Warranty and Return Policy Information

Dell Computer Corporation (“Dell”) manufactures its hardware products from parts and components that are new or equivalent to new in accordance with industry-standard practices. See your Dell PowerEdge System Information document for complete warranty information for your system.
Other Documents You May Need

In addition to this User’s Guide, the following documentation is included with your system:

• The Installation and Troubleshooting Guide provides instructions for installing system hardware and includes troubleshooting and diagnostic procedures for testing your computer system.

• The Dell PowerEdge System Information document, which provides information about your system.

You may also have one or more of the following documents:

• Operating system documentation is included with the system if you ordered the operating system software from Dell. This documentation describes how to install (if necessary), configure, and use the operating system software.

• The rack installation documentation provides detailed instructions for installing the system in a rack.

• Documentation is included with any options you purchase separately from the system. This documentation includes information that you need to configure and install these options in your Dell system.

• Technical information files—sometimes called “readme” files—may be installed on the hard-disk drive to provide last-minute updates about technical changes to the system or advanced technical reference material intended for experienced users or technicians.

• Documentation updates are sometimes included with the system to describe changes to the system or software. Always read these updates before consulting any other documentation because the updates often contain information that supersedes the information in the other documents.

Typographical Conventions

The following list defines (where appropriate) and illustrates typographical conventions used as visual cues for specific elements of text throughout this document:

• Interface components are window titles, button and icon names, menu names and selections, and other options that appear on the monitor screen or display. They are presented in bold.
  Example: Click OK.

• Keycaps are labels that appear on the keys on a keyboard. They are enclosed in angle brackets.
  Example: <Enter>

• Key combinations are series of keys to be pressed simultaneously (unless otherwise indicated) to perform a single function.
  Example: <Ctrl><Alt><Enter>
• **Commands** presented in lowercase bold are for reference purposes only and are not intended to be typed when referenced.

Example: “Use the **format** command to...”

In contrast, commands presented in the Courier New font are part of an instruction and intended to be typed.

Example: “Type **format a:** to format the diskette in drive A.”

• **Filenames** and **directory names** are presented in lowercase bold.

Examples: **autoexec.bat** and **c:\windows**

• **Syntax lines** consist of a command and all its possible parameters. Commands are presented in lowercase bold; variable parameters (those for which you substitute a value) are presented in lowercase italics; constant parameters are presented in lowercase bold. The brackets indicate items that are optional.

Example: **del [drive:] [path] filename [p]**

• **Command lines** consist of a command and may include one or more of the command’s possible parameters. Command lines are presented in the Courier New font.

Example: **del c:\myfile.doc**

• **Screen text** is a message or text that you are instructed to type as part of a command (referred to as a **command line**). Screen text is presented in the Courier New font.

Example: The following message appears on your screen:

No boot device available

Example: “Type **md c:\programs** and press <Enter>.”

• **Variables** are placeholders for which you substitute a value. They are presented in italics.

CHAPTER 1
Introduction

The Dell™ PowerEdge™ 350 system is an ultra-slim, rack-mounted server. This system is a full-featured system which provides a robust, reliable, rack-optimized platform on which both large and small customers can deploy Internet infrastructure applications.

This chapter describes the system's major hardware and software features, provides information about the indicators and controls on the system's front panel, and discusses connecting external devices.

NOTE: The PowerEdge 350 system is a "headless" system that operates without keyboard, monitor or mouse. While it is possible to connect these peripherals to the system, it is generally not necessary unless troubleshooting the system.

