Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS, Release 11.1: Volume 2

Revision History
30 April 2011—Revision 3
15 November 2010—Revision 2
4 June 2010—Revision 1

The information in this document is current as of the date listed in the revision history.

END USER LICENSE AGREEMENT

READ THIS END USER LICENSE AGREEMENT ("AGREEMENT") BEFORE DOWNLOADING, INSTALLING, OR USING THE SOFTWARE. BY DOWNLOADING, INSTALLING, OR USING THE SOFTWARE OR OTHERWISE EXPRESSING YOUR AGREEMENT TO THE TERMS CONTAINED HEREIN, YOU (AS CUSTOMER OR IF YOU ARE NOT THE CUSTOMER, AS A REPRESENTATIVE/AGENT AUTHORIZED TO BIND THE CUSTOMER) CONSENT TO BE BOUND BY THIS AGREEMENT. IF YOU DO NOT OR CANNOT AGREE TO THE TERMS CONTAINED HEREIN, THEN (A) DO NOT DOWNLOAD, INSTALL, OR USE THE SOFTWARE, AND (B) YOU MAY CONTACT JUNIPER NETWORKS REGARDING LICENSE TERMS.

1. **The Parties.** The parties to this Agreement are (i) Juniper Networks, Inc. (if the Customer's principal office is located in the Americas) or Juniper Networks (Cayman) Limited (if the Customer's principal office is located outside the Americas) (such applicable entity being referred to herein as "Juniper"), and (ii) the person or organization that originally purchased from Juniper or an authorized Juniper reseller the applicable license(s) for use of the Software ("Customer") (collectively, the "Parties").

2. **The Software.** In this Agreement, "Software" means the program modules and features of the Juniper or Juniper-supplied software, for which Customer has paid the applicable license or support fees to Juniper or an authorized Juniper reseller, or which was embedded by Juniper in equipment which Customer purchased from Juniper or an authorized Juniper reseller. "Software" also includes updates, upgrades and new releases of such software. "Embedded Software" means Software which Juniper has embedded in or loaded onto the Juniper equipment and any updates, upgrades, additions or replacements which are subsequently embedded in or loaded onto the equipment.

3. **License Grant.** Subject to payment of the applicable fees and the limitations and restrictions set forth herein, Juniper grants to Customer a non-exclusive and non-transferable license, without right to sublicense, to use the Software, in executable form only, subject to the following use restrictions:

a. Customer shall use Embedded Software solely as embedded in, and for execution on, Juniper equipment originally purchased by Customer from Juniper or an authorized Juniper reseller.

b. Customer shall use the Software on a single hardware chassis having a single processing unit, or as many chassis or processing units for which Customer has paid the applicable license fees; provided, however, with respect to the Steel-Belted Radius or Odyssey Access Client software only, Customer shall use such Software on a single computer containing a single physical random access memory space and containing any number of processors. Use of the Steel-Belted Radius or IMS AAA software on multiple computers or virtual machines (e.g., Solaris zones) requires multiple licenses, regardless of whether such computers or virtualizations are physically contained on a single chassis.

c. Product purchase documents, paper or electronic user documentation, and/or the particular licenses purchased by Customer may specify limits to Customer's use of the Software. Such limits may restrict use to a maximum number of seats, registered endpoints, concurrent users, sessions, calls, connections, subscribers, clusters, nodes, realms, devices, links, ports or transactions, or require the purchase of separate licenses to use particular features, functionalities, services, applications, operations, or capabilities, or provide throughput, performance, configuration, bandwidth, interface, processing, temporal, or geographical limits. In addition, such limits may restrict the use of the Software to managing certain kinds of networks or require the Software to be used only in conjunction with other specific Software. Customer's use of the Software shall be subject to all such limitations and purchase of all applicable licenses.

d. For any trial copy of the Software, Customer's right to use the Software expires 30 days after download, installation or use of the Software. Customer may operate the Software after the 30-day trial period only if Customer pays for a license to do so. Customer may not extend or create an additional trial period by re-installing the Software after the 30-day trial period.

e. The Global Enterprise Edition of the Steel-Belted Radius software may be used by Customer only to manage access to Customer's enterprise network. Specifically, service provider customers are expressly prohibited from using the Global Enterprise Edition of the Steel-Belted Radius software to support any commercial network access services.

The foregoing license is not transferable or assignable by Customer. No license is granted herein to any user who did not originally purchase the applicable license(s) for the Software from Juniper or an authorized Juniper reseller.

4. **Use Prohibitions.** Notwithstanding the foregoing, the license provided herein does not permit the Customer to, and Customer agrees not to and shall not: (a) modify, unbundle, reverse engineer, or create derivative works based on the Software; (b) make unauthorized copies of the Software (except as necessary for backup purposes); (c) rent, sell, transfer, or grant any rights in and to any copy of the Software, in any form, to any third party; (d) remove any proprietary notices, labels, or marks on or in any copy of the Software or any product in which the Software is embedded; (e) distribute any copy of the Software to any third party, including as may be embedded in Juniper equipment sold in the secondhand market; (f) use any 'locked' or key-restricted feature, function, service, application, operation, or capability without first purchasing the applicable license(s) and obtaining a valid key from Juniper, even if such feature, function, service, application, operation, or capability is enabled without a key; (g) distribute any key for the Software provided by Juniper to any third party; (h) use the

Software in any manner that extends or is broader than the uses purchased by Customer from Juniper or an authorized Juniper reseller; (i) use Embedded Software on non-Juniper equipment; (j) use Embedded Software (or make it available for use) on Juniper equipment that the Customer did not originally purchase from Juniper or an authorized Juniper reseller; (k) disclose the results of testing or benchmarking of the Software to any third party without the prior written consent of Juniper; or (l) use the Software in any manner other than as expressly provided herein.

5. **Audit.** Customer shall maintain accurate records as necessary to verify compliance with this Agreement. Upon request by Juniper, Customer shall furnish such records to Juniper and certify its compliance with this Agreement.

6. **Confidentiality.** The Parties agree that aspects of the Software and associated documentation are the confidential property of Juniper. As such, Customer shall exercise all reasonable commercial efforts to maintain the Software and associated documentation in confidence, which at a minimum includes restricting access to the Software to Customer employees and contractors having a need to use the Software for Customer's internal business purposes.

7. **Ownership.** Juniper and Juniper's licensors, respectively, retain ownership of all right, title, and interest (including copyright) in and to the Software, associated documentation, and all copies of the Software. Nothing in this Agreement constitutes a transfer or conveyance of any right, title, or interest in the Software or associated documentation, or a sale of the Software, associated documentation, or copies of the Software.

8. **Warranty, Limitation of Liability, Disclaimer of Warranty.** The warranty applicable to the Software shall be as set forth in the warranty statement that accompanies the Software (the "Warranty Statement"). Nothing in this Agreement shall give rise to any obligation to support the Software. Support services may be purchased separately. Any such support shall be governed by a separate, written support services agreement. TO THE MAXIMUM EXTENT PERMITTED BY LAW, JUNIPER SHALL NOT BE LIABLE FOR ANY LOST PROFITS, LOSS OF DATA, OR COSTS OR PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES, OR FOR ANY SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THIS AGREEMENT, THE SOFTWARE, OR ANY JUNIPER OR JUNIPER-SUPPLIED SOFTWARE. IN NO EVENT SHALL JUNIPER BE LIABLE FOR DAMAGES ARISING FROM UNAUTHORIZED OR IMPROPER USE OF ANY JUNIPER OR JUNIPER-SUPPLIED SOFTWARE. EXCEPT AS EXPRESSLY PROVIDED IN THE WARRANTY STATEMENT TO THE EXTENT PERMITTED BY LAW, JUNIPER DISCLAIMS ANY AND ALL WARRANTIES IN AND TO THE SOFTWARE (WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE), INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT. IN NO EVENT DOES JUNIPER WARRANT THAT THE SOFTWARE, OR ANY EQUIPMENT OR NETWORK RUNNING THE SOFTWARE, WILL OPERATE WITHOUT ERROR OR INTERRUPTION, OR WILL BE FREE OF VULNERABILITY TO INTRUSION OR ATTACK. In no event shall Juniper's or its suppliers' or licensors' liability to Customer, whether in contract, tort (including negligence), breach of warranty, or otherwise, exceed the price paid by Customer for the Software that gave rise to the claim, or if the Software is embedded in another Juniper product, the price paid by Customer for such other product. Customer acknowledges and agrees that Juniper has set its prices and entered into this Agreement in reliance upon the disclaimers of warranty and the limitations of liability set forth herein, that the same reflect an allocation of risk between the Parties (including the risk that a contract remedy may fail of its essential purpose and cause consequential loss), and that the same form an essential basis of the bargain between the Parties.

9. **Termination.** Any breach of this Agreement or failure by Customer to pay any applicable fees due shall result in automatic termination of the license granted herein. Upon such termination, Customer shall destroy or return to Juniper all copies of the Software and related documentation in Customer's possession or control.

10. **Taxes.** All license fees payable under this agreement are exclusive of tax. Customer shall be responsible for paying Taxes arising from the purchase of the license, or importation or use of the Software. If applicable, valid exemption documentation for each taxing jurisdiction shall be provided to Juniper prior to invoicing, and Customer shall promptly notify Juniper if their exemption is revoked or modified. All payments made by Customer shall be net of any applicable withholding tax. Customer will provide reasonable assistance to Juniper in connection with such withholding taxes by promptly: providing Juniper with valid tax receipts and other required documentation showing Customer's payment of any withholding taxes; completing appropriate applications that would reduce the amount of withholding tax to be paid; and notifying and assisting Juniper in any audit or tax proceeding related to transactions hereunder. Customer shall comply with all applicable tax laws and regulations, and Customer will promptly pay or reimburse Juniper for all costs and damages related to any liability incurred by Juniper as a result of Customer's non-compliance or delay with its responsibilities herein. Customer's obligations under this Section shall survive termination or expiration of this Agreement.

11. **Export.** Customer agrees to comply with all applicable export laws and restrictions and regulations of any United States and any applicable foreign agency or authority, and not to export or re-export the Software or any direct product thereof in violation of any such restrictions, laws or regulations, or without all necessary approvals. Customer shall be liable for any such violations. The version of the Software supplied to Customer may contain encryption or other capabilities restricting Customer's ability to export the Software without an export license.

12. **Commercial Computer Software.** The Software is "commercial computer software" and is provided with restricted rights. Use, duplication, or disclosure by the United States government is subject to restrictions set forth in this Agreement and as provided in DFARS 227.7201 through 227.7202-4, FAR 12.212, FAR 27.405(b)(2), FAR 52.227-19, or FAR 52.227-14(ALT III) as applicable.

13. **Interface Information.** To the extent required by applicable law, and at Customer's written request, Juniper shall provide Customer with the interface information needed to achieve interoperability between the Software and another independently created program, on payment of applicable fee, if any. Customer shall observe strict obligations of confidentiality with respect to such information and shall use such information in compliance with any applicable terms and conditions upon which Juniper makes such information available.

14. **Third Party Software.** Any licensor of Juniper whose software is embedded in the Software and any supplier of Juniper whose products or technology are embedded in (or services are accessed by) the Software shall be a third party beneficiary with respect to this Agreement, and such licensor or vendor shall have the right to enforce this Agreement in its own name as if it were Juniper. In addition, certain third party software may be provided with the Software and is subject to the accompanying license(s), if any, of its respective owner(s). To the extent portions of the Software are distributed under and subject to open source licenses obligating Juniper to make the source code for such portions publicly available (such as the GNU General Public License ("GPL") or the GNU Library General Public License ("LGPL")), Juniper will make such source code portions (including Juniper modifications, as appropriate) available upon request for a period of up to three years from the date of distribution. Such request can be made in writing to Juniper Networks, Inc., 1194 N. Mathilda Ave., Sunnyvale, CA 94089, ATTN: General Counsel. You may obtain a copy of the GPL at http://www.gnu.org/licenses/gpl.html, and a copy of the LGPL at http://www.gnu.org/licenses/lgpl.html .

15. **Miscellaneous.** This Agreement shall be governed by the laws of the State of California without reference to its conflicts of laws principles. The provisions of the U.N. Convention for the International Sale of Goods shall not apply to this Agreement. For any disputes arising under this Agreement, the Parties hereby consent to the personal and exclusive jurisdiction of, and venue in, the state and federal courts within Santa Clara County, California. This Agreement constitutes the entire and sole agreement between Juniper and the Customer with respect to the Software, and supersedes all prior and contemporaneous agreements relating to the Software, whether oral or written (including any inconsistent terms contained in a purchase order), except that the terms of a separate written agreement executed by an authorized Juniper representative and Customer shall govern to the extent such terms are inconsistent or conflict with terms contained herein. No modification to this Agreement nor any waiver of any rights hereunder shall be effective unless expressly assented to in writing by the party to be charged. If any portion of this Agreement is held invalid, the Parties agree that such invalidity shall not affect the validity of the remainder of this Agreement. This Agreement and associated documentation has been written in the English language, and the Parties agree that the English version will govern. (For Canada: Les parties aux présentés confirment leur volonté que cette convention de même que tous les documents y compris tout avis qui s'y rattaché, soient redigés en langue anglaise. (Translation: The parties confirm that this Agreement and all related documentation is and will be in the English language)).

About This Guide

How to Use This Guide

This guide, the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 2,* provides the following information about the Junos Operating System (Junos OS) for J-EX Series switches: Layer 2 bridging and Virtual LANs (VLANs), spanning-tree protocols, Layer 3 protocols, IGMP snooping and multicast, access control, rate limiting, port security, routing policy and packet filtering (firewall filters), class of service (CoS), fibre channel over Ethernet (FCoE), MPLS, and network management and monitoring.

For a complete product overview and additional J-EX Series software information, see Volume 1.

To download the Dell PowerConnect J-EX Series documentation listed in Table 1 on page liii, see the following Dell support website:

http://www.support.dell.com/manuals

Table 1: List of J-EX Series Guides

Table 1: List of J-EX Series Guides *(continued)*

Title	Description
Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1	Junos OS for J-EX Series switches product overviews and complete software configuration statement hierarchy—plus feature descriptions, configuration examples, instructions, and reference pages for software installation, user interfaces, system setup, configuration file management, user access management, system services, system monitoring, Virtual Chassis, high availability, and interfaces
Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 2	Junos OS for J-EX Series switches feature descriptions, configuration examples, instructions, and reference pages for Layer 2 bridging and Virtual LANs (VLANs), spanning-tree protocols, Layer 3 protocols, IGMP snooping and multicast, access control, rate limiting, port security, routing policy and packet filtering (firewall filters), class of service (CoS), fibre channel over Ethernet (FCoE), MPLS, and network management and monitoring

To download additional Junos OS documentation for J-EX Series and all other PowerConnect J-Series products, see the following Juniper Networks support website: http://www.juniper.net/support/partners/dell.

If the information in the latest release notes differs from the information in the documentation, follow the release notes.

Downloading Software

You can download Junos OS for J-EX Series switches from the Download Software area at juniper.net/support/csc/swdist-domestic/. To download the software, you must have a Juniper Networks user account. For information about obtaining an account, see http://www.support.dell.com.

Documentation Symbols Key

Notice Icons		
Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Text and Syntax Conventions		
Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the **configure** command: user@host> **configure**
`Fixed-width text like this`	Represents output that appears on the terminal screen.	`user@host>` **show chassis alarms** `No alarms currently active`
Italic text like this	• Introduces important new terms. • Identifies book names. • Identifies RFC and Internet draft titles.	• A policy *term* is a named structure that defines match conditions and actions. • *Junos System Basics Configuration Guide* • RFC 1997, *BGP Communities Attribute*
Italic text like this	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# **set system domain-name** *domain-name*
Plain text like this	Represents names of configuration statements, commands, files, and directories; IP addresses; configuration hierarchy levels; or labels on routing platform components.	• To configure a stub area, include the **stub** statement at the **[edit protocols ospf area area-id]** hierarchy level. • The console port is labeled **CONSOLE**.
< > (angle brackets)	Enclose optional keywords or variables.	**stub <default-metric** ***metric*****>;**
| (pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	**broadcast | multicast** (***string1*** **|** ***string2*** **|** ***string3***)

Text and Syntax Conventions		
Convention	Description	Examples
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	**rsvp { # Required for dynamic MPLS only**
[ ] (square brackets)	Enclose a variable for which you can substitute one or more values.	**community name members [*community-ids*]**

Indention and braces ({ })	Identify a level in the configuration hierarchy.	[edit]
		routing-options {
		  static {
		  route default {
		  nexthop *address*;
		  retain;
		  }
		  }
		}

; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
J-Web GUI Conventions		
Bold text like this	Represents J-Web graphical user interface (GUI) items you click or select.	• In the Logical Interfaces box, select **All Interfaces**. • To cancel the configuration, click **Cancel**.
> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select **Protocols>Ospf**.

Repair and Warranty

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

For more information, see "Getting Help" in the hardware guide for your Dell PowerConnect J-EX Series Ethernet Switch.

Requesting Technical Support

For technical support, see http://www.support.dell.com. For more information, see "Getting Help" in the hardware guide for your Dell PowerConnect J-EX Series Ethernet Switch.

PART 1

Layer 2 Bridging and VLANs

CHAPTER 1

Bridging and VLANs—Overview

Understanding Bridging and VLANs on J-EX Series Switches

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN. This topic explains the following concepts regarding bridging and VLANs on J-EX Series Switches:

History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each *VLAN* is a collection of some of the LAN network nodes grouped together to form individual broadcast domains. When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

How Bridging of VLAN Traffic Works

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet , a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the

sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

Flooding finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

Filtering, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

Packets Are Either Tagged or Untagged

To identify which VLAN a packet belongs to, all packets on an Ethernet VLAN are identified by a numeric tag, as defined in the IEEE 802.1Q standard. For a simple network that has only a single VLAN, all traffic has the same default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged *native* packets.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. That unique VLAN 802.1Q ID is applied to all packets so that network nodes receiving the packets can detect which non-default VLAN the packets belong to. The presence of these unique IDs means the packets are now *tagged*. VLAN tags 0 and 4095 are reserved by the Junos operating system (Junos OS), so you cannot assign those tags to a VLAN in your network. The VLAN tags 1 through 4094 can be assigned to VLANs.

Switch Interface Modes—Access, Trunk, or Tagged Access

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

Access Mode

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. By default, when you boot a switch and use the factory default configuration, or when you boot the switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that instead of **default**. You can also configure a port to accept untagged packets from the user-configured VLAN. For details on this concept (native VLAN), see "Trunk Mode and Native VLAN" on page 6.

Trunk Mode

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination. An untagged packet is not recognized on a trunk access port unless you configure additional settings on the port connected in access mode. In the rare case where you want untagged packets to be recognized on a trunk port, you must configure the single VLAN on the access port as native VLAN.

Trunk Mode and Native VLAN

With native VLAN configured, frames that do not carry VLAN tags are sent over the trunk interface. If you have a situation where packets pass from a device to a switch in access mode, and you want to then send those packets from the switch over a trunk port, use native VLAN mode. Configure the single VLAN on the switch's device port (which is in access mode) as a native VLAN. The switch's trunk port will then treat those frames differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, frames on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN on the port attached to a device as a native VLAN. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Tagged-Access Mode

Tagged-access mode accommodates cloud computing, specifically virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same

downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.
- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

  Like trunk mode, tagged-access mode also supports native VLAN.

NOTE: **Control packets are never reflected back on the downstream port.**

Additional Advantages of Using VLANs

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.
- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the number of that VLAN, thereby providing easy identification because a VLAN ID on a packet cannot be altered. (We recommend that you avoid using VLAN 1, because that ID is a default.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- In VLANs, the physical location of nodes is not important. On an Ethernet LAN, all network nodes must be physically connected to the same network. On VLANs, however, you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

Maximum VLANs and VLAN Members Per Switch

The number of VLANs supported per switch varies for each model. Use the configuration-mode command **set vlans id vlan-id ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended

VLAN member maximum. To determine the maximum number of VLAN members allowed on a switch, multiply the VLAN maximum for the switch times 8 (vmember limit = vlan max * 8).

If a switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (**eswd**) due to memory allocation failure.

A Default VLAN Is Configured on Most Switches

Some J-EX Series switches are pre-configured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On those switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

The following switches are not pre-configured to belong to **default** or any other VLAN—the J-EX8200 switches and any switch that is part of a Virtual Chassis. The reason that these switches are not pre-configured is that the physical configuration in both situations is flexible. There is no way of knowing which line cards have been inserted in the J-EX8200 switch. There is also no way of knowing which switches are included in the Virtual Chassis. Switch interfaces in these two cases must first be defined as Ethernet switching interfaces. Once an interface is defined as an Ethernet switching interface, the default VLAN appears in output from the ? help and other commands.

NOTE: When a Dell PowerConnect J-EX Series J-EX4200 Ethernet Switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

Assigning Traffic to VLANs

You can assign traffic on any switch to a particular VLAN by referencing either the interface port or the MAC address:

- Reference an interface port on the switch to assign a VLAN. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID.
- Reference a device's MAC address to assign a VLAN. In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on

the switch. This method is cumbersome to configure manually, but it can be useful when automated databases manage the switches on your network.

Forwarding VLAN Traffic

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols and Multiple VLAN Registration Protocol (MVRP).

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. On J-EX Series switches, the same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multi-layer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under “Trunk Mode” on page 6.

Switches Perform Logical Routing with RVIs

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain but routers were needed to route traffic from one broadcast domain to another. Routers also traditionally performed other Layer 3 functions such as traffic engineering. J-EX Series switches perform these routing functions using a Layer 3 routed VLAN interface (RVI) named **vlan**. The RVI detects both MAC addresses and IP addresses, and routes data to other Layer 3 interfaces, thereby eliminating the need to have both a switch and a router.

The RVI (otherwise known as the **vlan** interface) must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it. The RVI supports IPv4, IPv6, MPLS, and IS-IS traffic. At least one Layer 2 logical interface must be operating for the RVI to be operational. You must configure a broadcast domain or VPLS routing instance for the RVI, just as you would configure a VLAN on the switch. Multicast data, broadcast data, or unicast data is switched between ports within the same RVI broadcast domain or VPLS routing instance.

Jumbo packets of up to 9216 bytes are supported on an RVI. To route jumbo data packets on the RVI, you must configure the jumbo maximum transmission unit (MTU) size on the member physical interfaces of the RVI (not the RVI **vlan** interface). For releases after Junos OS Release 10.2, you must also configure a jumbo framesize on the RV **vlan** interface. For jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the RVI **vlan** interface .

Understanding Private VLANs on J-EX Series Switches

The private VLAN (PVLAN) feature on J-EX Series Switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. A PVLAN consists of a primary VLAN with other VLANs nested inside it as secondary VLANs. Just like regular VLANs, PVLANs are isolated on Layer 2 and require that a Layer 3 device be used to route traffic among them. PVLANs are useful for restricting the flow of broadcast and unknown unicast traffic and for limiting the communication between known hosts.

A PVLAN can be created on a single switch or can be configured to span multiple switches.

NOTE: You can configure the PVLAN to span different lines of supported switches. For a list of switches that support this feature, see "J-EX Series Switch Software Features Overview" in in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

This topic explains the following concepts regarding PVLANs on J-EX Series switches:

- PVLAN Broadcast Domains on page 10
- 802.1Q Tags Within PVLANs on page 11
- PVLAN Ethernet Switch Ports on page 12
- PVLANs' Efficient Use of IP Addresses on page 13

PVLAN Broadcast Domains

A PVLAN is designated the primary VLAN, and other VLANs are nested inside that VLAN as secondary VLANs. The types of PVLAN broadcast domains are:

- Primary VLAN—VLAN used to forward frames downstream to isolated and community VLANs.
- Isolated VLAN—(When a PVLAN is configured on only one switch) A secondary VLAN that receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.

- Inter-switch isolated VLAN—(When a PVLAN is configured to span multiple switches) A secondary (internal) VLAN that is used to forward isolated VLAN traffic from one switch to another through **pvlan-trunk** ports.
- Community VLAN—A secondary VLAN that transports frames among community interfaces within the same community and forwards frames upstream to the primary VLAN.

802.1Q Tags Within PVLANs

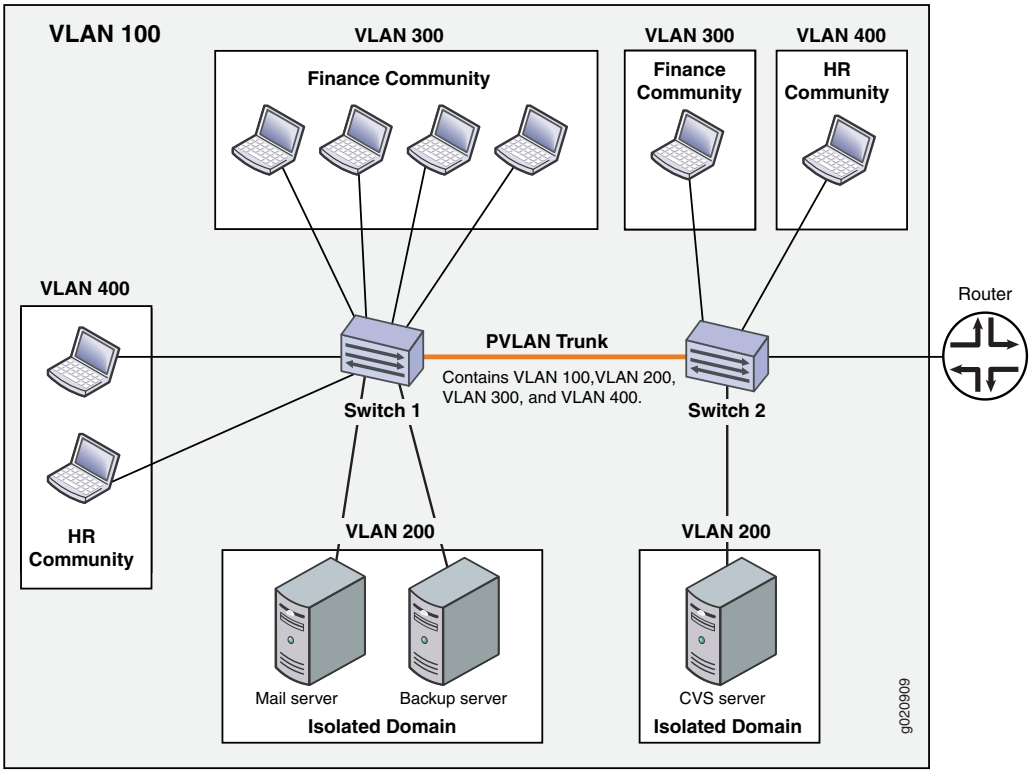
The primary VLAN of the PVLAN must be associated with an 802.1Q tag regardless of whether the PVLAN is configured on a single switch or is configured to span multiple switches. However, you do not need 802.1Q tags for secondary VLANs when a PVLAN is configured on a single switch.

When a PVLAN spans multiple switches:

- Specify an 802.1Q tag for each community VLAN by setting **vlan-id**.
- Specify the 802.1Q tag for the inter-switch isolated VLAN by setting **isolation-id**.

Figure 1 on page 11 shows a PVLAN spanning multiple switches, where the primary VLAN (**100**) contains two community domains (**300** and **400**) and one inter-switch isolated domain.

Figure 1: PVLAN Spanning Multiple Switches



PVLAN Ethernet Switch Ports

PVLANs can have the following types of switch ports:

- Promiscuous port—An upstream (trunk) port that is connected to the routers or shared resources. These ports have Layer 2 connectivity to all the other ports on the switch, including the isolated ports.
- Community port—An access port that belongs to a community. These ports have Layer 2 connectivity with other ports in the same community.
- Isolated port—An access port that is isolated from the other ports on the switch. Isolated ports have Layer 2 connectivity only with promiscuous ports and PVLAN trunk ports. An isolated port cannot communicate with another isolated port even if they are members of the same isolated VLAN (or inter-switch isolated VLAN) domain. Typically, a server (such as a mail server or a backup server) is connected on this type of port.
- PVLAN trunk port—A trunk port that connects two switches when a PVLAN is configured spanning those switches. The PVLAN trunk port is a member of all the VLANs within the PVLAN (that is, the primary VLAN, the community VLANs, and the inter-switch isolated VLAN). It can communicate with all ports other than the isolated ports.

  The membership of the PVLAN trunk port in the inter-switch isolated VLAN is "egress-only". Incoming traffic on the PVLAN trunk port will never get assigned to the inter-switch isolated VLAN. The communication between a PVLAN trunk port and an isolated port is unidirectional. An isolated port can forward packets to a PVLAN trunk port, but a PVLAN trunk port cannot forward packets to an isolated port.

Table 2 on page 12 summarizes the Layer 2 connectivity between the different types of ports.

Table 2: PVLAN Ports and Layer 2 Connectivity

Port Mode	Promiscuous Port	Community Port	Isolated Port	PVLAN Trunk Port
Promiscuous Port	Can communicate.	Can communicate.	Can communicate.	Can communicate.
Community Port	Can communicate.	Can communicate within the same community.	Cannot communicate.	Can communicate.
Isolated Port	Can communicate.	Cannot communicate.	Cannot communicate.	Can communicate. NOTE: This communication is unidirectional.
PVLAN Trunk Port	Can communicate.	Can communicate within the same community.	Cannot communicate.	Can communicate.

NOTE: If you enable no-mac-learning on a primary VLAN, all isolated VLANs (or the inter-switch isolated VLAN) in the PVLAN inherit that setting. However, if you want to disable MAC address learning on any of the community VLANs, you must configure no-mac-learning on each of those VLANs.

PVLANs' Efficient Use of IP Addresses

PVLANs provide IP address conservation and efficient allocation of IP addresses. In a typical network, VLANs usually correspond to a single IP subnet. In private VLANs, the hosts in all the secondary VLANs still belong to the same IP subnet as the subnet allocated to the primary VLAN. Hosts within the secondary VLAN are numbered based on IP subnets associated with the primary VLAN, and their IP subnet masking information reflects that of the primary VLAN subnet.

Understanding Virtual Routing Instances on J-EX Series Switches

Virtual routing instances allow administrators to divide a J-EX Series Switch into multiple independent virtual routers, each with its own routing table. Splitting a device into many virtual routing instances isolates traffic traveling across the network without requiring multiple devices to segment the network.

You can use virtual routing instances to isolate customer traffic on your network and to bind customer-specific instances to customer-owned interfaces.

Virtual routing and forwarding (VRF) is often used in conjunction with Layer 3 subinterfaces, allowing traffic on a single physical interface to be differentiated and associated with multiple virtual routers. Each logical Layer 3 subinterface can belong to only one routing instance.

J-EX Series switches support IPv4 and IPv6 unicast and multicast VRF traffic.

J-EX4200 Ethernet Switches support up to 252 IPv4 virtual routing instances and up to 64 IPv6 virtual routing instances. J-EX8200 Series Ethernet Switches support up to 252 IPv4 and IPv6 virtual routing instances.

Understanding Redundant Trunk Links on J-EX Series Switches

In a typical enterprise network comprised of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk port goes down. Traffic is routed to another trunk port, keeping network convergence time to a minimum. You can configure a maximum of 16 redundant trunk groups on a standalone switch or on a Virtual Chassis.

To configure a redundant trunk link, create a redundant trunk group. The redundant trunk group is configured on the access switch, and contains two links: a primary or active link, and a secondary link. If the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal STP convergence.

Data traffic is forwarded only on the active link. Data Traffic on the secondary link is dropped and shown as dropped packets when you issue the operational mode command **show interfaces xe-** ***interface-name*** **extensive**.

While data traffic is blocked on the secondary link, Layer 2 control traffic is still permitted. For example, an LLDP session can be run between two J-EX Series Switches on the secondary link.

STP is enabled by default on J-EX Series switches to create a loop-free topology. When trunk links are placed in a redundant group, they cannot be part of an STP topology. The Junos operating system (Junos OS) for J-EX Series switches does not allow an interface to be in a redundant trunk group and in an STP topology at the same time. However, STP can continue operating in other parts of the network. For example, STP may continue operating between the distribution switches and linking them to the enterprise core.

Figure 2 on page 15 shows three switches in a basic topology for redundant trunk links. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports **ge-0/0/9.0** (Link 1) and **ge-0/0/10.0** (Link 2). Link 1 and Link 2 are in a redundant trunk group called **group1**. Link 1 is designated as the primary link. Traffic flows between Switch 3 in the access layer and Switch 1 in the distribution layer through Link 1. While Link 1 is active, Link 2 blocks traffic.

Figure 2: Redundant Trunk Group, Link 1 Active

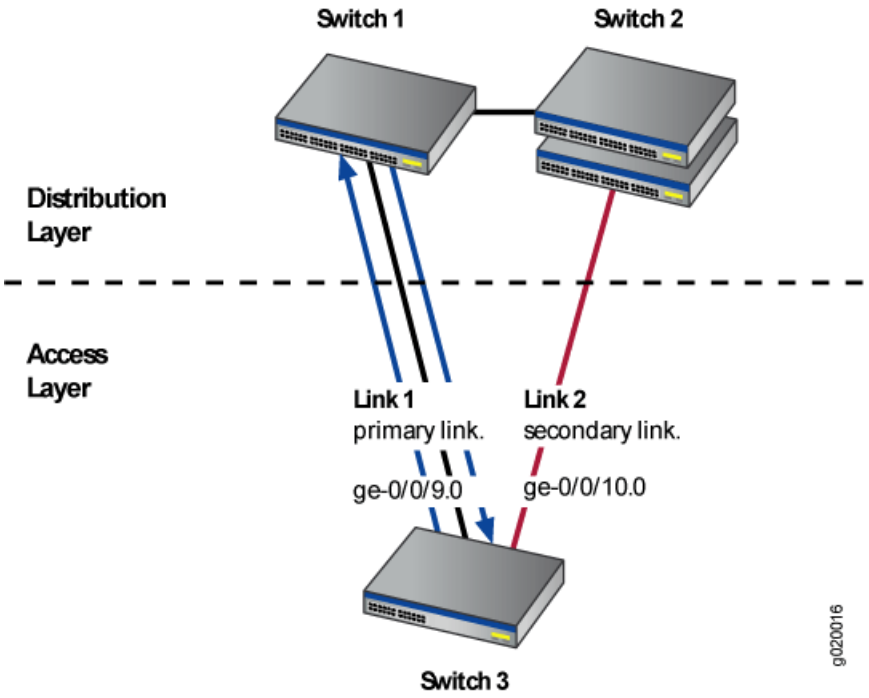

Figure 3 on page 15 illustrates how the redundant trunk link topology works when the primary link goes down.

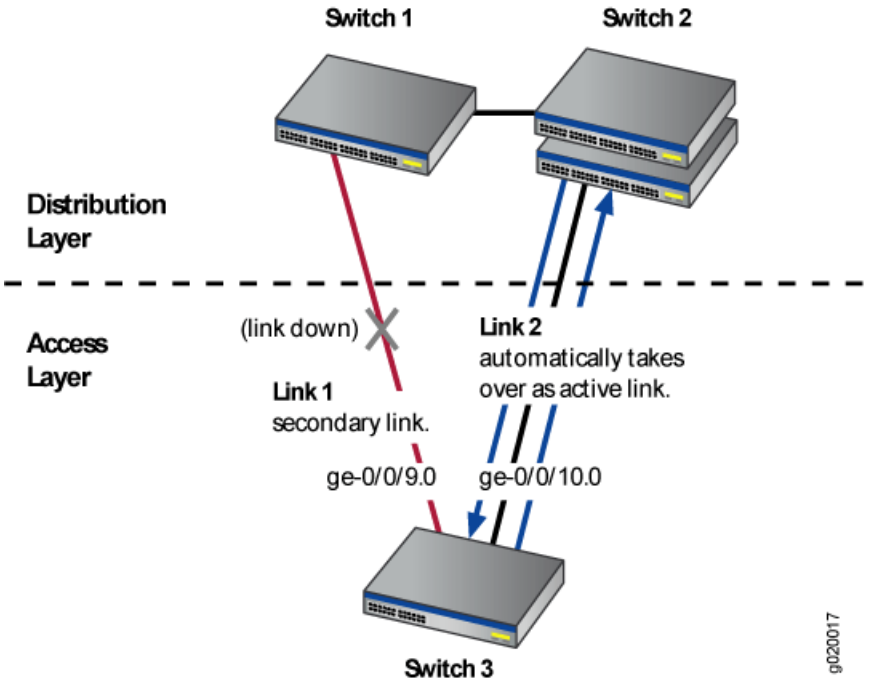
Figure 3: Redundant Trunk Group, Link 2 Active



Link 1 is down between Switch 3 and Switch 1. Link 2 takes over as the active link. Traffic between the access layer and the distribution layer is automatically switched to Link 2 between Switch 1 and Switch 2.

Understanding Q-in-Q Tunneling on J-EX Series Switches

Q-in-Q tunneling allows service providers on Ethernet access networks to extend a Layer 2 Ethernet connection between two customer sites. Using Q-in-Q tunneling, providers can also segregate or bundle customer traffic into fewer VLANs or different VLANs by adding another layer of 802.1Q tags. Q-in-Q tunneling is useful when customers have overlapping VLAN IDs, because the customer's 802.1Q (dot1Q) VLAN tags are prepended by the service VLAN (S-VLAN) tag. The Junos operating system (Junos OS) implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

This topic describes:

- How Q-in-Q Tunneling Works on page 16
- Disabling MAC Address Learning on page 17
- Mapping C-VLANs to S-VLANs on page 17
- Routed VLAN Interfaces on Q-in-Q VLANs on page 18
- Limitations for Q-in-Q Tunneling on page 19

How Q-in-Q Tunneling Works

In Q-in-Q tunneling, as a packet travels from a customer VLAN (C-VLAN) to a service provider's VLAN, a customer-specific 802.1Q tag is added to the packet. This additional tag is used to segregate traffic into service-provider-defined service VLANs (S-VLANs). The original customer 802.1Q tag of the packet remains and is transmitted transparently, passing through the service provider's network. As the packet leaves the S-VLAN in the downstream direction, the extra 802.1Q tag is removed.

When Q-in-Q tunneling is enabled on J-EX Series Switches, trunk interfaces are assumed to be part of the service provider network and access interfaces are assumed to be customer facing. An access interface can receive both tagged and untagged frames in this case.

An interface can be a member of multiple S-VLANs. You can map one C-VLAN to one S-VLAN (1:1) or multiple C-VLANs to one S-VLAN (N:1). Packets are double-tagged for an additional layer of segregating or bundling of C-VLANs. C-VLAN and S-VLAN tags are unique; so you can have both a C-VLAN 101 and an S-VLAN 101, for example. You can limit the set of accepted customer tags to a range of tags or to discrete values. Class-of-service (CoS) values of C-VLANs are unchanged in the downstream direction. You may, optionally, copy ingress priority and CoS settings to the S-VLAN. Using private

VLANs, you can isolate users to prevent the forwarding of traffic between user interfaces even if the interfaces are on the same VLAN.

You can use the **native** option to specify an S-VLAN for untagged and priority tagged packets when using many-to-one bundling and mapping a specific interface approaches to map C-VLANs to S-VLANs. Otherwise the packets are discarded. The **native** option is not available for all-in-one bundling because there is no need to specify untagged and priority tagged packets when all packets are mapped to the C-VLAN. See "Mapping C-VLANs to S-VLANs" on page 17 for information on the methods of mapping C-VLANs to S-VLANs.

Firewall filters allow you to map an interface to a VLAN based on a policy. Using firewall filters to map an interface to a VLAN is useful when you want a subset of traffic from a port to be mapped to a selected VLAN instead of the designated VLAN. To configure a firewall filter to map an interface to a VLAN, the **vlan** option has to be configured as part of the firewall filter and the **mapping policy** option must be specified in the interface configuration for each logical interface using the filter.

Disabling MAC Address Learning

In a Q-in-Q deployment, customer packets from downstream interfaces are transported without any changes to source and destination MAC addresses. You can disable MAC address learning at both the interface level and the VLAN level. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member. When you disable MAC address learning on a VLAN, MAC addresses that have already been learned are flushed.

If you disable MAC address learning on an interface or a VLAN, you cannot include MAC move limiting or 802.1X authentication in that same VLAN configuration.

