp**
  - Enter the keyword `arp` to display the ARP VLT statistics.
- **domain**
  - Enter the keyword `domain` to display the domain VLT statistics.
- **igmp-snoop**
  - Enter the keywords `igmp-snoop` to display the IGMP snooping VLT statistics.
- **mac**
  - Enter the keyword `mac` to display the VLT MAC addresses VLT statistics.
- **multicast**
  - Enter the keyword `multicast` to display the multicast VLT statistics.
- **ndp**
  - Enter the keyword `ndp` to display the NDP VLT statistics.

Default

Not configured.

Command Modes

EXEC

</tr>
</tbody>
</table>

Usage Information

When you create a VLT domain on a switch, the Dell Networking OS automatically creates a VLT-system MAC address used for internal system operations.

To reconfigure the default MAC address for the domain, use the `system-mac` command. The MAC address must be in the `nn:nn:nn:nn:nn:nn` format. Also reconfigure the same MAC address on the VLT peer switch.

unit-id

Configure the default unit ID of a VLT peer switch.

Syntax

```
unit-id [0 | 1]
```

Parameters

- **0 | 1**
  
  Configure the default unit ID of a VLT peer switch. Enter 0 for the first peer. Enter 1 for the second peer.

Defaults

Automatically assigned based on the MAC address of each VLT peer. The peer with the lower MAC address is assigned unit 0; the peer with the higher MAC address is assigned unit 1.

Command Modes

VLT DOMAIN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.5(0.1)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>
Usage Information

When you create a VLT domain on a switch, the Dell Networking OS automatically assigns a unique unit ID (0 or 1) to each peer switch. The unit IDs are used for internal system operations. To explicitly configure the unit ID of a VLT peer, use the `unit-id` command. Configure a different unit ID (0 or 1) on each peer switch.

This command minimizes the time required for the VLT system to determine the unit ID assigned to each peer switch when one peer reboots.

**vlt domain**

Enable VLT on a switch, configure a VLT domain, and enter VLT-Domain Configuration mode.

Syntax

```
vlt domain domain-id
```

Parameters

- `domain-id` Enter the domain ID number. Configure the same domain ID on the peer switch. The range of domain IDs is from 1 to 1000.

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>
Usage Information
The VLT domain ID must be the same between the two VLT devices. If the domain ID is not the same, a syslog message generates and VLT does not launch.

Related Commands
- `show vlt brief` — display the delay-restore value.

**vlt-peer-lag port-channel**

Associate the port channel to the corresponding VLT peer port channel for the VLT connection to an attached device.

**Syntax**
```
vlt-peer-lag port-channel id-number
```

**Parameters**
- `id-number` Enter the respective VLT port-channel number of the peer device. The range is from 1 to 128.

**Defaults**
Not configured.

**Command Modes**
INTERFACE PORT-CHELANNEL

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**show vlt private-vlan**

Display the private VLAN (PVLAN) associated with the VLT LAG for VLT peer nodes.

**Syntax**
```
show vlt private-vlan
```

**Command Modes**
EXEC
This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>

### Usage Information

If you add an ICL or VLTi link as a member of a primary VLAN, the ICL becomes a part of the primary VLAN and its associated secondary VLANs, similar to the behavior for normal trunk ports. VLAN symmetry is not validated if you associate an ICL to a PVLAN.

Similarly, if you dissociate an ICL from a PVLAN, although the PVLAN symmetry exists, ICL is removed from that PVLAN. The **ICL Status** field displays the type of VLAN port of the VLTi link configured in a PVLAN.

### Example

```
Dell#show vlt private-vlan vlan-id

Codes: C - Community, I - Isolated, V - Internally tagged, T - tagged, * - VLT

Pvlan Primary Secondary ICL Status
10    20 (C)        V (\*)
     30 (I)        V

40    50 (C)        T
     60 (I)        T
```
Virtual Router Redundancy Protocol (VRRP)

Virtual router redundancy protocol (VRRP) is supported by the Dell Networking OS.

Topics:
- IPv4 VRRP Commands
- IPv6 VRRP Commands

IPv4 VRRP Commands

The following are IPv4 VRRP commands.

advertise-interval

Set the time interval between VRRP advertisements.

Syntax
advertise-interval {seconds | centisecs centisecs }

Parameters
- seconds: Enter the number of seconds. The range is from 1 to 255. The default is 1 second.
- centisecs: Enter the keyword centisecs then the number of centisecs in multiples of 25 centisecs. The range is 25 to 4075 centisecs in multiples of 25 centisecs.

Defaults
1 second or 100 centisecs.

Command Modes
INTERFACE-VRRP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.5(0.0)</td>
<td>Added support for centisecs on the Z9000, S6000, S4820T, S4810, and MXL.</td>
</tr>
</tbody>
</table>
**authentication-type**

Enable authentication of VRRP data exchanges.

```
authentication-type simple [encryption-type] password
```

To delete an authentication type and password, use the `no authentication-type` command.

**Parameters**

- **simple**
  - Enter the keyword `simple` to specify simple authentication.
  
