A. LICENSE TERMS

The free distribution and use of this software in both source and binary form is allowed (with or without changes) provided that:

1. Distributions of this source code include the above copyright notice, this list of conditions and the following disclaimer;
2. Distributions in binary form include the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other associated materials;
3. The copyright holder's name is not used to endorse products built using this software without specific written permission.

DISCLAIMER

This software is provided "as is" with no explicit or implied warranties in respect of its properties, including, but not limited to, correctness and/or fitness for purpose.

XXXVIII. Portions of this product make use of STLport. A copy of the license may be obtained at http://www.stlport.org/doc/license.html.

A. License Agreement:

Boris Fomitchev grants Licensee a non-exclusive, non-transferable, royalty-free license to use STLport and its documentation without fee.

By downloading, using, or copying STLport or any portion thereof, Licensee agrees to abide by the intellectual property laws and all other applicable laws of the United States of America, and to all of the terms and conditions of this Agreement.

Licensee shall maintain the following copyright and permission notices on STLport sources and its documentation unchanged:

Copyright 1999,2000 Boris Fomitchev

This material is provided "as is", with absolutely no warranty expressed or implied. Any use is at your own risk.

Permission to use or copy this software for any purpose is hereby granted without fee, provided the above notices are retained on all copies. Permission to modify the code and to distribute modified code is granted, provided the above notices are retained, and a notice that the code was modified is included with the above copyright notice.

The Licensee may distribute binaries compiled with STLport (whether original or modified) without any royalties or restrictions.
The Licensee may distribute original or modified STLport sources, provided that:

- The conditions indicated in the above permission notice are met;
- The following copyright notices are retained when present, and conditions provided in accompanying permission notices are met:

Copyright 1994 Hewlett-Packard Company - Permission to use, copy, modify, distribute and sell this software and its documentation for any purpose is hereby granted without fee, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation. Hewlett-Packard Company makes no representations about the suitability of this software for any purpose. It is provided "as is" without express or implied warranty.

Copyright 1996,97 Silicon Graphics Computer Systems, Inc. - Permission to use, copy, modify, distribute and sell this software and its documentation for any purpose is hereby granted without fee, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation. Silicon Graphics makes no representations about the suitability of this software for any purpose. It is provided "as is" without express or implied warranty.

Copyright 1997 Moscow Center for SPARC Technology - Permission to use, copy, modify, distribute and sell this software and its documentation for any purpose is hereby granted without fee, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation. Moscow Center for SPARC Technology makes no representations about the suitability of this software for any purpose. It is provided "as is" without express or implied warranty.

1. urwid

Copyright (C) 2004-2012 Ian Ward

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it is useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

GNU LESSER GENERAL PUBLIC LICENSE

Version 3, 29 June 2007
Welcome

Copyright (C) 2007 Free Software Foundation, Inc. <http://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates the terms and conditions of version 3 of the GNU General Public License, supplemented by the additional permissions listed below.

1. Additional Definitions.

   As used herein, "this License" refers to version 3 of the GNU Lesser General Public License, and the "GNU GPL" refers to version 3 of the GNU General Public License.

   "The Library" refers to a covered work governed by this License, other than an Application or a Combined Work as defined below.

   An "Application" is any work that makes use of an interface provided by the Library, but which is not otherwise based on the Library. Defining a subclass of a class defined by the Library is deemed a mode of using an interface provided by the Library.

   A "Combined Work" is a work produced by combining or linking an Application with the Library. The particular version of the Library with which the Combined Work was made is also called the "Linked Version".

   The "Minimal Corresponding Source" for a Combined Work means the Corresponding Source for the Combined Work, excluding any source code for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

   "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

1. Exception to Section 3 of the GNU GPL.

   You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.

2. Conveying Modified Versions.

   If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:

   a) under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or

   b) under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

   The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:

   a) Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.

   b) Accompany the object code with a copy of the GNU GPL and this license document.

You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:

a) Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.

b) Accompany the Combined Work with a copy of the GNU GPL and this license document.

c) For a Combined Work that displays copyright notices during execution, include the copyright notice for the Library among these notices, as well as a reference directing the user to the copies of the GNU GPL and this license document.

d) Do one of the following:

0) Convey the Minimal Corresponding Source under the terms of this License, and the Corresponding Application Code in a form suitable for, and under terms that permit, the user to recombine or relink the Application with a modified version of the Linked Version to produce a modified Combined Work, in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.

1) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (a) uses at run time a copy of the Library already present on the user's computer system, and (b) will operate properly with a modified version of the Library that is interface-compatible with the Linked Version.

e) Provide Installation Information, but only if you would otherwise be required to provide such information under section 6 of the GNU GPL, and only to the extent that such information is necessary to install and execute a modified version of the Combined Work produced by recombining or relinking the Application with a modified version of the Linked Version. (If you use option 4d0, the Installation Information must accompany the Minimal Corresponding Source and Corresponding Application Code. If you use option 4d1, you must provide the Installation Information in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.)

You may place library facilities that are a work based on the Library side by side in a single library together with other library facilities that are not Applications and are not covered by this License, and convey such a combined library under terms of your choice, if you do both of the following:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities, conveyed under the terms of this License.

b) Give prominent notice with the combined library that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

6. Revised Versions of the GNU Lesser General Public License.

The Free Software Foundation may publish revised and/or new versions of the GNU Lesser General Public License from time to time. Such new versions is similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library as you received it specifies that a certain numbered version of the GNU Lesser General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that published version or of any later version published by the Free Software Foundation. If the Library as you received it does not specify a version number of the GNU Lesser General Public License, you may choose any version of the GNU Lesser General Public License ever published by the Free Software Foundation.
If the Library as you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public License shall apply, that proxy's public statement of acceptance of any version is permanent authorization for you to choose that version for the Library.

GNU LESSER GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <https://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates the terms and conditions of version 3 of the GNU General Public License, supplemented by the additional permissions listed below.

0. Additional Definitions.

As used herein, "this License" refers to version 3 of the GNU Lesser General Public License, and the "GNU GPL" refers to version 3 of the GNU General Public License.

"The Library" refers to a covered work governed by this License, other than an Application or a Combined Work as defined below.

An "Application" is any work that makes use of an interface provided by the Library, but which is not otherwise based on the Library.

Defining a subclass of a class defined by the Library is deemed a mode of using an interface provided by the Library.

A "Combined Work" is a work produced by combining or linking an Application with the Library. The particular version of the Library with which the Combined Work was made is also called the "Linked Version".

The "Minimal Corresponding Source" for a Combined Work means the Corresponding Source for the Combined Work, excluding any source code for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

The "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

1. Exception to Section 3 of the GNU GPL.

You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.

2. Conveying Modified Versions.

If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:

a. under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or

b. under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:

a. Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.

b. Accompany the object code with a copy of the GNU GPL and this license document.

You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:

a. Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.

b. Accompany the Combined Work with a copy of the GNU GPL and this license document.

c. For a Combined Work that displays copyright notices during execution, include the copyright notice for the Library among these notices, as well as a reference directing the user to the copies of the GNU GPL and this license document.

d. Do one of the following:

0) Convey the Minimal Corresponding Source under the terms of this License, and the Corresponding Application Code in a form suitable for, and under terms that permit, the user to recombine or relink the Application with a modified version of the Linked Version to produce a modified Combined Work, in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.

1) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (a) uses at run time a copy of the Library already present on the user's computer system, and (b) will operate properly with a modified version of the Library that is interface-compatible with the Linked Version.

e. Provide Installation Information, but only if you would otherwise be required to provide such information under section 6 of the GNU GPL, and only to the extent that such information is necessary to install and execute a modified version of the Combined Work produced by recombining or relinking the Application with a modified version of the Linked Version. (If you use option 4d0, the Installation Information must accompany the Minimal Corresponding Source and Corresponding Application Code. If you use option 4d1, you must provide the Installation Information in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.)

You may place library facilities that are a work based on the Library side by side in a single library together with other library facilities that are not Applications and are not covered by this License, and convey such a combined library under terms of your choice, if you do both of the following:

a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities, conveyed under the terms of this License.
b. Give prominent notice with the combined library that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

6. Revised Versions of the GNU Lesser General Public License.

The Free Software Foundation may publish revised and/or new versions of the GNU Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library as you received it specifies that a certain numbered version of the GNU Lesser General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that published version or of any later version published by the Free Software Foundation. If the Library as you received it does not specify a version number of the GNU Lesser General Public License, you may choose any version of the GNU Lesser General Public License ever published by the Free Software Foundation.

If the Library as you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public License shall apply, that proxy's public statement of acceptance of any version is permanent authorization for you to choose that version for the Library.

CXXII. License Information:

Copyright (c) 1999 - 2017 Dell Inc. All rights reserved.

This software and associated documentation (if any) is furnished under a license and may only be used or copied in accordance with the terms of the license.

Dell elects to use only the Apache license for any software where a choice of Apache v2, and Mozilla Public License 1.1 license versions are made available with the language indicating that Apache v2, and Mozilla Public License 1.1 "or any later version may be used, or where a choice of which version of the Apache v2, and Mozilla Public License 1.1" is applied is unspecified.

CXXIV. Portions of this product make use of Compat.ICSharpCode.SharpZipLib and ICSharpCode.SharpZipLib in Mono under GNU LESSER GENERAL PUBLIC LICENSE v3. You may obtain a copy of the license at https://www.gnu.org/licenses/lgpl.txt, although the full text is available below.

GNU LESSER GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <https://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates the terms and conditions of version 3 of the GNU General Public License, supplemented by the additional permissions listed below.

1. Additional Definitions.

As used herein, "this License" refers to version 3 of the GNU Lesser General Public License, and the "GNU GPL" refers to version 3 of the GNU General Public License.

"The Library" refers to a covered work governed by this License, other than an Application or a Combined Work as defined below.

An "Application" is any work that makes use of an interface provided by the Library, but which is not otherwise based on the Library.

Defining a subclass of a class defined by the Library is deemed a mode of using an interface provided by the Library.

A "Combined Work" is a work produced by combining or linking an Application with the Library. The particular version of the Library with which the Combined Work was made is also called the "Linked Version".

The "Minimal Corresponding Source" for a Combined Work means the Corresponding Source for the Combined Work, excluding any source code for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

The "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

2. Exception to Section 3 of the GNU GPL.

You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.
3. Conveying Modified Versions.

If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:

a. under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or

b. under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:

a. Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.

b. Accompany the object code with a copy of the GNU GPL and this license document.

5. Combined Works.

You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:

a. Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.

b. Accompany the Combined Work with a copy of the GNU GPL and this license document.

c. For a Combined Work that displays copyright notices during execution, include the copyright notice for the Library among these notices, as well as a reference directing the user to the copies of the GNU GPL and this license document.

d. Do one of the following:

0) Convey the Minimal Corresponding Source under the terms of this License, and the Corresponding Application Code in a form suitable for, and under terms that permit, the user to recombine or relink the Application with a modified version of the Linked Version to produce a modified Combined Work, in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.

1) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (a) uses at run time a copy of the Library already present on the user's computer system, and (b) will operate properly with a modified version of the Library that is interface-compatible with the Linked Version.

e. Provide Installation Information, but only if you would otherwise be required to provide such information under section 6 of the GNU GPL, and only to the extent that such information is necessary to install and execute a modified version of the Combined Work produced by recombining or relinking the Application with a modified version of the Linked Version. (If you use option 4d0, the Installation Information must accompany the Minimal Corresponding Source and Corresponding Application Code. If you use option 4d1, you must provide the Installation Information in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.)

You may place library facilities that are a work based on the Library side by side in a single library together with other library facilities that are not Applications and are not covered by this License, and convey such a combined library under terms of your choice, if you do both of the following:

a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities, conveyed under the terms of this License.

b. Give prominent notice with the combined library that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

7. Revised Versions of the GNU Lesser General Public License.

The Free Software Foundation may publish revised and/or new versions of the GNU Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library as you received it specifies that a certain numbered version of the GNU Lesser General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that published version or of any later version published by the Free Software Foundation. If the Library as you received it does not specify a version number of the GNU Lesser General Public License, you may choose any version of the GNU Lesser General Public License ever published by the Free Software Foundation.

If the Library as you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public License shall apply, that proxy's public statement of acceptance of any version is permanent authorization for you to choose that version for the Library.

---

Classpath is distributed under the terms of the GNU General Public License with the following clarification and special exception.

Linking this library statically or dynamically with other modules is making a combined work based on this library. Thus, the terms and conditions of the GNU General Public License cover the whole combination.

As a special exception, the copyright holders of this library give you permission to link this library with independent modules to produce an executable, regardless of the license terms of these independent modules, and to copy and distribute the resulting executable under terms of your choice, provided that you also meet, for each linked independent module, the terms and conditions of the license of that module. An independent module is a module which is not derived from or based on this library. If you modify this library, you may extend this exception to your version of the library, but you are not obligated to do so. If you do not wish to do so, delete this exception statement from your version.

As such, it can be used to run, create and distribute a large class of applications and applets. When GNU Classpath is used unmodified as the core class library for a virtual machine, compiler for the java language, or for a program written in the java programming language it does not affect the licensing for distributing those programs directly.

Source code for this component can be found at http://opensource.dell.com.

Get Started

Get Started with Dell Data Security

- Once your environment has been configured in the Server Configuration Tool, ensure that Dell services are started.
- Log in to the Management Console.
- Add Client Access Licenses, as needed.
- Add domains from your directory server.
- If you require that users receive non-default policies upon activation, modify policies at the appropriate level.
- Add groups and users, as necessary.
- Assign administrators, as necessary.
- Deploy clients.

Log In

To perform a given administrative procedure, an administrator must first log in to the Management Console using an appropriate Dell administrator account.

The Dell Server installs with a default super administrator user name (superadmin) and password (changeit) that you can use to add additional Dell administrator accounts.

1. Open a supported browser and type http://<server.domain.com>:8443/webui/login.
2. If you are logging in for the first time, in the Username, enter superadmin. In the Password, enter changeit.
   If you are not logging in for the first time, enter your user name in one of the formats listed below. In Password, enter <your_case-sensitive_password>.
   user@domain.com (preferred format)
   sAMAccountName, such as jsmith
   <DOMAIN>\<Username> - You must specify your domain name as an alias to use this format. For more information, refer to Add Domains.
3. Click Sign in.

To log out, see Log Out.

Log Out

If you are an account administrator and make changes to your own account, you must log out and log back in to see the results.

- Click the gear icon in the top right corner of the Management Console and select Log out from the menu.
Dashboard

The dashboard displays an overview of status information for your enterprise. Access more detailed information directly from the dashboard by clicking its statistics, graphs, and chart legends.

In the top right, select the **Widgets** menu to add or remove the following widgets:

- Notifications
- Protection Status
- Threat
- Protection History
- Inventory History
- Summary Statistics

The images below reflect what may be seen in the dashboard, depending on widgets enabled.

Click an area below to view a description of the detail accessible by clicking the same area in the dashboard.
An Advanced Threat Prevention event is not necessarily a threat. An event is generated when a recognized file or program is quarantined, safe listed, or waived. Threats are a category of events that are newly detected as potentially unsafe files or programs and require guided remediation.
Get Started

Start Services

Start the following Services:

- Dell Compatibility Server
- Dell Compliance Reporter
- Dell Console Web Services
- Dell Core Server
- Dell Device Server
- Dell Key Server
- Dell Message Broker
- Dell Policy Proxy
- Dell Security Server

From the Service Panel:

1. Click Start > Run. Type services.msc and click OK.
2. In the Services (Local) window, highlight Dell Compatibility Server. Right-click the entry and select Start.
3. Continue in the manner above until all Dell Services are started.
4. Close the Services window.

To stop Services, see Stop Services.

Stop Services

You may find it necessary to shut down the Services to run backups or perform other system maintenance. While the Server is down, the Policy Proxy cannot poll the Server, which means that it cannot pick up updated security policies, or activate/reactivate endpoints.

Stop the following Services:

- Dell Compatibility Server
- Dell Compliance Reporter
- Dell Console Web Services
- Dell Core Server
- Dell Device Server
- Dell Key Server
- Dell Message Broker
- Dell Policy Proxy
- Dell Security Server

From the Service Panel:

1. Click Start > Run. Type services.msc and click OK.
2. In the Services (Local) window, highlight Dell Compatibility Server. Right-click the entry and select Stop.
3. Continue in the manner above until all Dell Services are stopped.
4. Close the Services window.

To start Services, see Start Services.

Change Superadmin Password

1. In the masthead at the top of the screen, click the gear icon and select Change superadmin password.
2. Enter the current password.
3. Enter the new password.

The new password must be at least 6 characters, contain at least one capital letter and one of these characters: ~@#$%^*(){}[]?.}
4. Confirm the new password.

5. Click **Update**.

After three failed login attempts, the superadmin account is locked for five minutes. To change these settings, see [Set or Change Account Lockout Settings](#).
Components
Architecture Drawings

Architecture with Manager

Architecture with Encryption Enterprise for Windows/Manager

Default Port Values
Components

Internal:
Active Directory communication: TCP/389
Email communication (optional): 25

To Front End (if needed):
Communication from external Policy Proxy to Message Broker: TCP/61616 and STOMP/61613
Communication to Back End Security Server: HTTPS/8443
Communication to Back End Core Server: HTTPS/8888 and 9000
Communication to RMI ports - 1099
Communication to Back End Device Server: HTTP(S)/8443 - If your Dell Server is v7.7 or later. If your Dell Server is pre-v7.7, HTTP(S)/8081.
Message Broker: TCP/61616 and STOMP/61613 (closed or, if configured for DMZ, 61613 is open)

External (if needed):
SQL Database: TCP/1433
LDAP: TCP/389/636 (local domain controller), TCP/3268/3269 (global catalog), TCP/135/49125+ (RPC)
Compatibility Server: TCP/1099
Compliance Reporter: HTTP(S)/8084 (automatically configured at installation)
Core Server: HTTPS/8888 and 9000 (8888 is automatically configured at installation)
Device Server: HTTP(S)/8081 - If your Dell Server is pre-v7.7/8443 - If your Dell Server is v7.7 or later
Key Server: TCP/8050
Policy Proxy: TCP/8000
Security Server: HTTPS/8443
Client authentication: HTTPS/8449 (If using Dell Encryption on a server operating system)
Management Console: HTTPS/8443
Client communication if using Advanced Threat Prevention: HTTPS/TCP/443
Beacon server if using Data Guardian: HTTP/8446

Proxy Servers
The proxy server installation, implementation, and deployment are fast and easy. The proxy server is a simplified web server with a single web application.

Types of Proxy Servers
- Security Server (defaults to 8443)
- Core Server (defaults to 8888)
- Device Server (defaults to 8081) see Note
Note: The purpose of Device Server proxy is to support legacy Encryption clients (pre-v8.0) that communicate with port 8081. Newer Encryption clients (v8.0 and later) are configured by the client installer to communicate with the Security Server (or Security Server proxy) on port 8443. The full Device Server is not installed in v8.1. The Device Server proxy forwards all communications to the Security Server behind the firewall.
Policy Proxy

Policy Proxy serves as intermediary between Dell Server and Encryption client, delivering information from each to the other.

Time Slotting

To prevent Dell Server traffic jams, Policy Proxies use a time slotting mechanism that allows them to independently choose well-distributed time slots for communicating with the Dell Server.

Polling

On every poll, the endpoint authenticates, checks for policy updates, and uploads inventory. A successful authentication is required for the process to begin.

Poll Triggers

A user must be logged in to poll. On the next user login, another poll occurs. The poll information needed is only available per user, and when that user is logged in.

Other times a poll occurs:

- Immediately upon login, after encryption keys are unlocked.
- When a network status update is signaled by the operating system (cable plugged in, wireless network connected, VPN becomes active).
- When the polling period elapses, as specified by policy.

Failed Poll Attempts

Policy Proxy poll attempts are based on a timer. When a poll attempt fails, the timer is reset. The length of time set for the next attempt is based on when the attempt failed. If the device misses a poll when powered off, the timer is triggered when the device is next powered on.

If the poll attempt failed while making the attempt, the time is set to one tenth the policy value for the polling interval. For example, if the polling interval is 100 minutes, then the next interval after a failed attempt is 10 minutes. If it fails again, the next interval is still 10 minutes. The interval remains 10 minutes until a successful poll, after which it returns to 100 minute intervals.

General Information

- Policy Proxy is generally installed on only a few computers.
- Creates inventory information for the Dell Server.
- Passes on to the Dell Server device inventory it receives when the Encryption client successfully retrieves policies.
- Secures distributes security policies and encryption keys to devices via the network when contacted.
- May be in your DMZ.
- Always belongs to a group. By default, all Policy Proxies belong to the same group.
Navigate the Dell Server

Navigation

The Management Console is a central control center that the administrator can use to deploy and monitor security for the organization. It consists of security and configuration settings that are applied through policy to groups called Populations.

The menu pane allows access to the following:

Dashboard

The Management Console opens to the dashboard. The dashboard provides graphs and statistics on endpoints and threat protection as well as summary statistics on populations and operating systems.

Populations

A population is a grouping for which security policies, settings, and actions can be configured. For example, security policies can be applied at the Enterprise, Domain, User Group, User, Endpoint Group, and Endpoint levels. See Populations. See Manage Security Policies.

Reporting

Reporting menu items provide reports on the protection state of the environment and endpoints, deployment issues that require action, and devices within the network. Create and manage reports with the Manage Reports tool or by launching Compliance Reporter. This menu allows you to collect, view, and export audit events to a SIEM server.

Management

Commit policies, manage licenses, services, alerts, and Data Guardian external users.

Masthead Icons

The following icons display on the masthead:

1. Logged in user - The user icon and name of the user that is currently logged on.
2. Gear icon - From the gear icon, you can Change the Superadmin Password, view information about the Dell Server, get Dell ProSupport contact information, and log out.
3. Question mark icon - Open a help topic that explains the current screen in the Management Console.

Disconnected Mode

Disconnected mode allows a Dell Server to manage Advanced Threat Prevention endpoints without client connection to the Internet or external network. Disconnected mode also allows the Dell Server to manage clients without Internet connection or a provisioned and hosted Advanced Threat Prevention service. The Dell Server captures all event and threat data in Disconnected mode.
To determine if a Dell Server is running in Disconnected mode, click the gear icon at the top right of the Management Console and select About. The About screen indicates that a Dell Server is in Disconnected mode, below the Dell Server version.

Disconnected mode is different than a standard connected installation of Dell Server in the following ways.

**Client Activation**

An install token is generated when the administrator uploads an Advanced Threat Prevention license, which allows the Advanced Threat Prevention client to activate.

**Management Console**

The following items are **not available** in the Management Console when Dell Server is running in Disconnected mode:

- The following areas specific to Advanced Threat Prevention: Advanced Threats by Priority, (Advanced Threat) Events by Classification, Advanced Threats Top Ten, and Advanced Threat Prevention Events.
- Enterprise > Advanced Threats tab, which provides a dynamic display of detailed events information for the entire enterprise, including a list of the devices on which events occurred and any actions taken on those devices for those events.
- (Left navigation pane) Services Management, which allows enabling of the Advanced Threat Prevention service and product notifications enrollment.

The following item **is available** to the Management Console when Dell Server is running in Disconnected mode:

- Enterprise > Advanced Threat Events tab, which list events information for the entire enterprise based on information available in the Dell Server, even when running in Disconnected mode.

**Functionality**

The following functionality is **not available** in the Management Console when Dell Server is running in Disconnected mode:

- Security Management Server upgrade, update, and migration
- Security Management Server Virtual auto update - an update must be done manually
- Cloud profile update
- Advanced Threat Prevention auto update
- Upload of Unsafe or Abnormal Executable files for Advanced Threat Prevention analysis
- Advanced Threat Prevention file upload and log file upload

The following functionality differs:

- The Dell Server sends the Global Safe List, Quarantine List, and Safe List to client computers.

The Global Safe List is imported to the Dell Server through the Global Allow policy. For more information, see the Global Allow policy.

The Quarantine List is imported through Quarantine List policy. For more information, see the Quarantine List policy.

The Safe List is imported through Safe List policy. For more information, see the Safe List policy.

**Dashboard**
Dashboard

The dashboard displays an overview of status information for your enterprise. Access more detailed information directly from the dashboard by clicking its statistics, graphs, and chart legends.

In the top right, select the **Widgets** menu to add or remove the following widgets:

- Notifications
- Protection Status
- Threat
- Protection History
- Inventory History
- Summary Statistics

The images below reflect what may be seen in the dashboard, depending on widgets enabled.

Click an area below to view a description of the detail accessible by clicking the same area in the dashboard.
An Advanced Threat Prevention event is not necessarily a threat. An event is generated when a recognized file or program is quarantined, safe listed, or waived. Threats are a category of events that are newly detected as potentially unsafe files or programs and require guided remediation.
Notifications List

The notifications list provides a configurable summary of news, alerts, and events to display on the dashboard or to be sent as email notifications. For more information, see Dashboard Field Descriptions and Notification Management.

Notification Types

Select the notification types to include in the list. Notifications of the remaining types are hidden.

Types include:

Update - News of upcoming product updates. To view and receive product updates, you must enroll to receive them. Select Services Management > Product Notifications, click On, then click Save Preferences.

Config - News about configuration changes.

Knowledge Base - Summaries and links to knowledge base articles with in-depth technical information such as workarounds and configuration methods.

License - Alerts when your volume license is low, or when your client access license count has been exceeded.

Announcement - News of upcoming releases and new products.

Threat Protection - A threat alert from Advanced Threat Prevention.

Advanced Threat Event - An event detected by Advanced Threat Prevention. The summary contains a listing of Critical, Major, Minor, Caution, and Information events, with links to more detailed information.
**Threat Event** - An event detected by Threat Protection.

**Certificate** - Certificate expiration notification.

**Server Exceptions** - A Dell Server communication issue is impacting deliveries of the following notifications: Threat Protection, Update, Config, Knowledge Base, and Announcement.

After selecting one or more types, click in the neutral space above the list to apply the selections.

Select **Clear selected items** to reset the selections in this list.

**Priority Levels**

Notification priority levels are not related to priority levels displayed on the dashboard other than in the notifications area.

Priorities are Critical, High, Medium, and Low. These priority levels are only relative to one another within a type of notification.

Select the priority levels of notifications to include in the dashboard notifications area or email notifications lists. Notifications of the remaining priority levels are not included in the dashboard or email notifications lists.

In the dashboard, after selecting one or more priority levels, click in the neutral space above the list to apply selections.

Select **Clear selected items** to reset the selections in this drop down list. All notifications will display (unless filtered elsewhere).

**Endpoint Protection Status**

In the Endpoint Protection Status section of the dashboard, view endpoint status by platform: Windows, Mac, Mobile Devices, and All Platforms with a numeric value and bar chart that shows the numbers of protected and unprotected endpoints. A pie chart representing total protected and unprotected endpoints displays on the left.

Click a value to display a list of the endpoints represented in the value.

**Protection Status**

To access this page, click a link in the dashboard's Endpoint Protection Status graph. Click a specific platform type or **All**. The page provides protection details on the endpoints within that platform.

Platform - Windows, Mac, Mobile Devices, All, Protected, or Not Protected

Endpoint ID - Value that uniquely identifies the endpoint.

Protected - A green check mark indicates the endpoint is protected. The protection status of a Windows workstation is derived from the current encryption policies and encryption states of the Encryption client users, as well as the current device encryption policy and state of the endpoint. On the dashboard's Endpoint Protection Status graph, select endpoints by platform, protected endpoints, non-protected endpoints, or all endpoints. See Protected.

Shield Inventory Received - The date and time that the inventory was received and placed in the queue.

Shield Inventory Processed - The date and time that the inventory was picked up from the queue and processed. **(Note: If the server is under load, the Processed and Received times may be different, but usually they are the same.)**
Agent Inventory Received - The date and time that the inventory was received and placed in the queue.

Agent Inventory Processed - The date and time that the inventory was picked up from the queue and processed (Note: If the Dell Server is under load, the Processed and Received times may be different, but usually they are the same.)

Shield - If encryption is installed on the endpoint, an icon displays.

Manager (Windows only) - If installed on the endpoint, an icon displays. This includes endpoints with activated PBA, SED, or BitLocker Manager.

**Threat Protection Status**

Threat Protection monitors the network for viruses, spyware, unwanted programs, suspicious communications through the firewall, and unsafe websites and downloads.

The Threat Protection Status pane shows threats by category: Critical, Major, Minor, and Caution. Each category is listed in a colored bar chart with a numerical value for the corresponding number of threats found during the time frame.

The time frame is selectable, in days: 1, 7, 14, 30, 60, and 90 days.

Click a Threat Category value to display a detailed list of threats included in the category.

**Threat Protection Status for Severity Level**

To access this page, click a value on the dashboard's Threat Protection Status graph.

This page provides a detailed view of threats based on individual severity levels and devices that have a threat within that severity level. The columns list the specific counts for each type of threat event on a device.

List of severity levels - Select a another option from the list (Critical, Major, Minor, Caution, Information). **Critical** is the most dangerous threat to the endpoint, and **Information** is a notification of an event that is unlikely to harm the endpoint.

List of days - Select a time frame option: 1, 7, 14, 30, 60, and 90 days.

Platform - The platform type

Device ID - Value that uniquely identifies the target device. Click a link to view information about that endpoint.

Event Count columns - For each device, lists the number for each of the following threat events:

- **Malware/Exploit** - Includes counts for viruses, spyware, and unwanted programs. This could be exploited buffer overflows that seek to execute arbitrary code on a device or attempts to exploit browser vulnerabilities. Counts may include malware that executes from within memory space.
- **Web Filter** - Includes threats related to web browsing and downloads.
- **Web Protection** - Includes threats related to web browsing and downloads.
- **Firewall** - Includes suspicious communications related to incoming or outgoing traffic and any attacks.
- **Uncategorized** - Lists the number of threats that do not belong in other event counts.

**Advanced Threat Prevention Events**
The Advanced Threat Prevention Events pane displays a timeline of Advanced Threat events over the course of a month, by file type as assigned by Advanced Threat Prevention.

Click a file type for details of the events of that type.

File types include:

**Unsafe** - A suspicious file with a high score (-60 to –100) likely to be malware

**Abnormal** - A suspicious file with a lower score (-1 to –59) less likely to be malware

**Quarantined** - A file that is moved from its original location, stored in the Quarantine folder, and prevented from executing on a specific device.

**Waived** - A file allowed to execute on a specific device.

**Cleared** - A file that has been cleared within the organization. Cleared files include files that are Waived, added to the Safe list, and deleted from the Quarantine folder on a device.

For more detail about events, see [Advanced Threat Prevention Classifications](#) and [Advanced Threats Top Ten](#)

### Advanced Threats by Priority

Advanced Threats by Priority classifies suspicious files by priority levels of High, Medium, and Low. This prioritization helps administrators determine which threats and devices to address first. To view a list of threats with the corresponding priority level, click a value in **Advanced Threats by Priority** on the dashboard.

Files are analyzed for the following attributes:

- The file has a Cylance score greater than 80.

  A score is assigned to each file that is deemed Abnormal or Unsafe. The score represents the confidence level that the file is malware. The higher the number, the greater the confidence.

  - The file is currently running.
  - The file has been run previously.
  - The file is set to auto run.
  - The file is detected by Execution Control.

Files are prioritized based on the number of the above attributes it has:

- Low = 0-1 attributes
- Medium = 2-3 attributes
- High = 4-5 attributes

As an example, following is the analysis of three threats:

### Threat 1

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Attribute Value</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cylance score</td>
<td>90</td>
<td>+1</td>
</tr>
</tbody>
</table>
Currently running on any device | True | +1
---|---|---
Ever run on any device | True | +1
Set to auto run on any device | True | +1
Detected by Execution Control | False | +0

**Total score** 5: High Priority

### Threat 2

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Attribute Value</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cylance score</td>
<td>20</td>
<td>+0</td>
</tr>
<tr>
<td>Currently running on any device</td>
<td>True</td>
<td>+1</td>
</tr>
<tr>
<td>Ever run on any device</td>
<td>False</td>
<td>+0</td>
</tr>
<tr>
<td>Set to auto run on any device</td>
<td>True</td>
<td>+1</td>
</tr>
<tr>
<td>Detected by Execution Control</td>
<td>False</td>
<td>+0</td>
</tr>
</tbody>
</table>

**Total score** 2: Medium Priority

### Threat 3

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Attribute Value</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cylance score</td>
<td>20</td>
<td>+0</td>
</tr>
<tr>
<td>Currently running on any device</td>
<td>False</td>
<td>+0</td>
</tr>
<tr>
<td>Ever run on any device</td>
<td>False</td>
<td>+0</td>
</tr>
</tbody>
</table>
### Advanced Threat Prevention Classifications

Advanced Threat Prevention can provide details on the static and dynamic characteristics of files. This allows administrators to not only block threats, but also to understand threat behavior to further mitigate or respond to threats.

### Type of Threat

Threats are classified by the type of threat - Malware, Dual Use, and Potentially Unwanted Program.

### Malware

If the file is identified as a piece of malware, the file should be removed or quarantined as soon as possible. Verified malware can be further subclassified as one of the following:

<table>
<thead>
<tr>
<th>Subclass</th>
<th>Definition</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backdoor</td>
<td>Malware that provides unauthorized access to a system, bypassing security measures.</td>
<td>Back Orifice, Eleanor</td>
</tr>
<tr>
<td>Bot</td>
<td>Malware that connects to a central Command and Control (C&amp;C) botnet server.</td>
<td>QBot, Koobface</td>
</tr>
<tr>
<td>Downloader</td>
<td>Malware that downloads data to the host system.</td>
<td>Staged-Downloader</td>
</tr>
<tr>
<td>Dropper</td>
<td>Malware that installs other malware on a system.</td>
<td></td>
</tr>
<tr>
<td>Exploit</td>
<td>Malware that attacks a specific vulnerability on the system.</td>
<td></td>
</tr>
<tr>
<td>FakeAlert</td>
<td>Malware that masquerades as legitimate security software to trick the user into fixing fake security problems at a price.</td>
<td>Fake AV White Paper</td>
</tr>
<tr>
<td>Generic</td>
<td>Any malware that does not fit into an existing category.</td>
<td></td>
</tr>
<tr>
<td>InfoStealer</td>
<td>Malware that records login credentials and/or other sensitive information.</td>
<td>Snifula</td>
</tr>
<tr>
<td>Ransom</td>
<td>Malware that restricts access to system or files and demands payment for removal of restriction, thereby holding the system for ransom.</td>
<td>CryptoLocker, CryptoWall</td>
</tr>
<tr>
<td>Remnant</td>
<td>Any file that has malware remnants post removal attempts.</td>
<td></td>
</tr>
<tr>
<td>Rootkit</td>
<td>Malware that enables access to a computer while protecting itself or other files to avoid detection and/or</td>
<td>TDL, Zero Access Rootkit</td>
</tr>
</tbody>
</table>

---

Navigate the Dell Server

<table>
<thead>
<tr>
<th>Set to auto run on any device</th>
<th>False</th>
<th>+0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detected by Execution Control</td>
<td>True</td>
<td>+5</td>
</tr>
</tbody>
</table>

**Total score** 5: High Priority
removal by administrators or security technologies.

Trojan
Malware that disguises itself as a legitimate program or file. Zeus

Virus
Malware that propagates by inserting or appending itself to other files. Salty, Virut

Worm
Malware that propagates by copying itself to another device. Code Red, Stuxnet

Dual Use
Dual Use indicates the file can be used for malicious and non-malicious purposes. Caution should be used when allowing the use of these files in your organization. For example, while PsExec can be a useful tool for executing processes on another system, that same benefit can be used to execute malicious files on another system.

Subclass | Definition | Examples
--- | --- | ---
Crack | Technologies that can alter (or crack) another application to bypass licensing limitations or Digital Rights Management protection (DRM). | 
Generic | Any Dual Use tool that does not fit into an existing category. | 
KeyGen | Technologies which can generate or recover/reveal product keys that can be used to bypass Digital Rights Management (DRM) or licensing protection of software and other digital media. Technologies that track a user's online activities without awareness of the user by logging and possibly transmitting logs of one or more of the following: | Veriato 360, Refog, Keylogger
Monitoring Tool | • user keystrokes • email messages • chat and instant messaging • web browsing activity • screenshot captures • application usage | 
Pass Crack | Technologies that can reveal a password or other sensitive user credentials either by cryptographically reversing passwords or by revealing stored passwords. | l0phtcrack, Cain & Abel
RemoteAccess | Technologies that can access another system remotely and administer commands on the remote system, or monitor user activities without user notification or consent. | Putty, PsExec, TeamViewer
Tool | Programs that offer administrative features but can be used to facilitate attacks or intrusions. | Nmap, Nessus, P0f

Potentially Unwanted Programs
The file has been identified as a **Potentially Unwanted Program.** This indicates that the program may be unwanted, despite the possibility that users consented to download it. Some PUPs may be permitted to run on a limited set of systems in your organization (EX. A VNC application allowed to run on domain administrator devices). A Dell Server administrator can choose to waive or block PUPs on a per device basis or globally quarantine or safelist based on company policies. Depending on how much analysis can be performed against a PUP, further subclassification may be possible. Those subclasses are shown below and will aid an administrator in determining whether a particular PUP should be blocked or allowed to run:

<table>
<thead>
<tr>
<th>Subclass</th>
<th>Definition</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adware</td>
<td>Technologies that provide annoying advertisements (example: pop-ups) or provide bundled third-party add-ons when installing an application. This usually occurs without adequate notification to the user about the nature or presence of the add-on, control over installation, control over use, or the ability to fully uninstall the add-on.</td>
<td>Gator, Adware Info</td>
</tr>
<tr>
<td>Corrupt</td>
<td>Any executable that is malformed and unable to run.</td>
<td>Steam Games, League of Legends</td>
</tr>
<tr>
<td>Game</td>
<td>Technologies that create an interactive environment with which a player can play.</td>
<td>Steam Games, League of Legends</td>
</tr>
<tr>
<td>Generic</td>
<td>Any PUP that does not fit into an existing category.</td>
<td></td>
</tr>
<tr>
<td>HackingTool</td>
<td>Technologies that are designed to assist hacking attempts.</td>
<td>Cobalt Strike, MetaSp0it</td>
</tr>
<tr>
<td>Portable Application</td>
<td>Program designed to run on a computer independently, without needing installation.</td>
<td>Turbo</td>
</tr>
<tr>
<td>Scripting Tool</td>
<td>Any script that can run as if it were an executable.</td>
<td>AutoIT, py2exe</td>
</tr>
<tr>
<td>Toolbar</td>
<td>Technologies that place additional buttons or input fields on-screen.</td>
<td>Nasdaq Toolbar, Bring Me Sports</td>
</tr>
</tbody>
</table>

**Score**

A **Score** is assigned to each file. Negative scores, from -1 to -100 denote files that are deemed Abnormal or Unsafe. The score represents the confidence level that the file is malware. The higher the negative number, the greater the confidence.

**File Type**

The file is assigned a type, based on the score.

**File Types:**

- **Unsafe:** A file with a score ranging from -60 to -100. An Unsafe file is one in which the Advanced Threat Prevention agent finds attributes that greatly resemble malware.
- **Abnormal:** A file with a score ranging from -1 to -59. An Abnormal file has a few malware attributes but fewer than an unsafe file, thus is less likely to be malware.
Note: Occasionally, a file may be classified as Unsafe or Abnormal even though the score displayed doesn’t match the range for the classification. This could result from updated findings or additional file analysis after the initial detection. For the most up-to-date analysis, enable Auto Upload in the Device Policy.

Priority Level

The file is given a priority level. The priority level helps administrators determine which threats and devices to address first. For more information, see Advanced Threats by Priority.

Advanced Threats Top Ten

Click Threats to view the threats found on the largest number of devices.
- Click a threat to display additional information about the threat. Details display on a new page.

Click Devices to view a list of devices that have the largest number of threats.
- Click a device to display additional information about the device. Details display on a new page.

Endpoint Protection History

This graph gives a time line snapshot of the past 90 days of the total number of endpoints that are protected and total number that are not protected. This graph is especially useful during initial deployment, when moving toward complete protection.

The green bars represent the total number of protected endpoints. The red bars represent the total number of endpoints that are not protected.

Endpoint Inventory History

This graph gives a time line snapshot of the past 90 days of the total number of endpoints that have communicated with and sent inventory to the Dell Server and the total number that have not sent inventory.

Summary Statistics

Summary Statistics provides a breakdown of the following:
- Domains
- User groups
- Endpoint groups
- AD users
- Local users
- Endpoints
- Protected
- Not protected
- Shields
- Managers
- Modified policies

Summary Statistics provides a breakdown of endpoints by platform, with a link to a detailed report for the selected platform:

- Windows
- Mac
- Mobile device
- All

**Endpoint OS Report**

To access this page, click a platform link on the dashboard's Summary Statistics. If you click All and the Platform Report page opens, click **view** in the OS Report column.

OS/Version - Operating system name and version as reported in the endpoint's inventory
Count - Number of endpoints or devices
Shielded - Number of encrypted endpoints for that OS and version
Unshielded - Number of endpoints for that OS and version that are not encrypted
Platform Report - Click **view** for a report on all the platforms
Endpoint List - Click the icon to navigate to the Endpoints page and the list of endpoints for that OS and version

**Platform Report**

To access this page, click All on the dashboard's Summary Statistics. If you click a specific platform link and access the Endpoint OS Report page, click **view** in the Platform Report column.

Platform - Windows or Mac
Count - Number of endpoints or devices **Platform Report** for that platform
Shielded - Number of encrypted endpoints for that platform
Unshielded - Number of endpoints for that platform that are not encrypted
OS Report - Click **view** for a report based on each operating system/version for that platform
Endpoint List - Click the icon to navigate to the Endpoints page and the list of endpoints for that platform

**Populations**

A population is a grouping for which policies, settings, and actions can be configured.

To access a Populations page, click **Populations** in the left pane and select a Population. For example, **Populations > Enterprise**.

Tabs available on each Populations page provide information, allow you to edit details of the Population, and provide configuration options for that Population. The table lists the tabs available for each Population.
To access the tabs for each Population:

- **Enterprise** - Click **Populations > Enterprise**.
- Populations other than Enterprise - Click a Population link, then search for or click a Domain, User Group, User, Endpoint Group, Endpoint, or Administrator link.

The tabs available for an administrator may vary, depending on the role.

**Enterprise**

**View or Modify Enterprise Policies**

To view or modify Enterprise policies, follow these steps:

1. In the left pane, click **Populations > Enterprise**.
2. Click the **Security Policies** tab.
3. Select the technology group, such as *Windows Encryption*, or policy group, such as *Policy-Based Encryption*, to view or modify.

**View Threat Events**

Threats are categorized as Malware/Exploit, Web Filter, Firewall, or Uncategorized events. The list of threat events can be sorted by any of the column headers. You can view threat events for the entire enterprise or for a specific endpoint. To view threat events of a specific endpoint, from the Enterprise Threat Events tab, select the endpoint's device in the Device ID column.

To view threat events in the enterprise, follow these steps:

1. In the left pane, click **Populations > Enterprise**.
2. Click the **Threat Events** tab.
3. Select the desired severity level and time period to display events.

To view threat events on a specific endpoint, follow these steps:

1. In the left pane, click **Populations > Endpoints**.
2. Search or select a hostname, then the **Threat Events** tab.

### Manage Enterprise Advanced Threats

#### Advanced Threats tab

If the Advanced Threat Prevention service is provisioned and licenses are available, the Advanced Threats tab provides a dynamic display of detailed events information for the entire enterprise, including a list of the devices on which events occurred and any actions taken on those devices for those events. For information about provisioning the service, see [Provision Advanced Threat Prevention Service](#).

To access the Enterprise Advanced Threats tab, follow these steps:

1. In the left pane, click **Populations > Enterprise**.
2. Select the **Advanced Threats** tab.

Information about events, devices, and actions are organized on the following tabs:

- **Protection** - Lists potentially harmful files and scripts and details about them, including the devices on which the files and scripts are found.
- **Agents** - Provides information about devices running the Advanced Threat Prevention client as well as the option to export the information or remove devices from the list.
- **Global List** - Lists files in the Global Quarantine and Safe list and provides the option to move files to these lists.
- **Options** - Provides a way to integrate with Security Information Event Management (SIEM) software using the Syslog feature as well as export Advanced Threat data.
- **Certificate** - Allows certificate upload. After upload, certificates display on the Global List tab and can be Safe listed.

Tables on the tabs can be organized in these ways:

- **Add or remove columns from the table** - Click the arrow next to any column header, select **Columns**, then select the columns you want to display. Clear the check box of columns to hide.
- **Sort the data** - Click a column header.
- **Group by a column** - Drag the column header up, until it turns green.
- **Filter based on data of one column** - Click the down-arrow on any column to display the context menu, and select **Filter**.

#### Advanced Threat Events tab

The Advanced Threat Events tab displays information about events for the entire enterprise based on information available in the Dell Server.

The tab displays if the Advanced Threat Prevention service is provisioned and licenses are available.

To export data from the Advanced Threat Events tab, click **Export** and select **Excel** or **CSV** file format.

**Note:** Excel files are limited to 65,000 rows. CSV files have no size limit.

For a list of fields and filters on the tab, see [Advanced Threat Events tab fields and filters](#).
Domains

On the Domains page, you can add a domain or search and select a domain to View or Modify Domain Information.