When a routed VLAN interface (RVI) is associated with either an interface or a VLAN on which MAC address learning is disabled, the Layer 3 routes resolved on that VLAN or that interface are not resolved with the Layer 2 component. This results in routed packets flooding all the interfaces associated with the VLAN.

Mapping C-VLANs to S-VLANs

There are three ways to map C-VLANs to an S-VLAN:

- All-in-one bundling—Use the **dot1q-tunneling** option to map without specifying customer VLANs. All packets from all access interfaces are mapped to the S-VLAN.
- Many-to-one bundling—Use the **customer-vlans** option to specify which C-VLANs are mapped to the S-VLAN.
- Mapping a specific interface—Use the **mapping** option to indicate a specific S-VLAN for a given C-VLAN. The specified C-VLAN applies to only one VLAN and not all access interfaces as in the cases of all-in-one and many-to-one bundling.

If you configure multiple methods, the switch gives priority to mapping a specific interface, then to many-to-one bundling, and last to all-in-one bundling. However, you cannot have overlapping rules for the same C-VLAN under a given approach.

- All-in-One Bundling on page 18
- Many-to-One Bundling on page 18
- Mapping a Specific Interface on page 18

All-in-One Bundling

All-in-one bundling maps all packets from all access interfaces to the S-VLAN. All-in-one bundling is configured using the **dot1q-tunneling** option without specifying customer VLANs.

When all-in-one bundling is used, all packets leaving the C-VLAN, including untagged and priority tagged packets, enter the S-VLAN.

Many-to-One Bundling

Many-to-one bundling is used to specify which C-VLANs are mapped to an S-VLAN. Many-to-one bundling is configured using the **customer-vlans** option.

Many-to-one bundling is used when you want a subset of the C-VLANs on the access switch to be part of the S-VLAN. When using many-to-one bundling, untagged and priority tagged packets can be mapped to the S-VLAN when the **native** option is specified along with the **customer-vlans** option.

Mapping a Specific Interface

Use the mapping a specific interface approach when you want to assign an S-VLAN to a specific C-VLAN on an interface. The mapping a specific interface configuration only applies to the configured interface, not to all access interfaces as in the cases of the all-in-one bundling and many-to-one bundling approaches. The mapping a specific interface approach is configured using the **mapping** option to indicate a specific S-VLAN for a given C-VLAN.

The mapping a specific interface approach has two suboptions for treatment of traffic: swap and push. When traffic that is mapped to a specific interface is pushed, the packet retains its tag as it moves between the S-VLAN and C-VLAN and an additional VLAN tag is added to the packet. When traffic that is mapped to a specific interface is swapped, the incoming tag is replaced with a new VLAN tag. Using the **swap** option is also referred to as VLAN ID translation.

It might be useful to have S-VLANs that provide service to multiple customers. Each customer will typically have its own S-VLAN plus access to one or more S-VLANs that are used by multiple customers. A specific tag on the customer side is mapped to an S-VLAN. Typically, this functionality is used to keep data from different customers separate or to provide individualized treatment of the packets on a certain interface.

Routed VLAN Interfaces on Q-in-Q VLANs

Routed VLAN interfaces (RVIs) are supported on Q-in-Q VLANs.

Packets arriving on an RVI that is using Q-in-Q VLANs will get routed regardless of whether the packet is single or double tagged. The outgoing routed packets contain an S-VLAN tag only when exiting a trunk interface; the packets exit the interface untagged when exiting an access interface.

Limitations for Q-in-Q Tunneling

Q-in-Q tunneling does not support most access port security features. There is no per-VLAN (customer) policing or per-VLAN (outgoing) shaping and limiting with Q-in-Q tunneling unless you configure these security features using firewall filters.

Related Documentation

- Understanding Bridging and VLANs on J-EX Series Switches on page 3
- Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches on page 58
- Configuring Q-in-Q Tunneling (CLI Procedure) on page 122

Understanding Multiple VLAN Registration Protocol (MVRP) on J-EX Series Switches

Multiple VLAN Registration Protocol (MVRP) is a Layer 2 messaging protocol that manages the addition, deletion, and renaming of active virtual LANs, thereby reducing network administrators' time spent on these tasks. Use MVRP on J-EX Series Switches to dynamically register and de-register active VLANs on trunk interfaces. Using MVRP means that you do not have to manually register VLANs on all connections— that is, you do not need to explicitly bind a VLAN to each trunk interface. With MVRP, you configure a VLAN on one switch interface and the VLAN configuration is distributed through all active switches in the domain.

MVRP is an application protocol of the Multiple Registration Protocol (MRP) and is defined in the IEEE 802.1ak standard. MRP and MVRP replace Generic Attribute Registration Protocol (GARP) and GARP VLAN Registration Protocol (GVRP) and overcome GARP and GVRP limitations.

This topic describes:

- How MVRP Updates, Creates, and Deletes VLANs on the Switches on page 19
- MVRP Is Disabled by Default on the Switches on page 20
- MVRP Registration Modes for Each Interface on a Switch on page 20
- MRP Timers Control MVRP Updates on page 20
- MVRP Uses MRP Messages to Transmit Switch and VLAN States on page 21

How MVRP Updates, Creates, and Deletes VLANs on the Switches

When any MVRP-member VLAN is changed, that VLAN sends a protocol data unit (PDU) to all other MVRP-member active VLANs. The PDU informs the other VLANs which switches and interfaces currently belong to the sending VLAN. This way, all MVRP-member VLANs are always updated with the current VLAN state of all other MVRP-member VLANs. Timers dictate when PDUs can be sent and when switches receiving MVRP PDUs can update their MVRP VLAN information.

In addition to sending PDU updates, MVRP dynamically creates VLANs on member interfaces when a new VLAN is added to any one interface. This way, VLANs created on one member switch are propagated to other member switches as part of the MVRP message exchange process.

To keep VLAN membership information current, MVRP removes switches and interfaces when they become unavailable. Pruning VLAN information has these benefits:

- Limits the network VLAN configuration to active participants, thereby reducing network overhead.
- Limits broadcast, unknown unicast, and multicast (BUM) traffic to interested devices.

MVRP Is Disabled by Default on the Switches

MVRP is disabled by default on the switches and, when enabled, affects only trunk interfaces. Once you enable MVRP, all VLAN interfaces on that switch belong to MVRP unless you specifically configure an interface as **forbidden**. VLAN updating, dynamic VLAN configuration through MVRP, and VLAN pruning are all active on trunk interfaces when MVRP is enabled.

MVRP Registration Modes for Each Interface on a Switch

Although MVRP is enabled by default on all switch interfaces, individual interfaces do not have to participate in MVRP. The MVRP registration mode defines whether a particular interface on a switch does or does not participate. On an interface, MVRP can be in either of two modes:

- Forbidden—This interface is not registered in MVRP and does not participate.
- Normal—This interface accepts PDU messages and sends its own PDU messages. This is the default interface registration mode setting when MVRP is enabled on a switch.

MRP Timers Control MVRP Updates

MVRP registration and updates are controlled by timers that are part of MRP. These timers are set on a per-interface basis and define when MVRP PDUs can be sent and when MVRP information can be updated on a switch.

The following timers are used to control the operation of MVRP:

- Join timer—Controls the interval for the next MVRP PDU transmit opportunity.
- Leave timer—Controls the period of time that an interface on the switch waits in the leave state before changing to the unregistered state.
- LeaveAll timer—Controls the frequency with which the interface generates LeaveAll messages.

BEST PRACTICE: **Unless there is a compelling reason to change the timer settings, leave the default settings in place. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.**

MVRP Uses MRP Messages to Transmit Switch and VLAN States

MVRP uses MRP messages to register and declare MVRP states for a switch or VLAN and to inform the switching network that a switch or VLAN is leaving MVRP. These messages are communicated as part of the PDU sent by any switch interface to the other switches in the network.

The following MRP messages are communicated for MVRP:

- Empty—MVRP information is not declared and no VLAN is registered.
- In—MVRP information is not declared but a VLAN is registered.
- JoinEmpty—MVRP information is declared but no VLAN is registered.
- JoinIn—MVRP information is declared and a VLAN is registered.
- Leave—MVRP information that was previously declared is withdrawn.
- LeaveAll—Unregister all VLANs on the switch. VLANs must re-register to participate in MVRP.
- New—The MVRP information is new and a VLAN might not be registered yet.

Understanding Layer 2 Protocol Tunneling on J-EX Series Switches

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to J-EX Series Switches that are not part of the local broadcast domain. This feature is useful when you want to run Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

This topic includes:

- Layer 2 Protocols Supported by L2PT on J-EX Series Switches on page 21
- How L2PT Works on page 22
- L2PT Basics on J-EX Series Switches on page 22

Layer 2 Protocols Supported by L2PT on J-EX Series Switches

L2PT on J-EX Series switches supports the following Layer 2 protocols:

- 802.1X authentication
- 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

NOTE: If you enable L2PT for untagged OAM LFM packets, do not configure LFM on the corresponding access interface.

- Cisco Discovery Protocol (CDP)
- Ethernet local management interface (E-LMI)
- GARP VLAN Registration Protocol (GVRP)
- Link Aggregation Control Protocol (LACP)

NOTE: If you enable L2PT for untagged LACP packets, do not configure LACP on the corresponding access interface.

- Link Layer Discovery Protocol (LLDP)
- Multiple MAC Registration Protocol (MMRP)
- Multiple VLAN Registration Protocol (MVRP)
- Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP)
- Unidirectional Link Detection (UDLD)
- VLAN Spanning Tree Protocol (VSTP)
- VLAN Trunking Protocol (VTP)

NOTE: CDP, UDLD, and VTP cannot be configured on J-EX Series switches. L2PT does, however, tunnel CDP, UDLD, and VTP PDUs.

How L2PT Works

L2PT works by encapsulating Layer 2 PDUs, tunneling them across a service provider network, and decapsulating them for delivery to their destination switches. L2PT encapsulates Layer 2 PDUs by enabling the ingress provider edge (PE) device to rewrite the PDUs' destination media access control (MAC) addresses before forwarding them onto the service provider network. The devices in the service provider network treat these encapsulated PDUs as multicast Ethernet packets. Upon receipt of these PDUs, the egress PE devices decapsulate them by replacing the destination MAC addresses with the address of the Layer 2 protocol that is being tunneled before forwarding the PDUs to their destination switches.

L2PT Basics on J-EX Series Switches

L2PT is enabled on a per-VLAN basis. When you enable L2PT on a VLAN, all access interfaces are considered to be customer-facing interfaces, all trunk interfaces are considered to be service provider network-facing interfaces, and the specified Layer 2

protocol is disabled on the access interfaces. L2PT only acts on logical interfaces of the family **ethernet-switching**.

NOTE: Access interfaces in an L2PT-enabled VLAN should not receive L2PT-tunneled PDUs. If an access interface does receive L2PT-tunneled PDUs, it might mean that there is a loop in the network. As a result, the interface will be shut down.

L2PT is configured under the **[edit vlans *vlan-name* dot1q-tunneling]** hierarchy level, meaning Q-in-Q tunneling is (and must be) enabled. If L2PT is not enabled, Layer 2 PDUs are handled in the same way they were handled before L2PT was enabled.

NOTE: If the switch receives untagged or priority-tagged Layer 2 control PDUs to be tunnelled, then you must configure the switch to map untagged and priority-tagged packets to an L2PT-enabled VLAN. For more information on assigning untagged and priority-tagged packets to VLANs, see "Understanding Q-in-Q Tunneling on J-EX Series Switches" on page 16 and "Configuring Q-in-Q Tunneling (CLI Procedure)" on page 122.

Understanding Proxy ARP on J-EX Series Switches

You can configure proxy Address Resolution Protocol (ARP) on your J-EX Series Switch to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch

maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

Proxy ARP Overview

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

NOTE: **For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.**

You can configure proxy ARP for each interface. You can also configure proxy ARP for a VLAN by using a routed VLAN interface (RVI).

J-EX Series switches support two modes of proxy ARP, restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- Restricted—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.
- Unrestricted—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

Best Practices for Proxy ARP on J-EX Series Switches

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP to restricted mode.
- Use restricted mode when configuring proxy ARP on RVIs.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

Understanding MAC Notification on J-EX Series Switches

J-EX Series Switches track clients on a network by storing Media Access Control (MAC) addresses in the Ethernet switching table on the switch. When switches learn or unlearn a MAC address, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as MAC notification.

The MAC Notification MIB controls MAC notification for the network management system. For general information on the MAC Notification MIB, see the *Junos OS Network Management Configuration Guide*.

The MAC notification interval defines how often these SNMP notifications are sent to the network management system. The MAC notification interval works by tracking all of the MAC address additions or removals on the switch over a period of time and then sending all of the tracked MAC address additions or removals to the network management server at the end of the interval. For instance, if the MAC notification interval is set to 10, all of the MAC address addition and removal SNMP notifications are sent to the network management system every 10 seconds.

Enabling MAC notification allows users to monitor the addition and removal of MAC addresses from the Ethernet switching table remotely using a network management system. The advantage of setting a high MAC notification interval is that the amount of network traffic is reduced because updates are sent less frequently. The advantage of setting a low MAC notification interval is that the network management system is better synchronized with the switch.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

Understanding MAC Address Aging

J-EX Series switches store MAC addresses in the Ethernet switching table, also called the *MAC table*. When the aging time for a MAC address in the table expires, the address is removed.

You can configure the MAC table aging time on all VLANs on the switch or on a per-VLAN basis. You can also configure aging time to be unlimited, either on all VLANs or per-VLAN, so that MAC addresses never age out of the table.

To learn MAC addresses, the switch reads all packets that it detects on the LAN or on the local VLAN, looking for MAC addresses of sending nodes. It places these addresses into its Ethernet switching table, along with two other pieces of information—the interface on which the traffic was received and the time when the address was learned.

When the switch receives traffic on an interface, it searches the Ethernet switching table for the MAC address of the destination. If the MAC address is not found, the traffic is flooded out all of the other interfaces associated with the VLAN—if traffic is received on an interface that is associated with VLAN v-10 and there is no entry in the Ethernet switching table for VLAN v-10 (the Ethernet switching table is organized by VLAN), then the traffic is flooded to all access and trunk interfaces that are members of VLAN v-10.

Flooding allows the switch to learn about destinations that are not yet in its Ethernet switching table. If a particular destination MAC address is not in the Ethernet switching table, the switch floods the traffic to all interfaces except the interface on which it was received. When the destination node receives the flooded traffic, it sends an acknowledgment packet back to the switch, allowing the switch to learn the MAC address of the node and to add the address to its Ethernet switching table.

The switch uses a mechanism called aging to keep the Ethernet switching table current. For each MAC address in the Ethernet switching table, the switch records a timestamp of when the information about the network node was learned. Each time the switch detects traffic from a MAC address that is in its Ethernet switching table, it updates the timestamp of that MAC address. A timer on the switch periodically checks the timestamp, and if it is older than the value set for **mac-table-aging-time**, the switch removes the node's MAC address from the Ethernet switching table. This aging process ensures that the switch tracks only active MAC addresses on the network and that it is able to flush out from the Ethernet switching table MAC addresses that are no longer available.

You configure how long MAC addresses remain in the Ethernet switching table using the **mac-table-aging-time** statement in either the **edit ethernet-switching-options** or the **vlans** hierarchy, depending on whether you want to configure it for the entire switch or only for specific VLANs.

For example, if you have a printer VLAN, you might choose to configure the aging time for that VLAN to be considerably longer than for other VLANs so that MAC addresses of printers on this VLAN age out less frequently. Because the MAC addresses remain in the table, even if a printer has been idle for some time before traffic arrives for it, the switch still finds the MAC address and does not need to flood the traffic to all other interfaces.

Similarly, in a data center environment where the list of servers connected to the switch is fairly stable, you might choose to increase MAC address aging time, or even set it to unlimited, to increase the efficiency of the utilization of network bandwidth by reducing flooding.

Understanding Reflective Relay for Use with VEPA Technology

Reflective relay returns packets to a device using the same downstream port that delivered the packets to the J-EX Series Switch. You use reflective relay in situations when one interface must both send and receive packets—for example, when a switch receives aggregated virtual machine packets from a technology such as virtual Ethernet packet aggregation (VEPA).

- What Is VEPA and Why Does It Require Reflective Relay? on page 27
- How Does Reflective Relay Work? on page 27

What Is VEPA and Why Does It Require Reflective Relay?

Even though virtual machines are capable of sending packets directly to one another with a technology called VEB (virtual Ethernet bridging), you typically want to use physical switches for switching because VEB uses expensive server hardware to accomplish the task. Instead of using VEB, you can install VEPA on a server to aggregate virtual machine packets and pass them to a physical switch. By passing aggregated packets to a physical switch, you both off-load switching activities from a server's virtual switches and you take advantage of the physical switch's security and tracking features.

When aggregated packets such as VEPA packets are received on a switch, reflective relay must be configured on that switch because some packets may have to be sent back to the server, destined for another virtual machine on the same server. Reflective relay returns those packets to the original device using the same downstream port that delivered the packets to the switch.

How Does Reflective Relay Work?

The switches execute reflective relay, also known as hairpin turns, by receiving and returning packets back to the physical server on the same downstream port. Reflective relay only does this in two situations:

- When the destination address of the packet was learned on that downstream port.
- When the destination has not yet been learned.

NOTE: **Control packets are never reflected back on the downstream port.**

Other than this, reflective relay does not change the operation of the switch. If the source VLAN and MAC address of the virtual machine packet are not yet included in the Ethernet switching table, an entry is added. If the destination VLAN and MAC address of an incoming packet is not yet present in the Ethernet switching table, the switch floods the packet on all the other ports that are members of the same VLAN, including the port on which the packet arrived.

Understanding Routed VLAN Interfaces on J-EX Series Switches

Traditionally, switches sent traffic only to hosts within the same broadcast domain and routers handled traffic between different broadcast domains. This meant that network devices in different domains could not communicate without a router. This system worked well with early LANs, when each LAN had its own broadcast domain. However, the introduction of VLANs, and later virtual private LAN services (VPLS), made this scheme impractical.

VLANs reduce the load on a network by dividing a LAN into smaller segments and keeping local traffic within a VLAN. However, because each VLAN has its own domain, a mechanism is needed for VLANs to pass data to other VLANs without passing the data through a router. The solution is to use logical routers, otherwise known as routed VLAN interfaces (RVIs). With RVIs, the switch recognizes packet destinations that are local to the sending VLAN and bridges (switches) those packets—with RVIs, only packets destined for another VLAN are routed. Whenever packets are switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address lookups.

The switches use a Layer 3 RVI named **vlan** to route traffic to other Layer 3 interfaces, thus eliminating the need for a physical router. You can use RVIs to route Layer 3 traffic either out of a broadcast domain such as a VLAN, or out of a virtual private LAN service (VPLS) used by service providers. RVIs support IPv4, IPv6, MPLS, and IS-IS traffic. Multicast data, broadcast data, and unicast data are all routed with RVIs using their MAC address destination addresses.

CHAPTER 2

Examples: Bridging and VLAN Configuration

Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch

J-EX Series switches use bridging and virtual LANs (VLANs) to connect network devices in a LAN—desktop computers, IP telephones, printers, file servers, wireless access points, and others—and to segment the LAN into smaller bridging domains. The switch's default configuration provides a quick setup of bridging and a single VLAN.

This example describes how to configure basic bridging and VLANs for a J-EX Series switch:

Requirements

This example uses the following software and hardware components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX4200 Virtual Chassis switch

Before you set up bridging and a VLAN, be sure you have:

- Installed your J-EX Series switch. For instructions, see the *Dell PowerConnect J-Series J-EX4200 Ethernet Switch Hardware Guide* at http://www.support.dell.com/manuals.
- Performed the initial switch configuration. For connection and configuration instructions, see the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

J-EX Series switches connect network devices in an office LAN or a data center LAN to provide sharing of common resources such as printers and file servers and to enable wireless devices to connect to the LAN through wireless access points. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN.

To use a J-EX Series switch to connect network devices on a LAN, you must, at a minimum, configure bridging and VLANs. If you simply power on the switch and perform the initial switch configuration using the factory-default settings, bridging is enabled on all the switch's interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **default**, which is automatically configured. When you plug access devices—such as desktop computers, Avaya IP telephones, file servers, printers, and wireless access points—into the switch, they are joined immediately into the **default** VLAN and the LAN is up and running.

The topology used in this example consists of one J-EX4200-24T switch, which has a total of 24 ports. Eight of the ports support Power over Ethernet (PoE), which means they provide both network connectivity and electric power for the device connecting to the port. To these ports, you can plug in devices requiring PoE, such as Avaya VoIP telephones, wireless access points, and some IP cameras. (Avaya phones have a built-in hub that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one port on the switch.) The remaining 16 ports provide only network connectivity. You use them to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers. Table 3 on page 31 details the topology used in this configuration example.

Table 3: Components of the Basic Bridging Configuration Topology

Property	Settings
Switch hardware	J-EX4200-24T switch, with 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE ports (**ge-0/0/8** through **ge-0/0/23**)
VLAN name	**default**
Connection to wireless access point (requires PoE)	**ge-0/0/0**
Connections to Avaya IP telephone—with integrated hub, to connect phone and desktop PC to a single port (requires PoE)	**ge-0/0/1** through **ge-0/0/7**
Direct connections to desktop PCs (no PoE required)	**ge-0/0/8** through **ge-0/0/12**
Connections to file servers (no PoE required)	**ge-0/0/17** and **ge-0/0/18**
Connections to integrated printer/fax/copier machines (no PoE required)	**ge-0/0/19** through **ge-0/0/20**
Unused ports (for future expansion)	**ge-0/0/13** through **ge-0/0/16**, and **ge-0/0/21** through **ge-0/0/23**

Configuration

CLI Quick Configuration

By default, after you perform the initial configuration on the J-EX4200 switch, switching is enabled on all interfaces, a VLAN named **default** is created, and all interfaces are placed into this VLAN. You do not need to perform any other configuration on the switch to set up bridging and VLANs. To use the switch, simply plug the Avaya IP phones into the PoE-enabled ports **ge-0/0/1** through **ge-0/0/7**, and plug in the PCs, file servers, and printers to the non-PoE ports, **ge-0/0/8** through **ge-0/0/12** and **ge-0/0/17** through **ge-0/0/20**.

Step-by-Step Procedure

To configure bridging and VLANs:

1. Make sure the switch is powered on.
2. Connect the wireless access point to switch port **ge-0/0/0**.
3. Connect the seven Avaya phones to switch ports **ge-0/0/1** through **ge-0/0/7**.
4. Connect the five PCs to ports **ge-0/0/8** through **ge-0/0/12**.
5. Connect the two file servers to ports **ge-0/0/17** and **ge-0/0/18**.
6. Connect the two printers to ports **ge-0/0/19** and **ge-0/0/20**.

Results

Verification

To verify that switching is operational and that a VLAN has been created, perform these tasks:

- Verifying That the VLAN Has Been Created on page 35
- Verifying That Interfaces Are Associated with the Proper VLANs on page 35

Verifying That the VLAN Has Been Created

Purpose Verify that the VLAN named **default** has been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/0.0*, ge-0/0/1.0, ge-0/0/2.0, ge-0/0/3.0,
                        ge-0/0/4.0,  ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0,
                        ge-0/0/8.0*, ge-0/0/9.0, ge-0/0/10.0, ge-0/0/11.0*,
                        ge-0/0/12.0, ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0,
                        ge-0/0/16.0, ge-0/0/17.0, ge-0/0/18.0, ge-0/0/19.0*,
                        ge-0/0/20.0, ge-0/0/21.0, ge-0/0/22.0, ge-0/0/23.0,
                        ge-0/1/0.0*, ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*
mgmt
                        me0.0*
```

Meaning The **show vlans** command lists the VLANs configured on the switch. This output shows that the VLAN **default** has been created.

Verifying That Interfaces Are Associated with the Proper VLANs

Purpose Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

Action List all interfaces on which switching is enabled:

```
user@switch> show ethernet-switching interfaces
```

```
Interface   State    VLAN members          Blocking
ge-0/0/0.0  up       default               unblocked
ge-0/0/1.0  down     default               blocked - blocked by STP/RTG
ge-0/0/2.0  down     default               blocked - blocked by STP/RTG
ge-0/0/3.0  down     default               blocked - blocked by STP/RTG
ge-0/0/4.0  down     default               blocked - blocked by STP/RTG
ge-0/0/5.0  down     default               blocked - blocked by STP/RTG
ge-0/0/6.0  down     default               blocked - blocked by STP/RTG
ge-0/0/7.0  down     default               blocked - blocked by STP/RTG
ge-0/0/8.0  up       default               unblocked
ge-0/0/9.0  down     default               blocked - blocked by STP/RTG
ge-0/0/10.0 down     default               blocked - blocked by STP/RTG
ge-0/0/11.0 up       default               unblocked
ge-0/0/12.0 down     default               blocked - blocked by STP/RTG
ge-0/0/13.0 down     default               blocked - blocked by STP/RTG
ge-0/0/14.0 down     default               blocked - blocked by STP/RTG
ge-0/0/15.0 down     default               blocked - blocked by STP/RTG
ge-0/0/16.0 down     default               blocked - blocked by STP/RTG
ge-0/0/17.0 down     default               blocked - blocked by STP/RTG
ge-0/0/18.0 down     default               blocked - blocked by STP/RTG
ge-0/0/19.0 up       default               unblocked
ge-0/0/20.0 down     default               blocked - blocked by STP/RTG
ge-0/0/21.0 down     default               blocked - blocked by STP/RTG
ge-0/0/22.0 down     default               blocked - blocked by STP/RTG
ge-0/0/23.0 down     default               blocked - blocked by STP/RTG
ge-0/1/0.0  up       default               unblocked
ge-0/1/1.0  up       default               unblocked
ge-0/1/2.0  up       default               unblocked
ge-0/1/3.0  up       default               unblocked
me0.0       up       mgmt                  unblocked
```

Meaning The **show ethernet-switching interfaces** command lists all interfaces on which switching is enabled (in the **Interfaces** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, **ge-0/0/0** through **ge-0/0/12** and **ge-0/0/17** through **ge-0/0/20** and that they are all part of VLAN **default**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows **ge-0/0/0.0** instead of **ge-0/0/0**. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a J-EX Series switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the

entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure bridging for a J-EX Series switch and how to create two VLANs to segment the LAN:

Requirements

This example uses the following hardware and software components:

- One J-EX4200-48T Virtual Chassis switch
- Junos OS Release 10.2 or later for J-EX Series switches

Before you set up bridging and VLANs, be sure you have:

- Installed your J-EX Series switch. For instructions, see the *Dell PowerConnect J-Series J-EX4200 Ethernet Switch Hardware Guide* at http://www.support.dell.com/manuals.
- Performed the initial switch configuration. For connection and configuration instructions, see the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

J-EX Series switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as printers and file servers and to enable wireless devices to connect to the LAN through wireless access points. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and allows you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers, printers, and wireless access points. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology for this example consists of one J-EX4200-48T switch, which has a total of 48 Gigabit Ethernet ports, 8 of which support Power over Ethernet (PoE). Most of the switch ports connect to Avaya IP telephones. The remainder of the ports connect to wireless access points, file servers, and printers. Table 4 on page 38 explains the components of the example topology.

Table 4: Components of the Multiple VLAN Topology

Property	Settings
Switch hardware	J-EX4200-48T, 48 Gigabit Ethernet ports, 8 of them PoE-enabled (**ge-0/0/0** through **ge-0/0/07**)
VLAN names and tag IDs	**sales**, tag **100** **support**, tag **200**
VLAN subnets	**sales**: **192.0.2.0/25** (addresses **192.0.2.1** through **192.0.2.126**) **support**: **192.0.2.128/25** (addresses **192.0.2.129** through **192.0.2.254**)
Interfaces in VLAN **sales**	Avaya IP telephones: **ge-0/0/2** through **ge-0/0/4** Wireless access point: **ge-0/0/0** Printers: **ge-0/0/22** and **ge-0/0/23** File servers: **ge-0/0/20** and **ge-0/0/21**
Interfaces in VLAN **support**	Avaya IP telephones: **ge-0/0/5** through **ge-0/0/7** Wireless access point: **ge-0/0/1** Printers: **ge-0/0/44** and **ge-0/0/45** File servers: **ge-0/0/46** and **ge-0/0/47**
Unused interfaces	**ge-0/0/8** through **ge0/0/19** and **ge-0/0/24** through **ge–0/0/43**

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

Configuration

Configure Layer 2 switching for two VLANs:

CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description “Sales wireless access point port”
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description “Sales phone port”
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description “Sales printer port”
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description “Sales file server port”
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/1 unit 0 description “Support wireless access point port”
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/6 unit 0 description “Support phone port”
set interfaces ge-0/0/6 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description “Support printer port”
```

```
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description “Support file server port”
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3–interface vlan.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

Step-by-Step Procedure

Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the wireless access point in the sales VLAN:

```
[edit interfaces ge-0/0/0 unit 0]
user@switch# set description “Sales wireless access point port”
user@switch# set family ethernet-switching vlan members sales
```

2. Configure the interface for the Avaya IP phone in the sales VLAN:

```
[edit interfaces ge-0/0/3 unit 0]
user@switch# set description “Sales phone port”
user@switch# set family ethernet-switching vlan members sales
```

3. Configure the interface for the printer in the sales VLAN:

```
[edit interfaces ge-0/0/22 unit 0]
user@switch# set description “Sales printer port”
user@switch# set family ethernet-switching vlan members sales
```

4. Configure the interface for the file server in the sales VLAN:

```
[edit interfaces ge-0/0/20 unit 0]
user@switch# set description “Sales file server port”
user@switch# set family ethernet-switching vlan members sales
```

5. Configure the interface for the wireless access point in the support VLAN:

```
[edit interfaces ge-0/0/1 unit 0]
user@switch# set description “Support wireless access point port”
user@switch# set family ethernet-switching vlan members support
```

6. Configure the interface for the Avaya IP phone in the support VLAN:

```
[edit interfaces ge-0/0/6 unit 0]
user@switch# set description “Support phone port”
user@switch# set family ethernet-switching vlan members support
```

7. Configure the interface for the printer in the support VLAN:

```
[edit interfaces ge-0/0/44 unit 0]
user@switch# set description “Support printer port”
user@switch# set family ethernet-switching vlan members support
```

8. Configure the interface for the file server in the support VLAN:

```
[edit interfaces ge-0/0/46 unit 0]
user@switch# set description “Support file server port”
user@switch# set family ethernet-switching vlan members support
```

9. Create the subnet for the sales broadcast domain:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25
```

10. Create the subnet for the support broadcast domain:

```
[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25
```

11. Configure the VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200
```

12. To route traffic between the sales and support VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:

```
[edit vlans]
user@switch# set sales l3-interface
user@switch# set support l3-interface vlan.1
```

```
user@switch> show configuration
interfaces {
  ge-0/0/0 {
    unit 0 {
      description “Sales wireless access point port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description “Sales phone port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/22 {
    unit 0 {
      description “Sales printer port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      description “Sales file server port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/1 {
    unit 0 {
```

```
            description “Support wireless access point port”;
            family ethernet-switching {
              vlan members support;
            }
          }
        }
        ge-0/0/6 {
          unit 0 {
            description “Support phone port”;
            family ethernet-switching {
              vlan members support;
            }
          }
        }
        ge-0/0/44 {
          unit 0 {
            description “Support printer port”;
            family ethernet-switching {
              vlan members support;
            }
          }
        }
        ge-0/0/46 {
          unit 0 {
            description “Support file server port”;
            family ethernet-switching {
              vlan members support;
            }
          }
          vlans {
            unit 0 {
              family inet address 192.0.2.0/25;
            }
            unit 1 {
              family inet address 192.0.2.128/25;
            }
          }
        }
      }
      vlans {
        sales {
          vlan-id 100;
          interface ge-0/0/0.0:
          interface ge-0/0/3/0;
          interface ge-0/0/20.0;
          interface ge-0/0/22.0;
          l3-interface vlan 0;
        }
        support {
          vlan-id 200;
          interface ge-0/0/1..0:
          interface ge-0/0/6.0;
          interface ge-0/0/44.0;
          interface ge-0/0/46.0;
          l3-interface vlan 1;
        }
```

```
}
```

TIP: To quickly configure the sales and support VLAN interfaces, issue the **load merge terminal** command, then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the “sales” and “support” VLANs have been created and are operating properly, perform these tasks:

- Verifying That the VLANs Have Been Created and Associated to the Correct Interfaces on page 42
- Verifying That Traffic Is Being Routed Between the Two VLANs on page 43
- Verifying That Traffic Is Being Switched Between the Two VLANs on page 43

Verifying That the VLANs Have Been Created and Associated to the Correct Interfaces

Purpose Verify that the VLANs **sales** and **support** have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

Action List all VLANs configured on the switch:

Use the operational mode commands:

```
user@switch>  show vlans
Name            Tag     Interfaces
default
                        ge-0/0/1.0, ge-0/0/2.0, ge-0/0/4.0, ge-0/0/5.0,
                        ge-0/0/6.0,  ge-0/0/7.0, ge-0/0/8.0, ge-0/0/9.0,
                        ge-0/0/10.0*, ge-0/0/11.0, ge-0/0/12.0, ge-0/0/13.0*,
                        ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0,
                        ge-0/0/18.0, ge-0/0/19.0, ge-0/0/21.0, ge-0/0/23.0*,
                        ge-0/0/25.0, ge-0/0/27.0, ge-0/0/28.0, ge-0/0/29.0,
                        ge-0/0/30.0, ge-0/0/31.0, ge-0/0/32.0, ge-0/0/33.0,
                        ge-0/0/34.0, ge-0/0/35.0, ge-0/0/36.0, ge-0/0/37.0,
                        ge-0/0/38.0, ge-0/0/39.0, ge-0/0/40.0, ge-0/0/41.0,
                        ge-0/0/42.0, ge-0/0/43.0, ge-0/0/45.0, ge-0/0/47.0,
                        ge-0/1/0.0*, ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*

sales           100
                        ge-0/0/0.0*, ge-0/0/3.0, ge-0/0/20.0, ge-0/0/22.0

support         200
                        ge-0/0/1.0, ge-0/0/6.0, ge-0/0/44.0, ge-0/0/46.0*

mgmt
                        me0.0*
```

Meaning The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with

interfaces **ge-0/0/0.0**, **ge-0/0/3.0**, **ge-0/0/20.0**, and **ge-0/0/22.0**. VLAN **support** has a tag ID of 200 and is associated with interfaces **ge-0/0/1.0**, **ge-0/0/6.0**, **ge-0/0/44.0**, and **ge-0/0/46.0**.

Verifying That Traffic Is Being Routed Between the Two VLANs

Purpose Verify routing between the two VLANs.

Action List the Layer 3 routes in the switch's Address Resolution Protocol (ARP) table:

```
user@switch> show arp
MAC Address       Address         Name                    Flags

00:00:0c:06:2c:0d       192.0.2.3       vlan.0                  None
00:13:e2:50:62:e0       192.0.2.11      vlan.1                  None
```

Meaning Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

Verifying That Traffic Is Being Switched Between the Two VLANs

Purpose Verify that learned entries are being added to the Ethernet switching table.

Action List the contents of the Ethernet switching table:

```
user@switch> show ethernet-switching table

Ethernet-switching table: 8 entries, 5 learned
  VLAN              MAC address       Type         Age Interfaces
  default           *                 Flood          - All-members
  default           00:00:05:00:00:01 Learn          - ge-0/0/10.0
  default           00:00:5e:00:01:09 Learn          - ge-0/0/13.0
  default           00:19:e2:50:63:e0 Learn          - ge-0/0/23.0
  sales             *                 Flood          - All-members
  sales             00:00:5e:00:07:09 Learn          - ge-0/0/0.0
  support           *                 Flood          - All-members
  support           00:00:5e:00:01:01 Learn          - ge-0/0/46.0
```

Meaning The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **ge-0/0/0.0** and **ge-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29
- Example: Connecting an Access Switch to a Distribution Switch on page 44
- Understanding Bridging and VLANs on J-EX Series Switches on page 3

Example: Connecting an Access Switch to a Distribution Switch

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect an access switch to a distribution switch:

Requirements

This example uses the following hardware and software components:

- For the distribution switch, one J-EX4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an uplink module with two 10-Gigabit Ethernet ports.
- For the access switch, one EX4200-24T, which has twenty-four 1-Gigabit Ethernet ports, 8 of which support Power over Ethernet (PoE), and an uplink module with four 1-Gigabit Ethernet ports.
- Junos OS Release 10.2 or later for J-EX Series switches

Before you connect an access switch to a distribution switch, be sure you have:

- Installed your J-EX Series switch. For instructions, see the *Dell PowerConnect J-Series J-EX4200 Ethernet Switch Hardware Guide* at http://www.support.dell.com/manuals.
- Performed the initial switch configuration. For connection and configuration instructions, see the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single access switch to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on the access switch's uplink module connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

Figure 4 on page 45 shows one J-EX4200 switch that is connected to the three access switches.

Figure 4: Topology for Configuration

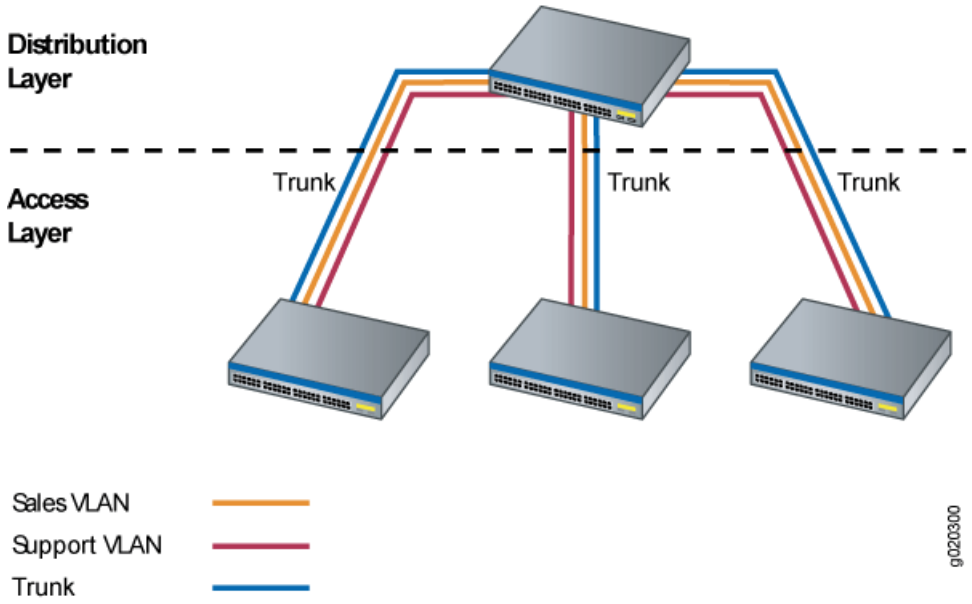

Table 5 on page 45 explains the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

Table 5: Components of the Topology for Connecting an Access Switch to a Distribution Switch

Property	Settings
Access switch hardware	J-EX4200-24T, 24 1-Gigabit Ethernet ports, with 8 ports PoE-enabled (**ge-0/0/0** through **ge-0/0/7**); one uplink module
Distribution switch hardware	J-EX4200-24F, 24 1-Gigabit Ethernet fiber SPF ports (**ge-0/0/0** through **ge-0/0/23**); one uplink module
VLAN names and tag IDs	**sales**, tag **100** **support**, tag **200**
VLAN subnets	**sales**: **192.0.2.0/25** (addresses **192.0.2.1** through **192.0.2.126**) **support**: **192.0.2.128/25** (addresses **192.0.2.129** through **192.0.2.254**)
Trunk port interfaces	On the access switch: **ge-0/1/0** On the distribution switch: **ge-0/0/0**
Access port interfaces in VLAN **sales** (on access switch)	Avaya IP telephones: **ge-0/0/2** through **ge-0/0/4** Wireless access point: **ge-0/0/0** Printers: **ge-0/0/22** and **ge-0/0/23** File servers: **ge-0/0/20** and **ge-0/0/21**
Access port interfaces in VLAN **support** (on access switch)	Avaya IP telephones: **ge-0/0/5** through **ge-0/0/7** Wireless access point: **ge-0/0/1** Printers: **ge-0/0/44** and **ge-0/0/45** File servers: **ge-0/0/46** and **ge-0/0/47**

Table 5: Components of the Topology for Connecting an Access Switch to a Distribution Switch *(continued)*

Property	Settings
Unused interfaces on access switch	**ge-0/0/8** through **ge-0/0/19** and **ge-0/0/24** through **ge-0/0/43**

Configuring the Access Switch

To configure the access switch:

CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description “Sales Wireless access point port”
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description “Sales phone port”
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description “Sales printer port”
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description “Sales file server port”
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/1 unit 0 description “Support wireless access point port”
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/6 unit 0 description “Support phone port”
set interfaces ge-0/0/6 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description “Support printer port”
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description “Support file server port”
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/1/0 unit 0 description “Uplink module port connection to distribution switch”
set interfaces ge-0/1/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/1/0 unit 0 family ethernet-switching native-vlan-id 1
set interfaces ge-0/1/0 unit 0 family ethernet switching vlan members [sales support]
set interfaces vlan unit 0 family inet address 192.0.2.1/25
set interfaces vlan unit 1 family inet address 192.0.2.129/25
set vlans sales interface ge-0/0/0.0
set vlans sales interface ge-0/0/3.0
set vlans sales interface ge-0/0/22.0
set vlans sales interface ge-0/0/20.0
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans sales vlan-description “Sales VLAN”
set vlans support interface ge-0/0/1.0
set vlans support interface ge-0/0/6.0
set vlans support interface ge-0/0/44.0
set vlans support interface ge-0/0/46.0
set vlans support vlan-id 200
set vlans support l3–interface vlan.1
set vlans support vlan-description “Support VLAN”
```

Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:

```
[edit interfaces ge-0/1/0 unit 0]
user@access-switch# set description “Uplink module port connection to distribution switch”
user@access-switch# set ethernet-switching port-mode trunk
```

2. Specify the VLANs to be aggregated on the trunk port:

```
[edit interfaces ge-0/1/0 unit 0]
user@access-switch# set ethernet-switching vlan members [ sales support ]
```

3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):

```
[edit interfaces ge-0/1/0 unit 0]
user@access-switch# set ethernet-switching native-vlan-id 1
```

4. Configure the sales VLAN:

```
[edit vlans sales]
user@access-switch# set vlan-description “Sales VLAN”
user@access-switch# set vlan-id 100
user@access-switch# set l3-interface vlan.0
```

5. Configure the support VLAN:

```
[edit vlans support]
user@access-switch# set vlan-description “Support VLAN”
user@access-switch# set vlan-id 200
user@access-switch# set l3-interface vlan.1
```

6. Create the subnet for the sales broadcast domain:

```
[edit interfaces]
user@access-switch# set vlan unit 0 family inet address 192.0.2.1/25
```

7. Create the subnet for the support broadcast domain:

```
[edit interfaces]
user@access-switch# set vlan unit 1 family inet address 192.0.2.129/25
```

8. Configure the interfaces in the sales VLAN:

```
[edit interfaces]
user@access-switch# set ge-0/0/0 unit 0 description “Sales wireless access point port”
user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/3 unit 0 description “Sales phone port”
user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/20 unit 0 description “Sales file server port”
user@access–switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/22 unit 0 description “Sales printer port”
user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members sales
```

9. Configure the interfaces in the support VLAN:

```
[edit interfaces]
user@access-switch# set ge-0/0/1 unit 0 description “Support wireless access point
port”
user@access-switch# set ge-0/0/1 unit 0 family ethernet-switching vlan members
support
user@access-switch# set ge-0/0/6 unit 0 description “Support phone port”
user@access-switch# set ge-0/0/6 unit 0 family ethernet-switching vlan members
support
user@access-switch# set ge-0/0/44 unit 0 description “Support printer port”
user@access-switch# set ge-0/0/44 unit 0 family ethernet-switching vlan members
support
user@access-switch# set ge-0/0/46 unit 0 description “Support file server port”
user@access-switch# set ge-0/0/46 unit 0 family ethernet-switching vlan members
support
```

10. Configure descriptions and VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]
user@access-switch# set sales vlan-description “Sales VLAN”
user@access-switch# set sales vlan-id 100
user@access-switch# set support vlan-description “Support VLAN”
user@access-switch# set support vlan-id 200
```

11. To route traffic between the sales and support VLANs and associate a Layer 3 interface with each VLAN:

```
[edit vlans]
user@access-switch# set sales l3-interface vlan.0
user@access-switch# set support l3-interface vlan.1
```

Results Display the results of the configuration:

```
user@access-switch> show
interfaces {
  ge-0/0/0 {
    unit 0 {
      description “Sales wireless access point port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description “Sales phone port”;
        family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      description “Sales file server port”;
        family ethernet-switching {
        vlan members sales;
      }
```

```
    }
  }
  ge-0/0/22 {
    unit 0 {
      description “Sales printer port”;
        family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/1 {
    unit 0 {

        family ethernet-switching {
        vlan members support;
      }
    }
  }
  ge-0/1/0 {
    unit 0 {
      description “Uplink module port connection to distribution switch”;
        family ethernet-switching {
        port-mode trunk;
          vlan members [ sales support ];
        native-vlan-id 1;
      }
    }
  }
  vlan {
    unit 0 {
      family inet address 192.0.2.1/25;
    }
```

```
        unit 1 {
          family inet address 192.0.2.129/25;
        }
      }
    }
    vlans {
      sales {
        vlan-id 100;
        vlan-description “Sales VLAN”;
        l3-interface vlan.0;
      }
      support {
        vlan-id 200;
        vlan-description “Support VLAN”;
        l3-interface vlan.1;
      }
    }
```

TIP: To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

Configuring the Distribution Switch

To configure the distribution switch:

CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```
set interfaces ge-0/0/0 description “Connection to access switch”
set interfaces ge-0/0/0 ethernet-switching port-mode trunk
set interfaces ge-0/0/0 ethernet-switching vlan members [ sales support ]
set interfaces ge-0/0/0 ethernet-switching native-vlan-id 1
set interfaces vlan unit 0 family inet address 192.0.2.2/25
set interfaces vlan unit 1 family inet address 192.0.2.130/25
set vlans sales vlan-description “Sales VLAN”
set vlans sales vlan-id 100
set vlans sales l3-interface vlan.0
set vlans support vlan-description “Support VLAN”
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

Step-by-Step Procedure

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:

   ```
   [edit interfaces ge-0/0/0 unit 0]
   user@distribution-switch# set description “Connection to access switch”
   user@distribution-switch# set ethernet-switching port-mode trunk
   ```

2. Specify the VLANs to be aggregated on the trunk port:

   ```
   [edit interfaces ge-0/0/0 unit 0]
   user@distribution-switch# set ethernet-switching vlan members [ sales support ]
   ```

3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):

```
[edit interfaces]
user@distribution-switch# set ge-0/0/0 ethernet-switching native-vlan-id 1
```

4. Configure the sales VLAN:

```
[edit vlans sales]
user@distribution-switch# set vlan-description “Sales VLAN”
user@distribution-switch# set vlan-id 100
user@distribution-switch# set l3-interface vlan.0
```

5. Configure the support VLAN:

```
[edit vlans support]
user@distribution-switch# set vlan-description “Support VLAN”
user@distribution-switch# set vlan-id 200
user@distribution-switch# set l3-interface vlan.1
```

6. Create the subnet for the sales broadcast domain:

```
[edit interfaces]
user@distribution-switch# set vlan unit 0 family inet address 192.0.2.2/25
```

7. Create the subnet for the support broadcast domain:

```
[edit interfaces]
user@distribution-switch# set vlan unit 1 family inet address 192.0.2.130/25
```

Results Display the results of the configuration:

```
user@distribution-switch> show
interfaces {
    ge-0/0/0 {
        description “Connection to access switch”;
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan members [ sales support ];
                native-vlan-id 1;
            }
        }
    }
    vlan {
        unit 0 {
            family inet address 192.0.2.2/25;
        }
        unit 1 {
            family inet address 192.0.2.130/25;
        }
    }
}
vlans {
    sales {
        vlan-id 100;
        vlan-description “Sales VLAN”;
        l3-interface vlan.0;
    }
```

```
    support {
      vlan-id 200;
      vlan-description “Support VLAN”;
      l3-interface vlan.1;
    }
  }
```

TIP: To quickly configure the distribution switch, issue the **load merge terminal** command, then copy the hierarchy and paste it into the switch terminal window.

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the VLAN Members and Interfaces on the Access Switch on page 52
- Verifying the VLAN Members and Interfaces on the Distribution Switch on page 53

Verifying the VLAN Members and Interfaces on the Access Switch

Purpose Verify that the **sales** and **support** have been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/1.0, ge-0/0/2.0, ge-0/0/4.0, ge-0/0/5.0,
                        ge-0/0/6.0, ge-0/0/7.0, ge-0/0/8.0*, ge-0/0/9.0,

                        ge-0/0/10.0, ge-0/0/11.0*, ge-0/0/12.0, ge-0/0/13.0,
                        ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0,
                        ge-0/0/18.0, ge-0/0/19.0*,ge-0/0/21.0, ge-0/0/23.0,
                        ge-0/0/25.0, ge-0/0/27.0*,ge-0/0/28.0, ge-0/0/29.0,
                        ge-0/0/30.0, ge-0/0/31.0*,ge-0/0/32.0, ge-0/0/33.0,
                        ge-0/0/34.0, ge-0/0/35.0*,ge-0/0/36.0, ge-0/0/37.0,
                        ge-0/0/38.0, ge-0/0/39.0*,ge-0/0/40.0, ge-0/0/41.0,
                        ge-0/0/42.0, ge-0/0/43.0*,ge-0/0/45.0, ge-0/0/47.0,
                        ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*

sales           100
                        ge-0/0/0.0*, ge-0/0/3.0, ge-0/0/20.0, ge-0/0/22.0,
                        ge-0/1/0.0*,

support         200
                        ge-0/0/1.0*, ge-0/0/6.0, ge-0/0/44.0, ge-0/0/46.0,

mgmt
                        me0.0*
```

Meaning The output shows the **sales** and **support** VLANs and the interfaces associated with them.

Verifying the VLAN Members and Interfaces on the Distribution Switch

Purpose Verify that the **sales** and **support** have been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/1.0, ge-0/0/2.0, ge-0/0/3.0, ge-0/0/4.0,
                        ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0*, ge-0/0/8.0,

                        ge-0/0/9.0, ge-0/0/10.0*, ge-0/0/11.0, ge-0/0/12.0,
                        ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0,
                        ge-0/0/17.0, ge-0/0/18.0*, ge-0/0/19.0, ge-0/0/20.0,
                        ge-0/0/21.0, ge-0/0/22.0*, ge-0/0/23.0, ge-0/1/1.0*,
                        ge-0/1/2.0*, ge-0/1/3.0*

sales           100
                        ge-0/0/0.0*

support         200
                        ge-0/0/0.0*

mgmt
                        me0.0*
```

Meaning The output shows the **sales** and **support** VLANs associated to interface **ge-0/0/0.0**. Interface **ge-0/0/0.0** is the trunk interface connected to the access switch.

Example: Configuring Redundant Trunk Links for Faster Recovery

You can manage network convergence by configuring both a primary link and a secondary link on a switch; this is called a redundant trunk group (RTG). If the primary link in a redundant trunk group fails, it passes its known MAC address locations to the secondary link, which automatically takes over.

This example describes how to create a redundant trunk group with a primary and a secondary link:

Requirements

This example uses the following hardware and software components:

- Two J-EX Series distribution switches
- One J-EX Series access switch
- Junos OS Release 10.4 or later for J-EX Series switches

Before you configure the redundant trunk links network on the access and distribution switches, be sure you have:

- Configured interfaces **ge-0/0/9** and **ge-0/0/10** on the access switch, Switch 3, as trunk interfaces. For instructions, see "Configuring Gigabit Ethernet Interfaces (CLI Procedure)" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals..
- Configured one trunk interface on each distribution switch, Switch 1 and Switch 2.
- Connected the three switches as shown in the topology for this example (see Figure 5 on page 56).

Overview and Topology

In a typical enterprise network comprised of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk interface goes down. After a trunk interface failure, data traffic is routed to another trunk interface, thereby keeping network convergence time to a minimum. This example shows the configuration of a redundant trunk group, which includes one primary link (and its interface) and one unspecified link (and its interface) that serves as the secondary link. A second type of redundant trunk group, not illustrated in the example, consists of two unspecified links (and their interfaces); in this case, neither of the links is primary. In this second case, the software selects an active link by comparing the port numbers of the two links and activating the link with the higher port number. For example, if the two link interfaces use interfaces **ge-0/1/0** and **ge-0/1/1**, the software activates **ge-0/1/1.** (In the interface names, the final number is the port number.)

The two links in a redundant trunk group generally operate the same way, whether they are configured as primary/unspecified or unspecified/unspecified. Data traffic initially passes through the active link but is blocked on the inactive link. While data traffic is blocked on the secondary link, note that Layer 2 control traffic is still permitted if the link is active. For example, an LLDP session can be run between two switches on the secondary link. If the active link either goes down or is disabled administratively, it broadcasts a list of its known MAC addresses for data traffic; the other link immediately picks up and adds the MAC addresses to its address table, becomes active, and begins forwarding traffic.

The one difference in operation between the two types of redundant trunk groups occurs when a primary link is active, goes down, is replaced by the secondary link, and then reactivates. When a primary link is re-enabled like this while the secondary link is active, the primary link waits 2 minutes (you can change the length of time to accommodate your network) and then takes over as the active link. In other words, the primary link has

priority and is always activated if it is available. This differs from the behavior of two unspecified links, which act as equals. Because the unspecified links are equal, the active link remains active until it either goes down or is disabled administratively; this is the only time that the other unspecified link learns the MAC addresses and immediately becomes active.

The example given here illustrates a primary/unspecified configuration for a redundant trunk group because that configuration gives you more control and is more commonly used.

NOTE: Rapid Spanning Tree Protocol (RSTP) is enabled by default on J-EX Series switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You will need to disable RSTP on the two distribution switches in the example, Switch 1 and Switch 2. Spanning-tree protocols can, however, continue operating in other parts of the network—for example, between the distribution switches and also in links between distribution switches and the enterprise core.

Figure 5 on page 56 displays an example topology containing three switches. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk interfaces **ge-0/0/9.0** (Link 1) and **ge-0/0/10.0** (Link 2).

Table 6 on page 56 lists the components used in this redundant trunk group.

Because RSTP and RTG cannot operate simultaneously on a switch, you disable RSTP on Switch 1 and Switch 2 in the first configuration task, and you disable RSTP on Switch 3 in the second task.

The second configuration task also creates a redundant group called **example 1** on Switch 3. The trunk interfaces **ge-0/0/9.0** and **ge-0/0/10.0** are the two links configured in the second configuration task. You configure the trunk interface **ge-0/0/9.0** as the primary link. You configure the trunk interface **ge-0/0/10.0** as an unspecified link, which becomes the secondary link by default.

Figure 5: Topology for Configuring the Redundant Trunk Links

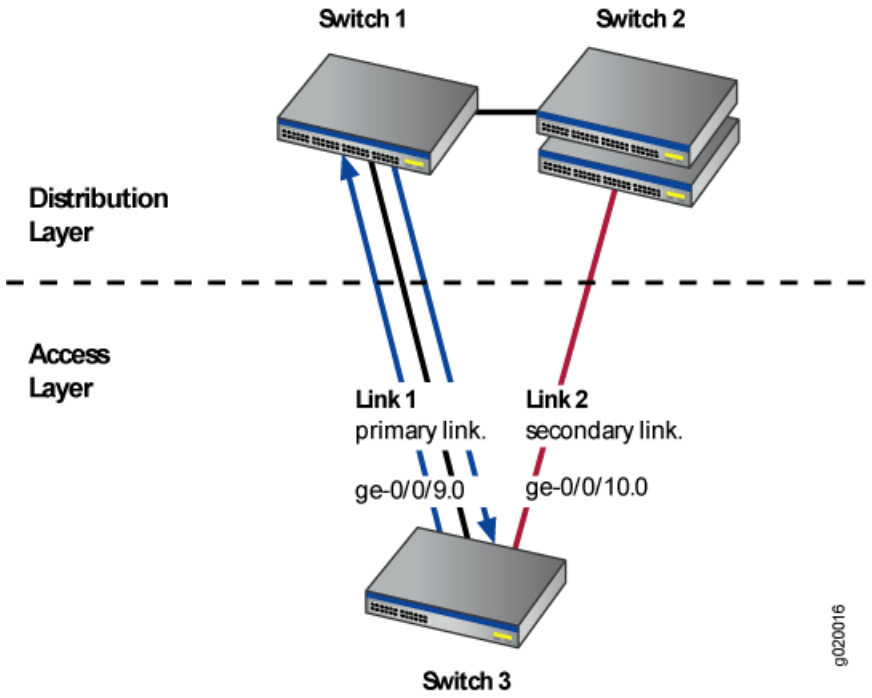

Table 6: Components of the Redundant Trunk Link Topology

Property	Settings
Switch hardware	• Switch 1–1 J-EX Series distribution switch • Switch 2–1 J-EX Series distribution switch • Switch 3–1 J-EX Series access switch
Trunk interfaces	On Switch 3 (access switch): **ge-0/0/9.0** and **ge-0/0/10.0**
Redundant trunk group	**example1**

Disabling RSTP on Switches 1 and 2

To disable RSTP on Switch 1 and Switch 2, perform this task on each switch:

CLI Quick Configuration

To quickly disable RSTP on Switch 1 and Switch 2, copy the following command and paste it into each switch terminal window:

```
[edit]
user@switch# set protocols rstp disable
```

Step-by-Step Procedure

To disable RSTP on Switch 1 and Switch 2:

1. Disable RSTP on Switch 1 and Switch 2:

```
[edit]
user@switch# set protocols rstp disable
```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
protocols {
  rstp {
    disable;
  }
}
```

Configuring Redundant Trunk Links on Switch 3

To configure redundant trunk links on Switch 3, perform these tasks:

CLI Quick Configuration

To quickly configure the redundant trunk group **example1** on Switch 3, copy the following commands and paste them into the switch terminal window:

```
user@switch> set protocols rstp disable
[edit]
user@switch# set ethernet-switching-options redundant-trunk-group group example1 interface ge-0/0/9.0 primary
user@switch# set ethernet-switching-options redundant-trunk-group group example1 interface ge-0/0/10.0
user@switch# set redundant-trunk-group group example1 preempt-cutover-timer 60
```

Step-by-Step Procedure

Configure the redundant trunk group **example1** on Switch 3.

1. Turn off RSTP:

   ```
   user@switch> set protocols rstp disable
   ```

2. Name the redundant trunk group example1 while configuring trunk interface **ge-0/0/9.0** as the primary link and **ge-0/0/10** as an unspecified link to serve as the secondary link:

   ```
   [edit ethernet-switching-options]
   user@switch#  set redundant-trunk-group group example1 interface ge-0/0/9.0 primary
   user@switch#  set redundant-trunk-group group example1 interface ge-0/0/10.0
   ```

3. (Optional) Change the length of time (from the default 120 seconds) that a re-enabled primary link waits to take over for an active secondary link:

   ```
   [edit ethernet-switching-options]

   user@switch#  set redundant-trunk-group group example1 preempt-cutover-timer 60
   ```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
ethernet-switching-options
  redundant-trunk-group {
    group example1 {
      preempt-cutover-timer 60;
        interface ge-0/0/9.0
        primary;
      interface ge-0/0/10.0;
    }
  }
protocols
```

```
rstp {
  disable;
}
```

Verification

To confirm that the configuration is working properly, perform this task:

- Verifying That a Redundant Trunk Group Was Created on page 58

Verifying That a Redundant Trunk Group Was Created

Purpose Verify that the redundant trunk group **example1** has been created on Switch 1 and that trunk interfaces are members of the redundant trunk group.

Action List all redundant trunk groups configured on the switch:

```
user@switch> show redundant-trunk-group
Group       Interface   State       Time of last flap          Flap
name                                                           count

example1    ge-0/0/9.0  Up/Pri      Never                       0
            ge-0/0/10.0 Up          Never                       0
```

Meaning The **show redundant-trunk-group** command lists all redundant trunk groups configured on the switch, both links' interface addresses, and the links' current states (up or down for an unspecified link, and up or down and primary for a primary link). For this configuration example, the output shows that the redundant trunk group **example1** is configured on the switch. The **(Up)** beside the interfaces indicates that both link cables are physically connected. The **(Pri)** beside trunk interface **ge-0/0/9.0** indicates that it is configured as the primary link.

Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches

Service providers can use Q-in-Q tunneling to transparently pass Layer 2 VLAN traffic from a customer site, through the service provider network, to another customer site without removing or changing the customer VLAN tags or class-of-service (CoS) settings. You can configure Q-in-Q tunneling on J-EX Series switches.

This example describes how to set up Q-in-Q:

- Requirements on page 59
- Overview and Topology on page 59

Requirements

This example requires one J-EX Series switch with Junos OS Release 10.2 or later for J-EX Series switches.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 109.

Overview and Topology

In this service provider network, there are multiple customer VLANs mapped to one service VLAN.

Table 7 on page 59 lists the settings for the example topology.

Table 7: Components of the Topology for Setting Up Q-in-Q Tunneling

Interface	Description
ge-0/0/11.0	Tagged S-VLAN trunk port
ge-0/0/12.0	Untagged customer-facing access port
ge-0/0/13.0	Untagged customer-facing access port
ge-0/0/14.0	Tagged S-VLAN trunk port

Configuration

CLI Quick Configuration

To quickly create and configure Q-in-Q tunneling, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans qinqvlan vlan-id 4001
set vlans qinqvlan dot1q-tunneling customer-vlans 1-100
set vlans qinqvlan dot1q-tunneling customer-vlans 201-300
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members 4001
set interfaces ge-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/12 unit 0 family ethernet-switching vlan members 4001
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members 4001
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members 4001
set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

Step-by-Step Procedure

To configure Q-in-Q tunneling:

1. Set the VLAN ID for the S-VLAN:

```
[edit vlans]
user@switch# set qinqvlan vlan-id 4001
```

2. Enable Q-in-Q tuennling and specify the customer VLAN ranges:

```
[edit vlans]
user@switch# set qinqvlan dot1q-tunneling customer-vlans 1-100
user@switch# set qinqvlan dot1q-tunneling customer-vlans 201-300
```

3. Set the port mode and VLAN information for the interfaces:

```
[edit interfaces]
user@switch# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/11 unit 0 family ethernet-switching vlan members 4001
user@switch# set ge-0/0/12 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/12 unit 0 family ethernet-switching vlan members 4001
user@switch# set ge-0/0/13 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/13 unit 0 family ethernet-switching vlan members 4001
user@switch# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/14 unit 0 family ethernet-switching vlan members 4001
```

4. Set the Q-in-Q Ethertype value:

```
[edit]
user@switch# set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

Results

Check the results of the configuration:

```
user@switch> show configuration vlans qinqvlan
vlan-id 4001;
  dot1q-tunneling {
  customer-vlans [ 1-100 201-300 ];
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That Q-in-Q Tunneling Was Enabled on page 60

Verifying That Q-in-Q Tunneling Was Enabled

Purpose

Verify that Q-in-Q tunneling was properly enabled on the switch.

Action

Use the **show vlans** command:

```
user@switch> show vlans qinqvlan extensive
VLAN: qinqvlan, Created at: Thu Sep 18 07:17:53 2008
802.1Q Tag: 4001, Internal index: 18, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
                    1-100
                    201-300
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  4 (Active = 0)
```

```
ge-0/0/11.0, tagged, trunk
ge-0/0/14.0, tagged, trunk
ge-0/0/12.0, untagged, access
ge-0/0/13.0, untagged, access
```

Meaning The output indicates that Q-in-Q tunneling is enabled and that the VLAN is tagged and shows the associated customer VLANs.

Example: Configuring a Private VLAN on a Single J-EX Series Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature on J-EX Series switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN.

This example describes how to create a PVLAN on a single J-EX Series switch:

NOTE: **Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.**

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches

Before you begin configuring a PVLAN, make sure you have created and configured the necessary VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 109.

Overview and Topology

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows a simple topology to illustrate how to create a PVLAN with one primary VLAN and two community VLANs, one for HR and one for finance, as well as two isolated ports; one for the mail server and the other for the backup server.

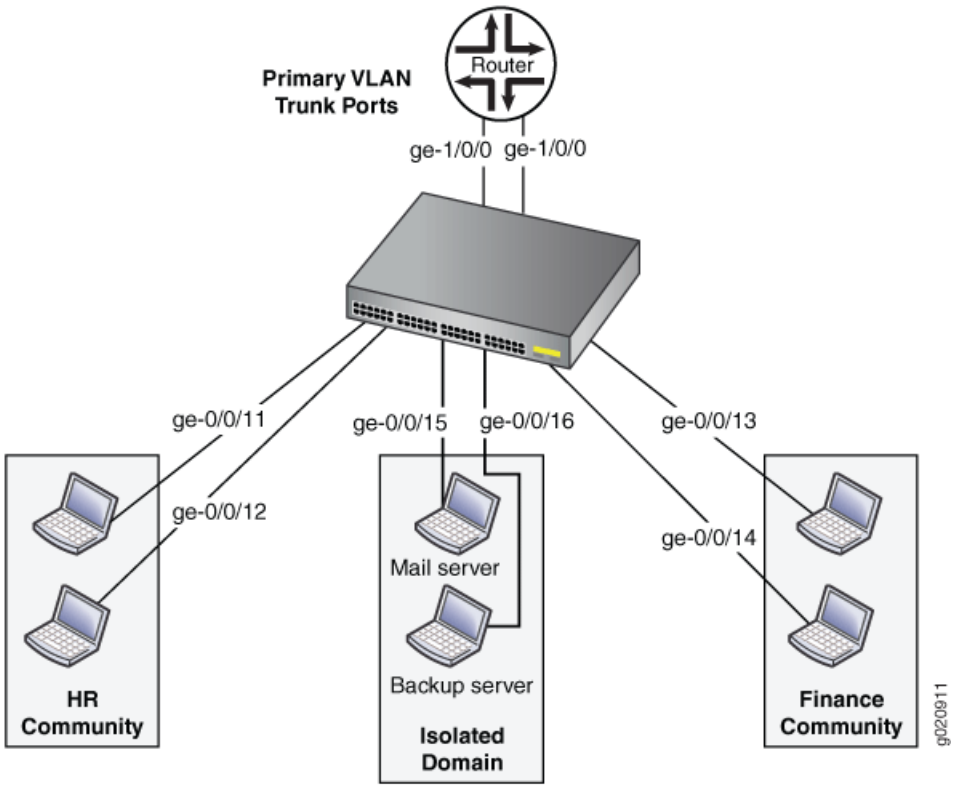
Table 8 on page 62 lists the settings for the example topology.

Table 8: Components of the Topology for Configuring a PVLAN

Interface	Description
ge-0/0/0.0	Primary VLAN (**pvlan**) trunk interface
ge-0/0/11.0	User 1, HR Community (**hr-comm**)
ge-0/0/12.0	User 2, HR Community (**hr-comm**)
ge-0/0/13.0	User 3, Finance Community (**finance-comm**)
ge-0/0/14.0	User 4, Finance Community (**finance-comm**)
ge-0/0/15.0	Mail server, Isolated (**isolated**)
ge-0/0/16.0	Backup server, Isolated (**isolated**)
ge-1/0/0.0	Primary VLAN (**pvlan**) trunk interface

Figure 6 on page 62 shows the topology for this example.

Figure 6: PVLAN Topology on a Single Switch



Configuration

To configure a PVLAN, perform these tasks:

CLI Quick Configuration

To quickly create and configure a PVLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans pvlan vlan-id 1000
set interfaces ge-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/15 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/16 unit 0 family ethernet-switching port-mode access
set vlans pvlan no-local-switching
set vlans pvlan interface ge-0/0/0.0
set vlans pvlan interface ge-1/0/0.0
set vlans hr-comm interface ge-0/0/11.0
set vlans hr-comm interface ge-0/0/12.0
set vlans finance-comm interface ge-0/0/13.0
set vlans finance-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan
set vlans finance-comm primary-vlan pvlan
```

Step-by-Step Procedure

To configure the PVLAN:

1. Set the VLAN ID for the primary VLAN:

   ```
   [edit vlans]
   user@switch# set pvlan vlan-id 1000
   ```

2. Set the interfaces and port modes:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0 unit 0 family ethernet-switching port-mode trunk

   user@switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan

   user@switch# set ge-1/0/0 unit 0 family ethernet-switching port-mode trunk

   user@switch# set ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan

   user@switch# set ge-0/0/11 unit 0 family ethernet-switching port-mode access

   user@switch# set ge-0/0/12 unit 0 family ethernet-switching port-mode access

   user@switch# set ge-0/0/13 unit 0 family ethernet-switching port-mode access

   user@switch# set ge-0/0/14 unit 0 family ethernet-switching port-mode access

   user@switch# set ge-0/0/15 unit 0 family ethernet-switching port-mode access

   user@switch# set ge-0/0/16 unit 0 family ethernet-switching port-mode access
   ```

3. Set the primary VLAN to have no local switching:

   NOTE: The primary VLAN must be a tagged VLAN.

   ```
   [edit vlans]
   ```

```
user@switch# set pvlan no-local-switching
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
user@switch# set pvlan interface ge-0/0/0.0

user@switch# set pvlan interface ge-1/0/0.0
```

5. For each secondary VLAN, configure access interfaces:

NOTE: We recommend that the secondary VLANs be untagged VLANs. It does not impair functioning if you tag the secondary VLANS. However, the tags are not used when a secondary VLAN is configured on a single switch.

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/11.0

user@switch# set hr-comm interface ge-0/0/12.0

user@switch# set finance-comm interface ge-0/0/13.0

user@switch# set finance-comm interface ge-0/0/14.0
```

6. For each community VLAN, set the primary VLAN:

```
[edit vlans]
user@switch# set hr-comm primary-vlan pvlan

user@switch# set finance-comm primary-vlan pvlan
```

7. Add each isolated interface to the primary VLAN:

```
[edit vlans]
user@switch# set pvlan interface ge-0/0/15.0

user@switch# set pvlan interface ge-0/0/16.0
```

Results Check the results of the configuration:

```
[edit]
  user@switch# show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members pvlan;
        }
      }
    }
  }
  ge-1/0/0 {
    unit 0 {
      family ethernet-switching;
```

```
        }
    }
    ge-0/0/11 {
        unit 0 {
            family ethernet-switching {
                port-mode access;
            }
        }
    }
    ge-0/0/12 {
        unit 0 {
            family ethernet-switching {
                port-mode access;
            }
        }
    }
    ge-0/0/13 {
        unit 0 {
            family ethernet-switching {
                port-mode access;
            }
        }
    }
    ge-0/0/14 {
        unit 0 {
            family ethernet-switching {
                port-mode access;
            }
        }
    }
}
vlans {
    finance-comm {
    interface {
        ge-0/0/13.0;
        ge-0/0/14.0;
    }
    primary-vlan pvlan;
    }
    hr-comm {
        interface {
            ge-0/0/11.0;
            ge-0/0/12.0;
        }
        primary-vlan pvlan;
    }
    pvlan {
        vlan-id 1000;
        interface {
            ge-0/0/15.0;
            ge-0/0/16.0;
            ge-0/0/0.0;
            ge-1/0/0.0;
        }
        no-local-switching;
    }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Private VLAN and Secondary VLANs Were Created on page 66

Verifying That the Private VLAN and Secondary VLANs Were Created

Purpose Verify that the primary VLAN and secondary VLANs were properly created on the switch.

Action Use the **show vlans** command:

```
user@switch> show vlans pvlan extensive
VLAN: pvlan, Created at: Tue Sep 16 17:59:47 2008
802.1Q Tag: 1000, Internal index: 18, Admin State: Enabled, Origin: Static

      ge-0/0/11.0, untagged, access
      ge-0/0/12.0, untagged, access
      ge-1/0/0.0, tagged, trunk
```

```
user@switch> show vlans finance-comm extensive
VLAN: finance-comm, Created at: Tue Sep 16 17:59:47 2008
Internal index: 21, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  2 (Active = 0)
      ge-0/0/0.0, tagged, trunk
      ge-0/0/13.0, untagged, access
      ge-0/0/14.0, untagged, access
      ge-1/0/0.0, tagged, trunk
```

```
user@switch> show vlans __pvlan_pvlan_ge-0/0/15.0__ extensive
VLAN: __pvlan_pvlan_ge-0/0/15.0__, Created at: Tue Sep 16 17:59:47 2008
Internal index: 19, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan
Protocol: Port Mode
```

```
Number of interfaces: Tagged 2 (Active = 0), Untagged  1 (Active = 0)
      ge-0/0/0.0, tagged, trunk
      ge-0/0/15.0, untagged, access
      ge-1/0/0.0, tagged, trunk

user@switch> show vlans __pvlan_pvlan_ge-0/0/16.0__ extensive
VLAN: __pvlan_pvlan_ge-0/0/16.0__, Created at: Tue Sep 16 17:59:47 2008
Internal index: 20, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  1 (Active = 0)
      ge-0/0/0.0, tagged, trunk
      ge-0/0/16.0, untagged, access
      ge-1/0/0.0, tagged, trunk
```

Meaning The output shows that the primary VLAN was created and identifies the interfaces and secondary VLANs associated with it.

Related Documentation

- Example: Configuring a Private VLAN Spanning Multiple J-EX Series Switches on page 67
- Creating a Private VLAN on a Single J-EX Series Switch (CLI Procedure) on page 120

Example: Configuring a Private VLAN Spanning Multiple J-EX Series Switches

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature on J-EX Series switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. A PVLAN can span multiple switches.

This example describes how to create a PVLAN spanning multiple J-EX Series switches. The example creates one primary PVLAN, containing multiple secondary VLANs:

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

Requirements

This example uses the following hardware and software components:

- Two J-EX4200 switches for the access switches and one J-EX4200 switch for the distribution switch

- Junos OS Release 10.4 or later for J-EX Series switches

Before you begin configuring a PVLAN, make sure you have created and configured the necessary VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 109.

Overview and Topology

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows a topology to illustrate how to create a PVLAN spanning multiple J-EX Series switches, with one primary VLAN containing two community VLANs (one for HR and one for Finance), and an Inter-switch Isolated VLAN (for the mail server, the backup server, and CVS server). The PVLAN is comprised of three switches, two access switches and one distribution switch. The PVLAN is connected to a router through a promiscuous port, which is configured on the distribution switch.

NOTE: The isolated ports on Switch 1 and on Switch 2 do not have Layer 2 connectivity with each other even though they are included within the same domain. See “Understanding Private VLANs on J-EX Series Switches” on page 10.

Figure 7 on page 69 shows the topology for this example—two access switches connecting to a distribution switch, which has a connection (through a promiscuous port) to the router.

Figure 7: PVLAN Topology Spanning Multiple Switches

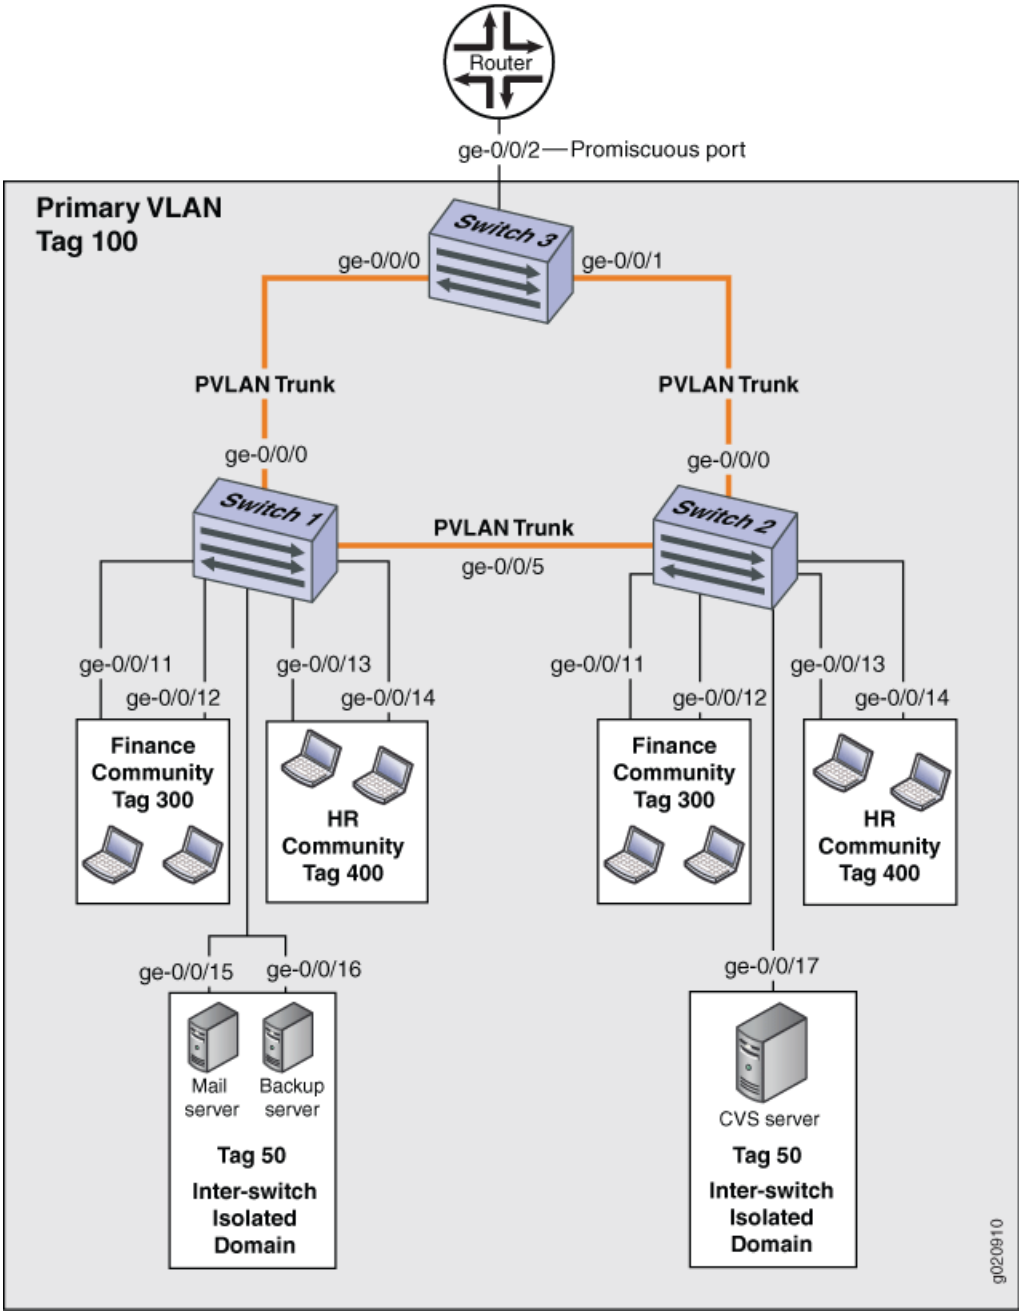

Table 9 on page 70, Table 10 on page 70, and Table 11 on page 71 list the settings for the example topology.

Table 9: Components of Switch 1 in the Topology for Configuring a PVLAN Spanning Multiple J-EX Series Switches

Property	Settings
VLAN names and tag IDs	**primary-vlan**, tag **100** **isolation-id**, tag **50** **finance-comm**, tag **300** **hr-comm**, tag **400**
PVLAN trunk interfaces	**ge-0/0/0.0**, Connects Switch 1 to Switch 3 **ge-0/0/5.0**, Connects Switch 1 to Switch 2
Interfaces in VLAN **isolation**	**ge-0/0/15.0**, Mail server **ge-0/0/16.0**, Backup server
Interfaces in VLAN **finance-com**	**ge-0/0/11.0** **ge-0/0/12.0**
Interfaces in VLAN **hr-comm**	**ge-0/0/13.0** **ge-0/0/14.0**

Table 10 on page 70 lists the settings for the example topology.

Table 10: Components of Switch 2 in the Topology for Configuring a PVLAN Spanning Multiple J-EX Series Switches

Property	Settings
VLAN names and tag IDs	**primary-vlan**, tag **100** **isolation-id**, tag **50** **finance-comm**, tag **300** **hr-comm**, tag **400**
PVLAN trunk interfaces	**ge-0/0/0.0**, Connects Switch 2 to Switch 3 **ge-0/0/5.0**, Connects Switch 2 to Switch 1
Interfaces in VLAN **isolation**	**ge-0/0/17.0**,CVS server
Interfaces in VLAN **finance-com**	**ge-0/0/11.0** **ge-0/0/12.0**
Interfaces in VLAN **hr-comm**	**ge-0/0/13.0** **ge-0/0/14.0**

Table 11 on page 71 lists the settings for the example topology.

Table 11: Components of Switch 3 in the Topology for Configuring a PVLAN Spanning Multiple J-EX Series Switches

Property	Settings
VLAN names and tag IDs	**primary-vlan**, tag **100** **isolation-id**, tag **50** **finance-comm**, tag **300** **hr-comm**, tag **400**
PVLAN trunk interfaces	**ge-0/0/0.0**, Connects Switch 3 to Switch 1 **ge-0/0/1.0**, Connects Switch 3 to Switch 2
Promiscuous port	**ge-0/0/2**, Connects the PVLAN to the router NOTE: You must configure the trunk port that connects the PVLAN to another switch or router outside the PVLAN as a member of the PVLAN, which implicitly configures it as a promiscuous port.

Configuring a PVLAN on Switch 1

CLI Quick Configuration

To quickly create and configure a PVLAN spanning multiple switches, copy the following commands and paste them into the terminal window of Switch 1:

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm interface ge-0/0/11.0
set vlans finance-comm interface ge-0/0/12.0
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm interface ge-0/0/13.0
set vlans hr-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/15.0
set vlans pvlan100 interface ge-0/0/16.0
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/5.0 pvlan-trunk
set vlans pvlan100 no-local-switching
set vlans pvlan100 isolation-id 50
```