System Features

PowerEdge 350 systems contain the following major features:

- An Intel® Celeron™ microprocessor with 128 kilobytes (KB) of level 2 (L2) cache memory and a minimum operating speed of 600 megahertz (MHz).
  or
- An Intel Pentium® III microprocessor with 256 KB of L2 cache memory and an operating speed of 750 MHz.
- Up to 1 gigabyte (GB) of system memory.
- Two 1-inch integrated drive electronics (IDE) hard-disk drives.
- A single, 1.44-megabyte (MB) 3.5-inch diskette drive.
- An IDE CD-ROM drive.
- A video graphics array (VGA)-compatible video controller card.
- Two integrated Intel PRO/100+ network interface controllers (NICs), which provide two Ethernet interfaces.
- A Personal System/2 (PS/2)-style keyboard port and mouse port, two serial ports, and two Universal Serial Bus (USB) connectors.
- The System Setup program, which can be accessed at system boot for quickly viewing and changing the system configuration information for your system. For more information about the System Setup program, see Chapter 3, “Using the System Setup Program.”
- The Dell OpenManage™ software. For information on this software, see the software documentation provided with your system.
- Diagnostics for evaluating your system’s components and devices. For information on using the system diagnostics, see “Running the Dell Diagnostics” in your Installation and Troubleshooting Guide.

**Supported Operating Systems**

Dell supports the following network operating systems for use on PowerEdge 350 systems:

- Microsoft® Windows® 2000 Server
- Microsoft Windows NT® Server 4.0
- Red Hat Linux 7.x

*NOTE: Installation service and support for other operating systems are available through DellPlus™. For more information, see “Getting Help” in your Installation and Troubleshooting Guide.*

**System Orientation**

The front panel of your system contains switches, indicator lights, and diskette and CD-ROM drives. To view the front panel, you must remove the optional front bezel from the system.

**Removing the Optional Front Bezel**

To remove the optional front bezel, press the tab on each end of the bezel and lift the bezel from the chassis (see Figure 1-1).
**Figure 1-1. Removing the Optional Front Bezel**

**Front-Panel Features**
Figure 1-2 shows the main features on the system front panel.

**Connecting External Devices**

You can connect various external devices, such as a mouse or network connection, to the input/output (I/O) ports and connectors on the system’s back panel. Figure 1-6 shows the back-panel connections on your system.
The system basic input/output system (BIOS) detects the presence of external devices when you boot or reboot your system. When you connect external devices to your system, follow these guidelines:

- Check the documentation that accompanied the device for specific installation and configuration instructions.
- Always attach external devices while your system is turned off. Turn on any external devices before turning on the system unless the documentation for the device specifies otherwise. (If the system does not seem to recognize the device, try turning on the system before turning on the device.)

**Power Protection Devices**

A number of devices are available that protect your system against power problems such as power surges, transients, and power failures. The following subsections describe some of these devices.

**Surge Protectors**

Surge protectors are available in a variety of types and usually provide a level of protection commensurate with the cost of the device. Surge protectors prevent voltage spikes, such as those caused during an electrical storm, from entering a system through the electrical outlet. Surge protectors, however, do not offer protection against brownouts, which occur when the voltage drops more than 20 percent below the normal AC line voltage level.

**Line Conditioners**

Line conditioners go beyond the overvoltage protection of surge protectors. Line conditioners keep a system’s AC power source voltage at a fairly constant level and, therefore, can handle brownouts. Because of this added protection, line conditioners cost more than surge protectors—up to several hundred dollars. However, these devices cannot protect against a complete loss of power.

**Uninterruptible Power Supplies**

Uninterruptible power supply (UPS) systems offer the most complete protection against variations in power because they use battery power to keep the system running when AC power is lost. The battery is charged by the AC power while it is available, so once AC power is lost, the battery can provide power to the system for a limited amount of time—from 15 minutes to an hour or so—depending on the UPS system.

UPS systems range in price from a few hundred dollars to several thousand dollars, with the more expensive units allowing you to run larger systems for a longer period of time when AC power is lost. UPS systems that provide only 5 minutes of battery power let you conduct an orderly shutdown of the system, but are not intended to provide continued operation. Surge protectors should be used with all UPS systems, and the UPS system should be Underwriters Laboratories (UL) safety-approved.
**Getting Help**

If at any time you do not understand a procedure described in this guide, or if your system does not perform as expected, Dell provides a number of tools to help you. For more information on these help tools, see “Getting Help” in your *Installation and Troubleshooting Guide*.