- **encryption-type**
  - (OPTIONAL) Enter one of the following:
    - `0` (zero) specifies an unencrypted authentication data follows.
    - `7` (seven) specifies a hidden authentication data follows.
    - `LINE` is the unencrypted (cleartext) authentication data.

- **password**
  - Enter a character string up to eight characters long as a password. If you do not enter an encryption-type, the password is stored as clear text.

**Defaults**

Not configured.

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
The system encrypts the password and the `show config` command displays the encrypted text string.

### clear counters vrrp
Clear the counters maintained on VRRP operations.

**Syntax**
clear counters vrrp [vrrp-id] [ipv6]

**Parameters**

- **vrrp-id**
  
  (OPTIONAL) Enter the number of the VRRP group ID to clear the group’s counters. The range is from 1 to 255.

- **ipv6**
  
  (OPTIONAL) Enter the keyword ipv6 to clear counters from the IPv6 VRRP group.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>7.6.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

**NOTE:** This command also enables you to clear the port configurations corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/[subport]`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1/1 - 1/1/4`.

### debug vrrp

Enable VRRP debugging.

**Syntax**

```
debug vrrp [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}
```

To disable debugging, use the `no debug vrrp [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}` command.

**Parameters**

- **vrrp-id**
  - (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.
- **all**
  - Enter the keyword `all` to enable debugging of all VRRP groups.
- **bfd**
  - Enter the keyword `bfd` to enable debugging of VRRP BFD interactions.
- **database**
  - Enter the keyword `database` to enable debugging of configuration changes.
- **interface**
  - Enter the following keywords and the interface information:
    - For Port Channel interface types, enter the keywords `port-channel` then the number.
    - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a VLAN interface, enter the keyword `vlan` then the VLAN ID. The VLAN ID range is from 1 to 4094.
- **interface**
  - Enter the keyword `interface` to enable debugging of interface state changes.
ipv6

Enter the keyword ipv6 to enable debugging for IPv6.

packets

Enter the keyword packets to enable debugging of VRRP control packets.

state

Enter the keyword state to enable debugging of VRRP state changes.

timer

Enter the keyword timer to enable debugging of the VRRP timer.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you do not specify an option, debug is active on all interfaces and all VRRP groups.

description

Configure a short text string describing the VRRP group.

**Syntax**

description text

To delete a VRRP group description, use the no description command.

**Parameters**

text

Enter a text string up to 80 characters long.

**Defaults**

Not enabled.

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
VRRP

Virtual Router Redundancy Protocol (VRRP)
Usage Information

To enable VRRP traffic, assign an IP address to the VRRP group using the virtual-address command and enter no disable.

Related Commands

- virtual-address — specify the IP address of the virtual router.

**hold-time**

Specify a delay (in seconds) before a switch becomes the MASTER virtual router. By delaying the initialization of the VRRP MASTER, the new switch can stabilize its routing tables.

**Syntax**

```
hold-time {seconds | centisecs centisecs}
```

To return to the default value, use the no hold-time command.

**Parameters**

- **seconds**
  - Enter the number of seconds. The range is from 0 to 65535. The default is zero (0) seconds.

- **centisecs centisecs**
  - Enter the keyword centisecs then the number of centisecs in units of 25 centisecs. The range is from 0 to 65525 in units of 25 centisecs.

**Defaults**

zero (0) seconds or (0) centiseconds

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0)
- 9.10(0.0)
- 9.8(2.0)
- 9.8(1.0)
- 9.8(0.0P5)
- 9.8(0.0P2)
- 9.7(0.0)
- 9.5(0.0)
- 9.2(1.0)

**Description**

- Introduced on the S3148.
- Introduced on the S6100–ON.
- Introduced on the S3100 series.
- Introduced on the Z9100–ON.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the S6000-ON.
- Introduced on the Z9000, S6000, S4820T, S4810, and MXL.
Usage Information
If a switch is a MASTER and you change the hold timer, disable and re-enable VRRP for the new hold timer value to take effect.

Related Commands
• disable — disables a VRRP group.

preempt

To preempt or become the MASTER router, configure a BACKUP router with a higher priority value.

Syntax
preempt
To prohibit preemption, use the no preempt command.

Defaults
Enabled (that is, a BACKUP router can preempt the MASTER router).

Command Modes
VRRP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.2.1.1 Introduced on the E-Series.
**priority**

Specify a VRRP priority value for the VRRP group. The VRRP protocol uses this value during the MASTER election process.

**Syntax**

```plaintext
priority  priority
```

To return to the default value, use the `no priority` command.

**Parameters**

- `priority` Enter a number as the priority. Enter 255 only if the router’s virtual address is the same as the interface’s primary IP address (that is, the router is the OWNER). The range is from 1 to 255. The default is `100`.

**Defaults**

`100`

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant `Dell Networking OS Command Line Reference Guide`.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

To guarantee that a VRRP group becomes MASTER, configure the VRRP group’s virtual address with same IP address as the interface’s primary IP address and change the priority of the VRRP group to 255.
If you set the priority command to 255 and the virtual-address is not equal to the interface's primary IP address, an error message appears.

**show config**

View the non-default VRRP configuration.

**Syntax**

```
show config [verbose]
```

**Parameters**

- `verbose` (OPTIONAL) Enter the keyword `verbose` to view all the VRRP group configuration information, including default information.