Step-by-Step Procedure

To configure a PVLAN on Switch 1 that will span multiple switches:

1. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:

```
[edit vlans]
user@switch# finance-comm vlan-id 300

user@switch# set pvlan100 vlan–id 100
```

2. Configure access interfaces for the **finance-comm** VLAN:

```
[edit vlans]
user@switch# set finance-comm interface ge-0/0/11.0

user@switch# set finance-comm interface ge-0/0/12.0
```

3. Set the primary VLAN of this secondary community VLAN, **finance-comm** :

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```

4. Set the VLAN ID for the HR community VLAN that spans the switches.

```
[edit vlans]
user@switch# hr-comm vlan-id 400
```

5. Configure access interfaces for the **hr-comm** VLAN:

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/13.0

user@switch# set hr-comm interface ge-0/0/14.0
```

6. Set the primary VLAN of this secondary community VLAN, **hr-comm** :

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```

7. Set the VLAN ID for the primary VLAN:

```
[edit vlans]
user@switch# set pvlan100 vlan–id 100
```

8. Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk

user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```

9. Set the primary VLAN to have no local switching:

```
[edit vlans]
user@switch# set pvlan100 no-local-switching
```

10. Set the inter-switch isolated ID to create an inter-switch isolated domain that spans the switches:

```
[edit vlans]
user@switch# set pvlan100 isolation-id 50
```

NOTE: To configure an isolated port, include it as one of the members of the primary VLAN but do not configure it as belonging to one of the community VLANs.

Results Check the results of the configuration:

```
[edit]
  user@switch# show
vlans {
  finance-comm {
    vlan-id 300;
    interface {
```

```
        ge-0/0/11.0;
        ge-0/0/12.0;
      }
      primary-vlan pvlan100;
    }
    hr-comm {
      vlan-id 400;
      interface {
        ge-0/0/13.0;
        ge-0/0/14.0;
      }
      primary-vlan pvlan100;
    }
    pvlan100 {
      vlan-id 100;
      interface {
        ge-0/0/15.0;
        ge-0/0/16.0;
        ge-0/0/0.0 {
          pvlan-trunk;
        }
        ge-0/0/5.0 {
          pvlan-trunk;
        }
      }
      no-local-switching;
      isolation-id 50;
    }
  }
```

Configuring a PVLAN on Switch 2

CLI Quick Configuration

To quickly create and configure a private VLAN spanning multiple switches, copy the following commands and paste them into the terminal window of Switch 2:

NOTE: The configuration of Switch 2 is the same as the configuration of Switch 1 except for the interface in the inter-switch isolated domain. For Switch 2, the interface is ge-0/0/17.0.

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm interface ge-0/0/11.0
set vlans finance-comm interface ge-0/0/12.0
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm interface ge-0/0/13.0
set vlans hr-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/17.0
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/5.0 pvlan-trunk
set vlans pvlan100 no-local-switching
set vlans pvlan100 isolation-id 50
```

Step-by-Step Procedure

To configure a PVLAN on Switch 2 that will span multiple switches:

1. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:

```
[edit vlans]
user@switch# finance-comm vlan-id 300

user@switch# set pvlan100 vlan–id 100
```

2. Configure access interfaces for the **finance-comm** VLAN:

```
[edit vlans]
user@switch# set finance-comm interface ge-0/0/11.0

user@switch# set finance-comm interface ge-0/0/12.0
```

3. Set the primary VLAN of this secondary community VLAN, **finance-comm** :

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```

4. Set the VLAN ID for the HR community VLAN that spans the switches.

```
[edit vlans]
user@switch# hr-comm vlan-id 400
```

5. Configure access interfaces for the **hr-comm** VLAN:

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/13.0

user@switch# set hr-comm interface ge-0/0/14.0
```

6. Set the primary VLAN of this secondary community VLAN, **hr-comm** :

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```

7. Set the VLAN ID for the primary VLAN:

```
[edit vlans]
user@switch# set pvlan100 vlan–id 100
```

8. Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk

user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```

9. Set the primary VLAN to have no local switching:

```
[edit vlans]
user@switch# set pvlan100 no-local-switching
```

10. Set the inter-switch isolated ID to create an inter-switch isolated domain that spans the switches:

```
[edit vlans]
user@switch# set pvlan100 isolation-id 50
```

NOTE: To configure an isolated port, include it as one of the members of the primary VLAN but do not configure it as belonging to one of the community VLANs.

Results Check the results of the configuration:

```
[edit]
  user@switch# show
vlans {
  finance-comm {
    vlan-id 300;
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
      ge-0/0/16.0;
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/5.0 {
        pvlan-trunk;
      }
      ge-0/0/17.0;
    }
    no-local-switching;
    isolation-id 50;
  }
}
```

Configuring a PVLAN on Switch 3

CLI Quick Configuration To quickly configure Switch 3 to function as the distribution switch of this PVLAN, copy the following commands and paste them into the terminal window of Switch 3:

NOTE: Interface ge-0/0/2.0 is a trunk port connecting the PVLAN to a router.

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/1.0 pvlan-trunk
set vlans pvlan100 no-local-switching
set vlans pvlan100 isolation-id 50
```

Step-by-Step Procedure

To configure Switch 3 to function as the distribution switch for this PVLAN, use the following procedure:

1. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:

```
[edit vlans]
user@switch# finance-comm vlan-id 300

[edit vlans]
user@switch# set pvlan100 vlan–id 100
```

2. Set the primary VLAN of this secondary community VLAN, **finance-comm** :

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```

3. Set the VLAN ID for the HR community VLAN that spans the switches.

```
[edit vlans]
user@switch# hr-comm vlan-id 400
```

4. Set the primary VLAN of this secondary community VLAN, **hr-comm** :

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```

5. Set the VLAN ID for the primary VLAN:

```
[edit vlans]
user@switch# set pvlan100 vlan–id 100
```

6. Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk

user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```

7. Set the primary VLAN to have no local switching:

```
[edit vlans]
user@switch# set pvlan100 no-local-switching
```

8. Set the inter-switch isolated ID to create an inter-switch isolated domain that spans the switches:

```
[edit vlans]
user@switch# set pvlan100 isolation-id 50
```

NOTE: To configure an isolated port, include it as one of the members of the primary VLAN but do not configure it as belonging to one of the community VLANs.

Results Check the results of the configuration:

```
[edit]
  user@switch# show
vlans {
  finance-comm {
    vlan-id 300;
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/1.0 {
        pvlan-trunk;
      }
      ge-0/0/2.0;
    }
    no-local-switching;
    isolation-id 50;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 1 on page 77
- Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 2 on page 79
- Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 3 on page 80

Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 1

Purpose Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 1:

Action Use the **show vlans extensive** command:

```
user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_ge-0/0/15.0__, Created at: Thu Sep 16 23:15:27 2010
Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  1 (Active = 1)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/15.0*, untagged, access

VLAN: __pvlan_pvlan100_ge-0/0/16.0__, Created at: Thu Sep 16 23:15:27 2010
Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  1 (Active = 1)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/16.0*, untagged, access

VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:15:27 2010
802.1Q Tag: 50, Internal index: 7, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  0 (Active = 0)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk

VLAN: default, Created at: Thu Sep 16 03:03:18 2010
Internal index: 2, Admin State: Enabled, Origin: Static
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged  0 (Active = 0)

VLAN: finance-comm, Created at: Thu Sep 16 23:15:27 2010
802.1Q Tag: 300, Internal index: 8, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  2 (Active = 2)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/11.0*, untagged, access
      ge-0/0/12.0*, untagged, access

VLAN: hr-comm, Created at: Thu Sep 16 23:15:27 2010
802.1Q Tag: 400, Internal index: 9, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  2 (Active = 2)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/13.0*, untagged, access
      ge-0/0/14.0*, untagged, access

VLAN: pvlan100, Created at: Thu Sep 16 23:15:27 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  6 (Active = 6)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/11.0*, untagged, access
      ge-0/0/12.0*, untagged, access
```

```
      ge-0/0/13.0*, untagged, access
      ge-0/0/14.0*, untagged, access
      ge-0/0/15.0*, untagged, access
      ge-0/0/16.0*, untagged, access
Secondary VLANs: Isolated 2, Community  2, Inter-switch-isolated  1
  Isolated VLANs :
      __pvlan_pvlan100_ge-0/0/15.0__
      __pvlan_pvlan100_ge-0/0/16.0__
  Community VLANs :
      finance-comm
      hr-comm
  Inter-switch-isolated VLAN :
      __pvlan_pvlan100_isiv__
```

Meaning The output shows that a PVLAN was created on Switch 1 and shows that it includes two isolated VLANs, two community VLANs, and an inter-switch isolated VLAN. The presence of the **pvlan-trunk** and **Inter-switch-isolated** fields are indicative that this PVLAN is spanning more than one switch.

Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 2

Purpose Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 2:

Action Use the **show vlans extensive** command:

```
user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_ge-0/0/17.0__, Created at: Thu Sep 16 23:19:22 2010
Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  1 (Active = 1)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/17.0*, untagged, access

VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 50, Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  0 (Active = 0)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk

VLAN: default, Created at: Thu Sep 16 03:03:18 2010
Internal index: 2, Admin State: Enabled, Origin: Static
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged  0 (Active = 0)

VLAN: finance-comm, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 300, Internal index: 7, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  2 (Active = 2)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/11.0*, untagged, access
      ge-0/0/12.0*, untagged, access
```

```
VLAN: hr-comm, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 400, Internal index: 8, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  2 (Active = 2)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/13.0*, untagged, access
      ge-0/0/14.0*, untagged, access

VLAN: pvlan100, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  5 (Active = 5)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/5.0*, tagged, trunk, pvlan-trunk
      ge-0/0/11.0*, untagged, access
      ge-0/0/12.0*, untagged, access
      ge-0/0/13.0*, untagged, access
      ge-0/0/14.0*, untagged, access
      ge-0/0/17.0*, untagged, access
Secondary VLANs: Isolated 1, Community  2, Inter-switch-isolated  1
  Isolated VLANs :
      __pvlan_pvlan100_ge-0/0/17.0__
  Community VLANs :
      finance-comm
      hr-comm
  Inter-switch-isolated VLAN :
      __pvlan_pvlan100_isiv__
```

Meaning The output shows that a PVLAN was created on Switch 1 and shows that it includes two isolated VLANs, two community VLANs, and an inter-switch isolated VLAN. The presence of the **pvlan-trunk** and **Inter-switch-isolated** fields are indicative that this is PVLAN spanning more than one switch. When you compare this output to the output of Switch 1, you can see that both switches belong to the same PVLAN (**pvlan100**).

Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 3

Purpose Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 3:

Action Use the **show vlans extensive** command:

```
user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 50, Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  0 (Active = 0)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: default, Created at: Thu Sep 16 03:03:18 2010
Internal index: 2, Admin State: Enabled, Origin: Static
Protocol: Port Mode, Mac aging time: 300 seconds
```

```
Number of interfaces: Tagged 0 (Active = 0), Untagged  0 (Active = 0)

VLAN: finance-comm, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 300, Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  0 (Active = 0)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: hr-comm, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 400, Internal index: 7, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  0 (Active = 0)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: pvlan100, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged  0 (Active = 0)
      ge-0/0/0.0*, tagged, trunk, pvlan-trunk
      ge-0/0/1.0*, tagged, trunk, pvlan-trunk
Secondary VLANs: Isolated 0, Community  2, Inter-switch-isolated  1
  Community VLANs :
      finance-comm
      hr-comm
  Inter-switch-isolated VLAN :
      __pvlan_pvlan100_isiv__
```

Meaning The output shows that the PVLAN (**pvlan100**) is also configured on Switch 3 and that it includes two isolated VLANs, two community VLANs, and an inter-switch isolated VLAN. But Switch 3 is functioning as a distribution switch, so the output does not include access interfaces within the PVLAN. It shows only the **pvlan-trunk** interfaces that connect **pvlan100** from Switch 3 to the other switches (Switch 1 and Switch 2) in the same PVLAN.

Related Documentation

- Example: Configuring a Private VLAN on a Single J-EX Series Switch on page 61
- Creating a Private VLAN on a Single J-EX Series Switch (CLI Procedure) on page 120

Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches

Virtual routing instances allow each J-EX Series switch to have multiple routing tables on a device. With virtual routing instances, you can segment your network to isolate traffic without setting up additional devices.

This example describes how to create virtual routing instances:

- Requirements on page 82
- Overview and Topology on page 82

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches

Before you create the virtual routing instances, make sure you have:

- Configured the necessary VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 109.

Overview and Topology

In a large office, you may need multiple VLANs to properly manage your traffic. This configuration example shows a simple topology to illustrate how to connect a single J-EX Series switch with a virtual routing instance for each of two VLANs, enabling traffic to pass between those VLANs.

In the example topology, the LAN is segmented into two VLANs, each associated with an interface and a routing instance on the J-EX Series switch.

Configuration

CLI Quick Configuration

To quickly create and configure virtual routing instances, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 vlan-tagging
set interfaces ge-0/0/3 unit 0 vlan-id 1030 family inet address 103.1.1.1/24
set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 103.1.1.1/24
set routing-instances r1 instance-type virtual-router
set routing-instances r1 interface ge-0/0/1.0
set routing-instances r1 interface ge-0/0/3.0
set routing-instances r2 instance-type virtual-router
set routing-instances r2 interface ge-0/0/2.0
set routing-instances r2 interface ge-0/0/3.1
```

Step-by-Step Procedure

To configure virtual routing instances:

1. Create a VLAN-tagged interface:

   ```
   [edit]
   user@switch# set interfaces ge-0/0/3 vlan-tagging
   ```

2. Create two subinterfaces, on the interface, one for each routing instance:

   ```
   [edit]
   user@switch# set interfaces ge-0/0/3 unit 0 vlan-id 1030 family inet address 103.1.1.1/24

   user@switch# set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 103.1.1.1/24
   ```

3. Create two virtual routers:

```
[edit]
user@switch# set routing-instances r1 instance-type virtual-router
user@switch# set routing-instances r2 instance-type virtual-router
```

4. Set the interfaces for the virtual routers:

```
[edit]
user@switch# set routing-instances r1 interface ge-0/0/1.0

user@switch# set routing-instances r1 interface ge-0/0/3.0

user@switch# set routing-instances r2 interface ge-0/0/2.0

user@switch# set routing-instances r2 interface ge-0/0/3.1
```

Results Check the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching;
    }
  }
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching;
    }
  }
  ge-0/0/3 {
    vlan-tagging;
    unit 0 {
      vlan-id 1030;
      family inet {
        address 103.1.1.1/24;
      }
    }
    unit 1 {
      vlan-id 1031;
      family inet {
        address 103.1.1.1/24;
      }
    }
  }
  routing-instances {
    r1 {
      instance-type virtual-router;
      interface ge-0/0/1.0;
      interface ge-0/0/3.0;
    }
    r2 {
      instance-type virtual-router;
      interface ge-0/0/2.0;
      interface ge-0/0/3.1;
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Routing Instances Were Created on page 84

Verifying That the Routing Instances Were Created

Purpose Verify that the virtual routing instances were properly created on the switch.

Action Use the **show route instance** command:

```
user@switch> show route instance
Instance             Type
        Primary RIB                                  Active/holddown/hidden
master               forwarding
        inet.0                                       3/0/0

r1                   virtual-router
        r1.inet.0                                    1/0/0

r2                   virtual-router
        r2.inet.0                                    1/0/0
```

Meaning Each routing instance created is displayed, along with its type, information about whether it is active or not, and its primary routing table.

Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex and the task of efficiently configuring VLANs on multiple J-EX Series switches becomes increasingly difficult. To automate VLAN administration, you can enable Multiple VLAN Registration Protocol (MVRP) on the network.

MVRP also dynamically creates VLANs, further simplifying the network overhead required to statically configure VLANs.

NOTE: **Only trunk interfaces can be enabled for MVRP.**

This example describes how to use MVRP to automate administration of VLAN membership changes within your network and how to use MVRP to dynamically create VLANs:

- Requirements on page 85
- Overview and Topology on page 85
- Configuring VLANs and MVRP on Access Switch A on page 87

Requirements

This example uses the following hardware and software components:

- Two J-EX Series access switches
- One J-EX Series distribution switch
- Junos OS Release 10.2 or later for J-EX Series switches

Overview and Topology

MVRP is used to manage dynamic VLAN registration in a LAN. It can also be used to dynamically create VLANs.

This example uses MVRP to dynamically create VLANs on the switching network. You can disable dynamic VLAN creation and create VLANs statically, if desired. Enabling MVRP on the trunk interface of each switch in your switching network ensures that the active VLAN information for the switches in the network is propagated to each switch through the trunk interfaces, assuming dynamic VLAN creation is enabled for MVRP.

MVRP ensures that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs in a static or dynamic VLAN creation setup.

You do not need to explicitly bind a VLAN to the trunk interface. When MVRP is enabled, the trunk interface advertises all the VLANs that are active (bound to access interfaces) on that switch. An MVRP-enabled trunk interface does not advertise VLANs that have been configured on the switch but that are not currently bound to an access interface. Thus, MVRP provides the benefit of reducing network overhead—by limiting the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

When VLAN access interfaces become active or inactive, MVRP ensures that the updated information is advertised on the trunk interface. Thus, in this example, distribution Switch C does not forward traffic to inactive VLANs.

This example shows a network with three VLANs: **finance**, **sales**, and **lab**.

Access Switch A has been configured to support all three VLANS and all three VLANS are active, bound to interfaces that are connected to personal computers:

- **ge-0/0/1**—Connects PC1 as a member of **finance**, VLAN ID 100
- **ge-0/0/2**—Connects PC2 as a member of **lab**, VLAN ID 200
- **ge-0/0/3**—Connects PC3 as a member of **sales**, VLAN ID 300

Access Switch B has also been configured to support three VLANS. However, currently only two VLANs are active, bound to interfaces that are connected to personal computers:

- **ge-0/0/0**—Connects PC4 as a member of **finance**, VLAN ID 100
- **ge-0/0/1**—Connects PC5 as a member of **lab**, VLAN ID 200

Distribution Switch C learns the VLANs dynamically using MVRP through the connection to the access switches. Distribution Switch C has two trunk interfaces:

- **xe-0/1/1**—Connects the switch to access Switch A.
- **xe-0/1/0**—Connects the switch to access Switch B.

Figure 8 on page 86 shows MVRP configured on two access switches and one distribution switch.

Figure 8: MVRP Configured on Two Access Switches and One Distribution Switch for Automatic VLAN Administration

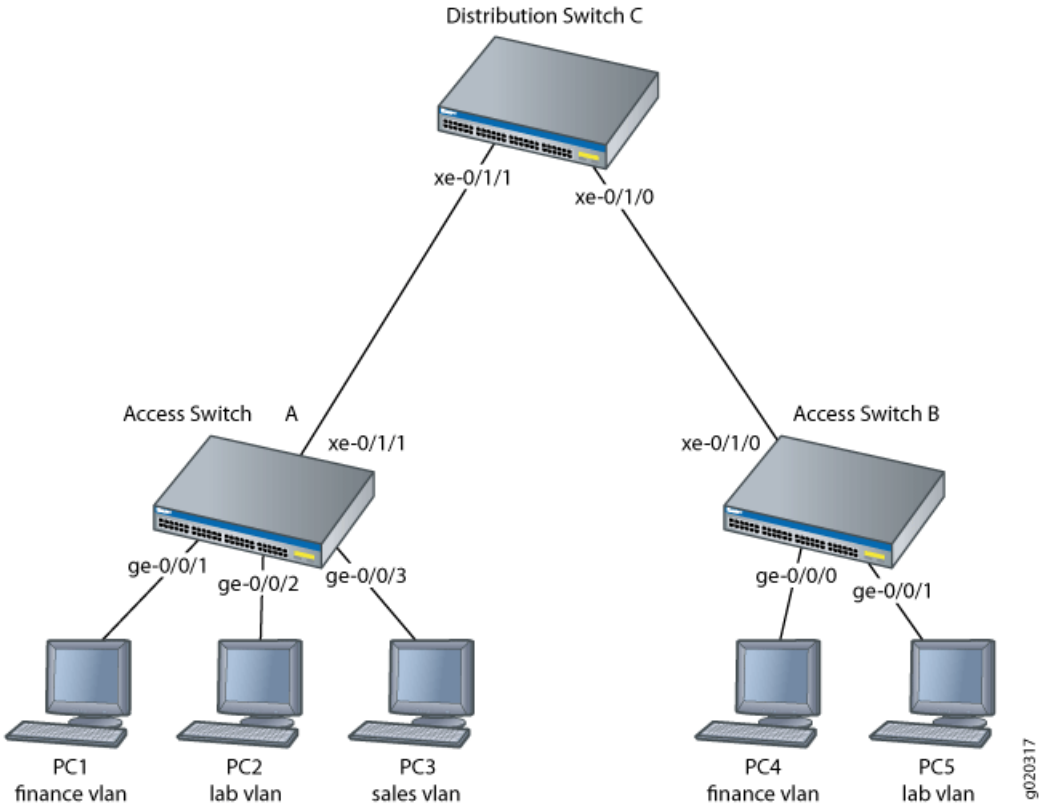

Table 12 on page 86 explains the components of the example topology.

Table 12: Components of the Network Topology

Property	Settings
Switch hardware	• Access Switch A • Access Switch B • Distribution Switch C

Table 12: Components of the Network Topology *(continued)*

VLAN names and tag IDs	**finance**, tag **100** **lab**, tag **200** **sales**, tag **300**
Interfaces	Access Switch A interfaces: • **ge-0/0/1**—Connects PC1 to access Switch A. • **ge-0/0/2**—Connects PC2 to access Switch A. • **ge-0/0/3**—Connects PC3 to access Switch A. • **xe-0/1/1**—Connects access Switch A to distribution Switch C (trunk). Access Switch B interfaces: • **ge-0/0/0**—Connects PC4 to access Switch B. • **ge-0/0/1**—Connects PC5 to access Switch B. • **xe-0/1/0**—Connects access Switch B to distribution Switch C. (trunk) Distribution Switch C interfaces: • **xe-0/1/1**—Connects distribution Switch C to access Switch A. (trunk) • **xe-0/1/0**—Connects distribution Switch C to access Switch B. (trunk)

Configuring VLANs and MVRP on Access Switch A

To configure VLANs on the switch, bind access interfaces to the VLANs, and enable MVRP on the trunk interface of access Switch A, perform these tasks:

CLI Quick Configuration

To quickly configure access Switch A for MVRP, copy the following commands and paste them into the switch terminal window of Switch A:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members lab
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface xe-0/1/1.0
```

NOTE: As we recommend as a best practice, default MVRP timers are used in this example. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Step-by-Step Procedure

To configure access Switch A for MVRP:

1. Configure the finance VLAN:

```
[edit]
user@Access-Switch-A# set vlans finance vlan-id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Access-Switch-A# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Access-Switch-A# set vlans sales vlan–id 300
```

4. Configure an Ethernet interface as a member of the finance VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan
members finance
```

5. Configure an Ethernet interface as a member of the lab VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan
members lab
```

6. Configure an Ethernet interface as a member of the sales VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan
members sales
```

7. Configure a trunk interface:

```
[edit]
user@Access-Switch-A# set interfaces xe-0/1/1 unit 0 family ethernet-switching
port-mode trunk
```

8. Enable MVRP on the trunk interface:

```
[edit]
user@Access-Switch-A# set protocols mvrp interface xe-0/1/1.0
```

Results

Check the results of the configuration:

```
[edit]
  user@switch# show
  interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members finance;
        }
      }
    }
  }
  ge-0/0/2 {
```

```
        unit 0 {
          family ethernet-switching {
            vlan {
              members lab;
            }
          }
        }
      }
      ge-0/0/3 {
        unit 0 {
          family ethernet-switching {
            vlan {
              members sales;
            }
          }
        }
      }
      xe-0/1/1 {
        unit 0 {
          family ethernet-switching {
            port-mode trunk;
          }
        }
      }
    }
    protocols {
      mvrp {
        interface xe-0/1/1.0;
      }
    }
    vlans {
      finance {
        vlan-id 100;
      }
      lab {
        vlan-id 200;
      }
      sales {
        vlan-id 300;
        }
      }
```

Configuring VLANs and MVRP on Access Switch B

To configure three VLANs on the switch, bind access interfaces for PC4 and PC5 to the VLANs, and enable MVRP on the trunk interface of access Switch B, perform these tasks:

CLI Quick Configuration

To quickly configure Access Switch B for MVRP, copy the following commands and paste them into the switch terminal window of Switch B:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members finance
```

```
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members lab
set interfaces xe-0/1/0 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface xe-0/1/0.0
```

Step-by-Step Procedure

To configure access Switch B for MVRP:

1. Configure the finance VLAN:

```
[edit]
user@Access-Switch-B# set vlans finance vlan-id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Access-Switch-B# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Access-Switch-B# set vlans sales vlan–id 300
```

4. Configure an Ethernet interface as a member of the finance VLAN:

```
[edit]
user@Access-Switch-B# set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan
members finance
```

5. Configure an Ethernet interface as a member of the lab VLAN:

```
[edit]
user@Access-Switch-B# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan
members lab
```

6. Configure a trunk interface:

```
user@Access-Switch-B# set interfaces xe-0/1/0 unit 0 family ethernet-switching
port-mode trunk
```

7. Enable MVRP on the trunk interface:

```
[edit]
user@Access-Switch-B# set protocols mvrp xe-0/1/0.0
```

NOTE: As we recommend as a best practice, default MVRP timers are used in this example. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Results

Check the results of the configuration:

```
[edit]
user@Access-Switch-B# show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        vlan {
```

```
            members finance;
          }
        }
      }
    }
    ge-0/0/1 {
      unit 0 {
        family ethernet-switching {
          vlan {
            members lab;
          }
        }
      }
    }
    xe-0/1/0 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
        }
      }
    }
    }
}

protocols {
  mvrp {
    interface xe-0/1/0.0;
  }
}
vlans {
  finance {
    vlan-id 100;
  }
  lab {
    vlan-id 200;
  }
  sales {
    vlan-id 300;
  }
}
```

Configuring VLANS and MVRP on Distribution Switch C

CLI Quick Configuration

To quickly configure distribution Switch C for MVRP, copy the following commands and paste them into the switch terminal window of distribution Switch C:

```
[edit]
set interfaces xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/1/0 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface xe-0/1/1.0
set protocols mvrp interface xe-0/1/0.0
```

Step-by-Step Procedure

To configure distribution Switch C for MVRP:

1. Configure the trunk interface to access Switch A:

```
[edit]
user@Distribution-Switch-C# set interfaces xe-0/1/1 unit 0 family ethernet-switching
port-mode trunk
```

2. Configure the trunk interface to access Switch B:

```
[edit]
user@Distribution-Switch-C# set interfaces xe-0/1/0 unit 0 family ethernet-switching
port-mode trunk
```

3. Enable MVRP on the trunk interface for **xe-0/1/1** :

```
[edit]
user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/1.0
```

4. Enable MVRP on the trunk interface for **xe-0/1/0** :

```
[edit]
user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/0.0
```

Results

Check the results of the configuration:

```
[edit]
user@Distribution Switch-D# show
interfaces {
  xe-0/1/0 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
      }
    }
  }
  xe-0/1/1 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
      }
    }
  }
}
  protocols {
    mvrp {
      interface xe-0/1/0.0;
      interface xe-0/1/1.0;
    }
```

Verification

To confirm that the configuration is updating VLAN membership, perform these tasks:

- Verifying That MVRP Is Enabled on Access Switch A on page 93
- Verifying That MVRP Is Updating VLAN Membership on Access Switch A on page 93
- Verifying That MVRP Is Enabled on Access Switch B on page 93

Verifying That MVRP Is Enabled on Access Switch A

Purpose Verify that MVRP is enabled on the switch.

Action Show the MVRP configuration:

```
user@Access-Switch-A> show mvrp
MVRP configuration
MVRP status                 : Enabled
MVRP dynamic VLAN creation  : Enabled

MVRP timers (ms):
Interface            Join   Leave       LeaveAll
--------------       -----  --------    -----------
all                   200   1000        10000
xe-0/1/1.0            200   1000        10000

Interface       Status        Registration Mode
--------------  --------      -----------------
all             Disabled      Normal
xe-0/1/1.0      Enabled       Normal
```

Meaning The results show that MVRP is enabled on the trunk interface of Switch A and that the default timers are used.

Verifying That MVRP Is Updating VLAN Membership on Access Switch A

Purpose Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch A.

Action List Ethernet switching interfaces on the switch:

```
user@Access-Switch-A> show ethernet-switching interfaces
Interface   State    VLAN members   Tag  Tagging       Blocking
ge-0/0/1.0  up       finance        100  untagged      unblocked
ge-0/0/2.0  up       lab            200  untagged      unblocked
ge-0/0/3.0  up       sales          300  untagged      unblocked
xe-0/1/1.0  up       finance        100  untagged      unblocked
                     lab            200  untagged      unblocked
```

Meaning MVRP has automatically added **finance** and **lab** as VLAN members on the trunk interface because they are being advertised by access Switch B.

Verifying That MVRP Is Enabled on Access Switch B

Purpose Verify that MVRP is enabled on the switch.

Action Show the MVRP configuration:

```
user@Access-Switch-B> show mvrp

MVRP configuration
```

```
MVRP status                 : Enabled
MVRP dynamic VLAN creation  : Enabled

MVRP timers (ms):
Interface          Join   Leave       LeaveAll
--------------     -----  --------    -----------
all                 200   1000       10000
xe-0/1/0.0          200   1000       10000

Interface       Status        Registration Mode
--------------  --------      -----------------
all             Disabled      Normal
xe-0/1/0.0      Enabled       Normal
```

Meaning The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

Verifying That MVRP Is Updating VLAN Membership on Access Switch B

Purpose Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch B.

Action List Ethernet switching interfaces on the switch:

```
user@Access-Switch-B> show ethernet-switching interfaces
Interface   State    VLAN members   Tag  Tagging       Blocking
ge-0/0/0.0  up       finance        100  untagged      unblocked
ge-0/0/1.0  up       lab            200  untagged      unblocked
xe-0/1/1.0  up       finance        100  untagged      unblocked
                     lab            200  untagged      unblocked
                     sales          300  untagged      unblocked
```

Meaning MVRP has automatically added **finance**, **lab**, and **sales** as VLAN members on the trunk interface because they are being advertised by access Switch A.

Verifying That MVRP Is Enabled on Distribution Switch C

Purpose Verify that MVRP is enabled on the switch.

Action Show the MVRP configuration:

```
user@Distribution-Switch-C> show mvrp

MVRP configuration
MVRP status                 : Enabled
MVRP dynamic VLAN creation  : Enabled

MVRP timers (ms):
Interface            Join   Leave       LeaveAll
--------------       -----  --------    -----------
all                   200   1000        10000
xe-0/0/1.0            200   1000        10000
xe-0/1/1.0            200   1000        10000

Interface       Status        Registration Mode
--------------  --------      -----------------
all             Disabled      Normal
```

```
xe-0/0/1.0      Enabled       Normal
xe-0/1/1.0      Enabled       Normal
```

Verifying That MVRP Is Updating VLAN Membership on Distribution Switch C

Purpose Verify that MVRP is updating VLAN membership on distribution Switch C by displaying the Ethernet switching interfaces and associated VLANs on distribution Switch C.

Action List the Ethernet switching interfaces on the switch:

```
user@Distribution-Switch-C> show ethernet-switching interfaces
Interface   State    VLAN members   Tag  Tagging       Blocking
xe-0/1/1.0  up       __mvrp_100__               unblocked
                     __mvrp_200__               unblocked
                     __mvrp_300__               unblocked
xe-0/1/0.0  up       __mvrp_100__               unblocked
                     __mvrp_200__               unblocked
```

List the VLANs that were created dynamically using MVRP on the switch:

```
user@Distribution-Switch-C> show mvrp dynamic-vlan-memberships

MVRP dynamic vlans for routing instance 'default-switch'
 (s) static vlan, (f) fixed registration

VLAN ID          Interfaces
100              xe-0/1/1.0
                 xe-0/1/0.0
200              xe-0/1/1.0
                 xe-0/1/0.0
300              xe-0/1/1.0
```

Note that this scenario has no fixed registration, which is typical when MVRP is enabled.

Meaning Distribution Switch C has two trunk interfaces. Interface **xe-0/1/1.0** connects distribution Switch C to Access Switch A and is therefore updated to show that it is a member of all the VLANs that are active on Switch A. Any traffic for those VLANs will be passed on from distribution Switch C to Switch A, through interface **xe-0/1/1.0**. Interface **xe-0/1/0.0** connects distribution Switch C to Switch B and is updated to show that it is a member of the two VLANs that are active on Switch B. Thus, distribution Switch C sends traffic for **finance** and **lab** to both Switch A and Switch B. But distribution Switch C sends traffic for **sales** only to Switch A.

Distribution Switch C also has three dynamic VLANs created using MVRP: **mvrp_100**, **mvrp_200**, and **mvrp_300**. The dynamically created VLANs **mvrp_100** and **mvrp_200** are active on interfaces **xe-0/1/1.0** and **xe-0/1/1.0**, and dynamically created VLAN **mvrp_300** is active on interface **xe-0/1/1.0**.

Related Documentation

- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124
- Understanding Multiple VLAN Registration Protocol (MVRP) on J-EX Series Switches on page 19

Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to J-EX Series switches that are not part of the local broadcast domain. This feature is useful when you want to run Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

NOTE: L2PT and VLAN translation configured with the **mapping** statement cannot both be configured on the same VLAN. However, L2PT can be configured on one VLAN on a switch while VLAN translation can be configured on a different VLAN that has no L2PT.

This example describes how to configure L2PT:

Requirements

This example uses the following hardware and software components:

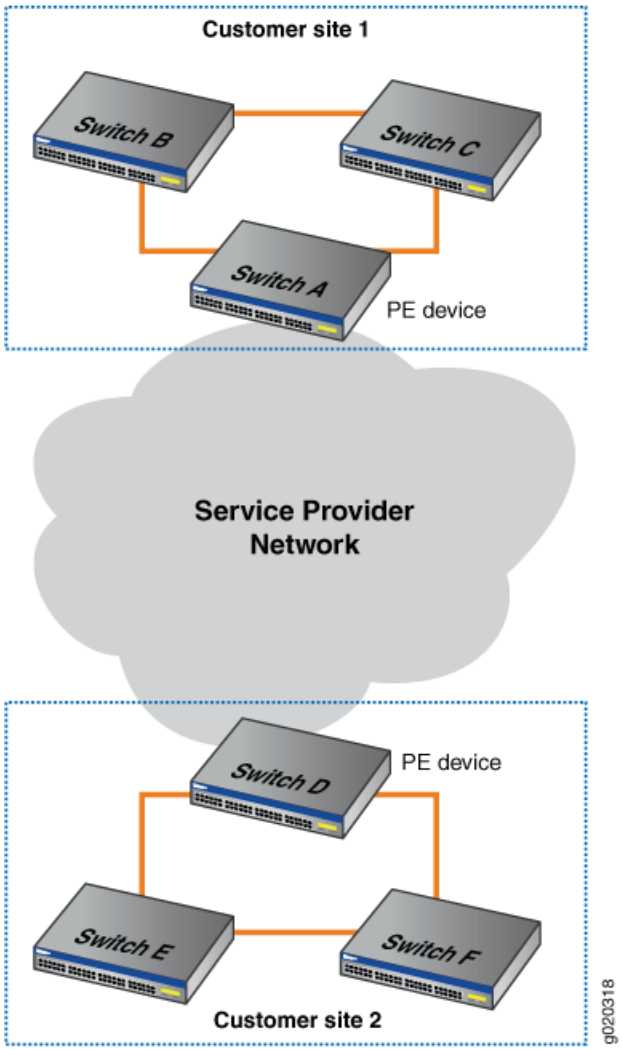
- Six J-EX Series switches, with three each at two customer sites, with one of the switches at each site designated as the provider edge (PE) device
- Junos OS Release 10.2 or later for J-EX Series switches

Overview and Topology

L2PT allows you to send Layer 2 PDUs across a service provider network and deliver them to J-EX Series switches that are not part of the local broadcast domain.

Figure 9 on page 97 shows a customer network that includes two sites that are connected across a service provider network. Site 1 contains three switches connected in a Layer 2 network, with Switch A designated as a provider edge (PE) device in the service provider network. Site 2 contains a Layer 2 network with a similar topology to that of Site 1, with Switch D designated as a PE device.

Figure 9: L2PT Topology



When you enable L2PT on a VLAN, Q-in-Q tunneling is also (and must be) enabled. Q-in-Q tunneling ensures that Switches A, B, C, D, E, and F are part of the same broadcast domain.

This example uses STP as the Layer 2 protocol being tunneled, but you could substitute any of the supported protocols for STP. You can also use the **all** keyword to enable L2PT for all supported Layer 2 protocols.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that problem can be isolated. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold.

The **drop-theshold** configuration statement allows you to specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold must be less than or equal to the shutdown threshold. If the drop threshold is greater than the shutdown threshold and you try to commit the configuration, the commit will fail.

The **shutdown-threshold** configuration statement allows you to specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the specified interface is disabled. The shutdown threshold must be greater than or equal to the drop threshold. You can specify a drop threshold without specifying a shutdown threshold, and you can specify a shutdown threshold without specifying a drop threshold. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

In this example, we will configure both a drop threshold and a shutdown threshold to show how this is done.

If L2PT-encapsulated packets are received on an access interface, the switch reacts as it does when there is a loop between the service provider network and the customer network and shuts down (disables) the access interface.

Once an interface is disabled, you must explicitly reenable it using the **clear ethernet-switching layer2-protocol-tunneling error** command or else the interface will remain disabled.

Configuration

To configure L2PT, perform these tasks:

CLI Quick Configuration

To quickly configure L2PT, copy the following commands and paste them into the switch terminal window of each PE device (in Figure 9 on page 97, Switch A and Switch D are the PE devices):

```
[edit]
set vlans customer-1 dot1q-tunneling
set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp drop-threshold 50
set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp shutdown-threshold 100
```

Step-by-Step Procedure

To configure L2PT, perform these tasks on each PE device (in Figure 9 on page 97, Switch A and Switch D are the PE devices):

1. Enable Q-in-Q tunneling on VLAN **customer-1**:

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling
   ```

2. Enable L2PT for STP on VLAN **customer-1**:

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
   ```

3. Configure the drop threshold as **50**:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
drop-threshold 50
```

4. Configure the shutdown threshold as **100**:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
shutdown-threshold 100
```

Results Check the results of the configuration:

```
[edit]
user@switch# show vlans customer-1 dot1q-tunneling
layer2-protocol-tunneling {
  stp {
    drop-threshold 50;
    shutdown-threshold 100;
  }
}
```

Verification

To verify that L2PT is working correctly, perform this task:

- Verify That L2PT Is Working Correctly on page 99

Verify That L2PT Is Working Correctly

Purpose Verify that Q-in-Q tunneling and L2PT are enabled.

Action Check to see that Q-in-Q tunneling and L2PT are enabled on each PE device (Switch A and Switch D are the PE devices):

```
user@switchA> show vlans extensive customer-1
VLAN: customer-1, Created at: Thu Jun 25 05:07:38 2009
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Dot1q Tunneling status: Enabled
Layer2 Protocol Tunneling status: Enabled
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged  3 (Active = 0)
      ge-0/0/7.0, untagged, access
      ge-0/0/8.0, untagged, access
      ge-0/0/9.0, untagged, access
```

Check to see that L2PT is tunneling STP on VLAN **customer-1** and that **drop-threshold** and **shutdown-threshold** have been configured:

```
user@switchA> show ethernet-switching layer2-protocol-tunneling vlan customer-1

Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop       Shutdown
                            Threshold  Threshold
customer-1    stp           50         100
```

Check the state of the interfaces on which L2PT has been enabled, including what kind of operation (encapsulation or decapsulation) they are performing:

```
user@switchA> show ethernet-switching layer2-protocol-tunneling interface

Layer2 Protocol Tunneling information:
Interface     Operation       State      Description
ge-0/0/0.0    Encapsulation   Shutdown   Shutdown threshold exceeded
ge-0/0/1.0    Decapsulation   Shutdown   Loop detected
ge-0/0/2.0    Decapsulation   Active
```

Meaning The **show vlans extensive customer-1** command shows that Q-in-Q tunneling and L2PT have been enabled. The **show ethernet-switching layer2-protocol-tunneling vlan customer-1** command shows that L2PT is tunneling the STP protocol on VLAN **customer-1**, the drop threshold is set to **50**, and the shutdown threshold is set to **100**. The **show ethernet-switching layer2-protocol-tunneling interface** command shows the type of operation being performed on each interface, the state of each interface and, if the state is **Shutdown**, the reason why the interface is shut down.

Example: Configuring Reflective Relay for Use with VEPA Technology

Reflective relay returns packets to a device using the same downstream port that delivered the packets to the switch. You need to use reflective relay, for example, when a switch receives aggregated virtual machine packets from a technology such as virtual Ethernet packet aggregation (VEPA).

This example shows how to configure a switch port interface to return packets sent by VEPA on the downstream interface back to the server using the same downstream interface:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 11.1 or later for J-EX Series switches

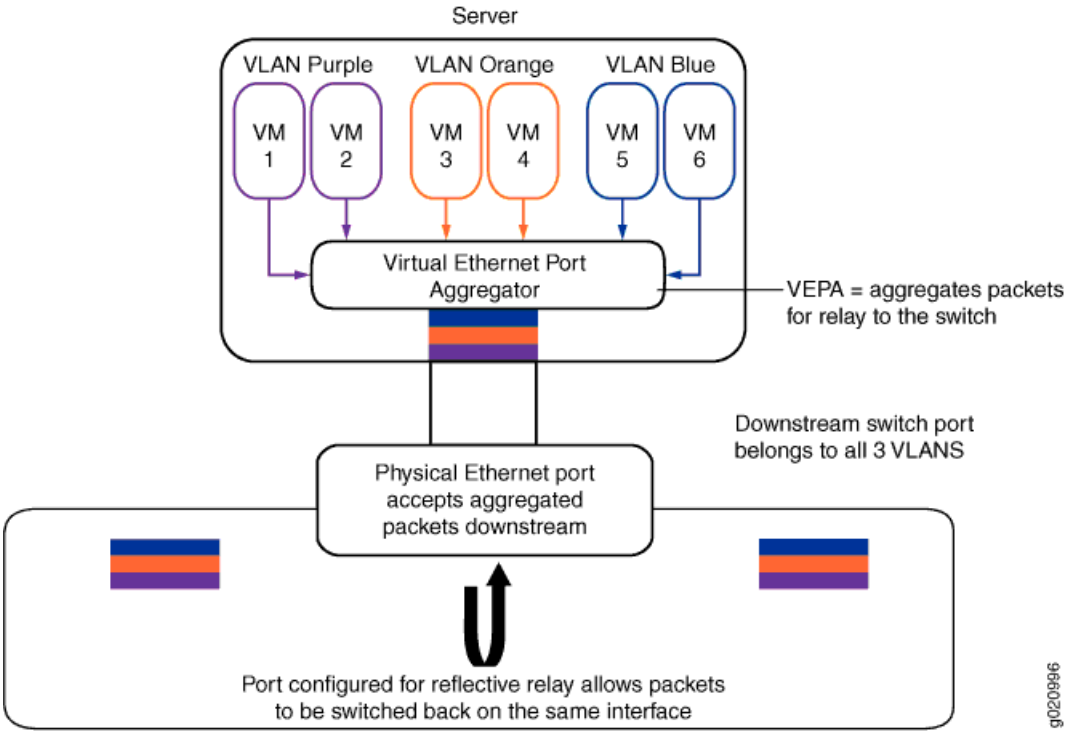
Before you configure reflective relay on a switch port, be sure you have:

- Configured a server with six virtual machines, VM 1 through VM 6. See your server documentation.
- Configured the server with three VLANs named VLAN_Purple, VLAN_Orange, and VLAN_Blue and added two virtual machines to each VLAN. See your server documentation.
- Configured the same three VLANs named VLAN_Purple, VLAN_Orange, and VLAN_Blue on one interface. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112.
- Installed and configured a VEPA to aggregate the virtual machine packets.

Overview and Topology

In this example, illustrated in Figure 10 on page 102, a switch is connected to one server that is hosting six virtual machines and is configured with a VEPA for aggregating packets. The server’s six virtual machines are VM 1 through VM 6 and each virtual machine belongs to one of the three server VLANs, VLAN_Purple, VLAN_Orange, or VLAN_Blue. Instead of the server directly passing packets between virtual machines, packets from any of the three VLANS that are destined for another one of the three VLANs are aggregated with VEPA technology and passed to the switch for processing. You must configure the switch port to accept these aggregated packets on the downstream interface and to return appropriate packets to the server on the same downstream interface after they are processed. Figure 10 on page 102 shows the topology for this example.

Figure 10: Reflective Relay Topology



In this example, you configure the physical Ethernet switch port interface for tagged-access port mode and reflective relay. Configuring tagged-access port mode allows the interface to accept VLAN tagged packets. Configuring reflective relay allows the downstream port to return those packets on the same interface. Table 13 on page 102 shows the components used in this example.

Table 13: Components of the Topology for Configuring Reflective Relay

Component	Description
J-EX Series switch	For a list of switches that support this feature, see the software features overview in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.
ge-7/0/2	Switch interface to the server.
Server	Server with virtual machines and VEPA technology.
Virtual machines	The six virtual machines located on the server are named V1, V2, V3, V4, V5, and V6.
VLANs	The three VLANs are named VLAN_Purple, VLAN_Orange, and VLAN_Blue. Each VLAN has two virtual machine members.
VEPA	Virtual Ethernet port aggregator that aggregates virtual machine packets on the server before the resulting single stream is transmitted to the switch.

Configuration

To configure reflective relay, perform these tasks:

- Configuring Reflective Relay on the Port on page 103

Configuring Reflective Relay on the Port

CLI Quick Configuration

To quickly configure reflective relay, copy the following commands and paste them into the switch window:

```
[edit]
set interfaces ge-7/0/2 unit 0 family ethernet-switching port-mode tagged-access
set interfaces ge-7/0/2 unit 0 family ethernet-switching reflective-relay
set interfaces ge-7/0/2 unit 0 family ethernet-switching vlan members [VLAN_Blue VLAN_Orange
VLAN_Purple]
```

Step-by-Step Procedure

To configure reflective relay:

1. Configure the tagged-access port mode on the interface:

   ```
   [edit]
   user@switch# set interfaces ge-7/0/2 unit 0 family ethernet-switching port-mode
   tagged-access
   ```

2. Configure reflective relay on the interface to allow it to both accept and send packets:

   ```
   [edit]
   user@switch# set interfaces ge-7/0/2 unit 0 family ethernet-switching reflective-relay
   ```

3. Configure the interface for the three VLANs on the server:

   ```
   [edit]
   user@switch# set interfaces ge-7/0/2 unit 0 family ethernet-switching vlan members
   [VLAN_Purple VLAN_Orange VLAN_Blue]
   ```

Results

Check the results of the configuration:

```
[edit interfaces ge-7/0/2] ]
user@switch# show

  unit 0 {
      family ethernet-switching {
      port-mode tagged-access;
      reflective-relay;
      vlan {
       members [ VLAN_Purple VLAN_Orange VLAN_Blue ];
      }
    }
  }
```

Verification

To confirm that reflective relay is enabled and working correctly, perform these tasks:

- Verifying That Reflective Relay Is Enabled and Working Correctly on page 104

Verifying That Reflective Relay Is Enabled and Working Correctly

Purpose Verify that reflective relay is enabled and working correctly.

Action Use the **show ethernet-switching interfaces detail** command to display the reflective relay status:

```
user@switch> show ethernet-switching interfaces ge-7/0/2 detail
Interface: ge-7/0/2, Index: 66, State: down, Port mode: Tagged-access
Reflective Relay Status: Enabled
Ether type for the interface: 0x8100
VLAN membership:
    VLAN_Purple, 802.1Q Tag: 450, tagged, unblocked
    VLAN_Orange, 802.1Q Tag: 460, tagged, unblocked
    VLAN_Blue, 802.1Q Tag: 470, tagged, unblocked
Number of MACs learned on IFL: 0
```

Next, confirm that reflective relay is working by sending a Layer 2 broadcast message from a virtual machine located in one VLAN to a virtual machine located in a different VLAN. Check the switch to verify that the switch sends the packets back on the same interface on which they were received. One way to check this is to set up port mirroring on the switch interface, connect a traffic generator to the mirrored interface, and use the traffic generator to examine packets. See “Configuring Port Mirroring to Analyze Traffic (CLI Procedure)” on page 2383 for details on setting up port mirroring.

Alternatively, if you don’t have a traffic generator available, you can send traffic between two virtual machines with FTP, Telnet, or SSH, while running **tcpdump** on the receiver virtual machine port to capture reflected packets.

Meaning The reflective relay status is **Enabled**, meaning that interface **ge-7/0/2** is configured for the tagged-access port mode, which accepts VLAN-tagged packets, and for reflective relay, which accepts and returns packets on the same interface.

When the traffic generator shows packets arriving at the switch and returning to the server on the same interface, reflective relay is working.

Example: Configuring Proxy ARP on a J-EX Series Switch

You can configure proxy Address Resolution Protocol (ARP) on your J-EX Series switch to enable the switch to respond to ARP queries for network addresses by offering its own MAC address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

This example shows how to configure proxy ARP on an access switch:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch

Overview and Topology

This example shows the configuration of proxy ARP on an interface of a J-EX Series switch using restricted mode. In restricted mode, the switch does not proxy for hosts on the same subnet.

The topology for this example consists of one J-EX Series switch. When a host wants to communicate with a host that is not already in its ARP table, it broadcasts an ARP request for the MAC address of the destination host:

- When proxy ARP is not enabled, a host that shares the same IP address replies directly to the ARP request, providing its MAC address, and future transmissions are sent directly to the destination host MAC address.
- When proxy ARP is enabled, the switch responds to ARP requests, providing the switch's MAC address—even when the destination IP address is the same as the source IP address. Thus, communications must be sent through the switch and then routed through the switch to the appropriate destination.

Configuration

To configure proxy ARP, perform the following tasks:

CLI Quick Configuration

To quickly configure proxy ARP on an interface, copy the following command and paste it into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 unit 0 proxy-arp restricted
```

Step-by-Step Procedure

You configure proxy ARP on individual interfaces.

1. To configure proxy ARP on an interface:

```
[edit interfaces]
user@switch# set ge-0/0/3 unit 0 proxy-arp restricted
```

BEST PRACTICE: We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid the situation of the switch's response to a gratuitous ARP request appearing to the host to be an indication of an IP conflict:

```
[edit interfaces]
user@switch# set ge-0/0/3 no-gratuitous-arp-request
```

Results

Display the results of the configuration:

```
user@switch> show configuration
  interfaces {
    ge-0/0/3 {
      unit 0 {
        proxy-arp restricted;
        family ethernet-switching;
      }
    }
```

Verification

To verify that the switch is sending proxy ARP messages, perform these tasks:

- Verifying That the Switch Is Sending Proxy ARP Messages on page 106

Verifying That the Switch Is Sending Proxy ARP Messages

Purpose

Verify that the switch is sending proxy ARP messages.

Action

List the system statistics for ARP messages:

```
user@switch> show system statistics arp
arp:
        198319 datagrams received
        45 ARP requests received
        12 ARP replies received
        2 resolution requests received
        2 unrestricted proxy requests
        0 restricted proxy requests
        0 received proxy requests
        0 proxy requests not proxied
        0 restricted-proxy requests not proxied
        0 with bogus interface
        0 with incorrect length
        0 for non-IP protocol
```

```
0 with unsupported op code
0 with bad protocol address length
0 with bad hardware address length
0 with multicast source address
0 with multicast target address
0 with my own hardware address
168705 for an address not on the interface
0 with a broadcast source address
0 with source address duplicate to mine
29555 which were not for me
0 packets discarded waiting for resolution
4 packets sent after waiting for resolution
27 ARP requests sent
47 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
0 replies for from unnumbered interfaces
0 requests on unnumbered interface with non-subnetted donor
0 replies from unnumbered interface with non-subnetted donor
```

Meaning The statistics show that two proxy ARP requests were received, and the **proxy requests not proxied** field indicates that all the unproxied ARP requests received have been proxied by the switch.

CHAPTER 3

Configuring Bridging and VLANs

Configuring VLANs for J-EX Series Switches (J-Web Procedure)

You can use the VLAN Configuration page to add a new VLAN or to edit or delete an existing VLAN on a J-EX Series switch.

To access the VLAN Configuration page:

1. Select **Configure** > **Switching** > **VLAN**.

   The VLAN Configuration page displays a list of existing VLANs. If you select a specific VLAN, the specific VLAN details are displayed in the Details section.

NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—creates a VLAN.
   - **Edit**—edits an existing VLAN configuration.
   - **Delete**—deletes an existing VLAN.

   NOTE: If you delete a VLAN, the VLAN configuration for all the associated interfaces is also deleted.

   When you are adding or editing a VLAN, enter information as described in Table 14 on page 110.

Table 14: VLAN Configuration Details

Field	Function	Your Action
General tab		
VLAN Name	Specifies a unique name for the VLAN.	Enter a name.
VLAN Id/Range	Specifies the identifier or range for the VLAN.	Select one: • VLAN ID—Type a unique identification number from **1** through **4094**. If no value is specified, it defaults to 1. • VLAN Range—Type a number range to create VLANs with IDs corresponding to the range. For example, the range **2–3** will create two VLANs with the IDs **2** and **3**.
Description	Describes the VLAN.	Enter a brief description for the VLAN.
MAC-Table-Aging-Time	Specifies the maximum time that an entry can remain in the forwarding table before it 'ages out'.	Type the number of seconds from **60** through **1000000**.
Input filter	Specifies the VLAN firewall filter that is applied to incoming packets.	To apply an input firewall filter, select the firewall filter from the list.
Output filter	Specifies the VLAN firewall filter that is applied to outgoing packets.	To apply an output firewall filter, select the firewall filter from the list.

Table 14: VLAN Configuration Details *(continued)*

Field	Function	Your Action
Ports tab		
Ports	Specifies the ports (interfaces) to be associated with this VLAN for data traffic. You can also remove the port association.	Click one: • **Add**—Select the ports from the available list. • **Remove**—Select the port that you do not want associated with the VLAN.
IP address tab		
IPv4 address	Specifies IPv4 address options for the VLAN.	Select **IPv4 address** to enable the IPv4 address options. To configure IPv4: 1. Enter the IP address. 2. Enter the subnet mask—for example, **255.255.255.0**. You can also specify the address prefix. 3. To apply an input firewall filter to an interface, select the firewall filter from the list. 4. To apply an output firewall filter to an interface, select the firewall filter from the list. 5. Click the **ARP/MAC Details** button. Enter the static IP address and MAC address in the window that is displayed.
IPv6 address	Specifies IPv6 address options for the VLAN.	Select **IPv6 address** to enable the IPv6 address options. To configure IPv6: 1. Enter the IP address—for example: **2001:ab8:85a3::8a2e:370:7334**. 2. Specify the subnet mask.
Voip tab		
Ports	Specifies the ports to be associated with this VLAN for voice traffic. You can also remove the port association.	Click one: • **Add**—Select the ports from the available list. • **Remove**—Select the port that you do not want associated with the VLAN.

Related Documentation

- Configuring VLANs for J-EX Series Switches (CLI Procedure) on page 112
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29
- Understanding Bridging and VLANs on J-EX Series Switches on page 3
- Configuring Routed VLAN Interfaces (CLI Procedure) on page 113

Configuring VLANs for J-EX Series Switches (CLI Procedure)

J-EX Series switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

NOTE: The number of VLANs supported per switch varies for each model. Use the command set vlans id vlan-id ? to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum . To determine the maximum number of VLAN members allowed on a switch, multiply the VLAN maximum for the switch times 8.

If a switch configuration exceeds the recommended member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet bridging process (eswd) due to memory allocation failure.

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Set the description of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set description vlan-description
```

2. Set the unique name of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID range for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

or

```
[edit vlans]
user@switch# set vlan-name vlan-range vlan-id-low-vlan-id-high
```

5. To specify the maximum time that an entry can remain in the forwarding table before it ages out (optional):

```
[edit vlans]
```

```
user@switch# set vlan-name mac-table-aging-time time
```

6. To specify a VLAN firewall filter to be applied to incoming or outgoing packets (optional):

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

Related Documentation

- Configuring VLANs for J-EX Series Switches (J-Web Procedure) on page 109
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29
- Configuring Routed VLAN Interfaces (CLI Procedure) on page 113
- Creating a Series of Tagged VLANs (CLI Procedure) on page 117
- Understanding Bridging and VLANs on J-EX Series Switches on page 3

Configuring Routed VLAN Interfaces (CLI Procedure)

Routed VLAN interfaces (RVIs) enable the J-EX Series switch to recognize which packets are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address lookups.

An interface named **vlan** functions as the logical router, on which you can configure a Layer 3 logical interface for each VLAN. For redundancy, an RVI can be combined with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and VPLS environments.

Jumbo frames of up to 9216 bytes are supported on an RVI. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the **vlan** interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named **vlan** (the RVI).

CAUTION: **Setting or deleting the jumbo MTU size on the RVI (the vlan interface) while the switch is transmitting packets might result in dropped packets.**

To configure the routed VLAN interface (RVI):

1. Create a Layer 2 VLAN by assigning it a name (for example, **support**) and a VLAN ID (for example, **111**).

```
[edit]
user@switch# set vlans support vlan-id 111
```

2. Assign an interface (for example, **ge-0/0/18**) to the VLAN (**support**) by naming the VLAN as a trunk member on the logical interface, thereby making the interface part of the VLAN's broadcast domain.

```
[edit]
user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members
support
```

3. Create a logical Layer 3 RVI (**vlan.111**) on a subnet for the VLAN's broadcast domain.

```
[edit]
user@switch# set interfaces vlan unit 111 family inet address 111.111.111.1/24
```

4. Link the Layer 2 VLAN to the logical Layer 3 interface.

```
[edit]
user@switch# set vlans support l3-interface vlan.111
```

NOTE: Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces vlan terse
Interface               Admin Link Proto    Local                 Remote
vlan                    up    up

Configuring MAC Table Aging (CLI Procedure)

The Ethernet switching table (or MAC table) aging process ensures that the J-EX Series switch tracks only active MAC addresses on the network and is able to flush out MAC addresses that are no longer used.

You can configure the MAC table aging time, the maximum time that an entry can remain in the Ethernet Switching table before it "ages out," either on all VLANs on the switch or on particular VLANs. This setting can influence efficiency of network resource use by affecting the amount of traffic that is flooded to all interfaces because when traffic is received for MAC addresses no longer in the Ethernet switching table, the switch floods the traffic to all interfaces.

To configure the MAC table aging time on all VLANs on the switch:

```
[edit]
user@switch# set ethernet-switching-options mac-table-aging-time seconds
```

To configure the MAC table aging time on a VLAN:

```
[edit]
user@switch# set vlans vlan-name mac-table-aging-time seconds
```

NOTE: You can set the MAC table aging time to unlimited. If you specify the value as unlimited, entries are never removed from the table. Generally, use this setting only if the switch or the VLAN has a fairly static number of end devices; otherwise the table will eventually fill up. You can use this setting to minimize traffic loss and flooding that might occur when traffic arrives for MAC addresses that have been removed from the table.

Configuring the Native VLAN Identifier (CLI Procedure)

J-EX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. The logical interface on which untagged packets are to be received must be configured with the same native VLAN ID as that configured on the physical interface.

To configure the native VLAN ID using the CLI:

1. Configure the port mode so that the interface is in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN. Configure the port mode as **trunk**:

```
[edit interfaces ge-0/0/3 unit 0 family ethernet-switching]
user@switch# set port-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces ge-0/0/3 unit 0 family ethernet-switching]
user@switch# set native-vlan-id 3
```

Creating a Series of Tagged VLANs (CLI Procedure)

To identify which VLAN traffic belongs to, all frames on an Ethernet VLAN are identified by a tag, as defined in the IEEE 802.1Q standard. These frames are *tagged* and are encapsulated with 802.1Q tags. For a simple network that has only a single VLAN, all traffic has the same 802.1Q tag.

Instead of configuring VLANS and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames know which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10-12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag **10**
- VLAN **employee-11**, tag **11**
- VLAN **employee-12**, tag **12**

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.
- Voice over IP (VoIP) configurations do not support a range of tagged VLANs.

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-range 120-130
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces ge-0/0/22.0 family ethernet-switching vlan members
employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces ge-0/0/22.0 family ethernet-switching vlan members
120–130
```

Associating a series of tagged VLANS to an interface by name or by VLAN range have the same result: VLANs **__employee_120__** through **__employee_130__** are created.

NOTE: When a series of VLANs are created using the vlan-range command, the VLAN names are prefixed and suffixed with a double underscore.

Related Documentation

Configuring Virtual Routing Instances (CLI Procedure)

Use virtual routing and forwarding (VRF) to divide a J-EX Series switch into multiple virtual routing instances. VRF allows you to isolate traffic traversing the network without using multiple devices to segment your network. VRF is supported on all Layer 3 interfaces.

Before you begin, make sure to set up your VLANs. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 112 or "Configuring VLANs for J-EX Series Switches (J-Web Procedure)" on page 109.

To configure virtual routing instances:

1. Create a routing instance:

   ```
   [edit routing-instances]
   user@switch# set routing-instance-name instance-type virtual-router
   ```

   

   NOTE: J-EX Series switches only support the virtual-router instance type.

2. Bind each routing instance to the corresponding physical interfaces:

   ```
   [edit routing-instances]
   user@switch# set routing-instance-name interface interface-name.logical-unit-number
   ```

3. Create the logical interfaces that are bound to the routing instance.

   - To create a logical interface with an IPv4 address:

     ```
     [edit interfaces]
     user@switch# set interface-name unit logical-unit-number family inet address ip-address
     ```

   - To create a logical interface with an IPv6 address:

     ```
     [edit interfaces]
     user@switch# set interface-name unit logical-unit-number family inet6 address
     ipv6–address
     ```

     

     NOTE: Do not create a logical interface using the family ethernet-switching option in this step. Binding an interface using the family ethernet-switching option to a routing instance can cause the interface to shutdown.

4. Enable VLAN tagging on each physical interface that was bound to the routing instance:

   ```
   [edit interfaces]
   user@switch# set interface-name vlan-tagging
   ```

Related Documentation

Creating a Private VLAN on a Single J-EX Series Switch (CLI Procedure)

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature on J-EX Series switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. This task describes how to configure a PVLAN on a single switch.

Before you begin, make sure you set up the VLANs. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 112 or "Configuring VLANs for J-EX Series Switches (J-Web Procedure)" on page 109.

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

To configure a private VLAN on a single switch:

1. Set the primary VLAN to have no local switching:

   

   NOTE: The primary VLAN must be a tagged VLAN.

   ```
   [edit vlans]
   user@switch# set primary-vlan-name no-local-switching
   ```

2. For each community VLAN, configure access interfaces:

   

   NOTE: The secondary VLANs should be untagged VLANs. It does not impair functioning if you tag the secondary VLANS. However, the tags are not used when a secondary VLAN is configured on a single switch.

   ```
   [edit vlans]
   user@switch# set community-vlan-name interface interface-name
   ```

3. For each community VLAN, set the primary VLAN:

   ```
   [edit vlans]
   user@switch# set community-vlan-name primary-vlan primary-vlan-name
   ```

4. For each isolated VLAN, add the interface to the primary VLAN:

   ```
   [edit vlans]
   user@switch# set primary-vlan-name interface interface-name
   ```

Related Documentation

- Example: Configuring a Private VLAN on a Single J-EX Series Switch on page 61
- Creating a Private VLAN Spanning Multiple J-EX Series Switches (CLI Procedure) on page 121

- Verifying That a Private VLAN Is Working on page 137

Creating a Private VLAN Spanning Multiple J-EX Series Switches (CLI Procedure)

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature on J-EX Series switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. This task describes how to configure a PVLAN to span multiple switches.

Before you begin, make sure you have created and configured the necessary VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 109.

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

To configure a private VLAN to span multiple switches:

1. Configure the name and 802.1Q tag for a community VLAN that spans the switches.

   ```
   [edit vlans]
   user@switch# set community-vlan-name vlan-id number
   ```

2. Add the access interfaces to the specified community VLAN:

   ```
   [edit vlans]
   user@switch# set community-vlan-name interface interface-name
   ```

3. Set the primary VLAN of the specified community VLAN:

   ```
   [edit vlans]
   user@switch# set community-vlan-name primary-vlan primary-vlan-name
   ```

4. Configure the name and the 802.1Q tag for the primary VLAN:.

   ```
   [edit vlans]
   user@switch# set primary-vlan-name vlan-id number
   ```

5. Add the isolated port to the specified primary VLAN:

   ```
   [edit vlans]
   user@switch# set primary-vlan-name interface interface-name
   ```

NOTE: To configure an isolated port, include it as one of the members of the primary VLAN but do not configure it as belonging to one of the community VLANs.

6. Set the PVLAN trunk interface that will connect the specified VLAN to the neighboring switch:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name pvlan-trunk
```

7. Set the primary VLAN to have no local switching:

```
[edit vlans]
user@switch# set primary-vlan-name no-local-switching
```

8. Set the 802.1Q tag of the inter-switch isolated VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name isolation-id number
```

Configuring Q-in-Q Tunneling (CLI Procedure)

Q-in-Q tunneling allows service providers on Ethernet access networks to segregate or bundle customer traffic into different VLANs by adding another layer of 802.1Q tags. You can configure Q-in-Q tunneling on J-EX Series switches.

NOTE: You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

Before you begin configuring Q-in-Q tunneling, make sure you set up your VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 109.

To configure Q-in-Q tunneling:

1. Enable Q-in-Q tunneling on the S-VLAN:

```
[edit vlans]
user@switch# set s-vlan-name dot1q-tunneling
```

2. Set the allowed C-VLANs on the S-VLAN (optional). Here, the C-VLANs are identified by VLAN range:

```
[edit vlans]
user@switch# set s-vlan-name dot1q-tunneling customer-vlans range
```

3. Change the global Ethertype value (optional):

```
[edit]
```

```
user@switch# set ethernet-switching-options dot1q-tunneling ether-type
ether-type-value
```

4. Disable MAC address learning on the S-VLAN (optional):

```
[edit vlans]
user@switch# set s-vlan-name no-mac-learning
```

Related Documentation

Configuring Redundant Trunk Groups (J-Web Procedure)

A redundant trunk link provides a simple solution for network recovery when a trunk interface goes down. Traffic is routed to another trunk interface, keeping network convergence time to a minimum. You can configure redundant trunk groups (RTGs) with a primary link and a secondary link on trunk interfaces, or configure dynamic selection of the active interface. If the primary link fails, the secondary link automatically takes over without waiting for normal STP convergence. An RTG can be created only if the following conditions are satisfied:

- A minimum of two trunk interfaces that are not part of any RTG are available.
- All the selected trunk interfaces to be added to the RTG have the same VLAN configuration.
- The selected trunk interfaces are not part of a spanning-tree configuration.

To configure an RTG using the J-Web interface:

1. Select **Configure** > **Switching** > **RTG**.

   The RTG Configuration page displays a list of existing RTGs. If you select a specific RTG, the details of the selected RTG are displayed in the Details of group section.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Creates an RTG.
   - **Edit**—Modifies an RTG.
   - **Delete**—Deletes an RTG.

When you are adding or editing an RTG, enter information as described in Table 15 on page 124.

3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

Table 15: RTG Configuration Fields

Field	Function	Your Action
Group Name	Specifies a unique name for the RTG.	Enter a name.
Member Interface 1	Specifies a logical interface containing multiple trunk interfaces.	Select a trunk interface from the list.
Member Interface 2	Specifies a trunk interface containing multiple VLANs.	Select a trunk interface from the list.
Select Primary Interface	Enables you to specify one of the interfaces in the RTG as the primary link. The interface without this option is the secondary link in the RTG.	1. Select the option button. 2. Select the primary interface.
Dynamically select my active interface	Specifies that the system dynamically selects the active interface.	Select the option button.

Related Documentation

Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)

Multiple VLAN Registration Protocol (MVRP) is used to manage dynamic VLAN registration in a LAN. You can use MVRP on J-EX Series switches.

MVRP is disabled by default on J-EX Series switches.

To enable MVRP or set MVRP options, follow these instructions:

Enabling MVRP

MVRP can only be enabled on trunk interfaces.

To enable MVRP on all trunk interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all
```

To enable MVRP on a specific trunk interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0
```

Disabling MVRP

MVRP is disabled by default. You only need to perform this procedure if you have previously enabled MVRP.

To disable MVRP on all trunk interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set disable
```

To disable MVRP on a specific trunk interface:

```
[edit protocols mvrp]
user@switch# set disable interface xe-0/0/1.0
```

Disabling Dynamic VLANs

Dynamic VLANs can be created on interfaces participating in MVRP by default. Dynamic VLANs are VLANs created on one switch that are propagated to other switches dynamically; in this case, using MVRP.

Dynamic VLAN creation through MVRP cannot be disabled per switch interface. To disable dynamic VLAN creation for interfaces participating in MVRP, you must disable it for all interfaces on the switch.

To disable dynamic VLAN creation:

```
[edit protocols mvrp]
user@switch# set no-dynamic-vlan
```

Configuring Timer Values

The timers in MVRP define the amount of time an interface waits to join or leave MVRP or to send or process the MVRP information for the switch after receiving an MVRP PDU. The join timer controls the amount of time the switch waits to accept a registration request, the leave timer controls the period of time that the switch waits in the Leave state before changing to the unregistered state, and the leaveall timer controls the frequency with which the LeaveAll messages are communicated.

The default MVRP timer values are 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer.

BEST PRACTICE: **Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.**

To set the join timer for all interfaces on the switch:

```
[edit protocols mvrp]
```

```
user@switch# set interface all join-timer 300
```

To set the join timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 300
```

To set the leave timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all leave-timer 1200
```

To set the leave timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 leave-timer 1200
```

To set the leaveall timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all leaveall-timer 12000
```

To set the leaveall timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 leaveall-timer 12000
```

Configuring MVRP Registration Mode

The default MVRP registration mode for any interface participating in MVRP is normal. An interface in normal registration mode participates in MVRP when MVRP is enabled on the switch.

An interface in forbidden registration mode does not participate in MVRP even if MVRP is enabled on the switch.

To set all interfaces to forbidden registration mode:

```
[edit protocols mvrp]
user@switch# set interface all registration forbidden
```

To set one interface to forbidden registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration forbidden
```

To set all interfaces to normal registration mode:

```
[edit protocols mvrp]
user@switch# set interface all registration normal
```

To set one interface to normal registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration normal
```

Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure)

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to J-EX Series switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that the problem can be isolated. You do so using the **shutdown-threshold** statement. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold using the **drop-threshold** statement.

There are no default settings for **drop-threshold** and **shutdown-threshold**. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

You can specify a drop threshold value without specifying a shutdown threshold value, and you can specify a shutdown threshold value without specifying a drop threshold value. If you specify both threshold values, then the drop threshold value must be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit will fail.

NOTE: L2PT and VLAN translation configured with the **mapping** statement cannot both be configured on the same switch.

NOTE: If the switch receives untagged Layer 2 control PDUs to be tunnelled, then you must configure the switch to map untagged (native) packets to an L2PT-enabled VLAN. Otherwise, the untagged Layer 2 control PDU packets are discarded. For more information, see “Understanding Q-in-Q Tunneling on J-EX Series Switches” on page 16 and “Configuring Q-in-Q Tunneling (CLI Procedure)” on page 122.

To configure L2PT on a J-EX Series switch:

1. Because L2PT operates under the Q-in-Q tunneling configuration, you must enable Q-in-Q tunneling before you can configure L2PT. Enable Q-in-Q tunneling on VLAN **customer-1**:

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling
   ```

2. Enable L2PT for the Layer 2 protocol you want to tunnel, on the VLAN:

   - To enable L2PT for a specific protocol (here, STP):

     ```
     [edit]
     user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
     ```

   - To enable L2PT for all supported protocols:

     ```
     [edit]
     user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling all
     ```

3. (Optional) Configure the drop threshold:

   

   NOTE: If you also configure the shutdown threshold, ensure that you configure the drop threshold value to be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you to try to commit the configuration changes, the commit will fail.

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
   drop-threshold 50
   ```

4. (Optional) Configure the shutdown threshold:

   

   NOTE: If you also configure the drop threshold, ensure that you configure the shutdown threshold value to be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value and you to try to commit the configuration changes, the commit will fail.

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
   shutdown-threshold 100
   ```

   

   NOTE: Once an interface is disabled, you must explicitly reenable it using the clear ethernet-switching layer2-protocol-tunneling error command. Otherwise, the interface remains disabled.

Configuring MAC Notification (CLI Procedure)

When a switch learns or unlearns a MAC address, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as MAC notification.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- Enabling MAC Notification on page 129
- Disabling MAC Notification on page 129
- Setting the MAC Notification Interval on page 130

Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

```
[edit ethernet-switching-options]
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, the MAC notification interval is set to 60 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 60
```

Disabling MAC Notification

MAC Notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit ethernet-switching-options]
user@switch# delete mac-notification
```

Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 5
```

Related Documentation

- Verifying that MAC Notification Is Working Properly on page 144

Configuring Proxy ARP (CLI Procedure)

You can configure proxy Address Resolution Protocol (ARP) on your J-EX Series switch to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set ge-0/0/3 unit 0 proxy-arp restricted
```

BEST PRACTICE: We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch is not a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid the situation of the switch's response to a gratuitous ARP request appearing to the host to be an indication of an IP conflict:

To configure proxy ARP on a routed VLAN interface (RVI):

```
[edit interfaces]
user@switch# set vlan unit 100 proxy-arp restricted
```

Related Documentation

- Example: Configuring Proxy ARP on a J-EX Series Switch on page 104
- Verifying That Proxy ARP Is Working Correctly on page 144
- Configuring Routed VLAN Interfaces (CLI Procedure) on page 113

Configuring Reflective Relay (CLI Procedure)

Configure reflective relay when a switch port must return packets on a downstream port. For example, configure reflective relay when a switch port receives aggregated virtual machine packets from a technology such as virtual Ethernet packet aggregation (VEPA). When packets like this are passed through the switch, reflective relay allows the switch to send those packets back on the same interface that was used for delivery.

Before you begin configuring reflective relay, ensure that you have:

- Configured packet aggregation on the server connected to the port. See your server documentation.
- Configured the port for all VLANs that could be included in aggregated packets. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 112.

To configure reflective relay on a port interface:

1. Configure tagged-access port mode on the interface:

   ```
   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching port-mode tagged-access
   ```

2. Configure the interface for reflective relay:

   ```
   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching reflective-relay
   ```

3. Configure the interface for the VLANs that exist on the VM server:

   ```
   [edit]
   user@switch# set interfaces interface-name unit 0 family ethernet-switching vlan vlan-names
   ```

Related Documentation

- Understanding Reflective Relay for Use with VEPA Technology on page 27

Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)

The Ethernet switching table, also known as the forwarding table, specifies the known locations of VLAN nodes. There are two ways to populate the Ethernet switching table on a switch. The easiest method is to let the switch update the table with MAC addresses.

The second way to populate the Ethernet switching table is to manually insert a VLAN node location into the table. You can do this to reduce flooding and speed up the switch's automatic learning process. To further optimize the switching process, indicate the next hop (next interface) packets will use after leaving the node.

Before configuring a static MAC address, be sure that you have:

- Set up the VLAN. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112.

To add a MAC address to the Ethernet switching table:

1. Specify the MAC address to add to the table:

```
[edit ethernet-switching-options]
set static vlan vlan-name mac mac-address
```

2. Indicate the next hop MAC address for packets sent to the indicated MAC address:

```
[edit ethernet-switching-options]
set static vlan vlan-name mac mac-address next-hop interface
```

CHAPTER 4

Verifying Bridging and VLAN Configuration

Verifying That a Series of Tagged VLANs Has Been Created

Purpose Verify that a series of tagged VLANs is created on the switch.

Action Display the VLANs in the ascending order of their VLAN ID:

```
user@switch> show vlans sort-by tag

Name              Tag         Interfaces
__employee_120__  120
                              ge-0/0/22.0*
__employee_121__  121
                              ge-0/0/22.0*
__employee_122__  122
                              ge-0/0/22.0*
__employee_123__  123
                              ge-0/0/22.0*
__employee_124__  124
                              ge-0/0/22.0*
__employee_125__  125
                              ge-0/0/22.0*
__employee_126__  126
                              ge-0/0/22.0*
__employee_127__  127
                              ge-0/0/22.0*
__employee_128__  128
                              ge-0/0/22.0*
__employee_129__  129
                              ge-0/0/22.0*
```

```
__employee_130__   130
                              ge-0/0/22.0*
```

Display the VLANs by the alphabetical order of the VLAN name:

```
user@switch>  show vlans sort-by name

Name              Tag   Interfaces

__employee_120__ 120
                        ge-0/0/22.0*
__employee_121__ 121
                        ge-0/0/22.0*
__employee_122__ 122
                        ge-0/0/22.0*
__employee_123__ 123
                        ge-0/0/22.0*
__employee_124__ 124
                        ge-0/0/22.0*
__employee_125__ 125
                        ge-0/0/22.0*
__employee_126__ 126
                        ge-0/0/22.0*
__employee_127__ 127
                        ge-0/0/22.0*
__employee_128__ 128
                        ge-0/0/22.0*
__employee_129__ 129
                        ge-0/0/22.0*
__employee_130__ 130
                        ge-0/0/22.0*
```

Display the VLANs by specifying the VLAN-range name (here, the VLAN-range name is **employee**):

```
user@switch>  show vlans employee

Name              Tag   Interfaces

__employee_120__ 120
                        ge-0/0/22.0*
__employee_121__ 121
                        ge-0/0/22.0*
__employee_122__ 122
                        ge-0/0/22.0*
__employee_123__ 123
                        ge-0/0/22.0*
__employee_124__ 124
                        ge-0/0/22.0*
__employee_125__ 125
                        ge-0/0/22.0*
__employee_126__ 126
                        ge-0/0/22.0*
__employee_127__ 127
                        ge-0/0/22.0*
__employee_128__ 128
                        ge-0/0/22.0*
__employee_129__ 129
                        ge-0/0/22.0*
```

```
__employee_130__ 130
                        ge-0/0/22.0*
```

Meaning The sample output shows the VLANs configured on the switch. The series of tagged VLANs is displayed: **__employee_120__** through **__employee_130__**. Each of the tagged VLANs is configured on the trunk interface **ge-0/0/22.0**. The asterisk (*****) beside the interface name indicates that the interface is **UP**.