**Safety, Regulatory, and Warranty Information**

For safety, regulatory, and warranty information for your system, see the *System Information* document included with your system.
CHAPTER 2
Using the Dell OpenManage Server Assistant CD

The Dell OpenManage Server Assistant CD contains utilities, diagnostics, drivers, and other items that can help you configure your system to best meet your needs. This chapter describes how to use the Dell OpenManage Server Assistant CD.

Starting the Dell OpenManage Server Assistant CD

The Dell OpenManage Server Assistant application program has two modes of operation: a setup mode for setting up and configuring your system, creating diskettes, and viewing information, and a service mode for creating diskettes and viewing information. Documentation is available on the Dell Online Documentation CD.

In both setup mode and service mode, the Dell OpenManage Server Assistant main screen gives you the option to choose one of the supported languages as the language for the screen text. You can choose a language at any time from the main screen.

Setup Mode

To set up your system, as well as to access the utilities, drivers, and other items available on the Dell OpenManage Server Assistant CD, insert the Dell OpenManage Server Assistant CD into your CD-ROM drive, and turn on or reboot the system. The Dell OpenManage Server Assistant main page appears.

If the CD does not boot, verify that the Boot Sequence is set to CD-ROM device in the System Setup program.

Service Mode

You can create system diskettes and view information on any system that has Microsoft Internet Explorer 4.0 (or later). When you insert the CD in a system that uses the Microsoft Windows NT or Windows 2000 Server operating system, the system automatically starts the browser software and displays the Dell OpenManage Server Assistant main page.
Navigating the CD

The Dell OpenManage Server Assistant CD utilizes a standard Web browser interface. Navigating the CD is accomplished by clicking the mouse on the various icons and text hyperlinks.

Click the Back icon to return to the previous screen. Click the Exit icon to exit the program. Exiting the program causes the system to reboot to the standard operating system boot partition.

Setting Up Your System

If you purchase a system that does not have an operating system preinstalled by Dell, or if you reinstall an operating system at a later date, you should use the Server Setup option to configure your system or install your operating system.

Server Setup Mode

Dell recommends using the Server Setup program for most situations including installing and reinstalling an operating system. The Dell OpenManage Server Assistant CD guides you through the operating system setup and configuration process. The program prompts you to select the operating system used on the drive and leads you through a step-by-step process to install the operating system.

To start the Server Setup program, perform the following steps:

1. Click the SETUP icon at the top of the screen.
2. Click Server Setup.

After you start the Server Setup program, follow the directions on the screen to complete the installation and configuration process. The Server Setup program takes you through the following tasks:

- Configuring your redundant array of independent disks (RAID) controller (if applicable)
- Entering operating system and hard-disk drive information
- Entering operating system configuration
- Installing an operating system

Running System Diagnostics

To run the system diagnostics you must create diagnostics diskettes from the Dell OpenManage Server Assistant CD. See the following subsection, “Creating Diagnostic Diskettes.”

The system hardware diagnostics are described in “Running the Dell Diagnostics” in your Installation and Troubleshooting Guide.
**Creating Diagnostic Diskettes**

To create diagnostic diskettes from the Dell OpenManage Server Assistant CD, select Create Diskettes from the Dell OpenManage Server Assistant menu and then continue down the menu hierarchy by selecting the following categories: PowerEdge 350, Diskette Set, System Utilities, Server Diagnostics. Create five Server Diagnostics diskettes. To run the diagnostics, reboot your system with the first diskette you made.

**Creating an Asset Tag**

Using Dell OpenManage IT Assistant, you can enter an asset tag number for your system. An asset tag number can have up to ten characters and any combination of characters, excluding spaces.

