1 Introduction

1.1 Purpose

This document addresses the configuration and implementation considerations for the key components required to deliver Advanced Threat Prevention, Policy-Based Encryption and Removable Media Encryption in a Citrix persistent or non-persistent Virtual Desktop Infrastructure environment.

1.2 Scope

Relative to delivering the virtual desktop environment, the objectives of this document are to:
- Provide a configuration document for the setup of Endpoint Security Suite Enterprise in a VDI environment.
- Configuration of Advanced Threat Prevention.
- Configuration of Removable Media Encryption.
- Configuration of Policy-Based Encryption.

1.3 Configuration Prerequisites

This lists the prerequisites needed:
- Citrix Environment. See Section 4 for more details.
- Microsoft SQL Server available. See Section 4 for more details.
- Virtual Machine running Microsoft Server 2012 R2 for management.
- .Net Framework 3.5
- Endpoint Security Suite Enterprise and Dell Enterprise Server documentation located with the downloaded zip files
- CALS – make sure that you have client access licenses for the Endpoint Security Suite Enterprise available. This does not cover Citrix, Microsoft or application licenses requirements.

Note: For Endpoint Security Suite Enterprise CALS, contact Dell Sales Team or Support for assistance.
2 Solution Architecture Overview

2.1 Introduction
The Endpoint Security Suite Enterprise software delivers an out-of-the-box Advanced Threat Prevention (ATP), Policy-Based Encryption (PBE) and Removable Media Encryption (EMS) solution for virtual desktops that provide antivirus and encryption that other solution may not be able to offer. Endpoint Security Suite Enterprise is a turnkey solution that comes ready to integrate into your Citrix VDI environment. The Endpoint Security Suite Enterprise unique architecture allows enterprises to protect their environment from endpoints to virtual desktops and physical machines with a simple path to enterprise protection.

2.2 Endpoint Security Suite Enterprise Overview
Endpoint Security Suite Enterprise is to be configured in the Citrix environment, which is outlined below. Dell Enterprise Server includes the subcomponents shown below, with a brief description of each.
• DDP Remote Management Console: This is where the administrator will configure security policies and domain settings for the environment.

• Dell Enterprise Server: Refer to section 2.3 for component breakdown of Endpoint Security Suite Enterprise.

• Active Directory: Domain management.

• Microsoft SQL Server: Database used by Dell Enterprise Server.

• Certificate Authority: Handling of certificates in the domain environment.

• DDPE Client Agents: Encryption and Endpoint Security Suite Enterprise client software is installed in VDI environment providing the Encryption client and Advanced Threat Prevention agent.
2.3 Dell Enterprise Server Architecture

This is the actual back-end Dell Server installation, which is made up of the following components.

- **Compliance Reporter**
  Provides an extensive view of the environment for auditing and compliance reporting.

- **Core Server**
  Used for policy and license management as well as providing updates and registration.

- **Key Server**
  Service that negotiates, authenticates, and encrypts client connection using Kerberos API’s. Requires SQL database to access the key data.

- **Security Server**
  Communicates with Policy Proxy. Provides the mechanism for controlling commands and communication with Active Directory, which is used as an authentication source. Provides authentication, including identity validation for authentication into the Remote Management Console.

- **Compatibility Server**
  A service for managing the enterprise architecture. Collects and stores initial inventory data during activation and policy data during migrations. Processes data based on user groups in this service.

- **Device Server**
  Supports activations and password recovery.

- **Message Broker**
  Handles communication between the services of the Dell Enterprise Server. Stages policy information created by the Compatibility Server for policy proxy queuing.

- **Policy Proxy**
  Provides a network based communication path to deliver DDP policy updates and inventory updates.