When a series of VLANs is created using the **vlan-range** statement, the VLAN names are prefixed and suffixed with a double underscore.

Verifying That Virtual Routing Instances Are Working

Purpose After creating a virtual routing instance, make sure it is set up properly.

Action

1. Use the **show route instance** command to list all of the routing instances and their properties:

```
user@switch> show route instance

Instance             Type
         Primary RIB
Active/holddown/hidden
master               forwarding
         inet.0                                          3/0/0

__juniper_private1__ forwarding
         __juniper_private1__.inet.0                     1/0/3

__juniper_private2__ forwarding

instance1            forwarding

r1                   virtual-router
         r1.inet.0                                       1/0/0

r2                   virtual-router
         r2.inet.0                                       1/0/0
```

2. Use the **show route forwarding-table** command to view the forwarding table information for each routing instance:

```
user@switch> show route forwarding-table

Routing table: r1.inet
Internet:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    rjct   539     2
0.0.0.0/32         perm     0                    dscd   537     1
103.1.1.0/24       ifdn     0                    rslv   579     1
ge-0/0/3.0
103.1.1.0/32       iddn     0 103.1.1.0          recv   577     1
ge-0/0/3.0
103.1.1.1/32       user     0                    rjct   539     2
103.1.1.1/32       intf     0 103.1.1.1          locl   578     2
```

```
103.1.1.1/32       iddn     0 103.1.1.1          locl   578     2
103.1.1.255/32     iddn     0 103.1.1.255        bcst   576     1
ge-0/0/3.0
224.0.0.0/4        perm     0                    mdsc   538     1
224.0.0.1/32       perm     0 224.0.0.1          mcst   534     1
255.255.255.255/32 perm     0                    bcst   535     1
```

Meaning The output confirms that the virtual routing instances are created and the links are up and displays the routing table information.

Related Documentation

- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 81

Verifying That Q-in-Q Tunneling Is Working

Purpose After creating a Q-in-Q VLAN, verify that it is set up properly.

Action

1. Use the **show configuration vlans** command to determine if you successfully created the primary and secondary VLAN configurations:

```
user@switch> show configuration vlans

svlan {
   vlan-id 300;
   dot1q-tunneling {
      customer-vlans [ 101–200 ];
   }
}
```

2. Use the **show vlans** command to view VLAN information and link status:

```
user@switch> show vlans s-vlan-name extensive

VLAN: svlan, Created at: Thu Oct 23 16:53:20 2008
802.1Q Tag: 300, Internal index: 2, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
                     101–200
Protocol: Port Mode
Number of interfaces: Tagged 1 (Active = 0), Untagged  1 (Active = 0)
      ge-0/0/1, tagged, trunk
      ge-0/0/2, untagged, access
```

Meaning The output confirms that Q-in-Q tunnling is enabled and that the VLAN is tagged, and lists the customer VLANs that are associated with the tagged VLAN.

Related Documentation

- Configuring Q-in-Q Tunneling (CLI Procedure) on page 122
- Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches on page 58

Verifying That a Private VLAN Is Working

Purpose After creating and configuring private VLANs (PVLANs), verify that they are set up properly.

Action 1. To determine whether you successfully created the primary and secondary VLAN configurations:

- For a PVLAN on a single J-EX Series switch, use the **show configuration vlans** command:

```
user@switch> show configuration vlans

community1 {
    interface {
        interface a;
        interface b;
    }
    primary-vlan pvlan;
}
community2 {
    interface {
        interface d;
        interface e;
    }
    primary-vlan pvlan;
}
pvlan {
    vlan-id 1000;
    interface {
        isolated1;
        isolated2;
        trunk1;
        trunk2;
    }
    no-local-switching;
}
```

- For a PVLAN spanning multiple switches, use the **show vlans extensive** command:

```
user@switch> show vlans extensive

VLAN: COM1, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 100, Internal index: 3, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  1 (Active = 1)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk
      ge-0/0/7.0*, untagged, access

VLAN: __pvlan_primary_ge-0/0/0.0__, Created at: Tue May 11 18:16:05 2010

Private VLAN Mode: Inter-switch-isolated, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  0 (Active = 0)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk

VLAN: community2, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 20, Internal index: 8, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  2 (Active = 2)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk
      ge-0/0/1.0*, untagged, access
      ge-1/0/6.0*, untagged, access

VLAN: primary, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 10, Internal index: 2, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  5 (Active = 4)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk
      ge-0/0/0.0*, untagged, access
      ge-0/0/1.0*, untagged, access
      ge-0/0/2.0, untagged, access
      ge-0/0/7.0*, untagged, access
      ge-1/0/6.0*, untagged, access

Secondary VLANs: Isolated 2, Community  2, Inter-switch-isolated  1
  Isolated VLANs :
      __pvlan_primary_ge-0/0/0.0__
      __pvlan_primary_ge-0/0/2.0__
  Community VLANs :
      COM1
      community2
  Inter-switch-isolated VLAN :
      __pvlan_primary_isiv__
```

2. Use the **show vlans extensive** command to view VLAN information and link status for a PVLAN on a single switch or for a PVLAN spanning multiple switches.

   - For a PVLAN on a single switch:

     ```
     user@switch> show vlans pvlan extensive

     VLAN: pvlan, Created at: time
     802.1Q Tag: vlan-id, Internal index: index-number, Admin State: Enabled,
      Origin: Static
     Private VLAN Mode: Primary
     Protocol: Port Mode
     Number of interfaces: Tagged 2 (Active = 0), Untagged  6 (Active = 0)
           trunk1, tagged, trunk
           interface a, untagged, access
           interface b, untagged, access
           interface c, untagged, access
           interface d, untagged, access
           interface e, untagged, access
           interface f, untagged, access
           trunk2, tagged, trunk
     Secondary VLANs: Isolated 2, Community  2
       Isolated VLANs :
           __pvlan_pvlan_isolated1__
           __pvlan_pvlan_isolated2__
       Community VLANs :
           community1
           community2
     ```

   - For a PVLAN spanning multiple switches:

     ```
     user@switch> show vlans extensive

     VLAN: COM1, Created at: Tue May 11 18:16:05 2010

Private VLAN Mode: Inter-switch-isolated, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  0 (Active = 0)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk

VLAN: community2, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 20, Internal index: 8, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  2 (Active = 2)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk
      ge-0/0/1.0*, untagged, access
      ge-1/0/6.0*, untagged, access

VLAN: primary, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 10, Internal index: 2, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged  5 (Active = 4)
      ge-0/0/20.0*, tagged, trunk
      ge-0/0/22.0*, tagged, trunk, pvlan-trunk
      ge-0/0/23.0*, tagged, trunk, pvlan-trunk
      ge-0/0/0.0*, untagged, access
      ge-0/0/1.0*, untagged, access
      ge-0/0/2.0, untagged, access
      ge-0/0/7.0*, untagged, access
      ge-1/0/6.0*, untagged, access

Secondary VLANs: Isolated 2, Community  2, Inter-switch-isolated  1
  Isolated VLANs :
      __pvlan_primary_ge-0/0/0.0__
      __pvlan_primary_ge-0/0/2.0__
  Community VLANs :
      COM1
      community2
  Inter-switch-isolated VLAN :
      __pvlan_primary_isiv__
```

3. Use the **show ethernet-switching table** command to view logs for MAC learning on the VLANs:

```
user@switch> show ethernet-switching table

Ethernet-switching table: 8 entries, 1 learned

  VLAN              MAC address       Type         Age Interfaces

  default           *                 Flood          - All-members
```

```
pvlan                 *                 Flood          - All-members
pvlan                 MAC1              Replicated     - interface a
pvlan                 MAC2              Replicated     - interface c
pvlan                 MAC3              Replicated     - isolated2
pvlan                 MAC4              Learn          0 trunk1
__pvlan_pvlan_isolated1__ *             Flood          - All-members
__pvlan_pvlan_isolated1__ MAC4          Replicated     - trunk1
__pvlan_pvlan_isolated2__ *             Flood          - All-members
__pvlan_pvlan_isolated2__ MAC3          Learn          0 isolated2
__pvlan_pvlan_isolated2__ MAC4          Replicated     - trunk1
community1            *                 Flood          - All-members
community1            MAC1              Learn          0 interface a
community1            MAC4              Replicated     - trunk1
community2            *                 Flood          - All-members
community2            MAC2              Learn          0 interface c
community2            MAC4              Replicated     - trunk1
```

NOTE: If you have configured a PVLAN spanning multiple switches, you can use the same command on all the switches to check the logs for MAC learning on the those switches.

Meaning In the samples for a PVLAN on a single switch, you can see that the primary VLAN contains two community domains (**community1** and **community2**), two isolated ports, and two trunk ports. The PVLAN on a single switch has only one tag (**1000**), which is for the primary VLAN.

The PVLAN that spans multiple switches contains multiple tags:

- The community domain, **COM1**, is identified with tag **100**.
- The community domain, **community2** is identified with tag **20**.
- The inter-switch isolated domain is identified with tag **50**.
- The primary VLAN, **primary**, is identified with tag **10**.

Also, for the PVLAN that spans multiple switches, the trunk interfaces are identified as **pvlan-trunk**.

Monitoring Ethernet Switching

Purpose Use the monitoring feature to view details that the J-EX Series switch maintains in its Ethernet switching table. These are details about the nodes on the LAN such as VLAN name, VLAN ID, member interfaces, MAC addresses, and so on.

Action To display Ethernet switching details in the J-Web interface, select **Monitor** > **Switching** > **Ethernet Switching**.

To view Ethernet switching details in the CLI, enter the following commands:

- **show ethernet-switching table**
- **show vlans**
- **show ethernet-switching interfaces**

Meaning Table 16 on page 142 summarizes the Ethernet switching output fields.

Table 16: Ethernet Switching Output Fields

Field	Value
Ethernet Switching Table Information	
MAC Table Count	The number of entries added to the Ethernet switching table.
MAC Table Learned	The number of dynamically learned MAC addresses in the Ethernet switching table.
Ethernet Switching Table Information	
VLAN	The VLAN name.
MAC Address	The MAC address associated with the VLAN. If a VLAN range has been configured for a VLAN, the output displays the MAC addresses for the entire series of VLANs that were created with that name.
Type	The type of MAC address. Values are: • **static**—The MAC address is manually created. • **learn**—The MAC address is learned dynamically from a packet's source MAC address. • **flood**—The MAC address is unknown and flooded to all members.
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.
Interfaces	The associated interfaces.

Table 16: Ethernet Switching Output Fields *(continued)*

Field	Value
MAC Learning Log	
VLAN-Name	The VLAN name.
MAC Address	The learned MAC address associated with the VLAN ID.
Time	Timestamp for the time at which when the MAC address was added or deleted from the MAC learning log.
State	Operating state of the interface. Values are **Up** and **Down**.

Verifying That MVRP Is Working Correctly

Purpose After configuring your J-EX Series switch to participate in MVRP, verify that the configuration is properly set and that MVRP messages are being sent and received on your switch.

Action

1. Confirm that MVRP is enabled on your switch.

```
user@switch> show mvrp

Global MVRP configuration
  MVRP status               : Enabled
  MVRP dynamic vlan creation: Enabled
  MVRP Timers (ms):
   Interface        Join   Leave   LeaveAll
   --------------   ----   -----   --------
   all              200    600     10000
   xe-0/1/1.0       200    600     10000

  Interface based configuration:
   Interface        Status     Registration   Dynamic VLAN Creation
   --------------   --------   ------------   ---------------------
   all          Disabled   Fixed          Enabled
   xe-0/1/1.0       Enabled    Normal         Enabled
```

2. Confirm that MVRP messages are being sent and received on your switch.

```
user@switch> show mvrp statistics interface xe-0/1/1.0

MVRP statistics
  MRPDU received                : 3342
  Invalid PDU received          : 0
  New received                  : 2
  Join Empty received           : 1116
  Join In received              : 2219
  Empty received                : 2
```

```
In received                    : 2
Leave received                 : 1
LeaveAll received              : 1117
MRPDU transmitted              : 3280
MRPDU transmit failures        : 0
New transmitted                : 0
Join Empty transmitted         : 1114
Join In transmitted            : 2163
Empty transmitted              : 1
In transmitted                 : 1
Leave transmitted              : 1
LeaveAll transmitted           : 1111
```

Meaning The output of **show mvrp** shows that interface **xe-0/1/1.0** is enabled for MVRP participation as shown in the status in the **Interface based configuration** field.

The output for **show mvrp statistics interface xe-0/1/1.0** confirms that MVRP messages are being transmitted and received on the interface.

Verifying That MAC Notification Is Working Properly

Purpose Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

Action Verify that MAC notification is enabled while also verifying the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 30
```

Meaning The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 30 seconds.

Related Documentation

- Configuring MAC Notification (CLI Procedure) on page 129

Verifying That Proxy ARP Is Working Correctly

Purpose Verify that the switch is sending proxy ARP messages.

Action List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
        198319 datagrams received
        45 ARP requests received
        12 ARP replies received
        2 resolution requests received
        2 unrestricted proxy requests
        0 restricted proxy requests
        0 received proxy requests
        0 proxy requests not proxied
        0 restricted-proxy requests not proxied
        0 with bogus interface
        0 with incorrect length
        0 for non-IP protocol
        0 with unsupported op code
        0 with bad protocol address length
        0 with bad hardware address length
        0 with multicast source address
        0 with multicast target address
        0 with my own hardware address
        168705 for an address not on the interface
        0 with a broadcast source address
        0 with source address duplicate to mine
        29555 which were not for me
        0 packets discarded waiting for resolution
        4 packets sent after waiting for resolution
        27 ARP requests sent
        47 ARP replies sent
        0 requests for memory denied
        0 requests dropped on entry
        0 requests dropped during retry
        0 requests dropped due to interface deletion
        0 requests on unnumbered interfaces
        0 new requests on unnumbered interfaces
        0 replies for from unnumbered interfaces
        0 requests on unnumbered interface with non-subnetted donor
        0 replies from unnumbered interface with non-subnetted donor
```

Meaning The statistics show that two proxy ARP requests were received, and the **proxy requests not proxied** field indicates that all the unproxied ARP requests received have been proxied by the switch.

CHAPTER 5

Troubleshooting Bridging and VLAN Configuration

Troubleshooting Ethernet Switching

Troubleshooting issues for Ethernet switching on J-EX Series switches:

MAC Address in the Switch's Ethernet Switching Table Is Not Updated After a MAC Address Move

Problem Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table. However, sometimes silent devices, such as SYSLOG servers or SNMP Trap receivers that receive UDP traffic but do not return acknowledgement (ACK) messages to the traffic source, do not send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

Solution Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. In Junos OS Release 9.4 and later, the range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table

arp

Syntax

```
arp {
  aging-timer minutes;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the time interval between ARP updates.

Options

aging-timer *minutes*—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high, increasing the time between updates can improve system performance.

Range: 5 to 240 minutes

Default: 20 minutes

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- For more information about ARP updates, see the *Junos OS System Basics Configuration Guide* .

bridge-priority

Syntax bridge-priority *priority*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **mstp msti** *msti-id*],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.

Default 32,768

Options ***priority***—Bridge priority. It can be set only in increments of 4096.

Range: 0 through 61,440

Default: 32,768

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**

- Understanding VSTP for J-EX Series Switches on page 272

customer-vlans

Syntax customer-vlans (*id* | native | *range*);

Hierarchy Level [edit **vlans** *vlan-name* **dot1q-tunneling**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Limit the set of accepted C-VLAN tags to a range or to discrete values.

Options *id*—Numeric identifier for a VLAN.

native—Accepts untagged and priority-tagged packets from access interfaces and assigns the configured S-VLAN to the packet.

range—Range of numeric identifiers for VLANs.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Q-in-Q Tunneling (CLI Procedure) on page 122
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16

description

Syntax description *text-description*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Option **text-description** enhanced from supporting up to 128 characters to supporting up to 256 characters in Junos OS Release 10.2 for J-EX Series switches.

Description Provide a textual description of the VLAN. The text has no effect on the operation of the VLAN or switch.

Options ***text-description***—Text to describe the interface. It can contain letters, numbers, and hyphens (-) and can be up to 256 characters long. If the text includes spaces, enclose the entire text in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **show vlans on page 249**
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29

disable (MVRP)

Syntax disable;

Hierarchy Level [edit protocols **mvrp**],
[edit protocols **mvrp interface**(all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the MVRP configuration on the interface.

Default MVRP is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

dot1q-tunneling (Ethernet Switching)

Syntax

```
dot1q-tunneling {
  ether-type (0x8100 | 0x88a8 | 0x9100);
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches. The remaining statement is explained separately.

Description Set a global value for the Ethertype for Q-in-Q tunneling.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **dot1q-tunneling on page 169**
- Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches on page 58
- Configuring Q-in-Q Tunneling (CLI Procedure) on page 122

dot1q-tunneling (VLANs)

Syntax

```
dot1q-tunneling {
  customer-vlans (id | native | range);
  layer2-protocol-tunneling all | protocol-name {
    drop-threshold number;
    shutdown-threshold number;
  }
}
```

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable Q-in-Q tunneling on the specified VLAN.

NOTE:

- The VLAN on which you enable Q-in-Q tunneling must be a tagged VLAN.
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Q-in-Q Tunneling (CLI Procedure) on page 122
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16

drop-threshold

Syntax drop-threshold *number*;

Hierarchy Level [edit vlans *vlan-name* dot1q-tunneling layer2-protocol-tunneling all | *protocol-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold value must be less than or equal to the shutdown threshold value.

NOTE: If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit will fail.

You can specify a drop threshold value without specifying a shutdown threshold value.

Default No drop threshold is specified.

Options *number*—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs.

Range: 1 through 1000

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **shutdown-threshold on page 205**
- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 96
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 127

ether-type

Syntax ether-type (0x8100 | 0x88a8 | 0x9100)

Hierarchy Level [edit **ethernet-switching-options dot1q-tunneling**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a global value for the Ethertype. Only one Ethertype value is supported at a time. The Ethertype value appears in the Ethernet type field of the packet. It specifies the protocol being transported in the Ethernet frame.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Ethernet switching options.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

filter

Syntax filter (input | output) *filter-name*;

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a firewall filter to traffic coming into or exiting from the VLAN.

Default All incoming traffic is accepted unmodified to the VLAN, and all outgoing traffic is sent unmodified from the VLAN.

Options ***filter-name*** —Name of a firewall filter defined in a **filter** statement.

- **input**—Apply a firewall filter to VLAN ingress traffic.
- **output**—Apply a firewall filter to VLAN egress traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Firewall Filters for J-EX Series Switches Overview on page 1707

group

Syntax

```
group name {
    interface interface-name <primary>;
    interface interface-name;
}
```

Hierarchy Level [edit **ethernet-switching-options redundant-trunk-group**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a redundant trunk group.

Options *name*—The name of the redundant trunk group. The group name must start with a letter and can consist of letters, numbers, dashes, and underscores.

The remaining options are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

instance-type

Syntax instance-type *type*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*], [edit routing-instances *routing-instance-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the type of routing instance.

Options *type*—Can be one of the following:

- **l2vpn**—Enable a Layer 2 VPN on the routing instance. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.
- **virtual-router**—Enable a virtual router routing instance. You must configure the **interface** statement for this type of routing instance. You do not need to configure the **route-distinguisher**, **vrf-import**, and **vrf-export** statements.
- **vpls**—Enable VPLS on the routing instance. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.
- **vrf**—VPN routing and forwarding (VRF) instance. Required to create a Layer 3 VPN. Create a VRF table (***instance-name*.inet.0**) that contains the routes originating from and destined for a particular Layer 3 VPN. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 81
- Configuring Routing Instances on PE Routers in VPNs
- Configuring Virtual Routing Instances (CLI Procedure) on page 119

interface (MVRP)

Syntax

```
interface (all | interface-name) {
    disable;
    join-timer milliseconds;
    leave-timer milliseconds;
    leaveall-timer milliseconds;
    registration (forbidden | normal);
}
```

Hierarchy Level [edit protocols mvrp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify interfaces on which to configure Multiple VLAN Registration Protocol (MVRP).

Default By default, MVRP is disabled.

Options **all**—All interfaces on the switch.

interface-name—Names of interface to be configured for MVRP.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 84
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

interface

Syntax

interface *interface-name* <primary>;
interface *interface-name*;

Hierarchy Level

[edit **ethernet-switching-options redundant-trunk-group group** *name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over as the primary link without waiting for normal STP convergence.

Options

interface *interface-name*—A logical interface or an aggregated interface containing multiple ports.

primary—(Optional) Specify one of the interfaces in the redundant group as the primary link. The interface without this option is the secondary link in the redundant group. If a link is not specified as **primary**, the software compares the two links and selects the link with the highest port number as the active link. For example, if the two interfaces are **ge-0/1/0** and **ge-0/1/1**, the software assigns **ge-0/1/1** as the active link.

Required Privilege Level

system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Redundant Trunk Links for Faster Recovery on page 53
- Understanding Redundant Trunk Links on J-EX Series Switches on page 14

interface

Syntax interface *interface-name*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*], [edit routing-instances *routing-instance-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Interface over which the VPN traffic travels between the PE router or switch and customer edge (CE) router or switch. You configure the interface on the PE router or switch. If the value **vrf** is specified for the **instance-type** statement included in the routing instance configuration, this statement is required.

Options *interface-name*—Name of the interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **instance-type on page 177**
- Configuring Routing Instances on PE Routers in VPNs

interface

Syntax
```
interface interface-name {
  mapping (native (push | swap) | policy | tag (push | swap));
  pvlan-trunk;
}
```

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Option **pvlan-trunk** introduced in Junos OS Release 10.4 for J-EX Series switches.

Description For a specific VLAN, configure an interface.

Options ***interface-name***—Name of a Gigabit Ethernet interface.

The remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29
- Configuring VLANs for J-EX Series Switches (CLI Procedure) on page 112

- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16

interfaces

Syntax

```
interfaces interface-name {
    no-mac-learning;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure settings for interfaces that have been assigned to family **ethernet-switching**.

Options ***interface-name*** --Name of an interface that is configured for **family ethernet-switching**.

The remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16

join-timer (MVRP)

Syntax join-timer *milliseconds*;

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum number of milliseconds interfaces must wait before sending Multiple VLAN Registration Protocol (MVRP) protocol data units (PDUs).

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Default 200 milliseconds

Options ***milliseconds***—Number of milliseconds that the interface must wait before sending MVRP PDUs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **leave-timer on page 185**
- **leaveall-timer on page 186**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 84
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

l3-interface

Syntax l3-interface vlan.*logical-interface-number*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

Default No Layer 3 (routing) interface is associated with the VLAN.

Options **vlan.*logical-interface-number***—Number of the logical interface defined with a **set interfaces vlan unit** command. For the logical interface number, use the same number you configure in the **unit** statement.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

layer2-protocol-tunneling

Syntax

```
layer2-protocol-tunneling all | protocol-name {
    drop-threshold number;
    shutdown-threshold number;
}
```

Hierarchy Level [edit vlans *vlan-name* dot1q-tunneling]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable Layer 2 protocol tunneling (L2PT) on the VLAN.

The remaining statements are explained separately.

Default L2PT is not enabled.

Options **all**—Enable all supported Layer 2 protocols.

protocol-name—Name of the Layer 2 protocol. Values are:

- **802.1x**—IEEE 802.1X authentication
- **802.3ah**—IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

  NOTE: If you enable L2PT for untagged OAM LFM packets, do not configure LFM on the corresponding access interface.

- **cdp**—Cisco Discovery Protocol
- **e-lmi**—Ethernet local management interface
- **gvrp**—GARP VLAN Registration Protocol
- **lacp**—Link Aggregation Control Protocol

  NOTE: If you enable L2PT for untagged LACP packets, do not configure LACP on the corresponding access interface.

- **llpd**—Link Layer Discovery Protocol
- **mmrp**—Multiple MAC Registration Protocol
- **mvrp**—Multiple VLAN Registration Protocol
- **stp**—Spanning Tree Protocol, Rapid Spanning Tree Protocol, and Multiple Spanning Tree Protocol
- **udld**—Unidirectional Link Detection (UDLD)
- **vstp**—VLAN Spanning Tree Protocol

- **vtp**—VLAN Trunking Protocol

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- **show ethernet-switching layer2-protocol-tunneling interface on page 223**
- **show ethernet-switching layer2-protocol-tunneling statistics on page 225**

- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 96
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 127

leave-timer (MVRP)

Syntax leave-timer *milliseconds*;

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple VLAN Registration Protocol (MVRP), configure the number of milliseconds the switch retains a VLAN in the Leave state before the VLAN is unregistered. If the interface receives a join message before this timer expires, the VLAN remains registered.

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Default 1000 milliseconds

Options ***milliseconds***—Number of milliseconds that the switch retains a VLAN in the Leave state before the VLAN is unregistered. At a minimum, set the leave-timer interval at twice the join-timer interval.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **join-timer on page 182**
- **leaveall-timer on page 186**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 84
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

leaveall-timer (MVRP)

Syntax leaveall-timer *milliseconds*;

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple VLAN Registration Protocol (MVRP), configure the interval at which the LeaveAll state operates on the interface.

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Default 10000 milliseconds

Options ***milliseconds***—Number of milliseconds between the sending of Leave All messages.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **join-timer on page 182**
- **leave-timer on page 185**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 84
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

mac

Syntax

```
mac mac-address {
    next-hop interface-name;
}
```

Hierarchy Level [edit ethernet-switching-options static vlan *vlan-name*]

Description Specify the MAC address to add to the Ethernet switching table.

The remaining statement is explained separately.

Options ***mac-address***—MAC address

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Adding a Static MAC Address Entry to the Ethernet Switching Table on page 131

mac-limit

Syntax mac-limit *number*;

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of MAC addresses allowed on a VLAN.

The number of MAC addresses allowed per VLAN varies depending on the J-EX Series switch model. Issue the **set vlans *vlan-name* mac-limit ?** command to see the number of MAC addresses allowed on your J-EX Series switch.

When you reset the number of MAC addresses, the Ethernet switching table is not automatically cleared. Therefore, if you reduce the number of addresses from the default (unlimited) or a previously set limit, you could already have more entries in the table than the new limit allows. Previous entries remain in the table after you reduce the number of addresses, so you should clear the Ethernet switching table for a specified interface, MAC address, or VLAN when you reduce the MAC limit. Use the command **clear ethernet-switching table** to clear existing MAC addresses from the table.

Default The MAC limit is disabled, so entries are unlimited.

Options *number*—Maximum number of MAC addresses.
Range: 1 through 32768

NOTE: Do not set the mac-limit value to 1. The first learned MAC address is often inserted into the forwarding database automatically—for instance, for a routed VLAN interface (RVI), the first MAC address inserted into the forwarding database is the MAC address of the RVI. For aggregated Ethernet bundles (LAGs) using LACP, the first MAC address inserted into the forwarding database in the Ethernet switching table is the source address of the protocol packet. In these cases, the switch does not learn MAC addresses other than the automatic address when mac-limit is set to 1, and this causes problems with MAC learning and forwarding.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **show vlans on page 249**
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29
- Configuring MAC Table Aging (CLI Procedure) on page 115
- Understanding Bridging and VLANs on J-EX Series Switches on page 3

mac-notification

Syntax

```
mac-notification {
  notification-interval seconds;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable MAC notification for a switch. If you configure this statement without setting a notification interval, MAC notification is enabled with the default MAC notification interval of 30 seconds.

The remaining statement is explained separately.

Default MAC notification is disabled by default.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring MAC Notification (CLI Procedure) on page 129

mac-table-aging-time

Syntax mac-table-aging-time (*seconds* | unlimited);

Hierarchy Level [edit **ethernet-switching-options**],
[edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description You configure how long MAC addresses remain in the Ethernet switching table using the **mac-table-aging-time** statement in either the **[edit ethernet-switching-options]** or the **vlans** hierarchy, depending on whether you want to configure it for the entire switch or only for specific VLANs.

If you specify the time as **unlimited**, entries are never removed from the table. Generally, use this setting only if the switch or the VLAN has a fairly static number of end devices; otherwise the table will eventually fill up. You can use this setting to minimize traffic loss and flooding that might occur when traffic arrives for MAC addresses that have been removed from the table.

Default Entries remain in the Ethernet switching table for 300 seconds

Options ***seconds***—Time that entries remain in the Ethernet switching table before being removed.
Range: 60 through 1,000,000 seconds
Default: 300 seconds

unlimited—Entries remain in the Ethernet switching table.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **show ethernet-switching statistics aging on page 233**
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 29

- Configuring VLANs for J-EX Series Switches (CLI Procedure) on page 112

mapping

Syntax mapping (native (push | swap) | policy | *tag* (push | swap));

Hierarchy Level [edit **vlans** *vlan-name* **interface** *interface-name* ingress]:
[edit **vlans** *vlan-name* **interface** *interface-name* egress]:
[edit **vlans** *vlan-name* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Map a specific C-VLAN to an S-VLAN. By default, the received incoming or outgoing tag is replaced with the new tag.

This statement is also required if you are configuring firewall filters to map traffic from an interface to a VLAN. If you are configuring firewall filters to map traffic from an interface to a VLAN, the **mapping policy** option must be configured using this command. The firewall filter also has to be configured using the **vlan** action for a match condition in the firewall filter stanza for firewall filters to map traffic from an interface for a VLAN.

Options

native—Maps untagged and priority-tagged packets to an S-VLAN.

policy—Maps the interface to a firewall filter policy to an S-VLAN.

push—Retains the incoming tag and add an additional VLAN tag instead of replacing the original tag.

swap—Swaps the incoming VLAN tag with the VLAN ID tag of the S-VLAN. Use of this option is also referred to as VLAN ID translation.

tag—Retains the incoming 802.1Q tag on the interface.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring VLANs for J-EX Series Switches (CLI Procedure) on page 112
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16
- Understanding Bridging and VLANs on J-EX Series Switches on page 3

members

Syntax members [(all | *names* | *vlan-ids*)];

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family ethernet-switching **vlan**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For trunk interfaces, configure the VLANs for which the interface can carry traffic.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type **?** after **vlan** or **vlans** in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

NOTE: The number of VLANs supported per switch varies for each model. Use the configuration-mode command **set vlans id vlan-id ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum. To determine the maximum number of VLAN members allowed on a switch, multiply the VLAN maximum for the switch times 8 (vmember limit = vlan max * 8).

If a switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (**eswd**) due to memory allocation failure.

Options **all**—Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

NOTE: Since VLAN members are limited, specifying **all** could cause the number of VLAN members to exceed the limit at some point.

names—Name of one or more VLANs. VLAN IDs are applied automatically in this case.

NOTE: **all** cannot be a VLAN name.

vlan-ids—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, **10-20** or **10-20 23 27-30**.

NOTE: **Each configured VLAN must have a specified VLAN ID to successfully commit the configuration; otherwise, the configuration commit fails.**

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

mvrp

Syntax

```
mvrp {
  disable
  interface (all | interface-name) {
    disable;
    join-timer milliseconds;
    leave-timer milliseconds;
    leaveall-timer milliseconds;
    registration (forbidden | normal);
  }
  no-dynamic-vlan;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Multiple VLAN Registration Protocol (MVRP) on a trunk interface to ensure that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs.

The remaining statements are explained separately.

Default MVRP is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 84
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

native-vlan-id

Syntax native-vlan-id *vlan-id*;

Hierarchy Level [edit interfaces *interface-name* unit 0 family ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN identifier to associate with untagged packets received on the interface.

Options ***vlan-id***—Numeric identifier of the VLAN.
Range: 0 through 4095

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

next-hop

Syntax next-hop *interface-name;*

Hierarchy Level [edit ethernet-switching-options static vlan *vlan-name* mac *mac-address*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify the next hop for the indicated Ethernet node.

Options *interface-name*—Name of the next-hop interface.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Adding a Static MAC Address Entry to the Ethernet Switching Table on page 131

no-dynamic-vlan

Syntax no-dynamic-vlan;

Hierarchy Level [edit protocols mvrp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the dynamic creation of VLANs using Multiple VLAN Registration Protocol (MVRP) for interfaces participating in MVRP.

Dynamic VLAN configuration can be enabled on an interface independent of MVRP. The MVRP dynamic VLAN configuration setting does not override the interface configuration dynamic VLAN configuration setting. If dynamic VLAN creation is disabled on the interface in the interface configuration, no dynamic VLANs are created on the interface, including dynamic VLANs created using MVRP.

This option can only be applied globally; it cannot be applied per interface.

Default If MVRP is enabled, the dynamic creation of VLANs as a result of MVRP protocol exchange messages is enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

no-local-switching

Syntax no-local-switching

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that access ports in this VLAN domain do not forward packets to each other. You use this statement with primary VLANs and isolated secondary VLANs.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation
- Example: Configuring a Private VLAN on a J-EX Series Switch on page 61
- Creating a Private VLAN (CLI Procedure) on page 120

no-mac-learning

Syntax no-mac-learning;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disables MAC address learning for the specified VLAN.

Options There are no options to this statement.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation
- Configuring Q-in-Q Tunneling (CLI Procedure) on page 122
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16

no-mac-learning

Syntax no-mac-learning;

Hierarchy Level [edit ethernet-switching-options **interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable MAC address learning for the specified interface. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member.

Options There are no options to this statement.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 16

notification-interval

Syntax notification-interval *seconds*;

Hierarchy Level [edit **ethernet-switching-options mac-notification**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the MAC notification interval for a switch.

The MAC notification interval is the amount of time the switch waits before sending learned or unlearned MAC address SNMP notifications to the network management server. For instance, if the MAC notification interval is set to 10, all of the MAC address addition and removal SNMP notifications will be sent to the network management system every 10 seconds.

Options *seconds*—The MAC notification interval, in seconds.

Range: 1 through 60

Default: 30

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring MAC Notification (CLI Procedure) on page 129

port-mode

Syntax port-mode *mode*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether an interface on the switch operates in access, tagged-access, or trunk mode.

Default All switch interfaces are in access mode.

Options *mode*—Operating mode for an interface can be one of the following:

- **access**—In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to single network devices such as PCs, printers, IP telephones, and IP cameras.
- **tagged-access**—In this mode, the interface can accept tagged packets from one access device. Tagged-access interfaces typically connect to servers running Virtual machines using VEPA technology.
- **trunk**—In this mode, the interface can be in multiple VLANs and accept tagged packets from multiple devices. Trunk interfaces typically connect to other switches and to routers on the LAN.

NOTE: The number of VLANs supported per switch varies for each model. Use the configuration-mode command **set vlans id vlan-id ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum. To determine the maximum number of VLAN members allowed on a switch, multiply the VLAN maximum for the switch times 8 (vmember limit = vlan max * 8).

If a switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (**eswd**) due to memory allocation failure.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

preempt-cutover-timer

Syntax preempt-cutover-timer *seconds*;

Hierarchy Level [edit ethernet-switching-options **redundant-trunk-group name** *name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Change the length of time that a re-enabled primary link waits to take over from an active secondary link in a redundant trunk group.

Default If you do not change the time with the **preempt-cutover-timer** statement, a re-enabled primary link takes over from the active secondary link after 120 seconds.

Options **seconds**—Number of seconds that the primary link waits to take over from the active secondary link.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Redundant Trunk Links for Faster Recovery on page 53
- Configuring Redundant Trunk Links for Faster Recovery (CLI Procedure)

primary-vlan

Syntax primary-vlan *vlan-name*;

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the primary VLAN for this private VLAN (PVLAN). The primary VLAN is always tagged.

- If the PVLAN is configured on a single switch, do not assign a tag to the community VLANs.
- If the PVLAN is configured to span multiple switches, you must assign tags to the community VLANs also.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN name is displayed for a VLAN range.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

- Example: Configuring a Private VLAN on a Single J-EX Series Switch on page 61
- Example: Configuring a Private VLAN Spanning Multiple J-EX Series Switches on page 67

proxy-arp

Syntax proxy-arp (restricted | unrestricted);

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.

Default Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.

Options

- **none**—The switch responds to any ARP request for a local or remote address if the switch has a route to the target IP address.
- **restricted**—(Optional) The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The switch must also have a route to the target IP address.
- **unrestricted**—(Optional) The switch responds to any ARP request for a local or remote address if the switch has a route to the target IP address.

Default: unrestricted

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Unrestricted Proxy ARP
- Configuring Proxy ARP (CLI Procedure) on page 130
- Example: Configuring Proxy ARP on a J-EX Series Switch on page 104

pvlan-trunk

Syntax pvlan-trunk;

Hierarchy Level [edit **vlans** *vlan-name* **vlan-id** *number* **interface** *interface-name*]

Release Information Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Configure an interface to be the trunk port, connecting switches that are configured with a private VLAN (PVLAN) across these switches.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Creating a Private VLAN Spanning Multiple J-EX Series Switches (CLI Procedure) on page 121

redundant-trunk-group

Syntax
```
redundant-trunk-group {
  group name {
    interface interface-name <primary>;
      interface interface-name;
    interface preempt-cutover-timer;
  }
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over without waiting for normal STP convergence.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Redundant Trunk Links for Faster Recovery on page 53
- Understanding Redundant Trunk Links on J-EX Series Switches on page 14

reflective-relay

Syntax reflective-relay;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family ethernet-switching]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Configure a switch interface to return packets back to a device on the same interface that was used to deliver the packets.

Default Switch interfaces are not configured for reflective relay.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Reflective Relay for Use with VEPA Technology on page 100
- Configuring Reflective Relay (CLI Procedure) on page 131

registration

Syntax registration (forbidden | normal);

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specifies the Multiple VLAN Registration Protocol (MVRP) registration mode for the interface if MVRP is enabled.

Default **normal**

Options **forbidden**—The interface or interfaces do not register and do not participate in MVRP.

normal—The interface or interfaces accept MVRP messages and participate in MVRP.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 124

routing-instances

Syntax

```
routing-instances routing-instance-name {
    instance-type virtual-router;
    interface interface-name;
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a virtual routing entity.

Options ***routing-instance-name***—Name for this routing instance.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 81
- Configuring Virtual Routing Instances (CLI Procedure) on page 119

shutdown-threshold

Syntax shutdown-threshold *number*;

Hierarchy Level [edit vlans *vlan-name* dot1q-tunneling layer2-protocol-tunneling all | *protocol-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled. Once an interface is disabled, you must explicitly reenable it using the **clear ethernet-switching layer2-protocol-tunneling error** command. Otherwise, the interface remains disabled.

The shutdown threshold value must be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value, the drop threshold value has no effect.

You can specify a shutdown threshold value without specifying a drop threshold value.

Default No shutdown threshold is specified.

Options *number*—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled.

Range: 1 through 1000

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **drop-threshold on page 170**
- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 96
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 127

static

Syntax

```
static {
  vlan vlan-name {
    mac mac-address {
      next-hop interface-name;
    }
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify VLAN and MAC addresses to add to the Ethernet switching table.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Adding a Static MAC Address Entry to the Ethernet Switching Table on page 131

vlan

Syntax

```
vlan vlan-name {
  mac mac-address {
      next-hop interface-name;
  }
}
```

Hierarchy Level [edit ethernet-switching-options static]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify the name of a VLAN to add to the Ethernet switching table.

Options *vlan-name*—Name of the VLAN to add to the Ethernet switching table.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Adding a Static MAC Address Entry to the Ethernet Switching Table on page 131

vlan

Syntax

```
vlan {
  members [ (all | names | vlan-ids) ];
}
```

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Bind an 802.1Q VLAN tag ID to a logical interface.

The remaining statement is explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- **show ethernet-switching interfaces on page 219**

- *Junos OS Network Interfaces Configuration Guide*

vlan-id

Syntax vlan-id *number*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

Default If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of **1**. The number zero is reserved for priority tagging and the number 4095 is also reserved.

Options ***number*** —VLAN tag identifier

Range:

- 1 through 4094 (

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches on page 36
- Example: Configuring a Private VLAN on a Single J-EX Series Switch on page 61
- Example: Configuring a Private VLAN Spanning Multiple J-EX Series Switches on page 67
- Creating a Private VLAN on a Single J-EX Series Switch (CLI Procedure) on page 120
- Creating a Private VLAN Spanning Multiple J-EX Series Switches (CLI Procedure) on page 121

vlan-range

Syntax vlan-range *vlan-id-low-vlan-id-high*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multiple VLANs. Each VLAN is assigned a VLAN ID number from the range.

Default None.

Options ***vlan-id-low-vlan-id-high*** —Specify the first and last VLAN ID number for the group of VLANs.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

vlans

Syntax

```
vlans {
  vlan-name {
    description text-description;
    dot1q-tunneling {
      customer-vlans (id | range)
      layer2-protocol-tunneling all | protocol-name {
        drop-threshold number;
        shutdown-threshold number;
      }
    }
    filter input filter-name;
    filter output filter-name;
    interface interface-name {
      mapping (native (push | swap) | policy | tag (push | swap));
      pvlan-trunk;
    }
    isolation-id id-number;
    l3-interface vlan.logical-interface-number;
    mac-limit number;
    mac-table-aging-time seconds;
    no-local-switching;
    no-mac-learning;
    primary-vlan vlan-name;
    vlan-id number;
    vlan-range vlan-id-low-vlan-id-high;
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches. Options **isolation-id** and **pvlan-trunk** introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Configure VLAN properties on J-EX Series switches. The following configuration guidelines apply:

- Only private VLAN (PVLAN) firewall filters can be used when the VLAN is enabled for Q-in-Q tunneling.
- An S-VLAN tag is added to the packet if the VLAN is dot1q-tunneled and the packet is arriving from an access interface.
- You cannot use a firewall filter to assign a routed VLAN interface (RVI) to a VLAN.
- VLAN assignments performed using a firewall filter override all other VLAN assignments.