To create an asset tag number, perform the following steps:

1. From the Dell OpenManage Server Assistant CD, select Dell OpenManage IT Assistant in Read/Write mode.
2. From the main Dell OpenManage IT Assistant window, select Servers.
3. From the new window, select the particular server for which you wish to create the asset tag.
4. Select the Status tab and click the Asset Tag Field.
5. Log in to Dell OpenManage IT Assistant. You must have administrative rights to do this.
6. In the Edit Attribute dialog box, type the asset tag number you want to assign to the system and click OK.
CHAPTER 3

Using the System Setup Program

Each time you turn on your system, the system compares the configuration of the hardware installed in the system to the hardware listed in the system configuration information stored in nonvolatile random-access memory (NVRAM) on the system board. If the system detects a discrepancy, it generates error messages that identify the incorrect configuration settings. The system then prompts you to enter the System Setup program to correct the setting.

You can use the System Setup program as follows:

• To change the system configuration information after you add, change, or remove any hardware in your system
• To set or change user-selectable options—for example, the time or date on your system

After you set up your system, run the System Setup program to familiarize yourself with your system configuration information and optional settings. Dell recommends that you print the System Setup screens (by pressing <Print Screen>) or record the information for future reference.

Before you use the System Setup program, you need to know the kind of diskette drive(s) and hard-disk drive(s) installed in your system. If you are unsure of any of this information, see the Manufacturing Test Report that was shipped with your system. You can access the Manufacturing Test Report from the Dell Accessories folder.

NOTE: The PowerEdge 350 system is a “headless” system that operates without keyboard, monitor, or mouse. You must connect the keyboard and monitor to perform the procedures in this chapter.

Entering the System Setup Program

Enter the System Setup program as follows:

1. Turn on your system.

   If your system is already on, shut it down and then restart it.

2. Press <F2> immediately after you see the following message:
   
   F2 = Setup
If you wait too long and your operating system begins to load into memory, let the system complete the load operation, and then shut down the system and try again.

NOTE: To ensure an orderly system shutdown, consult the documentation that accompanied your operating system.

You can also enter the System Setup program by responding to certain error messages. See “Responding to Error Messages” in the following section.

**Responding to Error Messages**

If an error message appears on your monitor screen while the system is booting, make a note of the message. Then, before entering the System Setup program, see “POST Beep Codes” and “System Messages” in your Installation and Troubleshooting Guide for an explanation of the message and suggestions for correcting any errors. (An exception to this routine: It is normal to receive an error message the first time you boot your system after installing a memory upgrade. In that situation, do not refer to “POST Beep Codes” and “System Messages.” Instead, follow the instructions for performing a memory upgrade in “Memory Modules” in your Installation and Troubleshooting Guide.)

If you are given an option of pressing either <F1> to continue or <F2> to run the System Setup program, press <F2>.

**Using the System Setup Navigation Keys**

Table 3-1 lists the keys that you use to view, move around in, or change information on the System Setup screens and to exit the program.

NOTE: For help using the System Setup program, press <F1>.

Using the System Password Features

**NOTICE:** The password features provide a basic level of security for the data on your system. However, they are not foolproof. If your data requires more security, it is your responsibility to obtain and use additional forms of protection, such as data encryption programs.

The System Setup program allows you to install supervisor and user passwords. A supervisor password is used to access the System Setup program while a user password is used to access the system, such as when logging in.

Your Dell system is shipped to you without the supervisor password feature installed. If system security is a concern, you should operate your system only with supervisor password protection.

You can assign a supervisor password whenever you use the System Setup program. After a supervisor password is assigned, only those who know the password have full use of the System Setup program.
When the **Set Supervisor Password** option is **Installed**, the system then prompts you for the supervisor password (only when going into system setup) just after the system boots.

To change an existing supervisor password, you must know the supervisor password (see the section “Deleting or Changing an Existing Supervisor Password” found later in this chapter). If you assign and later forget a supervisor password, you need to be able to remove the system cover to change a jumper setting that disables the supervisor password feature (see the section “Deleting a Forgotten Password” found later in this chapter). Note that this procedure erases the user password at the same time.

**NOTICE:** If you leave your system running and unattended without having a supervisor password assigned, or if you leave your system unlocked so that someone can disable the password by changing a jumper setting, anyone can access the data stored on your hard-disk drive.

### Assigning a Supervisor Password (System Setup Only)

Before you can assign a supervisor password, you must enter the System Setup program and select the **Set Supervisor Password** option.