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.2.1.1 | Introduced on the E-Series.

**Example**

```
Dell(conf-if-vrid-4)# show config
vrrp-group 4
  virtual-address 119.192.182.124
  !
Dell(conf-if-vrid-4)#
```
**show vrrp**

View the VRRP groups that are active. If no VRRP groups are active, the Dell Networking OS returns No Active VRRP group.

**Syntax**

```
show vrrp [vrrp-id][brief][interface type][ipv6][interface type][vrf vrf-name]
```

**Parameters**

- **vrrp-id** (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.
- **brief** (OPTIONAL) Enter the keyword brief to view a table of information about the VRRP groups.
- **interface type** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a VLAN interface, enter the keyword vlan, and then the VLAN ID. The VLAN ID range is from 1 to 4094.
- **ipv6** (OPTIONAL) Enter the keyword ipv6 to view only VRRP IPv6 groups.
- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf and then the name of the VRF to view active VRRP groups corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</table>
### Version Description
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **6.2.1.1**: Introduced on the E-Series.

### Usage Information
The following describes the `show vrrp brief` command.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Lists the interface type, slot, and port of the configured VRRP group.</td>
</tr>
<tr>
<td>Grp</td>
<td>Displays the VRRP group ID.</td>
</tr>
<tr>
<td>Pri</td>
<td>Displays the priority value assigned to the interface. If you configured the track command to track that interface and you disable the interface, the cost is subtracted from the priority value assigned to the interface.</td>
</tr>
<tr>
<td>Pre</td>
<td>States whether preempt is enabled on the interface:</td>
</tr>
<tr>
<td></td>
<td>• Y = Preempt is enabled.</td>
</tr>
<tr>
<td></td>
<td>• N = Preempt is not enabled.</td>
</tr>
<tr>
<td>State</td>
<td>Displays the operational state of the interface using one of the following:</td>
</tr>
<tr>
<td></td>
<td>• NA/IF (the interface is not available).</td>
</tr>
<tr>
<td></td>
<td>• MASTER (the interface associated with the MASTER router).</td>
</tr>
<tr>
<td></td>
<td>• BACKUP (the interface associated with the BACKUP router).</td>
</tr>
<tr>
<td>Master addr</td>
<td>Displays the IP address of the MASTER router.</td>
</tr>
<tr>
<td>Virtual addr(s)</td>
<td>Displays the virtual IP addresses of the VRRP routers associated with the interface.</td>
</tr>
</tbody>
</table>

### Example (Brief)
```
Dell> Interface Grp Pri Pre State Master addr Virtual addr(s)
Description-----------------------------------------------
Gi 1/37 1 100 Y Master 200.200.200.200 200.200.200.201
Gi 1/37 3 100 Y Master 1.1.1.1 1.1.1.2
short desc
Dell>
```

### Usage Information
The following describes the `show vrrp` command.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet 1/3...</td>
<td>Displays the interface, VRRP group ID, and network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network address.</td>
</tr>
<tr>
<td>State: master...</td>
<td>Displays the interface's state:</td>
</tr>
<tr>
<td></td>
<td>• Na/If (not available)</td>
</tr>
<tr>
<td></td>
<td>• master (MASTER virtual router)</td>
</tr>
</tbody>
</table>
Item | Description
--- | ---
backup (BACKUP virtual router) | Also displays the interface’s priority and IP address of the MASTER.

Hold Down:... | Displays additional VRRP configuration information:
- Hold Down displays the hold down timer interval in seconds.
- Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.
- AdvInt displays the Advertise Interval in seconds.

Adv rcvd:... | Displays counters for the following:
- Adv rcvd displays the number of VRRP advertisements received on the interface.
- Adv sent displays the number of VRRP advertisements sent on the interface.
- Gratuitous ARP sent displays the number of gratuitous ARPs sent.

Virtual MAC address | Displays the virtual MAC address of the VRRP group.
Virtual IP address | Displays the virtual IP address of the interface’s VRRP router.
Authentication:... | States whether authentication is configured for the VRRP group. If it is configured, this lists the authentication type and password.
Tracking states:... | Displays if the track command is configured on an interface. Also displays the following information about the tracked interface:
- Dn or Up states whether the interface is down or up.
- The interface type slot/port information.

Example

Dell> show vrrp
------------------
GigabitEthernet 1/3, VRID: 1, Net: 10.1.1.253
VRF: 0 default
State: Master, Priority: 105, Master: 10.1.1.253 (local)
Hold Down: 0 sec, Preempt: TRUE, AdvInt: 1 sec
Adv rcvd: 0, Adv sent: 1862, Gratuitous ARP sent: 0
Virtual MAC address:
00:00:5e:00:01:01
Virtual IP address:
10.1.1.252
Authentication: (none)
Tracking states for 1 interfaces:
  Up GigabitEthernet 1/17 priority-cost 10
------------------
GigabitEthernet 1/4, VRID: 2, Net: 10.1.2.253
VRF: 0 default
State: Master, Priority: 110, Master: 10.1.2.253 (local)
Hold Down: 10 sec, Preempt: TRUE, AdvInt: 1 sec
Adv rcvd: 0, Adv sent: 1862, Gratuitous ARP sent: 0
Virtual MAC address:
00:00:5e:00:01:02
Virtual IP address:
10.1.2.252
Authentication: (none)
Tracking states for 2 interfaces:
  Up GigabitEthernet 2/1 priority-cost 10
Example (VRRP VRF)

track

Monitor an interface and lower the priority value of the VRRP group on that interface if it is disabled.