Default If you use the default factory configuration, all switch interfaces become part of the VLAN **default**.

Options

vlan-name—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

CHAPTER 7

Operational Commands for Bridging and VLANs

clear ethernet-switching layer2-protocol-tunneling error

Syntax clear ethernet-switching layer2-protocol-tunneling error
<interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear Layer 2 protocol tunneling (L2PT) errors on one or more interfaces. If an interface has been disabled because the amount of Layer 2 protocol traffic exceeded the **shutdown-threshold** or because the switch has detected an error in the network topology or configuration, use this command to reenable the interface.

Options none—Clears L2PT errors on all interfaces.

interface *interface-name*—(Optional) Clear L2PT errors on the specified interface.

Required Privilege Level view

Related Documentation
- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 96
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 127

List of Sample Output

Sample Output

clear ethernet-switching layer2-protocol-tunneling error

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error
```

clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0
```

clear ethernet-switching layer2-protocol-tunneling statistics

Syntax
clear ethernet-switching layer2-protocol-tunneling statistics
<interface *interface-name*>
<vlan *vlan-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Layer 2 protocol tunneling (L2PT) statistics on one or more interfaces or VLANs.

Options
none—Clear L2PT statistics on all interfaces and VLANs.

interface *interface-name*—(Optional) Clear L2PT statistics on the specified interface.

vlan *vlan-name*—(Optional) Clear L2PT statistics on the specified VLAN.

Required Privilege Level
view

List of Sample Output

Sample Output

clear ethernet-switching layer2-protocol-tunneling statistics

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics
```

clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics interface ge-0/1/1.0
```

clear ethernet-switching layer2-protocol-tunneling error vlan v2

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics vlan v2
```

clear ethernet-switching table

Syntax

clear ethernet-switching table
<interface *interface-name*>
<mac *mac-address*>
<management-vlan>
<vlan *vlan-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).

Options

none—Clear learned entries in the Ethernet switching table.

interface *interface-name*—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.

mac *mac-address*—(Optional) Clear the specified learned MAC address from the Ethernet switching table.

management-vlan—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.

vlan *vlan-name*—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

Required Privilege Level

clear mvrp statistics interface ge-0/0/1.0 on page 218

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear mvrp statistics

```
user@switch> clear mvrp statistics
```

clear mvrp statistics interface ge-0/0/1.0

```
user@switch> clear mvrp statistics interface ge-0/0/1.0
```

show ethernet-switching interfaces

Syntax
show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.
In Junos OS Release 11.1 for J-EX Series switches, the **detail** view was updated to include reflective relay information.

Description
Display information about Ethernet switching interfaces.

Options
none—Display brief information for Ethernet switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet switching information for a specific interface.

Required Privilege Level
view

Output Fields
Table 17 on page 219 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 17: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	none, **brief**, **detail**, **summary**
Index	VLAN index internal to Junos OS.	**detail**
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**

Table 17: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Port mode	**Access mode** is the port mode default and works with a single VLAN. Port mode can also be **trunk**, which accepts tagged packets from multiple VLANs on other switches. The third port mode value is **tagged-access** which accepts tagged packets from access devices.	**detail**
Reflective Relay Status	Reflective relay allows packets to use the same interface for both upstream and downstream traffic. When reflective relay has been configured, the status displayed is always **enabled** . When reflective relay is not configured, this entry does not appear in the command output.	**detail**
Ethertype for the interface	EtherType is a two-octet field in an Ethernet frame used to indicate which protocol is encapsulated in the payload of an incoming Ethernet packet. Both 802.1Q packets and Q in Q packets use this field. The output displayed for this particular field indicates the interface's ethertype which is used to match the ethertype of incoming 802.1Q packets and Q in Q packets. The indicated ethertype field is also added to the interface's outgoing 802.1Q and Q in Q packets.	**detail**
VLAN membership	Names of VLANs that belong to this interface.	none, **brief**, **detail**,
Tag	Number of the 802.1Q-tag.	none, **brief**, **detail**,
Tagging	Specifies whether the interface forwards 802.1Q **tagged** or **untagged** traffic.	none, **brief**, **detail**,
Blocking	The forwarding state of the interface: • **unblocked**—Traffic is forwarded on the interface. • **blocked**—Traffic is not being forwarded on the interface. • **Disabled by bpdu control**—The interface is disabled due to receiving BPDUs on a protected interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. • **blocked by RTG**—The specified redundant trunk group is disabled. • **blocked by STP**—The interface is disabled due to a spanning tree protocol error. • **MAC limit exceeded**—The interface is temporarily disabled due to a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **MAC move limit exceeded**—The interface is temporarily disabled due to a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **Storm control in effect**—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.	none, **brief**, **detail**,
Number of MACs learned on IFL	Number of MAC addresses learned by this interface.	**detail**

Table 17: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
mapping	When mapping is configured, the status is one of the following C-VLAN to S-VLAN mapping types: • **dot1q-tunneled**—The interface maps all traffic to the S-VLAN (all-in-one bundling). • **native**—The interface maps untagged and priority tagged packets to the S-VLAN. • **push**—The interface maps packets to a firewall filter to an S-VLAN. • **policy-mapped**—The interface maps packets to a specifically defined S-VLAN. • *integer*—The interface maps packets to the specified S-VLAN. When mapping is not configured, this entry does not appear in the command output.	**detail**

Sample Output

show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces

Interface    State  VLAN members        Tag   Tagging  Blocking

ae0.0        up     default                   untagged unblocked
ge-0/0/2.0   up     vlan300           300     untagged blocked by RTG (rtggroup)
ge-0/0/3.0   up     default                            blocked by STP
ge-0/0/4.0   down   default                            MAC limit exceeded
ge-0/0/5.0   down   default                            MAC move limit exceeded
ge-0/0/6.0   down   default                            Storm control in effect
ge-0/0/7.0   down   default                            unblocked
ge-0/0/13.0  up     default                   untagged unblocked
ge-0/0/14.0  up     vlan100             100   tagged   unblocked
                    vlan200             200   tagged   unblocked
ge-0/0/15.0  up     vlan100             100   tagged   blocked by STP
                    vlan200             200   tagged   blocked by STP
ge-0/0/16.0  down   default                   untagged unblocked
ge-0/0/17.0  down   vlan100             100   tagged   Disabled by bpdu-control

                    vlan200             200   tagged   Disabled by bpdu-control
```

show ethernet-switching interfaces ge-0/0/15 brief

```
user@switch> show ethernet-switching interfaces ge-0/0/15 brief
Interface   State  VLAN members    Tag   Tagging        Blocking

ge-0/0/15.0 up     vlan100         100   tagged         blocked by STP
                   vlan200         200   tagged         blocked by STP
```

    VLAN_Purple VLAN_Orange VLAN_Blue, 802.1Q Tag: 450, tagged, unblocked
Number of MACs learned on IFL: 0
```

show ethernet-switching layer2-protocol-tunneling interface

Syntax show ethernet-switching-layer2-protocol-tunneling interface <*interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Layer 2 protocol tunneling (L2PT) on interfaces that have been configured for L2PT.

Options none—Display L2PT information about all interfaces on which L2PT is enabled.

interface-name—(Optional) Display L2PT information for the specified interface.

Required Privilege Level view

Output Fields Table 18 on page 223 lists the output fields for the **show ethernet-switching layer2-protocol-tunneling interface** command. Output fields are listed in the approximate order in which they appear.

Table 18: show ethernet-switching layer2-protocol-tunneling interface Output Fields

Field Name	Field Description
Interface	Name of an interface on the switch.
Operation	Type of operation being performed on the interface. Values are **Encapsulation** and **Decapsulation**.
State	State of the interface. Values are **active** and **shutdown**.
Description	If the interface state is **shutdown**, displays why the interface is shut down. If the description says **Loop detected**, it means that the interface is an access interface that has received L2PT-enabled PDUs. Access interfaces should not receive L2PT-enabled PDUs. This scenario might mean that there is a loop in the network.

Sample Output

show ethernet-switching layer2-protocol-tunneling interface

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface

Layer2 Protocol Tunneling information:
Interface     Operation       State      Description
ge-0/0/0.0    Encapsulation   Shutdown   Shutdown threshold exceeded
```

```
ge-0/0/1.0    Decapsulation   Shutdown   Loop detected
ge-0/0/2.0    Decapsulation   Active
```

show ethernet-switching layer2-protocol-tunneling interface ge-0/0/0.0

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface ge-0/0/0.0

Layer2 Protocol Tunneling information:
Interface     Operation       State      Description
ge-0/0/0.0    Encapsulation   Shutdown   Shutdown threshold exceeded
```

show ethernet-switching layer2-protocol-tunneling statistics

Syntax show ethernet-switching-layer2-protocol-tunneling statistics
<interface *interface-name*>
<vlan *vlan-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Layer 2 protocol tunneling (L2PT) statistics for Layer 2 PDU packets received by the switch.

NOTE: The **show ethernet-switching-layer2-protocol-tunneling statistics** command does not display L2PT statistics for Layer 2 PDU packets transmitted from the switch.

Options none—Display L2PT statistics for all interfaces on which you enabled L2PT.

<interface *interface-name*>—(Optional) Display L2PT statistics for the specified interface.

<vlan *vlan-name*>—(Optional) Display L2PT statistics for the specified VLAN.

Required Privilege Level view

Table 19: show ethernet-switching layer2-protocol-tunneling statistics Output Fields

VLAN	Field Description
VLAN	Name of a VLAN on which L2PT has been configured.

Table 19: show ethernet-switching layer2-protocol-tunneling statistics Output Fields *(continued)*

VLAN	Field Description
Interface	Name of an interface on which L2PT has been configured.
Protocol	Name of a protocol for which L2PT has been enabled. Values are **all**, **802.1x**, **802.3ah**, **cdp**, **e-lmi**, **gvrp**, **lacp**, **lldp**, **mmrp**, **mvrp**, **stp**, **udld**, **vstp**, and **vtp**.
Operation	Type of operation being performed on the interface. Values are **Encapsulation** and **Decapsulation**.
Packets	Number of packets that have been encapsulated or decapsulated.
Drops	Number of packets that have exceeded the drop threshold and have been dropped.
Shutdowns	Number of times that packets have exceeded the shutdown threshold and the interface has been shut down.

Sample Output

show ethernet-switching layer2-protocol-tunneling statistics

```
user@switch> show ethernet-switching layer2-protocol-tunneling statistics

Layer2 Protocol Tunneling Statistics:
VLAN   Interface  Protocol  Operation     Packets Drops      Shutdowns

Output Fields Table 23 on page 233 lists the output fields for the **show ethernet-switching statistics aging** command. Output fields are listed in the approximate order in which they appear.

Table 23: show ethernet-switching statistics aging Output Fields

Field Name	Field Description	Level of Output
Total age messages received	Total number of aging messages received from the hardware.	All levels
Immediate aging	Aging message indicating that the entry should be removed immediately.	All levels
MAC address seen	Aging message indicating that the MAC address has been detected by hardware and that the aging timer should be stopped.	All levels
MAC address not seen	Aging message indicating that the MAC address has not been detected by the hardware and that the aging timer should be started.	All levels
Error age messages	The received aging message contains the following errors: • **Invalid VLAN**—The VLAN of the packet does not exist. • **No such entry**—The MAC address and VLAN pair provided by the aging message does not exist. • **Static entry**—An unsuccessful attempt was made to age out a static MAC entry.	All levels

Sample Output

show ethernet-switching statistics aging

```
user@switch> show ethernet-switching statistics aging

Total age messages received: 0
```

```
  Immediate aging: 0, MAC address seen: 0, MAC address not seen: 0
Error age messages: 0
  Invalid VLAN: 0, No such entry: 0, Static entry: 0
```

show ethernet-switching statistics mac-learning

Syntax
show ethernet-switching statistics mac-learning
<brief | detail>
<interface *interface-name*>

Release Information
Command introduced in Junos OS Release 9.4 for J-EX Series switches.

Description
Display media access control (MAC) learning statistics.

Options
none—(Optional) Display MAC learning statistics for all interfaces.

brief | detail—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display MAC learning statistics for the specified interface.

Required Privilege Level
view

Output Fields
Table 24 on page 235 lists the output fields for the **show ethernet-switching statistics mac-learning** command. Output fields are listed in the approximate order in which they appear.

Table 24: show ethernet-switching statistics mac-learning Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface for which statistics are being reported.	All levels
Learning message from local packets	MAC learning message generated due to packets coming in on the management interface.	All levels
Learning message from transit packets	MAC learning message generated due to packets coming in on network interfaces.	All levels

Table 24: show ethernet-switching statistics mac-learning Output Fields *(continued)*

Field Name	Field Description	Level of Output
Learning message with error	MAC learning messages received with errors: • **Invalid VLAN**—The VLAN of the packet does not exist. • **Invalid MAC**—The MAC address is either NULL or a multicast MAC address. • **Security violation**—The MAC address is not an allowed MAC address. • **Interface down**—The MAC address is learned on an interface that is down. • **Incorrect membership**—The MAC address is learned on an interface that is not a member of the VLAN. • **Interface limit**—The number of MAC addresses learned on the interface has exceeded the limit. • **MAC move limit**—This MAC address has moved among multiple interfaces too many times in a given interval. • **VLAN limit**—The number of MAC addresses learned on the VLAN has exceeded the limit. • **Invalid VLAN index**—The VLAN of the packet, although configured, does not yet exist in the kernel. • **Interface not learning**—The MAC address is learned on an interface that does not yet allow learning—for example, the interface is blocked. • **No nexthop**—The MAC address is learned on an interface that does not have a unicast next hop. • **MAC learning disabled**—The MAC address is learned on an interface on which MAC learning has been disabled. • **Others**—The message contains some other error.	All levels

Sample Output

show ethernet-switching statistics mac-learning

```
user@switch> show ethernet-switching statistics mac-learning

Learning stats: 0 learn msg rcvd, 0 error
  Interface         Local pkts        Transit pkts      Error
  ge-0/0/0.0        0                 0                 0

show ethernet-switching table

Syntax

show ethernet-switching table
<brief | detail | extensive | summary>
<interface *interface-name*>
<management-vlan>
<sort-by (*name* | *tag*)>
<vlan *vlan-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the Ethernet switching table.

Options

none—(Optional) Display brief information about the Ethernet switching table.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display the Ethernet switching table for a specific interface.

management-vlan—(Optional) Display the Ethernet switching table for a management VLAN.

sort-by (*name* | *tag*)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

vlan *vlan-name*—(Optional) Display the Ethernet switching table for a specific VLAN.

Required Privilege Level

show ethernet-switching table extensive on page 241
show ethernet-switching table interface ge-0/0/1 on page 241

Output Fields

Table 25 on page 238 lists the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

Table 25: show ethernet-switching table Output Fields

Field Name	Field Description	Level of Output
VLAN	The name of a VLAN.	All levels

Table 25: show ethernet-switching table Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tag	The VLAN ID tag name or number.	**extensive**
MAC or **MAC address**	The MAC address associated with the VLAN.	All levels
Type	The type of MAC address. Values are: • **static**—The MAC address is manually created. • **learn**—The MAC address is learned dynamically from a packet's source MAC address. • **flood**—The MAC address is unknown and flooded to all members.	All levels
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
Interfaces	Interface associated with learned MAC addresses or **All-members** (flood entry).	All levels
Learned	For learned entries, the time which the entry was added to the Ethernet switching table.	**detail**, **extensive**
Nexthop index	The next-hop index number.	**detail**, **extensive**

Sample Output

show ethernet-switching table

```
user@switch> show ethernet-switching table
Ethernet-switching table: 57 entries, 17 learned
  VLAN              MAC address       Type         Age Interfaces

show mvrp

Syntax show mvrp

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Multiple VLAN Registration Protocol (MVRP) configuration information.

Required Privilege Level view

Related Documentation

- **show mvrp statistics on page 245**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 84
- Verifying That MVRP Is Working Correctly on page 143

List of Sample Output **show mvrp on page 242**

Output Fields Table 26 on page 242 lists the output fields for the **show mvrp** command. Output fields are listed in the approximate order in which they appear.

Table 26: show mvrp Output Fields

Field Name	Field Description
Global MVRP configuration	Displays global MVRP information: • **MVRP status**—Displays whether MVRP is **Enabled** or **Disabled**. • **MVRP dynamic vlan creation**—Displays whether global MVRP dynamic VLAN creation is **Dnabled** or **Disabled**.
MVRP Timers (ms)	Displays MVRP timer information: • **Interface**—The interface on which MVRP is configured. • **Join**—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements. • **Leave**—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message. • **LeaveAll**—The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.
Interface based configuration	Displays interface-specific MVRP information: • **Interface**—The interface on which MVRP is configured. • **Status**—Displays whether MVRP is **Enabled** or **Disabled**. • **Registration**—Displays whether registration for the interface is **Forbidden** or **Normal**. • **Dynamic VLAN Creation**—Displays whether interface dynamic VLAN creation is **Enabled** or **Disabled**.

Sample Output

show mvrp

```
user@switch> show mvrp
```

```
Global MVRP configuration
  MVRP status               : Enabled
  MVRP dynamic vlan creation: Enabled
  MVRP Timers (ms):
   Interface        Join   Leave   LeaveAll
   --------------   ----   -----   --------
   all              200    600     10000
   xe-0/1/1.0       200    600     10000

  Interface based configuration:
   Interface        Status     Registration   Dynamic VLAN Creation
   --------------   --------   ------------   ---------------------
   all       Disabled   Normal    Enabled
   xe-0/1/1.0     Enabled    Normal         Enabled
```

show mvrp dynamic-vlan-memberships

Syntax show mvrp dynamic-vlan-memberships

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display all VLANs that have been created dynamically using Multiple VLAN Registration Protocol (MVRP) on the switch.

Required Privilege Level clear

Related Documentation

List of Sample Output **show mvrp dynamic-vlan-memberships on page 244**

Output Fields Table 27 on page 244 lists the output fields for the **show mvrp dynamic-vlan-memberships** command. Output fields are listed in the approximate order in which they appear.

Table 27: show mvrp dynamic-vlan-memberships Output Fields

Field Name	Field Description
VLAN Name	The name of the dynamically created VLAN.
Interfaces	The interface or interfaces that are bound to the dynamically created VLAN.

Sample Output

show mvrp dynamic-vlan-memberships

```
user@switch> show mvrp dynamic-vlan-memberships
VLAN Name              Interfaces
-------------------        ----------------
__mvrp_100__               xe-0/1/1.0
                           xe-0/1/0.0
__mvrp_200__               xe-0/1/1.0
                           xe-0/1/0.0
__mvrp_300__               xe-0/1/1.0
```

show mvrp statistics

Syntax show mvrp statistics <interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Multiple VLAN Registration Protocol (MVRP) statistics in the form of Multiple Registration Protocol data unit (MRPDU) messages.

Options none—Show MVRP statistics for all interfaces on the switch.

interface *interface-name*—Show MVRP statistics for the specified interface.

Required Privilege Level clear

List of Sample Output **show mvrp statistics interface xe-0/1/1.0 on page 246**

Output Fields Table 28 on page 245 lists the output fields for the **show mvrp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 28: show mvrp statistics Output Fields

Field Name	Field Description
MRPDU received	Number of MRPDU messages received on the switch.
Invalid PDU received	Number of invalid MRPDU messages received on the switch.
New received	Number of new messages received on the switch.
Join Empty received	Number of MRP Join Empty messages received on the switch.
Join In received	Number of MRP Join In messages received on the switch.
Empty received	Number of MRP Empty messages received on the switch.
In received	Number of MRP In messages received on the switch.
Leave received	Number of MRP Leave messages received on the switch.
LeaveAll received	Number of LeaveAll messages received on the switch.

Table 28: show mvrp statistics Output Fields *(continued)*

Field Name	Field Description
MRPDU transmitted	Number of MRPDU messages transmitted from the switch.
MRPDU transmit failures	Number of MRPDU transmit failures from the switch.
New transmitted	Number of new messages transmitted from the switch.
Join Empty transmitted	Number of Join Empty messages sent from the switch.
Join In transmitted	Number of MRP Join In messages sent from the switch.
Empty transmitted	Number of MRP Empty messages sent from the switch.
In transmitted	Number of MRP In messages sent from the switch.
Leave transmitted	Number of MRP Leave Empty messages sent from the switch.
LeaveAll transmitted	Number of MRP LeaveAll messages sent from the switch.

Sample Output

show mvrp statistics interface xe-0/1/1.0

```
user@switch> show mvrp statistics interface xe-0/1/1.0
MVRP statistics
  MRPDU received                : 3342
  Invalid PDU received          : 0
  New received                  : 2
  Join Empty received           : 1116
  Join In received              : 2219
  Empty received                : 2
  In received                   : 2
  Leave received                : 1
  LeaveAll received             : 1117
  MRPDU transmitted             : 3280
  MRPDU transmit failures       : 0
  New transmitted               : 0
  Join Empty transmitted        : 1114
  Join In transmitted           : 2163
  Empty transmitted             : 1
  In transmitted                : 1
  Leave transmitted             : 1
  LeaveAll transmitted          : 1111
```

show redundant-trunk-group

Syntax **show redundant-trunk-group <group-name *group-name*>**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about redundant trunk groups.

Options group-name *group-name*—Display information about the specified redundant trunk group.

Required Privilege Level view

Related Documentation
- Example: Configuring Redundant Trunk Links for Faster Recovery on page 53
- Understanding Redundant Trunk Links on J-EX Series Switches on page 14

List of Sample Output **show redundant-trunk-group group-name Group1 on page 247**

Output Fields Table 29 on page 247 lists the output fields for the **show redundant-trunk-group** command. Output fields are listed in the approximate order in which they appear.

Table 29: show redundant-trunk-group Output Fields

Field Name	Field Description
Group Name	Name of the redundant trunk port group.
Interface	Name of an interface belonging to the trunk port group. • **(P)** denotes a primary interface. • **(A)** denotes an active interface. • Lack of **(A)** denotes a blocking interface.
State	Operating state of the interface: **UP** or **DOWN**.
Last Time of Flap	Date and time at which the advertised link became unavailable, and then, available again.
# Flaps	Total number of flaps since the last switch reboot.

Sample Output

show redundant-trunk-group group-name Group1

```
user@switch> show redundant—trunk-group group-name Group1
show redundant-trunk-group group-name Group1

Group Name Interface         State     Last Time of Flap       # Flaps
  Group1   ge-0/0/45.0 (P)     UP      Fri Jan  2 04:10:58      0
           ge-0/0/47.0         UP      Fri Jan  2 04:10:58      0
```

show system statistics arp

Syntax show system statistics arp

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display system-wide Address Resolution Protocol (ARP) statistics.

Required Privilege Level view

Related Documentation

- Example: Configuring Unrestricted Proxy ARP on a J-EX Series Switch on page 104
- Verifying That Unrestricted Proxy ARP Is Working Correctly on page 144

Sample Output

```
user@switch> show system statistics arp
arp:
        90060 datagrams received
        34 ARP requests received
        610 ARP replies received
        0 resolution request  received
        0 unrestricted proxy requests
        0 restricted proxy requests
        0 received proxy requests
        0 unrestricted proxy requests not proxied
        0 restricted proxy requests not proxied
        0 datagrams with bogus interface
        0 datagrams with incorrect length
        0 datagrams for non-IP protocol
        0 datagrams with unsupported op code
        0 datagrams with bad protocol address length
        0 datagrams with bad hardware address length
        0 datagrams with multicast source address
        0 datagrams with multicast source address
        0 datagrams with my own hardware address
        0 datagrams for an address not on the interface
        0 datagrams with a broadcast source address
        294 datagrams with source address duplicate to mine
        89113 datagrams which were not for me
        0 packets discarded waiting for resolution
        0 packets sent after waiting for resolution
        309 ARP requests sent
        35 ARP replies sent
        0 requests for memory denied
        0 requests dropped on entry
        0 requests dropped during retry
        0 requests dropped due to interface deletion
        0 requests on unnumbered interfaces
        0 new requests on unnumbered interfaces
        0 replies for from unnumbered interfaces
        0 requests on unnumbered interface with non-subnetted donor
        0 replies from unnumbered interface with non-subnetted donor
```

show vlans

Syntax

show vlans
<brief | detail | extensive>
<dot1q-tunneling>
<management-vlan>
<sort-by (name | tag)>
<summary>
<*vlan-name*>
<*vlan-range-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
Command modified in Junos OS Release 10.4 for J-EX Series switches to display fields that are present when a private VLAN is configured to span multiple switches.

Description

Display information about VLANs configured on bridged Ethernet interfaces. For interfaces configured to support a voice over IP (VoIP) VLAN and a data VLAN, the **show vlans** command displays both tagged and untagged membership for those VLANs.

NOTE: When a series of VLANs is created with the **vlan-range** statement, such VLAN names are prefixed and suffixed with a double underscore. For example, a series of VLANs using the VLAN range 1–3 and the base VLAN name **marketing** are displayed as **__marketing_1__**, **__marketing_2__**, and **__marketing_3__**.

NOTE: To display an 802.1X supplicant successfully authenticated in multiple-supplicant mode with dynamic VLAN movement, use the **show vlans** ***vlan-name*** **extensive** operational mode command, where ***vlan-name*** is the name of the dynamic VLAN.

Options

none—Display information for all VLANs. VLAN information is displayed by VLAN name in ascending order.

brief | detail | extensive—(Optional) Display the specified level of output.

dot1q-tunneling—(Optional) Display VLANs with the Q-in-Q tunneling feature enabled.

management-vlan—(Optional) Display management VLANs.

sort-by (name | tag)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

summary—(Optional) Display the total number of VLANs and counts of VLANs by type—for example, the number of dynamic, 802.1Q-tagged, and Q-in-Q tunneled VLANs.

vlan-name—(Optional) Display information for the specified VLAN.

vlan-range-name—(Optional) Display information for the specified VLAN range. To display information for all members of the VLAN range, specify the base VLAN name—for example, **employee** for a VLAN range that includes **__employee_1__** through **__employee_10__**.

Required Privilege Level view

Output Fields Table 30 on page 250 lists the output fields for the **show vlans** command. Output fields are listed in the approximate order in which they appear.

Table 30: show vlans Output Fields

Field Name	Field Description	Level of Output
Name	Name of a VLAN.	none, **brief**
Tag	The 802.1Q tag applied to this VLAN. If **none** is displayed, no tag is applied.	All levels
Interfaces	Interface associated with learned MAC addresses or all-members (flood entry). An asterisk (*) beside the interface indicates that the interface is **UP**.	All levels
Address	The IP address.	none, **brief**
Ports Active / Total	The number of interfaces associated with a VLAN. The **Active** column indicates interfaces that are **UP**, and the **Total** column indicates interfaces that are active and inactive.	**brief**
VLAN	Name of a VLAN.	**detail**, **extensive**

Table 30: show vlans Output Fields *(continued)*

Field Name	Field Description	Level of Output
Admin state	Indicates whether the physical link is operational and can pass packets.	**detail**, **extensive**
Dot1q Tunneling Status	Indicates whether Q-in-Q tunneling is enabled.	**detail**, **extensive**
MAC learning Status	Indicates whether MAC learning is disabled.	**detail**, **extensive**
Description	A description for the VLAN.	**detail**,**extensive**
Primary IP	Primary IP address associated with a VLAN.	**detail**
Number of interfaces	The number of interfaces associated with a VLAN. Both the total number of interfaces and the number of active interfaces associated with a VLAN are displayed. Also lists the following attributes of the interfaces: • **tagged** or **untagged** • **trunk** or **access** port mode • **pvlan-trunk**	**detail**, **extensive**
STP	The spanning tree associated with a VLAN.	**detail**, **extensive**
RTG	The redundant trunk group associated with a VLAN.	**detail**, **extensive**
Tagged interfaces	The tagged interfaces to which a VLAN is associated.	**detail**, **extensive**
Untagged interfaces	The untagged interfaces to which a VLAN is associated.	**detail**. **extensive**
Customer VLAN Ranges	Lists the customer VLAN (C-VLAN) ranges associated with this service VLAN (S-VLAN).	**extensive**
Private VLAN Mode	The private VLAN mode (type of broadcast domain) for this VLAN. Values are **Primary**, **Isolated**, **Inter-switch-isolated**, and **Community**.	**detail**, **extensive**
Primary VLAN	The primary VLAN tag for this secondary VLAN.	**extensive**
Internal Index	VLAN index internal to Junos OS.	**extensive**
Origin	The manner in which the VLAN was created. Values are **static** and **learn**.	**extensive**
Protocol	Port-based VLAN or MAC-based VLAN. MAC-based protocol is displayed when VLAN assignment is done either statically or dynamically through 802.1X.	**extensive**
Mac aging time	The MAC aging timer.	**extensive**
IP addresses	IP address associated with a VLAN.	**extensive**
Number of MAC entries	For MAC-based VLANs created either statically or dynamically, the MAC addresses associated with an interface.	**extensive**

Table 30: show vlans Output Fields *(continued)*

Field Name	Field Description	Level of Output
Secondary VLANs	The secondary VLANs associated with a primary VLAN.	**extensive**
Isolated VLAN	The isolated VLANs associated with a primary VLAN.	**extensive**
Inter-switch isolated VLAN	The inter-switch isolated VLAN associated with a primary VLAN.	**extensive**
Community VLANs	The community VLANs associated with a primary VLAN.	**extensive**
VLANs summary	VLAN counts: • **Total**—Total number of VLANs on the switch. • **Configured VLANs**—Number of VLANs that are based on user-configured settings. • **Internal VLANs**—Number of VLANs created by the system with no explicit configuration or protocol—for example, the **default** VLAN and the VLAN created when a trunk interface is not configured with native VLAN membership. • **Temporary VLANs**—Number of VLANs from the previous configuration that the system retains for a limited time after restart. Temporary VLANs are converted into one of the other types of VLAN, or are removed from the system if the current configuration does not require them.	All levels

Dot1q VLANs summary	802.1Q VLAN counts:
	• **Total**—Total number of 802.1Q-tagged and untagged VLANs on the switch.
	• **Tagged VLANs**—Number of 802.1Q-tagged VLANs.
	• **Untagged VLANs**—Number of untagged 802.1Q VLANs.
	• **Private VLAN**—Counts of the following kinds of 802.1Q private VLANs (PVLANs):
	  • **Primary VLANs**—Number of primary forwarding private VLANs.
	  • **Community VLANs**—Number of community transporting and forwarding private VLANs.
	  • **Isolated VLANs**—Number of isolated receiving and forwarding private VLANs.
	  • **Inter–switch–isolated VLANs**—Number of inter-switch isolated receiving and forwarding private VLANs.
		All levels

Dot1q Tunneled VLANs summary	Q-in-Q-tunneled VLAN counts: • **Total**—Total number of Q-in-Q-tunneled VLANs on the switch. • **Private VLAN**—Counts of primary, community, and isolated Q-in-Q-tunneled private VLANs (PVLANs).	All levels

Table 30: show vlans Output Fields *(continued)*

Field Name	Field Description	Level of Output
Dynamic VLANs	Counts of VLANs assigned or created dynamically by a protocol: • **Total**—Total number of dynamic VLANs on the switch. • **Dot1x**—Number of 802.1Q-tagged VLANs authenticated and assigned when the switch learns the MAC address of a supplicant host from a packet's source MAC address. • **MVRP**—Number of VLANs created by the Multiple VLAN Registration Protocol (MVRP).	All levels

Sample Output

PART 2

Spanning-Tree Protocols

CHAPTER 8

Spanning-Tree Protocols—Overview

Understanding STP for J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default factory configuration for J-EX Series switches uses RSTP. If your network includes 802.1D 1998 bridges, you can explicitly configure STP. Note that when doing so, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0, which is an RSTP configuration that is compatible with basic STP. If you use VLANs, we recommend that you enable MSTP unless your network requires the device compatibility provided by VSTP.

STP is a protocol designed to intelligently avoid loops in a network by creating a tree topology (spanning tree) of the entire bridged network with only one available path between the tree root and a leaf. The tree *root* is a switch within the network elected by the STA (spanning tree algorithm) to use in computing the shortest path (lowest root path cost) between bridges throughout the network and the root bridge. Frames travel through the network to their destination–a *leaf* such as an end-user PC–along branches. A tree *branch* is a network segment, or link, between bridges.

STP uses frames called Bridge Protocol Data Units (BPDUs) to create and maintain the spanning tree. A BPDU frame is a message sent from one switch to another to communicate information about itself, such as its bridge ID, root path costs, and port MAC addresses. The initial exchange of BPDUs between switches determines the root bridge. Simultaneously, BPDUs are used to communicate the cost of each link between

branch devices, which is based upon port speed or user configuration. STP uses this path cost to determine the ideal route for data frames to travel from one leaf to another leaf and then blocks all other routes.

Switches that forward frames through the spanning tree are called *designated bridges*. The ports of a designated bridge function in one of three roles:

- Root port—The root port is the port closest to the root bridge and serves as the only port that receives frames from and forwards frames to the root bridge. A switch has only one root port.
- Designated port—A designated port forwards traffic away from the root bridge toward a leaf. A switch has one designated port for every link connection it serves.
- Blocked port—A blocked or "non-designated" port is not part of the spanning tree. Any switch ports not serving as the root or a designated port are blocked.

In addition to assigning a bridge's ports to one of three roles in the spanning tree, STP also places the ports of a designated bridge in one of five states:

- Disabled—The port cannot receive or send any frame and is not part of the spanning tree.
- Blocking—The port does not forward frames but listens for BPDUs to determine if it should become active in the spanning tree and to ensure its neighbor switches are still working.
- Listening—The port receives BPDUs but does not forward traffic or learn addresses. This state is the first of two through which the port transitions to the forwarding state. The port waits for information indicating that it should return to the blocking state. If it doesn't receive this information before the forwarding delay timer expires (default 15 seconds), then it transitions to the learning state.
- Learning—The port prepares to forward traffic by examining received frames for location information in order to build its address table. At the end of a second forwarding delay timer (default 15 seconds), the port transitions to the forwarding state.
- Forwarding—The port filters and forwards frames. A port in the forwarding state is part of the active spanning tree.

The spanning tree converges when the STA identifies the root and designated bridges and all ports are in either a forwarding or blocking state. To maintain the tree, the root bridge continues to send BPDUs at a "hello time" interval (default 2 seconds). These BPDUs communicate the current tree topology. When a bridge receives a hello BPDU, it compares the information to that already stored for the receiving port. If the data matches, the bridge resets a timer called "max age" to zero and then forwards a new BPDU with the current active topology information to the next bridge in the spanning tree.

The default interval for the max age timer is 20 seconds. This timer controls how long a bridge saves configuration BPDU information for the receiving port. As long as the bridge receives consistent hello BPDUs within this interval, the spanning tree remains unchanged. If the max age timer expires, which indicates a link failure, the port re-enters the listening state. After waiting the time allotted for the forwarding delay, the port transitions to the learning state and again waits. At the end of a second forwarding delay, the port transitions

from the learning to the forwarding state, thereby allowing frames to be received and forwarded by the port.

For STP to recover from a link failure, therefore, it takes approximately 50 seconds: 20 seconds for a BPDU to age out, 15 seconds for the listening state, and 15 seconds for the learning state. This recalculation of the spanning tree is a time-consuming process and can result in delayed message delivery as ports transition between states. Users perceive these delays as service interruptions and certain applications, protocols, or processes can time out. These results are unacceptable in current high-availability networks, which led to the evolution of STP to RSTP.

Understanding RSTP for J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default factory configuration for J-EX Series switches uses RSTP. If your network includes 802.1D 1998 bridges, you can explicitly configure STP. Note that when doing so, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0, which is an RSTP configuration that is compatible with basic STP. If you use VLANs, we recommend that you enable MSTP unless your network requires the device compatibility provided by VSTP.

RSTP is an evolution of the STP IEEE 802.1D protocol designed to provide faster spanning tree re-convergence after a switch port, switch, or LAN failure. STP takes up to 50 seconds to respond to topology changes while RSTP responds to changes within the timeframe of three hello BPDUs (Bridge Protocol Data Units), or 6 seconds. RSTP calculates the spanning tree in the same manner as STP, but re-convergence after a connectivity failure works differently. The key difference between STP and RSTP is that the latter does not use timers (rather a handshake) to transition between port states and roles.

A port's state determines how it processes a frame. A port's role determines how it participates in the spanning tree. STP places each port of a designated bridge in one of five states and assigns it a role as root, designated, or non-designated port. (See "Understanding STP for J-EX Series Switches" on page 263.) RSTP assigns a port to one of three states, simplifying the process for a port to enter the forwarding state, and establishes new port roles that serve as back-ups for a failed root or designated port on a designated bridge.

The three port states used by RSTP are:

- Discarding—The port discards all BPDUs. This state replaces the disabled, blocking, and learning states used by STP. A port in this state discards all frames it receives and does not learn MAC addresses.
- Learning—The port prepares to forward traffic by examining received frames for location information in order to build its MAC address table. RSTP eliminates the listening state that proceeds the learning state in STP because the new mechanism for re-convergence (proposal-agreement handshake) does not require the switch to spend time listening for the spanning tree to reconfigure.
- Forwarding—The port filters and forwards frames. A port in the forwarding state is part of the active spanning tree.

The five port roles used by RSTP are:

- Root port—The port closest to the root bridge (has the lowest path cost from a bridge) and serves as the only port that receives frames from and forwards frames to the root bridge. The root port functions the same as in STP.
- Designated port—The port that forwards traffic away from the root bridge toward a leaf. A designated bridge has one designated port for every link connection it serves. A root bridge forwards frames from all of its ports, which serve as designated ports. A designated port functions the same as in STP.
- Alternate port—A port that provides an alternate path toward the root bridge if the root port fails and is placed in the discarding state. This port is not part of the active spanning tree, but if the root port fails, the alternate port immediately takes over.
- Backup port—A port that provides a backup path toward the leaves of the spanning tree if a designated port fails and is placed in the discarding state. A backup port can only exist where two or more bridge ports connect to the same LAN for which the bridge serves as the designated bridge. A backup port for a designated port immediately takes over if the port fails.
- Disabled port—The port is not part of the active spanning tree. Note that in STP, “disabled” is a state and not a role.

STP and RSTP maintain the spanning tree differently. Both use BPDUs to communicate the current tree topology. With STP, however, the root bridge initiates these messages and they propagate throughout the tree every hello time interval. With RSTP, a non-root bridge sends a BPDU with its current information every hello time interval, regardless of receiving BPDUs from the root bridge. If an RSTP device does not receive a configuration message from its neighbor after an interval of three hello times, it determines it has lost a connection with that neighbor. In this way, the RSTP BPDUs serve as a “keep-alive” mechanism that provides rapid failure detection. Note that J-EX Series switches configured to use STP actually run RSTP force version 0, which is compatible with STP, so BPDU behavior is the same.