Add a Domain

To add a Domain, follow these steps:

1. In the left pane, click Populations > Domains.
2. On the Domains page, click Add.
3. Complete the fields on the Add Domains page.
   - Domain DNS Suffix - Enter the fully qualified host name or the computer name and domain portion of the hostname (for example, <computer_name>.<domainname>.com) for the enterprise directory server.
   - Port - Enter a port for the directory server. If you do not specify a port, the default port of 389 is used. The secure port, 636, uses an SSL connection instead of clear text. Global catalog ports are 3268 (clear-text) and 3269 (secure).
   - Distinguished Name - Populated when you tab from the completed Host Name field or refresh the URL. If necessary, correct the entry to reflect the domain (for example, DC=domainname, DC=com).
   - User Name - Enter a user name with rights for the domain to read and run queries on the enterprise directory server. The format must be UPN, such as user@domain.com.
   - Password - Enter a password with rights for the domain to read and run queries on the enterprise directory server.
4. In the Domain Alias area, enter the domain name or other alias and click Add. It is recommended that you add a pre-Windows 2000 domain name as an alias. You may enter any UPN suffixes that are allowed for the domain and are configured in the enterprise directory server.
   - A Domain Alias is a mapping the Dell Server uses to select which domains to search to locate users that might match the suffix in the UPN.
5. Click Add Domain.

Users

Users are added through reconciliation. Reconciliation is the automated process the Dell Server uses to compare user data in the Dell Server database with user data in the enterprise directory server and update the Dell Server database when necessary.

In the left pane, click Populations > Users and then click a user name, to view details about the user. Click the arrow next to a User Name to view the Common Name, sAM Account Name, and User Principal Name.

Add a User by Domain

1. In the left pane, click Populations > Users.
2. On the Users page, click **Add Users by Domain**.

3. In the Add Users by Domain dialog, select a domain from the pull-down list.

4. In **Full name**, enter the exact text for the user name or use the wildcard character (*).

5. Select **Common Name**, **Universal Principal Name**, or **sAMAccountName** from the list.

   A Common Name, Universal Principal Name, and sAMAccountName must be defined in the enterprise directory server for every user. If a user is a member of a domain or group but does not display in the domain or group members list in the Management Console, ensure that all three names are properly defined for the user in the enterprise directory server.

6. Click **Search**. Depending on the size, this may take a few minutes to populate.

   If the query is too large, a dialog prompts you to revise the query.

7. Select users from the directory user list to add to the Domain. The user names are added to the field below the list.

8. Click X to remove the user name or click **Add**.

---

**User Groups**

Add a user group, edit **User Group priority**, or search and select a user group to **View or Modify User Group Policies and Information**.

**Add a User Group**

1. In the left pane, click **Populations > User Groups**.

2. On the User Groups page, click **Add**.

3. Select the type of User Group from the list: **Active Directory User Group** or **ADMIN-DEFINED User Group**

   **Note:** If adding user groups for Access Groups, see **Set_up_Access_Groups**.

4. Select a domain from the list.

5. For Active Directory User Groups, follow these steps:
   a. Enter the exact text for the group name or use the wildcard character (*).
   b. Click **Search**. Depending on the size, this may take a few minutes to populate.
   c. Select a group from the list to add to the domain. The group name is added to the field below the list.

   Click the X in the group name to remove the group name.

   d. Click **Add**.

6. For ADMIN-DEFINED User Groups, follow these steps:
   a. Enter the exact text for the group name or use the wildcard character (*).
   b. Enter a description for the group.
   c. Click **Add Group**.

**Notes:**
Universal security groups are only supported for domains that connect through the Global Catalog port.

Nested groups are not supported.

Add Non-Domain Users

To add non-domain users, the non-domain activation feature can be enabled by contacting Dell ProSupport and requesting instructions.

View or Modify Domain Policies and Information

1. In the left pane, click Populations > Domains.
2. Search or select the appropriate Domain Name to display Domain Detail.

   When you click a Domain, the Domain Detail page displays.

3. Click the tab that corresponds with the action to perform:

   Details & Actions - To view properties of the Domain, click Details & Actions

   Members - To view, add, or modify information for groups and users within the domain. For instructions on how to perform these tasks, refer to the appropriate topic:

   Add Users to Domain
   Add User Groups
   View or Modify User Information
   View or Modify User Group Information

Settings - To configure LDAP settings for the domain, click Settings. Refer to Add Domains for instructions.

Key Server - To configure components for use with Kerberos Authentication/Authorization, click Key Server. See Domain Key Server for instructions.

Domain Details & Actions

The Domain Details & Actions tab lists the properties of a domain.

To access the Domain Details & Actions tab, follow these steps:

1. In the left pane, click Populations > Domains.
2. Search or select a Domain Name, then the Details & Actions tab.

Details displayed on the Domain Details & Actions tab:

Domain Name - Name of the domain server. This should match the domain name in the title of the page.

Location - The location (path) of the domain within the enterprise structure. This information is derived from the fully qualified hostname or the computer name and domain portion of the hostname entered when the domain was added. Example: /com/enterpriseserver
Navigate the Dell Server

LDAP Url - URL to the active directory. This field is populated after adding the domain. The information is derived from the completed hostname.

Example - LDAP://domainname.com:portnumber/DC=domainname,DC=com

To configure LDAP settings for the domain, click the Settings tab.

Status - Describes the health of the domain server (Good, Fair, Poor).

Domain Members

This page allows you to view, add, or modify information for groups and users within the domain.

To access the Domain Members tab, follow these steps:

1. In the left pane, click Populations > Domains.
2. Search or select a Domain Name, then the Members tab.

From this tab, you can perform these actions:

Add Users to Domain - Allows you to add users by domain
Add Group - Allows you to add a user group by domain

Select to view the following information about groups & users, users only, or groups only:

User/Group - Each user or user group in the domain. Click an entry to view details.

Distinguished Name

CN is the common name, either a user or group name.
OU is the organizational unit name, for example, Dallas.
DC are domain components, for example, DC=Organization, DC=com

Common Name - For a user, the user name; for a group, the group name

User - Column displays a green checkmark
Group - Column displays a green checkmark

Domain Settings

This page allows you to configure or modify LDAP settings for the Domain.

To access the Domain Settings tab, follow these steps:

1. In the left pane, click Populations > Domains.
2. Search or select a Domain Name, then the Settings tab.

On the Domain Settings tab, you can view this information:

Directory URL - Lists the current URL for the enterprise directory server. If you modify the settings, click Refresh URL.

Host Name - The fully qualified hostname or the computer name and domain portion of the hostname (for example, <computer_name>,<domainname>.com) for the enterprise directory server.

Port - The port for the directory server. If you do not specify a port, the default port of 389 is used. The secure port, 636, uses an SSL connection instead of clear text. Global catalog ports are 3268 (clear-
Security Management Server v10.2.6 AdminHelp

Distinguished Name - This field is populated when you tab from the completed hostname or refresh the URL. If necessary, correct the entry to reflect the domain (for example, DC=domainname, DC=com).

Secure LDAP - Select this check box for LDAPS.

User Name - The user name with rights to read and run queries on the enterprise directory server. The format must be UPN, such as user@domain.com.

Password - Enter a password with rights to read and run queries on the enterprise directory server.

Alias - A mapping that the Dell Server uses to select which domains to search to locate users that might match the suffix in the UPN. The domain name or other alias. It is recommended that you add a pre-Windows 2000 domain name as an alias. You may enter any UPN suffixes that are allowed for the domain and are configured in the enterprise directory server.

Click Add, and the entry populates the field below.

Select an alias in the list, and click Remove Selected.

Update Domain - Click to update changes.

Domain Key Server

This page allows you to view or modify components for use with Kerberos Authentication/Authorization.

Account - Enter an account name.

Click Add Account, and the entry populates the field below.

Select an account in the list, and click Remove Selected.

To access the Domain Key Server tab, follow these steps:

1. In the left pane, click Populations > Domains.
2. Search or select a Domain Name, then the Key Server tab.

User Groups

Add a User Group

Add a user group, edit User Group priority, or search and select a user group to View or Modify User Group Policies and Information.

Add a User Group

1. In the left pane, click Populations > User Groups.
2. On the User Groups page, click Add.
3. Select the type of User Group from the list: Active Directory User Group or ADMIN-DEFINED User Group.
   
   Note: If adding user groups for Access Groups, see Set up Access Groups.
4. Select a domain from the list.
5. For Active Directory User Groups, follow these steps:
   a. Enter the exact text for the group name or use the wildcard character (*).
b. Click **Search**. Depending on the size, this may take a few minutes to populate.

c. Select a group from the list to add to the domain. The group name is added to the field below the list.

Click the **X** in the group name to remove the group name.

d. Click **Add**.

6. For **ADMIN-DEFINED** User Groups, follow these steps:

   a. Enter the exact text for the group name or use the wildcard character (*).
   
   b. Enter a description for the group.
   
   c. Click **Add Group**.

**Notes:**

- Universal security groups are only supported for domains that connect through the Global Catalog port.
- Nested groups are not supported.

**Remove User Groups**

1. In the left pane, click **Populations > User Groups**.

2. Click a group name link or enter a filter to search for available groups. The wildcard character (*) is supported.

3. Select a row to highlight it.

4. At the top, click **Delete**.

   As another option, click a group name link and select the **Details & Actions** tab. Click **Remove Group**.

If you remove a user group that has administrative privileges and later re-add the group, it remains an Administrator Group.

**Find User Groups**

1. In the left pane, click **Populations > User Groups**.

2. Enter a filter to search for available Groups. The wildcard character (*) is supported.

3. Click **Search**.

   A Group or list of Groups displays, based on the search filter.

**View or Modify User Group Policies and Information**

1. In the left pane, click **Populations > User Groups**.

2. Search or select the appropriate group name to display the User Group Detail page. The wildcard character (*) is supported.

   Click a group name to display the User Group Detail page.
3. Click the tab that corresponds with the action to perform:

**Security Policies** - To view or modify policies of the Group, click **Security Policies**.

**Details & Actions** - To view properties of the Group, click **Details & Actions**. Viewable information includes:

- Group Name: Group1 (DOMAIN\Group1)
- Distinguished Name: CN=Group1, OU=Dallas, DC=Organization, DC=com
- Common Name: Group1
- Last Modified in Directory - date and time stamp
- Last Reconciled - date and time stamp
- AG Enabled - Access Group is configured for a user group when selected

**Members** - To view or modify the information of a user in the group, click **Members**. The list of users in the group displays. Click a user to view the user's Security Policies, Details & Actions, Endpoints, User Groups, and Admin. For instructions on how to view or modify User information, refer to **View or Modify User Information**.

**Admin** - To view, assign, or modify administrator roles assigned to the group, click **Admin**. Select or deselect administrator roles to modify administrator roles assigned to the Group. For more information about privileges available to each administrator role, refer to **Administrator Roles**.

4. If modified, click **Save**.

**VDI User Policies**

To manage policy for users in a VDI environment, create a Windows domain group, associate domain users with that group, and then import the group into Dell Server. This allows Dell Server to manage the users and their policies.

Policy settings differ, based on whether persistent or non-persistent VDI is deployed in the environment. For an explanation of the differences between persistent and non-persistent VDI, see **Persistent vs. Non-Persistent VDI**.

**Policy and Configuration Requirements for VDI Users**

The policy requirements below are for VDI users running Advanced Threat Prevention. The list includes only policies that are significant for VDI users. VDI endpoint group policy settings must also meet certain requirements. See **Policy and Configuration Requirements for VDI Endpoint Groups**.

**Note**: Ensure that you turn off Advanced Threat Prevention Agent Auto Update. In the left pane of the Management Console, select Management > Services Management > Advanced Threats - Agent Auto Update, then select **Off**.

**Note**: With Persistent VDI groups, ensure that roaming user profiles are configured.

These policy and configuration settings for VDI users must be configured before VDI client activation:

<table>
<thead>
<tr>
<th>Technology</th>
<th>Category</th>
<th>Policy or Setting</th>
<th>Persistent VDI group setting</th>
<th>Non-Persistent VDI group setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Encryption</td>
<td>Policy-Based Encryption</td>
<td>Policy-Based Encryption</td>
<td>On</td>
<td>Off</td>
</tr>
</tbody>
</table>
User Group Details & Actions

The User Group Details & Actions tab lists the properties of a selected user group.

1. In the left pane, click **Populations > User Groups**.
2. Search or select a group name, then the **Details & Actions** tab.

Remove Group

The **Remove Group** command permanently removes this user group from the Dell Server.

**Details:**

Group Name - Name of the user group `<user group>\<domain name>\<user group>`. This should match the user group name in the title of the page.

Distinguished Name - CN=Group1, OU=Dallas, DC=Organization, DC=com

- CN is the common name
- OU is the organizational unit name
- DC are domain components

Common Name - non-technical name of the user group

Last Modified - Date/time stamp of the last time this information changed.

Last Reconciled - Date/time stamp of the last time this information was reconciled.

Access Groups Enabled - Access Group is configured for a user group when selected.

User Group Members

This page displays information about each user within the user group.

1. In the left pane, click **Populations > User Groups**.
2. Search or select a Group Name, then click the numeral in the **Members column**.
User - Each user in that user group

Distinguished Name - CN=Group1, OU=Dallas, DC=Organization, DC=com
  CN is the common name
  OU is the organizational unit name
  DC are domain components
Common Name - non-technical name of the user group

Add Users to the Group
1. On the Members tab, click Add Users to Group.
2. Search or select a user, then select the check box to the left of the user name.
3. Click Add Selected Users to Group.
   OR
   Select Upload Multiple User from File, then click Browse to select a CSV file and click Upload.

Valid CSV requirements:
- The file must be in valid CSV format and contain a maximum of 999 endpoints.
- The first column must contain valid fully qualified host names. All columns except the first column are ignored.
- Only activated endpoints are added to the group.

Remove Users from the Group
1. In User Group Detail, search or select a user, then select the check box to the left of the user name.
2. Click Remove Users from Group.
3. Click OK.

Users can also be removed from the ADMIN DEFINED Groups.

User Group Admin
Assign, modify, or view Administrator roles for a group.
1. In the left pane, click Populations > User Groups.
2. Search or select a Group Name, then the Admin tab.

   Administrator Roles - Assign or modify roles for a group membership and click Save.
   Delegated Roles - Delegate Administrator rights for the Group to a User.

Edit Group Priority

The Group priority feature is used to determine policy precedence for effective policies that affect multiple groups. Group priority creates a weight associated with the specific group it is assigned to, and that weight is used to determine which policy setting is applied to an endpoint that is a member of more than one Endpoint Group when policy settings differ between those groups. Policy overrides are used from the group with higher priority when two (or more) separate groups have different priority levels.

Edit Endpoint Group Priority

Endpoint Group Priority can be changed only for Rule-Defined, Admin-Defined, and Active Directory Groups. System-Defined Group priority cannot be modified. In general, the Endpoint Group at the top of the list of Endpoint Groups has highest priority. The Endpoint Group at the bottom of the list has lowest priority.

Precedence Ranking

The System Defined Non-Persistent VDI Endpoint Group has the highest priority level, followed by the Persistent VDI Endpoint Group.

Order of priority:

1. Non-Persistent VDI Endpoint Group
2. Persistent VDI Endpoint Group
3. Highest ranked Active Directory/Rule-Defined/Admin-Defined Endpoint Group
4. Second and subsequent highest ranked Active Directory/Rule-Defined/Admin-Defined Endpoint Groups
5. Opt-in Endpoint Group
6. Default Endpoint Group

To change Active Directory/Rule-Defined/Admin-Defined Endpoint Group priority:

1. In the left pane, click Populations > Endpoint Groups.
2. Click Edit Priority.
3. Select the row of the appropriate group and drag it to the location in the list of Endpoint Groups that reflects its new priority level.
4. Click Save.

Edit User Group Priority
The user group at the top of the list has highest priority. The user group at the bottom of the list has lowest priority.

To edit User Group priority:
1. In the left pane, click **Populations > User Groups**.
2. Click **Edit Priority**.
3. Select the row of the appropriate group and drag it to the location in the list of Endpoint Groups that reflects its new priority level.
4. Click **Save**.

**Assign or Modify Administrator Roles**

View or modify existing administrator privileges.
1. In the left pane, click **Populations > Administrators**.
2. Search or select the row that displays the user name of the appropriate administrator to display User Detail.
3. View or modify administrator roles in the pane at the right.
4. Click **Save**.

Dell recommends assigning administrator roles at the Group level rather than at the User level.
1. In the left pane, click **Populations > User Groups**.
2. Search or select a group name, then the **Admin** tab.
3. Select or deselect administrator roles assigned to the group.
4. Click **Save**.

If you remove a group that has administrative privileges and later re-add the group, it remains an administrator group.

To view, assign, or modify administrator roles at the User level, see **User Admin**.
Related topics:
- Administrator Roles
- User Admin
- Delegate Administrator Roles

View Reconciliation Date

To view the date and time a user group's or user's information was last reconciled with Active Directory, click the Details & Actions tab for the group or user, and refer to last reconciled. For instructions, refer to View or Modify User Group Policies and Information and View or Modify User Policies and Information.

View Policy Proxy State

The Management Console tracks the Policy Proxy's policy updating state.

1. In the left pane, click Populations > Endpoints.
2. Select an endpoint type, for example, Workstation or Mobile Device.
3. If you know the full endpoint hostname, enter it into Search and click .

For Windows and Mac, enter the full endpoint hostname if you know it. Leave the field blank to display all Windows and Mac endpoints.

For Mobile devices, optionally enter the user’s email address.

If you do not know the full hostname or user email address, scroll through the list of available endpoints to locate the endpoint.

4. Click an endpoint in the list to display the endpoint detail.
5. Click the Details & Actions tab of the endpoint to view information.

Users

Users are added through reconciliation. Reconciliation is the automated process the Dell Server uses to compare user data in the Dell Server database with user data in the enterprise directory server and update the Dell Server database when necessary.

In the left pane, click Populations > Users and then click a user name, to view details about the user. Click the arrow next to a User Name to view the Common Name, sAM Account Name, and User Principal Name.

Add a User by Domain

1. In the left pane, click Populations > Users.
2. On the Users page, click Add Users by Domain.
3. In the Add Users by Domain dialog, select a domain from the pull-down list.
4. In Full name, enter the exact text for the user name or use the wildcard character (*).
5. Select Common Name, Universal Principal Name, or sAMAccountName from the list.
A Common Name, Universal Principal Name, and sAMAccountName must be defined in the enterprise directory server for every user. If a user is a member of a domain or group but does not display in the domain or group members list in the Management Console, ensure that all three names are properly defined for the user in the enterprise directory server.

6. Click **Search**. Depending on the size, this may take a few minutes to populate.

If the query is too large, a dialog prompts you to revise the query.

7. Select users from the directory user list to add to the Domain. The user names are added to the field below the list.

8. Click **X** to remove the user name or click **Add**.

**Remove Users**

In general, a user cannot be removed in the Management Console. Instead, you must remove the user from Active Directory.

**Find Users**

1. In the left pane, click **Populations > Users**.

2. Do one of these:
   - Enter the user name or a filter in **Search** and click **Search**.
   - Enter Common Name, Universal Principal Name, or sAMAccountName. The wildcard character is supported.
   - Scroll through the user name list.

3. Click a link in the user name column.

The User Detail page opens, displaying the Security Policies tab.

**Deactivate/Suspend Users**

If the user to deactivate is no longer associated with your organization, be sure the **Current Shield State** policy is set to a value other than **Activate**, and ensure that the policy commit is complete and successful prior to your enterprise directory server. The user does not need to be in your enterprise directory server, but the policy does need to delivered to be their device for it to take effect.

**Best Practice** - Deleting users from the enterprise directory server is not recommended. If a user leaves the organization, the account should be moved to a disabled group. With that said, if a deletion occurs, the user is simply marked “removed”, rather than deleted. The user does not display in the Management Console, but their encryption keys and other information are still available in the Dell Server database.

1. In the left pane, click **Populations > Users**.

2. Click a user name link or enter a filter to search for available users.

   Enter Common Name, Universal Principal Name, or sAMAccountName. The wildcard character (*) is supported. On the User Detail > Security Policies tab in the **Windows Encryption** technology group, click the Policy-Based Encryption policy group.

3. Click **Show advanced settings**.
4. Change the *Current Shield State* policy to **Suspend**.
5. Click **Save**.
6. **Commit Policies**.

To reactivate a deactivated Windows user, follow the instructions in **Reinstate Suspended Users**.

**Reinstate Suspended Users**

To reinstate a suspended user, follow these steps:

1. In the left pane, click **Populations > Users**.
2. Click a user name link or enter a filter to search for available users.
   - To Search, enter Common Name, Universal Principal Name, or sAMAccountName. The wildcard character (*) is supported.
3. On the **User Detail > Security Policies** tab in the *Windows Encryption* technology group, click the **Policy-Based Encryption** policy group.
4. Click **Show advanced settings**.
5. Change the *Current Shield State* policy to **Activate**.
6. Click **Save**.
7. **Commit Policies**.
   - Repeat these steps for each type of device the user was suspended from.
8. To reinstate a suspended Dell Encryption user, perform the preceding steps and then run WSDeactivate on the computer that was suspended for that particular user. WSDeactivate and its instructions are located in the Dell installation media. When using WSDeactivate, existing local encryption keys, credentials, and policy material are no longer accessible to Dell Encryption, and all managed users are forced to reactivate upon their next log on.

**View or Modify User Policies and Information**

1. In the left pane, click **Populations > Users**.
2. Click a user name or enter a filter to search for available users. The wildcard character (*) is supported.
   - Click a user name to display the User Detail page.
3. Click the tab that corresponds with the action to perform:
   - **Security Policies** - Click to view or modify policies of the user.
   - **Details & Actions** - Click to view properties of the user. Viewable information includes:
     - **User Name**: (username@organization.com)
     - **Distinguished Name**: CN=User Name, OU=Dallas, DC=Organization, DC=com
     - **Common Name**: User Name
     - **User Principal Name**: username@organization.com
     - **sAM Account Name**: username
User Type - possible values are AD or local
Last Modified - Date/time stamp
Last Reconciled - Date/time stamp

Endpoints - Click to view or modify information for the User's endpoints. For instructions on how to modify endpoint information, refer to View or Modify Endpoint Information.

User Groups - Click Groups to view information for groups for which the user belongs. Click a user group to view the group's Security Policies, Details & Actions, Members, and Admin.

Admin - Click to view, assign, or modify administrator roles assigned to the user. Select or deselect administrator types to modify administrator roles assigned to the user.

4. If modified, click Save.

User Details & Actions
The user Details & Actions tab lists the properties of the selected user.

1. In the left pane, click Populations > Users.
2. Search or select a user name, then the Details & Actions tab.

Details:
User Name - (username@organization.com)
Distinguished Name - CN=User Name, OU=Dallas, DC=Organization, DC=com
Common Name - User Name
Universal Principal Name - username@organization.com
sAMAccountName - username
Email - User email address
User Type - possible values are AD or local
Last Modified - Date/time stamp
Last Reconciled - Date/time stamp

User Endpoints
This page displays information about a user's endpoints, listed by platform type. Endpoint categories include Shield, Mobile Device, and Cloud.

1. In the left pane, click Populations > Users.
2. Search or select a user name, then the Endpoints tab.

Shield
Platform - The platform type
Device ID - Value that uniquely identifies the target device
Last Successful Login - Date/time stamp, per endpoint
Last Unsuccessful Login - Date/time stamp, per endpoint
Last Gatekeeper Sync - Date/time stamp, per endpoint
Effective Policies - Click view for a simple layout view of the effective endpoint policies
Actions - Click Recover to proceed to the Recover Data page
Last Encryption Sweep Start - Date/time stamp, per user
Sweep End - Date/timestamp, per user
Encryption Failure - Click view for a simple list of files that could not be encrypted, per user
States (Date/time stamp, per endpoint):
Policy Updating
User Encryption Profile Updating
EMS Encryption Profile Updating
User Data Encryption On
Deactivation Pending
Suspension Pending
Suspended

Mobile Device
Platform - The platform type
Device ID - Value that uniquely identifies the target device
Effective Policies - Click view for a simple layout view of the effective endpoint policies

Cloud
Platform - The platform type
Device ID - Value that uniquely identifies the target device

User Groups
If the user belongs to a user group, this page displays information about the group and provides a link to the group.

1. In the left pane, click Populations > Users.
2. Search or select a user name, then the Users Groups tab.

User Group - Group to which the user belongs
Distinguished Name - CN=Group1, OU=Dallas, DC=Organization, DC=com
CN is the common name
OU is the organizational unit name
DC are domain components
User Admin

This page allows you to assign, modify, or view administrator roles for the user.

1. In the left pane, click **Populations > Users**.
2. Search or select a user name, then the **Admin** tab.

   Administrator Roles - Assign or modify roles for the user and click **Save**.

   Inherited Group Roles - A read-only list of roles that the user inherited from a group. To modify the roles, click the **User Groups** tab for that user and select the group name.

   Delegated Roles - Delegate administrator rights to a user.

Related topics:

- [Administrator Roles](#)
- [Assign or Modify Administrator Roles](#)
- [Delegate Administrator Roles](#)

View Reconciliation Date

To view the date and time a user group's or user's information was last reconciled with Active Directory, click the Details & Actions tab for the group or user, and refer to last reconciled. For instructions, refer to [View or Modify User Group Policies and Information](#) and [View or Modify User Policies and Information](#).

View Policy Proxy State

The Management Console tracks the Policy Proxy's policy updating state.

1. In the left pane, click **Populations > Endpoints**.
2. Select an endpoint type, for example, **Workstation** or **Mobile Device**.
3. If you know the full endpoint hostname, enter it into **Search** and click **Search**.

For Windows and Mac, enter the full endpoint hostname if you know it. Leave the field blank to display all Windows and Mac endpoints.

For Mobile devices, optionally enter the user’s email address.

If you do not know the full hostname or user email address, scroll through the list of available endpoints to locate the endpoint.

4. Click an endpoint in the list to display the endpoint detail.
5. Click the **Details & Actions** tab of the endpoint to view information.

Issue a User Decryption Policy

1. In the left pane, click **Populations > Users**.
2. Click a user name link or search for a user and then click a link to display the user detail.

   Enter Common Name, Universal Principal Name, or sAMAccountName. The wildcard character (*) is supported.

3. On the **Security Policies** tab, click **Policy-Based Encryption**.

4. Set the value of **Policy-Based Encryption** to **Off**.

5. Click **Save**.

6. **Commit Policies**.

Once this policy reaches the specified Encryption client, decryption begins.

### Endpoint Groups

**Endpoint Groups**

On the Endpoint Groups page, you can add or remove an Endpoint Group, edit Endpoint Group priority, or search and select an Endpoint Group to view or modify Endpoint Group information.

**Types of Endpoint Groups**

System - Endpoint Group maintained by Dell Server. System groups include Default Endpoint Group, Opt-In Endpoint Group, Persistent VDI Endpoint Group, and Non-Persistent VDI Endpoint Group. For more information about VDI Endpoint Groups, see [VDI Endpoint Groups](#).

Rule-Defined - Dynamic Endpoint Group based on a specification, or rule set, defined by the administrator.

Admin-Defined - Static endpoint group for which the administrator can select specific endpoints for inclusion. The group remains unchanged unless the administrator adds or removes an endpoint. For more information, see [Add Endpoints to an Admin-Defined Endpoint Group](#) or [Remove Endpoints from an Admin-Defined Endpoint Group](#).

Active Directory Group - Endpoint group for which the administrator can select a group from Active Directory for inclusion. The Active Directory group scope must be Global, and type must be Security. At least one endpoint in the Active Directory group must be running a Dell Data Security product and be managed by Dell Server. For more information about adding Active Directory endpoint groups to the Dell Server, see KB article [SLN306875](#).

**Add an Endpoint Group**

Before you add the first Endpoint Group see [Endpoint Groups Specification](#), which explains fields and expressions used in Group Specifications.

1. In the left pane, click **Populations > Endpoint Groups**.

2. Click **Add**.

3. In **Select the type of Endpoint Group**, select **RULE-DEFINED Group**, **ADMIN-DEFINED Group**, or **Active Directory Group**.

4. In **Group Name**, enter a name for the new Endpoint Group.

5. In **Description**, enter a description for the new Endpoint Group.

6. (For Rule-Defined Groups only) In **Specification**, enter the rule that describes the Endpoint Group. Specifications can be up to 20,000 characters and are case insensitive.

   (For Active Directory Groups only) In **Choose AD Group**, enter the beginning characters of an Active Directory group name (Example: Accounting), and select the desired group.
7. (For Rule-Defined and Active Directory Groups only) Click Preview to view the endpoints to be included in the group.
8. Click Add Group to save the group definition.
9. After the group is added, modify the group priority if necessary.

Remove an Endpoint Group
1. In the left pane, click Populations > Endpoint Groups.
2. Select the group to remove.
3. Click Delete, then click OK.

Modify an Endpoint Group
1. In the left pane, click Populations > Endpoint Groups.
2. Select the group to modify.
3. Click the Details & Actions tab.
4. Click Modify.
5. Make changes as desired.
6. Click Update Group.

VDI Endpoint Groups
Upon activation, a VDI endpoint is added to the appropriate VDI Endpoint Group on Dell Server, and policies are sent to the endpoint. Persistent VDI Endpoint Groups and Non-Persistent VDI Endpoint Groups are System Endpoint Groups, which are maintained by Dell Server.

Policy settings differ, based on whether persistent or non-persistent VDI is deployed in the environment. For an explanation of the differences between persistent and non-persistent VDI, see Persistent vs. Non-Persistent VDI.

Policy and Configuration Requirements for VDI Endpoint Groups
The policy requirements below are for VDI endpoints running Advanced Threat Prevention. The list includes only policies that are significant for VDI endpoints. VDI User policy settings must also meet certain requirements. See Policy and Configuration Requirements for VDI Users.

Note: Ensure that you turn off Advanced Threat Prevention Agent Auto Update. In the left pane of the Management Console, select Management > Services Management > Advanced Threats - Agent Auto Update, then select Off.

Note: With Persistent VDI Groups, ensure that roaming user profiles are configured.

These policy and configuration settings for VDI Endpoint Groups must be configured before VDI client activation:

**Persistent vs. Non-Persistent VDI**

Persistent and Non-Persistent VDI endpoints differ in the following ways:

<table>
<thead>
<tr>
<th>Persistent VDI</th>
<th>Non-Persistent VDI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Persistent endpoints may exist for many days to years.</td>
<td>Non-persistent endpoints usually exist only for a few days or weeks.</td>
</tr>
<tr>
<td>Persistent endpoints retain the configurations that are set for the VM, until the VM clone pool is removed and rebuilt.</td>
<td>Non-persistent endpoints revert to baseline settings after a user logs off.</td>
</tr>
<tr>
<td>A persistent endpoint is dedicated to a single user.</td>
<td>After reverting to baseline settings, a non-persistent endpoint is</td>
</tr>
</tbody>
</table>
Endpoint Groups Specification

To skip to instructions about how to add an endpoint, see Add Endpoint Groups.

At deployment time, all endpoints belong to a default endpoint group, which is generally sufficient for most deployments. This feature is used to assign policy to a specific group of endpoints. For instance, you may want to create an endpoint group based on the locale that the operating system sends up in inventory. Once that endpoint group is established, you could then apply a specific policy set to just the endpoints in your specified locale.

Conversely, creating an endpoint group based on a platform type would not be useful because policies are already grouped by platform.

Endpoint groups are created using a group specification. This specification allows you to define the endpoint characteristics used to add endpoints to a group. You cannot manually add endpoints to endpoint groups. The system, based on the characteristics in the endpoint group specification, automatically manages endpoints and endpoint group membership.

Endpoints can be members of many endpoint groups simultaneously, as there is no mutual exclusion requirement for endpoints in groups. All endpoints are included in the default endpoint group in addition to any defined endpoint groups that they may be a member of. This is similar to the way users are a member of the domain they are a part of, in addition to any security groups. Like the user group mapping, the endpoint group mapping creates a potential policy arbitration problem for endpoints. To resolve this problem, the default endpoint group has the lowest possible precedence, and cannot be altered. The endpoint groups that you create have medium precedence by default. For more information on group precedence, see Modify Group Precedence.

Endpoint Group Specification

The endpoint group specification is a domain specific language that allows you to define groups. The endpoint group specification consists of a set of operators and a set of data fields that these operators can be applied to. A group specification is a Boolean expression that is evaluated per endpoint to determine whether or not a endpoint is a member of a group.

The information obtained to assign endpoints to endpoint groups happens when inventory is received, not at activation time. If you set up endpoint groups, all endpoints will stay only in the default endpoint group until inventory is received.

Group specifications are created using the following fields and expressions. Multiple fields and operators can be used in a single group specification.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATEGORY</td>
<td>Endpoint category: WINDOWS, MAC, SED</td>
</tr>
<tr>
<td>UID</td>
<td>Windows hostname</td>
</tr>
<tr>
<td>DISPLAYNAME</td>
<td>Fully qualified hostname</td>
</tr>
<tr>
<td>OSVERSION</td>
<td>Operating system version as reported in inventory. Dell recommends using other available fields, as discrepancies in operating system versions may reduce the usefulness of this field.</td>
</tr>
<tr>
<td>OS</td>
<td>Operating system name as reported in the endpoint's inventory</td>
</tr>
<tr>
<td>PROCESSOR</td>
<td>System processor information</td>
</tr>
<tr>
<td>SERIALNUMBER</td>
<td>Endpoint serial number</td>
</tr>
<tr>
<td>LOCALE</td>
<td>The current locale of the endpoint. This is typically only reported by Encryption Enterprise.</td>
</tr>
<tr>
<td>WINCOMPUTERNAME</td>
<td>Fully qualified hostname</td>
</tr>
<tr>
<td>ASSETTAG</td>
<td>Asset tag of the computer manufacturer</td>
</tr>
<tr>
<td>SHIELDDVERSION</td>
<td>Version of Encryption client</td>
</tr>
<tr>
<td>AGENTVERSION</td>
<td>Agent version for Manager</td>
</tr>
<tr>
<td>PLUGINVERSION</td>
<td>Plugin version for Manager</td>
</tr>
<tr>
<td>MEMBEROFGROUP</td>
<td>Active Directory group name</td>
</tr>
<tr>
<td>MEMBEROFDOMAIN</td>
<td>Active Directory domain name</td>
</tr>
<tr>
<td>CLOUDPRESENT</td>
<td>All Dell Data Guardian clients</td>
</tr>
<tr>
<td>CLOUDINTERNAL</td>
<td>Internal Data Guardian clients</td>
</tr>
<tr>
<td>CLOUDEXTERNAL</td>
<td>External Data Guardian clients</td>
</tr>
<tr>
<td>SEDPRESENT</td>
<td>All SED clients</td>
</tr>
<tr>
<td>BITLOCKERPRESENT</td>
<td>TRUE/FALSE value for BitLocker Manager, indicating if BitLocker is enabled.</td>
</tr>
<tr>
<td>TOTALMEMORY</td>
<td>Total memory available on the computer</td>
</tr>
</tbody>
</table>

### Operators and Expressions

The basic operators are the binary operators that return a Boolean value.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Boolean, Integer, and String equality operator</td>
</tr>
<tr>
<td>&gt;, &gt;=</td>
<td>Greater than, greater than or equal, integer operator</td>
</tr>
<tr>
<td>&lt;, &lt;=</td>
<td>Less than, less than or equal, integer operator</td>
</tr>
<tr>
<td>&lt;&gt;</td>
<td>Not equal, integer string operator</td>
</tr>
<tr>
<td>AND</td>
<td>Logical AND for Boolean expression</td>
</tr>
<tr>
<td>OR</td>
<td>Logical OR for Boolean expression</td>
</tr>
<tr>
<td>NOT</td>
<td>Logical NOT for Boolean expression</td>
</tr>
</tbody>
</table>

The logical operators follow the standard Boolean operator precedence (NOT, AND, OR). String fields have the following string operators that return Boolean values:

- **BEGINSWITH**
- **ENDSWITH**
- **CONTAINS**

These operators can be used on the string fields:

- **UID BEGINSWITH "A1850502"**
- **ASSETTAG CONTAINS "007"**

String fields also have the following string operators that return substrings of the field:

- **LEFT(string,int)**
- **RIGHT(string,int)**
MID(string, int, int)

The substring operators can be used in the string operators that return Boolean values:

LEFT(DISPLAYNAME, 4) = "A185"

There is one additional string operator that returns an integer value that is the length of the string:
LEN(string)

This can be used in a Boolean expression:

LEN(DISPLAYNAME) <= 10

- Using the FQDN of the client computer to attach it to a device group can be done by keying on any commonality amongst the desired client computers. In the example below, a child domain of ORGANIZATION, AMERS, represents a domain in America. Additionally, a 2nd child domain, EMEA, represents non-American based clients.

DISPLAYNAME ENDSWITH "AMERS.ORGANIZATION.COM"

This group will contain all clients that are in the AMERS domain according to their FQDN.

DISPLAYNAME ENDSWITH "EMEA.ORGANIZATION.COM"

This group will contain all clients that are in the EMEA domain according to their FQDN

- If the hostname of the client computers contain several notations that indicate desired ways in which to create a group, those specific portions can be captured as long as their location is consistent.

Looking at the hostname: A12345jdoe.AMER.ORGANIZATION.COM

A denotes an asset, while the following 5 digits denotes the asset's assigned value. The user that was assigned the asset has their SAM account appended to the end.

You can capture the assigned number of the asset, and that it is within a certain subsection of assets. This example shows how to look for assets that have a value less than 1000.

MID(DISPLAYNAME, 2, 5) < 1001

This example targets user's computer where their last name begins with ‘r’.

MID(DISPLAYNAME, 8, 1) = ‘r’

- Data Guardian:

  To display Data Guardian internal clients, add the specification "cloudpresent and cloudinternal".
  
  To display Data Guardian external clients, add the specification "cloudpresent and cloudexternal".
  
  For instructions about how to add an endpoint, see Add Endpoint Groups.

Edit Group Priority
The Group priority feature is used to determine policy precedence for effective policies that affect multiple groups. Group priority creates a weight associated with the specific group it is assigned to, and that weight is used to determine which policy setting is applied to an endpoint that is a member of more than one Endpoint Group when policy settings differ between those groups. Policy overrides are used from the group with higher priority when two (or more) separate groups have different priority levels.

**Edit Endpoint Group Priority**

Endpoint Group Priority can be changed only for Rule-Defined, Admin-Defined, and Active Directory Groups. System-Defined Group priority cannot be modified. In general, the Endpoint Group at the top of the list of Endpoint Groups has highest priority. The Endpoint Group at the bottom of the list has lowest priority.

**Precedence Ranking**

The System Defined Non-Persistent VDI Endpoint Group has the highest priority level, followed by the Persistent VDI Endpoint Group.

Order of priority:

1. Non-Persistent VDI Endpoint Group
2. Persistent VDI Endpoint Group
3. Highest ranked Active Directory/Rule-Defined/Admin-Defined Endpoint Group
4. Second and subsequent highest ranked Active Directory/Rule-Defined/Admin-Defined Endpoint Groups
5. Opt-in Endpoint Group
6. Default Endpoint Group

To change Active Directory/Rule-Defined/Admin-Defined Endpoint Group priority:

1. In the left pane, click **Populations > Endpoint Groups**.
2. Click **Edit Priority**.
3. Select the row of the appropriate group and drag it to the location in the list of Endpoint Groups that reflects its new priority level.
4. Click **Save**.

**Edit User Group Priority**

The user group at the top of the list has highest priority. The user group at the bottom of the list has lowest priority.
To edit User Group priority:

1. In the left pane, click Populations > User Groups.
2. Click Edit Priority.
3. Select the row of the appropriate group and drag it to the location in the list of Endpoint Groups that reflects its new priority level.
4. Click Save.

**View Endpoints in an Endpoint Group**

This page displays the endpoints included in information for every user of the specified endpoint.

1. In the left pane, click Populations > Endpoint Groups.
2. Click a Group Name link or enter a filter to search for available Groups. The wildcard character (*) is supported.

   When you click a Group Name, the Endpoint Group Detail page displays.
3. If applicable, View or Modify Endpoint Information.

**View or Modify Endpoint Group Policies and Information**

1. In the left pane, click Populations > Endpoint Groups.
2. Click a Group Name or enter a filter to search for available Endpoint Groups. The wildcard character (*) is supported.

   When you click a Group Name, the Endpoint Group Detail page displays.
3. Click the tab that corresponds with the action to perform:

   **Security Policies** - To view or modify policies of the Group, click Security Policies.
   **Note:** Before modifying VDI Endpoint Group policies, see Policy Requirements for VDI Endpoint Groups.
Details & Actions - To view properties of the Group, click Details & Actions. Viewable information includes:

Group Name: Group1 (DOMAIN\Group1)

Description: The description provided when the Group was added.

(For Rule-Defined groups) Specification: The endpoint group specification that defines endpoints as members of the group.

PBA Device Control - The PBA Unlock command for this endpoint group is carried out in the PBA Device Control area. This command unlocks the PBA screen after it has been locked – either by sending a Lock command or by exceeding the maximum number of authentications attempts allowed by policy.

Members - To view or modify the information of an endpoint in the group, click Members. The list of endpoints in the group displays. Click an endpoint to view the endpoint's Security Policies, Details & Actions, Users, Endpoint Groups, Threat Events, and Advanced Events.

4. If modified, click Save.

Endpoint Group Details & Actions

This page lists the properties of the selected Endpoint Group.

1. In the left pane, click Populations > Endpoint Groups.
2. Search or select a Group Name, then the Details & Actions tab.

Details:

Group Name of the endpoint group

A description of this endpoint group

The specification that was used to create this endpoint group (applies only to Rule-Defined Groups)

Active Directory Group (applies only to Active Directory Groups)

PBA Device Control

The PBA Unlock command for this endpoint group is carried out in the PBA Device Control area. This command unlocks the PBA screen after it has been locked – either by sending a Lock command or by exceeding the maximum number of authentications attempts allowed by policy.

Endpoint Group Members

This page lists the endpoints within an endpoint group. Information displays based on the group specification used to create the endpoint group.

1. In the left pane, click Populations > Endpoint Groups.
2. Search or select a Group Name, then the Members tab.

Category - WINDOWS, MAC, SED, iOS, or Android

Hostname - Endpoint hostname

OS/Version - Endpoint operating system and version

Add Endpoints to an Admin-Defined Endpoint Group
1. In the left pane, click **Populations > Endpoint Groups**.
2. Select the group to which to add endpoints.
3. Click the **Members** tab.
4. Select **Add Endpoints to Group**, then search for specific endpoints or select endpoints in the list, and click **Add Selected Endpoints to Group**.

   OR

   Select **Upload Multiple Endpoints from File**, then click **Browse** to select a CSV file and click **Upload**.

**Valid CSV requirements:**
- The file must be in valid CSV format and contain a maximum of 999 endpoints.
- The first column must contain valid fully qualified hostnames. All columns except the first column are ignored.
- Only activated endpoints are added to the group.

**Remove Endpoints from an Admin-Defined Endpoint Group**

1. In the left pane, click **Populations > Endpoint Groups**.
2. Select the group in which to add endpoints.
3. Click the **Members** tab.
4. Search for specific endpoints or select endpoints in the list. To select more than one endpoint, press **Shift** and select the endpoints.
5. Click the red X in the right column for each endpoint, or select the endpoints and click **Remove Endpoints from Group**.

**Endpoints**

**Endpoints**

On the Endpoints page, you can add an endpoint to a group, remove an endpoint, or search and select an endpoint to View or Modify Endpoint Information. You can also quickly view the following summary information about each endpoint:

* **Hostname** - Endpoint hostname.
* **OS/Version** - Operating system and version running on the endpoint (Example: Microsoft Windows 10 Enterprise).
* **Category** - Category of endpoint (Example: Windows or Mac).
* **Protected** - A green check displays if the endpoint is protected. If the endpoint is not protected, the column is blank.
* **Serial Number** - Manufacturer assigned serial number.
* **Win Computer Name** - Computer name Windows uses to identify the computer on the network.
* **PBE** - Policy-Based Encryption version.
* **Manager** - Manager/Agent version.
Data Guardian - Data Guardian version.

Hardware ID - A unique identifier sent to the server from the client.

* Click the column header to sort by column label.

Click a hostname to view additional details about the endpoint. Click an arrow at the left of a hostname to view the Category, Unique ID, and Processor.

**Add Endpoint to Group**

To add an endpoint to an Endpoint Group:

1. In the left pane, click **Populations > Endpoints**.
2. Select the check box next to a hostname in the list or enter a filter to search for available endpoints. The wildcard character (*) is supported.

For Windows and Mac, if you know the endpoint hostname, enter it in Search. Leave the field blank to display all Windows and Mac endpoints.

For Mobile devices, optionally enter the model name or user's email address.

3. At the top left, click **Add Endpoints to Group**.

An endpoint is added to inventory when a user who is in the Dell Server database activates the endpoint.

If the user is not found in the Dell Server database, they is located in Active Directory.

**Remove Endpoints**

Endpoint removal is permanent. Once an endpoint is removed, the action cannot be undone.

To remove an endpoint:

1. In the left pane, click **Populations > Endpoints**.
2. Select the appropriate endpoint type, for example, **Workstation** or **Mobile Device**.
3. Click the box next to a hostname in the list or enter a filter to search for available endpoints. The wildcard character (*) is supported.

For Windows and Mac, if you know the hostname of the endpoint, enter it in Search. Leave the field blank to display all Windows and Mac endpoints.

For Mobile devices, optionally enter the model name or user's email address.