- **Server Configuration Tool**
  Configures database communication with the Core Server and Compatibility Server/ Security Server. Used to initialize the database upon installation or to migrate the database to a newer schema. Used to control Dell Services.
3 Hardware Components

3.1 Network
The following sections contain the core network components for Endpoint Security Suite Enterprise.

3.1.1 Dell Networking S4048 (10Gb ToR Switch)
Optimize your network for virtualization with a high-density, ultra-low-latency ToR switch that features 48 x 10GbE SFP+ and 6 x 40GbE ports (or 72 x 10GbE ports in breakout mode) and up to 720Gbps performance. The S4048-ON also supports ONIE for zero-touch installation of alternate network operating systems. For BaseT connectivity, the S4048T model is available.

3.2 Dell Server
The following sections contain the core Dell Server components for the Endpoint Security Suite Enterprise solutions.

3.2.1 Dell R730 Server

The Dell R730 is a 2U platform with a broad range of configuration options. The Server comes equipped with dual CPUs, 10 to 20 cores, and up to 384GB of high-performance RAM by default. A minimum of four disks is required in the compute host, 4 x SSD for (Tier1). The PERC H730P is configured as a RAID 1+0 configuration connecting to the SSDs. Each platform can be outfitted with SFP+ or BaseT NICs. Refer to the next section on more specification on the architecture needed and break down of the server configurations.

3.2.2 Architecture Overview
This outlines the architecture overview of the Endpoint Security Suite Enterprise environment.
Separate Management and Compute Configuration.

In this environment we have separate management and compute nodes configured.

Compute Node: Only has VDI desktops hosted on it.

Management Node: Only has management VMs hosted on it.

See the table below for the breakdown of the management VMs for the environment and their configurations, this covers both configurations outlined here.
Combined management and compute

All the management VMs are placed on a single node with the VDI desktops.

Management VM configurations:

<table>

4 Software Components

4.1 Software Inventory

This details the installation of the Endpoint Security Suite Enterprise software and dependencies in the environment. There are a number of components that make up the Endpoint Security Suite Enterprise software and these will be outlined below and their function.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Note:** Client OS validation was done on the latest version of Windows operating system, Win 10. Please refer to Vendor documentation for supported OS level and DDP documentation for supported DDPSuite for supported version of OS.

4.1.1 Server OS

This is the operating system installed on the Host machines and virtual machines, which includes the installation of the Hypervisor, Hyper-V used for virtualization where applicable, i.e. on a physical host.

**Note:** Experience with the installation of Windows 2012 R2 OS and Setup of Hyper-V is assumed and therefore not covered in this document.
4.1.2 Microsoft SQL Server

This is the database software that the Endpoint Security Suite Enterprise will use to update and query and track the Endpoint Security Suite Enterprise environment.

**Note:** Experience with the installation of Microsoft SQL Server is assumed and therefore not covered in this document.

4.1.3 System Center Virtual Machine Manager

This is the virtual machine manager being used. Due to the Citrix environment using Machine Creation Services of the desktop images. Only MCS with Endpoint Security Suite Enterprise has been validated.

**Note:** Experience with the installation of System Center Virtual Machine Manager is assumed and therefore not covered in this document.

4.1.4 Citrix

This is the virtualization that is used in the environment into which Endpoint Security Suite Enterprise will be used.

**Note:** Experience with the installation of Citrix is assumed and therefore not covered in this document, as well as the following components Virtual Delivery Agent, Persistent and non-Persistent configuration, machine creation and delivery groups, machine creation services and Storefront.

4.1.5 Endpoint Security Suite Enterprise

Endpoint Security Suite Enterprise is to be configured in the environment. See section 2.3 Endpoint Security Suite Enterprise Architecture for breakdown of the various components.

4.1.6 Certificates

Creation of signed certificates are beyond the scope of this document the only certificates implemented are self-signed certs.

**Note:** Experience with certificates is assumed and therefore not covered in this document.

4.2 Dell Enterprise Server Installation

4.2.1 Installation

This section deals with the Dell Server installation. Please refer to documentation in extracted file location for further reference.

Copy **DDP-Enterprise-Server-9.6.0.xxx.zip** and extract to local system. This may take a while.
Copy the `extractedLocation\EnterpriseServer\InstallKey.ini` file from the extracted file location to `C:\Windows`.