Syntax

track interface [priority-cost cost]

To disable monitoring, use the no track interface command.

Parameters

- **interface**
  - (OPTIONAL) Enter the following keywords and the interface information:
    - For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a VLAN interface, enter the keyword vlan, and then the VLAN ID. The VLAN ID range is from 1 to 4094.

- **priority-cost**
  - (OPTIONAL) Enter a number as the amount to subtract from the priority value. The range is from 1 to 254. The default is 10.

Defaults

priority cost = 10

Command Modes

VRRP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100–ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>

<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>
If you disable the interface, the cost value is subtracted from the priority value and forces a new MASTER election if the priority value is lower than the priority value in the BACKUP virtual routers.

**virtual-address**

Configure up to 12 virtual router IP addresses in the VRRP group. To start sending VRRP packets, set at least one virtual IP address for the VRRP group.

**Syntax**

```
virtual-address ip-address1 [... ip-address12]
```

To delete one or more virtual IP addresses, use the `no virtual-address ip-address1 [... ip-address12]` command.

**Parameters**

- `ip-address1`: Enter an IP address of the virtual router in dotted decimal format. The IP address must be on the same subnet as the interface's primary IP address.
- `... ip-address12`: (OPTIONAL) Enter up to 11 additional IP addresses of virtual routers in dotted decimal format. Separate the IP addresses with a space. The IP addresses must be on the same subnet as the interface's primary IP address.

**Defaults**

Not configured.

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<td>Introduced support for telnetting to the VRRP group IP address assigned using this command.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets.
A system message appears after you enter or delete the `virtual-address` command.

To guarantee that a VRRP group becomes MASTER, configure the VRRP group’s virtual IP address with the same address as the interface’s primary IP address and change the priority of the VRRP group to 255.

You can ping the virtual IP addresses configured in all VRRP groups.

**vrrp delay minimum**

Set the delay time for VRRP initialization after an interface comes up.

**Syntax**

```
vrrp delay minimum seconds
```

**Parameters**

- **seconds**
  
  Enter the number of seconds for the delay for VRRP initialization after an interface becomes operational. The range is from 0 to 900 (0 indicates no delay).

**Defaults**

0

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>
</tr>
<tr>
<td>9.0.0.0</td>
<td>Introduced on the Z9000.</td>

<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command applies to a single interface. When you use this command with the `vrrp delay reload` command, the later timer rules VRRP enabling. For example, if `vrrp delay reload` is 600 and `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

**Related Command**

- `vrrp delay reload` — sets the delay time for VRRP initialization after a system reboot.
vrrp delay reload

Set the delay time for VRRP initialization after a system reboot.

Syntax

```
vrrp delay reload seconds
```

Parameters

- `seconds` Enter the number of seconds for the delay. The range is from 0 to 900 (0 indicates no delay).

Defaults

0

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

This command applies to all the VRRP interfaces on a system. When you use this command with the `vrrp delay minimum` command, the later timer rules VRRP enabling. For example, if `vrrp delay reload` is 600 and `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

For the delay timers to take effect, save the configuration and reload the system.

Related Command

- `vrrp delay minimum` — sets the delay time for VRRP initialization after a line card reboot.
vrrp-group

Assign a VRRP ID to an interface. You can configure up to 12 VRRP groups per interface.

Syntax

vrrp-group vrrp-id

Parameters

vrrp-id

Enter a number as the group ID. The range is from 1 to 255.

Defaults

Not configured.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual IP address, the VRRP group stops sending VRRP packets.

Related Command

- virtual-address — assigns up to 12 virtual IP addresses per VRRP group.

version

Set the VRRP protocol version for the IPv4 group.

Syntax

version {2 | 3 | both}

virtual-address — assigns up to 12 virtual IP addresses per VRRP group.
To return to the default setting, use the `no version` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>2</code></td>
<td>Enter the keyword <code>2</code> to specify VRRP version 2 as defined by RFC 3768, <em>Virtual Router Redundancy Protocol</em>.</td>
</tr>
<tr>
<td><code>3</code></td>
<td>Enter the keyword <code>3</code> to specify VRRP version 3 as defined by RFC 5798, <em>Virtual Router Redundancy Protocol</em>.</td>
</tr>
<tr>
<td><code>both</code></td>
<td>Enter the keyword <code>both</code> for in-service migration from VRRP version 2 to VRRP version 3.</td>
</tr>
</tbody>
</table>

**Defaults**

`2`

**Command Modes**

`VRRP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.