4. At the top left, click **Remove**.
5. Click **OK** to confirm removal of the endpoint.

As another option, click an endpoint and select the **Details & Actions** tab. Under **Endpoint Detail**, click **Remove**.

**Find Endpoints**

1. In the left pane, click **Populations > Endpoints**.
2. Navigate the list of endpoints using the scroll bar or page navigation controls at the bottom of the page or enter a filter into Search to search for available endpoints. The wildcard character (*) is supported.
For Windows and Mac, if you know the endpoint hostname, enter it in Search. Leave the field blank to display all Windows and Mac endpoints.

For Mobile devices, optionally enter the model name or user's email address.

**View or Modify Endpoint Policies and Information**

1. In the left pane, click **Populations > Endpoints**.
2. Select the appropriate endpoint type, for example, **Workstation** or **Mobile Device**.
3. Click a hostname in the list or enter a filter to search for available endpoints. The wildcard character (*) is supported.

For Windows and Mac, if you know the endpoint hostname, enter it in Search. Leave the field blank to display all Windows and Mac endpoints.

For Mobile devices, optionally enter the model name or user's email address.

Click a hostname or endpoint serial number to display the Endpoint Detail page.

4. Click the tab that corresponds with the action to perform:

   **Security Policies** - Click Security Policies to view or modify policies of the endpoint.

   **Details & Actions** - Click Details & Actions to view properties of the endpoint, including Inventory Information. Viewable information includes hardware information, effective policies, inventory and protection status, threat protection and Advanced Threat Prevention detail, and SED Device Control commands.

   **Users** - Click Users to view a list of users who store and access data on the endpoint. These statistics of users may be available on the Endpoint Detail page: login, last Gatekeeper sync, effective policies, and states. You can also recover data from this page.

   **Endpoint Groups** - Click Endpoint Groups to view a list of Endpoint Groups to which this endpoint belongs. All endpoint belong to at least one endpoint group, the Default Endpoint Group.

   **Threat Events** - Click Threat Events view information about threat events on the endpoint. The following information is displayed for events: severity, category (malware, web filtering, web protection, and firewall), event ID, event description, user name, and received.

   **Advanced Threat Events** - Click Advanced Threat Events view, export, quarantine, or waive unsafe files. Events are grouped by Status (unsafe, quarantined, or abnormal), and the following information is displayed for events: file name, file paths, score, classification, first found time stamp, running, auto run, and detected by.

5. If modified, click Save.

**View Effective Policy**

When you view Effective Policies, you are viewing the policies and settings that are enforced on an endpoint.

1. In the left pane, click **Populations > Endpoints**.
2. Click a hostname in the list or enter a filter to search for available endpoints. The wildcard character (*) is supported.

For Windows and Mac, if you know the endpoint hostname, enter it in Search. Leave the field blank to display all Windows and Mac endpoints.
For Mobile devices, optionally enter the model name or user's email address.

Click a hostname or endpoint serial number to display the Endpoint Detail page.

3. On the Endpoint Detail page, click the **Details & Actions** tab.
4. Under **Manager Detail**, click **View Effective Policies**.

Related topics:

**Manage Security Policies**

**Endpoint Details & Actions**

The Details & Actions page lists the details for the selected endpoint as well as commands, such as Remove Endpoint. Available details and commands vary, depending on the endpoint platform.

To access Endpoint Details & Actions, follow these steps:

1. In the left pane, click **Populations > Endpoints**.
2. Search or select a hostname, then the **Details & Actions** tab.

**Endpoint Detail**

**Command:**

- **Remove** - Endpoint is removed.

Endpoint removal is permanent. Once an endpoint is removed, the action cannot be undone.

**Details:**

**Windows**

- Category - Windows
- OS/Version - Example: Microsoft Windows 10 Enterprise
- Processor
- Serial Number - Manufacturer assigned serial number
- Host ID - Endpoint identifier
- Unique ID - Dell assigned unique identifier
- Hardware ID - A unique identifier sent to the server from the client.
- Protected - Date and time stamp

**Mac**

- Category - Mac
- OS/OS Version - Example: Mac OS X 10.11.0
- Processor
- Serial Number - Manufacturer assigned serial number
- Host ID - Endpoint identifier
- Unique ID - Dell assigned unique identifier
- Hardware ID - A unique identifier sent to the server from the client.
Protected - Date and time stamp

**Mobile Device**
Category - Mobile Device
OS/OS Version - Example: Lollipop / 5.0
Model Name - Examples: Android or iPad
Serial Number - Manufacturer assigned serial number
Last Contact Time - Date and time stamp of last contact with the Security Management Server

State:
- **Discovered** – device found
- **Blocked** – block from Exchange access

*Blocked Sub-States (on the Endpoint Detail page):*
- **Blocked by Admin** – (EAS only) blocked by administrative override using the Block Device command
- **Blocked by Policy** – (EAS or iOS) subject to the Allow iOS Devices and Allow Non-iOS Devices policies.
- **Pending** – iOS policy pending
- **Protected** – policies implemented

**Cloud**
Category - Windows, iOS, or Android
OS/OS Version - Examples:
- Windows 10
- Android / 5.0
- iPhone OS / 8.0
Model ID - Examples: iPhone6, or iPad3,4
Model Name (if available)
Phone ESN/IMEI (if available)
Processor (will display if the data is available)
Memory available and total (MBs) (will display if the data is available)
Battery remaining% (will display if the data is available)
Serial Number - Manufacturer assigned serial number
Unique ID - Dell assigned unique identifier
Actions - Hide or Remove Endpoint

**Shield Detail**

**Commands:**
To view the policies of the endpoint, click **View Effective Policies**.
Obtain the endpoint's recovery keys:
1. Click **Device Recovery Keys**.
2. Enter a Recovery Password and click **Download**.

The recovery bundle containing this endpoint's encryption keys is downloaded. You must remember the this recovery password to access the recovery keys.

**Detail:**

**Windows**

Policy Proxy Group (typically CMGREMOTE)

Recovery ID of the specific endpoint

Manager Detail (Windows only)

**Command:**
Click [View Effective Policies](#) to go to the effective policy page for this endpoint.

**States**
The client gathers the following information via a Windows Management Instrumentation (WMI) call to the Operating System. It is updated with each inventory update.

- **Inventory Received** - the date and time that the inventory was received by the Dell Server and placed in the queue.
- **Inventory Processed** - the date and time that the inventory was picked up from the queue and processed. **(Note: If the Dell Server is under load, the Processed and Received times may be different, but usually they is the same.)**
- **Agent Version** - the version of Manager the endpoint is running.
- **Protected** - the date and time that the device was protected.

**Protection Status**
- **Disk** - number of the disk
- **Partitions** - number of partitions the disk has
- **Capacity** - capacity of the disk
- **Encryption Technology** - encryption technology in use
- **Protection Status** - Protected or unprotected
- **Interface** - Disk interface (Examples: IDE, SATA)
- **Model** - Manufacturer name and model of the disk

Click the small black arrow on the left to expand the disk details to view information for each partition of the disk.

- **Logical Disk** - The name of the logical disk.
- **ID** - The identifying number of the logical disk.
- **Encryption %** - The percentage of the partition that has been encrypted.
- **Capacity** - The capacity of the partition.
- **Protection Status** - Protection status for the partition: Protected, Unprotected, Locked

**Providers**
- **Agent** - SED, FDE, Authentication Proxy, Preboot Authentication, Windows Authentication, BitLocker, TPM, Threat Protection, Advanced Threat Prevention
Plugin Functional Status (green check mark or red "x") - This indicates whether the Agent has been enabled via policy. To get more detail on whether each plugin is working as expected, look at Plugin State column.

Plugin State:

- BitLocker Plugin:
  - Starting - Manager is starting up. Because this is a fairly quick process, it is unlikely an inventory update would capture this so you would probably never see this state in the Management Console.
  - Disabled - Manager is disabled by policy and not enforcing any previously received policy.
  - Active - Manager is running normally and enforcing policies.
  - No Policy - Initial policy has not been received so the plugin is not actively enforcing any policy. This is only relevant the very first time you install the Manager client. Manager does not start a plugin until an initial policy is received from the Dell Server, versus starting the plugin with some default policy placed on the client during install. After an initial policy has been received from the Dell Server, via the activation process, plugins are always started with the last policy the client is aware of.
  - OpSys Not Supported - Manager does not support this operating system. Manager is not actively enforcing policy related to this plugin, due to this plugin-specific exception.

- TPM Plugin:
  - Starting - Manager is starting up. Because this is a fairly quick process, it is unlikely an inventory update would capture this so you would probably never see this state in the Management Console.
  - Disabled - Manager is disabled by policy and not enforcing any previously received policy.
  - Active - Manager is running normally and enforcing policies.
  - TPM Services Not Started – In the Enterprise Server Console this is listed as \textit{TPM Base Services Failed}. It means something is preventing the TPM service from starting as expected. The Manager is not actively enforcing policy related to this plugin, due to this plugin-specific exception.
  - No TPM Device – The TPM device is not present or is not detectable in the indicated computer. The Manager is not actively enforcing policy related to this plugin, due to this plugin-specific exception.
  - No Policy - Initial policy has not been received so the plugin is not actively enforcing any policy. This is only relevant the very first time you install the Manager client. Manager does not start a plugin until an initial policy is received from the Dell Server, versus starting the plugin with some default policy placed on the client during install. After an initial policy has been received from the Dell Server, via the activation process, plugins are always started with the last policy the client is aware of.

- SED Plugin:
  - Initialized - Manager is initialized waiting for delayed startup
  - Starting - Manager is starting up. Because this is a fairly quick process, it is unlikely an inventory update would capture this so you would probably never see this state in the Management Console.
  - Disabled - Manager is disabled by policy and not enforcing any previously received policy.
  - Active - Manager is running normally and enforcing policies.
No Policy - Initial policy has not been received so the plugin is not actively enforcing any policy. This is only relevant the very first time you install the Manager client. Manager does not start a plugin until an initial policy is received from the Dell Server, versus starting the plugin with some default policy placed on the client during install. After an initial policy has been received from the Dell Server, via the activation process, plugins are always started with the last policy the client is aware of.

Waiting For Escrow - Manager is waiting for keys to escrow

Waiting For Server Public Key - Manager is waiting for public key to proceed with activation

No Opal Drive Present - Manager did not detect an OPAL drive

Plugin Version - The version of the plugin, which is taken from the plugin's version information

Vendor version - The version of the underlying framework. For example, BitLocker is Microsoft's technology, therefore Vendor Version is Microsoft's version for BitLocker.

Threat Protection Detail (Windows only)

Scan Engine Version - Lists the version of the engine that performed the last scan.

DAT File Version - Lists the version of the DAT file.

Last Scan Started - Date/time stamp that the last scan was started.

Last Scan Completed - Date/time stamp that the last scan was completed.

Advanced Threat Prevention Detail

Device ID - Lists the identifier of the device as it pertains to Advanced Threat Prevention.

Agent Version - Lists the version of the agent.

Update Date - Date/time stamp that the agent was updated.

Provisioned Date - Date/time stamp that the client was provisioned.

Cloud Device Control

Cloud device commands apply to the selected endpoint and are carried out from the Cloud Device Control section of the device's endpoint page. Unlike policies, commands are pushed to the device to enable an action.

Commands:

Suspend - Suspends the endpoint device. It does not suspend the user account.

Unsuspend - Unsuspends the endpoint device.

FDE Device Control (Windows only)

Current State of the Endpoint - Unlocked or Locked

Commands:

PBA commands for a specific endpoint are carried out in the PBA Device Control area. Each command has a priority ranking. A command with a higher priority rank cancels commands of lower priorities in the enforcement queue. For a list of command priority rankings, see Priority of Commands for Self-Encrypting Drives.

Lock - Locks the PBA screen and prevents any user from logging into the computer.

Unlock - Unlocks the PBA screen after it has been locked on this endpoint, either by sending a Lock command or by exceeding the maximum number of authentications attempts allowed by policy.
Remove Users - Removes all users from the PBA.

Bypass Login - Bypasses the PBA screen one time to allow a user into the computer without authenticating. The user will still need to login to Windows after PBA has been bypassed.

Wipe - The Wipe command functions as a “restore to factory state” for the FDE drive. The Wipe command can be used to re-purpose a computer or, in an emergency situation, wipe the computer, making the data permanently unrecoverable. When the wipe command is consumed by the client, all history and details about this endpoint are removed from the Dell Server. Ensure that this is the desired behavior before invoking this command.

The FDE Device Control Table
The table lists the commands most recently sent to the PBA Device.
To sort the table, click a column header.

PBA Device Control (Windows only)

Current State of the Endpoint - Unlocked or Locked

Commands:

PBA commands for a specific endpoint are carried out in the PBA Device Control area. Each command has a priority ranking. A command with a higher priority rank cancels commands of lower priorities in the enforcement queue. For a list of command priority rankings, see Priority of Commands for Self-Encrypting Drives.

Lock - Locks the PBA screen and prevents any user from logging into the computer.

Unlock - Unlocks the PBA screen after it has been locked on this endpoint, either by sending a Lock command or by exceeding the maximum number of authentications attempts allowed by policy.

Remove Users - Removes all users from the PBA.

Bypass Login - Bypasses the PBA screen one time to allow a user into the computer without authenticating. The user will still need to login to Windows after PBA has been bypassed.

Wipe - The Wipe command functions as a “restore to factory state” for the SED drive. The Wipe command can be used to re-purpose a computer or, in an emergency situation, wipe the computer, making the data permanently unrecoverable. When the wipe command is consumed by the client, all history and details about this endpoint are removed from the Dell Server. Ensure that this is the desired behavior before invoking this command.

The PBA Device Control
Lists the commands most recently sent to the PBA device.
To sort, click a column header.

Protected Status

Protected status is indicated if any of the following criteria are met:

- Advanced Threat Prevention is installed and enabled.
- Data Guardian is installed and enabled.
- Self-Encrypting Drive Management is installed, enabled, and the PBA is enabled.
- BitLocker Manager is installed, enabled, and encryption has completed.
- Dell Encryption (Mac) is installed and enabled, and policy-based encryption has been enforced.
• Dell Encryption (Windows) is installed, enabled, Policy-Based Encryption has been set for the endpoint, and the most recent policy has been applied for the last logged on user.

To check Protected Status of an endpoint:

1. In the left pane, click **Populations > Endpoints**.
2. Click a hostname in the list or enter a filter to search for available endpoints. The wildcard character (*) is supported.
   - For Windows and Mac, if you know the endpoint hostname, enter it in the **Search** field. Leave the field blank to display all Windows and Mac endpoints.
   - For Mobile devices, optionally enter the model name or user's email address.
   - Click a hostname or endpoint serial number to display the Endpoint Detail page.
3. A green check mark displays in the Protected column if any of the criteria for Protected status are met.

**Endpoint Users**

This page displays information for every user of the specified endpoint. The user information differs for each technology group or policy category.

1. In the left pane, click **Populations > Endpoints**.
2. Search or select a hostname, then the **Users** tab.

**Shield**

- User - Each user on the specific endpoint
- Last Successful Login - Date/time stamp, per user
- Last Unsuccessful Login - Date/time stamp, per user
- Last Gatekeeper Sync - Date/time stamp, per user
- Effective Policies - Click **view** for a simple layout view of the effective user policies
- Actions - Click **Recover** to proceed to the Recover Data page
- Last Encryption Sweep Start - Date/time stamp, per user
- Sweep End - Date/time stamp, per user
- Encryption Failure - Click **view** for a simple list of files that could not be encrypted, per user

**States** (Date/time stamp, per user):

- Policy Updating
- User Encryption Profile Updating
- EMS Encryption Profile Updating
- User Data Encryption On
- EMS Data Encryption On
- Deactivation Pending
- Suspension Pending
Endpoint Threat Events

This page lists information on threat events for the selected endpoint.

1. In the left pane, click Populations > Endpoints > Workstation.
2. Search or select a Hostname, then the Threat Events tab.

Threat Event Data

Severity - Severity of the threat, where Critical is the most dangerous threat to the endpoint, and Information is just a notification of an event that is unlikely to harm the endpoint. (Critical, Major, Minor, Caution, Information)

Category - Category of the threat. Upon identification, threats are sorted into these categories: Malware, Web Filtering, Web Protection, and Firewall.

Event ID - Unique number assigned to each threat event.

Description - Description of the last preventative action taken to handle the threat.

User Name - The DOMAIN\Username associated with the endpoint where the threat was identified.

Received - Date/time stamp when the last action was taken to handle a threat.

Navigate the Threat Event Data

To sort the data, click a column header.

Use the controls at the bottom of the page to:

- Advance to the top of the data.
- Go back one page.
- Go forward one page.
- Advance to the end of the data.
- Increase or reduce the items per page.
- View the range of items currently displayed.
- Refresh the data.

Endpoint Advanced Threats

This page allows you to view, export, quarantine, or waive unsafe files that trigger events on the selected endpoint.

An event is not necessarily a threat. An event is generated when a recognized file or program is quarantined, safe listed, or waived. Threats are a category of events that are newly detected as potentially unsafe files or programs and require guided remediation.

1. In the left pane, click Populations > Endpoints.
2. Search or select a hostname, then the **Advanced Events** tab.

**List of Events**

The list presents all files that have triggered events found on this device.

**Columns**

- Icon - An icon displays in this column, when available.
- Name - File triggering the event.
- File Paths - The location of the file on the device.
- Cylance Score - A score is assigned to each file that is deemed Abnormal or Unsafe. The score represents the confidence level that the file is malware. The higher the number, the greater the confidence.
- Status - Indicates whether the file has been quarantined or waived.
- Classification - Classification of the threat: High, Medium, or Low. For details, see Advanced Threat Protection Classifications.
- First Found - Date/timestamp that the file was first found.
- Running - Indicates whether the file that triggered the event is running or not.
- Auto Run - Indicates whether the file was set to automatically run upon startup.
- Detected By - Indicates whether the file was detected by Execution Control or by Memory Protection.

**Configure the Threat List**

**Add or Remove Columns**

Click an arrow next to any column header and select **Columns** to add columns to, or remove columns from, the table.

**Filter on Column Data**

To filter the list based on column data, click the down-arrow on any column to display the context menu, and select **Filter**.

The filter options vary, depending on the type of data in the column. For example, you may want to filter the list so that it shows only high priority threats.

**Group by a Column**

Drag a column header, such as Status, to the area directly above the column headers to group the data by Status. When you drag a column header, it turns green, indicating that the table can be grouped by that data. You can drag additional headers over the table to group the data even further.

For each group, a number displays in parentheses to indicate the total number of threats that share that group's attribute.

**Commands:**

Select the check box next to a file name to perform an action on the file. To select all files, select the check box in the column heading row.
Export lets you export selected data to a .CSV file so that you can view the data in Excel or a similar application which has powerful sorting/organizing features.

After selecting the data to export, click Export to save the data in a .CSV file.

Click Quarantine to add the file to the Quarantine list.

Quarantining a file will prevent the file from being executed on this device.

**Note:** Quarantining a file will move the file from its original location to the Quarantine directory (C:\ProgramData\Cylance\Desktop\q).

Click Waive to allow the file to run on this device.

**Note:** Occasionally, a “good” file could be quarantined or reported. This could happen if the features of that file strongly resemble those of malicious files. Waiving or globally safe listing the file can be useful in these instances.

**Exploit Attempts**

This section lists the detection of attempts to exploit running processes, or malware that executes from within memory space.

A number displays the total number of events, followed by the number in each subcategory.

Check box - Select all events by selecting the check box in the column heading row, or select individual events. When you select a check box, Quarantine and Waive are activated.

Added - Date and time when the exploit attempt was added.

Process Name - Name of the process identified as an exploit attempt.

Process ID - Unique number associated with the exploit attempt.

Type - Type of memory exploit: Exploitation, Process Injection, Escalation.

Action - Action taken to protect the system from the exploit attempt:

- Ignore - The agent does not take any action against identified memory violations.
- Alert - The agent will record the violation and list the incident on this page.
- Block - If an application attempts to call a memory violation process, the agent will block the process call. The application that made the call is allowed to continue to run.
- Terminate - If an application attempts to call a memory violation process, the agent will block the process call and will also terminate the application that made the call.

User Name - Name of the user who was logged in when the exploit attempt was identified.

**Endpoint Advanced Threat Events**

The Advanced Threat Events tab displays if the Advanced Threat Prevention service is provisioned and Advanced Threat Prevention is enabled on the endpoint.

The tab displays information about events for the endpoint based on information available in the Dell Server.
To access the Enterprise Advanced Threats tab, follow these steps:

1. In the left pane, click **Populations > Endpoints**.
2. Search or select a hostname, then the **Advanced Threat Events** tab.

Use the following filters to select content to display on the Advanced Threat Events tab:

- **Type** - Threat Found, Threat Blocked, Threat Terminated, Memory Violation Blocked, Memory Violation Terminated, Memory Violation (Detected), Threat Removed, Threat Quarantined, Threat Waived, Threat Changed, Protection Status Changed.
- **Severity** - Severity level of the event: Critical, Major, Minor, Caution, or Informational.
- **Timeframe (in days)** - 1, 7, 14, 30, 60, 90
- **Columns** - Allows you to select the following additional columns to display:
  - **Hostname** - The fully qualified name of the computer
  - **Data** - Details about the event
  - **Created** - Date and time that the event was captured
  - **Machine Name** - Name of the computer on which the threat event was detected
  - **Path** - Path to the file in which the threat was detected
  - **Sha256** - The file's 256-character Secure Hash Algorithm can be compared with an expected result to indicate whether the file has been tampered with.
  - **Score** - The threat file's score, indicating the confidence level that the file is malware. The higher the number, the greater the confidence.

**Server Encryption Clients**

**Suspend an Encrypted Server**

When you suspend an encrypted server, you suspend the user associated with the encryption client rather than an individual user who logs on to the endpoint.

To suspend a Server Encryption client:

1. In the left pane, click **Populations > Users**.
2. In **Search**, enter **SERVER-USER** and click the search icon.
3. Click the user name of the appropriate user.
4. On the User Detail page, click the **Endpoints** tab.
5. Click the Device ID of the appropriate endpoint.
6. On the Endpoint Detail page, click the **Details & Action** tab.
7. In Server Device Control, click **Suspend**.

Suspension takes effect the next time the endpoint is rebooted.

To reinstate an encrypted server, follow the instructions in **Reinstate a Suspended Server Encryption Client**.

**Reinstate an Encrypted Server**

---

Navigate the Dell Server
To reinstate an encrypted server, follow these steps:

1. In the left pane, click **Populations > Users**.
2. In **Search**, enter **SERVER-USER** and click 
3. Click the user name of the appropriate user.
4. On the User Detail page, click the **Endpoints** tab.
5. Click the Device ID of the appropriate endpoint.
6. On the Endpoint Detail page, click the **Details & Action** tab.
7. In Server Device Control, click **Reinstate**.

Reinstatement takes effect the next time the endpoint is rebooted.

**Commands for Self-Encrypting Drives**

**Priority of Commands for Self-Encrypting Drives**

Each command for self-encrypting drives has a priority ranking. A command with a higher priority rank cancels commands of lower priorities in the enforcement queue.

Priority rankings (1 is highest):

1. Wipe
2. Lock
3. Remove Users
4. Unlock
5. Bypass

For example, a Wipe command cancels a Lock command that was previously queued to send to the endpoint.

**Allow PBA Login Bypass**

You can allow users to bypass the Preboot Authentication (PBA) screen one time to allow a user into the computer without authenticating on an endpoint equipped with a self-encrypting drive.

To send the Bypass Login command, follow these steps:

1. In the left pane, click **Populations > Endpoints**.
2. Select the Workstation Endpoint Type.
3. If you know the full endpoint hostname, enter it in Search. Leave the field blank to display all Workstation endpoints.

4. Click . An endpoint or list of endpoints displays, based on your search filter.

5. Click the endpoint hostname on which to allow PBA login bypass.

6. Click the Details & Actions tab.

7. Under SED Device Control, click Bypass Login.

8. Click Yes to confirm that you want to send the Bypass Login command to the endpoint.

Unlock a Self-Encrypting Drive

You can unlock the PBA screen after it has been locked on this endpoint, either by sending a Lock command or by exceeding the maximum number of authentications attempts allowed by policy.

To send the Unlock command, follow these steps:

1. In the left pane, click Populations > Endpoints.

2. Select the Workstation endpoint type.

3. If you know the full endpoint hostname, enter it in Search. Leave the field blank to display all Workstation endpoints.

4. Click . An endpoint or list of endpoints displays, based on your search filter.

5. Click the endpoint hostname with the self-encrypting drive to unlock.

6. Click the Details & Actions tab.

7. Under SED Device Control, click Unlock.

8. Click Yes to confirm that you want to send the Unlock command to the endpoint.

Remove Users from Endpoint with Self-Encrypting Drive

To remove users from the PBA, follow these steps:

1. In the left pane, click Populations > Endpoints.

2. Select the Workstation endpoint type.

3. If you know the full Hostname of the endpoint, enter it in the Search field. However, you may leave the field blank to display all Workstation endpoints.

4. Click the search icon.

An endpoint or list of endpoints displays, based on your search filter.

5. Click the Hostname of the endpoint from which to remove users.

6. Click the Details & Actions tab.

7. Under SED Device Control, click Remove Users.

8. Click Yes to confirm that you want to send the Remove Users command to the endpoint.
Lock a Self-Encrypting Drive

To lock the PBA screen and prevent any user from logging onto the computer, follow these steps:

1. In the left pane, click **Populations > Endpoints**.
2. Select the Workstation Endpoint Type.
3. If you know the full endpoint hostname, enter it in **Search**. Leave the field blank to display all Workstation endpoints.
4. Click **Search**. An endpoint or list of endpoints displays, based on your search filter.
5. Click the endpoint hostname with the self-encrypting drive to lock.
6. Click the **Details & Actions** tab.
7. Under **SED Device Control**, click **Lock**.
8. Click **Yes** to confirm that you want to send the Lock command to the endpoint.

Send Wipe Command to Self-Encrypting Drive

**CAUTION:** The Wipe command clears all data from the disk and cannot be undone.

The Wipe command functions as a “restore to factory state” for the self-encrypting drive. In an emergency situation, wipe the computer, making the data permanently unrecoverable. When the wipe command is consumed, all history and details about this endpoint are removed. Ensure that this is the desired behavior before invoking this command.

To send the Wipe command, follow these steps:

1. In the left pane, click **Populations > Endpoints**.
2. Select the Workstation Endpoint Type.
3. If you know the full endpoint hostname, enter it in **Search**. Leave the field blank to display all Workstation endpoints.
4. Click **Search**. An endpoint or list of endpoints displays, based on your search filter.
5. Click the endpoint hostname on which to wipe the self-encrypting drive.
6. Click the **Details & Actions** tab.
7. Under **SED Device Control**, click **Wipe**.
8. Click **Yes** to confirm that you want to send the Wipe command to the endpoint.

Set the Dell Server Connection Retry Interval

To set the interval that the SED client attempts to contact the Dell Server when it is unavailable to communicate with the SED client, set the following value on the client computer:

```
HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\DellMgmtAgent\Parameters
CommErrorSleepSecs (DWORD Value)=300
```

This value is the number of seconds the SED client waits to attempt to contact the Dell Server if it is unavailable to communicate with the SED client. The default is 300 seconds (5 minutes).

Administrators
Assign or Modify Administrator Roles

View or modify existing administrator privileges.

1. In the left pane, click **Populations > Administrators**.
2. Search or select the row that displays the user name of the appropriate administrator to display User Detail.
3. View or modify administrator roles in the pane at the right.
4. Click **Save**.

Dell recommends assigning administrator roles at the Group level rather than at the User level.

1. In the left pane, click **Populations > User Groups**.
2. Search or select a group name, then the **Admin** tab.
3. Select or deselect administrator roles assigned to the group.
4. Click **Save**.

If you remove a group that has administrative privileges and later re-add the group, it remains an administrator group.

To view, assign, or modify administrator roles at the User level, see **User Admin**.

Administrator Roles

Administrator login is integrated with Active Directory to simplify the process of managing administrators and to allow you to leverage your existing user authentication infrastructure. Administrators are assigned roles that define what level of access each administrator is allowed. For example, some administrators may only be allowed to implement help desk assisted recovery while others have full access to edit security policies. You can assign administrator roles to Active Directory groups so you can easily change the level of administrator access users have with a simple change to AD group membership. Non-domain users can be granted reporting-only access via Compliance Reporter.

There are 11 types of administrators. Distributed administration is key to the secure administration of your environment. It allows you to divide roles appropriately among your administrators and ensures the proper level of privileges are assigned to each administrator. A single administrator can have privileges of more than one administrator type. However, it is recommended to have a maximum of one super administrator (an administrator who has privileges of all administrator types).

The following table shows the tasks each administrator can perform in the Management Console or Compliance Reporter.

Delegate Administrator Rights

Administrator rights for a user group can be delegated to a user. The delegated administrator and users must be members of the user group not only in Active Directory but in the Dell Server database. Administrator rights are available to the delegated administrator only if the delegated administrator is a member of the user group in the Dell Server database. Delegated administrator rights are effective only with regard to Users who are members of the user group in the Dell Server database.

Only the superadmin and account administrator can delegate administrator rights.

To delegate Administrator rights, follow these steps:

1. In the left pane, click **Populations > User Groups**.
2. Search for the appropriate group.
3. Click the **Admin** tab.
4. Under **Delegated Roles**, click **Add**.
5. Search for and select the user to receive administrator rights, then click **Add**.

To remove delegated administrator rights, under **Delegated Roles** in User Group Detail, locate the user to remove as delegated administrator and click the red X next to the user name.

Reporting
Manage Reports

In the left pane, click **Reports > Manage Reports**. For compliance and monitoring purposes, you can:

- Manage reports
- View or modify an existing report
- Create a new report

The Manage Reports page has:

- **New Report** - See Create a new report.
- **Report Type** - Select All (default) or specific report types to display in the Name column. Clear selected items to undo selections. See Report Type.

**Note**: Policy-based reports are not an option.

- **Grouping** - Group by Report Type, Author, Private, or None (default).
- **Columns** - Select which columns to display on the Manage Reports page, such as Name, Description, Report Type, Author. Also:
  - **Private** - True indicates only the owner of the report can access it.
  - Report Administrator - can view all public and private reports.
  - Other Administrators - can view private reports they created and all public reports.
- **Created** - Date the report was created.
- **Modified** - Date the report was modified.
- **Search** - Hover to view columns for performing a search, then enter specific text for those columns. Use * for a wildcard. For additional filtering to provide a detailed search on a specific report, see Use Search and More to filter.

View or Modify an Existing Report

On the Manage Reports page, select a report from the Name column to view an instance of that report. The owner can make the report private or public. See View Report.

Create a New Report

On the Manage Reports page, click **New Report** and select an option. An instance of that report opens to customize the information to display. See View Report.

View Report

On the Manage Reports page, select an option in Create New Report or click an existing report in the Name column.
• New report - An administrator can select **Save As**. Save, Rename, and Delete options are activated, and the report is saved to the Manage Reports page. The owner can make the report private or public. You can create:
  • Single reports
  • Report templates - Determine frequent report content that you will generate. Select Column and Grouping options that are common to all those reports and save it as a template. See [View or modify an existing report](#).

• Existing report:
  • To filter a report, perform a query using **Search** and **More**.
  • Owner of a report - Can view their private reports and all public ones. Only the Owner or a Report administrator can modify or rename the report.
  • Report administrator - Can view all private and public reports. Can modify or rename public and private reports.
  • Public reports - Any administrator can select **Save As** to modify a copy of the report.

Grouping, Columns, and More differ for each report type. Some Column and Grouping options are selected by default.

• **Columns** allows customized options to display. After you select options, you can drag and resequence to avoid scrolling. The resequenced columns return to the default when you close the report.

• **Grouping** allows you to sort the column options you selected.

• Hover over **Search** to view suggested columns for performing a search, then enter specific text. Suggested column options differ for each report type. Use (*) as a wildcard.

For a description of each report's Column and Grouping options, click a link below.

<table>
<thead>
<tr>
<th>Report Type</th>
<th>Description and link</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Detail</td>
<td>Provides reports based on Windows, Mac, iOS, and Android device details. See <a href="#">Endpoint Details &amp; Actions</a>.</td>
</tr>
<tr>
<td>Shield Detail</td>
<td>Customize a report of an endpoint's policies, recovery keys, or details. See <a href="#">Shield Detail</a>.</td>
</tr>
<tr>
<td>Notifications</td>
<td>Customize a report of news, alerts, and events or email notifications. See <a href="#">Notifications</a>.</td>
</tr>
<tr>
<td>Log Analyzer</td>
<td>Customize a report of policy modifications or logs based on message priority level, date and time periods, and occurrences of usernames and hosts. See <a href="#">Log Analyzer</a>.</td>

</tbody>
</table>
Query using Search and More... to filter

Search performs a text-only quick search across multiple fields and may return numerous results.

- Hover to view columns that apply to this search, then enter specific text for those columns.
- Use * for a wildcard.

To filter and narrow the search with More...:

- Select More... and select a check box. Check boxes differ for each report type. Select one or multiple check boxes to narrow the search.
- An additional field displays for that check box option where you can either enter text to search on that column or select from a list of enumerators or a data type for that column.

Query example for Log Analyzer report

1. In Columns, select options. From menu options such as, Priority and Category select enumerators. Created allows you to filter by date.
2. Enter text in Search to perform a quick search on Username and Message.
3. For additional filtering, select More..., and then select Username, Message, or both. Additional text fields allow you to limit the text search specifically to that column.

Query example for Data Guardian and Audit Events report

With Data Guardian, you can set specify policies and the Protected Office and Beacon Monikers to identify protected Office files in an unexpected location or a non-Data Guardian Device that tries to access a protected Office document. See Protected_Office_Document_or_Basic_File_Protection_audit_events or Map_visualization.

Query example for BitLocker Manager report

1. In Columns, select options.
2. Enter text in Search to perform a quick search on Registered User.
3. For additional filtering, select More..., and then select one or more options. Additional text fields allow you to limit the text search to that column:
   - Registered User - Enter text to search specifically on that column.
   - BitLocker Enabled or TPM Enabled - Boolean search specifically on those columns.
   - Disk Status and Logical Disk Status - Enumerator searches specifically on those columns.

Export File

Export to Excel or a .csv file.

Add Schedule

To add an email schedule for a report:

1. In the left pane of the Management Console, click Reporting > Manage Reports.
2. In Columns, click a report name then click Schedule.
3. In Schedules, click Add Schedule.
4. In Add Schedule, set the following parameters:
• Email - add a single or multiple addresses separated by commas
• Schedule - select one of the following:
  • Every Day
  • Days of Week - select a specific weekday or multiple weekdays
  • Day of Month - select a day of the month
• Time - select a time of day
• Locale - select a language

5. Click **Save**.

---

**Compliance Reporter**

Compliance Reporter has its own help system. When Compliance Reporter launches, click the Help link on the top menu.

To launch Compliance Reporter:

1. In the left pane of the Management Console, click **Compliance Reporter**.
2. When Compliance Reporter launches, log in with superadmin credentials or reporting credentials.

**Data Guardian Audit Events**

Data Guardian audit event logs maintain an audit trail of file activity for Windows, Mac, mobile devices, and the web portal. By alternating between a map visualization and multiple filter options, you can access audit data in various ways, from a global overview to specific geolocations or audit data on a specific file or a specific user. This audit data offers the potential to visually identify data security breaches or preliminary security risks.

To view audit events, select **Reporting > Audit Events**. The Audit Events page contains the map visualization and columns for filtering. For tips on getting started, see **Get Started with Data Guardian Audit Events**.

**Map visualization**

In **Populations > Enterprise > Global Settings**, if you enable the **Data Guardian Geo Location Audit Data policy** and have the operating system’s geolocation API, audit events that are sent to the Dell Server include the geolocation data (latitude and longitude) of each device. A map visualization of audit events can identify device locations that might indicate significant location changes or unexpected/questionable locations for devices within an organization. The geolocation is checked periodically, not each time an event is recorded. See **Examples of Map Visualization and Column Filters**.

If the policy for geolocation is disabled, no geolocation data is contained in the audit events.

The map displays the following:
- Marker cluster - A numeric value represents audit events within a similar area. Hover over the marker cluster to view an outline of the determined area. Click a marker cluster to zoom to the audit event markers within that cluster. Continue to click marker clusters until blue markers.

- Blue marker - Represents the location of a single audit event.
  - Click a marker to list the device, file, user, and timestamp for that marker's audit event.
  - The audit event can be a combination of the device and user that caused the audit event, for example: One device or user accessed one file. Multiple devices or users accessed one file, and the time stamp indicates the user who last accessed the file. One user accessed numerous files.

- Mapping points of interest and points visible - Scroll to the bottom right of the columns to display the total number of items in the column. The map displays only files that have geolocation data (latitude and longitude). If a column lists 1000 files, but some lack geolocation data, the map displays only the points with geolocation data.
  - For performance, the map limits the display to the first 2000 audit events that have latitude/longitude points in the table. It also varies depending on the filters you set.
  - Drill into a marker cluster to list the total points of interest and visible points.

Note: Files that lack geolocation data and display only in the columns still provide some information for auditing.

- Show only visible check box - If you click a marker cluster, the map only displays the area for that cluster, but the columns list all audit events in the original query. Select the check box on the lower right for the columns to only list audit events for those visible map points. As you continue to drill down, the columns only list the events for the visible map points. Clear the check box to return to the global view.

Audit Event Options and Filters

Use these options to determine the type and amount of audit event data to display.

- Moniker - By default, information displays for all monikers. Select one or more check boxes to display specific monikers. Click Clear selected items to display all.
  - Cloud Encryption (mobile and web portal; Data Guardian v2.3 and earlier for Windows and Mac)
  - Protected Office or Basic File Protection (Windows, Mac, mobile, and web portal)
  - System - Populates the user logged into or logged out of the device that has Data Guardian installed.
  - Data Classification (Windows)
  - Protected Email (Windows) - Relates to files other than protected Office documents.
  - Share (Windows) - Lists events when a user shares one or more files or attaches an encrypted file to an email.
  - Beacon - (protected Office documents) Indicates a device without Data Guardian installed that tried to access a protected file. These audit events may have limited data. For example, the location where the file was accessed but without the name of the user of the device.

- Time stamp - Select the amount of past time for audit events to display - 1, 7, 14, 30, 60, or 90 days.
Navigate the Dell Server

- **More** - If you set filters and create a query, you can select the filter options in *More* to modify the query. As you select an option, it displays as a menu. Some actions apply to Windows, Mac, and mobile devices. Some are specific to one or more.

  - **Action** - The default is *All*. Select one or more check boxes to display specific actions associated with the payload file. See *Action* and the tables below for details and to determine the operating system.

  - **Cloud Action** - The default is *All*. Select one or more check boxes to display the reason for an Action. See *Cloud_Encryption_audit_events* and the tables below for details and to determine the operating system.

  - **Data Guardian Action** - The default is *All*. Select one or more check boxes to display the reason for an Action. See *Protected_Office_Document_or_Basic_File_ProtectionAudit_events* and the tables below for details and to determine the operating system.

  - **Net Action** - (Windows and Data Guardian v2.7 and earlier)

- **Grouping** - Allows you to select one option. The default is *None*. For example:

  - **Moniker** - Groups by moniker if you have more than one selected.

  - **Device** or **User** - Allows you to determine the activity of specific devices or users.

  - **File Name, File Path** or **File Key ID** - With device and user columns added, allows you to see which users or devices accessed a file.

- **Columns** - Filter the amount of data by selecting one or multiple columns to display. If you clear all column check boxes, audit events are listed for all endpoints and all users. Some filters apply to all monikers and some to specific monikers. For a description of column filters, see *Options in the Columns menu*.

- **Search** - Hover to view columns for performing a search (device, user, file name, and file key ID), then enter specific text for those columns. Use a wildcard (*) to search on .docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf.

- **Export File** - Export to Excel or a .csv file.

**Options in the Columns Menu**

Options can apply to all monikers or to a specific moniker. Policies must be enabled for audit data to display.

Search icons in the columns - If you click next to an item in the device, user, file name, or key ID columns, it copies the cell content to *Search* and executes a search on that content. You can then select *Action* or IP address to do additional filtering.

**Column options for all audit events**

<table>
<thead>
<tr>
<th>Audit Event - Column options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Moniker</strong> - Select one or more.</td>
<td>Category of the audit event:</td>
</tr>

</tr>
</tbody>
</table>

#### Column options related to Embargo:

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>From - The time that an external user can start viewing a protected file.</td>
<td>To - The time that an external user can no longer view a protected file.</td>
</tr>
</tbody>
</table>

### Protected Office Document or Basic File Protection audit events

This table lists audit events that apply to Office documents or other files entered in Basic File Protection:

- For Windows and Mac, audit events apply to Opt-in or Force Protected modes.
- Mobile has Opt-in mode only.
- The Cloud Provider name and Cloud Action events display for XEN audit events. Protected Office document audit events do not contain this information since protected Office documents can move to a cloud service provider outside of the bounds of Data Guardian.

</table>

**Column options for System (protected Office documents and Windows)**

The following actions relate to the computer, so they have no corresponding Data Guardian action.
Note: The greyed out options apply to Windows and Data Guardian v2.7 and earlier.

<table>
<thead>
<tr>
<th>Audit Event - Column options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login</td>
<td>If a user logged in and did a fast user switch, for example, logged in and then rebooted.</td>
</tr>
<tr>
<td>Logout</td>
<td>User logged out of a session.</td>
</tr>
<tr>
<td>Blocked PrintScreen</td>
<td>Indicates a file where a user tried to capture a screen while a protected Office document was open and is blocked.</td>
</tr>
<tr>
<td>Blocked Process</td>
<td>When policy blocks a specified process executable, indicates a file where a user tried to run that process executable.</td>
</tr>
<tr>
<td>Process Name</td>
<td>The name of the process that was blocked, for example, Snipping Tool.</td>
</tr>
<tr>
<td>Process Disposition</td>
<td>Indicates whether the process has exited or has been terminated.</td>
</tr>
</tbody>
</table>

Column options for Beacon only (protected Office documents)

<table>
<thead>
<tr>
<th>Audit Event - Column options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column options related to geolocation:</td>
<td></td>
</tr>
<tr>
<td>IP Address</td>
<td>IP Address: When a Beacon event comes in and the Beacon server can determine the location of the event, it lists the IP address.</td>
</tr>
<tr>
<td>Routable</td>
<td>Routable - True or False</td>
</tr>
<tr>
<td>Geo Type</td>
<td>If True, geolocation data exists for that IP address and identifies the device's latitude and longitude based on each operating system's APIs. Note: If the Routable column lists True, but no geolocation data displays, an error occurred.</td>
</tr>
<tr>
<td>Latitude</td>
<td>If False, the IP address is non-routable.</td>
</tr>
<tr>
<td>Longitude</td>
<td>Latitude and longitude - The data visualization is based on these coordinates rather than a street address. Usually, the map visualization displays the location of the device. If a user accesses the computer remotely and neither GPS or WiFi is available, the map visualization may display the location based on the remote computer's VPN IP address. The column lists the coordinates as plus (+) or minus (-), correlating to North, South, East, or West.</td>
</tr>
<tr>
<td>Geo Type</td>
<td>Geo Type - Typically, this is Point. Geolocation for audit events is supported on Windows 8.1 and higher</td>
</tr>
</tbody>
</table>

Column options for Cloud Encryption only (Mac and mobile; Windows with Data Guardian v2.3 and earlier)

<table>
<thead>
<tr>
<th>Audit Event - Column options</th>
<th>Description</th>

</tbody>
</table>

**Examples of Map Visualization and Column Filters**

You can alternate between drilling in at the map level and drilling in at the filter and search level. For example:

- Endpoint or endpoint group - If geolocation is enabled, the map displays the location of the events for each endpoint's .xen and protected Office files. If the map indicates protected files in an unexpected location, you can use the audit data to identify who modified the file. If several users modified the file, you can filter the time stamp column to determine the last person who modified it.

- User - You can audit a users' file activities. For example, in Columns, if you select Action, the protected Office files for that column can list Created or Modified. If you also select Data Guardian Action, the column lists the reason for a user modifying files, such as Updated or Swept. For information on Action and Data Guardian Action, see Options in the Columns menu, Cloud Encryption audit events, and Protected Office Document audit events.

1. In the global view, drill in to a marker cluster and select a blue marker.
2. Select the Show only visible check box for the columns to list only the files for that audit event.
3. Click next to a device, user, file name, or key ID. For example, click next to a user name, then click next to a file name to zoom to the map location of the specified user when a specified file was accessed.
4. Clear Search and press Enter to return to the global map view.

Return to [Data Guardian](#) policies.

**Get Started with Data Guardian Audit Events**

Before you begin, navigate to Populations > Global > Settings and select the Data Guardian Audit Data Enabled policy for these policy groups:
- **Audit Control Policies** (for Windows or Mac)
- **Web Portal Audit Policies**
- **Mobile Audit Control Policies**

In the Management Console > Reporting > Audit Events, use these examples to get started.

For detailed information about column options, see Data Guardian and Audit Events.