Navigate to:

`extractedLocation\DDP-Enterprise-Server-9.6.xxx\Dell\EnterpriseServer\x64`

1. Install

![Image showing the file explorer and setup.exe]

Right click `Setup.exe`.
Select **Run as administrator** from menu.

2. Install Wizard

![Image showing the Install Shield Wizard]

Select the language for installation.
Click **OK**.
3. Dependencies

Dependencies that are required will be listed for installation.
Click **Install**, wait for components to install this may take a while to run.

4. Welcome

Welcome wizard that will guide you through the installation process.
Click **Next**.
5. License Agreement

This is the license agreement review by using the scroll bar located on the right hand side or alternatively Click **Print** to print agreement.

Click **I accept the terms in the license agreement**

Click **Next**.

6. Product Key

Enter the Product Key, if you copied the EnterpriseServerInstallKey.ini as outlined in step 1, at start of this section in the install guide, this will auto populate the Product Key information. Otherwise open the EnterpriseServerInstallKey.ini and type in code manually.

Click **Next**.
7. Installation Type

Select **Back End Install (Full Enterprise Server Installation)**

Click **Next**.

8. Destination Folder

You may change to another install location by clicking the **Change**... button otherwise accept the default location to install into.

Click **Next**.
9. **Backup Location**

Make sure to backup this information. You can change the location by clicking the **Change**… button.

Click **Next**.

**Note:** The folder structure created by the installer during this installation step (example shown below) must remain unchanged.

```
- Backup
  - Compatibility Server
    - conf
  - Compliance Reporter
    - conf
    - Core Server
  - Device Server
    - conf
  - Message Broker
    - conf
  - Security Server
    - conf
```

**Note:** Experience with File System Backups are assumed and therefore not covered in this document.
10. Certificate

You have the choice of selecting what type of digital certificate to import into the server.

Click **Create a self-signed certificate and import in to key store.**
Click **Next.**

11. Create Self-Signed Certificate

Fill in Information as needed.
Click **Next.**
12. Install SSOS Certificate

Click “Create a self-signed certificate and import it to key store,”
Click Next.

13. Create Self-Signed Certificate

You can elect to fill in additional information. But the required must be filled in.
Click Next.
14. Back End Server Install Setup

Check the ports being used.

Click Edit Ports…

15. Edit Back End Ports

This lists the ports that are used for Endpoint Security Suite Enterprise. Also refer to the Endpoint Security Suite Enterprise architecture diagram in Section 2.2 to make sure that the firewalls in your environment can accommodate the ports listed for Endpoint Security Suite Enterprise.

Click OK.

Click Next.
16. Database Server

This is where you will configure the database connection for your environment to work.

Click **Browse** to select the server on which to install the database.

**Server**: `someSQLDBName`.

Port: 1433 – default port unless this has been changed in environment.

Select the authentication method for the installer to use to set up the Dell Data Protection database. After installation, the installed product does not use the credentials specified here.

Select connect using either Windows authentication or Server authentication.

**Windows authentication credentials of current user** - If you choose Windows Authentication, the same credentials that were used to log in to Windows will be used for authentication (User Name and Password fields will not be editable). Ensure that the account has system administrator rights and the ability to manage the SQL Server.

**OR**

**SQL server authentication using the credentials below** – If you use SQL authentication, the SQL account used must have system administrator rights on the SQL Server.

The installer must authenticate to the SQL Server with these permissions: create database, add user, assign permissions.

Name of catalog: database catalogue name, unless you wish to change it. Ours we changed to `DDP_Server_test`

Click **Next**.
The Question relates to the fact that the database does not contain the catalog that has been specified. Shown above is an example table name we used.

Click Yes.

17. Service Startup Account Information

Select the authentication method for the product to use. This step connects an account to the product.