<table>

</tr>
<tr>
<td>9.5(0.0)</td>
<td>Introduced on the Z9000, S6000, S4820T, S4810, and MXL.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can use the `both` command to migrate from VRRPv2 to VRRPv3. When you set the VRRP protocol version to `both`, the switch sends only VRRPv3 advertisements but can receive either VRRPv2 or VRRPv3 packets. To migrate an IPv4 VRRP group from VRRPv2 to VRRPv3:

1. Set the switches with the lowest priority to `both`.
2. Set the switch with the highest priority to version `3`.
3. Set all the switches from `both` to version `3`.

**NOTE:** Do not run VRRP version 2 and version 3 in the same group for an extended period of time.

**Example**

```
Dell(conf-if-gi-1/1-vrid-100)# version ?
2 VRRPv2
3 VRRPv3
both Interoperable, send VRRPv3 receive both
```

### IPv6 VRRP Commands

The following are IPv6 VRRP commands.

- `clear counters vrrp ipv6`
The following commands apply to IPv4 and IPv6:

- debug vrrp ipv6
- show vrrp ipv6
- vrrp-ipv6-group

The commands clear counters vrrp ipv6 are used to clear the counters recorded for IPv6 VRRP groups.

### clear counters vrrp ipv6

Clear the counters recorded for IPv6 VRRP groups.

**Syntax**

```
clear counters vrrp ipv6 [vrid | vrf vrf-name]
```

**Parameters**

- **vrid**  
  (OPTIONAL) Enter the number of an IPv6 VRRP group; range is from 1 to 255.

- **vrf vrf-name**  
  (OPTIONAL) Enter the name of a VRF instance to clear the counters of all IPv6 VRRP groups in the specified VRF. The maximum is 32 characters.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.9(0.0)</td>
<td>Added support to clear the interface configurations corresponding to a range of ports.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100–ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100–ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>

</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.10.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.4.1.0</td>
<td>Introduced on E-Series, C-Series, and S-Series. Support was added for IPv6 VRRP groups in nondefault VRF instances.</td>
</tr>
<tr>
<td>8.3.2.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>
Usage Information

**NOTE:** You can also clear the port configurations corresponding to a range of ports. For Open Networking (ON) platforms, the notation for specifying the port range in the command is different from how you specify the port range in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/ [subport]. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1/1 - 1/1/4`.

---

### debug vrrp ipv6

Enable VRRP debugging.

**Syntax**

```
debug vrrp ipv6 interface [vrid] {all | packets | state | timer}
```

**Parameters**

- **interface**: Enter the following keywords and the interface information:
  - For a 1-GigabitEthernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a Port Channel interface, enter the keywords `port-channel`, and then a number.
  - For a VLAN interface, enter the keyword `vlan`, and then the VLAN ID. The VLAN ID range is from 1 to 4094.

- **vrid**: (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.

- **all**: Enter the keyword `all` to enable debugging of all VRRP groups.

- **bfd**: Enter the keyword `bfd` to enable debugging of all VFFP BFD interactions.

- **database**: Enter the keyword `database` to display changes related to group, prefix, and interface entries in the VRRP table.

- **packets**: Enter the keyword `packets` to enable debugging of VRRP control packets.

- **state**: Enter the keyword `state` to enable debugging of VRRP state changes.

- **timer**: Enter the keyword `timer` to enable debugging of the VRRP timer.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
show vrrp ipv6

View the active IPv6 VRRP groups. If no VRRP groups are active, the Dell Networking OS returns No Active VRRP group.

Syntax
show vrrp ipv6 [vrid] [interface] [brief] [vrf vrf-name]

Parameters
vrid
(Optional) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.

interface
Enter the following keywords and the number information:

- For a 1-GigabitEthernet interface, enter the keyword GigabitEthernet then the slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel, and then a number.
- For a VLAN interface, enter the keyword vlan, and then a number from 1 to 4094.

brief
(Optional) Enter the keyword brief to view a table of information on the VRRP groups.

vrf vrf-name
Enter the keyword vrf then the name of the VRF to view IPv6 VRRP groups corresponding to that VRF.

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.

Usage Information
If you do not specify an option, debugging is active on all interfaces and all VRRP groups.
Usage Information

The following describes the **show vrrp ipv6** command.

### Line starting with Description

**GigabitEthernet...**
Displays the interface, VRRP group ID, and network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network IP address.

**VRF**
VRF instance to which the VRRP group interface belongs.

**State: master...**
Displays the interface’s state:
- Na/If (not available)
- master (MASTER virtual router)
- backup (BACKUP virtual router)

Also displays the interface’s priority and IP address of the MASTER.

**Hold Down:...**
Displays additional VRRP configuration information:
- Hold Down displays the hold down timer interval in seconds.
- Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.
- AdvInt displays the Advertise Interval in seconds.

**Adv rcvd:...**
Displays counters for the following:
- Adv rcvd displays the number of VRRP advertisements received on the interface.
- Adv sent displays the number of VRRP advertisements sent on the interface.
- Bad pkts rcvd displays the number of invalid packets received on the interface.

**Virtual MAC address**
Displays the virtual MAC address of the VRRP group.

**Virtual IP address**
Displays the virtual IP address of the VRRP router to which the interface is connected.

**Tracking states...**
Displays information on the tracked interfaces or objects configured for a VRRP group (**track** command), including:
- UP or DOWN state of the tracked interface or object (Up or Dn).
- Interface type and slot/port or object number, description, and time since the last change in the state of the tracked object.
Line starting with | Description  
--- | ---  
- Cost subtracted from the VRRP group priority if the state of the tracked interface/object goes DOWN.