### Audit Protected Office Documents

To audit protected Office documents only:

1. In Moniker, select **Protected Office**.
2. In More, select **Action** and **Data Guardian Action**.
3. In Columns, select **Device**, **User**, **Timestamp**, **File Name**, and **File KeyID**.
4. Optionally, in Grouping, select one item like **Device** or **User** to sort.
5. Select **Export File > Excel** or **CSV** to view the data for the **Action** and **Data Guardian Action** columns. For more information, see Protected_Office_Document_or_Basic_File_Protection_audit_events. Optionally, you can export the audit events to a SIEM server.
6. To identify issues, return to the Management Console, click **Data Guardian Action**, and select:
   - **Block Copy** (for Windows) - indicates a Windows user tried to copy from a protected Office document and was blocked.
   - **Geo Blocked** (for Mobile) - indicates a mobile user outside a geofence tried to access a protected document and the attempt was blocked.

If these options display in the Data Guardian Action column, click next to that user or device. In Data Guardian Action, click Clear selected items and view all the actions by that user or device to determine a potential issue. For more information, see Protected_Office_Document_audit_events.

7. To identify issues, select **Data Guardian Action** and select the following:
   - Detected tampering
   - Repaired tampering

If these options display, determine any potential issues.

8. For Windows, in Moniker, select **System**. In Action, select **Login** and **Logout** to identify a user who logged into the device that has Data Guardian installed.

9. Analyze the data in the Management Console or select **Export File > Excel** or **CSV** where you can sort the data. Optionally, you can export the audit events to a SIEM server.

### Audit events related to external users

In addition to the steps above:

1. In Columns, select:
   - **Client Type** - to indicate internal or external users.
   - **From** and **To** - to audit embargo and external users.
- **Request Access** - an external user requested access to encryption keys from an internal user.

2. Analyze the data in the Management Console or select Export File > Excel or CSV where you can sort the data. Optionally, you can export the audit events to a SIEM server.

**Map visualization**

You can use this to identify protected Office files in an unexpected location or a non-Data Guardian Device that tries to access a protected Office document.

For map data to display, you must enable policy. See Global > Settings and select the Data Guardian Geo Location Audit Data policy from one or more of these:

- Audit Control Policies
- Web Portal Audit Policies
- Mobile Audit Control Policies

For Beacon events, see the advanced settings for Data Guardian and select the Enable Callback Beacon policy from one or more of these policy groups:

- Protected Office
- Mobile Client
- Web Portal

1. In Moniker, select Protected Office and Beacon.

2. In the global map view, drill in to a marker cluster in an unexpected location and select a blue marker.

3. Select the Show only visible check box for the columns to list only the files for that audit event.

4. Click next to a Device, User, File Name, or File KeyID.

   For example, click next to a user name, then click next to a file name to zoom to the map location of the specified user when a specified file was accessed.

5. Analyze the data in the Management Console or click Export File > Excel or CSV where you can sort the data. Optionally, you can export the audit events to a SIEM server.

6. Clear Search and press Enter to return to the global map view.

**Audit Cloud Encryption (Mac or mobile)**

To audit protected .xen files only:

1. In Moniker, select Cloud Encryption.

**Default Monikers and Columns**

If you leave the defaults, all monikers and columns display. Select one item from Grouping to sort monikers or column options. Select options to minimize the data that displays.

**EU General Data Protection Regulation (GDPR)**

111
For privacy laws in Europe, you can disable audit events. See Enterprise > Global Settings > Settings > Web Portal Audit Policies.

View Audit Events (Geolocation)

Click Audit Events in the left pane to view geographic map points of file events on computers and devices running Data Guardian.

For a list of audit event types, see Data Guardian and Audit Events.

For information about exporting audit events to a SIEM server, see Export Events to SIEM Server.

Map points are color coded to indicate the number of audit events in a location:

<table>
<thead>
<tr>
<th>Map point</th>
<th>Number of Events</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use the + and - icons in the upper left corner of the map to zoom in or out. Drag the map to view different areas of the map.

To view individual events for map points representing multiple events, use the + icon in the upper left corner to zoom in on the map point. Click an individual map point within the group of points to view the event.

Event Data
Event data displays below the map about the events represented on the map. Narrow the amount of data displayed by using the + icon in the upper left corner of the map to zoom in. Expand the amount of data displayed by using the - icon in the upper left corner of the map to zoom out.

Filter the event data with the following fields, which are immediately below the map:

**Event Type** - Data Guardian Cloud Encryption, Protected Office, or Beacon

**Timestamp** - Event date and time

**Device** - Device type and identifier (hostname, serial number, IMEI/MEID, CDN)

**User** - User name in UPN format

**File Key ID** - GUID that identifies the key used to protect the file

**File Name** - File name with extension

**Action** - File action that triggered the event

**Data Guardian Action** - Action taken by Data Guardian, based on policy and the file action that triggered the event

Select columns to display from the **Columns** list.

**Export Events to a SIEM/Syslog Server**

Integrating with a SIEM/syslog server allows administrators to run customized analytics on threat and audit data within their environments. The Dell Server supports the export of Advanced Threat Prevention and Data Guardian events.

To export audit events to a syslog server or to a local file:

1. In the left pane, click **Management > Services Management**.
2. Select the **Events Management** tab.
3. Select the appropriate option(s):
   - **Export to Local File** allows export of audit events to a file. Enter the location in which to store the file. This option also provides a backup of the audit events database.
   - **Export to Syslog** allows specification of the syslog server to which to export the file. If TCP protocol is not selected, select it.
4. Click **Save Preferences**.

**Export Audit Events with TLS/SSL over TCP**

To use TLS/SSL, the syslog server must be configured to listen for TLS/SSL messages. The root certificate used for the syslog server configuration must be added to the Dell Server Java keystore.

The following example shows necessary configurations for a Splunk server with default certificates. Configurations are specific to individual environments. Property values vary when using non-default certificates.

1. Configure the Splunk server to use the Splunk server certificate and root certificate to listen on TCP for TLS/SSL messages:

   ```bash
   $SPLUNK_HOME/etc/system/local/inputs.conf
   [tcp-ssl:<port number>]
   disabled = 0
   ```
Navigate the Dell Server

```plaintext
[SSL]
serverCert = $SPLUNK_HOME/etc/auth/server.pem
sslPassword = <password>
requireClientCert = false

$SPLUNK_HOME/etc/system/local/server.conf
[sslConfig]
sslRootCAPath = $SPLUNK_HOME/etc/auth/cacert.pem
sslPassword = <password>
```

2. Restart the Splunk server.

After the restart, `splunkd.log` will have entries similar to the following:

```
07-10-2017 16:27:02.646 -0500 INFO  TcpInputConfig - IPv4 port 5540 is reserved for raw input (SSL)
07-10-2017 16:27:02.646 -0500 INFO  TcpInputConfig - IPv4 port 5540 will negotiate new-s2s protocol
07-10-2017 16:27:02.653 -0500 INFO  TcpInputConfig - IPv4 port 5540 is reserved for raw input (SSL)
07-10-2017 16:27:02.653 -0500 INFO  TcpInputConfig - IPv4 port 5540 will negotiate new-s2s protocol
07-10-2017 16:27:02.653 -0500 INFO  TcpInputConfig - IPv4 port 9997 is reserved for splunk 2 splunk
07-10-2017 16:27:02.653 -0500 INFO  TcpInputConfig - IPv4 port 9997 will negotiate new-s2s protocol
07-10-2017 16:27:02.654 -0500 INFO  TcpInputProc - Creating fwd data Acceptor for IPv4 port 9997 with Non-SSL
```

3. Configure the Dell Server to communicate with the Splunk server and export audit events.

Use the keytool command to add the Splunk server's root certificate (cacert.pem) to the Dell Server operating system Java keystore. The certificate is added to the operating system Java keystore and not to the Dell Server application Java keystore.

```
keytool -keystore <keystore_location> -alias <alias-name> -importcert -file <certificate_file>
```

Add the Splunk server's root certificate (cacert.pem) to the Java keystore, which in Windows is usually located at: `C:\Program Files\Dell\Java Runtime\jre1.8\lib\security\cacerts`

4. Modify the Dell Server database to change the SSL value from `false` to `true`:

In the database, navigate to the information table, SIEM-specific support configuration.

Change the "SSL":"false" value to "SSL":"true" – for example:
Advanced Threat Prevention Syslog Event Types

Following are event types that are supported with the Syslog/SIEM Advanced Threats option.

Application Control

This option is visible when the Application Control feature is enabled. Application Control events represent actions occurring when the device is in Application Control mode. Selecting this option sends a message to the Syslog server whenever an attempt is made to modify or copy an executable file, or when an attempt is made to execute a file from an external device or network location.

Example Message for Deny PE File Change:

```
CylancePROTECT: Event Type: AppControl, Event Name: pechange, Device Name: WIN-7entSh64, IP Address: (192.168.119.128), Action: PEFileChange, Action Type: Deny, File Path: C: \Users\admin\AppData\Local\Temp\MyInstaller.exe, SHA256: 64D4DC02D96673ECA9050FE728104FDB3B8E3CEFE80D72E93DB35A7984562AA
```

Example Message for Deny Execution from External Drive:

```
CylancePROTECT: Event Type: AppControl, Event Name: executionfromexternaldrives, Device Name: WIN-7entSh64, IP Address: (192.168.119.128), Action: PEFileChange, Action Type: Allow, File Path: \shared1\psexec.exe, SHA256: 8DBABDFA03068130C277CE49C60E35C029F22D9E3C74C362521F3FB02670D5
```

Devices

Select this option to send device events to the Syslog server.

- When a new device is registered, two messages for this event are received: Registration and SystemSecurity.

  Example Message for Device Registered Event:

  ```
  Event Type: Device, Event Name: Registration, Device Name: WIN-55NATVQ4BUU
  ```

- When a device is removed.

  Example Message for Device Removed Event:

  ```
  Event Type: Device, Event Name: SystemSecurity, Device Name: WIN-55NATVQ4BUU, Agent Version: 1.1.1270.58, IP Address: (10.3.0.154), MAC Address: (005956881877), Logged On Users: (WIN-55NATVQ4BUU\Administrator), OS: Microsoft Windows Server 2008 R2 Standard Service Pack 1 x64 6.1.7601
  ```
Navigate the Dell Server

- When a device's policy or logging level has changed.

  Example Message for Device Updated Event:

  ```
  Event Type: Device, Event Name: Device Updated, Device Message: Renamed: 'WIN-55NATVQHBuu' to 'WIN-2008R2-IRVI'; Policy Changed: 'Default' to 'IRVPolicy1';
  ```

**Memory Protection**

Selecting this option logs any Memory Exploit Attempts that might be considered an attack from any of the Tenant's devices to the Syslog server.

There are four types of Memory Exploit actions:

- **None**: Allowed because no policy has been defined for this violation.
- **Allowed**: Allowed by policy.
- **Blocked**: Blocked from running by policy.
- **Terminated**: Process has been terminated.

Example Message of Memory Protection Event:

```
CylancePROTECT: Event Type: ExploitAttempt, Event Name: blocked, Device Name: WIN-7entsH64, IP Address: (192.168.119.128), Action: Blocked, Process ID: 3804, Process Name: C:\\AttackTest64.exe, User Name: admin, Violation Type: LSASS Read
```

**Script Control**

Selecting this option logs any newly found scripts that have been blocked or have triggered an alert to the Syslog server.

Syslog Script Control events contain the following properties:

- **Alert**: The script is allowed to run. A script control event is sent to the Dell Server.
- **Block**: The script is not allowed to run. A script control event is sent to the Dell Server.

Example Message of Script Control

```
CylancePROTECT - - - Event Type: ScriptControl, Event Name: Blocked, Device Name: Fake_Device, File Path: d:\windows\system32\windowspowershell\v2.1\newlyMade.vbs, Interpreter: active, Interpreter Version: 6.1.7600.16385 (win7_rtm.090713-1255)
```

**Threats**

Select this option to log any newly found threats or changes observed for any existing threat, to the Syslog server. Changes include a threat being Removed, Quarantined, Waived, or Executed.
There are five types of Threat Events:

- **threat_found**: A new threat has been found in an Unsafe status.
- **threat_removed**: An existing threat has been Removed.
- **threat_quarantined**: A new threat has been found in the Quarantine status.
- **threat_waived**: A new threat has been found in the Waived status.
- **threat_changed**: The behavior of an existing threat has changed (examples: Score, Quarantine Status, Running Status).

Example Message of Threat Event:

![Example Message of Threat Event]

**Threat Classifications**

Hundreds of threats are classified each day as either Malware or Potentially Unwanted Programs (PUPs). If this option is selected, you subscribe to be notified when these events occur.

Example Message of Threat Classification:

![Example Message of Threat Classification]

**Security Information and Event Management (SIEM)**

Specifies the type of Syslog server or SIEM that events are to be sent to.

**Protocol**

This must match what is configured on your Syslog server. The choices are UDP or TCP. UDP is generally not recommended as it does not guarantee message delivery. Dell recommends TCP (default).

**TLS/SSL**

Only available if the Protocol specified is TCP. TLS/SSL ensures the Syslog message is encrypted in transit from Advanced Threat Prevention to the Syslog server. Dell encourages customers to select this option. Ensure that the Syslog server is configured to listen for TLS/SSL messages. To use TLS/SSL, it is necessary to configure the Syslog server and import certificates. For more information, see [Export Audit Events with TLS/SSL over TCP](#).

**IP/Domain**

Specifies the IP address or fully-qualified domain name of the Syslog server that the customer has setup. Consult with your internal network experts to ensure firewall and domain settings are properly configured.

**Port**
Specifies the port number on the devices that the Syslog server listens for messages. It must be a number between 1 and 65535. Typical values are: 512 for UDP, 1235 or 1468 for TCP, and 6514 for Secured TCP (example: TCP with TLS/SSL enabled).

**Severity**

Specifies the severity of the messages that should display in the Syslog server. This is subjective, and it may be set to whatever level preferred. The value of severity does not change the messages that are forwarded to Syslog.

**Facility**

Specifies what type of application is logging the message. The default is Internal (or Syslog). This is used to categorize the messages when they are received by the Syslog server.

**Testing the Connection**

Click **Test Connection** to test the IP/Domain, Port and Protocol settings. If valid values are entered, after a couple of moments, a success confirmation displays.

### Advanced Threat Prevention Syslog IP Addresses

Syslog server IP addresses to allow, by region:

- **US (includes my.cylance.com and my-vs2.cylance.com):**
  - 52.2.154.63
  - 52.20.244.157
  - 52.71.59.248
  - 52.72.144.44
  - 54.88.241.49
- **AU (my-au.cylance.com):**
  - 52.63.15.218
  - 52.65.4.232
- **EU (my-vs0-euc1.cylance.com and my-vs1-euc1.cylance.com):**
  - 52.28.219.170
  - 52.29.102.181
  - 52.29.213.11

**Note:** This IP Address should remain static.

For the latest IP addresses for Syslog messages, contact Dell ProSupport.

### Management

**Commit Policies**

Uncommitted policies display in a badge icon in the top left of the Management Console. Click the badge icon to navigate to **Management > Commit**.

To commit policies that have been modified and saved:
1. In the left pane, click **Management > Commit**.

2. In Comment, enter a description of the change.
   
   Best practice: add a comment about the changes that are committed.

3. Click **Commit Policies**.

A policy publication/commit occurs when an administrator clicks **Commit Policies**. The following information displays:

**Pending Policy Changes** - The number of policy changes ready to commit.

**Date Committed** - Date and time the policies were committed.

**Changed by** - User name of the administrator who performed the policy commit.

**Comment** - Any comments that were added when the policies were committed.

**Version** - The number of policy saves since the last policy commit plus the previous Version.

---

**Log Analyzer**

Log Analyzer gives you the power to search logs by message priority level, date and time periods, and occurrences of usernames and hosts.

To view or export logs:

1. In the left pane, click **Management > Log Analyzer**.

2. Select a Category.
   
   The Categories are Admin Actions, Shield for Server Events, Policy, Advanced Threat Events, System Logs, Whitelist, and Full Access List.

3. To narrow the results, select from these optional filters:
   
   - **Priority** - Choose DEBUG, INFO, WARN, ERROR, or FATAL. FATAL returns fewest entries; DEBUG returns the greatest number of entries.
   
   - **And more severe** - Select this option to include all areas of greater severity than the priority level you selected.
   
   - **Date Range** - Enter a Start Date and End Date to limit results to entries that occur between these dates. To insert dates into these fields, click the calendar icons to the right of the fields.
   
   - **Time Range** - If you entered a Date Range, further narrow the entries by entering a Start Time and End Time. To insert times into these fields, click the calendar icons to the right of the fields.
   
   - **Username and Host** - Enter a either a username or host or both.

4. Click **Search**.

5. To sort the results in ascending order by column, click the heading of the column to sort.

6. To export the results to an Excel or CSV file, pull down the **Export File** list and select Excel or CSV.
   
   Exported files can hold up to 100,000 records.

---

**Recovery**
Recover Data - Encryption External Media Authentication Failure

For the steps to perform a recovery on removable media when a user is no longer associated with your organization, see Encryption External Media Recovery for User Removed from Database.

Encryption External Media encrypts data on removable media, as defined by policy. There may be several conditions where access to encrypted data needs to be regained. In general, these scenarios fall into two categories:

- The Encryption External Media password is lost or forgotten
- The Encryption External Media software or encryption key material has been lost or corrupted on the device

If more than one Dell Server is part of a federation, to perform Encryption External Media Recovery across Dell Servers in the federation, see Enable Federated Key Recovery.

Manual Authentication when Encryption External Media Password is Lost or Forgotten

If a user has lost or forgotten a password, manual authentication is necessary.

1. The user is prompted for their password. Since the password is not available, the user clicks I forgot.
2. The user is given another opportunity to try again. If the user clicks Yes - I forgot, manual authentication begins (or the manual authentication begins upon the set number of retries allowed).
3. The user is instructed to contact their administrator and inform them that they need to manually recover Encryption External Media for Windows.
4. As a Dell administrator, log in to the Management Console.
5. In the left pane, click Populations > Users.
6. Enter a filter to search for the user. The wild card character is *. You can enter Common Name, Universal Principal Name, or sAMAccountName.
7. Click . A user or list of users displays, based on your search filter.
8. Locate the appropriate user and click the Endpoints tab.
9. Locate the appropriate Shielded Endpoint.
10. Under Actions, click the Recover link.

Tip: Numbers are red and letters are blue.

11. Ask the user for the Shield ID and verify that it is correct or enter it into Shield ID. Shield IDs do not contain the letters B, O, Q, and S.
12. Ask the user for the 8, 16, or 32-character Endpoint Code (not case sensitive) and enter it into the appropriate field. Endpoint Codes contain only the letters A-F.
13. Ask the user for the Key ID and enter it into the appropriate field (if your organization allows non-domain user activation, the Key ID is required.
14. Click Generate Access Code. The Restore User Access page displays the directory user alias associated with the Encryption client, along with an access code.
15. Confirm to your satisfaction that the request is coming from the directory user alias shown.

This is especially important if recovering media that may have been given to another user.
Security Management Server v10.2.6 AdminHelp

... recommends that you set a help desk policy for how to handle requests from users other than those who originally copied the data.

16. Do **one** of the following:
   - To allow the user to access the endpoint, click **Activate**.
   - To **not** allow the user to access the endpoint, click **Cancel**.

17. If the requester is the device authorized user, ask the user to enter the Access Code (not case sensitive) on the endpoint and click **OK**. The Access Code policies of the user affect this process (for example, how many attempts the user has to enter the code correctly).

18. When the user successfully enters the Access Code, the Encryption client changes the **Current Shield State** policy to **Activate**, and the successfully entered Access Code is no longer valid. Instruct the user to click **OK** to close the dialog.

19. In the left pane, click **Management > Commit**.

20. Click **Commit Policies**.

Once manual authentication is successful, the user is directed to reset their password. Depending on how policies are set, one of the following three options are displayed. The user enters a new password and confirms it, then clicks **OK** or **Cancel**.

Depending on policies set, the user may be prompted to type this password when using this removable media in other computers.

<table>
<thead>
<tr>
<th>If the policy is set to <strong>block</strong> all access to removable media until authenticated/encrypted and the user clicks <strong>Cancel</strong>, they cannot access any files on this removable storage.</th>
<th>If the policy gives <strong>read-access</strong> to removable storage until authenticated/encrypted and the user clicks <strong>Cancel</strong>, they can read/delete existing files on this removable media, but cannot edit/add files to this removable storage.</th>
<th>If the policy gives <strong>full access</strong> to removable media until authenticated/encrypted and the user clicks <strong>Cancel</strong>, they have full access to unencrypted files on this removable media, but cannot access encrypted files.</th>
</tr>
</thead>
<tbody>
<tr>
<td>If a user re-uses a password that has been used too recently, a dialog displays asking them to use a different password.</td>
<td>If a user re-uses a password that has been used too recently, a dialog displays asking them to use a different password.</td>
<td>If a user re-uses a password that has been used too recently, a dialog displays asking them to use a different password.</td>
</tr>
<tr>
<td>If a password does not meet the criteria set by policy, a dialog displays, outlining the password criteria.</td>
<td>If a password does not meet the criteria set by policy, a dialog displays, outlining the password criteria.</td>
<td>If a password does not meet the criteria set by policy, a dialog displays, outlining the password criteria.</td>
</tr>
</tbody>
</table>

The user may now use the removable media as usual.

If manual authentication is **not** successful, the device is disabled according to policy, as follows:

- The policy could be set to wait (cooldown) between unsuccessful manual authentication attempts.
or

- The policy may be set to delete the encryption key material and prevent any access to encrypted files on this removable media. In this case, the user need to contact an administrator again for instructions to re-enable access.

**Restore Lost Encryption Key Material**

If encryption keys have been deleted on the removable media (because of failed manual authentication, accidentally deleting a necessary file, a change in policy), the encrypted data is inaccessible until an authorized user reinitializes the encryption key material.

A dialog displays, notifying the user that key material is missing. Click Yes to use the self-healing feature of Encryption External Media or click No.

| If the policy blocks all access to removable media until encrypted and the user clicks No, they cannot access this removable media. | If the policy gives read-access to removable media until encrypted and the user clicks No, they have read-access to unencrypted data on this media, but no access to encrypted data. | If the policy gives full access to removable media, whether or not encrypted and the user clicks No, they have full access to unencrypted data on this media. They cannot access encrypted data. |

Occasionally, based on policies set, encryption keys cannot be reinitialized on the computer that the removable media is inserted in. If policy permits, the user can insert the media into any Dell-encrypted computer where the original user is logged in, to reinitialize the encryption keys. If policy does not permit this, it must be inserted into the originally encrypting computer, with the originally specified user name.

On rare occasions, when encryption key material is lost, the Encryption client cannot automatically locate the necessary information. Use the following process to recover encrypted data.

1. Attach the device to a Windows computer that is not running the Encryption client.
2. Copy all folders from the device onto the Windows computer.
3. Use WSScan to determine the DCID of the encrypted data.
4. Follow the process for recovering access to encrypted data on Windows computers. Use the DCID obtained from WSScan for the RecoveryID.

**Encryption External Media Recovery for User "Removed" from Database**

If a user is removed from Active Directory (such as an employee termination), when the Security Management Server gets the update from AD, the user is marked as "removed" in the database, so that they do not continue to get policy updates and endpoint access. However, if an Administrator needs to recover access to data on removable storage that was encrypted by the removed user, the Administrator does not know the user's password, and therefore cannot access the external media.

Note that the Administrator will need to repeat the following process for each piece of removable storage encrypted by the removed user, since the recovery code is per endpoint and does not apply to every piece of media owned by that user.

The following are SQL queries to accomplish "unmarking" the removed flag for the user in the database.

1. Follow the steps below. The user in this example is "games".
The next triage resets the "removed" flag.

2. Perform a recovery through Security Management Server (meaning, lock yourself out of the removable storage by entering an incorrect password until the recovery screen displays).

Generate an Access Code through the Security Management Server.

3. Reset the Encryption External Media password.

4. IMPORTANT - Reverse the process from step 1 to re-mark the flag as "removed" in the database.

Enable Federated Key Recovery

If more than one Dell Server is part of a federation, to perform Encryption External Media Recovery across Dell Servers in the federation, enable federated key recovery:

1. Navigate to <Security Server install dir>\conf\ and open the federatedservers.properties file.

2. Update the server.code property with a new a code, password or passphrase to be shared across Dell Servers in the federation. Enclose the code, password, or passphrase within a new CLR() tag, to replace the ENC() tag.

   Example: server.code=CLR(mypassword)

3. List all Dell Servers to be federated in the server uris property, delimited by a comma.

4. Save and copy the federatedservers.properties file to all Dell Servers that are part of the federation.

5. Restart all Security Servers in the federation.

   The restart converts the CLR() tag to the encrypted tag, ENC(), in the federatedservers.properties file.

Recover Data - BitLocker Manager

See the Recovery Guide for the most up-to-date recovery instructions.

Recover Endpoint

To download encryption keys of a managed or removed endpoint:
NOTE: Select Include Removed Endpoints to display endpoints that were previously removed.

1. In the left pane, click Management > Recover Endpoint.
2. Enter the hostname and click Search.
3. Click Recover next to the endpoint.
4. Enter a password then click Download.
5. Copy the recovery file to the endpoint and run the file.

Windows Recovery

For Windows Recovery, follow the instructions in the Recovery Guide. The latest Recovery Guide is available at these locations:

Encryption
Endpoint Security Suite Enterprise

SED Recovery

For information about SED authentication failure or SED endpoint recovery, see SED Recovery.

Encryption External Media Recovery

For information about recovering after Encryption External Media authentication failure, see Encryption External Media Authentication Failure.

Mac Recovery

See the Encryption Enterprise for Mac Administrator Guide, available at dell.com/support for the most up-to-date recovery instructions.

License Management

License Management

To view usage of Client Access Licenses (CALs) that you own and upload new licenses, click Management > License Management.

Upload Client Access Licenses

You received CALs separately from the installation files, either at the initial purchase or later if you added additional CALs.

1. In the left pane, click Management > License Management.
2. Under Upload Licenses, click Choose File to browse to and select the saved CAL.

View or Add License Notifications

Through Notification Management, you can set up notifications of license usage or expiration.

In the left pane, click Management > Notification Management.

Related topics:

CAL Information
Notification Management
Client Access License (CAL) Information

Upon log in to the Management Console, if there is a problem with your CAL, an error message displays (typically, the error states that the Dell Server has exceeded the maximum number of authorized client licenses). The next step is to review your CALs to ensure that your enterprise has the appropriate number of CALs to client ratio (1-to-1 ratio).

If authorized CALs exceed 5% of that specific CAL total, new client activations for that specific product is blocked until the license key is brought into compliance. No other client or Dell Server functions is impacted when a license key is in the over 105% state. Two separate warning messages are displayed, the first warning message is when the CAL reaches 99% of the authorized licenses, the second when the CAL count reaches or exceeds the 105% total.

For example:

- Authorized CAL for Dell Encryption (Windows): 5000 user licenses
- First warning message from Dell Server and an email message is sent to the administrator: CAL count reaches 5000
- Second warning message from Dell Server and an email message is sent to the administrator: CAL count reaches 5250

If a client has previously been activated and inventory records exist, then it is not blocked from any re-activation. However, if the CAL authorized count is exceeded during this process, new activations are blocked for the specific CAL that is in the over 105% state.

Licensing

1. License structure:
   b. Encryption External Media (EME)
   c. Dell Data Guardian (CE)
   d. Threat Protection (TP) - includes Malware Protection and/or Client Firewall and/or Web Protection features
   e. Advanced Threat Prevention (ATP) - includes optional Client Firewall and/or Web Protection features

2. Dell Digital Delivery of entitlements
Upload Client Access Licenses

You received CALs separately from the installation files, either at the initial purchase or later if you added additional CALs.

1. In the left pane of the Management Console, click **Management > License Management**.

2. Under **Upload Licenses**, click **Choose File** to browse to the location of the saved CAL.

Related topics:

- [CAL Information](#)
- [License Management](#)

**Services Management**

From the left pane of the Management Console, select **Management > Services Management**. The following options are available:
Provision or Recover the Advanced Threat Prevention service - After the service is provisioned, clients are automatically provisioned with Advanced Threat Prevention. For more information, see Provision or Recover Advanced Threat Prevention Service.

Enroll to receive Advanced Threat Prevention agent auto updates - After enrollment, clients can automatically download and apply updates from the Advanced Threat Prevention server. For more information, see Enroll for Agent Auto Update.

Export audit events - Audit events can be exported to a syslog server or to a local file. For more information, see Export Events to SIEM Server.

Provision or Recover Advanced Threat Prevention Service

The Advanced Threat Prevention service is provisioned and recovered through the Services Management Advanced Threats tab. Only system administrator can provision and recover the service.

After provisioning is complete, the contact information of the administrator who provisioned the service is displayed.

The guided setup prompts the system administrator to back up the Advanced Threat Prevention certificate at this time.

Provision service

To provision the Advanced Threat Prevention service:

1. In the left pane of the Management Console, click Management > Services Management.
2. Select the Advanced Threats tab.
3. Click Setup Advanced Threat Prevention Service.
4. Follow the guided setup and complete the necessary fields.

Regional provisioning to support geographical data centers is available for NA (North America), EU (EMEA), and AU (APAC).

Download and back up the Advanced Threat Prevention certificate in a safe location, separate from the server running the Dell Server. The backed up certificate is required if a service recovery is necessary.

Clients are automatically provisioned with Advanced Threat Prevention.

After provisioning is complete, the Setup link no longer displays.

Recover service

You will need your backed up certificate to recover the Advanced Threat Prevention service.

1. In the left pane of the Management Console, click Management > Services Management.
2. Click Recover Advanced Threat Prevention Service.
3. Follow the guided service recovery dialogs and upload the Advanced Threat Prevention certificate when prompted.

Enroll for Advanced Threat Prevention Agent Auto Updates

You can enroll to receive Advanced Threat Prevention agent auto updates. Enrolling to receive agent auto updates allows clients to automatically download and apply updates from the Advanced Threat Prevention server. Updates are released monthly.

Receive agent auto updates
To enroll to receive agent auto updates:

1. In the left pane of the Management Console, click **Management > Services Management**.
2. On the **Advanced Threats** tab, under **Agent Auto Update**, click **On** then click **Save Preferences**.

Stop receiving agent auto updates

To stop receiving agent auto updates:

1. In the left pane of the Management Console, click **Management > Services Management**.
2. On the **Advanced Threats** tab, under **Agent Auto Update**, click **Off** then click the **Save Preferences**.

**Events Management - Export Audit Events to a SIEM Server**

To export audit events to a syslog server or to a local file:

1. In the left pane, click **Management > Services Management**.
2. Select the **Events Management** tab.
3. Select the appropriate option(s):
   - **Export to Local File** allows you to export audit events to a file. Enter the location in which to store the file. This option also provides a backup of the audit events database.
   - **Export to Syslog** lets you specify the syslog server to which to export the file. If TCP protocol is not selected, select it.
4. Click the **Save Preferences** button.

**Product Notifications**

You can enroll to receive notifications of product updates, recommended configuration changes, and relevant knowledge base articles.

**Receive product notifications**

To enroll to receive product notifications:

1. In the left pane, click **Management > Services Management**.
2. Select the **Product Notifications** tab.
3. Click **On** then click **Save Preferences**.

**Note:** The product notification switch does not display when servers are configured in disconnected mode.

**Stop receiving product notifications**

To stop receiving product notifications:

1. In the left pane of the Management Console, click **Management > Services Management**.
2. Select the **Product Notifications** tab.
3. Click **Off** then click **Save Preferences**.
Enable Data Guardian Access Groups

You can allow access to selected user groups to collaborate on encrypted data by updating Access Groups preferences. Users outside that group cannot access or view the data unless the owner of the file grants access. See Configure Access Groups.

Note: Access Groups were initially named Circle of Trust. The Management Console is in the process of updating the user interface.

To enable Access Groups:

1. In the left pane, navigate to Management > Services Management.
2. Select the Data Guardian tab.
3. For Access Groups, click On.
   
   Important: Currently, if you enable Access Groups, you cannot disable it.
4. Click Save Preferences. A check box displays.
5. Optionally, if you are implementing a transitional period for an initial implementation, click the Auto access for swept files check box. When the transitional period is complete, clear the check box.
6. Click Save Preferences.
7. Continue with Configure Access Groups.

Notification Management

The Notification Management page lets you manage email notifications.

To add an email notification:

1. In the left pane, click Management > Notification Management.
2. Click Add and enter the following information:
   
   Email: Enter or select your email address.
   
   Notification Type: Select the type of alert to add.
   
   Priority Level: Select the priority levels of notifications.
   
   Email Frequency: Select how often alerts of this type. The default frequency is 24 hours.
3. Click Add when complete.

To edit an alert:

• Select the alert to change, click Edit, make the changes, and press Enter.

To delete an alert:

• Select the alert to delete, and click Delete.

License Management

Enable SMTP Server for Email Notifications
Enable SMTP Server for Email Notifications

If using Data Guardian, these settings are automated by using the Server Configuration Tool.

Use this procedure to enable the SMTP server for email notifications for purposes outside of Data Guardian.

When configuration changes are complete, restart the Security Server service. The Security Server service must be restarted for the settings to be updated.

Product Notifications

You can enroll to receive notifications of product updates, recommended configuration changes, and relevant knowledge base articles.

Receive product notifications

To enroll to receive product notifications:

1. In the left pane, click Management > Services Management.
2. Select the Product Notifications tab.
3. Click On then click Save Preferences.

Note: The product notification switch does not display when servers are configured in disconnected mode.

Stop receiving product notifications

To stop receiving product notifications:

1. In the left pane of the Management Console, click Management > Services Management.
2. Select the Product Notifications tab.
3. Click Off then click Save Preferences.

Data Guardian Management

Registration Access

To allow or block Data Guardian access for users who are not in the organization's domain:

1. In the left pane, click Management > Data Guardian Management.
2. Select the Registration Access tab.
3. Click Add.
4. Select Registration Access Type:
   Blacklist - Blocks registration and file access for a user or a domain.
   Full Access List - Grants registration and file access for a user or domain. If the user or domain is also on the blacklist, no access is granted.
5. Enter either a domain to set access for the entire domain, or email address to set access only for a single user.
6. Click Add.
External users can also be added to the blacklist from the Audit Events page, if the user is associated with an audit event:

1. In the left pane, click **Reporting > Audit Events**.
2. In the user column, click 🗡 to the right of the user name to add to the blacklist.

### Key Request

Data Guardian external users can request a key from an internal user to access a protected Office document. Key requests are shown on the Key Request Management page until the internal user approves or denies the request. After 48 hours, key requests are removed from the list. At that time, external users can request access again.

If the internal user is not available or has left the enterprise, an administrator can use this page to approve or deny requests.

Columns include:

- User - external user making the request
- File Name
- Request Date
- Request Expiration
- File Owner - internal user
- Approve/Deny

To approve or deny a request:

1. In the left pane, click **Management > Data Guardian Management**.
2. Select the **Key Request** tab.
3. Search for specific requests or select requests in the list.
   - To select multiple requests to approve or deny, press **Ctrl** and then select the requests.
   - To select multiple sequential requests, select the first request and then press **Shift** and select the last request in the sequential list.
4. Click **Approve** or **Deny**.

To approve or deny a single request, click approve ⌒ or deny ⌒ icon at the right end of the request.

### Key Revocation

The administrator can revoke access to files, at both the user level and the file level.

To revoke access:

1. In the left pane, click **Management > Data Guardian Management**.
2. Select the **Key Revocation** tab.
3. Select the user or file from which to revoke files.
4. Click **Revoke Keys**.
Key Management

The administrator can manage key ownership.

The keyid is available here:

- Reporting > Audit Events > Columns > File KeyID. See Options in the Columns menu.
- On the client side, a user can right-click a protected file to see the KeyID.

To find/change the owner for a key:

1. In the left pane, navigate to Management > Data Guardian Management.
2. Select the Key Management tab.
3. Enter the keyid and click Find Owner. The owner displays in the Current Owner field.
4. In the New Owner field, enter the email address of the new owner and click Change Owner.

To change ownership for all keys:

1. In the left pane, navigate to Management > Data Guardian Management.
2. Select the Key Management tab.
3. Select Change Ownership for ALL keys.
4. Enter the email address of the current owner.
5. Enter the email address of the new owner.
6. Click Change Owner.

If changing ownership for all keys, a table, Key Changes in Progress, displays at the bottom during the transfer. When complete, this content is removed. The Log Analyzer displays a log of the entries in the Transfer of keys column that have changed ownership.

Web Portal

To access the Web Portal URL:

1. In the left pane, click Management > Data Guardian Management.
2. Select the Web Portal tab.

Portal URL - The URL used to access the enterprise's Data Guardian web portal. After the portal URL is entered and saved, it is displayed on the Management Console's Downloads page. Additionally, it is displayed on the cover page of a protected file if the user does not have access to the key. This portal URL also displays on the Activation page after a new user registers.

Change Superadmin Password

1. In the masthead at the top of the screen, click the gear icon and select Change superadmin password.
2. Enter the current password.
3. Enter the new password. The new password must be at least 6 characters, contain at least one capital letter and one of these characters: ~@#$%^*()|?!{}[].
4. Confirm the new password.
5. Click Update.

After three failed login attempts, the superadmin account is locked for five minutes. To change these settings, see Set or Change Account Lockout Settings.

Change Account Lockout Settings

After three failed login attempts, the superadmin account is locked for five minutes. To change these settings:

1. Open <Security Server installation folder>\conf\application.properties.
2. Edit the following property to change the maximum allowed number of failed login attempts.
   login.cooldown.max.failed.attempts=3
3. Edit the following property to change the length of lockout time after the maximum allowed number of failed login attempts is reached.
   login.cooldown.minutes=5
4. Save the file, and restart the Security Server.

Downloads

Endpoint Software

To download the latest version of Dell Encryption:

1. In the left pane, click Management > Downloads.
2. Select the Endpoint Software tab.
3. Click Navigate to Download.
   The Download tab is only available if the user has been assigned a security and a system administrator role.

To download the latest version of Dell Data Guardian:

1. In the left pane, click Management > Downloads.
2. Select the Endpoint Software tab.
3. Choose from the following:
   - Navigate to Download (for Windows or Mac)
   - Download on the App Store (for iOS)
   - Get it on Google Play (for Android)
The Download tab is only available if the user has been assigned a security and a system administrator role.

To download the latest version of Endpoint Security Suite Enterprise (ESSE):

1. In the left pane, click Management > Downloads.
2. Select the Endpoint Software tab.
3. Click Dell Support to contact Dell for access to Dell Endpoint Security Suite Enterprise.
Manage Policies

**Manage Security Policies**

You can apply security policies at the Enterprise, Domain, User Group, User, Endpoint Group, and Endpoint levels. Default policy settings allow your enterprise to get started with Dell security, but you should customize the security and configuration settings. If you’ve migrated from an earlier version of Dell Server, your policy settings have been migrated for you.

Security policies are grouped by technology. Click a technology group to view its policies and policy descriptions.

- **Settings**

The following override information displays at the top of the Security Policies page:

- **Override count** - the number of policy settings that are changed from their default settings.
- **Uncommitted overrides** - the number of changes from default settings that are not yet committed.

**NOTE:** The Security Policies page for a population displays overrides to localizable policies in the browser language only.
Icons and their meanings:

- ✔️ The master switch for policies in the subgroup is On, which means the policy group is enabled. Policies in the group are sent to clients when policies are committed.
- ✗ Policies in the subgroup are not enabled.
- 🔴 At least one default setting in the policy group has been overridden.
- 🌐 Group of policy settings that has no master switch.
- 🕒 The policy change is not yet committed.
- ⌚️ The policy value can be localized, so that policies on the endpoint computer display in a selected language. For more information, see Localize Policies Displayed on the Endpoint Computer and Localizable_policies.
- 🔴 The default setting of a localizable policy is overridden.
- ☻️ A localizable policy change is not yet committed.

To remove a policy override, hover over the red flag next to the policy name. The red flag becomes a red X. Click the red X to revert to the default value.

Group precedence

You can Modify Group Precedence. Group precedence creates a weight associated with the specific group it is assigned to, and that weight is used in policy arbitration for all policy overrides.

Localize Policies Displayed on the Endpoint Computer

Localizable policies are indicated by: 🌐

To localize policies that are displayed on the endpoint computer, follow these steps:

1. In the left pane, expand Populations and select a population.
2. Click the **Security Policies** tab.

3. Select the technology group, such as *Windows Encryption*, or policy group, such as *Policy-Based Encryption*, to modify.

4. Select a language for localizable policies from the list at the top right of the screen.

5. Enter text that is in the language you selected for localizable policies. Navigate the populations and technology groups as necessary to localize all desired policies for that language.

6. Click **Save**.

7. To update policies in a different language, select the language from the list, enter localized text for all desired policies, and click **Save**.

   Save policy changes before selecting another language in the list. A different language cannot be selected until policy changes are saved.

8. When finished, select the desired language. Any changes made to localizable policies are made in the language that displays.

   **NOTE:** The Security Policies page for a population displays overrides to localizable policies in the browser language only.

Windows Encryption

A word about types of encryption: SDE is designed to encrypt the operating system and program files. To accomplish this purpose, SDE must be able to open its encryption key while the operating system is booting without intervention of a password by the user. Its intent is to prevent alteration or offline attacks on the operating system by an attacker. SDE is not intended for user data. Common and User key encryption are intended for sensitive user data because they require a user password to unlock encryption keys.

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full Disk Encryption (FDE)</td>
<td>This technology manages drives using software-based Full Disk Encryption. Authentication by users through a Pre-Boot Authentication environment (before the operating system has booted) is required to unlock the drive.</td>
<td></td>
</tr>
</tbody>
</table>

### Full Disk Encryption (FDE)

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On/Off</td>
<td></td>
<td>Toggle to ON to enable all full disk encryption policies. If this policy is toggled to OFF, no full disk encryption takes place, regardless of other policy values. On means that all Full Disk Encryption policies are enabled. Changing the value of this policy triggers a new sweep to encrypt/decrypt files.</td>
</tr>
</tbody>
</table>

**Encryption Algorithm**

| AES 256                  | AES 256, AES 128, FIPS AES 256, FIPS AES 128 Encryption algorithm used for Full Disk Encryption. |

**Encryption Mode**

| CBC                      | CBC, XTS Encryption mode used for Full Disk Encryption. |

**Enable FDE Plugin**

| Selected                 | The plugin must remain selected. To deactivate the PBA and disable full disk encryption, toggle the Full Disk Encryption policy to OFF. |

### Self-Encrypting Drive (SED)

This technology manages self-encrypting drives (SEDs). Authentication by users through a Pre-Boot Authentication environment (before the operating system has booted) is required to unlock the drive.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On/Off</td>
<td></td>
<td>Enable this policy to provision the PBA. If disabled after the PBA is provisioned, the PBA is de-provisioned and the PBA database is deleted. Re-enabling this policy re-provisions the PBA and re-creates the PBA database.</td>
</tr>
</tbody>
</table>

### Policy-Based Encryption

This technology uses Dell's proprietary data centric encryption to allow user data and computer encryption. This allows greater protection over individual data than traditional full disk encryption, by limiting access on a computer to only what a user is authorized to view.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On/Off</td>
<td></td>
<td>Toggle to ON to enable all policy-based encryption policies. If this policy is toggled to OFF, no policy-based encryption takes place, regardless of other policy values. On means that all Policy-Based Encryption policies are enabled. Changing the value of this policy triggers a new sweep to encrypt/decrypt files.</td>
</tr>
</tbody>
</table>

### Application Data Encryption Key

| Common                  | Common, User, User Roaming |

See [advanced settings](#)
## Manage Policies

Choose a key to indicate who can access files encrypted by Application Data Encryption List, and where.

**More...**

Common for these files to be accessible to all managed users on the computer where they were created (the same level of access as Common Encrypted Folders), and encrypted with the Common encryption algorithm.

User for these files to be accessible only to the user who created them, only on the computer where they were created (the same level of access as User Encrypted Folders), and encrypted with the user encryption algorithm.

User Roaming for these files to be accessible only to the user who created them, on any encrypted Windows computer, and encrypted with the User encryption algorithm.

Changes to this policy do not affect files already encrypted because of this policy.

<table>
<thead>
<tr>
<th>SDE Encryption Enabled</th>
<th>Not Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SDE Encryption Enabled</strong></td>
<td><strong>Not Selected</strong></td>
</tr>
</tbody>
</table>

If this policy is not selected, SDE encryption is disabled, regardless of other policy values. Selected means that all data not encrypted by other Intelligent Encryption policies are encrypted per the SDE Encryption Rules policy. Changing the value of this policy requires a reboot.

<table>
<thead>
<tr>
<th>SDE Encryption Rules</th>
<th>String</th>
</tr>
</thead>
</table>

Encryption rules to be used to encrypt/not encrypt certain drives, directories, and folders. See Encryption Rules for information. SDE Encryption Rules may be changed as appropriate for your environment. However, these defaults have been tested extensively. Removing these exclusions may result in Windows issues, particularly after applying patch updates. Contact ProSupport for guidance if you are unsure about changing the values.

On computers with a compatible TPM, three types of authentication are supported. Only one of the following can be required or allowed:
- Configure TPM Startup PIN
- Configure TPM Startup Key
- Configure TPM Startup Key and PIN

To use this policy, Require Additional Authentication at System Startup must be set to Selected.

This type of authentication involves the entry of a 4-digit to 20-digit personal identification number (PIN).

To use this policy, Require Additional Authentication at System Startup must be set to Selected.

This type of authentication involves insertion of a USB drive containing the startup key.

To use this policy, Require Additional Authentication at System Startup must be set to Selected.

This type of authentication involves a 4-digit to 20-digit personal identification number (PIN) and a USB drive containing the startup key.