**Windows authentication using the credentials below** - Enter the credentials for the product to use, and click Next.

Ensure that the account has system administrator rights and the ability to manage the SQL Server. The user account must have the SQL Server permissions Default Schema: dbo and Database Role Membership: dbo_owner, public.

These credentials are also used by Dell services as they work with the Dell Enterprise Server.

**OR**

**SQL server authentication using the credentials below** – Enter the SQL Server credentials for the Dell services to use as they work with the Dell Enterprise Server, and click Next.

The user account must have the SQL Server permissions Default Schema: dbo and Database Role Membership: dbo_owner, public.
18. Ready to Install

![Dell Enterprise Server x64 - InstallShield Wizard]

This is where you will proceed with the installation of the software, at this point you can use the back button to step back through, to check if you need to change any settings.

Click **Install**.

19. InstallShield Wizard Completed

![Dell Enterprise Server x64 - InstallShield Wizard]

Check the box **Launch Remote Management Console**.

Click **Finish**.
5 Client Installation

Endpoint Security Suite Enterprise client installation is performed on the master image for both persistent and non-persistent VDI solutions.

5.1 Advanced Threat Prevention (ATP) Install

**Note:** ATP can be installed on persistent or non-persistent desktops

1. Create Master VM and install applications user will need. Install the Endpoint Security Suite Enterprise client at this point as described in section 5.7.1 and 5.7.3 following.
2. Create Catalog and Delivery Group of either persistent or non-persistent desktops on Citrix Studio.

Refer to section 6.2.1 section below for ATP policy configuration.

5.2 Policy-Based Encryption (PBE) Install

**Note:** Policy-Based Encryption will not encrypt network drives by design. It can be installed on persistent or non-persistent desktops.

1. Create Master VM and install applications user will need. Install the Endpoint Security Suite Enterprise client at this point as described in section 5.7.1 and 5.7.3 following.
2. Refer to Endpoint Security Suite Enterprise documentation for scripted or System Center Configuration Manager (SCCM) deployment methods.

**Note:** Step 2 is beyond the scope of this document.

5.3 System Data Encryption (SDE)

**Note:** DO NOT enable SDE in a VDI environment or Encrypt Windows Page File. This configuration is not supported. If this feature is turned on the host will experience high disk IO and CPU utilization due to a file encryption sweep occurring that will affect the VM's that are assigned this policy. Contact Dell support for assistance if this policy needs to be configured in the environment.

5.4 Removable Media Encryption (EMS) Install

**Note:** If you wish to install the EMS piece only and not ATP at the same time, Create desktops using the steps listed below. It can be installed on persistent or non-persistent desktops

1. Create Master VM and install applications user will need. Install the Endpoint Security Suite Enterprise client at this point as described in section 5.7.1 and 5.7.3 following.
2. When the Endpoint Security Suite Enterprise client is installed shutdown the machine but do not restart it.
3. Create Catalog and Delivery Group of either persistent or non-persistent desktops on Citrix Studio.
4. Verify USB redirection in user's session.

5. In Citrix Studio enable the following policy or add to existing policy.

   Policy name: **USB Redirection this must be enabled for Removable Media Encryption to work.**

   ![USB redirection policy](image)

6. Verify USB redirection in user's session.

   From Citrix pull down menu located at top of VDI session, the following Icons should be visible.

   ![Devices icon](image)

   If the devices marked above do not appear in session menu then USB redirection is not enabled or session needs to be updated.

7. Insert Removable media

   ![Devices icon](image)

   Click **Devices**, click **Generic Mass Storage**.

   Refer to section 6.2.5 section below for EMS policy configuration.

5.5 **Authentication**

   **Note:** The authentication features in Endpoint Security Suite Enterprise are not supported for virtual desktops at this time. It is only supported on physical PCs. Please refer to Endpoint Security Suite Enterprise documentation.