**Example**

```
Dell# show vrrp ipv6
------------------
State: Master, Priority: 101, Master: fe80::201:e8ff:fe7a:6bb9 (local)
Hold Down: 0 centisec, Preempt: TRUE, AdvInt: 100 centisec
Accept Mode: FALSE, Master AdvInt: 100 centisec
Adv rcvd: 0, Bad pkts rcvd: 0, Adv sent: 64
Virtual MAC address:
  00:00:5e:00:02:ff
Virtual IP address:
  1::255 fe80::255
```

**vrrp-ipv6-group**

Assign an interface to a VRRP group.

**Syntax**

```
vrrp-ipv6-group vrid
```

**Parameters**

- `vrid` Enter the virtual-router ID number of the VRRP group. The VRID range is from 1 to 255.

**Defaults**

Not configured.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tbody>
</table>
Version Description
8.3.2.0     Introduced on the E-Series.

**Usage Information**
The VRRP group only becomes active and sends VRRP packets when you configure a link-local virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets.

- When you do not load the VRF microcode in the CAM, the VRID for a VRRP group is the same as the VRID number configured with the `vrrp-group` or `vrrp-ipv6-group` commands.
- When you load the VRF microcode in the CAM, the VRID for a VRRP group equals 16 times the `vrrp-group` or `vrrp-ipv6-group vrid` number, plus the `ip vrf vrf-id` number. For example, if you load the VRF microcode and you configure the VRRP group as 10 in VRF 2, the VRID for the VRRP group is \((16 \times 10) + 2\), or 162. This VRID value is used in the lowest byte of the virtual MAC address of the VRRP group and is also used for VRF routing.

**NOTE:** For all routers to interoperate, configure the same VRID on neighboring routers (Dell Networking or non-Dell Networking) in the same VRRP group.

**Related Commands**
- `virtual-address` — assigns up to 12 virtual IP addresses per VRRP group.
X.509v3 is a standard for public key infrastructure (PKI) to manage digital certificates and public key encryption. This standard specifies a format for public-key certificates or digital certificates. Dell Networking OS supports X.509v3 standards.

Topics:

crypto ca-cert delete

Deletes a CA certificate.

Syntax
crypto ca-cert delete [index]

Parameters
index  (Optional) Enter the keyword index to specify the index of the CA certificate. If index is not specified, the system deletes all of the installed CA certificates.

Defaults
NA.

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the command</td>
</tr>
</tbody>
</table>
Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Before deleting a CA certificate, the system checks whether that certificate is an issuer of other installed certificate on the system. If so, the system informs you to delete other installed certificates first.

Related Commands

- `crypto ca-cert install`
- `crypto cert generate`
- `crypto ca-cert install`

**crypto ca-cert install**

Downloads and installs the certificate of a Certificate Authority (CA) on to the device.

**Syntax**

```
crypto ca-cert install path
```

**Parameters**

`path`

Enter the path where the CA certificate is available for download. The format that you use to specify the location of the CA certificate also includes the protocol that is used to contact the CA. You can use the following options that you can use to download and install a certificate from the CA:

- `tftp` — `tftp://ca-ip-address/tftp/CAcert.pem`
- `usbflash:` — `usbflash:/certs/CAcert.pem`
- `ftp` — `ftp://userid:password@ca-ip-address/certs/CAcert.pem`
- `scp` — `scp://userid:password@ca-ip-address/certs/CAcert.pem`
- `http` — `http://192.168.1.100/certs/CAcert.pem`
- `flash` — `flash://filepath/filename`

**Defaults**

NA.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the command.</td>
</tr>
</tbody>
</table>

**Usage Information**

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Upon successful installation, the system displays a notification on the device. If remote logging is configured, the notification is also sent to the syslog server. Contents of the CA certificate's subject are displayed.

**Related Commands**

- `crypto cert install`
crypto cert delete

Deletes a trusted certificate.

Syntax

crypto cert delete

Defaults

NA.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the command.</td>
</tr>
</tbody>
</table>

Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

The certificate matching the current FIPS state is deleted. If the system is in FIPS mode, the FIPS certificate is deleted. If the system is in non-FIPS mode, the non-FIPS certificate is deleted.

Before deleting the system's trusted certificate, the system prompts you to specify whether to proceed with deletion. If you proceed, the system deletes the certificate and also the private key.

Related Commands

- crypto ca-cert install
- crypto cert generate

crypto cert generate

Generates a Certificate Signing Request (CSR) or a self-signed certificate.