**NOTE:** The supervisor password controls the user password access to the system setup. See “Security Menu” earlier in this chapter for a description of the levels of user password access.

When a supervisor password is assigned, the setting shown for the **Set Supervisor Password** option is **Installed**.

When no supervisor password is assigned and the password jumper on the system board is in the uninstalled position (its default), the setting shown for the **Set Supervisor Password** option is **Not Installed**. Only when this option is set to **Not Installed** can you assign a supervisor password, using the following procedure:

1. Enter the System Setup program by pressing <F2>.
2. Select the **Security** screen.
3. Verify that the **Supervisor Password Is** option is set to **Not Installed**.
4. Select the **Set Supervisor Password** option and press <Enter>.
   
   The system prompts you to **Enter Supervisor Password**.
5. Type your supervisor password.
   
   You can use up to seven characters in your password.

   As you press each character key (or the spacebar key for a blank space), an asterisk (*) placeholder appears in the field.

   The password assignment operation recognizes keys by their location on the keyboard; it is case sensitive. This means that the software distinguishes between lowercase and uppercase characters. For example, if you have an *M* in your password, the system does not recognize either *M* or *m* as correct; your system will
only accept M. Certain keys and key combinations are not valid. If you enter one of these keys or combinations, the system does not accept them. To erase a character when entering your password, press <Backspace> or the left-arrow key.

**NOTE:** To escape from the field without assigning a supervisor password, press the <Esc> key at any time before completing step 5.

6. Press <Enter>.

The system prompts you to Confirm New Password, followed by another empty seven-character field in square brackets.

7. To confirm your new password, type it a second time and press <Enter>.

The system tells you the Password Successfully Installed.

The password setting changes to **Installed**. Your supervisor password is now set; you can exit the System Setup program and begin using your system. Note, however, that password protection does not take effect until you reboot the system by turning the system off and then on again.

**Using Your Supervisor Password to Secure Your System Setup**

If the Supervisor Password Is option is set to **Installed**, the following prompt appears:

Enter CURRENT Password

After you type the correct supervisor password and press <Enter>, you can log on to the system as you normally would.

If a wrong or incomplete supervisor password is entered, the following message appears:

Enter CURRENT Password

If an incorrect or incomplete supervisor password is entered again, the same message appears.

The third and subsequent times an incorrect or incomplete supervisor password is entered, the system displays the following message:

Invalid Password-System Halted

To reboot the system and either set a new password, press <Ctrl><Alt><Del> or the reset button on the system unit.

The number of unsuccessful attempts made to enter the correct supervisor password can alert you to an unauthorized person attempting to use your system.

Even after your system is turned off and on, the previous message is displayed each time an incorrect or incomplete supervisor password is entered.
NOTE: The supervisor password only applies to the System Setup program. A user password should be installed to completely secure your system. See “Assigning a User Password” found later in this chapter.

Deleting or Changing an Existing Supervisor Password
To delete or change an existing supervisor password, perform the following steps:

1. Enter the System Setup program by pressing <F2>.
2. Select the Security screen field to verify that the Supervisor Password Is option is set to Installed.
3. Select the Set Supervisor Password option and press <Enter>. The system prompts you to Enter Current Password.
4. Type your current supervisor password and press <Enter>.
The system prompts you to Enter Supervisor Password.

NOTE: If you want to delete the password and not enter a new password, press <Enter> without typing in a new password, leaving the Enter Supervisor Password field blank.
5. To assign a new password, follow the procedure from step 4 on in “Assigning a Supervisor Password (System Setup Only)” found earlier in this chapter.

Using the User Password Feature
Your Dell system is shipped to you without the user password feature installed. If system security is a concern, you should operate your system with user password protection.

You can assign a user password whenever you use the System Setup program. After a user password is assigned, only those who know the password have access to the System Setup program.