Algorithm and cipher strength used by BitLocker Drive Encryption for OS Volumes.

AES-128
AES-256
XTS-AES-128 (for use with Windows 10 Anniversary Edition and later)
XTS-AES-256 (for use with Windows 10 Anniversary Edition and later)

Encryption Method and Cipher Strength (OS Volumes): XTS-AES-128
## Encryption Method and Cipher Strength (Removable Volumes)

| Algorithm and cipher strength used by BitLocker Drive Encryption for Removable Volumes. |
|---------------------------------|---------------------------------|
| AES-128                         | AES-256                         |
| XTS-AES-128 (for use with Windows 10 Anniversary Edition and later) | XTS-AES-256 (for use with Windows 10 Anniversary Edition and later) |
Algorithm and cipher strength used by BitLocker Drive Encryption for Removable Volumes.
To encrypt removable drives to use with older versions of Windows as well as with Windows 10 Anniversary Edition and later, use AES-128 or AES-256.

## Encryption Method and Cipher Strength (Fixed Volumes)

**Windows Policies that Require Logoff**

- SDE Encryption Enabled
- User state change to Suspended
- EMS Encrypt External Media
- EMS Scan External Media
- EMS Encryption Algorithm
- EMS Exclude CD/DVD Encryption
- EMS Data Encryption Key

**Advanced Windows Encryption**

A word about types of encryption: SDE is designed to encrypt the operating system and program files. To accomplish this purpose, SDE must be able to open its encryption key while the operating system is booting without intervention of a password by the user. Its intent is to prevent alteration or offline attacks on the operating system by an attacker. SDE is not intended for user data. Common and User key encryption are intended for sensitive user data because they require a user password to unlock encryption keys.

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Self-Encrypting Drive (SED)</strong></td>
<td></td>
<td>This technology manages self-encrypting drives (SEDs). Authentication by users through a Pre-Boot Authentication environment (before the operating system has booted) is required to unlock the drive.</td>
</tr>
<tr>
<td>Enable SED Plugin</td>
<td>Selected</td>
<td>The plugin must remain selected. To deactivate the PBA and disable SED Management, toggle the Self-encrypting Drive policy to OFF.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy-Based Encryption</td>
<td>This technology uses Dell's proprietary data centric encryption to allow user data and computer encryption. This allows greater protection over individual data than traditional full disk encryption, by limiting access on a computer to only what a user is authorized to view.</td>
<td></td>
</tr>
<tr>
<td>Encrypt with SDE when SED is detected</td>
<td>Not Selected</td>
<td>When Selected, this policy applies SDE encryption to self-encrypting drives. Use this policy when SDE encryption is preferred instead of native SED encryption.</td>
</tr>
<tr>
<td>User Encrypted Folders</td>
<td>String</td>
<td>A list of folders on the computer hard drive to be encrypted with the user data encryption key or excluded from encryption. If the same folder is specified in this policy for multiple users of the same Windows computer, each file in that folder is encrypted for the first owner of the file after the policy takes effect, and can be decrypted only by that owner. The text in this policy is translatable. More... Specify as for Common Encrypted Folders.</td>
</tr>
<tr>
<td>Application Data Encryption List</td>
<td>String</td>
<td>A list of applications (without paths) whose new files you want encrypted, separated by carriage returns. Do not use wildcards. The text in this policy is translatable. More... You can also specify these process names (separated by commas) via the registry value HKLM\Software\Dell\CMGShield\ApplicationDataEncryptionList. The Encryption client encrypts all new files (not already being encrypted by Common Encrypted Folders and User Encrypted Folders) on the current computer hard drives created by these application processes whenever they are owned by a currently-logged-on managed user. This may include files excluded from encryption by Common Encrypted Folders and/or User Encrypted Folders. The following folders and their subfolders are always excluded from encryption by this policy: C:\Windows\system32 C:\Windows\Software Distribution C:\Windows\Security C:\System Volume Information\Program Files\Dell[File</td>
</tr>
</tbody>
</table>
The following hard-coded system and installer process names are ignored if specified in this policy (you can also add to this list via the registry value HKLM\Software\Dell\CMGShield\EUWPrivilegedList):
- hotfix.exe, a Windows update process
- update.exe, a Windows update process
- setup.exe, a third-party installer process
- msiexec.exe, a third-party installer process
- wuaclt.exe, a Windows update process
- wmiprvse.exe, a Windows system process
- migrate.exe, a Windows update process
- unregmp2.exe, a Windows update process
- ikernel.exe, a third-party installer process
- wssetup.exe, the Windows Encryption client installer
- svchost.exe, a Windows system process

  • The users profile (C:\Users\jsmith) with the User data encryption key
  • %Users%\Public with the Common encryption key |

Encrypt Windows Paging File | Selected |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>When this policy is selected, the Windows paging file is encrypted. A change to this policy requires a reboot.</td>
<td></td>
</tr>
</tbody>
</table>
| **Managed Services** | **String** | String - maximum of 100 entries of 500 characters each (up to a maximum of 2048 characters)
When a service is managed by this policy, the service is started only after the user is logged in and the Encryption client is unlocked. This policy also ensures that the service managed by this policy is stopped before the Encryption client is locked during logoff. This policy can also prevent a user logoff if a service is unresponsive.

**More...**

Syntax is one Service name per line. Spaces in the service name are supported. Wildcards are not supported. Entries are not case-sensitive. For example, GoogleDesktop Manager is the same as googledesktopmanager. The service "log on as" setting has no bearing on whether or not the Encryption client can control it. It does not matter if a user logs on with user credentials verses the local system.
The startup type (Automatic or Manual) does not affect the ability of the Encryption client to control it. Automatic or Manual startup is acceptable. Managed services are not started if an unmanaged user logs on. |
| **Secure Post-Encryption Cleanup** | **No Overwrite** | No Overwrite, Single-pass Overwrite, Three-pass Overwrite, Seven-pass Overwrite
Once encryption is complete, this policy determines what happens to the unencrypted residue of the original files:
• No Overwrite deletes it. This value yields the fastest encryption processing.
• Single-pass Overwrite overwrites it with random data.
• Three-pass Overwrite overwrites it with a standard pattern of 1s and 0s, then with its complement, and then with random data.
• Seven-pass Overwrite overwrites it with a standard pattern of 1s and 0s, then with its complement, and then with random data five times. This value makes it most difficult to recover the original files from memory, and yields the most secure encryption processing. |
| **Secure Windows Credentials** | **Not Selected** | When this policy is selected, the Windows Credentials are secured by encrypting the entire registry with the exception of registry information required for computer boot. The information required for computer boot includes HKLM/SYSTEM and all sub-keys.

**More...**

A reboot is required when a change to this policy is delivered. To control this reboot, configure the following policies: Force Reboot on Update, Length of Each Reboot Delay, and Number of Reboot Delays Allowed. |
| **Block Unmanaged Access to Domain Credentials** | **Not Selected** | This policy prevents unmanaged users and applications from accessing the Windows domain credentials when a user is logged in. |
| **Secure Windows Hibernation File** | **Not Selected** | When this policy is selected, the hibernation file is encrypted only when the computer enters hibernation. The Encryption client disengages protection when the computer comes out of hibernation, providing protection without impacting users or applications while the computer is in use. |
| **Prevent Unsecured Hibernation** | **Not Selected** | When this policy is selected, the Encryption client does not allow computer hibernation if the client is unable to encrypt the hibernation data. |
| **Scan Workstation on Logon** | **Not selected** | When this policy is selected, all current and previously encrypted folders on the encrypted computer's local hard drives are scanned each time a managed user logs on, ensuring that all Common Encrypted Folders and User Encrypted Folders policy values are properly implemented. Abides by the Workstation Scan Priority policy. |
| **Workstation Scan Priority** |  | Highest, High, Normal, Low, Lowest
Specifies the relative Windows priority of encrypted folder scanning. High and Highest prioritize scanning speed over computer responsiveness, Low and Lowest prioritize computer responsiveness over scanning speed and favor other resource-intensive activities, and Normal balances the two. The client checks for a changed Workstation Scan Priority before processing the next file. |
The scan priority levels are used in two ways.

1. These values correspond with the values used by the Microsoft SDK to set thread execution priority.

2. The client uses these values to introduce a delay in the encryption sweep after every single file is processed. The values translate to the following millisecond delay ranges, where the encryption thread will sit idle and then return full control to the operating system:

   - Highest=0 ms / Lowest=100 ms

<table>
<thead>
<tr>
<th>User Data Encryption Key</th>
<th>User</th>
</tr>
</thead>
</table>

Common, User, User Roaming

Choose a key to indicate who can access files encrypted by the following policies, and where:

- User Encrypted Folders
- Encrypt Outlook Personal folders
- Encrypt Temporary Files (\Users\<Username>\AppData\Local\Temp only)
- Encrypt Temporary Internet Files
- Encrypt User Profile Documents (except \All Users\Shared Documents)

Select:

- Common for User Encrypted Folders to be accessible by all managed users on the computer where they were created (the same level of access as Common Encrypted Folders), and encrypted with the Common encryption algorithm.

More...

The Common encryption algorithm controls the encryption algorithm for all User Encrypted Folders and overrides any encryption algorithm selected, including the default User encryption algorithm. For example, if the Common encryption algorithm is set to AES 256, all Common and User Encrypted Files/Folders is encrypted with the AES 256 algorithm.

All other encryption parameters can be selected to override default settings. For example, if the Encrypt Temporary Files policy is set to Not Selected, you can override this setting for any managed user by setting this value to Selected.

Designated User Encrypted Folders use the Common Key, resulting in all managed users having the key to access any encrypted files stored in these folders as permitted by security settings on the operating system.

- User for these files to be accessible only to the user who created them, only on the computer where they were created (the same level of access as User Encrypted Folders), and encrypted with the User Encryption Algorithm.

- User Roaming for these files to be accessible only to the user who created them, on any encrypted Windows computer, and encrypted with the User encryption algorithm.

When incorporating an encryption policy to encrypt entire disk partitions, Dell recommends using the default SDE policy, rather than Common or User. This ensures that any operating system files that are encrypted are accessible during times when the managed user is not logged in.

<table>
<thead>
<tr>
<th>Policy Proxy Connections</th>
<th>String</th>
</tr>
</thead>
</table>

String - maximum of 1500 characters

List fully qualified Policy Proxy hostnames, or IP addresses, separated by carriage returns. Ports cannot be specified in this policy.

More...

Once a valid entry is found, the remainder of the Policy Proxies listed are ignored.

Entries are processed in the following order:

1. GKConnections Override (this registry entry overrides all other entries)
2. GKConnections (this registry entry is set automatically by the client, based on the this policy)
3. GK

To override this policy and specify ports via the registry key, set HKLM\Software\Microsoft\WindowsNT\CurrentVersion\
Manage Policies

<tbody>
<tr>
<td>The interval that the Encryption client attempts to poll Policy Proxy for policy updates, and send inventory information to Policy Proxy. The Encryption client also attempts to poll Policy Proxy each time a user logs on.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Allow Activations | Selected | This policy is available at the Enterprise, Domain, User Group, and User levels. This policy is used only by the Encryption client. Other applications do not have an activation policy setting. When this policy is selected, Encryption client activations are allowed. When this policy is not selected, activations are blocked. Blocking activations is useful for staggering activations, preventing activations during the initial Dell Server setup, or preventing activations during a maintenance interruption. |

| Current Shield State | Activate | Activate is the normal state for an encrypted user. A user must be in this state to activate a computer. Select Suspend to require recovery before the user can access the computer. When a user is suspended, encrypted data cannot be accessed. The user can be recovered by changing this policy to Activate, and committing the policy. |

**Bitlocker Encryption - Global Settings**

| Default Folder Location to Save Recovery Password | Qualified path
Important: This policy is not used by Bitlocker Manager, because it does not prompt the user when saving recovery passwords. Microsoft defines this policy as: This setting provides the default path that is displayed when the BitLocker drive encryption setup wizard prompts the user to enter the location of a folder to save the recovery password. The text in this policy is translatable. |
| Encryption Method and Cipher Strength | AES 128 with Diffuser
AES 256 with Diffuser
AES 128
AES 256
This policy specifies the encryption method and cipher strength used for BitLocker drive encryption. Changing this policy has no effect if the drive is already encrypted or encryption is in progress. |
| Enable Organizational Unique Identifiers | Not Selected
This policy allows for the association of unique organizational identifiers to a new drive that is enabled with BitLocker. These identifiers are stored as |
### Manage Policies

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Set Organizational Unique Identifiers</strong></td>
<td>The identification field allows you to associate a unique organizational identifier to BitLocker-protected drives. This identifier is automatically added to new BitLocker-protected drives and can be updated on existing BitLocker-protected drives using the <code>Manage-BDE</code> command-line tool. An identification field is required for management of certificate-based data recovery agents on BitLocker-protected drives and for potential updates to the BitLocker To Go Reader. BitLocker will only manage and update data recovery agents when the identification field on the drive matches the value configured in the identification field. In a similar manner, BitLocker will only update BitLocker To Go Reader when the identification field on the drive matches the value configured for the identification field. To use this policy, Enable Organizational Unique Identifiers must be set to Selected.</td>
</tr>
<tr>
<td><strong>Set Allowed Organizational Unique Identifiers</strong></td>
<td>The allowed identification field is used in combination with the Deny Write Access to Removable Drives Not Protected by BitLocker policy to help control the use of removable drives in the organization. It is a comma separated list of identification fields from your organization or other external organizations. To use this policy, Enable Organizational Unique Identifiers must be set to Selected.</td>
</tr>
<tr>
<td><strong>Prevent Memory Overwrite on Restart</strong></td>
<td>Selected prevents memory from being overwritten on restart. Preventing memory overwrite may improve restart performance, but will increase the risk of exposing BitLocker secrets. When Not Selected, BitLocker secrets are removed from memory when the computer restarts.</td>
</tr>
<tr>
<td><strong>Enable Smart Card Certificate Identifier</strong></td>
<td>Not Selected. This policy allows or denies an object identifier to be specified for enhanced key usage with a certificate. This policy must be set to Selected to use the policy Smart Card Certificate Identifier.</td>
</tr>
<tr>
<td><strong>Smart Card Certificate Identifier</strong></td>
<td>1.3.6.1.4.1.311.67.1.1. This policy provides for an object identifier to be specified for enhanced key usage with a certificate. BitLocker can identify which certificates may be used to authenticate a user certificate to a BitLocker drive by matching the object identifier in the certificate with the object identifier that is defined by this policy. Use caution if changing the default value. To use this policy, Enable Smart Card Certificate Identifier must be set to Selected.</td>

This policy must be set to Selected to use the policy Configure Specific TPM Platform Settings. See <a href="http://technet.microsoft.com/en-us/library/jj679890.aspx#BKMK_depopt3">http://technet.microsoft.com/en-us/library/jj679890.aspx#BKMK_depopt3</a> for more information.</td>
<td></td>
</tr>
<tr>
<td>Platform Validation Profile</td>
<td>Not Selected</td>
<td></td>
</tr>
<tr>
<td>Configure Specific TPM Platform Settings</td>
<td>This policy allows you to configure how the computer’s TPM security hardware secures the BitLocker encryption key. This policy setting does not apply if the computer does not have a compatible TPM or if BitLocker has already been turned on with TPM protection. This setting determines what values the TPM measures when it validates early boot components before unlocking a drive on a computer running Windows 7 or Windows Server 2008 R2. More... If you enable this policy before turning on BitLocker, you can configure the boot components that the TPM will validate before unlocking access to the BitLocker-encrypted operating system drive. If any of these components change while BitLocker protection is in effect, the TPM does not release the encryption key to unlock the drive and the computer will instead display the BitLocker recovery console and require that either the recovery password or recovery key be provided to unlock the drive. If you disable or do not configure this policy, the TPM uses the default platform validation profile or the platform validation profile specified by the setup script. A platform validation profile consists of a set of Platform Configuration Register (PCR) indices ranging from 0 to 23. The default platform validation profile secures the encryption key against changes to the Core Root of Trust of Measurement (CRTM), BIOS, and Platform Extensions (PCR 0), the Option ROM Code (PCR 2), the Master Boot Record (MBR) Code (PCR 4), the NTFS Boot Sector (PCR 8), the NTFS Boot Block (PCR 9), the Boot Manager (PCR 10), and the BitLocker Access Control (PCR 11). The descriptions of PCR settings for computers that use an Extensible Firmware Interface (EFI) are different than the PCR settings described for computers that use a standard BIOS. The BitLocker Drive Encryption Deployment Guide on Microsoft TechNet contains a complete list of PCR settings for both EFI and standard BIOS. Caution: Changing from the default platform validation profile affects the security and manageability of your computer. BitLocker’s sensitivity to platform modifications (malicious or authorized) is increased or decreased depending upon inclusion or exclusion (respectively) of the PCRs. To use this policy, Configure TPM Platform Validation Profile must be set to True.</td>

| This policy setting allows you to configure how the computer's TPM security hardware secures the BitLocker encryption key. This setting determines what values the TPM measures when it validates early boot components before unlocking an operating system drive on a computer with BIOS configuration or with UEFI firmware that has the Compatibility Support Module (CSM) enabled. If you enable this policy before turning on BitLocker, you can configure the boot components that the TPM will validate before unlocking access to the BitLocker-encrypted operating system drive. If any of these components change while BitLocker protection is in effect, the TPM does not release the encryption key to unlock the drive and the computer will instead display the BitLocker recovery console and require that either the recovery password or recovery key be provided to unlock the drive. To use this policy, Configure BIOS TPM Platform Validation Profile must be set to Selected. |

| Configure UEFI TPM Platform Validation Profile | Not Selected  
|                                               | Selected  
|                                               | Not Selected  
| Set to Selected to enable boot up UEFI TPM drive unlocking. Selected allows the configuration of how the UEFI TPM security hardware secures the BitLocker encryption key. This policy does not apply if the computer does not have a compatible TPM or if BitLocker has already been turned on with TPM protection. This policy must be set to Selected to use the policy Configure Specific UEFI TPM Platform Settings. See [http://technet.microsoft.com/en-us/library/jj679890.aspx#BKMK_tpmvaluefi](http://technet.microsoft.com/en-us/library/jj679890.aspx#BKMK_tpmvaluefi) for more information. |

| Configure Specific UEFI TPM Platform Settings | PCR0, on  
|                                               | PCR1, off

<tr>
<td>EMS Encrypt External Media</td>
<td>Not Selected</td>
<td>This policy must be selected to use all other removable media policies. Not Selected means that no encryption of removable media takes place, regardless of other removable media policy values.</td>
</tr>
<tr>
<td>EMS Exclude CD/DVD Encryption</td>
<td>Not Selected</td>
<td>Not Selected encrypts CD/DVD devices.</td>
</tr>
</tbody>
</table>
| EMS Access to unShielded Media | Read Only | **Block, Read Only, Full Access**  
Note that this policy interacts with the Storage > Subclass Storage: External Drive Control policy. If you intend to set this policy to Full Access, ensure that Subclass Storage: External Drive Control is not set to Read Only or Blocked.  
**More...**  
When this policy is set to Block Access, you have no access to removable media unless it is encrypted. Choosing either Read-Only or Full Access allows you to decide what removable media to encrypt.  
If you choose not to encrypt removable media and this policy is set to Full Access, you have full read/write access to removable media. If you choose not to encrypt removable media and this policy is set to Read-Only, you can read or delete existing files on the unencrypted media, but files cannot be edited on, or added to, the media. |
| EMS Encryption Algorithm | AES256 | AES 256, AES 128, 3DES  
Encryption algorithm used to encrypt removable media. Encryption algorithms in order of speed, fastest first, are AES 128, AES 256, 3DES. |
| EMS Automatic Authentication | Disabled | Disabled, Local, Roaming  
Local automatic authentication allows the encrypted media to be automatically authenticated when inserted in the originally encrypting computer when the owner of that media is logged in. When local automatic authentication is disabled, users must always manually authenticate to access encrypted media.  
Not selecting roaming automatic authentication helps to prevent users from forgetting their password when they take the media home or share it with a colleague. Not selecting roaming automatic authentication also promotes a sense of awareness from a security perspective for users that the data being written to that media is protected. |
| EMS Scan External Media | Not Selected | Selected allows removable media to be scanned every time it is inserted. When this policy is Not Selected and the EMS Encrypt External Media policy is Selected, only new and changed files are encrypted. See [EMS Encryption Rules](#) if changing this policy to Selected. Do not enable this policy without applying EMS Encryption Rules also.  
**More...**  
A scan occurs at every insertion so that any files added to the removable media without authenticating can be caught. Files can be added to the media if authentication is declined, but encrypted data cannot be accessed. The files added are not encrypted in this case, so the next time the media is authenticated (to work with encrypted data), any files that may have been added are scanned and encrypted. |
| EMS Access Encrypted Data on unShielded Device | Selected | Selected allows the user to access encrypted data on removable media whether the endpoint is encrypted or not.  
**More...**  
When this policy is Not Selected, the user can work with encrypted data |
when logged on to any encrypted device, regardless of the Dell Server the user activated against. The user cannot work with encrypted data using any unencrypted device.

<table>
<thead>
<tr>
<th>EMS Device Whitelist</th>
</tr>
</thead>
</table>

| String - Maximum of 150 devices with a maximum of 500 characters per PNPDeviceID. Maximum of 2048 total characters allowed. "Space" and "Enter" characters count in the total characters used. This policy allows the specification of removable media devices to exclude from encryption (using the device’s Plug and Play device identifier (PNPDeviceID)), thereby allowing users full access to the specified removable media devices. **More...**

This policy is available on an Enterprise, Domain, Group, and User level. Note that local settings override inherited settings. If a user is in more than one group, all EMS Device Whitelist entries, across all Groups, apply. This policy is particularly useful when using removable media devices which provide hardware encryption. However, this policy should be used with caution. This policy does not check whether external media devices on this list provide hardware encryption. Whitelisting removable storage devices that do not have hardware encryption do not have enforced security and are not protected.

*For example, the Kingston® DataTraveler® Vault Privacy model enforces that encryption is enabled to use the device. However, the Kingston DataTraveler Vault model has an unsecured partition and a secured partition. Because it is the same physical removable media device with only one PNPDeviceID, the two partitions cannot be distinguished, meaning that whitelisting this particular device would allow unencrypted data to leave the endpoint.*

Additionally, if a removable media device is encrypted and is subsequently added to the EMS Device Whitelist policy, it remains encrypted and requires a reformat of the device to remove encryption.

The following is an example of a PNPDeviceID, which contains the manufacturer identifier, product identifier, revision, and hardware serial number:

```
USBSTOR\DISK\VEN_KINGSTON &PROD_DTVault_Privacy\REV_105\07005B831A00048480
```

To whitelist a removable media device, provide a string value that matches portions of the device’s PNPDeviceID. Multiple device PNPDeviceIDs are allowed.

For example, to whitelist all Kingston DataTraveler Vault Privacy models, input the string:

```
PROD_DTVault_Privacy
```

To whitelist both models of Kingston DataTraveler, the Vault and Vault Privacy models, input the string:

```
PROD_DTVault_Privacy;
PROD_DTVault_Privacy
```

Space characters are considered part of the substring to match to a PNPDeviceID. Using the previous PNPDeviceID as an example, a space before and after the semicolon would cause neither of the substrings to be matched, because the space character is not part of the PNPDeviceID.

**Instructions...**

To find the PNPDeviceID for removable media:

1. Insert the removable media device into an encrypted computer.
2. Open the EMSService.log in C:\Programdata\Dell\[Dell Data Protection\Encryption\EMS.
3. Find PNPDeviceID=

For example:

```
14.03.18 18:50:06.834 [I] [Volume "F:\"] PnPDeviceID =
```
To find the PNPDeviceID for removable media on Windows 7 or later:
1. Insert the removable media device.
2. Open the Control Panel and go to Administrative Tools > Computer Management.
3. Select the Hardware tab, select the drive, and click Properties.
4. A new window displays. Select the Device Instance Path in the Property menu. The PNPDeviceID is displayed in Value.

Available Delimiters:
- Tabs
- Commas
- Semi colons
- Hex character 0x1E (Record separator character)

### Manage Policies

#### EMS Access Code Required Message
- **Authentication Failed. Please contact your system administrator.**

**String** - 5-512 characters - *Authentication Failed: Please contact your system administrator.*

- Message that displays when a user needs to contact an administrator for an access code after authentication failure.

**More...**

- Message policies must have non-blank values.
- "Space" and "Enter" characters used to add lines between rows count as characters used. Messages over the 512 character limit are truncated on the client.
- Optionally customize the second sentence of the message to include specific instructions about how to contact a help desk or security administrator for authentication failures.

#### EMS Cooldown Time Delay
- **30**

- **0-5000 seconds**

- Number of seconds the user must wait before attempting to enter the access code after failing the specified number of times.

#### EMS Cooldown Time Increment
- **20**

- **0-5000 seconds**

- Incremental time to add to the cooldown time each time the user fails to enter the correct access code in the specified number of attempts.

#### EMS Access Code Failed Message
- **You are not authorized to use this media. Please contact your system administrator.**

**String** - 5-512 characters - *You are not authorized to use this media. Please contact your system administrator.*

- Message that displays following unsuccessful Access Code Attempts Allowed.

**More...**

- Message policies must have non-blank values.
- "Space" and "Enter" characters used to add lines between rows count as characters used. Messages over the 512 character limit are truncated on the client.
- Optionally customize the message to include specific instructions about how to contact the help desk or security administrator.

#### EMS Encryption Rules
- **Encryption rules to be used to encrypt/not encrypt certain drives, directories, and folders.**

- A total of 2048 characters are allowed. "Space" and "Enter" characters used to add lines between rows count as characters used. Any rules exceeding the 2048 limit are ignored.

- See [Encryption Rules](#) for information.

**More...**

- Storage devices which incorporate multi-interface connections, such as Firewire, USB, eSATA, etc. may require the use of both Encryption External Media and encryption rules to encrypt the endpoint. This is necessary due to differences in how the Windows operating system handles storage devices based on interface type.

- To ensure encrypting an iPod via Encryption External Media does not make the device unusable, use the following rules:
  - R\#:\Calendars
  - R\#:\Contacts
  - R\#:\Pod_Control
  - R\#:\Notes
  - R\#:\Photos

- You can also force encryption of specific file types in the directories above. Adding the following rules will ensure that ppt, pptx, doc, docx, xls, and xlsx files are encrypted in the directories excluded from encryption via the previous rules:
  - ^R\#:\Calendars
  - .ppt,.doc
  - .xls,.pptx
  - .docx,.xlsx
  - ^R\#:\Contacts
Replacing these five rules with the following rule will force encryption of ppt, pptx, doc, docx, xls, and xlsx files in any directory on the iPod, including Calendars, Contacts, iPod_Control, Notes, and Photos:

- **R#:
  \iPod_Control\ppt.doc
  .xls.pptx
  .docx.xlsx
  **R#:\Notes\ppt.doc
  .xls.pptx
  .docx.xlsx
  **R#:\Photos\ppt.doc
  .xls.pptx
  .docx.xlsx

These rules disable or enable encryption for these folders and file types for all removable devices - not just an iPod. Use care when defining rules to exclude an iPod from encryption.

These rules have been tested against the following iPods:
- iPod Video 30gb fifth generation
- iPod Nano 2gb second generation
- iPod Mini 4gb second generation

Dell does not recommend the use of the iPod Shuffle, as unexpected results may occur.

As iPods change, this information could also change, so caution is advised when allowing the use of iPods on Encryption External Media-enabled computers.

Because folder names on iPods are dependent on the model of the iPod, Dell recommends creating an exclusion encryption policy which covers all folder names, across all iPod models.

<tr>
<td>Dell does not add explorer.exe or iexplorer.exe to the ADE list, as unexpected or unintended results may occur. Explorer.exe is the process used to create a new notepad file on the desktop using the right-click menu. Setting encryption by file extension, instead of the ADE list, provides more comprehensive coverage. Changes to this policy do not affect files already encrypted because of this policy. List process names of applications (without paths) whose new files you want encrypted, separated by carriage returns. Do not use wildcards. More... You can also specify these process names (separated by commas) via the registry value HKLM\SOFTWARE\Credant\CMGShield\ApplicationDataEncryptionList. The Encryption client encrypts all new files (not already being encrypted by Common Encrypted Folders and User Encrypted Folders) on the current computer hard drives created by these application processes whenever they are owned by a currently-logged-on managed user. This may include files excluded from encryption by Common Encrypted Folders and/or User Encrypted Folders. The following folders and their subfolders are always excluded from encryption by this policy: C:\Windows\system32 C:\Windows\Software Distribution C:\Windows\Security C:\System Volume Information\Program Files\Credant*.dll.exe.sys.mac.ddp.wip.ryt.mnd.inv)</td>
<td></td>
</tr>
</tbody>
</table>
Dell strongly recommends not listing applications or installers that write system-critical files. Doing so could result in encryption of important system files, which could make a Windows computer unbootable. Common process names:
- outlook.exe
- winword.exe
- powerpnt.exe
- msaccess.exe
- wordpad.exe
- mspaint.exe
- excel.exe

The following hard-coded system and installer process names are ignored if specified in this policy (you can also add to this list in the registry value HKLM\SOFTWARE\Credant\CMGShield\EUWPrivilegedList):
- hotfix.exe, a Windows update process
- setup.exe, a third-party installer process
- msiexec.exe, a third-party installer process
- wuauctl.exe, a Windows update process
- wmpvrse.exe, a Windows system process
- migrate.exe, a Windows update process
- unregmp2.exe, a Windows update process
- ikernel.exe, a third-party installer process
- wsetup.exe, the Windows Encryption client installer
- svchost.exe, a Windows system process

- EMS Scan External Media
- EMS Encryption Algorithm
- EMS Exclude CD/DVD Encryption
- EMS Data Encryption Key

Encryption Rules

Important: Before you begin, you must understand directory protection, as well as when and how to override directories and file types. If you do not completely understand the information included in this section, as well as the encryption settings that currently exist on your environment, do not attempt to override protected directories.

Do not encrypt files with the extension tmp. Encrypting .tmp files may result in an unbootable computer and/or require reformating drives.

Protected Directories
The Encryption client has several directories that are, by default, protected from encryption. The level of protection varies from folder to folder. If a folder is protected, then the only way to encrypt data within that directory is to use the override modifier described in Modifiers – What they are and what they do.

There are four levels (categories) of protection that directories and files can have: 0, 1, 2, and 3. Category 3 is the most protected level.

Modifiers - What they are and what they do

The `^` character is the “Override” command. It causes the listed policy to override protected directories. It may be followed by a “2” or a “3”, indicating the level of the override.

The `@` character is the “At” command. It will cause the listed policy to be applied at the specified folder location only (subdirectories of that folder are not subject to that policy).

The `-` is the “Not” command. It will cause the listed policy to be an exclusion policy instead of an inclusion policy.

Using the Override Modifier

The Override Modifier can be used to allow for inclusion or exclusion in cases where there is a higher level of protection. The following are the different override levels supported:

- `^` Category 1 Override
- `^2` Category 2 Override
- `^3` Category 3 Override

Encrypting/Not Encrypting Extensions

To include or exclude file name extensions using encryption rules, use the following within your rules:

- After specifying your directory location, use a semi-colon (`;`) before listing your extensions.
- After specifying your directory location, you do not need to list a trailing backslash (`\`).
- The period is used as a delineator. It is not meant to be used as “dot-extension.” However, you can precede the first extension with a period.
- The Override command (`^`) can be used with extensions.
- The At command (`@`) can be used with extensions.
- The Not command (`-`) can be used with extensions.
- You can make any combination of the modifiers with an extension inclusion or exclusion.

Examples of Extension Inclusions/Exclusion

\C:\;doc.xls.ppt.docx.xlsx.pptx

What this does: On the C: drive, this encrypts all doc, docx, xls, xlsx, ppt, and pptx files that do not exist within any protected directory.

`^\C:\;txt`

What this does: On the C: drive, this encrypts all txt files that are not in a directory that has protection of Category 1 or better.

`-\C:\;bat.exe.dll`

What this does: On the C: drive, this causes all files with the extension bat, exe, and dll to not be encrypted.
Encrypting/Not Encrypting Directories

To include or exclude directories using encryption rules, use the following within your rules:

- After specifying your directory location, you do not need to list a trailing backslash (\).
- If you list a directory for inclusion, every file contained within that directory is encrypted.
- The Override command (^) can be used with folders only when specifying an exclusion policy.
- The At command (@) can be used with folders.
- The Not command (-) can be used with folders.
- You can make any combination of the supported modifiers for folders. If the Override command (^) is used, the statement can only be an exclusion statement.

Examples of folder inclusion/exclusion

C:\CustomApplication\DataStore
What this does: On the C: drive, this causes every file within the directory of \CustomApplication\DataStore to be encrypted.

-C:\Documents and Settings\All Users
What this does: On the C: drive, this applies a Category 0 level of protection to the directory of \Documents and Settings\All Users.

-^2C:\CustomApplication\dll
What this does: On the C: drive, this applies a Category 2 level of protection to the directory of \CustomApplication\dll.

Sub-directories and Precedence of Directives

Encryption rules may be listed in any order. If more than one rule applies to a given folder or file, then the following general rules determine which one prevails:

1. The rule with the more specific path prevails.
2. If the rules have equal paths, specified extensions prevail.
3. If the rules both specify extensions, exclusion overrides inclusion.

Example of sub-directories

C:\

-C:\MyApplicationFolder
What this does: (1st statement is an inclusion, 2nd statement is an exclusion) On the C: drive, encrypt all files in folders at the root level and below, except for files residing in the protected directories and any files residing in “MyApplicationFolder”.

Example 1 of competing directives:

C:\

-C:\MyApplicationFolder

^C:\\doc.xls\ppts.docx.xlsx.pptx
What this does: (1st statement is an inclusion, 2nd statement is an exclusion, 3rd statement is an inclusion) On the C: drive, encrypt all files in folders at the root level and below, except for files residing in the protected directories and files residing in “MyApplicationFolder”.

However, override and encrypt
files with the extension doc, docx, xls, xlsx, ppt, and pptx in the protected directories and in the folder “MyApplicationFolder”.

Example 2 of competing directives:

C:\
-C:\MyApplicationFolder
^C:\;doc.xls.ppt.docx.xls.pptx
-^C:\MyApplicationFolder;doc.xls.ppt.docx.xls.pptx

What this does: (1st statement is an inclusion, 2nd statement is an exclusion, 3rd statement is an inclusion, 4th statement is an exclusion) On the drive of C:, encrypt all files in folders at the root level and below, except for files residing in the protected directories and files residing in “MyApplicationFolder”. However, override and encrypt files with the extension doc, docx, xls, xlsx, ppt, and pptx in the protected directories, but not in the folder “MyApplicationFolder”.

Example 3 of competing directives:

C:\
-C:\MyApplicationFolder
^C:\;doc.xls.ppt.docx.xls.pptx
-^C:\MyApplicationFolder;doc.xls.ppt.docx.xls.pptx
-^C:\MyApplicationFolder\Templates

What this does: (1st statement is an inclusion, 2nd statement is an exclusion, 3rd statement is an inclusion, 4th statement is an exclusion, 5th statement is an exclusion) On the C: drive, encrypt all files in folders at the root level and below, except for files residing in the protected directories and files residing in “MyApplicationFolder”. However, override and encrypt files with the extension doc, docx, xls, xlsx, ppt, and pptx in the protected directories, but not in the folder “MyApplicationFolder”. Additionally, the folder “MyApplicationFolder\Templates” gains a category 2 protection causing no data to be encrypted there, since the inclusion statements are less than or equal to category 2.

Environment Variables, KNOWNFOLDERID constants, and CSIDL

Using encryption rules, you can make use of environment variables, KNOWNFOLDERID constants (Windows 7 and later), and CSIDL values (pre-Windows 7 computers) in addition to specifying your policy folder locations as absolute paths. To use variables in your encryption rules, follow these formatting rules:

- Before and after the use of the variable, use a percent sign (%).
- For environment variables, you must use “ENV:” preceding the variable name, all contained within the percent signs.
- For KNOWNFOLDERID constants, you must use “FOLDERID:” preceding the variable name. Percent signs are not used.
- For CSIDL variables, you must use “CSIDL:” preceding the variable name, all contained within the percent signs.
- Ensure that your variable contains a trailing backslash if you plan on appending another directory after the use of the variable.
- Variables can be used in both folder and extension inclusion or exclusion rules.

The following environment variables are supported:
All locally defined environment variables

The following KNOWNFOLDERID values are supported:

RoamingAppData
Cookies
Desktop
Favorites
InternetCache
LocalAppData
Music
Pictures
Documents
Programs
Recent
SendTo
StartMenu

SENDTO
STARTMENU
STARTUP
TEMPLATES

Some examples of variables used in folder and extension policy:
Manage Policies

%ENV:SYSTEMDRIVE%\CustomApplication

**What this does:** This lists the folder \CustomApplication\ for encryption on the default drive where Windows is installed.

-%ENV:USERPROFILE%\Desktop

**What this does:** This lists the user who is logged in to have their desktop obtain a category 0 protection.

**Application Data Encryption (ADE)**

ADE encrypts any file written by a protected application, using a category 2 override. This means that any directory that has a category 2 protection or better, or any location that has specific extensions protected with category 2 or better, will cause ADE to not encrypt those files.

For example, ADE does not encrypt any files written into Windows\System32 folder, because this directory has a default protection of category 2.

**Example Policies for Common/User Key Encryption**

The following set of encryption rules encrypts most of the drive, including standard Microsoft Office-type documents in the Documents and Settings folders. This policy set should only be used for Common encryption (not User encryption, removable media, or SDE). This is considered a strong policy set, and will typically require some adjustments for local conditions and requirements.

%ENV:SYSTEMDRIVE%\%

^%ENV:USERPROFILE%\<insert standard office extensions here >

FOLDERID_Documents or %CSIDL\PERSONAL% (pre-Windows 7)

%ENV:USERPROFILE%\Desktop\%

^%ENV:USERPROFILE%\mp3.mp4.mpeg.avi.wmv.wav

^-%ENV:USERPROFILE%\Desktop\<system file extensions to exclude>

^-%ENV:SYSTEMDRIVE%\<system file extensions to exclude>

^-%ENV:SYSTEMDRIVE%\config.msi

**What this does:**

Encrypts all of C:\, except for protected directories

Encrypts standard Microsoft Office documents across the drive, except for protected directories, although it will encrypt them in the USERPROFILE directory.

Encrypts all of My Documents

Encrypts all of the Desktop, except for any selected excluded extensions

Excludes common system files from encryption

Excludes all encryption from C:\config.msi directory, due to MSI upgrade migration issues

All paths are dynamic based on environment variables

%ENV:USERPROFILE% (inclusion or exclusion) variable should never be used with SDE Encryption.

**System Data Encryption (SDE)**

SDE is an intelligent file-based encryption method where the encryption key is auto-authenticated during the volume mount process. A unique SDE key is generated for each volume that is targeted for
encryption by SDE. This allows the SDE key to be used to encrypt data that would not otherwise be possible with the Common or User keys due to time-based availability of the keys.

Due to the difference in how the SDE key can be used, there are several caveats to be aware of when considering use of this feature.

- The built-in exclusions covered in protected directories do not apply to SDE. By design, SDE excludes portions of the operating system that are necessary for booting and updating.
- If a file is targeted for encryption by any key other than SDE in addition to SDE, then SDE does not encrypt the file.
- All encryption rules apply when writing SDE policies.

**Encryption Rules for SDE Encryption**

The following is the default SDE policy. *Any changes to this policy should be considered carefully.*

The protection of the SystemRoot directory is specified so that only the root itself is protected, meaning that the sub-directories of the SystemRoot do not inherit this protection. This would be the equivalent of using the following policy:

```plaintext
-@C:\
```

**Encryption Rules for Encryption External Media**

Removable Media Encryption policies operate off their own set of encryption rules, independent of Common encryption, User encryption, or SDE uses. User/Common encryption policies are only applied to fixed disks. If an endpoint is determined to be removable media, then Removable Media Encryption policies are applied.

**What Happens When Policies Tie**

- When an exclusion and inclusion statement both apply to a given directory or file, the exclusion policy prevails.
- If you apply a Common encryption policy and User encryption policy specifically to the same file or location, the file or location is Common key encrypted.
- If you apply a Common encryption policy and an SDE encryption policy specifically to the same file or location, the file or location is Common key encrypted.
- If you apply a User encryption policy and an SDE encryption policy specifically to the same file or location, the file or location is User key encrypted.

See [Sub-directories and Precedence of Directives](#) for more information.

**Encryption Rules for Generic Drive Statements**

Instead of having to specify each drive in an inclusion or exclusion rule by its drive letter assignment, you may use a generic rule to target either All Fixed Drives or all Removable Drives.

**Fixed Drive Usage:** Replace the drive letter with F#.

*Example:* F#:\ instead of C:\ or D:\

The Fixed Drive rule can only be used within a Common Encrypted Folder policy, User Encrypted Folder policy, and/or SDE policy.

**Removable Drive Usage:** Replace the drive letter with R#.

*Example:* R#:\ instead of F:\ or H:\
The Removable Drive rule can only be used within an Encryption External Media Encryption Rules policy.

Remove System Data Encryption (SDE)

To completely decrypt SDE encrypted files, apply the following policies:
- SDE Encryption Enabled = Not Selected
- Encrypt Windows Paging File = Not Selected
- Secure Windows Credentials = Not Selected

Authentication

Authentication policies allow you to configure user experience and Windows authentication.

Policy descriptions also display in tooltips in the Management Console.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-Boot Authentication</td>
<td></td>
<td>This technology provides a secure, tamper-proof environment by preventing data from being read from the hard disk or operating system until the user enters the correct PBA login credentials. Pre-Boot Authentication serves as an extension of the BIOS or boot firmware to provide a trusted authentication layer, separate from the operating system.</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Password</td>
<td>Select the type of authentication to use when logging in to the PBA.</td>
</tr>
<tr>
<td>Support Information Text</td>
<td>String</td>
<td>Text to display on the PBA support information screen. Customize the message to include specific instructions about how to contact the help desk or Security administrator. Not entering text in this field results in no support contact information being available for the user. Text wrapping occurs at the word level, not the character level. If a single word is more than approximately 50 characters in length, it does not wrap and no scroll bar is present, therefore the text is truncated. The text in this policy is translatable.</td>
</tr>
<tr>
<td>PBA Title Text</td>
<td>0-17 characters</td>
<td>The text to display on the top of the PBA screen. Not entering text in this field results in no title being displayed. Text does not wrap, so entering more than 17 characters results in the text being truncated. The text in this policy is translatable.</td>
</tr>
<tr>
<td>Sync Users at PBA Activation</td>
<td>Not Selected</td>
<td>Select this option to sync all users of this computer with the PBA database during PBA activation.</td>
</tr>
</tbody>
</table>

Windows Authentication

This technology sets definitions around user login, specifically what is required to login (password, smart card, fingerprint), password recovery options, and password requirements (number of attempts allowed, password length).

Logon Authentication Policy for Windows Password and None The possible VALUES are:
## Advanced Authentication

Authentication policies allow you to configure user experience and Windows authentication.

Policy descriptions also display in tooltips in the Management Console.

### Manage Policies

<table>
<thead>
<tr>
<th>Feature</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Length of Forced Shutdown/Restart Notice**       | 60 seconds             | 60-1800 seconds
When user has reached the maximum number of authorized shutdown/restart snoozes/delays, this policy sets the number of seconds allowed before forcing a shutdown/restart.
TPM requires a reboot.
SED requires a shutdown. |
| **Allow PBA to Remember User Name**                | Selected               | Selected
Not Selected
Enables or disables the ability for users to select Remember Me on the PBA login screen. |
| **Crypto Erase Password**                          | String 0-100 characters | String 0-512 characters
A word or code of up to 100 characters used as a fail-safe security mechanism. Entering this word or code in the user name or password field during PBA authentication initiates a crypto erase, which removes the keys from secure storage. Once this process is invoked, the drive is unrecoverable. Leave this field blank if you do not want a crypto erase password available in case of emergency. |
| **Enable Client Check for PBA Commands**           | Not Selected           | Allows the client to automatically check for PBA Device Control commands that are pushed from the Dell Server. When enabled, the PBA environment checks for new commands from the Dell Server every five minutes. |

**See [basic settings](#)**

### Windows Authentication

This technology sets definitions around user login, specifically what is required to login (password, smart card, fingerprint), password recovery options, and password requirements (number of attempts allowed, password length).

</thead>
<tbody>
<tr>
<td>Selected</td>
</tr>
<tr>
<td>Not Selected</td>
</tr>
</tbody>
</table>

Set to Selected to allow users to use recovery questions/answers to log on to Windows.
### Log Events Level

**Audit**

Errors
Audit
Details

Level of detail in Windows Event logs. Determines whether events such as fingerprint registration and authentication attempts are logged in the Windows Event log. Each higher level includes all previous levels. Events are logged on the computer where they occur. Normally, the auditing level provides sufficient detail, covering all logon, authentication, fingerprint management, and user management events. The details levels can fill the log file very quickly. Status events provide information about the state of several important systems on the computer. They are logged on configurable intervals and generally used when events are remotely collected.