Syntax

crypto cert generate {self-signed | request} [cert-file cert-path key-file {private | key-path}] [country 2-letter code] [state state] [locality city] [organization organization-name] [orgunit unit-name] [cname common-name] [email email-address] [validity days] [length length] [altname alt-name]

Parameters

- self-signed
- request
- cert-file

| Parameter   | Description                                                                 |
|-------------|------------------------------------------------------------------------------|---|
| self-signed | Enter the keyword self-signed to create a self-signed certificate.             |
| request     | Enter the keyword request to create a certificate signing request.            |
| cert-file   | Enter the keyword cert-file to specify that the certificate needs to be created. |

**NOTE:** If the cert-file option is not specified in the command, then the system interactively prompts you to fill in rest of the fields of the certificate signing request (CSR).
cert-path Enter the path to locally store the self-signed certificate or CSR. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the CSR file is stored. You can then export the CSR to a CA using the “copy” command. Following is an example of a path that you can specify: flash://certs/s4810-001-request.csr.

key-file Enter the keyword key-file to specify the private key.

private Enter the keyword private to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.

key-path Enter the absolute or relative location on the device where the key is stored.

country Enter the keyword country followed by the two letter code that is used to identify the country name.

city Enter the keyword city followed by the name of the city.

organization Enter the keyword organization followed by the name of the organization.

organization-name Enter the keyword organization-name followed by the name of the organization.

orgunit Enter the keyword orgunit followed by the name of the unit.

cname Enter the keyword cname followed by the common name that you want to assign.

NOTE: Common Name is an important attribute while creating a CSR or a self-signed certificate. Common name is the main identity presented to connecting entities. By default, the device’s host name acts as the common name. However, you can still configure a different common name for the device. For example, you can specify an IP address to act as a Common Name for the device. If the Common Name does not match the device’s presented identity, then even a properly signed certificate does not validate correctly.

e-mail Enter the keyword e-mail followed a valid email address used for communication with the organization.

validity Enter the keyword validity followed by the number of days for which the certificate is valid.

NOTE: For CSRs, validity has no effect. For self-signed certificates, if validity is not specified, it defaults to 3650 days, or 10 years.

length Enter the keyword length followed by a bit length value. The default key length for both FIPS and non-FIPS mode is 2048. Minimum key length value for FIPS mode is 2048. The range is from 2048 to 4096. Minimum key length value for non-FIPS mode is 1024. The range is from 1024 to 4096.

altname Enter the keyword altname followed by the subject alternate name for the organization. For example, altname IP:192.168.1.100.

Defaults NA.

Command Modes EXEC Privilege

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command:
Version Description
9.11.0.0 Introduced the command.

Usage Information
The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

If the cert-file option is not specified in the command, then the system interactively prompts you to fill in various fields of the certificate signing request (CSR). You are prompted to fill out some metadata information for the certificate. The following example shows the fields that you are prompted to fill:

You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank.
For some fields there will be a default value; if you enter '.', the field will be left blank.

-----
Country Name (2 letter code) [US]:
State or Province Name (full name) [Some-State]:California
Locality Name (eg, city) []:San Francisco
Organization Name (eg, company) []:Starfleet Command
Organizational Unit Name (eg, section) []:NCC-1701A
Common Name (eg, YOUR name) [S4810-001]:
Email Address []:scotty@starfleet.com

You can enter only 256 characters per command. If you have field values that are larger than 256 characters in length, use the interactive mode of the command.

Related Commands
- crypto ca-cert install

**crypto cert install**

Installs a trusted certificate on a device.

**Syntax**

```
crypto cert install cert-file cert-path key-file {key-path | private} [password passphrase]
```

**Parameters**

cert-file

Enter the keyword cert-file to specify that the certificate needs to be downloaded.

cert-path

Enter the path where the certificate is locally stored. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the certificate file is stored. Following are example of a path that you can specify:

- `flash://certs/s4810-001-request.crt`
- `usbflash://certs/s4810-001-cert.pem`

**NOTE:** Before installing a trusted certificate, you first need to download it from a remote CA using the copy command.

key-file

Enter the keyword key-file to specify the private key.

private

Enter the keyword private to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.

key-path

Enter the absolute or relative location on the device where the key is stored.
NOTE: After the certificate is successfully installed, the private key is deleted from the specified location and copied to the hidden location in NVRAM.

(password passphrase) (Optional) Enter the keyword password followed by the password phrase used to decrypt the private key.

NOTE: You can generate the private key and certificate on another host. While doing so, you must keep the private key encrypted with a passphrase so that the private key is not compromised during transport. The password phrase acts a facility to decrypt the private key before installing it on the switch.

Defaults

NA.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
</table>
| 9.11.0.0 | Introduced the command.

Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Certain parameters must be met in order for this command to succeed:

- The downloaded certificate should be formatted properly.
- In order for verification to work, the CA certificate must be installed on the system before running this command.
- The downloaded certificate’s public key must correspond to the private key.
- If the certificate is not self-signed, then the CA certificate (from the CA that has signed the certificate) must be installed on the system prior to running this command for verification to work.

NOTE: It is possible for the switch to store two types of certificates: one for the FIPS mode and one for the non-FIPS mode. If the system is in FIPS mode, the certificate is installed as the FIPS certificate. If the system is in non-FIPS mode, the certificate is installed as the non-FIPS certificate. When FIPS mode is enabled or disabled, the certificates (and keys) are switched by the system.

NOTE: For the switch, there are two possible certificates stored - one for FIPS mode, one for non-FIPS mode. If the system is in FIPS mode, the certificate will be installed as the FIPS certificate. If the system is in non-FIPS mode, the certificate will be installed as the non-FIPS certificate. When FIPS mode is enabled/disabled, the certificates (and keys) are switched by the system.