5.6 **Endpoint Security Suite Enterprise Install**

   This section details the Endpoint Security Suite Enterprise client installation on client sessions. For all VDI installations for persistent or non-persistent desktops follow the client install directions on the master image and make the registry changes documented below to differentiate between persistent and non-persistent desktops.
5.6.1 Client Install

For VDI installations, the Endpoint Security Suite Enterprise client install installs the Encryption client and Advanced Threat Prevention agent. All other software including any VDI agents must already be installed. The Endpoint Security Suite Enterprise client install and setup of registry entries must be the last task performed on the master image before deployment. The master image should not be restarted before deployment.

In order to prevent the master image from performing an activation before deployment with the Dell Server, set the following for the correct Endpoint group (Non-Persistent/Persistent VDI Endpoint group) on the Dell Server.

- Turn off Policy Based Encryption
- Turn off Advanced Threat Protection

See the appendix section 7.2 for instructions

1. File Extraction

Locate the DDPSuite.exe file, which should be where you copied or downloaded the software.

Right Click, select Run as administrator from menu.
2. Extraction

Install will continue to the Welcome screen.

3. Welcome

On the Welcome screen, click Next.
4. **License Agreement**

   Review the license agreement by using the scroll bar located on the right hand side.
   Click **Print** to print agreement.
   Click **I accept the terms of the license agreement**.
   Click **Next**.

5. **Dell Enterprise Server Setup**

   This is where you will point the client to the Server you have installed in the previous section.
   Dell Enterprise Server Name: *enterDDPEEServerNameFQDN*
   The Dell Device Server URL will auto-populate.
   Click **Next**.
6. **Choose Destination Location**

You can change the destination location by clicking **Change**..., we proceeded with the Default destination.

Click **Next**.

7. **Select Features**

Select **Advanced Threat Protection**.

Click **Next**.
8. Ready to Install the Program

You can use the back button to check or change setting before proceeding.
Click Install.

The installation will take some time to complete.
9. Installation Wizard Complete

Default action is: **Yes, I want to restart my computer now**, select **No, I will restart my computer later** and click **Finish**.

Do not restart or shutdown the VM at this stage. It is necessary to insert the registry entries that indicate that the client is running in a VDI environment.

**5.6.2 Client Manual and Silent Install**

This details the manual process to extract and install the components as needed, this covers in particular the ATP install.

1. Use the following command to extract the DDP Suite installer into its individual components:

   From a command prompt do not run from PowerShell:
   ```
   DDPSuite.exe -y -gm2 /s /z""EXTRACT_INSTALLERS=C:\extracted"
   ```

   **Note**: the /s option can be left out as this is the silent option, and the path can be changed to whatever suits your environment. This operation may take some time to complete.

2. Do the following to install ATP: Where the extracted installers are navigate to `extracted\AdvancedThreatProtection\Win64R`

3. At a command prompt, enter the following commands:
The following example installs the basic Dell Client Security Framework component, without the SED Management client or BitLocker Manager (silent installation, no reboot, installed in the default location of C:\Program Files\Dell\Dell Data Protection).EMAgent_XXbit_setup.exe /s /v"FEATURE=BASIC CM_EDITION=1 SERVERHOST=server.organization.com SERVERPORT=8888 SECURITYSERVERHOST=server.organization.com SECURITYSERVERPORT=8443 /norestart /qn"

The following example installs Advanced Threat Prevention (silent installation, no reboot, installation log file and installation folder in the specified locations)

MSIEXEC.EXE /I "AdvancedThreatProtectionCSFplugins_x64.msi" /qn REBOOT=ReallySuppress APPPFOLDER="C:\Program Files\Dell\Dell Data Protection\Advanced Threat Protection\Plugins" /l*v "C:\ProgramData\Dell\Dell Data Protection\Installer Logs\AdvancedThreatProtectionPlugins.msi.log"

and

AdvancedThreatProtectionAgentSetup.exe /s /norestart REBOOT=ReallySuppress APPPFOLDER="C:\Program Files\Dell\Dell Data Protection\Advanced Threat Protection" /l*v "C:\ProgramData\Dell\Dell Data Protection\Installer Logs\AdvancedThreatProtection.log"

NOTE: These components must be installed by command line only. Double-clicking to install this component installs a non-Dell, non-managed version of the product, which is not supported. If this is accidentally done, simply go to Add/Remove Programs and uninstall that version.