### False Accept Rate of Fingerprint

**Medium High - 1 in 100,000**

The False Accept Rate is the probability of receiving a false acceptance decision when comparing fingerprints scanned from different fingers. You can select one of the following FAR values:

- Medium (1 in 10,000)
- Medium High (1 in 100,000)
- High (1 in 1,000,000)

For example: if you select Medium High, on average, one false acceptance will occur when a fingerprint is compared against one hundred thousand fingerprints scanned from different fingers. The higher the setting, the lower the chance of receiving a false acceptance. However, at the High setting, the system may reject legitimate fingerprints.

**NOTE:** The FAR is set on a per verification basis. When matching a fingerprint against fingerprints of multiple users (identification), the internally used FAR is automatically adjusted to maintain the same effective FAR as was selected for a single match.

<table>

In One Week
Every Two Hours

Reminder to Enroll Credentials Expiration Date (User) | Now | The date (time is always 12 am) when authentication policy is going into full effect. Meaning, the client stops asking the user to enroll credentials and forces them to enroll before they can logon. The default is “now”.

Action Upon Smart Card Removal | Lock Workstation | No Action
Lock Workstation
Force Logoff
Disconnect if on a Remote Desktop session
The action that occurs when a smart card is removed from the computer.

Threat Prevention

Threat Prevention policies are available at the Enterprise, Endpoint Group, and Endpoint levels.

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Advanced Threat Prevention | Off | On
Off
Toggle ON to enable Advanced Threat Prevention. If this policy is toggled to OFF, Advanced Threat Prevention is disabled, regardless of other policies. |
## File Actions

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsafe Executable Auto Quarantine with Executable Control Enabled</td>
<td>Selected</td>
<td>If selected, Unsafe executable files are automatically quarantined or blocked to prevent their execution. Note: If you Auto Quarantine, it is highly recommended that before deployment, you test Auto Quarantine only on devices using a test policy to observe the behavior and ensure that no business-critical applications are blocked at execution.</td>
</tr>
<tr>
<td>Abnormal Executable Auto Quarantine with Executable Control Enabled</td>
<td>Selected</td>
<td>If selected, Abnormal executable files are automatically quarantined or blocked to prevent their execution. Note: If you Auto Quarantine, it is highly recommended that before deployment, you test Auto Quarantine only on devices using a test policy to observe the behavior and ensure that no business-critical applications are blocked at execution.</td>

</tbody>
</table>

### Memory Actions

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory Protection Enabled</td>
<td>Not Selected</td>
<td>This policy must be selected to use all other Memory policies. If this policy is Not Selected, no Memory Action policies are enforced, regardless of other policy values. NOTE: Before enabling Memory Protection, enable Compatibility Mode, to ensure applications function properly on the client computer. For instructions on how to enable Compatibility Mode, see Enable_Compatibility_Mode_for_Memory_Protection.htm. Compatibility Mode does not apply to Mac clients.</td>
</tr>
</tbody>
</table>

See [advanced settings](#).

### Policy

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Threat Protection                           | Off             | On

  Toggle to ON to enable Threat Protection. If toggled to OFF, no Threat Protection policies are applied.

  Threat Protection includes Malware Protection, Web Protection, and Client Firewall.

| Exploit Protection | Selected | This policy is the “master policy” for all other Exploit Protection policies. If this policy is Not Selected, no Exploit Protection policies are enforced, regardless of other policy values.

  A Selected value means that Exploit Protection is enabled.

  Exploit Protection monitors for application vulnerabilities and keeps buffer overflow exploits from executing arbitrary code on the computer.

  This policy must be set to Selected to enable Exploit Protection. If this policy is Not Selected, no Exploit Prevention policies are applied.

| Action on Malicious Activity for Files and Folders | Block and Report | Block Only

  Report Only |
<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Web Protection</strong></td>
<td></td>
<td>This technology protects computers by leveraging a web-based content ranking system to determine if a site that a user is browsing is considered safe or not. This technology also grants the administrator the ability to define what happens when an unsafe site is navigated to (allow, block, warn).</td>
</tr>
<tr>
<td>Web Protection</td>
<td>Off</td>
<td><strong>On</strong>&lt;br&gt;Toggle to ON to enable Web Protection. If toggled to OFF, no Web Protection policies are applied.</td>
</tr>
<tr>
<td>Enforcement - Action to Apply to Sites Not Verified</td>
<td>Allow</td>
<td><strong>Block</strong>&lt;br&gt;Prevents users from accessing the site and displays a message that the site is blocked.&lt;br&gt;&lt;br&gt;<strong>Allow</strong>&lt;br&gt;Permits users to access the site.&lt;br&gt;&lt;br&gt;<strong>Warn</strong>&lt;br&gt;Displays a warning to notify users of potential dangers associated with the site. Users must dismiss the warning before continuing.</td>
</tr>
<tr>
<td>Enforcement - Enable File Scanning for File Downloads</td>
<td>Selected</td>
<td><strong>Selected</strong>&lt;br&gt;<strong>Not Selected</strong>&lt;br&gt;This policy is the &quot;master policy&quot; for all other On-Access Protection policies. If this policy is Not Selected, no On-Access Protection policies are enforced, regardless of other policy values. A Selected value means that On-Access Protection is enabled. This policy must be set to Selected to enable On-Access Protection. If this policy is Not Selected, no On-Access Protection policies are applied.</td>
</tr>
</tbody>
</table>
A Selected value scans all files (including .zip files) before downloading. This option prevents users from accessing a downloaded file until Threat Protection marks the file as clean. Downloaded files are sent to Threat Protection for scanning. Threat Protection performs a Reputation Service lookup on the file. If a downloaded file is detected as a threat, Threat Protection takes action on the file and alerts the user.

Enable Secure Search | Not Selected | Selected
--- | --- | ---
A Selected value enables Secure Search, automatically blocking malicious sites in search results based on safety rating.

Block Links to Risky Sites in Search Results | Not Selected | Selected
--- | --- | ---
A Selected value prevents users from clicking links to risky sites in search results.

<tbody>
<tr>
<td>Client Firewall</td>
<td>This technology protects computers by allowing administrators to determine which network traffic is permitted to pass between end user computers and the network.</td>
<td></td>
</tr>
</tbody>
</table>

Client Firewall

- **Off**
  - Toggle to ON to enable Client Firewall. If toggled to OFF, no Client Firewall Settings or Rules are applied.
  - Client firewall is a stateful firewall.

See advanced settings

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protection Settings</td>
<td>This technology allows control over Threat Prevention settings such as display of threat event notifications on the client computer and Web Protection and Client Firewall logging.</td>
<td></td>
</tr>
</tbody>
</table>

Suppress Popup Notifications | Not Selected | Selected
--- | --- | ---
If Selected, popup notifications of Advanced Threat Prevention events are disabled on the computer.

Minimum Popup Notification Level | High | High
--- | --- |
Severity level of events that result in popup notifications that display on the computer.
High allows only notifications of critical events to display.
Low displays all on-screen notifications for all events.
Listed below are examples of events:

- **High**
  1) Protection status has changed. (Protected means that the Advanced Threat Prevention service is running and protecting the computer and needs no user or administrator interaction.)
  2) A threat is detected and policy is not set to automatically address the threat.
### Security Management Server v10.2.6 AdminHelp

<tr>
<td>Memory Protection Enabled</td>
<td>Not Selected</td>
<td>This policy must be selected to use all other Memory policies. If this policy is Not Selected, no Memory Action policies are enforced, regardless of other policy values. NOTE: Before enabling Memory Protection, enable Compatibility Mode, to ensure applications function properly on the client computer. For instructions on how to enable Compatibility Mode, see Enable Compatibility Mode for Memory Protection. Compatibility Mode does not apply to Mac clients.</td>
</tr>
<tr>
<td>Enable Exclude executable files</td>
<td>Selected</td>
<td>Allow specific process files to be excluded from Memory Protection. This policy must be selected to use the Exclude executable files policy.</td>
</tr>
</tbody>
</table>
Exclude executable files

String

Exclude specific process files from Memory Protection. This allows the specified files to run or be installed on any device on which this policy is enforced.

All exclusions added must be specified using the relative path of that executable file (exclude the drive letter from the path).

Correct (Windows): `\Application\SubFolder\application.exe`

Correct (Mac): `/Users/application.app/executable`

Incorrect: `\Application\SubFolder`

Incorrect: `C:\Application\SubFolder\application.exe`

Exploitation: Stack Pivot

Alert

Specify the action to take when a stack pivot threat is detected.

Ignore - No action is taken against identified memory violations.

Alert - Record the violation and report the incident to the Dell Server.

Block - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.

Terminate - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.

Stack Pivot - The stack for a thread has been replaced with a different stack. Generally the system will only allocate a single stack for a thread. An attacker would use a different stack to control execution in a way that is not blocked by Data Execution Prevention (DEP).

The Stack Pivot exploitation affects Windows and macOS operating systems.

<td>Specify the action to take when a stack protect threat is detected. Ignore - No action is taken against identified memory violations. Alert - Record the violation and report the incident to the Dell Server. Block - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run. Terminate - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call. Stack Protect - The memory protection of a thread's stack has been modified to enable execution permission. Stack memory should not be executable, so usually this means that an attacker is preparing to run malicious code stored in stack memory as part of an exploit, an attempt which would otherwise be blocked by Data Execution Prevention (DEP). The Stack Protect exploitation affects Windows and macOS operating systems.</td>

                    Block
                    Terminate
                    Specify the action to take when a remote memory allocation threat is detected.
                    Ignore - No action is taken against identified memory violations.
                    Alert - Record the violation and report the incident to the Dell Server.
                    Block - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.
                    Terminate - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.
                    Remote Allocation of Memory - A process has allocated memory in another process. Most allocations will only occur within the same process. This generally indicates an attempt to inject code or data into another process, which may be a first step in reinforcing a malicious presence on a system.
                    The Remote Allocation of Memory process injection affects Windows and macOS operating systems. |
| **Process Injection:** |                                                                     |

                    Block
                    Terminate
                    Specify the action to take when a remote attempt to map memory threat is detected.
                    Ignore - No action is taken against identified memory violations.
                    Alert - Record the violation and report the incident to the Dell Server.
                    Block - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.
                    Terminate - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.
                    Remote Mapping of Memory - A process has introduced code and/or data into another process. This may indicate an attempt to begin executing code in another process and thereby reinforce a malicious presence.
                    The Remote Mapping of Memory process injection affects Windows and macOS operating systems. |
### Process Injection: Remote Write to Memory

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore</td>
<td>No action is taken against identified memory violations.</td>
</tr>
<tr>
<td>Alert</td>
<td>Record the violation and report the incident to the Dell Server.</td>
</tr>
<tr>
<td>Block</td>
<td>Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.</td>
</tr>
</tbody>
</table>

**Remote Write to Memory** - A process has modified memory in another process. This is usually an attempt to store code or data in previously allocated memory but it is possible that an attacker is trying to overwrite existing memory to divert execution for a malicious purpose.

The Remote Write to Memory process injection affects Windows and macOS operating systems.

### Process Injection: Remote Write PE to Memory

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore</td>
<td>No action is taken against identified memory violations.</td>
</tr>
<tr>
<td>Alert</td>
<td>Record the violation and report the incident to the Dell Server.</td>
</tr>
<tr>
<td>Block</td>
<td>Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.</td>
</tr>
</tbody>
</table>

**Remote Write PE to Memory** - A process has modified memory in another process to contain an executable image. Generally this indicates that an attacker is attempting to execute code without first writing that code to disk.

The Remote Write PE to Memory process injection affects Windows operating systems. This policy does not apply to Mac clients.

### Process Injection: Remote Overwrite Code

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore</td>
<td>No action is taken against identified memory violations.</td>
</tr>
<tr>
<td>Alert</td>
<td>Record the violation and report the incident to the Dell Server.</td>
</tr>
<tr>
<td>Block</td>
<td>Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.</td>
</tr>
</tbody>
</table>

**Remote Overwrite Code** - A process has modified executable memory in another process. Under normal conditions executable memory is not modified, especially by another process. This usually indicates an attempt to divert execution in another process.

The Remote Overwrite Code process injection affects Windows operating systems. This policy does not apply to Mac clients.
### Process Injection: Remote Unmap of Memory

<table>
<thead>
<tr>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore</td>
</tr>
<tr>
<td>Alert</td>
</tr>
<tr>
<td>Block</td>
</tr>
<tr>
<td>Terminate</td>
</tr>
</tbody>
</table>

Specify the action to take when a remote memory unmapping threat is detected.

- **Ignore** - No action is taken against identified memory violations.
- **Alert** - Record the violation and report the incident to the Dell Server.
- **Block** - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.
- **Terminate** - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.

**Remote Unmap of Memory** - A process has removed a Windows executable from the memory of another process. This may indicate an intent to replace the executable image with a modified copy for the purpose of diverting execution.

The Remote Unmap of Memory process injection affects Windows operating systems. This policy does not apply to Mac clients.

### Process Injection: Remote Thread Creation

<table>
<thead>
<tr>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore</td>
</tr>
<tr>
<td>Alert</td>
</tr>
<tr>
<td>Block</td>
</tr>
<tr>
<td>Terminate</td>
</tr>
</tbody>
</table>

Specify the action to take when a remote thread creation threat is detected.

- **Ignore** - No action is taken against identified memory violations.
- **Alert** - Record the violation and report the incident to the Dell Server.
- **Block** - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.
- **Terminate** - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.

**Remote Thread Creation** - A process has created a new thread in another process. A process's threads are usually only created by that same process. This is generally used by an attacker to activate a malicious presence that has been injected into another process.

The Remote Thread Creation process injection affects Windows and macOS operating systems.

### Process Injection: Remote APC Scheduled

<table>
<thead>
<tr>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore</td>
</tr>
<tr>
<td>Alert</td>
</tr>
<tr>
<td>Block</td>
</tr>
<tr>
<td>Terminate</td>
</tr>
</tbody>
</table>

Specify the action to take when a remote APC scheduled threat is detected.

- **Ignore** - No action is taken against identified memory violations.
- **Alert** - Record the violation and report the incident to the Dell Server.
- **Block** - Block the process call if an application attempts to call a memory violation process. The application that made the call is allowed to continue to run.
- **Terminate** - Block the process call if an application attempts to call a memory violation process and terminate the application that made the call.

**Remote APC Scheduled** - A process has diverted the execution of another process's thread. This is generally used by an attacker to activate a malicious presence that has been injected into another process.

The Remote APC Scheduled process injection affects Windows operating systems. This policy does not apply to Mac clients.

### Manage Policies

<table>
<thead>
<tr>
<th>Feature</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kill Unsafe Running Processes and Sub-Processes</td>
<td>Not Selected</td>
<td>If selected, processes and sub-processes are quarantined and terminated regardless of their state when a threat is detected (exe or dll). Although a process or sub-process is terminated, the command prompt window remains open. If a file has been determined to be Safe and allowed to run and then a threat model update occurs that results in the file being identified as unsafe, the process is automatically terminated. Dell recommends that you review threat model updates before selecting this policy. For more information, see Threat Model Updates.</td>
</tr>
<tr>
<td>Background Threat Detection</td>
<td>Run Once</td>
<td>If set to Run Recurring or Run Once, a full-disk scan is run to detect and analyze any dormant threats on the disk. An update to the Threat Model triggers a full-disk scan.</td>
</tr>
<tr>
<td>Watch for New Files</td>
<td>Selected</td>
<td>If selected, any new or modified files are detected and analyzed for dormant threats. Dell recommends enabling this policy. However, if Auto Quarantine is enabled for all Unsafe or Abnormal files, all malicious files are blocked at execution. Therefore, it is not necessary to enable this policy with Auto Quarantine mode unless you prefer to quarantine a file as it is added to a disk but before execution.</td>
</tr>
<tr>
<td>Set Maximum Archive File Size to Scan</td>
<td>150 MB</td>
<td>The default setting is 150 MB. Specify the maximum size of archive (compressed) files, including .jar files to be scanned. Because scanning compressed files can negatively affect computer performance, Dell recommends Quick-Scan - Scan Archives and Full-Scan - Scan Archives to run during off-work hours.</td>
</tr>
<tr>
<td>Protection Settings</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Enable Exclude Specific Folders (includes subfolders)</td>
<td>Selected</td>
<td>Allow specific folders to be excluded from Auto Quarantine and Auto Upload. This policy must be selected to use the Exclude Specific Folders policy.</td>
</tr>
<tr>
<td>Exclude Specific Folders (includes subfolders)</td>
<td>String</td>
<td>Folders specified in this policy are excluded from actions performed based on Background Threat Detection and Watch for New Files, when these policies are enabled. This exclusion extends to subfolders of folders that are specified in this policy. All exclusions must be specified using the Absolute path of that executable file. Windows requires an absolute path (requires a drive letter) Mac requires an absolute path (macOS does not use a drive letter) Correct (Windows): C:\Program Files\Dell \Correct (Mac): /Mac\ HD/Users/Application\ Support/Dell Incorrect: C:\Program Files\Dell\Executable.exe Incorrect: \Program Files\Dell\Spaces only must be escaped on Mac-based exclusions.</td>

<tbody>
<tr>
<td>Suppress Popup Notifications</td>
<td>Not Selected</td>
<td>If Selected, popup notifications for Advanced Threat Prevention events do not display on the client computer.</td>
</tr>
</tbody>
</table>
| Minimum Popup Notification Level   | High    | Severity level of events that result in popup notifications that display on the client computer. A setting of High allows only notifications of critical events to display. A setting of Low displays all on-screen notifications for all events. Listed below are examples of events that fall into the severity levels: 

- **High**
  1. Protection status has changed. (Protected means that the Advanced Threat Prevention service is running and protecting the computer and needs no user or administrator interaction.)
  2. A threat is detected and policy is not set to automatically address the threat.
- **Medium**
  1. Execution Control blocked a process from starting because it was detected as a threat.
  2. A threat is detected that has an associated mitigation (for example, the threat was manually quarantined), so the process has been terminated.
  3. A process was blocked or terminated due to a memory violation.
  4. A memory violation was detected and no automatic mitigation policy is in effect for that violation type.
- **Low**
  1. A file that was identified as a threat has been added to the Global Safe List or deleted from the file system.
  2. A threat has been detected and automatically quarantined.
  3. A file has been identified as a threat but waived on the computer.
  4. The status of a current threat has changed (for example, Threat to Quarantined, Quarantined to Waived, or Waived to Quarantined). |
| Enable BIOS Assurance              | Selected | If selected, BIOS integrity checks are performed on endpoints computers to validate that the BIOS has not been modified from the Dell factory version. A custom factory image cannot be used with this feature, as the BIOS has been modified. This feature is available only on Dell platforms. Platforms available with this feature include the newest release of select XPS, Latitude, Optiplex, Precision Workstations, and Venues. Speak to your Sales Associates for details or contact Dell ProSupport. This policy does not apply to Mac clients. |

Client Update
### Schedule

**Schedule** | **Selected**
---|---
This policy is the "master policy" for all other Client Scheduling policies. If this policy is Not Selected, no Client Scheduling takes place, regardless of other policy values.
A Selected value enables the Client Scheduling options.

### Schedule Repeats

**Schedule Repeats** | **Daily**
---|---
The schedule configuration defines when the task should run. Schedule types are Daily, Weekly, and Monthly.
Daily: Runs the task every day at the specified Schedule Start Time.
Weekly: Runs the task weekly on the days specified in Day of the Week.
Monthly: Runs the task monthly on the specified Day of the Month.

### Schedule Start Time

**Schedule Start Time** | **String**
---|---
The time the task should run.

### Day of the Week

**Day of the Week** | **Wednesday**
---|---
The day of the week the task should run.

### Day of the Month

**Day of the Month** | **1**
---|---
The day of the month the task should run.

### Debug Logging for Malware and Exploit Protection

**Debug Logging for Malware and Exploit Protection** | **Not Selected**
---|---
A Selected value enables debug logging of Malware and Exploit Protection activity.

### Exploit Protection

**Exploit Protection** | **Off**
---|---
Toggle to ON to enable Exploit Protection. If toggled to OFF, no Exploit Protection policies are applied.
Exploit Protection protects the critical operating system resources from changes made by malware or other unauthorized processes.

### On-Access Protection

**On-Access Protection** | **Off**
---|---
Toggle to ON to enable On-Access Protection. If toggled to OFF, no On-Access Protection policies are applied.
On-Access Protection protects the critical operating system resources from changes made by malware or other unauthorized processes at the time a resource is accessed.

### Max Seconds for Scan

**Max Seconds for Scan** | **45**
---|---
10 to 9999
Specifies the maximum number of seconds for each file scan. Limits each file scan to the specified number of seconds. If a scan exceeds the time limit, the scan stops and logs a message.

### On-Access Scan

**On-Access Scan**

### Scan Boot Sectors

**Scan Boot Sectors** | **Selected**
---|---
Examines the disk boot sector. Consider disabling this policy if a disk contains a unique or abnormal boot sector that cannot be scanned.
<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Scan Processes on Enable                   | Not Selected    | Rescans all processes that are currently in memory each time:  
- On-Access Scan is disabled and re-enabled.  
- The computer starts.  
When the on-access scanner is enabled, it always scans all processes when they are executed.  
Because some programs or executables start automatically when the computer starts, enabling this option can slow the computer and increase computer startup time. |
| Scan Trusted Installers                    | Not Selected    | Selects MSI files or Windows Trusted Installer service files. Disable this option to improve the performance of large Microsoft application installers.                                                                                                                                                                                                                                                                                                                                                     |
| Scan When Copying Between Local Folders    | Not Selected    | Selects scans files whenever the user copies from one local folder to another. If disabled, only items in the destination folder are scanned. If enabled, items in both source and destination folders are scanned.                                                                                                                                                                                                                                                                                                      |
| Reputation Service Sensitivity             | Medium          | When enabled, samples are submitted to the lab to determine if they are malware. Sensitivity level configures the sensitivity level to use when determining if a detected sample is malware.  
The higher the sensitivity level, the higher the number of malware detections. However, allowing more detections might result in more false positive results.  
Risk levels:  
Very Low - The detections and risk of false positives are the same as with regular content files. A detection is made available to Threat Protection when the lab publishes it instead of waiting for the next file update. Use this setting for desktops and servers with restricted user rights and a strong security footprint. This setting results in an average of 10–15 queries per day, per computer.  
Low - This setting is the minimum recommendation for laptops or desktops and servers with a strong security footprint. This setting results in an average of 10–15 queries per day, per computer.  
Medium - Use this level when the regular risk of exposure to malware is greater than the risk of a false positive. The proprietary, heuristic checks result in detections that are likely to be malware. However, some detections might result in a false positive. With this setting, the lab checks that popular applications and operating system files do not result in a false positive. This setting is the minimum recommendation for laptops or desktops and servers. This setting results in an average of 20–25 queries per day, per computer.  
High - Use this setting for deployment to systems or areas which are regularly infected. This setting results in an average of 20–25 queries per day, per computer.  
Very High - Dell recommends using this level only for scanning volumes and directories that do not support executing programs or operating systems. Detections found with this level are presumed malicious, but have not been fully tested to determine if they are false positives. Use this setting for on-demand scans on non-operating system volumes. This setting results in an average of 20–25 queries per day, per computer. |
### On-Demand Protection - Full Scan

**Selected**

This policy is the "master policy" for all other On-Demand Protection: Full Scan policies. If this policy is Not Selected, no On-Demand Protection: Full Scan policies are enforced, regardless of other policy values.

A Selected value means that On-Demand Protection: Full Scan is enabled.

This policy must be set to Selected to enable On-Demand Protection: Full Scan settings. If this policy is Not Selected, no On-Demand Protection: Full Scan policies are applied.

By default, every time Full Scan runs, it scans the following locations for threats:

- the computer memory for installed rootkits, hidden processes, and other behavior that suggests malware is attempting to hide itself. This scan occurs before all other scans.
- the memory of all running processes.
- all drives and their subfolders on the computer.

By default, the scanner scans all file types, regardless of extension.

This setting results in an average of 20–25 queries per day, per computer.

Exclusions
- String - Comma-separated list of parameters
  Specifying files, folders, and drives to exclude from scanning. Comma separated list of parameters:
  - `<ExclusionType>`, `<ExclusionData>`, `<ExcludeSubfolders` (only applies to FileOrFolder type)
  - Possible values: `<FileOrFolder|FileType|ModifiedAge|AccessedAge|CreatedAge>`, `<PathToFileOrFolder|FileType|Age>`, `<true|false`
  - Examples:
    - `FileOrFolder,C:\Users,false`
    - `FileType,xml,false`
    - `FileType,mp?,false`
    - `ModifiedAge,120,true`
    - `AccessedAge,150,false`
    - `CreatedAge,300,true`
| **Threat First Response** | Clean file | Clean file  
Delete file  
Continue scanning  
Specifies the first action for the scanner to take when a threat is detected.  
Clean files - Removes the threat from the detected file, if possible.  
Delete files - Deletes files with potential threats.  
Continue scanning - Continues scanning files when a threat is detected. The scanner does not move items to the quarantine. |
| **Threat First Response Fails** | Delete file | Clean file  
Delete file  
Continue scanning  
Specifies the action for the scanner to take when a threat is detected if the first action fails.  
Clean files - Removes the threat from the detected file, if possible.  
Delete files - Deletes files with potential threats.  
Continue scanning - Continues scanning files when a threat is detected. The scanner does not move items to the quarantine. |
| **Exploit First Response** | Clean file | Clean file  
Delete file  
Continue scanning  
Specifies the first action for the scanner to take when a potentially unwanted program is detected.  
Clean files - Removes the threat from the detected file, if possible.  
Delete files - Deletes files with potential threats.  
Continue scanning - Continues scanning files when a threat is detected. The scanner does not move items to the quarantine. |
| **Exploit First Response Fails** | Delete file | Clean file  
Delete file  
Continue scanning  
Specifies the action for the scanner to take when an unwanted program is detected if the first action fails.  
Clean files - Removes the threat from the detected file, if possible.  
Delete files - Deletes files with potential threats.  
Continue scanning - Continues scanning files when a threat is detected. The scanner does not move items to the quarantine. |
| **Use Scan Cache** | Selected | Selected  
A Selected value enables the scanner to use the existing clean scan results. A Selected value reduces duplicate scanning and improves performance. |
| **System Utilization** | Below Normal | Low Priority  
Below Normal  
Normal  
Enables the operating system to specify the amount of CPU time that the scanner receives during the scan. Each task runs independently, unaware of the limits for other tasks.  
Low Priority - Provides improved performance for other running applications. Select this option for computers with end user activity.  
Below Normal - Sets the computer utilization for the scan to the default. Normal - Enables the scan to complete faster. Select this option for computers that have large volumes and low user activity. |
| **Scan on Battery Power** | Not Selected | Selected  
Not Selected  
A Selected value allows the scan when the computer is using battery power. Not Selected postpones the scan until the computer is no longer using battery power. |

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Web Protection</strong></td>
<td>Off</td>
<td>This technology protects computers by leveraging a web-based content ranking system to determine if a site that a user is browsing is considered safe or not. This technology also grants the administrator the ability to define what happens when an unsafe site is navigated to (allow, block, warn).</td>
</tr>
<tr>
<td><strong>Enforcement - Action to Apply to Sites Not Verified</strong></td>
<td>Allow</td>
<td>Specifies the default action to apply to sites that have not been verified. Block: Prevents users from accessing the site and displays a message that the site is blocked. Allow: Permits users to access the site. Warn: Displays a warning to notify users of potential dangers associated with the site. Users must dismiss the warning before continuing.</td>
</tr>
<tr>
<td><strong>Enforcement - Enable File Scanning for File Downloads</strong></td>
<td>Selected</td>
<td>A Selected value scans all files (including .zip files) before downloading. This option prevents users from accessing a downloaded file until Threat Protection marks the file as clean. Downloaded files are sent to Threat Protection for scanning. Threat Protection performs a Reputation Service lookup on the file. If a downloaded file is detected as a threat, Threat Protection takes action on the file and alerts the user. NOTE: This policy does not apply when Web Protection is installed as an optional feature with Advanced Threat Prevention.</td>
</tr>
<tr>
<td><strong>Enforcement - Enable HTML iFrames Support</strong></td>
<td>Selected</td>
<td>A Selected value blocks access to malicious (Red) and warn (Yellow) sites that display in an HTML iframe.</td>
</tr>
<tr>
<td><strong>Enforcement - Block Sites by Default if Reputation Service Server is not Reachable</strong></td>
<td>Not Selected</td>
<td>A Selected value blocks access to websites if Web Control cannot reach the Reputation Service server.</td>
</tr>
<tr>
<td><strong>Enforcement - Block Phishing Pages for All Sites</strong></td>
<td>Selected</td>
<td>A Selected value blocks all phishing pages, overriding content rating actions.</td>
</tr>
</tbody>
</table>
### Enforcement - Specify Reputation Service Risk Level to Block

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Very High</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Disable</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Very Low</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Low</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Medium</td>
</tr>
<tr>
<td></td>
<td></td>
<td>High</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Very High</td>
</tr>
</tbody>
</table>

Specifies the Reputation Service risk level to block when the Threat Protection on-demand scan feature is not installed and enabled. Web Protection uses the risk level to calculate the score when retrieving the checksum reputation from the Reputation Service.

### IP Exclusions for Web Protection

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>String - IP or IP Range</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Configures Web Protection not to rate or act on the specified private IP address range. The format is the IP address or IP address range.</td>
</tr>
</tbody>
</table>

### Enable Secure Search

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Not Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Not Selected</td>
</tr>
</tbody>
</table>

A Selected value enables Secure Search, automatically blocking malicious sites in search results based on safety rating.

### Set Default Search Engine

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Google</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Yahoo</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bing</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Ask</td>
</tr>
</tbody>
</table>

Specifies the default search engine to use for supported browsers: Google, Yahoo, Bing, Ask.

### Block Links to Risky Sites in Search Results

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Not Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Not Selected</td>
</tr>
</tbody>
</table>

A Selected value prevents users from clicking links to risky sites in search results.

### Rating Action for Red Sites

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Block</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Allow</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Warn</td>
</tr>
</tbody>
</table>

Specifies the action to apply to sites that are rated Red. Block: Prevents users from accessing the site and displays a message that the site is blocked. Block is the default for Red sites. Allow: Permits users to access the site. Warn: Displays a warning to notify users of potential dangers associated with the site. Users must dismiss the warning before canceling or proceeding to the site. Green-rated sites and downloads are automatically allowed.

### Rating Action for Yellow Sites

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Warn</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Block</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Allow</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Warn</td>
</tr>
</tbody>
</table>

Specifies the action to apply to sites that are rated Yellow. Block: Prevents users from accessing the site and displays a message that the site is blocked. Allow: Permits users to access the site. Warn: Displays a warning to notify users of potential dangers associated with the site. Users must dismiss the warning before canceling or proceeding to the site. Warn is the default for Yellow sites. Green-rated sites and downloads are automatically allowed.

<td>DNS Blocking</td>
<td>Up/down number selector</td>
<td>Specifies the time, in seconds, that a UDP or ICMP Echo virtual connection remains active if no more packets matching the connection are sent or received. This option resets to its configured value every time a packet that matches the virtual connection is sent or received. The default number is 60; the valid range is 1–300.</td>
</tr>
</tbody>
</table>

### DNS Blocking

| Domain name | Button/text input field | Defines domain names to block.
When applied, this setting adds a rule near the top of the firewall rules that blocks connections to the IP addresses resolving to the domain names. Add - To add a domain name to block, click Add, then enter a domain name. You can use the * and ? wildcards. For example, *domain.com. Separate multiple domains with a comma (,) or a carriage return. Duplicate entries are automatically removed. Delete - To remove a domain name from the blocked list, select the domain name and click Delete. |

---

**Client Firewall Rules**

Client Firewall applies the rule at the top of the firewall rules list.

1. Client Firewall applies the rule at the top of the firewall rules list. If the traffic meets this rule's conditions, Client Firewall allows or blocks the traffic. It doesn't try to apply any other rules in the list.

2. If the traffic doesn't meet the first rule's conditions, Client Firewall continues to the next rule in the list until it finds a rule that the traffic matches.

3. If no rule matches, the firewall automatically blocks the traffic.

To modify Core Networking or Default Rules, expand either Core Networking Rules or Default Rules, select the rule to modify, and edit the desired settings, and click OK. The settings are described in the table below.

Alternatively, click one of the following buttons to perform the desired action:

- **Add Rule** - Adds a firewall rule.
- **Duplicate** - Creates a copy of the selected item.
- **Delete** - Removes a selected firewall item.

<table>
<thead>
<tr>
<th>Setting</th>
<th>UI Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Text input field</td>
<td>Specifies the descriptive name of the item.</td>
</tr>
</tbody>
</table>
### Status

**Check box**  
Select **Enable rule** to make the rule active.

### Actions

**Radio button/Check box**  
- **Allow**
- **Block**
- Treat match as intrusion
- Log matching traffic

**Allow** - Allows traffic through the firewall if the item is matched.
**Block** - Stops traffic from passing through the firewall if the item is matched.
Treat match as intrusion - Treats traffic that matches the rule as an attack and generates an event that is sent to the Reputation Service. The **Block** action for the rule must be selected for an event to be generated.
Log matching traffic - Preserves a record of matching traffic in the Firewall activity log on the Endpoint Security Client.

### Direction

**Drop-down menu**  
- **In**
- **Out**
- **Either**

**In** - Monitors incoming traffic.
**Out** - Monitors outgoing traffic.
**Either** - Monitors both incoming and outgoing traffic.

### Notes

**Text input field**  
Provides more information about the rule.

Advanced Threat Events tab fields and filters

The Advanced Threat Events tab displays information about events for the entire enterprise based on information available in the Dell Server.

The tab displays if the Advanced Threat Prevention service is provisioned and licenses are available.

To access the Enterprise Advanced Threats tab, follow these steps:

1. In the left pane, click **Populations > Enterprise**.
2. Select the **Advanced Threat Events** tab.

Use the following filters to select content to display on the Advanced Threat Events tab:

- **Type** - Threat Found, Threat Blocked, Threat Terminated, Memory Violation Blocked, Memory Violation Terminated, Memory Violation (Detected), Threat Removed, Threat Quarantined, Threat Waived, Threat Changed, Protection Status Changed.

- **Severity** - Severity level of the event: Critical, Major, Minor, Caution, or Informational.

- **Timeframe (in days)** - 1, 7, 14, 30, 60, 90

- **Columns** - Allows you to select the following additional columns to display:
  - **Hostname** - The fully qualified name of the computer
  - **Data** - Details about the event
  - **Created** - Date and time that the event was captured
  - **Machine Name** - Name of the computer on which the threat event was detected
  - **Path** - Path to the file in which the threat was detected
  - **Sha256** - The file's 256-character Secure Hash Algorithm can be compared with an expected result to indicate whether the file has been tampered with.
  - **Score** - The threat file's score, indicating the confidence level that the file is malware. The higher the number, the greater the confidence.

Manage Enterprise Advanced Threats - Protection

The Protection tab provides information about files and scripts that are potentially harmful.

**Threats**

The table lists all events found across the organization. An event may also be a threat but is not necessarily so.

View additional information about a specific threat either by clicking on the threat name link to view details displayed on a new page or by clicking anywhere in the row of the threat to view details at the bottom of the page.
To view additional threat information in the table, click the drop-down arrow on a column header to select and add columns. Columns display metadata about the file, such as Classifications, Cylance Score (confidence level), AV Industry conviction (links to VirusTotal.com for comparison with other vendors), Date first found, Data last found, SHA256, MD5, File information (author, description, version), and Signature details.

Filter Events Table Data

Click the Threat Filters list at the upper right side of the table to view data about events by Priority, Status: Last 24 Hours, and Status: Total.

The number of events occurring in each subcategory are shown in parentheses.

Priority: Unsafe - Select a priority to view only events that match the selected priority. High, Medium, or Low.

Status: Last 24 Hours - Select a status to view only events that have had changes to this status in the last 24 hours.

Status: Total - Select a status to only events with that status.

The predictive threat model used to protect devices receives periodic updates to improve detection rates. To understand differences in how a new threat model affects information about files in your organization, see Threat Model Updates.

Commands

Select a threat to act on it. On this page, you can do the following to the selected threat data:

Export - Export threat data to a CSV file.

Select the rows to export, and then click Export.

Open the file with Microsoft Excel or similar application, which allows you to sort and organize the data.

Global Quarantine - Add a file to the global quarantine list. The threat is permanently quarantined from all devices.

Add the selected file to the Global Quarantine list to prevent it from being run on any device in the organization. Adding a file to Quarantine removes it from lists of Unsafe files.

1. Select a threat.
2. Click Global Quarantine.
3. Enter a reason that this file should be global quarantined and click Yes.

Safe - Add a file to the safe list. The file is permanently treated as safe across all devices.

1. Select the file to list as safe.
2. Click Safe.
3. Select the category that fits the file.
4. Enter a reason why the file should be listed as safe, and click Yes.

Note: Occasionally, a “good” file may be reported as unsafe (this could happen if the features of that file strongly resemble those of malicious files). Waiving or safelisting the file can be useful in these instances.

Edit Global List - Add or remove files from the global quarantine list.

1. Click Edit Global List.
2. Select the items to change.
3. Select **Safe** to add the selected items to the safelist, or select **Remove from list** to remove the selected files from the Global Quarantine list.

**Manually Add File to the Global Quarantine list**

1. Click **Edit Global List**.
2. Click **Add File**.
3. Enter the file’s SHA256 hash number (required).
4. Enter the file’s MD5 number, if available.
5. Enter the file name, if available.
6. Enter the reason the file should be quarantined.
7. Click **Submit**.

**View Threat Details** - Click a threat name to display details of the threat details on a new page. Click anywhere in the threat’s row to display the same threat details on the left side of this page, under the table.

**File Details**

**Details: [file name]**

At the bottom of the page, this section displays details about the file that triggered an event. To display this information, select the row that displays the file name in the Advanced Events table.

Click the file name next to Details: to display the same information about the event on a new page.

**Overview**

The overview contains summary information about the file.

**Threat Indicators**

Threat Indicators are observations about a file that has been analyzed.

These indicators help administrators understand the reason for a file’s classification and provide insight into its attributes and behavior. Threat Indicators are grouped into categories.

**Devices**

In the Devices pane, the administrator can view a list of devices that have unsafe or abnormal files and quarantine or waive them.

The device list can be filtered by file state: Unsafe, Quarantined, Waived, or Abnormal.

Waiving a file will allow that file to run on the device.

**Detailed Threat Data**

If the file has been uploaded for analysis, the Detailed Threat Data pane may display a comprehensive summary of the static and dynamic characteristics of the file including additional file metadata, file structure details, and dynamic behaviors such as files dropped, registry keys created or modified, and URLs with which it attempted to communicate.

**Note:** If no results display in the Detailed Threat Data pane, the file has not yet been uploaded for analysis. Debug logging may provide information about why the file was not uploaded.

**Script Control Table**

The table lists details about Active and PowerShell scripts that have been blocked or have triggered an alert and the affected devices.
Columns display the file name, interpreter (PowerShell or ActiveScript), last found, drive type (such as internal hard drive), SHA256, Number of devices on which the script is found, and Number of occurrences that were blocked or triggered alerts.

To filter column data, click the filter icon on a column header and select values to include or exclude.

**Manage Enterprise Advanced Threats - Agents**

After an Advanced Threat Prevention client is installed on an endpoint computer, it is recognized by the Dell Server as an agent.

**Agents Table Data, Explained**

- **Name** - The name of the agent on the endpoint computer.
- **State** - State of the agent, online or offline. A computer is in the offline state after three failed attempts in a 15-minute period to contact the Cylance server.
- **Offline Date** - If applicable, the date on which the agent went offline.
- **Files Analyzed** - Number of files analyzed on the endpoint computer.
- **Unsafe** - Number of files deemed Unsafe on the device. An unsafe file has characteristics that greatly resemble malware.
- **Quarantined** - Number of files Quarantined on the device.
- **Waived** - Number of Waived files on the device.
- **Abnormal** - Number of Quarantined files on the device.
- **Exploit Attempts** - Number of exploit attempts on the device.

**Commands**

To export details about an agent or remove an agent from the list:

- **Export** - Creates and downloads a CSV file that contains device information (Name, State, Policy, etc.).
- **Remove** - Removes selected agents from the Agent Table. This does not uninstall the agent from the device.

**Manage Enterprise Advanced Threats - Certificate**

The Certificate tab allows you to upload a certificate for the purpose of safelisting it.

Certificates must be in .cer or .crt format.

To upload a certificate, follow these steps:

1. Navigate to **Populations > Enterprise > Advanced Threats tab > Certificate tab.**
2. Click **Browse.**
3. Select a certificate and click **Open.**
4. Click **Upload Certificate.**
5. Click **OK** once the upload is successful.

For instructions about how to safelist a certificate, see **Manage Enterprise Advanced Threats - Global List.**
Manage Enterprise Advanced Threats - Cylance Score and Threat Model Updates

A Cylance score is assigned to each file that is deemed Abnormal or Unsafe. The score represents the confidence level that the file is malware. The higher the number, the greater the confidence.

Threat Model Updates

The predictive threat model used to protect devices receives periodic updates to improve detection rates.

Two columns on the Protection page in the Management Console show how a new threat model affects your organization. Display and compare the Production Status and New Status columns to see which files on devices might be impacted by a model change.

To view the Production Status and New Status columns:

1. In the left pane, click Populations > Enterprise.
2. Select the Advanced Threats tab.
3. Click the Protection tab.
4. Click the down-arrow on a column header in the table.
5. Hover over Columns.
6. Select the Production Status and New Status columns.

Production Status - Current model status (Safe, Abnormal or Unsafe) for the file.

New Status - Model status for the file in the new model.

For example, a file that was considered Safe in the current model might change to Unsafe in the new model. If your organization needs that file, you can add it to the Safe list. A file that has never been seen or score by the current model might be considered Unsafe by the new model. If your organization needs that file, you can add it to the Safe list.

Only files found on device in your organization and that have a change in its Cylance Score are displayed. Some files might have a score change but still remain within its current Status. For example, if the score for a file goes from 10 to 20, the file status may remain Abnormal and the file appears in the updated model list (if this file exists on devices in your organization).

The information for the model comparison comes from the database, not your devices. So no re-analysis is done for the model comparison. However, when a new model is available and the proper Agent is installed, a re-analysis is done on your organization and any model changes are applied.

Compare Current Model with New Model

You can now review differences between the current model and the new model.

The two scenarios you should be aware of are:

Production Status = Safe, New Status = Abnormal or Unsafe

• Your Organization considers the file as Safe
• Your Organization has Abnormal and/or Unsafe set to Auto-Quarantine

Production Status = Null (not seen or scored), New Status = Abnormal or Unsafe

• Your Organization considers the file as Safe
• Your Organization has Abnormal and/or Unsafe set to Auto-Quarantine

In the above scenarios, the recommendation is to Safelist the files to allow in your organization.
Identify Classifications

To identify classifications that could impact your organization, Dell recommends the following approach:

1. Apply a filter to the New Status column to display all Unsafe, Abnormal, and Quarantined files.
2. Apply a filter to the Production Status column to display all Safe files.
3. Apply a filter to the Classification column to only show Trusted - Local threats.

Trusted - Local files have been analyzed by Cylance and found to be safe. Safelist these items after review. If you have a lot of files in the filtered list, you may need to prioritize using more attributes. For example, add a filter to the Detected By column to review threats found by Execution Control. These were convicted when a user attempted to execute an application and need more urgent attention than dormant files convicted by Background Threat Detection or File Watcher.

Manage Enterprise Advanced Threats - Global List

The Global Quarantine, Safe, and Unassigned tables provide a view of files in list as well as options to perform actions on these files.

Global Quarantine

Global Quarantine lists files that are permanently quarantined from all devices.

Add a file to the global quarantine list

Add the selected file to the Global Quarantine list to prevent it from being run on any device in the organization. Adding a file to Quarantine removes it from lists of Unsafe or Unassigned files.

1. Select Global Quarantine (n).
2. Select a threat.
3. Click Add File.
4. Enter a reason that this file should be global quarantined and click Yes.

Manually Add File to the Global Quarantine list

1. Select Global Quarantine (n).
2. Click Add File.
3. Enter the file's SHA256 hash number. (required)
4. Enter the file's MD5 number, if available.
5. Enter the file name, if available.
6. Enter the reason the file should be quarantined.
7. Click Submit.

Remove a file from the global quarantine list

Remove the selected file from the Global Quarantine list to allow it to run on any device in the organization.

1. Select Global Quarantine (n).
2. Select a file.
3. Click Remove from List.

Safelist a file from the global quarantine list
Safelist the selected file from the Global Quarantine list to allow it to run on any device in the organization.

1. Select Global Quarantine (n).
2. Select a file.
3. Click Safe.

Safe

Safelisted files and certificates are permanently treated as safe across all devices. Any certificate that is safelisted is a known safe certificate for the Advanced Threat Prevention tenant.

Add a file to the safe list

Safelisting a file allows that file to run on any device across the entire organization.

Note: Occasionally, a “good” file may be reported as unsafe (this could happen if the features of that file strongly resemble those of malicious files). Waiving or safelisting the file can be useful in these instances.

1. Select Safe (n).
2. Click Add File.
3. Enter the file's SHA256 hash number. (required)
4. Enter the file's MD5 number, if available.
5. Enter the file name, if available.
6. Enter the reason the file should be safelisted.
7. Click Submit.

Remove a file from the safe list

1. Select Safe (n).
2. Select Files (n).
3. Select the file to remove from the safe list.
4. Click Remove from List.

Add a certificate to the safe list

Safelisting a certificate allows access to that certificate, as needed, across the entire organization.