Related Commands

- crypto ca-cert install
**crypto x509 ocsp**

Configures the OCSP behavior.

**Syntax**

```plaintext
crypto x509 ocsp [nonce] [sign-requests]
```

**Parameters**

- **nonce**
  - Enter the keyword `nonce` to use the nonce feature for the OCSP requests to OCSP responder communication. This is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature.

- **sign-requests**
  - Enter the keyword `sign-requests` to sign the OCSP requests to OCSP responder communication with the system’s own certificate so that the OCSP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.

**Defaults**

NA.

---

**crypto x509 revocation**

Configure the revocation check behavior for the certificate.

**Syntax**

```plaintext
crypto x509 revocation ocsp {accept | reject}
```

**Parameters**

- **ocsp**
  - Enter the method used to check certificate revocation details. In this release, OCSP is the only option that is supported. So, you can specify OCSP as the method-list value.

- **accept**
  - Enter the keyword `accept` to accept the presented certificate and log in if OCSP retrieval fails.
reject

Enter the keyword reject to reject the presented certificate and log in if OCSP retrieval fails.

Defaults

crypto x509 revocation ocsp accept

</tbody>
</table>

Usage Information

The following RBAC roles are allowed to issue this command:

• sysadmin
• secadmin

You can use this command to verify an X509 certificate outside of use with Syslog over TLS.

Related Commands

• crypto cert install
• crypto cert generate
• crypto ca-cert install
logging secure

Creates a log file for various events related to X.509v3 certificates.

Syntax

logging {hostname} {secure | tcp | udp} [vrf vrf-name] [sha1 fingerprint] [port port-number]

Parameters

hostname
Enter the name of the host or device for which you wish to record logs corresponding to the certificates.

NOTE: The hostname can be an IPV4 address, an IPV6 address, or a DNS hostname—with or without DNS suffix.

secure
Enter the keyword secure to enable the Syslog feature to communicate with a compatible Syslog server using the secure TLS protocol over the default port (6514). The range is from 1024 to 65535.

tcp
Enter the keyword tcp to enable TCP.

udp
Enter the keyword udp to enable UDP.

vrf vrf-name
Enter the keyword vrf followed by the name of the VRF.

sha1 fingerprint
Enter the keyword sha1 followed by the fingerprint. This option is only available when the secure option is configured. This new option enables the Syslog feature to compare the received certificate's sha-1 fingerprint against this configured sha-1 fingerprint. If present, only the fingerprint is used for certificate revocation validation.

port port-number
Enter the keyword port followed by the port number. The default port number is 6514 for secure logging.

Defaults
None.

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command:

Version Description
9.11.0.0 Introduced this command.

Usage Information
The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Following are the pre-requisites to configure logging:

- The logging command must be configured to enable event logging.
- A certificate must be installed on the switch. This certificate is only used for secure logging.
- At least one CA certificate must be installed on the switch so that the logging server's certificate can be verified. If a SHA1 fingerprint is present, only the fingerprint is used for certificate revocation validation.
Related Commands

- crypto cert install
- crypto ca-cert install
- crypto cert generate

**crypto x509 ca-keyid**

Creates a per-certificate configuration context using the specified subject key identifier.

**Syntax**

crypto x509 ca-keyid subject-key-identifier

Use the no crypto x509 ca-keyid command to remove this configuration.

**Parameters**

- **subject-key-identifier**

  Enter the content of the SubjectKeyIdentifier field from the CA certificate.

  **NOTE:** To get the subject key identifier details, enter the show crypto ca-cert command. This command displays the CA certificate details.

**Defaults**

None.

**Command Modes**

- CONFIGURATION Mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced this command.</td>
</tr>
</tbody>
</table>

**Usage Information**

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

When you use this command, the device maps the current certificate context in the certificate store to a CA certificate through the subject key identifier field. The subject key identifier field contains the SHA-1 hash of the CA's public key. This configuration provides a way to uniquely identify a CA and associate it with any CA-specific settings.

This context is used to store certificate-specific settings such as alternate CRL and OCSP locations. Incoming X.509 certificates whose AuthorityKeyIdentifier extensions match the configured subject key identifier has these settings applied to them.

The **crypto x509 ca-keyid** command when used with the **ocsp-server** command in the global configuration mode creates a per-certificate configuration context under which the remaining commands are entered.

**Related Commands**

- ocsp-server
- crypto x509 ocsp
**ocsp-server**

Configures OCSP server on a CA.

**Syntax**

```
ocsp-server url [nonce] [sign-requests]
```

**Parameters**

- **url**
  - Enter the URL for the OCSP responder using standard URI format. Either http or https protocol can be used. For example, http://[1100::101]:8888.

- **nonce**
  - Enter the keyword `nonce` to use the nonce feature for the OCSP requests to OCSP responder communication. This number is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature.

- **sign-requests**
  - Enter the keyword `sign-requests` to sign the OCSP requests to OCSP responder communication with the system's own certificate so that the OCSP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.

**Defaults**

None.