To change an existing user password, you must know the user password (see the section “Deleting or Changing an Existing User Password” found later in this chapter). If you assign and later forget a user password, you need to be able to remove the system cover to change a jumper setting that disables the user password feature. See “Deleting a Forgotten Password” found later in this chapter. Note that this procedure erases the supervisor password at the same time.

NOTICE: If you leave your system running and unattended without having a user password assigned, or if you leave your system unlocked so that someone can disable the password by changing a jumper setting, anyone can access the data stored on your hard-disk drive.
Assigning a User Password

Before you can assign a user password, you must enter the System Setup program and select the Set User Password option.

To assign a user password, perform the following steps:

1. Enter the System Setup program by pressing <F2>.
2. Select the Security screen.
3. Select the Set User Password option and press <Enter>.

The system prompts you to Enter User Password.

4. Type your user password.

You can use up to seven characters in your password.

As you press each character key (or the spacebar key for a blank space), an asterisk (*) placeholder appears in the field.

The password assignment operation recognizes keys by their location on the keyboard; it is case sensitive. This means that the software distinguishes between lowercase and uppercase characters. For example, if you have an M in your password, the system does not recognize either M or m as correct; your system will only accept M. Certain keys and key combinations are not valid. If you enter one of these keys or combinations, the system does not accept them. To erase a character when entering your password, press <Backspace> or the left-arrow key.

NOTE: To escape from the field without assigning a user password, press the <Esc> key at any time prior to completing step 4.

5. Press <Enter>.

The system prompts you to Confirm New Password, followed by another empty seven-character field in square brackets.

6. To confirm your password, type it a second time and press <Enter>.

The system tells you that the Password Successfully Installed.

The password setting changes to Installed. Your supervisor password is now set; you can exit the System Setup program and begin using your system. A change to the Set User Password option becomes effective immediately (rebooting the system is not required).

NOTES: The user password can be the same as the supervisor password.

If the two passwords are different, the user password can be used as an alternate supervisor password. However, the supervisor password cannot be used in place of the user password.
Operating With a User Password Installed

If **Set User Password** is set to **Installed**, you must enter the correct user password before you can modify the majority of the System Setup options. When you start the System Setup program, the program prompts you to type the password.

If you do not enter the correct password in three tries, the system displays the following message:

Invalid Password-System Halted

Deleting or Changing an Existing User Password

To delete or change an existing user password, perform the following steps:

1. Enter the System Setup program by pressing <F2>.
2. Select the **Security** screen field to verify that the **User Password Is** option is set to **Installed**.
3. Select the **Set User Password** option and press <Enter>.
   
   The system prompts you to **Enter Current Password**.
4. Type your current user password and press <Enter>
   
   The system prompts you to **Enter User Password**.
   
   **NOTE:** If you want to delete the password and not enter a new password, press <Enter> without typing in a new password, leaving the **Enter User Password** field blank.
5. To assign a new password, follow the procedure from step 4 in “Assigning a User Password” found earlier in this chapter.

Deleting a Forgotten Password

If you forget your supervisor or user password, you cannot operate your system or change settings in the System Setup program until someone having a supervisor password clears and installs a new user password.

If you forgot your supervisor or user password, you cannot operate your system or change settings in the System Setup program until a trained service technician opens the system chassis, changes the password jumper setting to disable the passwords, and erases the existing passwords. This procedure is described in “Disabling Forgotten Passwords” in the *Installation and Troubleshooting Guide*.

**NOTE:** For the full name of an abbreviation or acronym used in this table, see the “Glossary.”
This section provides specific information about the input/output (I/O) ports and connectors on the back panel of the system.

**I/O Ports and Connectors**

The I/O ports and connectors on the back panel of the system are the gateways through which the system communicates with external devices, such as a keyboard, mouse, printer, and monitor. Figure B-1 identifies the I/O ports and connectors for your system.

*Figure B-1. I/O Ports and Connectors*
Serial Ports

The two integrated serial ports on the front and back panels of the system use 9-pin D-subminiature connectors. These ports support devices such as external modems, printers, plotters, and mice that require serial data transmission (the transmission of data one bit at a time over one line).