To check successful installation open Programs and Features in Control Panel and check for Cylance.

The following step will perform a completely silent install of DDP Suite.

1. From a command prompt that is started with administrative privileges run the following command:
   DDPSuite.exe -y -gm2 /S /z"""SERVER=<server fqdn>"

5.6.3 Create Registry entries for VDI awareness

In order to operate correctly in a VDI environment (Citrix or VMware) the master image must be prepared by inserting one of the following entries in the registry.

Note: Changes to the Windows registry are immediate and can have system wide consequences. There is no automatic backup taken of the registry. Ensure that you are confident to make these changes before proceeding.

Persistent VDI

For master images that will be used for persistent VDI solutions, add the following entry to the registry on the VM immediately after installing the Endpoint Security Suite Enterprise client. Shut down the master image once the registry change has been made.
Windows Registry Editor Version 5.00

[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Environment]
"Dell_isVDI"=dword:1
"Dell_VDI"=dword:102

Non-Persistent VDI

For master images that will be used for non-persistent VDI solutions, add the following entry to the registry on the VM immediately after installing the Endpoint Security Suite Enterprise client. Shut down the master image once the registry change has been made.

Windows Registry Editor Version 5.00

[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Environment]
"Dell_isVDI"=dword:1
"Dell_VDI"=dword:101

Prior to deploying the VDI pools, ensure that Policy Based Encryption and Advanced Threat Prevention have been turned on at the DDP Server on the correct Endpoint group.

5.6.4 Recomposing or updating VDI pools

Any updates to the master image require that the master image is started before changes can be made. If the master image starts it will attempt to activate which will cause conflicts in the DDP Server.

In order to prevent the master image performing an activation before an update or recompose with the DDP server set the following for the correct Endpoint group (Non-Persistent/Persistent VDI Endpoint group) on the DDP server:

- Turn off Policy Based Encryption
- Turn off Advanced Threat Prevention

See appendix Section 7.2 for instructions
Endpoint Security Suite Enterprise Management Console

Remote Management Console

The Remote Management Console is where you will configure licenses, enable and configure policies, and manage the environment.

You must first configure the Domain and Licenses before continuing onto configuring the policies. The domain only needs to be configured once. Licenses can be added as needed for your environment.

Browser Language

The language settings must be changed to match the locale that the endpoints are set to. The endpoints will not update their policies correctly if this change is not made.

**Note:** The browser language changes being made are in Internet Explorer 11. If you are using a different web browser, refer to product documentation to change the language settings.

Open Internet Explorer

1. Go To Tools, Internet Options

   ![Internet Options](image)

   Click Languages.
2. **Language Preference**

Click **Set Language Preferences** button.

3. **Change your language preferences**

Click **Add a language**.

4. **Add a Language**

Click **English**.
5. **English**

![Language settings](image)

Click **English (United States)**.

6. **Change language preference**

![Language settings](image)

Click first language and select **Move Down** from menu bar so that **English (United States)** is first in the list as shown below.
6.1.2 Domain Configuration

On the server where Dell Server is installed, login and open a web browser.

1. Enter https://servernameFQDN:8443/webui/Login

Use the following default username and password to access the management site.

Username: superadmin
Password: changeit

Note: Dell advises you to change the password at your earliest convenience.

2. Domain

This is where you will configure the Domain information.

Select Domain from the left pane, and click Add.

3. Add Domain
Host Name: domainName
Port: 389 or 3268
Distinguished Name: will auto populate
User Name: account to read AD –
Password: passwordForAccount
Alias: domainName – Click Add
Click Add Domain

4. Domain Details

Once the domain is configured, check the status before continuing.
Make sure that Status is Good. If not, investigate immediately.
6.1.3 Licenses

1. Licenses

You will need to add licenses to use in your environment.