1. Select Safe (n).
2. Select Certificates (n).
3. Select the certificate to list as safe.
4. Click Add Certificate.
5. Select the category that fits the certificate.
6. Enter a reason why the certificate should be listed as safe, and click Submit.

Note: You must upload a certificate for it to be available to safelist. For more information, see Manage Enterprise Advanced Threats - Certificate.

Remove a certificate from the safe list
1. Select **Safe** (n).
2. Select **Certificates** (n).
3. Select the certificate to remove from the safe list.
4. Click **Remove from List**.

### Unassigned

Unassigned files can be added to the global quarantine or safe list.

#### Add an unassigned file to the global quarantine list

Add the selected file to the Global Quarantine list to prevent it from being run on any device in the organization. Adding a file to Quarantine removes it from lists of Unsafe or Unassigned files.

1. Select **Unassigned** (n).
2. Select a file.
3. Click **Global Quarantine**.
4. Enter a reason that this file should be global quarantined and click **Yes**.

#### Manually Add File to the Global Quarantine list

1. Select **Unassigned** (n).
2. Click **Add File**.
3. Enter the file's SHA256 hash number. (required)
4. Enter the file's MD5 number, if available.
5. Enter the file name, if available.
6. Enter the reason the file should be quarantined.
7. Click **Submit**.

#### Add an unassigned file to the safe list

Safelisting a file allows that file to run on any device across the entire organization.

1. Select **Unassigned** (n).
2. Select a file.
3. Click **Safe**.
4. Select the category that fits the file.
5. Enter a reason why the file should be listed as safe, and click **Yes**.

**Note:** Occasionally, a “good” file may be reported as unsafe (this could happen if the features of that file strongly resemble those of malicious files). Waiving or safelisting the file can be useful in these instances.

#### Manually Add File to the Safe list

1. Select **Unassigned** (n).
2. Click **Add File**.
3. Enter the file's SHA256 hash number. (required)
4. Enter the file's MD5 number, if available.
5. Enter the file name, if available.
6. Enter the reason the file should be safelisted.
7. Click Submit.

Add the selected file to the Global Quarantine list to prevent it from being run on any device in the organization. Adding a file to Quarantine removes it from lists of Unsafe or Unassigned files.

1. Select Global Quarantine (n).
2. Select a threat.
3. Click Add File
4. Enter a reason that this file should be global quarantined and click Yes.

Manually Add File to the Global Quarantine list

1. Select Global Quarantine (n).
2. Click Add File.
3. Enter the file's SHA256 hash number. (required)
4. Enter the file's MD5 number, if available.
5. Enter the file name, if available.
6. Enter the reason the file should be quarantined.
7. Click Submit.

Manage Enterprise Advanced Threats - Options

The Options tab allows you to integrate with Security Information Event Management (SIEM) software using the Syslog feature as well as export Advanced Threat data. SIEM software allows administrators to run customized analytics on threat data within their environments. Software options include Splunk, available to Splunkbase users at https://splunkbase.splunk.com/app/3233.

Syslog events are persisted at the same time Agent events are persisted to the Cylance server. For more information about supported event types, see Syslog Event Types.

To integrate with SIEM, select Syslog/SIEM on the Options tab, and complete the form that displays. For a list of syslog server IP addresses to allow, see Syslog IP Addresses.

With SIEM integration, to export data about threats, select Threat Data Report on the Options tab. For instructions and a description of exportable data, see Threat Data Report.

Threat Data Report

Select Threat Data Report on the Options tab to enable threat data export to .csv files.

The following types of data are available for export:

Threats - Lists all threats discovered in your organization. This information includes file name and File Status (unsafe, abnormal, waived, and quarantined).

Devices - Lists all devices in your organization that have an Agent installed. This information includes device name, operating system version, agent version, and policy applied.
Events - Lists all events related to the Threat Events graph on the dashboard for the last 30 days. This information includes file hash, device name, file path, and the date the event occurred.

Indicators - Lists each threat and the associated threat characteristics.

Cleared - Lists all files that have been cleared in your organization. This information includes files that were waived, added to the safe list, or deleted from the quarantine folder on a device.

Export Data

To access the exported data:

1. Select Generate token.
2. Copy the URL of the desired data and paste it into a web browser address field.
3. In the URL, replace [Token] with the generated token displayed in Token.

To disable access to the exported data, select Delete or regenerate to invalidate the current token. After regenerating a token, provide it to persons who should have continued access to the exported data.

Advanced Threat Prevention Classifications

The Advanced Threat Prevention Classifications pane shows a heat map of threats. The color indicates the priority classification of the threat. The size of the box indicates the relative number of endpoints that have a particular threat. This classification helps administrators determine which threats and devices to address first. Click a threat to view threat and device details.

Threat classifications include the following:

Malware
- Trojan
- Downloader

Potentially Unwanted Programs (PUP)
- Adware
- Hacking Tool
- Portable Application

Enable Compatibility Mode for Memory Protection

Compatibility Mode allows applications to run on the client computer while Memory Protection or Memory Protection and Script Control policies are enabled. Compatibility Mode is enabled through a registry setting or a command on the client computer. Compatibility Mode does not apply to Mac clients.

To enable Compatibility Mode with a registry setting:

1. In the Remote Management Console, disable the Memory Protection Enabled policy. If the Script Control policy is enabled, disable it.
2. Save the policy changes, and Commit Policies.
3. Using the Registry Editor on the client computer, go to HKEY_LOCAL_MACHINE\SOFTWARE\Cylance\Desktop.
4. Right-click Desktop, click Permissions, then take ownership and grant yourself Full Control.

5. Right-click Desktop, then select New > Binary Value.

6. For the name, type CompatibilityMode.

7. Open the registry setting and change the value to 01.

8. Click OK, then close Registry Editor.

9. In the Management Console, enable the Memory Protection Enabled policy. If the Script Control policy was enabled, enable it.

10. Save the policy changes, and Commit_Policies.

**To add the registry setting with a command:**

1. In the Management Console, disable the Memory Protection Enabled policy. If the Script Control policy is enabled, disable it.

2. Save the policy changes, and Commit_Policies.

3. Select one command line option to run on the client computer:

   (For one computer) Psexec:
   
   psexec -s reg add HKEY_LOCAL_MACHINE\SOFTWARE\Cylance\Desktop /v CompatibilityMode /t REG_BINARY /d 01

   (For multiple computers) Invoke-Command cmdlet:
   
   $servers = "testComp1","testComp2","testComp3"
   $credential = Get-Credential -Credential {UserName}\administrator
   Invoke-Command -ComputerName $servers -Credential $credential -ScriptBlock {New-Item -Path HKCU:\Software\Cylance\Desktop -Name CompatibilityMode -Type REG_BINARY -Value 01}

4. In the Management Console, enable the Memory Protection Enabled policy. If the Script Control policy was enabled, enable it.

5. Save the policy changes, and Commit_Policies.

**Disconnected Mode Policy Examples**

Examples for Global Allow, Quarantine List, and Safe List policies are shown below.

**Global Allow policy example**

```xml
<?xml version="1.0" encoding="utf-8"?>
<disconnected_policy>
```
<policy_name>Default</policy_name>
<policy_company>Acme</policy_company>
<policy_company_id>uxSYabW9P2nMbGLzuqJhvT9Y</policy_company_id>

Quarantine List and Safe List policy examples

### Quarantine List

The Global Quarantine List contains hashes of files to be quarantined as shown in this example:

```
0A5F695900F1FC750708BBB7C7A55B5B5BCFAAD6FE
```

### Safe List

The Global Safe List contains hashes of files to be quarantined as shown in this example:

```
0A5F695900F1FC750708BBB7C7A55B5B5BCFAAD6FE
```
Threat Protection Policy Overview

Threat Protection policies are divided into the following categories:

- Threat Protection
- Client Firewall
- Web Protection

When you set the Threat Protection policy to Selected, you can then set policies for these client options:

- Actions to take when malicious activity is identified (Block, Report, Block and Report)
  Policies allow you to set the action to take when users attempt to modify or delete Threat Protection system files, registry keys, and processes. The default setting for these policies is Block and Report: Action on Malicious Activity for Files and Folders, Action on Malicious Activity for Registry, and Action on Malicious Activity for Processes.

- Exclusion of specified processes from Threat Protection scans

- Logging locations and debug/verbose logging of certain activities
  Activity logging is enabled by default. Debug logging is disabled by default.

- Client update scheduling
  Client updates ensure that client computers are always protected from the latest threats through content files that include definitions of threats such as viruses and spyware, that are used to detect threats. The Client Update Schedule policy is selected (Enabled) by default. The Client Update Schedule Repeats policy, which determines the frequency of client updates, is set to Daily by default.

The following policies represent the different types of scans included in Threat Protection:

On-Access Protection – When a user accesses files, folders, and programs, the on-access scanner intercepts the operation and scans the item. Default: Selected (Enabled).

On-Demand Protection - Full Scan – Based on a schedule set in policy, the on-demand scanner runs a thorough check of all areas of the computer. Default: Selected (Enabled).

By default, every time Full Scan runs, it scans the following for threats:

- Computer memory for installed rootkits, hidden processes, and other behavior that suggests malware is attempting to hide itself. This scan occurs before all other scans.
- Memory of all running processes.
- All drives on the computer and their subfolders.

By default, the scanner scans all file types, regardless of extension.

On-Demand Protection - Quick Scan – Based on a schedule set in policy, the on-demand scanner runs a quick check of areas of the computer that are most susceptible to threats. Default: Selected (Enabled).

By default, every time Quick Scan runs, it scans the following for threats:

- Memory of all running processes.
- Files that the Windows Registry references.
- Contents of the Windows folder.
• Contents of the Temp folder.

By default, the scanner scans all file types, regardless of extension.

Access Protection – Prevents other computers from making a connection and creating or altering autorun (autorun.inf) files from CDs. The rule prevents spyware and adware distributed on CDs from being executed and automatically blocks and reports such issues. Default: Selected (Enabled).

Exploit Protection – Monitors for application vulnerabilities and keeps buffer overflow exploits from executing arbitrary code on the computer. Default: Selected (Enabled).

Script Scan Protection – Enables scanning JavaScript and VBScript scripts to prevent unwanted scripts from executing. Default: Selected (Enabled).

Actions taken if a threat, unwanted program, or exploit is detected are controlled by policy and include the following:

Full-Scan Threat First Response - Specifies the first action for the scanner to take when a threat is detected. Default: Clean file.

Full-Scan Threat First Response Fails - Specifies the action for the scanner to take when a threat is detected if the first action fails. Default: Delete file.

Full-Scan Unwanted Program First Response - Specifies the first action for the scanner to take when a potentially unwanted program is detected. Default: Clean file.

Full-Scan Unwanted Program First Response Fails - Specifies the action for the scanner to take when an unwanted program is detected if the first action fails. Default: Delete file.

Quick-Scan Threat First Response - Specifies the first action for the scanner to take when a threat is detected. Default: Clean file.

Quick-Scan Threat First Response Fails - Specifies the action for the scanner to take when a threat is detected if the first action fails. Default: Delete file.

Quick-Scan Exploit First Response - Specifies the first action for the scanner to take when a potential exploit is detected. Default: Clean file.

Quick-Scan Exploit First Response Fails - Specifies the action for the scanner to take when an exploit is detected if the first action fails. Default: Delete file.

When the Full-Scan Reputation Service Sensitivity or Quick-Scan Reputation Service Sensitivity policies are enabled, samples are submitted to the Reputation Service lab to determine if they are malware. The sensitivity level is used when determining if a detected sample is malware. The higher the sensitivity level, the higher the number of malware detections. However, allowing more detections might result in more false positive results.

The following values can be set:

Disable - Samples are not submitted to the Reputation Service lab.

Very Low - A detection is made available to Threat Protection when the Reputation Service lab publishes it instead of waiting for the next file update. Average of 10-15 queries per day, per computer.

Low - This setting is the minimum recommendation for laptops or desktops and servers with a strong security footprint. This setting results in an average of 10-15 queries per day, per computer.

Medium - Use this level when the regular risk of exposure to malware is greater than the risk of a false positive. This setting is the minimum recommendation for laptops or desktops and servers. Average of 20-25 queries per day, per computer.
High - Use this setting for deployment to systems or areas which are regularly infected. This setting results in an average of 20-25 queries per day, per computer.

Very High - Dell recommends using this level only for scanning volumes and directories that do not support executing programs or operating systems. Detections found with this level are presumed malicious, but have not been fully tested to determine if they are false positives. Use this setting for on-demand scans on non-operating system volumes. This setting results in an average of 20-25 queries per day, per computer.

For more detail about Threat Protection policies, see Windows Threat Protection.

Client Firewall Policies

The Client Firewall is a stateful firewall that checks all incoming and outgoing traffic against its list of rules. If the traffic matches all criteria in a rule, the Client Firewall acts according to the rule, blocking or allowing traffic through the firewall.

Configurable options and rules define how the Client Firewall works. When the master policy, Client Firewall, is set to On, you can select View/Edit in the Settings and Rules policy to view or configure an extensive set of Client Firewall options and rules.

Options include which subsets of traffic to block or allow and logging settings, as well as timeout parameters for TCP, UDP, and ICMP connections.

Client firewall rules define specific handling of network traffic. Each rule provides a set of conditions that traffic must meet and an action to allow or block that traffic. When Client Firewall finds traffic that matches a rule's conditions, it performs the associated action.

Client Firewall uses precedence to apply rules and applies the rule at the top of the firewall rules list.

1. If the traffic meets the conditions of the rule at the top of the list, Client Firewall allows or blocks the traffic. It does not try to apply any other rules in the list.
2. If the traffic does not meet the first rule's conditions, Client Firewall continues to the next rule in the list until it finds a rule that the traffic matches.
3. If no rule matches, the firewall automatically blocks the traffic.

For a list of Client Firewall rules and their descriptions, see Client Firewall Settings and Rules.

Web Protection Policies

Web Protection monitors web browsing and downloads to identify threats and enforce action set by policy when a threat is detected, based on ratings for websites. When you set the master policy, Web Protection, to On, you can set other policies for Web Protection.

The Reputation Service analyzes each website and assigns a color-coded safety rating based on test results. The color indicates the level of safety for the site:

Red – Malicious
Yellow – Potentially malicious
Green - Safe

Through the following policies, you can assign actions to implement when a user accesses a website or attempts a download, based on website ratings:

Rating Action for Red Sites - Specifies the action to apply to sites that are rated Red. Default: Block.
Manage Policies

*Rating Action for Yellow Sites* - Specifies the action to apply to sites that are rated Yellow. Default: Warn.

*Rating Action for Unrated Sites* - Specifies the action to apply to sites that are Unrated. Default: Allow.

*Rating Action for Red Downloads* - Specifies the action to apply to file downloads that are rated Red. Default: Block.

*Rating Action for Yellow Downloads* - Specifies the action to apply to file downloads that are rated Yellow. Default: Warn.

*Rating Action for Unrated Downloads* - Specifies the action to apply to file downloads that are Unrated. Default: Allow.

Configurable actions for website access or download attempts include the following:

**Block** – Prevents users from accessing the site or downloading a file from the site. A message is displayed.

**Allow** – Permits users to access the site or proceed with the download.

**Warn** – Displays a warning to notify users of potential dangers associated with the site or download file. Users must dismiss the warning before ending the web session or proceeding with the download.

To exclude a private IP address or range of addresses from Web Protection content rating actions, specify the IP address or IP address range in the *IP Exclusions for Web Protection* policy.

To block all phishing pages, without regard to policy values that control content rating actions, select the *Enforcement - Block Phishing Pages for All Sites* policy.

**Designate a Threat Protection Signature Update Server**

Both an HTTP and FTP signature update server are pre-configured with your Dell Server installation. You can also, optionally, designate an internal signature update server or servers within your network.

Designating a signature update server within your network allows client computers to obtain signature updates without accessing the Internet. Rather than individual clients contacting an external update server, they contact your internal update server, which maintains current signatures through contact with the external signature update server.

To designate a signature update server, follow these steps:

1. As an administrator on the server to be the internal update server, run the appropriate command:

   VSSETUP_86.EXE /SetRelayServerEnable=1
   or
   VSSETUP_64.EXE /SetRelayServerEnable=1

2. Restart the internal update server.

4. In Malware Protection advanced settings, click *Source Sites for Updates*.

5. Click *Add*.

6. Enter a Name for the internal update server.

7. To enable connections to the internal update server, select *Enabled*. To enable later, clear the *Enabled* check box.
8. In **Order**, set the sequence in which clients will contact the internal update server in relation to other update servers. Dell recommends that you set the Order for internal update servers to precede the Order for external update servers.

9. Select the type of repository or path to the update server: HTTP repository, FTP repository, UNC path, or Local path.

10. Enter the URL or path to the internal update server.

11. Complete the remaining fields in the form, and click **OK**.

12. Repeat these steps to designate additional internal update servers.

To revert an internal update server to non-update server status, enter the appropriate command:

```
VSSETUP_86.EXE /SetRelayServerEnable=0
or
VSSETUP_64.EXE /SetRelayServerEnable=0
```

### Data Guardian

**Data Guardian**

Data Guardian provides the following:

- Data on the device and data-in-motion is encrypted. To decrypt and view the content, users must have Data Guardian installed on the client. Users can access protected files on Windows, Mac, mobile devices, and a web portal.

- An audit trail of file activity allows you to monitor security. See [Data Guardian and Audit Events](#).

- Protection against data leakage for protected Office documents - policies allow you to control copy/paste or to add a watermark with the user's name, domain, and computer ID

Data Guardian basic policies are available for these populations:

- **Cloud Encryption** (Mac; v2.3 and earlier for Windows) - Enterprise, Endpoint Groups, and Endpoints

- **Protected Office Documents** - Enterprise (master switch)

- **Classification** - Enterprise (master switch)

- **Mobile Client** - Enterprise, Domain, User Groups, and User

- **Web Portal** - Enterprise, Domain, User Groups, and User
  
  - Node level policies are only available at the Enterprise level and require a node restart.
  
  - Lock Account is only available at the User level.

Determine which Data Guardian policy groups you want to enable for Mac or for v2.3 and earlier Windows:

<table>
<thead>
<tr>
<th>Data Guardian Policy Groups</th>
<th>Windows</th>
<th>Mac</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protected Office Documents is <strong>On</strong></td>
<td>Office documents are protected based on policies. For more information, see <a href="#">Set Security Policies to Protect Office Documents in Windows</a>. No DDG VDisk virtual drive is created. Non-Office documents are not impacted.</td>
<td>N/A</td>
</tr>
<tr>
<td>Cloud Encryption is <strong>Off</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
If Force Protected Files Only is selected, an Unprotected folder is added to the root of the user’s Documents folder.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Encryption is On</td>
<td>Off</td>
<td>This technology allows for files to be automatically encrypted prior to being uploaded to supported public clouds; this maintains ownership/control of all data encryption keys. The supported public cloud providers are Dropbox, Dropbox for Business, Box, OneDrive, OneDrive for Business, and Google Drive.</td>
</tr>
<tr>
<td>Protected Office Documents is Off</td>
<td></td>
<td>A DDG VDisk virtual drive displays in the client’s Windows Explorer.</td>
</tr>
<tr>
<td>Both are On</td>
<td></td>
<td>Non-Office documents are protected as .xen files if in the DDG VDisk virtual drive. A DDG VDisk virtual drive displays in the client’s Windows Explorer. Office documents have different levels of security based on policy. If protected, the Office document retains its extension in the cloud but unauthorized users cannot access it. Additional policies impact Office documents. For more information, see Set Security Policies to Protect Office Documents in Windows. Non-Office documents are protected as .xen files. Office documents are protected based on Protected Office policies. For more information, see Set Security Policies to Protect Office Documents in Mac.</td>
</tr>
<tr>
<td>Neither is On</td>
<td></td>
<td>Files are not protected. If opened, content displays in cleartext.</td>
</tr>
</tbody>
</table>

The Dell Server automatically updates profiles of cloud storage providers. For more information, see Cloud Profile Update. Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Cloud Encryption                                    | Off             | On

Toggle On to enable Cloud Encryption policies. If this policy is Off, no Cloud protection takes place, regardless of other policies.

Enable Access to Restricted File (Windows - v2.3 and earlier) Not Selected Selected

Applies only to Google Drive. Selected disables any Google Drive-created shortcuts to the web that Data Guardian cannot encrypt.

Enable In-App Feedback (Cloud) (Mac; v2.3 and earlier for Windows) Not Selected Selected

When selected, an end user can submit feedback and satisfaction ratings to Dell via a link within the client application to a web form.
### Cloud Storage Protection Providers
(Mac; v2.3 and earlier for Windows)

<table>
<thead>
<tr>
<th>Protection Level</th>
<th>Profile Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protect</td>
<td>Dropbox_V1</td>

</tr>
</tbody>
</table>

*For these profiles, ProtectionLevel settings must match.

String Profiles that Allow, Block, Protect, or Bypass these providers/connections. Protect: Allow the provider/connection, encrypt the files, and send audit events about file/folder activity. Block: Block all access to the provider/connection. Allow: Allow the provider/connection to pass through without encrypting, but audit file/folder activity. Bypass: Bypass the protection of the provider/connection without encrypting or auditing.

The format is: ProtectionLevel,ProfileName.

ProtectionLevel options: Allow, Protect, Block, Bypass

The Dell Server automatically checks for updated profiles of Cloud storage providers supported with Data Guardian. When available, updated profiles are sent to Data Guardian clients after the administrator commits policy changes. When the Pending Policy Changes value in the Management Console is automatically incremented although an administrator has not modified policy values, at least one updated profile is available.

The polling interval for Cloud storage provider profile updates is daily at 12:30 a.m.

### Dropbox Encrypt Personal Folders

### Advanced Data Guardian

Advanced Data Guardian policies are available for these populations:

- **Cloud Encryption** (Mac; v2.3 and earlier for Windows) - Enterprise, Endpoint Groups, and Endpoints
- **Protected Office Documents** - Enterprise, Endpoint Groups, and Endpoints (The *Protected Office Documents* master policy, *Enable Callback Beacon*, and *Callback Beacon URL* policies are available at the Enterprise level only.)
- **Mobile Client** - Enterprise, Domain, User Groups, and User
- **Web Portal**:
  - Node level policies are only available at the Enterprise level and require a node restart.
  - Lock Account is only available at the User level.

See [Data Guardian policy groups](#) to determine which policies to enable.

The Dell Server automatically updates profiles of cloud storage providers. For more information, see [Cloud Profile Update](#).

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in **bold** font.

<table>
<thead>
<tr>

#### Protected Office Documents

This technology allows for Office documents (Excel, PowerPoint, and Word) to be encrypted at the file level. Encryption travels with the file wherever it goes, inside or outside the network.

- **Protected Office Documents** (Basic - Windows and Mac)
  - **Default Setting**: Off
  - **Description**: On
    - Toggle On to provide users with a menu option for protecting Office documents (.docx, .xlsx, .pptx, .docm, .xlsm, .pptm, and .pdf). On also allows you to enable other Protected Office policies. If this policy is Off, no Office-protected formatting takes place, regardless of other policies.
    - This policy is available at the Enterprise level.

- **Folder Exclusions for Basic File Protection** (Windows and Mac)
  - **Default Setting**: String
  - **Description**: String
    - Listing of folder paths that are excluded from Basic File Protection.
      - See [Configure_policy_to_exclude_folders](#).

- **Protected Office Document Process Protection** (Windows)
  - **Default Setting**: String
  - **Description**: String
    - Specifies which process and which extensions to block while a Protected Office Document is open.
      - The following are examples to follow for specific format inclusions:
        - SnippingTool.exe
        - mspaint.exe
<table>
<thead>
<tr>
<th>Feature</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Force Protected Files Only</strong> (Windows)</td>
<td>Not Selected</td>
<td>Selected forces users to save Office files as protected documents. It also enables a sweep on the clients' internal fixed drives to locate new Office files and change them to Protected mode. It disables the Share option. If Not Selected, users have some options in determining whether to save a file as protected or unprotected.</td>
</tr>
<tr>
<td><strong>Enable Time To Live and Embargo Control</strong> (Windows)</td>
<td>Not Selected</td>
<td>Selected allows users to specify dates for when protected Office files are accessible to external users.</td>
</tr>
<tr>
<td><strong>Print Control</strong> (Mac; Windows - v2.7 and earlier)</td>
<td>Allowed</td>
<td>Allowed - Print option is enabled for protected Office documents. Watermark - Print option is enabled for protected Office documents but a watermark with the user's name, domain name, and computer ID displays on each page. Unprotected documents print without the watermark. Disabled - Print option is enabled. However, if the user clicks Print for a protected Office document or when a protected Office document is open in Acrobat Reader DC, a toaster states that Print is not allowed. In addition, the attempt to print is an audit event. Users can always print unprotected Office documents. If Force Protected Files Only is Not Selected, the Print option is available for all unprotected Office documents.</td>
</tr>
</tbody>
</table>
| **Export Control** (Windows - v2.7 and earlier) | Allowed       | Allowed - This varies based on whether Force Protected Files Only is Selected. For detailed information, see Set Security Policies to Protect Office Documents. Watermark - Export is disabled. See Protected Export. Disabled - Export is disabled for protected Office documents. | On Screen Watermark | Not Selected | Selected displays a watermark on the mobile client screen when any protected Office file is open. |
Basic File Protection

<table>
<thead>
<tr>
<th>Feature</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic File Protection</td>
<td>Not Selected</td>
</tr>
</tbody>
</table>

When selected, the Basic File Protection Feature is enabled. This feature allows for the key-per-file encryption of line of business files that are not covered within Microsoft Office.

Basic File Protection Configuration

<table>
<thead>
<tr>
<th>Setting</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

Specifies which process and which extensions are included in Basic File Protection. For Windows, specifies which process and which extensions are included in Basic File Protection. For Mac and mobile devices, these encrypted files are read-only. These encrypted files can be uploaded to the web portal. The following are examples to follow for specific format inclusions:

- Notepad.exe: txt, csv
- Wordpad.exe: txt, rtf
- Word.exe: txt, rtf

Note: Basic File Protection Configuration is supported in Data Guardian v1.6 and later. See Configure Basic File Protection Policies.

Set Cover Page Policies

For Windows, Mac, mobile, and web portal, you can set policies to customize a cover page for protected Office documents.

- Internal users for all platforms and external users for mobile and web portal - The cover page displays for the following:
  - Protected Office Documents policies have been enabled, but the user has not yet installed or activated Data Guardian.
  - User opens a protected Office document or .pdf from the cloud.
  - User downloads a protected Office document or .pdf to a device that does not have Data Guardian installed.

- Unauthorized users - The cover page displays, and the person cannot access the content.

To customize the cover page for protected Office documents, you can use these Advanced Data Guardian policies:

- Protected Office Documents Cover Page Notice
- Protected Office Documents Cover Page Corporate Logo
- Protected Office Documents Cover Page Dell Server URL

See also, Data Guardian Management > Web Portal to add a URL to access the web portal.

Cloud Profile Update

The Security Management Server can automatically check for updated profiles of cloud storage providers supported with Data Guardian.

Note: For Windows, this applies to Data Guardian v2.3 and previous.
To configure Dell Server to automatically check for updated profiles, follow these steps:

1. Navigate to `<Security Server install dir>/conf/` and open the application.properties file.
2. Locate `cloud.profile.updater.enabled` and set the value to `true`.

When update is enabled and updated profiles are available, the profiles are sent to Data Guardian clients after the administrator commits policy changes. When the Pending Policy Changes value in the Management Console is automatically incremented although an administrator has not modified policy values, at least one updated profile is available.

The polling interval for cloud storage provider profile updates is daily at 12:30 a.m.

Set Policies to Protect Documents in Windows

For enhanced security on Office documents (.docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf), you can implement Data Guardian's Protected Office mode for internal users.

Users can open a protected .pdf file with:

- Adobe Acrobat Reader DC
- Microsoft Word - from a local drive or from the network

You cannot map a network drive to a local drive to open a .pdf.

The Basic File Protection policies allow you to configure additional file extensions to be encrypted.

If an unauthorized user tries to access a protected file, the file remains encrypted, for example when the file is:

- Attached in an email
- Moved in a browser - if the user selects Move in a cloud sync client
- Moved in File Explorer
- Stored on removable media

You can:

- [Set Policies for Protected Office Documents](#)
- [Determine Impact on Windows Users for Opt-in or Force Protected Modes](#)
- [File menu options for Data Guardian v2.7 and earlier](#)
- [Enable Both Cloud Encryption and Protected Office Documents Windows 2.3 and earlier](#)

Set Policies for Protected Office Documents

To set Protected-mode policies on Office documents for internal users:

1. Log in to the Management Console.
2. In Populations > Enterprise, in the Data Guardian technology group, click the Protected Office Documents policy group.
3. Determine the level of security for Office documents:
   - **Opt-in mode** (allows users the option to choose which Office documents to protect): Toggle the Protected Office Documents policy to **On**.
Determine Impact on Windows Users for Opt-in or Force Protected Modes

When you set Protected Office Documents policies and the client is activated, the File menu for Office documents displays additional options and enables/disables some options.

Dell recommends that you test policy updates on a test group of endpoints before applying them on a large scale.

This table provides an overview of the security impact on the Office File menu options for internal users based on which policies you activate:

- **Protected Office Documents** (Opt-in mode - user has the option to choose which Office documents to protect. Both Save As and Protected Save As are enabled). For Opt-in mode, a Secure Documents folder is added to the root of the user’s Documents folder. Documents in that folder are encrypted.

- **Protected Office Documents** and **Force Protected files only** (Force-Protected mode - higher security) - The Force Protected policy enables a sweep on the clients’ internal fixed drives to locate unprotected Office files and change them to Protected mode. It disables Save As and the Share option. It enables Protected Save As. For Force-Protected mode, an Unprotected Documents folder is added to the root of the user’s Documents folder. Documents in that folder are not encrypted.

For Data Guardian to sweep the Office documents, the user must log in and be connected to the network. The sweep acquires keys from the Dell Server for ten unprotected Office files at a time. If fewer than ten unprotected Office files require keys, the sweep waits 30 seconds for more files but then requests the keys.

Sweep ignores network file share, optical, and removable drives.

For Office-protected documents, users cannot run macros in macro-enabled documents.

<table>
<thead>

</tr>
</tbody>
</table>

**Return to list**

Enable Both Cloud Encryption and Protected Office Documents (Windows 2.3 and earlier)
If you enable both policy groups, Protected Office documents differ from non-Office documents in some areas:

- If the Cloud Storage Protection Providers policy is set to Allow and does not encrypt non-Office files, protected Office documents still maintain any protection status.
- If the Excluded Folders policy excludes a particular folder from encryption, protected Office documents still maintain any protection status if copied to those folders.

Return to Data Guardian policies.

Set Policies to Protect Office Documents in Mac

For enhanced security on Office documents (.docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf), you can implement Data Guardian's Protected Office mode. Protected Office documents are uploaded to the cloud, not as .xen files, but with their file extensions (.docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf). However, the Office documents are encrypted. If opened or downloaded to a device that does not have Data Guardian installed, only a cover page displays with instructions on how to obtain validated access. An authorized user can obtain installation or activation information from the enterprise. An unauthorized user cannot access the protected data.

The cloud storage provider is optional. Protected Office documents and .xen files can be opened from local storage.

The Basic File Protection policies allow you to configure additional file extensions to be encrypted. For Mac, this requires Force-Protected mode.

Set Protected Office Document Policies

To set Protected-mode policies on Office documents for internal users:

1. Log in to the Management Console.
2. In Populations > Enterprise, in the Data Guardian technology group, click the Protected Office Documents policy group.
3. Determine the level of security for Office documents:
   - **Opt-in mode** (allows users the option to choose which Office documents to protect):
     Toggle the Protected Office Documents policy to On.
   - **Force-Protected mode** (ensures protection of all Office documents):
     - At the Enterprise level, toggle the Protected Office Documents policy to On.
     - At the Enterprise, Endpoint Groups, or Endpoints level, click Show advanced settings and select the Force Protected Files Only check box.
4. In the Data Guardian technology group, click Settings.
5. Ensure the Allow Mac Data Guardian Activation check box is selected.
6. Set additional Protected Office policies at the Enterprise, Endpoint Groups, or Endpoints levels.
   For endpoint groups or endpoints, click an option to access the Detail page's Security Policies tab.
7. To view protected Office documents in mobile devices, see Set Policies to Protect Office Documents in Mobile Devices.

Determine Impact on Mac Users for Opt-in or Force Protected Modes
When you set **Protected Office Documents** policies and the client is activated, the *File* menu for Office documents displays additional options and enables/disables some options.

Dell recommends that you test policy updates on a test group of endpoints before applying them on a large scale.

This table provides an overview of the security impact on the Office File menu options for internal users based on which policies you activate:

- **Protected Office Documents** (Opt-in mode - user has the option to choose which Office documents to protect. Both Save As and Protected Save As are enabled). For Opt-in mode, a *Secure Documents* folder is added to the root of the user’s Documents folder. Documents in that folder are encrypted.

- **Protected Office Documents** and **Force Protected files only** (Force-Protected mode - higher security) - The *Force Protected* policy enables a sweep on the clients’ internal fixed drives to locate unprotected Office files and change them to Protected mode. It disables Save As and the Share option (Office 2013 and 2016). It enables Protected Save As. For Force-Protected mode, an *Unprotected Documents* folder is added to the root of the user's Documents folder. Mac protects files in \Users. Documents in that folder are not encrypted.

### Set Policies to Protect Documents in Mobile Devices

For enhanced security on Office documents (.docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf), you can implement Data Guardian’s Protected Office mode. Protected Office documents are uploaded to the cloud, not as .xen files, but with their file extensions (for example, .docx or .pdf). However, the Office documents are encrypted.

*Basic File Protection* policies allow you to configure additional file extensions to be encrypted. Copy the extensions from the Windows policy to the mobile’s *Basic File Protection Configuration* policy. Users can open, edit, and save encrypted files.

### Set Protected Office Document Policies

To set Protected-mode policies on Office documents:

1. Log in to the **Management Console**.
2. In **Populations > Enterprise**, in the *Data Guardian* technology group, click the **Protected Office Documents** policy group.
3. Toggle the **Protected Office Documents** policy to **On**.
   
   The *Force Protected files only* policy is not available for mobile.
4. In the *Data Guardian* technology group, click **Settings**.
5. Ensure the *Allow Mobile Data Guardian Activation* check box is selected.
6. Set additional Protected Office policies at the **Enterprise**, **Domains**, **User Groups**, or **Users** levels.

   For domains, user groups, or users, click an option to access the Detail page’s Security Policies tab.

### Set Policies to Protect Documents on the Web Portal

For enhanced security on Office documents (.docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf), you can implement Data Guardian’s Protected Office mode for internal users.
Manage Policies

Users can open a protected .pdf file with Adobe Acrobat Reader DC or Microsoft Word.

If additional file extensions are set through the Basic File Protection Configuration policy on a Windows client, users can upload those encrypted files on the web portal. If an editing policy is enabled, users can edit them.

With OneDrive for Business, users can connect to the cloud storage provider to download files directly from the cloud to the web portal.

Set Protected Office Document Policies

To set Protected-mode policies on Office documents:

1. Log in to the Management Console.
2. In Populations > Enterprise, in the Data Guardian technology group, click the Protected Office Documents policy group.
3. Toggle the Protected Office Documents policy to On.
4. In the Web_Portal policy group or Global Settings, set additional policies at the Enterprise, Domains, User Groups, or Users levels. Some policies are set at the Enterprise (node level) only.

For domains, user groups, or users, click an option to access the Detail page’s Security Policies tab.

Configure Basic File Protection Policies

With Data Guardian v1.6 and higher, you can configure applications and file types in addition to Office documents. This policy applies at the Enterprise level. A sweep of users’ computers encrypts those configured file types.

This topic includes:

- Supported applications and file types
- Additional applications and file types
- Configure policy for Basic File Protection
- Configure policy to exclude folders (Windows and Mac)
- Unsupported applications and file types
- Use the Recovery Tool

Supported applications and file types

This table lists applications and file types that Dell has certified.

<table>
<thead>
<tr>
<th>Supported applications</th>
<th>Supported file extensions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell has certified these applications:</td>
<td>.bmp .csv .gif .jif .jpe .jpg .jpeg .png</td>
<td>In the policy configuration field, enter the application, followed by applicable file extensions. As a best practice, only add the essential file extensions to prevent performance issues. .tmp extension Be aware that if you add a .tmp extension, all Temp files are encrypted. Use only if necessary.</td>
</tr>
<tr>
<td>Notepad</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wordpad</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Visio</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MSpaint</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Add these applications if you want them to open the supported file extensions. For an example, see</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
NoRename:
- Word (winword)
- Excel
- PowerPoint

These applications are partially supported:
- Microsoft.Photos.exe (Windows 10)

These file extensions are partially supported:
- .bmp

This file extension is partially supported:
- .odt

Add these applications if required by another application:
- Sihost
- Code Writer
- Runtime Broker

Additional applications and file types

Many applications and file types should work. However, Dell has not certified all. In addition, enterprise-created applications and file types may work.

You can add other applications and file types, but as a best practice, configure them in a test environment before deploying to your enterprise.

If you test frequently used or essential applications and would like Dell to confirm that and add them to the Supported list or if issues arise, contact Dell support.

Configure policy for Basic File Protection

To configure additional file types to be encrypted:

1. In the left pane, click Populations > Enterprise, enable the Protected Office Documents policy.

2. In the Data Guardian > Windows technology group, enable the Basic File Protection policy.

   Note: This policy applies to the Enterprise population only. Also, if you enable Allow File Exclusions, users must remove files from the Unprotected Documents folder for these file types to be swept and encrypted.

3. In Windows technology group’s Basic File Protection Configuration policy field, enter an application that you want to be encrypted, followed by a colon, for example:

   notepad.exe:

4. After the colon, add the file extensions that is encrypted and any processes needed to support that application. Here are some sample configuration strings that Dell has certified. Only add essential extensions to prevent performance issues.

   wordpad.exe:rtf.odt.txt.png.jpg.csv.bmp
   notepad.exe:txt.csv
   visio.exe:vsdx.png.jpg.jpe.jfif.gif.tif.tiff.bmp
   mspaint.exe:png.jpg.jpe.jfif.gif.tif.tiff.bmp
   sihost.exe:png.jpg.jpe.jfif.gif.tif.tiff.rt.txt.bmp
   microsoft.photos.exe:png.jpg.jpe.jfif.gif.tif.tiff.bmp
5. For Mobile, copy the extensions from the Windows policy to the Enterprise > Mobile Client > Basic File Protection Configuration policy. The file extensions in the Mobile policy must match Windows.

**Basic File Protection policy and operating systems**

- **Windows, Mac, and mobile**: When the policy is enabled, these files are swept and Data Guardian encrypts all local files with those extensions. Files encrypted with Basic File Protection can only be viewed and edited using the application associated with the file extension. Mac requires Force-Protected mode.

- **Web Portal**: If the Edit Permission policy is enabled for web portal, users can edit them.

Some folders are excluded from Windows’ Basic File Protection sweep and files are not encrypted:

- AppData
- Some System folders
- Folders that relate to protected Office documents, such as the Secure Documents folder

6. If applicable, add these workflows to the policy lists:

- **NoRename** - add this for Office applications to ensure that if users open them, they can only save them as an Office file, not as a Basic File Protection file. Here are some examples:
  - `winword.exe:NoRename.odt.txt.png.jpg.csv.rtf.jpeg.jpe.gif.tif.tiff.bmp`
  - `excel.exe:NoRename.png.jpg.csv.jpeg.jpe.gif.tif.tiff.bmp`
  - `powerpnt.exe:NoRename.png.jpg.jpeg.jpe.gif.tif.tiff.bmp`

  **Note**: Do not add Office file extensions to this policy configuration.

- **NoNetwork** – if users log in to a network and files hang when users close them, add this to the application to prevent network save.

7. Before deploying Basic File Protection to the enterprise, be sure to test applications and file extensions in a test environment to ensure that the intended file types remain encrypted. Also, you can download procmon (process monitor) to determine file types that might create an issue for that application.

8. Inform users:

- Which applications and file types your enterprise encrypts
- Which operating systems can be used and whether files are read only or can be edited
- Files sent to external users or to devices that do not have Data Guardian installed

**Configure policy to exclude folders for Basic File Protection (Windows and Mac)**

After you enter file types, like .txt or .png, in the Basic File Protection Configuration policy field, a sweep will encrypt those files on the client computers.

You may want to exclude some of those file types, for example:

- To prevent files needed by the system from being encrypted
- To create a folder where users can place files of that type that do not require encrypting

In the Folder Exclusions for Basic File Protection policy, enter the path for a folder on client computers to exclude files from a Basic File Protection sweep.

**Note**: You cannot exclude the Secure Documents folder.
Windows example

Enter the string in one of these formats based on type:

- C:\Program Files, System, or a subfolder in those paths - for files needed by the system
- Variables with a %VALUE% format
- KNOWNFOLDERID - for Windows-specified known-folder ID mappings. For example, enter a string for a uniquely named folder like My Excluded Basic File Types and then tell users to create that folder in their User Profile. Here are examples of supported formats for Known Folder ID mappings:
  - GUID with dashes: D0384E7D-BAC3-4797-8F14-CBA229B392B5
  - GUID without dashes: D0384E7DBAC347978F14CBA229B392B5
  - GUID with dashes and curly brackets: {D0384E7D-BAC3-4797-8F14-CBA229B392B5}

If the computer has more than one user, only the current logged-in user can place files in that folder and have them excluded from the sweep. Any files that another user has placed in that folder will be swept and encrypted.

Mac example

Enter the string in this format:

- Variable with a $VALUE format, for example, $HOME/Documents or $HOME/Hidden

Note: For Force-protected mode, a sweep occurs in the /Users folder.

Inform users of the impact or usability

If you define a unique folder name in the Folder Exclusions for Basic File Protection policy so that users can store files of a specific type that should not be encrypted, the policy does not create that folder on the client computers. You must inform users of the folder name and the need to create it.

Users can add subfolders and create names. The content of subfolders is also excluded.

Note: If that folder already has files that are encrypted with Basic File Protection, those files are not decrypted.

Unsupported applications and file types

- Do not add these Office file extensions to the Basic File Configuration policy: .docx, .pptx, .xlsx, .docm, .pptm, .xlsm, .pdf. Basic File Protection does not scan these during a sweep.
- PhotosApp.exe (Windows 8.1)

Remove a file type

If you modify the Folder Exclusions for Basic File Protection policy to remove a file type, those encrypted files on the client computer are decrypted.

However, if the computer has more than one user, only the current logged-in user has files decrypted. If the logged in user logs out and a second user logs in, the sweep starts again but decrypts only the files of the second logged-in user.

Use the Recovery Tool
For more information, see the Recovery Tool document > Data Guardian.

Plan for factors in configuration

You can modify Data Guardian to encrypt additional file types. However, to ensure protection, be aware of the following factors.

<table>
<thead>
<tr>
<th>File extension type or environment</th>
<th>Issue</th>
<th>Options or Solution</th>
</tr>
</thead>
</table>
| Cloud Encryption enabled (Windows 2.7 and earlier) Windows 8.1 - 10 and higher Universal Windows Platform (UWP) application added to Basic File Protection Configuration policy (See below for steps to add a UWP application.) | In the Basic File Protection Configuration policy, if you add any UWP application and the processes that support the app, all UWP applications are enabled to read these encrypted file types. Edge is a UWP application. File extensions added to the policy, such as .txt or .png, are encrypted. However, if users use Edge to upload these encrypted files to a cloud storage provider, the file is decrypted. | Options to avoid Edge decrypting files on upload: |}
| | | • Do not add UWP apps to the configuration field. | |
| | | or | |
| | | • If you add a UWP application, block Edge through GPO or ensure that it is not installed on computers. | |
| | | • Consider which UWP applications you want users to have encrypted. However, test all UWP applications before deploying Basic File Protection to the enterprise to ensure that the intended file types remain encrypted. | |

To add a Universal Windows Platform (UWP) application

1. In the Basic File Protection Configuration policy, enter the UWP application name.
2. Also enter the following process names:
   - RuntimeBroker.exe
   - sihost.exe

   **Note:** For Windows 8, if you want to add Photo Previewer as a UWP application to the Basic File Protection Configuration policy, you must also add the DLLHost.exe process.
3. To add the file extensions that each .exe will encrypt, follow the examples in the policy.

Set TITUS classification (Opt-in mode)

For Data Guardian 1.6 and later, you can use the Titus Classification Encryption Mapping policy to set one or more TITUS classifications to encrypt unprotected Office documents (.docx, .pptx, .xlsx, .docm, .pptm, .xlsm, or .pdf) for Windows.

TITUS classification in a Data Guardian environment with Opt-in mode provides another way for users to protect Office documents. When a user right-clicks and selects a TITUS classification that you have configured, Data Guardian converts it to a protected Office document.

Currently, TITUS classification applies only to Office documents and PDFs, not additional file extensions set in the Basic File Protection policy.
In the policy, you can also add keywords.

**Configure TITUS to encrypt files**

**TITUS server**

The TITUS server administrator must set the TITUS Classification levels on the TITUS server.

Here are some examples.

<table>
<thead>
<tr>
<th>TITUS Classification level</th>
<th>TITUS Classification Encryption mapping policy - formatting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public</td>
<td>t_class_1</td>
</tr>
<tr>
<td>Internal</td>
<td>t_class_2</td>
</tr>
<tr>
<td>Confidential</td>
<td>t_class_3</td>
</tr>
<tr>
<td>Restricted</td>
<td>t_class_4</td>
</tr>
</tbody>
</table>

For more information, see the *TITUS Administration Guide*.