Most software uses the term COM (for communications) plus a number to designate a serial port (for example, COM1 or COM2). The default designations of your system’s integrated serial ports are COM1 and COM2.

Serial Port Connectors

If you reconfigure your hardware, you may need pin number and signal information for the serial port connectors. Figure B-2 illustrates the pin numbers for the serial port connectors and Table B-1 defines the pin assignments and interface signals for the serial port connector.

Keyboard and Mouse Connectors

The system uses a Personal System/2 (PS/2)-style keyboard and supports a PS/2-compatible mouse. Cables from both devices attach to 6-pin, miniature Deutsche Industrie Norm (DIN) connectors on the back panel of your system.

Mouse driver software can give the mouse priority with the microprocessor by issuing IRQ12 whenever a new mouse movement is detected. The driver software also passes along the mouse data to the application program that is in control.

Keyboard Connector

If you reconfigure your hardware, you may need pin number and signal information for the keyboard connector. Figure B-3 illustrates the pin numbers for the keyboard connector and Table B-2 defines the pin assignments and interface signals for the keyboard connector.

Mouse Connector

If you reconfigure your hardware, you may need pin number and signal information for the mouse connector. Figure B-4 illustrates the pin numbers for the mouse connector, and Table B-3 defines the pin assignments and interface signals for the mouse connector.
The system uses a 15-pin high-density D-subminiature connector on a video controller for attaching a video graphics array (VGA)-compatible monitor to your system. The video circuitry on the system board synchronizes the signals that drive the red, green, and blue electron guns in the monitor.

If you reconfigure your hardware, you may need pin number and signal information for the video connector. Figure B-5 illustrates the pin numbers for the video connector, and Table B-4 defines the pin assignments and interface signals for the video connector.
USB Connectors

Your system contains two Universal Serial Bus (USB) connectors for attaching USB-compliant devices. USB devices are typically peripherals such as mice, printers, keyboards, and system speakers.

**NOTICE:** Do not attach a USB device or a combination of USB devices that draw a maximum current over 500 milliamperes (mA) per channel or +5 volts (V). Attaching devices that exceed this threshold may cause the USB ports to shut down. See the documentation that accompanied the USB devices for their maximum current ratings.

If you reconfigure your hardware, you may need pin number and signal information for the USB connectors. Figure B-6 illustrates the USB connector and Table B-5 defines the pin assignments and interface signals for the USB connector.

Integrated Network Interface Controller Connector

Your system has two integrated 10/100–megabit-per-second (Mbps) network interface controllers (NICs). Each NIC provides all the functions of a separate network expansion card and supports both the 10BASE-T and 100BASE-TX Ethernet standards.

Each NIC includes a Wakeup On LAN feature that enables the system to be started by a special local area network (LAN) signal from a server management console. Wakeup On LAN provides remote system setup, software downloading and installation, file updates, and asset tracking after hours and on weekends when LAN traffic is typically at a minimum.

Network Cable Requirements

Your system’s RJ45 NIC connectors are designed for attaching an unshielded twisted pair (UTP) Ethernet cable equipped with standard RJ45-compatible plugs. Press one end of the UTP cable into the NIC connector until the plug snaps securely into place. Connect the other end of the cable to an RJ45 jack wall plate or to an RJ45 port on a UTP concentrator or hub, depending on your network configuration. Observe the following cabling restrictions for 10BASE-T and 100BASE-TX networks.

NOTICE: To avoid line interference, voice and data lines must be in separate sheaths.

- For 10BASE-T networks, use Category 3 or greater wiring and connectors.
- For 100BASE-TX networks, use Category 5 or greater wiring and connectors.
- The maximum cable run length (from a workstation to a concentrator) is 328 feet (ft) (100 meters [m]).
- For 10BASE-T networks, the maximum number of daisy-chained concentrators on one network segment is four.

**boot routine**
When you start your system, it clears all memory, initializes devices, and loads the operating system. Unless the operating
system fails to respond, you can reboot (also called warm boot) your system by pressing <Ctrl><Alt><Del>; otherwise, you must perform a cold boot by pressing the reset button (if your system has one) or by turning the system off and then back on.