**Note:** License details are beyond the scope of this document. Contact your Dell Sales Representative or ProSupport for assistance.

Click Choose File.

2. Choose File to Upload

Highlight the license file, and click Open.
3. **Upload License**

If license upload is successful, you will get the above dialog box,
Click **OK**.

6.2 **Policy Configuration**

6.2.1 **ATP Policy Configuration**

1. **ATP Policy Configuration**

Click **Enterprise** in the left pane.

Under Windows Threat Protection, select **Advanced Threat Protection**.
2. Security Policies

Go to advanced settings to configure additional settings.

Click **Show Advanced Settings**.

3. Settings

Check Memory Action: **Memory Protection Enabled**.

Add files to Exclude Specific Folders (includes subfolders)

Example may be C:\DDPE

**Note:** This document does not cover what Files, Folders need to be protected or excluded.

Refer to **Endpoint Security Suite Enterprise Support for VDI** for policy settings for persistent and non-persistent VDI clients.

Click **On** to enable protection.

Click **Save**.
4. Commit

**Note:** If single or multiple changes are made, you will need to save these changes for each policy and then commit these changes for them to be updated.

Click **Commit** in the left pane.

Dell recommends that you to add a comment about policies you have changed and reasons for the changes.

Click **Commit Policies**.

5. Verify ATP is Enabled

After policy changes are committed, Advanced Threat Protection should show a **Red flag** and **Green Check Mark**.
6.2.2 ATP Client Verification

1. Client verification on client desktop.

Logon to client desktop and look for the above icon.

Double-click the **DDP Console** icon.

2. ATP Client

Click the **Advanced Threat Protection** tile as highlighted above.

3. Status

Advanced Threat Protection Status

- **Protection Status**: Protected
  - The Advanced Threat Protection service is running and Protection Status is enabled.
  - Advanced Threat Protection: Enabled
  - Memory Protection: Enabled

File System
- Unsafe Files: 0
- Threats Quarantined: 0

Memory Protection
- Memory Violations: 0
- Blocked Violations: 0
To check that Advanced Threat Prevention is enabled for client.
Protection Status: **Protected**
Advanced Threat Protection: **Enabled**
Memory Protection: **Enabled**

### 6.2.3 Policy Based Encryption Configuration

1. **Policy Based Encryption Configuration**

   1. **Click** **Enterprise** in the left pane.
   2. **Under** Windows Encryption, **select** **Policy-Based Encryption**.

2. **Enable Policy Based Encryption**
Refer to *Endpoint Security Suite Enterprise Support for VDI* for policy settings for persistent and non-persistent VDI clients.

Set Policy-Based Encryption to **On**.

Click **Save**.

3. **Commit Policy**

   - **Policies**
     - Pending Policy Changes: 1
     - Comment: FBE Update

   - **Commit History**
     - Data Committed: 08/22/16 11:09:50 AM
     - Changed by: superadmin
     - Comment: FBE On Enterprise level

Click **Commit** in the left pane.

Dell recommends that you to add a comment about policies you have changed and reasons for the changes.

Click **Commit Policies**.

4. **Verify policy is active**

   - **Enterprise**
     - Security Policies
       - Overriden Count: 6
       - Uncommitted Overrides: 0
       - Windows Encryption
         - Self-Encrypting Drive (SED)
         - Hardware Crypto Accelerator (HCA)
         - Policy-Based Encryption
       - BitLocker Encryption
       - Server Encryption

After policy changes are committed, Policy-Based Encryption should show a **Red flag** and **Green Check Mark**.
6.2.4 PBE Client Verification

1. Verify PBE on Client

Open File Explorer and navigate to the user's home directories.

**Note:** The Citrix (P:) is the Personal vDisk for persistent virtual machines drive letter may change in customers environment.