**Management Console**

Configure the policy on the Management Console:

1. From the TITUS server administrator, obtain the format for each TITUS classification level.
2. In the *Management Console > Protected Office Documents* policy group, enable these policies:
   - *Protected Office Documents*
   - *Advanced: Encrypt based on Titus Classification*

   Do not select the *Force Protected Files Only* policy.
3. In the *Titus Classification Encryption Mapping* policy field, enter the formatting. For example, for Data Guardian to encrypt a *Restricted* TITUS classification, enter **Set classification to t_class_4**.
4. Separate each classification by a carriage return, semi-colon, or comma, for example, **t_class_1, t_class_2**.
5. Optionally, obtain keywords for sensitive data from the TITUS administrator. For example, TITUS can scan a document for sensitive data, like Social Security Numbers. If you enter a keyword for that in this policy field and TITUS detects it, that document is protected as *Restricted* regardless of which TITUS option the user selects. For more information, see *Actions* in the *TITUS Administration Guide*.

**Configure TITUS to encrypt macro-enabled documents**

To use TITUS classification with Data Guardian and macro-enabled documents (.docm, .pptm, .xlsm) requires additional configuration.

1. In the TITUS Administration Console, select the *Configurations* tab.
2. Select the current enabled configuration from the list and click *Edit*.
3. In the left pane, click *Adapters*.
4. In the Adapter column, click *OPC Document Properties*.
5. Click *Edit*.
7. Click Save.

**Configure Data Classification for Data Guardian’s Opt-in mode**

In Windows for Office documents and PDFs, use the *Data Classification Rules* policy to set rules that enforce encryption on sensitive data.

**Note:** Users also have the option to right-click a file that has been analyzed by Data Classification and select **Protect File**.

You can set Classification rules at the Enterprise, Endpoint Groups, or Endpoints populations. Dell recommends that IT best practices are followed during the deployment. This includes, but is not limited to, controlled test environments for initial tests and staggered deployments to users. Initially, do not select the Encrypt check box for any classifications. View the audit event reports to see the amount of data returned and the number of endpoints affected. Then modify your rules. To store a large amount of data, see Export Dell Data Guardian Audit Events to SIEM a Server.

To configure the *Data Classification Rules* policy:

1. In the **Data Guardian** technology group, set these policies to on:
   - **Protected Office Documents**
   - **Classification**

2. Click **Edit Rules**. Edit and delete icons display for each classification. An Elements button displays at the bottom.

3. Configure the classifications, rules, elements, and actions:
   - **Modify a Classification**
   - **Add an Enterprise-Specific Classification or Tag Element**
   - **View Audit Event Reports**

4. Each time you add or modify a classification or add a rule, you must click **Save** beneath the *Data Classification Rules* policy.

   **Note:** If you navigate away from this page without clicking Save at the bottom, your changes are not saved.

5. When finished, click **Save** in the upper-right and commit the policy.

The sweep for Data Classification does not include folders for your cloud storage provider. Also, if a file is already encrypted, the sweep does not rescan it to classify it.

**Modify a Classification**

The *Data Classification Rules* policy allows you to modify:

- **Classification Name and Priority** - The policy lists sample classification names with default priorities that you can modify:
  - Restricted - priority 3, the highest
  - Internal Use - priority 2
  - Public - priority 1, the lowest. The lowest priority displays *(default)* after the classification name, and no rules or actions apply.

  **Important:** Optionally, you can delete these classifications but the policy requires a minimum number. See Delete.
**Actions:**

- **Encrypt** - If you select the Encrypt check box for a non-default classification, the system encrypts the files. In addition, Reports can list which files were encrypted based on classification rules. If you select Encrypt and the system sweeps an endpoint and encrypts, the files remain encrypted.

- **Audit** - By default when the Classification policy is enabled, the Audit action applies to all files. You can view these in Audit Events and Reports. The report displays the first 2000 audit events. Before deploying, you can configure the classifications and rules without selecting the Encrypt option and then generate an audit report to determine the impact on endpoints and then further modify the rules.

- **Rules** - For configured rules, the system will sweep and detect them when a user saves the file. If the Encrypt check box is selected, the system encrypts the files.

- **Elements** - Options for configuring a rule, such as Credit Card number, US Name, Social Security Number, or Tags.

**Classification Name and Priority**

To modify:

1. See Configuration overview.
2. Select a non-default classification name, and click the Edit icon.
3. Optionally, modify the classification name.
4. Modify the priority:
   - The Priority label lists the range of numbers based on your number of classifications.
   - The largest number is the highest priority.
   - By default, Public is set to 1, the lowest priority. Whichever classification is set to priority 1 is listed with the (default) label and has no Encrypt option and no rules to modify. If you configure rules for a higher classification but then change the priority to 1, those rules are ignored.
5. To remove a classification, select one and click the Delete icon (X). The range of priorities will also decrease.

**Important:** The policy requires a minimum number of classifications

- For files to be encrypted, this policy requires a minimum of two classifications and one Encrypt check box selected.
- For the policy to function and create audit events, this policy requires a minimum of one classification.

6. In Edit Classification, click Save.
7. Below the Data Classification Rules policy, click Save.

**Actions**

To modify:

1. See Configuration overview.
2. Click the icon to expand a non-default classification.
3. Select the Encrypt check box if you want the audit report to display files that have met the criteria for encryption.

4. Below the Data Classification Rules policy, click Save.

Return to top

Rules

To modify:

1. See Configuration_overview.
2. Click the icon to expand a non-default classification.
3. Click + to add a rule.
4. In the Rule field that displays, select one or more check boxes for that rule and modify the number if needed. Incremented numbers mean that a file must contain that element, such as U.S. Address or Social Security Number, the specified number of times or higher in order to encrypt the file. For example, if your file lists a sample U.S. Address, you may not want the file to be encrypted. Therefore, you could set this number to 2 for an encryption.
5. Click + to add and configure more rules for that classification. Rules are or’d together.
6. Below the Data Classification Rules policy, click Save.

Return to top

Elements

To view Elements:

1. See Configuration_overview.
2. Select a non-default classification.
3. Click the Elements button at the bottom.
4. On the Elements window, select an element.
5. Do not modify the Content Identifier or Content Type.
6. See the table below.
7. When finished with the Elements window, click Save.
8. Below the Data Classification Rules policy, click Save.

For elements that you can modify, if you use them in multiple classifications be aware that future changes impact all classifications that use that element.

<table>
<thead>
<tr>
<th>Data Classification Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Predefined Elements:</td>
<td></td>
</tr>
<tr>
<td>• Credit Card</td>
<td>Do not modify these elements, except for US Name.</td>
</tr>
<tr>
<td>• Email (IPv4 and IPv6 IP addresses are recognized.)</td>
<td>For US Name, use these fields: First Names, Last Names, Common Words.</td>
</tr>
<tr>
<td>• IP Address</td>
<td>You cannot delete these elements.</td>
</tr>
<tr>
<td>• Social Security Number</td>
<td></td>
</tr>
<tr>
<td>• US Address</td>
<td></td>
</tr>
<tr>
<td>• US Date</td>
<td></td>
</tr>
</tbody>
</table>
### Keywords elements

In the Keywords field, type any key words that you want the system to recognize when encrypting files for that classification. The format is [object Object].

Click **Save** to save.

Click **X** to delete.

See [Add an Enterprise-Specific Classification or Tag Element](#).

### Tags elements

**Public, Internal Use, Confidential, Restricted**

Select the tag element that corresponds to the classification, for example, with the **Restricted** classification, select **Restricted Tag**.

In the Tag field, a default tag displays. The system recognizes that tag when encrypting that classification.

For Tag elements, do not enter content in the **Regex** field.

Click **X** to delete.

**Note:** If end users want to use the Tag option in Office documents to trigger a classification, inform them of the content in the Tag field. End users must match the case.

See [Add an Enterprise-Specific Classification or Tag Element](#).

### Custom Regex element

The best practice is not to modify the Regex for predefined elements or Tag elements. Use the Custom Regex element or create a new Regex element. See [Add an Enterprise-Specific Classification or Tag Element](#).

9. When finished with the Elements window, click **Save**.

10. Below the **Data Classification Rules** policy, click **Save**.

[Return to top](#)

---

### Add an Enterprise-Specific Classification or Tag Element

#### Create a Classification

You can create an additional classification or modify the names of existing ones.

To create a new classification:

1. See [Configuration overview](#).
2. In the **Data Classification Rules** policy, click the add icon (+) next to **Classifications**.
3. In the Add Classification window, enter a name for the classification.
4. Enter a priority. A number displays to indicate the range of classifications in your list. See [Classification_Name_and_Priority](#).
5. Click **Add**.
6. Below the **Data Classification Rules** policy, click **Save**.

#### Create an Element

To create an element:

1. See [Configuration overview](#).
2. In the **Elements** window, click the add icon (+) next to **Elements**.
3. In the Content Identifier field, enter a unique identifier.
4. Select a Content Type.

**Note:** Select the KeywordContent for any Keywords elements; the FileTagMetadataContent for any Tag elements, and the CustomRegexContent for any Regex elements.
5. Click **Add**.

---

285
6. Below the Data Classification Rules policy, click Save.

7. Modify the Element when it displays in the Element window.

After you create an element, you can add it as a new rule.

For Regex, the best practice is to create a new element with a Content Identifier such as MyEnterprise Custom Regex or Custom Regex for Internal Use. Any Custom Regex would use the Content Type Custom Regex. However, do not use Custom Regex for predefined or Tags elements.

**Note:** Data Classification uses the .NET regex engine.

**Return to top**

**View Audit Event Reports**

Any documents that are impacted by Data Classification rules can display in Audit Events and Reports. If you select the Encrypt check box in policy, the report can also display which files were encrypted based on these rules.

You can set filters on the columns to view the essential data in the report.

**Return to top**

**Configure Access Groups (On-prem)**

Data Guardian's Access Groups (formerly Circle of Trust) enhances security by creating user groups that can collaborate on encrypted data. Users outside a group cannot access or view the data unless the owner of the file grants access. Access Groups can include internal and external users. You can use Access Groups with Windows, Mac, mobile, and web portal.

Data Guardian encrypted files:

- Internal users within an access group have access to encrypted data.
- Internal users outside an access group or external users do not have access but can request access.

**Important:** Currently, if you enable Access Groups in the Management Console, you cannot disable it.

To configure access groups, complete the following:

- **Set up Access Groups**
- Determine whether the enterprise already has Data Guardian installed. Implementation will be easier if you have a brief transition period where you allow users with shared files to prepare a plan for shared files. Do one of these:
  - **Enterprise does not yet have Data Guardian** - Transition time differs based on Force-Protected or Opt-in mode. Instruct users to process shared files.
  - **Enterprise has Data Guardian Installed** - Instruct users to process shared, encrypted files.
- **Configure Access Groups**
- **Disable Auto access for swept files**

**Set up Access Groups**

Analyze which users to include within each access group based on which users need to share or collaborate on documents. You can create groups before or after enabling Access Groups in the Management Console.
To set up groups, see Add a User Group.

For Access Groups, you can configure the following:

- Import existing AD groups, for example, an accounting or legal group that shares files.
- Select ADMIN-DEFINED User Groups for cross-functional teams of managed users and any external users that share or collaborate on files.
  
  **Note:** When defining new groups, be sure to use descriptive names. On the client side, users will be selecting some of these groups.
- After you add the user group, you can select that group, select the Details and Action tab, and enable Access Groups for a single group or a combination of groups.

Also consider the following:

- Develop a plan for adding and removing users from a group if internal users join or leave the enterprise.
- As a best practice, stagger deployment of Access Groups to user groups.
  
  **Note:** Access groups should be specific groups within the enterprise, not the entire enterprise.

**Enterprise does not yet have Data Guardian**

If you do not yet have Data Guardian installed, develop a plan for implementing access groups and creating a smooth transition for users who have shared files.

**Determine a transitional time range for deployment**

Initially, enable Access Groups and Auto access for swept files for a transitional period. This should be a brief time but long enough for user files to be swept. In the transitional period, allow enough time for the following:

- Determine or estimate the quantity of documents that users have. Allow enough time for Data Guardian to sweep unprotected files. A sweep occurs with the following:
  - If you enable Force-Protected mode (Office documents and PDFs) or Basic File Protection (additional file types), all those unprotected files are swept.
  - Opt-in mode - A sweep only occurs for Data Classification (Windows only), TITUS Classification (Windows only), or Basic File Protection (additional file types).
- Users must log in to their computers while Access Groups and Auto access for swept files are enabled. Be sure to allow for users who are out of the office or on vacation.

**Instruct users to process shared files**

Inform internal users who will be in their access group and allow them to process shared files to ensure a smooth transition. Inform them that this effort will minimize their having to request access to shared files later.

- After Access Groups is enabled, a sweep occurs for Windows and Mac files. See Disable Auto access for swept files. If files are shared by multiple users, the first computer to be swept gives ownership of any shared files to the owner of that computer, not the original author.
  - All internal users within the same access group will have access to the file.
• If the original author of the file is not in the access group with the user whose computer was first swept, the author must request access or request that the administrator change ownership of the file.

• External users’ unprotected shared files are not swept.

• If Auto access will be temporarily enabled, instruct users that any internal user outside their access group who has a copy of the file has permanent access to the key. In some cases, the key cannot be revoked later. See Disable_Auto_access_for_swept_files.

Note: After Auto access is disabled, for those outside an access group, the internal user can grant access or users outside the access group can request access if they receive an encrypted file. You can revoke the key access in the Management Console if needed.

Return to top

Enterprise has Data Guardian Installed

If you have Data Guardian installed, develop a plan for implementing access groups and creating a smooth transition for users who have shared files.

Determine a transitional time range for deployment

Initially, enable Access Groups and Auto access for swept files for a transitional period. This should be a brief time but owners of a protected, shared file should plan for any impact to that file.

Instruct users to process shared files

Inform internal users who will be in their access group and allow them to process shared files to ensure a smooth transition.

• During the Auto-access transitional period, all internal users within the same access group have access to the shared, protected files.

• If Auto access will be temporarily enabled, instruct users that any internal user outside their access group who has a copy of the file and opens it has permanent access to the key. In some cases, the key cannot be revoked later. See Disable_Auto_access_for_swept_files.

• If a user does not open a file and auto access is disabled, they lose access.

• If an internal user already granted access to an external user, the external user will not lose access.

• When a file is created after Access Groups is enabled, all users within that access group have access to the file.

• If a user is removed from the access group, the user no longer has access to the files.

• If the owner of the file is removed from the access group, others who shared access still have access.

For detailed information on the impact, see Disable_Auto_access_for_swept_files.

Return to top

Configure Access Groups

IT best practices should be followed during deployment. This includes, but is not limited to, controlled test environments for initial tests, and staggered deployments to users.

1. Enable Data Guardian Access Groups and, optionally, Auto access for swept files.

Important: Currently, if you enable Access Groups, you cannot disable it.
2. If you have not yet created user groups for this feature, see Add a User Group.
3. In User Groups, select a group.
4. On User Group Detail, select the Details and Action tab.
5. Click the check box for Access Group Enabled.

**Note:** You can also modify the group members, remove the group, or clear the Access Group check box.

With Access Groups enabled, the Protected File Access screen allows internal users to select one or more access groups or add an individual when sharing a protected file. External users who own a document can share it with individual users but not access groups. This is available on Windows, Mac, mobile, and web portal. For more information, see the Data Guardian User Guide.

**Disable Auto access for swept files (Windows and Mac)**

If you have a transitional period, when it is complete, clear the Auto access for swept files check box.

Be aware of the following for an enterprise that already had Data Guardian installed on Windows or Mac.

**Internal users in access groups**

<table>
<thead>
<tr>
<th>Force-protected mode</th>
<th>Pre-existing encrypted files created before Access Groups</th>
<th>New files created after were enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Force-protected mode - files that Data Guardian swept</strong></td>
<td>Internal users within the access group do not have automatic access.</td>
<td>Internal users within the access group have protected files.</td>
</tr>
<tr>
<td>• Force-Protected sweep (Office documents, PDFs)</td>
<td>• Owner of the file can grant protected access.</td>
<td>• If someone is removed from access.</td>
</tr>
<tr>
<td>• Basic File Protection sweep (additional file types)</td>
<td>• Users with a protected file can request access.</td>
<td>• If the owner of a file leaves then still have access.</td>
</tr>
<tr>
<td></td>
<td>In the Management Console, if needed, you can revoke key access that has been granted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> During the transitional period when Auto access for swept files was enabled, if a user within the access group opened the file, that user has permanent access, and you cannot revoke key access.</td>
<td></td>
</tr>
</tbody>
</table>

**Opt-in mode**

<table>
<thead>
<tr>
<th>Opt-in mode - files that Data Guardian swept</th>
<th>Same as above.</th>
<th>Same as above.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Secure documents folder sweep</td>
<td>Same as above.</td>
<td>Same as above.</td>
</tr>
<tr>
<td>• Basic File Protection sweep (additional file types)</td>
<td>Same as above.</td>
<td>Same as above.</td>
</tr>
<tr>
<td>• TITUS classification (Windows)</td>
<td>Same as above.</td>
<td>Same as above.</td>
</tr>
<tr>
<td>• Data classification (Windows)</td>
<td>Same as above.</td>
<td>Same as above.</td>
</tr>
</tbody>
</table>

**Opt-in mode files protected through:**

<table>
<thead>
<tr>
<th></th>
<th>Same as above.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Protected Save As</td>
<td>Same as above.</td>
</tr>
<tr>
<td>• Right-click protect</td>
<td>Same as above.</td>
</tr>
<tr>
<td>• Basic File Protection - direct save</td>
<td>Same as above.</td>
</tr>
<tr>
<td>• Protected messages</td>
<td>Same as above.</td>
</tr>
<tr>
<td>Internal users within the access group do not have automatic access.</td>
<td>Owner of the file can grant protected access.</td>
</tr>
<tr>
<td></td>
<td>Users with a protected file can request access.</td>
</tr>
<tr>
<td>In the Management Console, if needed, you can revoke key access that has been granted.</td>
<td></td>
</tr>
</tbody>
</table>

**Internal users not in the access group and external users**
Manage Policies

Files created before Access Groups were enabled

<table>
<thead>
<tr>
<th>Force-protected mode - files that Data Guardian swept</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Force-Protected sweep (Office documents, PDFs)</td>
</tr>
<tr>
<td>• Basic File Protection sweep (additional file types)</td>
</tr>
<tr>
<td>Note: Sweeping only applies to internal users. External users' computers are not swept.</td>
</tr>
</tbody>
</table>

Internal users outside the access group and external users do not have automatic access.

- Owner of the file can grant protected access.
- Users with a protected file can request access.

In the Management Console, if needed, you can revoke key access that has been granted.

Note: During the transitional period when Auto access for swept files was enabled, if a user within the access group opened the file, that user has permanent access, and you cannot revoke key access.

Opt-in mode

<table>
<thead>
<tr>
<th>Opt-in mode - files that Data Guardian swept</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Secure documents folder sweep</td>
</tr>
<tr>
<td>• Basic File Protection sweep (additional file types)</td>
</tr>
<tr>

</tr>
<tr>
<td>• Data classification (Windows)</td>
</tr>
<tr>
<td>Note: Sweeping only applies to internal users. External users' computers are not swept.</td>
</tr>
</tbody>
</table>

Internal users outside the access group and external users: Same as above.

Opt-in mode files protected through:

- Protected Save As
- Right-click protect
- Basic File Protection - direct save
- Protected messages

Internal users outside the access group and external users: Same as above.

During the transitional period when Auto access for swept files was enabled, if a user within the access group opened the file, that user has permanent access, and you cannot revoke key access.

Change the owner of a file

After enabling Access Groups, if another user was designated as the owner of a shared, encrypted document, you can change the owner. See Key Management.

Removable Media Encryption

A note about Removable Media policies: Mac Media Encryption policies are device-based policies. This is different behavior than Windows Media Encryption, which are user-based.

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<td>This technology allows definition of what media encryption events to retain in logs.</td>
</tr>
</tbody>
</table>
| Event Retention         |                 | "security", "fail", "30"  
"security", "success", "30"  
"application", "error", "30"  
"application", "warn", "15"  
"application", "info", "5"  
"application", "debug", "5"  
Defines the amount of time (in days) that Encryption External Media, and PCS event types are maintained in the event log. Each event type is defined by category and level. You may set different retention times for each event level in each category. The Security category represents events related to user authentication, authorization, or encryption. This includes events for Dell-encrypting devices, updating security policies, or failed authentication attempts. Security events are further differentiated by a fail or success indicating the outcome of the event. The Application category (application type event, rather than a security type event) represents events related to general application actions. These events are further differentiated by a set of severity levels - error, warn, info, and debug. You should use longer retention times for more severe levels. |

Removable Media Policies that Require Logoff

- Windows Media Encryption
- EMS Scan External Media
- EMS Encryption Algorithm
- EMS Exclude CD/DVD Encryption
- EMS Data Encryption Key

Advanced Removable Media Encryption

A note about Removable Media Encryption policies: Mac Media Encryption policies are device-based policies. This is different behavior than Windows Media Encryption, which are user-based.

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.
<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Windows Media Encryption</strong></td>
<td>Off</td>
<td>This technology works on Windows computers using Dell Encryption External Media to encrypt data on removable devices, which can be accessed using a user-defined password. These policies allow configuration of the Encryption External Media password requirements and the removable media allowed.</td>
</tr>
<tr>
<td><strong>EMS Exclude CD/DVD Encryption</strong></td>
<td>Not Selected</td>
<td>False encrypts CD/DVD devices.</td>
</tr>
<tr>
<td><strong>EMS Allow Read-access to unShielded Media (5.4.x Only)</strong></td>
<td>Selected</td>
<td>This policy applies to 5.4.x Windows Encryption clients only.</td>
</tr>
<tr>
<td><strong>EMS Encryption Algorithm</strong></td>
<td>AES256</td>
<td>AES 256, AES 128, 3DES Encryption algorithm used to encrypt removable media. Encryption algorithms in order of speed, fastest first, are AES 128, AES 256, 3DES.</td>
</tr>
<tr>
<td><strong>EMS Data Encryption Key</strong></td>
<td>User Roaming</td>
<td>Common, User, User Roaming Choose a key to be used by the Encryption client to encrypt all data encrypted by the Encryption External Media. You cannot save a policy where this policy has the same value as either User Data Encryption Key policy or Application Data Encryption Key policy, the error message Policy Constraint Violation: The value for EMS Data Encryption Key conflicts with User Data Encryption Key and/or Application Data Encryption Key will display.</td>
</tr>
<tr>
<td><strong>EMS Automatic Authentication</strong></td>
<td>Disabled</td>
<td>Disabled, Local, Roaming Local automatic authentication allows the encrypted media to be automatically authenticated when inserted in the originally encrypting computer when the owner of that media is logged in. When automatic authentication is Disabled, users must always manually authenticate to access encrypted media. Not Selecting Roaming automatic authentication helps to prevent users from forgetting their password when they take the media home or share it with a colleague. Not selecting Roaming automatic authentication also promotes a sense of awareness from a security perspective for users that the data being written to that media is protected.</td>
</tr>
<tr>
<td><strong>EMS Access Encrypted Data on unShielded Device</strong></td>
<td>Selected</td>
<td>Selected allows the user to access encrypted data on removable media whether the endpoint is Dell-encrypted or not. When this policy is False, the user can work with encrypted data when logged on to any Dell-encrypted endpoint. The user cannot work with encrypted data using any device that is not Dell-encrypted.</td>
</tr>
<tr>
<td><strong>EMS Device Whitelist</strong></td>
<td>String</td>
<td>Maximum of 150 devices with a maximum of 500 characters per PNPDeviceID. Maximum of 2048 total characters allowed. &quot;Space&quot; and &quot;Enter&quot; characters count in the total characters used. This policy allows the specification of removable media devices to exclude from encryption [using the device’s Plug and Play device identifier (PNPDeviceID)], thereby allowing users full access to the specified removable media devices. This policy is available on an Enterprise, Domain, Group, and User level. Local settings override inherited settings. If a user is in more than one group, all EMS Device Whitelist entries, across all Groups, apply. This policy is particularly useful when using removable media devices which provide hardware encryption. However, this policy should be used with caution. This policy does not check whether external media devices on this list provide...</td>
</tr>
</tbody>
</table>
hardware encryption. Whitelisting removable storage devices that do not have
hardware encryption do not have enforced security and are not protected.
For example, the Kingston® DataTraveler® Vault Privacy model enforces that
encryption is enabled to use the device. However, the Kingston DataTraveler Vault
model has an unsecured partition and a secured partition. Because it is the same
physical removable media device with only one PNPDeviceID, the two partitions
cannot be distinguished, meaning that whitelisting this particular device would
allow unencrypted data to leave the endpoint.
Additionally, if a removable media device is encrypted and is subsequently added
to the EMS Device Whitelist policy, it remains encrypted and requires a reformat of
the device to remove encryption.
The following is an example of a PNPDeviceID, which contains the manufacturer
identifier, product identifier, revision, and hardware serial number:
USBSTOR\DISK&VEN_KINGSTON
&PROD_DTVault_Privacy
&REV_104070058831A0048480
To whitelist a removable media device, provide a string value that matches
portions of the device’s PNPDeviceID. Multiple device PNPDeviceIDs are allowed.
For example, to whitelist all Kingston DataTraveler Vault Privacy models, input the
string:
PROD_DTVault_Privacy
To whitelist both models of Kingston DataTraveler, the Vault and Vault Privacy
models, input the string:
PROD_DTVault_Privacy;
PROD_DT_Vault
Space characters are considered part of the substring to match to a PNPDeviceID.
Using the previous PNPDeviceID as an example, a space before and after the
semicolon would cause neither of the substrings to be matched, because the
space character is not part of the PNPDeviceID.
Instructions...
To find the PNPDeviceID for removable media:
1. Insert the removable media device into an encrypted computer.
2. Open the EMSService.log in C:\Programdata\Dell\Dell Data
   Protection\Encryption\EMS.
3. Find PNPDeviceID=

   For example:
   14.03.18 18:50:06.834 [I] [Volume "F:\"] PnPDeviceID =
   USBSTOR\DISK&VEN_SEAGATE
   &PROD_USB&REV_04092HCD15KK&0
   VEN=Vendor; Green highlighted text is for the vendor to be excluded
   PROD=Product/Model Name; Adding text highlighted blue also
   excludes all of Seagate’s USB drives
   REV=Firmware Revision; Adding text highlighted gray also excludes the
   specific model being used
   Serial number (in this example); Adding text highlighted yellow excludes
   just this device

   OR

To find the PNPDeviceID for removable media on Windows 7 or later:
1. Insert the removable media device.
2. Open the Control Panel and go to Administrative Tools > Computer
   Management.
3. Select the Hardware tab, select the drive, and click Properties.
4. A new windows displays. Select the Device Instance Path in the
   Property menu.
The PNPDeviceID is displayed in Value .

</tbody>
</table>

**More...**

Message policies must have non-blank values. "Space" and "Enter" characters used to add lines between rows count as characters used. Messages over the 512 character limit are truncated on the client. Optionally customize the message to include specific instructions about how to contact the help desk or security administrator for authentication failures.
Storage devices which incorporate multi-interface connections, such as Firewire, USB, eSATA, etc. may require the use of both EMS and encryption rules to encrypt the endpoint. This is necessary due to differences in how the Windows operating system handles storage devices based on interface type.

To ensure encrypting an iPod via EMS does not make the device unusable, use the following rules:
- \R#: \Calendars
- \R#: \Contacts
- \R#: \iPod_Control
- \R#: \Notes
- \R#: \Photos

You can also force encryption of specific file types in the directories above. Adding the following rules will ensure that ppt, pptx, doc, docx, xls, and xlsx files are encrypted in the directories excluded from encryption via the previous rules:
- ^R#: \Calendars
  .ppt.doc
  .xls.pptx
  .docx.xlsx
- ^R#: \Contacts
  .ppt
  .doc.xl
  .pptx.docx
  .xlsx
- ^R#: \iPod_Control
  .ppt.doc
  .xls.pptx
  .docx.xlsx
- ^R#: \Notes
  .ppt.doc
  .xls.pptx
  .docx.xlsx
- ^R#: \Photos
  .ppt.doc
  .xls.pptx
  .docx.xlsx

Replacing these five rules with the following rule will force encryption of ppt, pptx, doc, docx, xls, and xlsx files in any directory on the iPod, including Calendars, Contacts, iPod_Control, Notes, and Photos:
- ^R#: \; ppt.doc.xls.pptx.docx.xlsx

These rules disable or enable encryption for these folders and file types for all removable devices - not just an iPod. Use care when defining rules to exclude an iPod from encryption.

These rules have been tested against the following iPods:
- iPod Video 30gb fifth generation
- iPod Nano 2gb second generation
- iPod Mini 4gb second generation

Dell does not recommend the use of the iPod Shuffle, as unexpected results may occur.

As iPods change, this information could also change, so caution is advised when allowing the use of iPods on EMS-enabled computers.

Because folder names on iPods are dependent on the model of the iPod, Dell recommends creating an exclusion encryption policy which covers all folder names, across all iPod models.
Mac Media Encryption
This technology works on Mac computers using Dell Encryption External Media to encrypt data on removable devices, which can be accessed using a user-defined password. These policies allow configuration of the Encryption External Media password requirements and the removable media allowed.

<tr>
<td>This policy is available on an Enterprise, Domain, Group, and User level. Local settings override inherited settings. If a user is in more than one group, all EMS Device Whitelist entries, across all Groups, apply. This policy is particularly useful when using removable media devices which provide hardware encryption. However, this policy should be used with caution. This policy does not check whether external media devices on this list provide hardware encryption. Whitelisting removable storage devices that do not have hardware encryption do not have enforced security and are not protected. For example, the Kingston® DataTraveler® Vault Privacy model enforces that encryption is enabled to use the device. However, the Kingston DataTraveler Vault model has an unsecured partition and a secured partition. Because it is the same physical removable media device with only one PNPDeviceID, the two partitions cannot be distinguished, meaning that whitelisting this particular device would allow unencrypted data to leave the endpoint. Additionally, if a removable media device is encrypted and is subsequently added to the EMS Device Whitelist policy, it remains encrypted and requires a reformat of the device to remove encryption. The following is an example of a PNPDeviceID, which contains the manufacturer identifier, product identifier, revision, and hardware serial number: USBSTOR\DISK\VEN_KINGSTON &amp;PROD_DTVault_Privacy\REV_10\07005B831A0048480 To whitelist a removable media device, provide a string value that matches portions of the device’s PNPDeviceID. Multiple device PNPDeviceIDs are allowed. For example, to whitelist all Kingston DataTraveler Vault Privacy models, input the string:</td>
</tr>
</tbody>
</table>

300
To whitelist both models of Kingston DataTraveler, the Vault and Vault Privacy models, input the string:

```
PRD_DTVault_Privacy;
PRD_DT_Vault
```

Space characters are considered part of the substring to match to a PNPDeviceID. Using the previous PNPDeviceID as an example, a space before and after the semicolon would cause neither of the substrings to be matched, because the space character is not part of the PNPDeviceID.

**Instructions...**

1. Insert removable media.
2. Open System Profiler.
3. Under Hardware, select the device and find the Product ID and Vendor ID, as follows:
   - Capacity: 2.06 GB (2,055,019,008 bytes)
   - Removable Media: Yes
   - Detachable Drive: Yes
   - BSD Name: disk2
   - **Product ID:** 0x5406
   - **Vendor ID:** 0x0781 (SanDisk Corporation)
   - **Version:** 0.10
   - **Serial Number:** 000001B8C36725BC8
   - **Speed:** Up to 480 Mb/sec
   - **Manufacturer:** SanDisk
   - **Location ID:** 0x24100000
   - **Current Available (mA):** 500
   - **Current Required (mA):** 200
   - **Partition Map Type:** MBR (Master Boot Record)
   - **S.M.A.R.T. status:** Not Supported

4. The following whitelist rules can be used:
   - `USBVendorName=abc`
   - `USBVendorNum=0x02`
   - `USBVendorNum=2,USBProductNum=3`
   - `USBVendorNum=2,USBProdName=abc`

   For this example, add the following key/pair string to the EMS Device Whitelist policy, as shown below:
   ```
   "USBVendorNum=0x0781,USBProductNum=0x05406"
   ```
   (including quotes)

5. When satisfied with the EMS Device Whitelist rules, save and commit the policy.

---

**EMS Trust for Unsupported File Systems**

<table>
<thead>
<tr>
<th>Ignore</th>
<th>Ignore, Provisioning Rejected, Unshieldable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies how media are handled when formatted by file systems that are not supported with Encryption External Media.</td>
<td></td>
</tr>
</tbody>
</table>

**Restricted user list for access to unencrypted media**

| Dictionary | Users matching this dictionary are restricted from unencrypted media use. Example:
| <key>AccessUnencryptedMediaRestrictionUsers</key> |
| <dict> |
| <key>dsAttrTypeStandard:AuthenticationAuthority</key> |
| <array> |
| <string>Kerberosv5;username1@domainName.com;domainName.com*</string> |
| <string>Kerberosv5;@domainName.org;domainName.org*</string> |
| </array> |
| </dict> |

**Restrict Access to Unencrypted Media**

| Full | Full, Read Only, Block |
| Specify how media encrypted with Encryption External Media is handled for users matching unencrypted media restriction. |

**Removable Media Policies that Require Logoff**

301
Mac Encryption

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell Volume Encryption</td>
<td>On, Off</td>
<td>This technology allows the use of either Mac FileVault full disk encryption or Dell’s proprietary Dell Volume Encryption. Toggle ON to enable Dell Volume Encryption policies. If this policy is toggled to OFF, no Dell Volume Encryption takes place, regardless of other policies.</td>
</tr>
<tr>
<td>Encrypt Using FileVault for Mac</td>
<td>Not Selected</td>
<td>If selected, FileVault is enabled to encrypt all volumes including System Volumes and Fusion Drives.</td>
</tr>
<tr>
<td>Workstation Scan Priority</td>
<td>Normal</td>
<td>Specifies the relative priority of encrypted folder scanning. High and Highest prioritize scanning speed over computer responsiveness, Low and Lowest prioritize computer responsiveness over scanning speed and favor other resource-intensive activities, and Normal balances the two. The Encryption client checks for a changed Workstation Scan Priority before processing the next file. This policy applies to Dell Encryption, not FileVault encryption.</td>
</tr>
</tbody>
</table>

See advanced settings

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac Global Settings</td>
<td>System Volume Only, All Fixed Volumes</td>
<td>This technology defines Mac encryption behavior, including targeted volumes, polling intervals, and restart policies. The System Volume Only setting secures only the currently running system volume.</td>
</tr>
<tr>
<td>Volumes Targeted for Encryption</td>
<td>All Fixed Volumes</td>
<td></td>
</tr>
<tr>
<td>Policy Proxy Connections</td>
<td>String - maximum of 1500 characters</td>
<td></td>
</tr>
</tbody>
</table>
List fully qualified Policy Proxy hostnames, or IP addresses, separated by carriage returns.

More...

Once the Encryption client finds a valid entry, the remainder of the entries are ignored.

Entries are processed in the following order:
1. GKConnections Override (this registry entry overrides all other entries)
2. GKConnections (this registry entry is set automatically by the Encryption client, based on the this policy)
3. GK

This policy works in conjunction with the Policy Proxy Polling Interval policy.

You cannot specify ports in this policy.

The Encryption client communicates with Policy Proxies using the GKPORT specified during client installation (the default is 8000).

Inherited values for this policy accumulate.

For the Encryption client to connect to a Policy Proxy specified in this policy, it must be in the same group as the Policy Proxy specified during client installation.

Because the Shield supports up to 255 users per endpoint, this policy is available only at the Enterprise level.

<table>
<thead>
<tr>
<th>Policy Proxy Polling Interval</th>
<th>360</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-1440 minutes</td>
<td>The interval that the Encryption client attempts to poll Policy Proxy for policy updates, and send inventory information to Policy Proxy. Setting the Policy Proxy Polling Interval below 60 minutes is not recommended, due to potential degradation of performance. The Encryption client also attempts to poll Policy Proxy each time a user logs on.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Force Restart on Policy Updates</th>
<th>Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this policy is set to Selected, the Encryption client will force a computer restart after the specified delay upon receiving a policy update requiring a restart. The delay is specified by the Length of Each Restart Delay and Number of Restart Delays Allowed policies. If this policy is set to Not Selected, the Encryption client will neither force nor prompt for a restart. The policy requiring the restart will take effect the next time the user restarts their computer.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Length of Each Restart Delay</th>
<th>15</th>
</tr>
</thead>
<tbody>
<tr>
<td>If Force Restart on Policy Updates is set to Selected, this value is the number of minutes the user can delay the restart before another restart prompt is displayed. If Force Restart on Policy Updates is set to Not Selected, this policy is ignored. More... The Encryption client displays the restart prompt for five minutes each time. If the user does not respond to the prompt, the prompt is dismissed and next delay begins. If the five-minute timer expires and no restart delays remain, the computer restarts immediately.</td>
<td></td>
</tr>
</tbody>
</table>
**Manage Policies**

Tip: Calculate the maximum possible delay as follows (a maximum delay would involve the user responding to each delay prompt immediately prior to the 5-minute mark):
(Number of Reboot Delays Allowed x Length of Each Reboot Delay) + (5 minutes x [Number of Reboot Delays Allowed + 1]).

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Restart Delays Allowed</td>
<td>3</td>
<td>If Force Restart on Policy Update is set to Selected, this value is the number of times the user can delay the restart. If this policy is set to “0”, the Encryption client prompts the user to restart immediately and forces the restart if the user does not acknowledge the prompt within five minutes. If Force Restart on Policy Updates is set to Not Selected, this policy is ignored.</td>
</tr>
</tbody>
</table>

**Advanced Mac Encryption**

</thead>
</table>
| Max Password Delay            | 300             | 0-32400 seconds  
Limits the maximum delay in seconds that can be set in the system preferences “max password delay after screen saver or sleep” of the Security panel. |
| Delay Authentication          | Not Selected    | If Selected, users are not prompted to activate or authenticate to the Dell Server until required, such as to use media encrypted with Encryption External Media. |
| No Auth User List             | Dictionary      | Users matching this dictionary are not required to activate or authenticate to the Dell Server. Example: 
```
<key>NoAuthenticateUsers</key> 
<dict> 
<key>dsAttrTypeStandard:AuthenticationAuthority</key> 
<string>;Kerberosv5;;@students.school.edu;students.school.edu</string> 
</dict>
```
| FileVault 2 PBA User List     | Dictionary      | Users matching this dictionary are allowed to add themselves to FileVault Preboot Authentication. Example: 
```
<key>FV2PBAUsers</key> 
<dict> 
<key>dsAttrTypeStandard:AuthenticationAuthority</key> 
<string>;Kerberosv5;;*@students.school.edu;students.school.edu*</string> 
</dict>
```

Port Control

Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Windows Port Control</strong></td>
<td>Disabled</td>
<td>Enable or Disable all Port Control System policies. If this policy is set to Disable, no Port Control System policies are applied, regardless of other Port Control System policies. All PCS policies require a reboot before the policy takes effect.</td>
</tr>
<tr>
<td>Port: Express Card Slot</td>
<td>Enabled</td>
<td>Enable, Disable, or Bypass ports exposed through the Express Card Slot.</td>
</tr>
</tbody>
</table>
### Manage Policies

**Port: USB**
- **Enabled**
- Enable, Disable, or Bypass port access to external USB ports.
- USB port-level blocking and HID class-level blocking is only honored if we can identify the computer chassis as a laptop/notebook form-factor. We rely on the computer’s BIOS for the identification of the chassis.

**Port: eSATA**
- **Enabled**
- Enable, Disable, or Bypass port access to external SATA ports.

**Class: Storage**
- **Enabled**
- PARENT to the next 3 policies. Set this policy to Enabled to use the next 3 Subclass Storage policies. Setting this policy to Disabled disables all 3 Subclass Storage policies - no matter what their value.

See [advanced settings](#)

### Windows Device Control
This technology allows for control of all the devices on a Windows computer (disable/enable), and can be customized by device type.

**Class: Windows Portable Device (WPD)**
- **Enabled**
- Control access to all Windows Portable Devices.

**Subclass Windows Portable Device (WPD): Storage**
- **Full Access**
- CHILD of Class: Windows Portable Device (WPD).
- Control access to all Human Interface Devices (keyboards, mice).

**Class: Human Interface Device (HID)**
- **Enabled**
- Control access to all Human Interface Devices (keyboards, mice).

See [advanced settings](#)

### Advanced Port Control
Policy descriptions also display in tooltips in the Management Console. In this table, master policies are in bold font.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Windows Port Control</strong></td>
<td></td>
<td>This technology allows for control of all the physical ports on a Windows computer (disable/enable/bypass), and can be customized by port type.</td>
</tr>
</tbody>
</table>

**Subclass Storage: External Drive Control**
- **Full Access**
- CHILD of Class: Storage. Class: Storage must be set
This policy interacts with EMS Access to unShielded Media policy. If you intend to have Full Access to media, also set this policy to Full Access to ensure that the media is not set to read only and the port is not blocked.

- **Full Access:** External Drive port does not have read/write data restrictions applied
- **Read Only:** Allows read capability. Write data is disabled
- **Blocked:** Port is blocked from read/write capability

This policy is endpoint-based and cannot be overridden by user policy.

**Subclass Storage: Optical Drive Control**

- **CHILD of Class:** Storage. Class: Storage must be set to Enabled to use this policy.
- **Full Access:** Optical Drive port does not have read/write data restrictions applied
- **UDF Only:** Blocks all data writes that are not in the UDF format (CD/DVD burning, ISO burning). Read data is enabled.
- **Read Only:** Allows read capability. Write data is disabled
- **Blocked:** Port is blocked from read/write capability

This policy is endpoint-based and cannot be overridden by user policy.

Universal Disk Format (UDF) is an implementation of the specification known as ISO/IEC 13346 and ECMA-167 and is an open vendor-neutral file system for computer data storage for a broad range of media.

To encrypt data written to CD/DVD media:
- Set EMS Encrypt External Media = True, EMS Exclude CD/DVD Encryption = False, and Storage Class: Optical Drive Control = UDF Only.

**Subclass Storage: Floppy Drive Control**

- **CHILD of Class:** Storage. Class: Storage must be set to Enabled to use this policy.
- **Full Access:** Floppy Drive port does not have read/write data restrictions applied
- **Read Only:** Allows read capability. Write data is disabled
- **Blocked:** Port is blocked from read/write capability

This policy is endpoint-based and cannot be overridden by user policy.

**Port: PCMCIA**

- **Enabled**
- Enable, Disable, or Bypass port access to PCMCIA ports.

**Port: Firewire (1394)**

- **Enabled**
- Enable, Disable, or Bypass port access to external Firewire (1394) ports.

**Port: SD**

- **Enabled**
- Enable, Disable, or Bypass port access to SD card ports.

**Port: Memory Transfer Device (MTD)**

- **Enabled**
- Enable, Disable, or Bypass access to Memory Transfer Device (MTD) ports.

See [basic settings](#).

---

**Windows Device Control**

This technology allows for control of all the devices on a Windows computer (disable/enable), and can be customized by device type.
Manage Policies

Class: Other  |  Enabled  | Control access to all devices not covered by other Classes.

See [basic settings](#)

Global Settings

Global Settings policies are available at the Enterprise, Endpoint Groups, and Endpoints levels. All Global Settings policies are endpoint-based, meaning the policies follow the endpoint, not the user.

Audit Control policies are available at the Enterprise, Endpoint Groups, Endpoints, User Groups, and Users levels.

Policy descriptions also display in tooltips in the Management Console.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Settings</strong></td>
<td></td>
<td>This technology allows control over general settings such as polling intervals, support dialogs, in-app feedback, auto updates, data auditing, and client retention periods.</td>
</tr>
<tr>
<td>Device Lease Period</td>
<td>30</td>
<td>Defines the period of inactivity (in days) before any activated entity (a user, endpoint, or policy proxy) is automatically removed from management. The inactivity period is based on the number of days since the Dell Server last received inventory information from the activated entity. Once removed, the entity is no longer included in reports, statistics, and other administrative views. If the activated entity communicates with the Dell Server after the inactivity period has expired, it returns to being in a managed state. The Dell Server always keeps encryption keys in escrow, even for removed endpoints. This ensures recoverability of data through various workflows, such as re-activation and forensic analysis.</td>
</tr>
<tr>
<td>Enable In-App Feedback</td>
<td>Not selected</td>
<td>When selected, a user can submit feedback and satisfaction ratings to Dell via a link within the application to a web form.</td>
</tr>
<tr>
<td>Server Polling Interval</td>
<td>360 minutes</td>
<td>1-1440 minutes  How often in minutes the SED client attempts to contact the Dell Server for updates.</td>
</tr>
<tr>
<td>Custom Support Dialog</td>
<td>String</td>
<td>Customizable text that provides information for users to contact IT support for the organization. This allows a maximum of 10,000 characters, which can be four lines with a maximum of 2500 characters each. The text cannot contain line feeds, Enters, or similar characters unless they are escaped. If an administrator enters an invalid character (non-JSON format), this may cause Data Guardian clients to stop activating. For user experience on Windows devices, a maximum of 2000 characters is recommended; for Mobile devices and Mac, a maximum of 1000 characters is recommended.</td>
</tr>