**bootable diskette**
You can start your system from a diskette in drive A. To make a bootable diskette, insert a diskette in drive A, type **sys a:** at the command line prompt and then press <Enter>. Use this bootable diskette if your system will not boot from the hard disk drive.

**bus**
A bus forms an information pathway between the components of a system. Your system contains an expansion bus that allows the microprocessor to communicate with controllers for all the various peripheral devices connected to the system. Your system also contains an address bus and a data bus for communications between the microprocessor and RAM.

**byte**
Eight contiguous bits of information; the basic data unit used by your system.

**C**
Abbreviation for Celsius.

**cache**
To facilitate quicker data retrieval, a storage area for keeping a copy of data or instructions. For example, your system’s BIOS may cache ROM code in faster RAM. Or a disk-cache utility may reserve RAM in which to store frequently accessed information from your system’s disk drives; when a program makes a request to a disk drive for data that is in the cache, the disk-cache utility can retrieve the data from RAM faster than from the disk drive.

**CD-ROM**

**device driver**
A device driver allows the operating system or a program to interface correctly with a peripheral such as a printer or network card. Some device drivers—such as network drivers—must be loaded from the config.sys file (with a device= statement) or as memory-resident programs (usually, from the autoexec.bat file). **directory**  
Directories help keep related files organized in a hierarchical, “inverted tree” structure. Each disk has a ‘root’ directory; for example, a C:\prompt normally indicates that you are at the root directory of hard-disk drive C. Additional directories that branch off of the root directory are called subdirectories. Subdirectories may contain additional directories branching off of them.

**drive-type number**  
Your system can recognize a number of specific hard-disk drives. Each is assigned a drive-type number that is stored in NVRAM. The hard-disk drive(s) specified in your system’s System Setup program must match the actual drive(s) installed in the system. System diskette is a synonym for bootable diskette.

**system memory**
System memory is a synonym for RAM.

**System Setup program**
System Setup program options allow you to configure your system’s hardware. Some options in the System Setup program require that you reboot the system to effect a hardware-configuration change. Because the System Setup program is stored in NVRAM, any options that you set remain in effect until you change them again.

**TCP/IP**

**terminator**
Some devices, especially disk drives, contain a terminator to absorb and dissipate excess current. When more than one such device is connected in a series, you may need to remove the terminator—or change a jumper setting to disable it—unless it is the last device in the series. However, some devices have terminators that should never be removed or disabled.

**UPS**

Typically, a video adapter comes with video drivers for displaying popular application programs and operating environments in a variety of video modes.

On most current Dell systems, a video adapter is integrated into the system board. Also available are many video adapter cards that plug into an expansion-card connector.

Video adapters can include memory separate from RAM on the system board. The amount of video memory, along with the adapter's video drivers, may affect the number of colors that can be simultaneously displayed. Video adapters can also include their own coprocessor chip for faster graphics rendering.

video driver
Graphics-mode application programs and operating environments, such as Windows, often require video drivers to display at a chosen resolution with the desired number of colors. A program may include some "generic" video drivers. Any additional video drivers may need to match the video adapter; you can find these drivers on a separate diskette with your system or video adapter.

video memory
Most VGA and SVGA video adapters include VRAM or DRAM memory chips in addition to your system's RAM. The amount of video memory installed primarily influences the number of colors that a program can display (with the appropriate video drivers and monitor capability).

video mode
Video adapters normally support multiple text and graphics display modes. Character-based software (such as MS-DOS) displays in text modes that can be defined as \(x\) columns by \(y\) rows of characters. Graphics-based software (such as Windows) displays in graphics modes that can be defined as \(x\) horizontal by \(y\) vertical pixels by \(z\) colors.

video resolution
Video resolution—640 x 480, for example—is expressed as the number of pixels across by the number of pixels up and down. To display a program at a specific graphics resolution, you must install the appropriate video drivers and your monitor must support the resolution.