Double-click on drive “**Citrix (P:)**”

2. Encrypted files

**Note:** Key icons show that the files are encrypted.
3. Properties

Right click any file that shows the encryption icon in the user’s documents.

Click **Properties**.

Click the Encryption tab.

5. File Encrypted properties

This indicates that the file is encrypted.
6. Folder encryption

When accessing the path C:\users\<username>, the encryption icon indicates that Desktop, Documents and Downloads are encrypted folders.

7. File View

When accessing the path C:\users\<username>\Documents folders, you will notice that the encryption icons are missing.

Right-click on the book2 excel spread sheet and select Properties.
8. File Properties

Select the Encryption tab.

9. Encryption Properties

You will notice that the fields are blank, and not like our earlier example where the fields are populated.

**Note:** This is due to this being a file system junction that has been created for redirection of the Users home folders to point to the Personal vDisk (PvD).
6.2.5 EMS Policy Configuration

1. Removable Media Policy Configuration

Click **Enterprise** in the left pane.

Select **Removable Media Encryption**.

2. Windows Media Encryption

Refer to *Endpoint Security Suite Enterprise Support for VDI* for policy settings for persistent and non-persistent VDI clients.

Set Windows Media Encryption to **On**.

Click **Save**.
3. Commit

Click **Commit** in the left pane.

Dell recommends that you **add a comment about policies you have changed and reasons for the changes.**

Click **Commit Policies.**

4. Verify Removable Media

After policy changes are committed, Windows Media Encryption should show a **Red flag** and **Green Check Mark.**
5. When the removable media is plugged into the client, an Unprotected Media Found dialog displays.

Click “Yes”. This will create a vault on the removable media.

If you select No, you will be able to access the removable media but will not be able to add any files or folders to the media.

6. Enter New Password

New Password: thisIsYourPassword
Retype Password: thisIsYourPassword
Click OK.
7. Shielding External Device

Note: Files already on the device will not be encrypted. Only new files that are added to the media will be encrypted. Wait for the process to complete before continuing. This may take a while.

8. External Media Device Protected

Click OK.

At this point, you can proceed to copy file to external media, and the files will automatically be encrypted.

9. Reading media on another computer

If you move the removable media to another computer, you will be prompted to enter the password for the vault on the media before you can read the encrypted files.

Note: Recovering lost passwords and encrypting files that were on the media before creating the vault is beyond the scope of this document.

Endpoint Security Suite Enterprise installation and configuration are complete.
### Appendix

#### 7.1 List of features supported by Endpoint Security Suite Enterprise

<table>
<thead>
<tr>
<th>Feature</th>
<th>Persistent/Non-Persistent VDI</th>

7.2 Prevent Master Image Activation prior to deployment or pool update (Recompose)

The following actions will prevent the master image from activating if the master image is restarted or updated before a recompose. This also will prevent conflicts on the Dell Server.

Turn off Encryption client activation by choosing Policy-Based Encryption on the Enterprise Menu. Choose Show advanced settings, clear the "Allow Activations" check box, and click Save.

Turn off the Advanced Threat Prevention by selecting the correct Endpoint group (e.g. Persistent VDI Endpoint Group).

Select Advanced Threat Protection and set Advanced Threat Protection and click Save.

Click Commit in the left pane.

Dell recommends that you to add a comment about policies you have changed and reasons for the changes.

Click Commit Policies.
7.3 **Recommended VDI Policies**

Please see the following location for Dell Data Protection | Endpoint Security Suite Enterprise addendum.

7.4 **DDP Resources**

The following resources contain technical information about the Dell Data Protection product.

The following page contains links to client and server manuals and also an Architectural overview.

Getting Started with Dell Data Protection

This site contains links to manuals, support articles and drivers. The following manuals can be found on the manuals page:

- Endpoint Security Suite Enterprise Support for VDI
- Endpoint Security Suite Enterprise Advanced Installation Guide
- Enterprise Edition Advanced Installation Guide
- Virtual Edition Quick Start Guide and Installation Guide
- Enterprise Server AdminHelp