When a root port or a designated port fails on an RSTP-enabled device, the alternate or backup port takes over after an exchange of BPDUs called the proposal-agreement handshake. RSTP propagates this handshake over *point-to-point links*, which are dedicated links between two network nodes, or switches, that connect one port to another. If a local port becomes a new root or designated port, it negotiates a rapid transition with

the receiving port on the nearest neighboring switch by using the proposal-agreement handshake to ensure a loop-free topology.

RSTP also defines the concept of an *edge port*, which is a designated port that connects to non-STP-capable devices, such as PCs, servers, routers, or hubs that are not connected to other switches. Because edge ports connect directly to end stations, they cannot create network loops and can transition to the forwarding state immediately, skipping the listening and learning stages required by STP. You can manually configure edge ports, and a switch can also detect edge ports by noting the absence of configuration BPDUs from any attached systems. If an edge port receives a BPDU, it transitions to a regular STP port.

By taking advantage of edge ports and point-to-point links, RSTP provides rapid re-configuration of the spanning tree that can occur in less than one second. Contrasted with the default 50-second re-convergence time based on STP timers (IEEE 802.1D), RSTP provides critical support for networks carrying delay-sensitive traffic, such as voice or video.

Understanding MSTP for J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default factory configuration for J-EX Series switches uses RSTP, but RSTP does not solve an inherent problem in STP: All virtual local area networks (VLANs) within a local area network (LAN) share the same spanning tree, which limits the number of forwarding paths for data traffic. To address this problem, we recommend that you enable MSTP if you use VLANs, unless your network requires the device compatibility provided by VSTP.

MSTP extends STP and RSTP functionality by mapping multiple independent spanning-tree instances onto one physical topology. Each spanning-tree instance (STI) includes one or more VLANs. Unlike in STP and RSTP configurations, a port may belong to multiple VLANs and be dynamically blocked in one spanning-tree instance but forwarding in another. This behavior significantly improves network resource utilization by load-balancing across the network and maintaining switch CPU loads at moderate levels. MSTP also leverages the fast re-convergence time of RSTP when a network, switch, or port failure occurs within a spanning-tree instance.

When enabling MSTP, you define one or more MSTP regions. An MSTP region defines a logical domain where MSTIs can be administered independently of MSTIs in other regions,

setting the boundary for Bridge Protocol Data Units (BPDUs) sent by one MSTI. An MSTP region is a group of switches that is defined by three parameters:

- Region name—User-defined alphanumeric name for the region.
- Revision level—User-defined value that identifies the region.
- Mapping table—Numerical digest of VLAN-to-instance mappings.

An MSTP region can support up to 64 MSTIs, and each instance can support from 1 to 4094 VLANs. When you define a region, MSTP automatically creates an internal spanning-tree instance (IST instance 0) that provides the root switch for the region and includes all currently configured VLANs that are not specifically assigned to a user-defined Multiple Spanning-Tree Instance (MSTI). An MSTI includes all static VLANs that you specifically add to it. The switch places any dynamically created VLANs in the IST instance by default, unless you explicitly map them to another MSTI. Once you assign a VLAN to a user-defined MSTI, the switch removes the VLAN from the IST instance.

MSTP creates a Common and Internal Spanning Tree (CIST) to interconnect and manage all MSTP regions and even individual devices that run RSTP or STP, which are recognized as distinct spanning-tree regions by MSTP. The CIST views each MSTP region as a virtual bridge, regardless of the actual number of devices participating in the MSTP region, and enables MSTIs to link to other regions. The CIST is a single topology that connects all switches (STP, RSTP, and MSTP devices) through an active topology, ensuring connectivity between LANs and devices within a bridged network. This functionality provided by MSTP enables you to better utilize network resources while remaining backwards-compatible with older network devices.

Understanding BPDU Protection for STP, RSTP, and MSTP on J-EX Series Switches

Networks frequently use multiple protocols simultaneously to achieve different goals and in some cases those protocols can conflict with each other. One such case is spanning-tree protocols, where a special type of switching frame called a bridge protocol data unit (BPDU) can conflict with BPDUs generated on other devices such as PCs. The different kinds of BPDUs are not compatible but they can still be recognized by other devices that use BPDUs and cause network outages. You need to protect any device that recognizes BDPUs from picking up the wrong BPDUs.

Different Kinds of BPDUs. Spanning-tree protocols such as Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP) generate their own BPDUs. These peer

STP applications use their BPDUs to communicate, and ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

User bridge applications running on a PC can also generate BPDUs. If these outside BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations, and those miscalculations can lead to network outages. At the same time, BPDUs generated by STP protocols can cause problems if they are picked up by devices like PCs that are not using STP.

Protecting from Outside BPDUs. To protect STP on switches from outside BDPUs, enable BPDU protection on spanning-tree switch interfaces connected to user devices—for example on edge ports connected to PCs. Use the same strategy when a non-STP device is connected to a switch through a trunk interface that could be forwarding STP-BDPUs. In this case, you would protect the non-STP device (like a PC) from BPDUs generated by the STP on the switch.

To configure BPDU protection on a switch with a spanning-tree, include the **bpdu-block-on-edge** statement at the [**edit protocols** (**stp** | **mstp** | **rstp**)] hierarchy level. To prevent a switch with a spanning-tree from forwarding STP-BPDUs to devices, include the **bpdu-block** statement at the [**edit ethernet-switching-options interface** *interface-name*] hierarchy level.

When an interface configured with bdpu-block protection encounters an outside BDPU, it shuts down. After an interface shuts down due to external BPDUs, there are two ways to re-enable the interface:

- If you included the **disable-timeout** statement in the BPDU configuration, the interface automatically returns to service after the timer expires.
- You can issue the operational mode command **clear ethernet-switching bpdu-error** on the switch.

Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from moving into a forwarding state that would result in a loop opening up in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and makes sure both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It doesn't transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and then it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**log**, **block**, or both).

Note that an interface can be configured for either loop protection or root protection, but not for both.

Understanding Root Protection for STP, RSTP, VSTP, and MSTP on J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election. Root protection allows network administrators to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives superior STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving superior STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

Understanding VSTP for J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default factory configuration for J-EX Series switches uses RSTP. If you use VLANs, however, we recommend that you enable MSTP unless your network requires the device compatibility provided by VSTP. Switches configured to run VSTP automatically assign each VLAN to one spanning-tree instance that runs RSTP. While this approach is useful to optimize network usage in small networks with a limited number of VLANs, a VSTP configuration in networks with several hundred VLANs can overload switch CPUs. MSTP ensures that your network does not slow down from the increased network traffic caused by hundreds of VLANs, each with its own spanning-tree instance.

When using VSTP, you can selectively configure the maximum number of VLANs per switch shown in Table 31 on page 272:

Table 31: Maximum VSTP VLANS per Switch

Switch	Maximum VSTP VLANS
J-EX8200	253
J-EX4500	253
J-EX4200	253

Additional VLANs are automatically configured to use RSTP. (VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on a switch.) If your network includes 802.1D 1998 bridges, you can explicitly configure STP on those devices. When you explicitly configure STP, the J-EX Series switch uses the IEEE 802.1D 2004 specification, force version 0, which is an RSTP configuration that is compatible with basic STP. For more information, see “Configuring STP (CLI Procedure)” on page 326.

NOTE: **When you configure VSTP, we recommend that you enable VSTP on all VLANs that can receive VSTP bridge protocol data units (BPDUs).**

CHAPTER 9

Examples of Spanning-Tree Protocols Configuration

Example: Configuring Faster Convergence and Improving Network Stability with RSTP on J-EX Series Switches

J-EX Series switches use Rapid Spanning Tree Protocol (RSTP) by default to provide a loop-free topology. RSTP works by identifying certain links as point to point links and blocking other possible paths. When one of the point-to-point links fails, a designated alternate link transitions to the forwarding state and take over.

This example describes how to configure RSTP on four J-EX Series switches:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Four J-EX Series switches

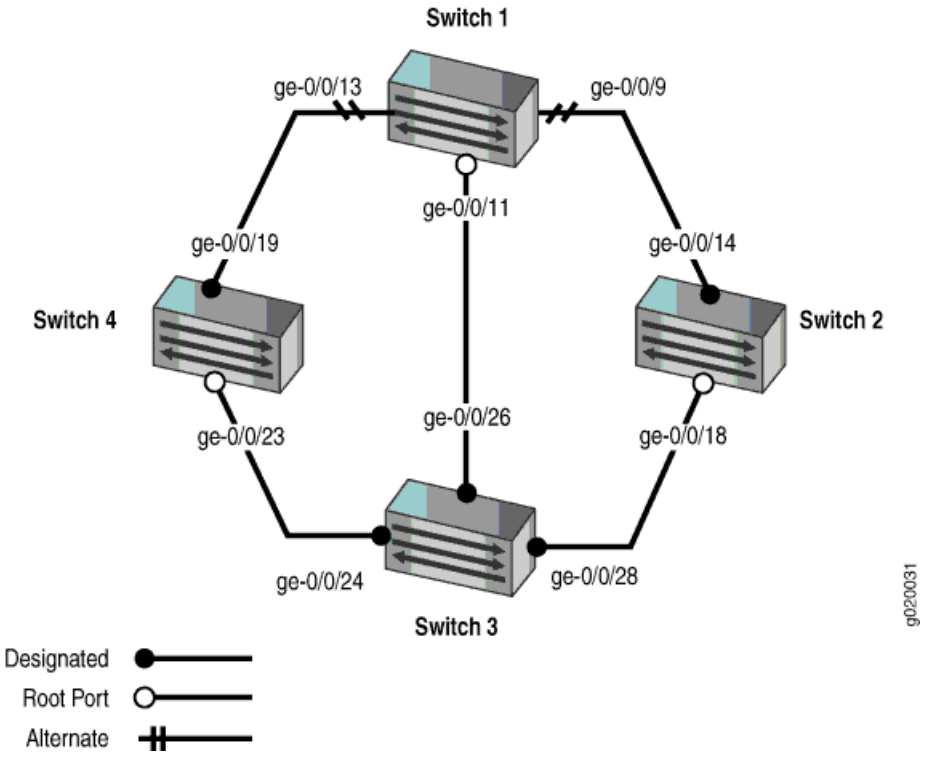
Before you configure the switches for RSTP, be sure you have:

- Installed the four switches. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guides at http://www.support.dell.com/manuals.
- Performed the initial software configuration on all switches. For connection and configuration instructions, see the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

In this example, four J-EX Series switches are connected in the topology displayed in Figure 11 on page 274 to create a loop-free topology.

Figure 11: Network Topology for RSTP



The interfaces shown in Table 32 on page 275 will be configured for RSTP.

NOTE: You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 32: Components of the Topology for Configuring RSTP on J-EX Series Switches

Property	Settings
Switch 1	The following ports on Switch 1 are connected in this way: • **ge-0/0/9** is connected to Switch 2 • **ge-0/0/13** is connected to Switch 4 • **ge-0/0/11** is connected to Switch 3
Switch 2	The following ports on Switch 2 are connected in this way: • **ge-0/0/14** is connected to Switch 1 • **ge-0/0/18** is connected to Switch 3
Switch 3	The following ports on Switch 3 are connected in this way: • **ge-0/0/26** is connected to Switch 1 • **ge-0/0/28** is connected to Switch 2 • **ge-0/0/24** is connected to Switch 4
Switch 4	The following ports on Switch 4 are connected in this way: • **ge-0/0/19** is connected to Switch 1 • **ge-0/0/23** is connected to Switch 3
VLAN names and tag IDs	**voice-vlan**, tag **10** **employee-vlan**, tag **20** **guest-vlan**, tag **30** **camera-vlan**, tag **40**

This configuration example creates a loop-free topology between four J-EX Series switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.
- The backup port is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

NOTE: You also can create a loop-free topology between the aggregation layer and the distribution layer using redundant trunk links. For more information about configuring redundant trunk links, see “Example: Configuring Redundant Trunk Links for Faster Recovery” on page 53.

Configuring RSTP on Switch 1

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/13.0 cost 1000
set protocols rstp interface ge-0/0/13.0 mode point-to-point
set protocols rstp interface ge-0/0/9.0 cost 1000
set protocols rstp interface ge-0/0/9.0 mode point-to-point
set protocols rstp interface ge-0/0/11.0 cost 1000
set protocols rstp interface ge-0/0/11.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 1:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch1# set voice-vlan description “Voice VLAN”
user@switch1# set voice-vlan vlan-id 10
user@switch1# set employee-vlan description “Employee VLAN”
user@switch1# set employee-vlan vlan-id 20
user@switch1# set guest-vlan description “Guest VLAN”
user@switch1# set guest-vlan vlan-id 30
user@switch1# set camera-vlan description “Camera VLAN”
user@switch1# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30
40]
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface ge-0/0/13.0 cost 1000
user@switch1# rstp interface ge-0/0/13.0 mode point-to-point
user@switch1# rstp interface ge-0/0/9.0 cost 1000
user@switch1# rstp interface ge-0/0/9.0 mode point-to-point
user@switch1# rstp interface ge-0/0/11.0 cost 1000
user@switch1# rstp interface ge-0/0/11.0 mode point-to-point
```

Results Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
      interface ge-0/0/13.0 {
```

```
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/9.0 {
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/11.0 {
            cost 1000;
            mode point-to-point;
          }
        }
      }
    }
    vlans {
      voice-vlan {
        vlan-id 10;
      }
      employee-vlan {
        vlan-id 20;
      }
      guest-vlan {
        vlan-id 30;
      }
      camera-vlan {
        vlan-id 40;
      }
    }
```

Configuring RSTP on Switch 2

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface ge-0/0/14.0 cost 1000
set protocols rstp interface ge-0/0/14.0 mode point-to-point
set protocols rstp interface ge-0/0/18.0 cost 1000
set protocols rstp interface ge-0/0/18.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 2:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch2# set voice-vlan description “Voice VLAN”
user@switch2# set voice-vlan vlan-id 10
user@switch2# set employee-vlan description “Employee VLAN”
user@switch2# set employee-vlan vlan-id 20
user@switch2# set guest-vlan description “Guest VLAN”
user@switch2# set guest-vlan vlan-id 30
user@switch2# set camera-vlan vlan-description “Camera VLAN”
user@switch2# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface ge-0/0/14.0 cost 1000
user@switch2# rstp interface ge-0/0/14.0 mode point-to-point
user@switch2# rstp interface ge-0/0/18.0 cost 1000
user@switch2# rstp interface ge-0/0/18.0 mode point-to-point
```

Results

Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
    ge-0/0/14 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/18 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
```

```
        }
      }
    }
  }
  protocols {
    rstp {
      bridge-priority 32k;
        interface ge-0/0/14.0 {

      vlan-id 20;
    }
    guest-vlan {
      vlan-id 30;
    }
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring RSTP on Switch 3

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface ge-0/0/26.0 cost 1000
set protocols rstp interface ge-0/0/26.0 mode point-to-point
set protocols rstp interface ge-0/0/28.0 cost 1000
```

```
set protocols rstp interface ge-0/0/28.0 mode point-to-point
set protocols rstp interface ge-0/0/24.0 cost 1000
set protocols rstp interface ge-0/0/24.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 3:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch3# set voice-vlan description “Voice VLAN”
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description “Employee VLAN”
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description “Guest VLAN”
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description “Camera VLAN”
user@switch3# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface ge-0/0/26.0 cost 1000
user@switch3# rstp interface ge-0/0/26.0 mode point-to-point
user@switch3# rstp interface ge-0/0/28.0 cost 1000
user@switch3# rstp interface ge-0/0/28.0 mode point-to-point
user@switch3# rstp interface ge-0/0/24.0 cost 1000
user@switch3# rstp interface ge-0/0/24.0 mode point-to-point
```

Results

Check the results of the configuration:

```
user@switch3> show configuration
  interfaces {
    ge-0/0/26 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members [10 20 30 40];
          }
        }
      }
```

```
        }
        ge-0/0/28 {
          unit 0 {
            family ethernet-switching {
              port-mode trunk;
              vlan {
                members [10 20 30 40];
              }
            }
          }
        }
        ge-0/0/24 {
          unit 0 {
            family ethernet-switching {
              port-mode trunk;
              vlan {
                members [10 20 30 40];
              }
            }
          }
        }
      }
    }
    protocols {
      rstp {
        bridge-priority 8k;
          interface ge-0/0/26.0 {
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/28.0 {
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/24.0 {
            cost 1000;
            mode point-to-point;
          }
        }
        bridge-priority 8k;
          }
        }
      }
    }
    vlans {
      voice-vlan {
        vlan-id 10;
      }
      employee-vlan {
        vlan-id 20;
      }
      guest-vlan {
        vlan-id 30;
      }
      camera-vlan {
        vlan-id 40;
```

```
    }
  }
```

Configuring RSTP on Switch 4

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan–id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/23.0 cost 1000
set protocols rstp interface ge-0/0/23.0 mode point-to-point
set protocols rstp interface ge-0/0/19.0 cost 1000
set protocols rstp interface ge-0/0/19.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 4:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

   ```
   [edit vlans]
   user@switch4# set voice-vlan description “Voice VLAN”
   user@switch4# set voice-vlan vlan-id 10
   user@switch4# set employee-vlan description “Employee VLAN”
   user@switch4# set employee-vlan vlan-id 20
   user@switch4# set guest-vlan description “Guest VLAN”
   user@switch4# set guest-vlan vlan-id 30
   user@switch4# set camera-vlan description “Camera VLAN”
   user@switch4# set guest-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   ```

3. Configure the port mode for the interfaces:

   ```
   [edit interfaces]
   user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
   user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
   ```

4. Configure RSTP on the switch:

   ```
   [edit protocols]
   user@switch4# rstp bridge-priority 16k
   user@switch4# rstp interface all cost 1000
   ```

```
user@switch4# rstp interface ge-0/0/23.0 cost 1000
user@switch4# rstp interface ge-0/0/23.0 mode point-to-point
user@switch4# rstp interface ge-0/0/19.0 cost 1000
user@switch4# rstp interface ge-0/0/19.0 mode point-to-point
```

Results Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  ge-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
      interface ge-0/0/23.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/19.0 {
        cost 1000;
        mode point-to-point;
      }
    }
  }
}
vlans {
  voice-vlan {
    vlan-id 10;
  }
  employee-vlan {
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
```

```
    vlan-id 40;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying RSTP Configuration on Switch 1 on page 285
- Verifying RSTP Configuration on Switch 2 on page 285
- Verifying RSTP Configuration on Switch 3 on page 286
- Verifying RSTP Configuration on Switch 4 on page 286

Verifying RSTP Configuration on Switch 1

Purpose Verify the RSTP configuration on Switch 1.

Action Use the operational mode command:

```
user@switch1> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID         bridge ID          Cost
ge-0/0/13.0    128:526      128:526  16384.0019e25040e0      1000  BLK    ALT
ge-0/0/9.0     128:522      128:522  32768.0019e2503d20      1000  BLK    ALT
ge-0/0/11.0    128:524      128:524   8192.0019e25051e0      1000  FWD    ROOT
```

Meaning Refer to the topology in Figure 11 on page 274. The operational mode command **show spanning-tree interface** shows that **ge-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocking.

Verifying RSTP Configuration on Switch 2

Purpose Verify the RSTP configuration on Switch 2.

Action Use the operational mode command:

```
user@switch2> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID         bridge ID          Cost
ge-0/0/14.0     128:527      128:527  32768.0019e2503d20      1000  FWD    DESG
ge-0/0/18.0     128:529      128:529   8192.0019e25051e0      1000  FWD    ROOT
```

Meaning Refer to the topology in Figure 11 on page 274. The operational mode command **show spanning-tree interface** shows that **ge-0/0/18.0** is in a forwarding state and is the root port.

Verifying RSTP Configuration on Switch 3

Purpose Verify the RSTP configuration on Switch 3.

Action Use the operational mode commands:

```
user@switch3>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/26.0     128:539      128:539   8192.0019e25051e0      1000  FWD    DESG
ge-0/0/28.0     128:541      128:541   8192.0019e25051e0      1000  FWD    DESG
ge-0/0/24.0     128:537      128:537   8192.0019e25051e0      1000  FWD    DESG
```

Meaning Refer to the topology in Figure 11 on page 274. The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

Verifying RSTP Configuration on Switch 4

Purpose Verify the RSTP configuration on Switch 4.

Action Use the operational mode commands:

```
user@switch4>  show spanning-tree interface
Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost

ge-0/0/23.0    128:536      128:536   8192.0019e25051e0      1000  FWD    ROOT
ge-0/0/19.0    128:532      128:532   16384.0019e25040e0     1000  FWD    DESG
```

Meaning Refer to the topology in Figure 11 on page 274. The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/23.0** is the root interface and forwarding.

- Understanding RSTP for J-EX Series Switches on page 265

Example: Configuring Network Regions for VLANs with MSTP on J-EX Series Switches

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates better load sharing across redundant links.

Up to 64 MSTI instances can be created for a J-EX Series switch, and each MSTI can support up to 4094 VLANs.

This example describes how to configure MSTP on four J-EX Series switches:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Four J-EX Series switches

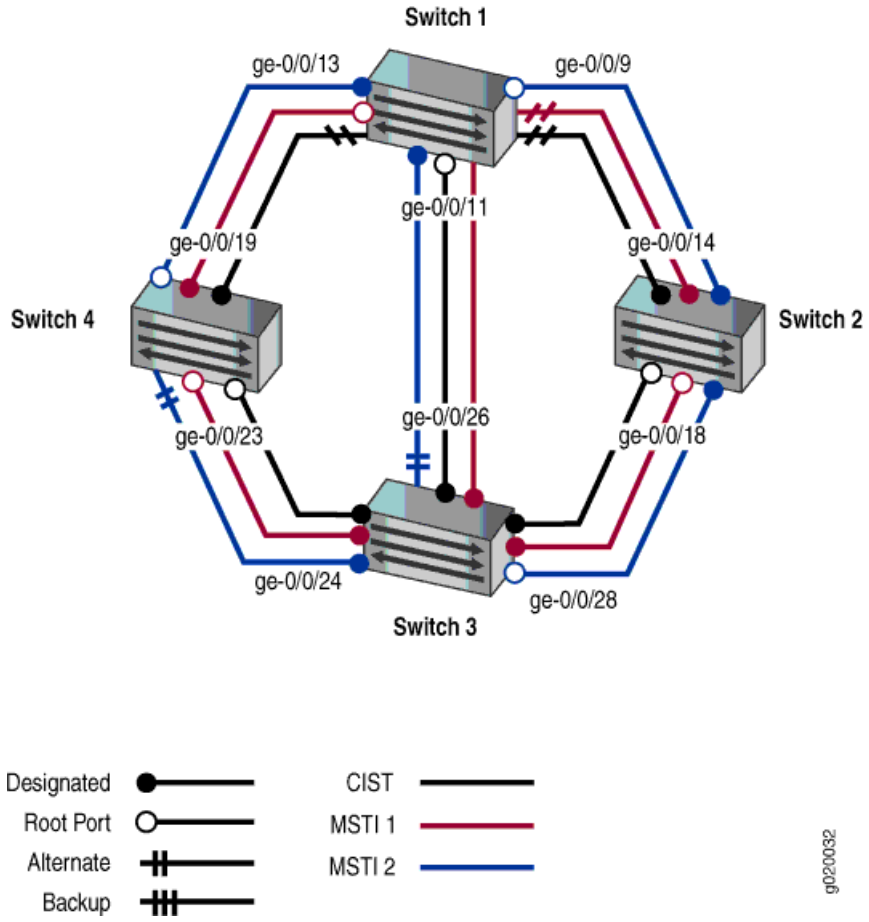
Before you configure the switches for MSTP, be sure you have:

- Installed the four switches. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guides at http://www.support.dell.com/manuals.
- Performed the initial software configuration on all switches. For connection and configuration instructions, see the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

When the number of VLANs grows in a network, MSTP provides a more efficient way of creating a loop-free topology using MSTIs. Each MSTI in the spanning tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.

Figure 12: Network Topology for MSTP



The interfaces shown in Table 33 on page 288 will be configured for MSTP.

NOTE: You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

Table 33: Components of the Topology for Configuring MSTP on J-EX Series Switches

Property	Settings
Switch 1	The following ports on Switch 1 are connected in this way: • **ge-0/0/9** is connected to Switch 2 • **ge-0/0/13** is connected to Switch 4 • **ge-0/0/11** is connected to Switch 3
Switch 2	The following ports on Switch 2 are connected in this way: • **ge-0/0/14** is connected to Switch 1 • **ge-0/0/18** is connected to Switch 3

Table 33: Components of the Topology for Configuring MSTP on J-EX Series Switches *(continued)*

Property	Settings
Switch 3	The following ports on Switch 3 are connected in this way: • **ge-0/0/26** is connected to Switch 1 • **ge-0/0/28** is connected to Switch 2 • **ge-0/0/24** is connected to Switch 4
Switch 4	The following ports on Switch 4 are connected in this way: • **ge-0/0/19** is connected to Switch 1 • **ge-0/0/23** is connected to Switch 3
VLAN names and tag IDs	**voice-vlan**, tag **10** **employee-vlan**, tag **20** **guest-vlan**, tag **30** **camera-vlan**, tag **40**
MSTIs	**1** **2**

The topology in Figure 12 on page 288 shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.
- The backup port is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The **voice-vlan** supports voice traffic and has a VLAN tag identifier of 10.
- **employee-vlan** supports data traffic and has a VLAN tag identifier of 20.
- The **guest-vlan** supports guest VLAN traffic (for supplicants that fail 802-1X authentication) and has a VLAN tag identifier of 30.
- The **camera-vlan** supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, **1** and **2**, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

Configuring MSTP on Switch 1

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge-0/0/13.0 cost 1000
set protocols mstp interface ge-0/0/13.0 mode point-to-point
set protocols mstp interface ge-0/0/9.0 cost 1000
set protocols mstp interface ge-0/0/9.0 mode point-to-point
set protocols mstp interface ge-0/0/11.0 cost 1000
set protocols mstp interface ge-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface ge-0/0/11.0 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

   ```
   [edit vlans]
   user@switch1# set voice-vlan description “Voice VLAN”
   user@switch1# set voice-vlan vlan-id 10
   user@switch1# set employee-vlan description “Employee VLAN”
   user@switch1# set employee-vlan vlan-id 20
   user@switch1# set guest-vlan description “Guest VLAN”
   user@switch1# set guest-vlan vlan-id 30
   user@switch1# set camera-vlan description “Camera VLAN”
   user@switch1# set guest-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch1# set ge–0/0/13 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30
   40]
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   ```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch1# set ge–0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface ge-0/0/13.0 cost 1000
user@switch1# mstp interface ge-0/0/13.0 mode point-to-point
user@switch1# mstp interface ge-0/0/9.0 cost 1000

```

Configuring MSTP on Switch 2

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan—id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge—0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface ge-0/0/14.0 cost 1000
set protocols mstp interface ge-0/0/14.0 mode point-to-point
set protocols mstp interface ge-0/0/18.0 cost 1000
set protocols mstp interface ge-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

   ```
   [edit vlans]
   user@switch2# set voice-vlan description “Voice VLAN”
   user@switch2# set voice-vlan vlan-id 10
   user@switch2# set employee-vlan description “Employee VLAN”
   user@switch2# set employee-vlan vlan-id 20
   user@switch2# set guest-vlan description “Guest VLAN”
   user@switch2# set guest-vlan vlan-id 30
   user@switch2# set camera-vlan vlan-description “Camera VLAN”
   user@switch2# set guest-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   ```

3. Configure the port mode for the interfaces:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
   ```

4. Configure MSTP on the switch, including the two MSTIs:

   ```
   [edit protocols]
   ```

```
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
user@switch2# mstp interface ge-0/0/14.0 cost 1000
user@switch2# mstp interface ge-0/0/14.0 mode point-to-point
user@switch2# mstp interface ge-0/0/18.0 cost 1000
user@switch2# mstp interface ge-0/0/18.0 mode point-to-point
user@switch2# mstp interface all cost 1000
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]
```

Results Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  ge-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 32k;
    interface ge-0/0/14.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/18.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
```

```
        bridge-priority 32k;
        vlan [ 10 20 ];
      }
      msti 2 {
        bridge-priority 4k;
        vlan [ 30 40 ];
      }
    }
  }
  vlans {
    voice-vlan {
      vlan-id 10;
    }
    employee-vlan {
      vlan-id 20;
    }
    guest-vlan {
      vlan-id 30;
    }
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring MSTP on Switch 3

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan—id 40
set interfaces ge—0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge—0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge—0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface ge-0/0/26.0 cost 1000
set protocols mstp interface ge-0/0/26.0 mode point-to-point
set protocols mstp interface ge-0/0/28.0 cost 1000
set protocols mstp interface ge-0/0/28.0 mode point-to-point
set protocols mstp interface ge-0/0/24.0 cost 1000
set protocols mstp interface ge-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch3# set voice-vlan description “Voice VLAN”
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description “Employee VLAN”
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description “Guest VLAN”
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description “Camera VLAN”
user@switch3# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface ge-0/0/26.0 cost 1000
user@switch3# mstp interface ge-0/0/26.0 mode point-to-point
user@switch3# mstp interface ge-0/0/28.0 cost 1000
user@switch3# mstp interface ge-0/0/28.0 mode point-to-point
user@switch3# mstp interface ge-0/0/24.0 cost 1000
user@switch3# mstp interface ge-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

Results Check the results of the configuration:

```
user@switch3> show configuration
  interfaces {
    ge-0/0/26 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members 10;
```

```
                members 20;
                members 30;
                members 40;
            }
          }
        }
      }
      ge-0/0/28 {
        unit 0 {
          family ethernet-switching {
            port-mode trunk;
            vlan {
              members 10;
              members 20;
              members 30;
              members 40;
            }
          }
        }
      }
      ge-0/0/24 {
        unit 0 {
          family ethernet-switching {
            port-mode trunk;

              members 10;
              members 20;
              members 30;
              members 40;
            }
          }
        }
      }
    }
}
protocols {
    mstp {
      configuration-name region1;
      bridge-priority 8k;
      interface ge-0/0/26.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/28.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/24.0 {
        cost 1000;
        mode point-to-point;
      }
      msti 1 {
        bridge-priority 4k;
        vlan [ 10 20 ];
      }
      msti 2 {
```

```
        bridge-priority 16k;
        vlan [ 30 40 ];
      }
    }
  }
  vlans {
    voice-vlan {
      vlan-id 10;
    }
    employee-vlan {
      vlan-id 20;
    }
    guest-vlan {
      vlan-id 30;
    }
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring MSTP on Switch 4

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice–vlan description “Voice VLAN”
set vlans voice-vlan vlan–id 10
set vlans employee—vlan description “Employee VLAN”
set vlans employee—vlan vlan—id 20
set vlans guest—vlan description “Guest VLAN”
set vlans guest—vlan vlan—id 30
set vlans camera—vlan description “Camera VLAN”
set vlans camera—vlan vlan—id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge—0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge—0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge—0/0/23.0 cost 1000
set protocols mstp interface ge—0/0/23.0 mode point-to-point
set protocols mstp interface ge—0/0/19.0 cost 1000
set protocols mstp interface ge—0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch4# set voice-vlan description “Voice VLAN”
user@switch4# set voice-vlan vlan—id 10
user@switch4# set employee-vlan description “Employee VLAN”
user@switch4# set employee-vlan vlan—id 20
user@switch4# set guest-vlan description “Guest VLAN”
user@switch4# set guest-vlan vlan—id 30
user@switch4# set camera-vlan description “Camera VLAN”
user@switch4# set guest-vlan vlan—id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set ge—0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge—0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface ge—0/0/23.0 cost 1000
user@switch4# mstp interface ge—0/0/23.0 mode point-to-point
user@switch4# mstp interface ge—0/0/19.0 cost 1000
user@switch4# mstp interface ge—0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

Results

Check the results of the configuration:

```
user@switch3> show configuration
  interfaces {
    ge-0/0/26 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members 10;
            members 20;
            members 30;
            members 40;
          }
        }
```

```
        }
      }
      ge-0/0/28 {
        unit 0 {
          family ethernet-switching {
            port-mode trunk;
            vlan {
              members 10;
              members 20;
              members 30;
              members 40;
            }
          }
        }
      }
      ge-0/0/24 {
        unit 0 {
          family ethernet-switching {
            port-mode trunk;
            vlan {
              members 10;
              members 20;
              members 30;
              members 40;
            }
          }
        }
      }
    }
  }
  protocols {
    mstp {
      configuration-name region1;
      bridge-priority 8k;
      interface ge-0/0/26.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/28.0 {
        cost 1000;
        mode point-to-point;
      }
      interface ge-0/0/24.0 {
        cost 1000;
        mode point-to-point;
      }
      msti 1 {
        bridge-priority 4k;
        vlan [ 10 20 ];
      }
      msti 2 {
        bridge-priority 16k;
        vlan [ 30 40 ];
      }
    }
  }
```

```
vlans {
  voice-vlan {
    vlan-id 10;
  }
  employee-vlan {
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
    vlan-id 40;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying MSTP Configuration on Switch 1 on page 301
- Verifying MSTP Configuration on Switch 2 on page 302
- Verifying MSTP Configuration on Switch 3 on page 304
- Verifying MSTP Configuration on Switch 4 on page 305

Verifying MSTP Configuration on Switch 1

Purpose Verify the MSTP configuration on Switch 1.

Action Use the operational mode commands:

```
user@switch1> show spanning-tree interface
Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/13.0    128:527      128:525  16384.0019e25040e0      1000  FWD    ROOT
ge-0/0/9.0     128:529      128:513  32768.0019e2503d20      1000  BLK    ALT
ge-0/0/11.0    128:531      128:513   8192.0019e25051e0      4000  BLK    ALT

Spanning tree interface parameters for instance 1

Interface    Port ID    Designated      Designated         Port    State  Role

- Understanding MSTP for J-EX Series Switches on page 267

Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). You need to configure BPDU protection on these STP interfaces if they could possibly receive outside BPDUs—outside BPDUs can cause network outages.

This example configures BPDU protection on a J-EX Series switch using RSTP. The upstream configuration is done on the edge interfaces, where outside BDPUs are often received from other devices:

- Requirements on page 307
- Overview and Topology on page 308
- Configuration on page 309
- Verification on page 310

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Two J-EX Series switches in an RSTP topology

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Receipt of outside BPDUs in an STP, RSTP, or MSTP topology, however, can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on STP interfaces that could receive outside BDPUs. If an outside BPDU is received on a BPDU-protected interface, the interface shuts down to prevent the outside BDPU from accessing the STP interface.

Two J-EX Series switches are displayed in Figure 13 on page 308. In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are edge access ports—edge access ports frequently receive outside BPDUs generated by PC applications.

This example configures interface **ge-0/0/5** and interface **ge-0/0/6** as edge ports on Switch 2, and then configures BPDU protection on those ports. With BPDU protection enabled, these interfaces shut down when they encounter an outside BPDU sent by the PCs connected to Switch 2. Figure 13 on page 308 shows the topology of this example.

Figure 13: BPDU Protection Topology

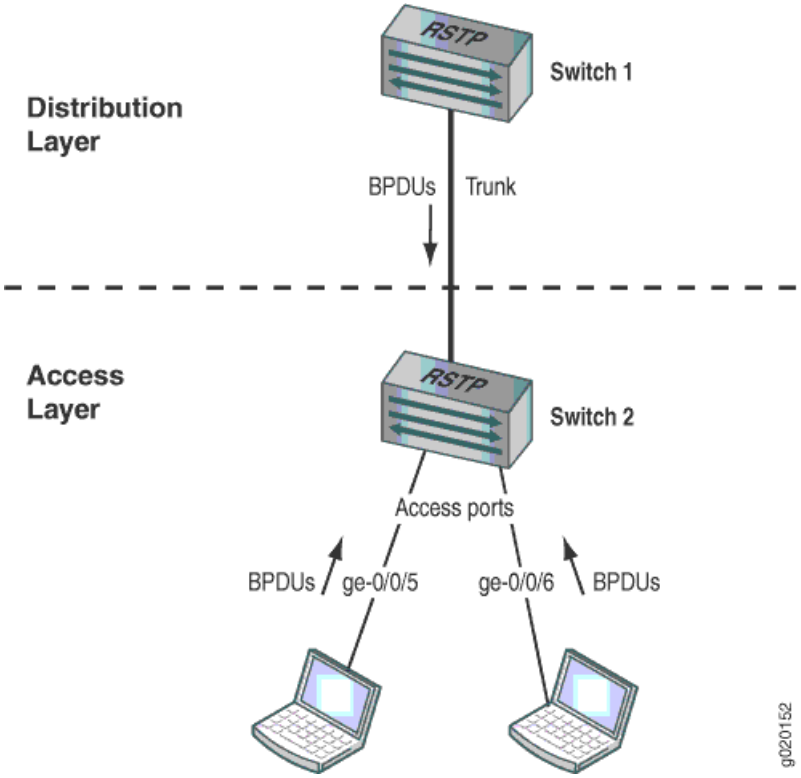

Table 34 on page 309 shows the components that will be configured for BPDU protection.

Table 34: Components of the Topology for Configuring BPDU Protection on J-EX Series Switches

Property	Settings
Switch 1 (Distribution Layer)	Switch 1 is connected to Switch 2 on a trunk interface.
Switch 2 (Access Layer)	Switch 2 has these access ports that require BPDU protection: • **ge-0/0/5** • **ge-0/0/6**

This configuration example uses RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the [**edit protocols** (**mstp** | **stp**)] hierarchy level.

Configuration

To configure BPDU protection on two access interfaces:

CLI Quick Configuration

Quickly configure RSTP on the two Switch 2 interfaces, and then configure BPDU protection on all edge ports on Switch 2 by copying the following commands and pasting them into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/5 edge
set protocols rstp interface ge-0/0/6 edge
set protocols rstp bpdu-block-on-edge
```

Step-by-Step Procedure

To configure RSTP on the two Switch 2 interfaces, and then configure BPDU protection:

1. Configure interface **ge-0/0/5** and interface **ge-0/0/6** as edge ports:

   ```
   [edit protocols rstp]
   user@switch# set interface ge-0/0/5 edge
   user@switch#set interface ge-0/0/6 edge
   ```

2. Configure BPDU protection on all edge ports on this switch:

   ```
   [edit protocols rstp]
   user@switch# set bpdu-block-on-edge
   ```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/5.0 {
   edge;
}
interface ge-0/0/6.0 {
   edge;
}
bpdu-block-on-edge;
```

Verification

To confirm that the configuration is working properly:

- Displaying the Interface State Before BPDU Protection Is Triggered on page 310
- Verifying That BPDU Protection Is Working Correctly on page 310

Displaying the Interface State Before BPDU Protection Is Triggered

Purpose Before BPDUs can be received from PCs connected to interface **ge-0/0/5** and interface **ge-0/0/6**, confirm the interface state.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518      128:518  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/6.0     128:519      128:519  32768.0019e2503f00     20000  FWD    DESG
[output truncated]
```

Meaning The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/5.0** and interface **ge-0/0/6.0** are ports in a forwarding state.

Verifying That BPDU Protection Is Working Correctly

Purpose In this example, the PCs connected to Switch 2 start sending BPDUs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0** . Verify that BPDU protection is configured on the interfaces.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518      128:518  32768.0019e2503f00     20000  BLK    DIS
(Bpdu-Incon)
ge-0/0/6.0     128:519      128:519  32768.0019e2503f00     20000  BLK    DIS
(Bpdu-Incon)
ge-0/0/7.0     128:520        128:1  16384.00aabbcc0348     20000  FWD    ROOT
```

```
ge-0/0/8.0      128:521      128:521  32768.0019e2503f00      20000  FWD    DESG
[output truncated]
```

Meaning When BPDUs are sent from the PCs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state causes the interfaces to shut down.

Disabling the BPDU protection configuration on an interface does not automatically re-enable the interface. However, if the **disable-timeout** statement has been included in the BPDU configuration, the interface does return to service after the timer expires. Otherwise, you must use the operational mode command **clear ethernet-switching bpdu-error** to unblock and re-enable the interface.

If the PCs connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state, causing them to shut down. In such cases, you need to find and repair the misconfiguration on the PCs that is sending BPDUs to Switch 2.

Example: Configuring BPDU Protection on non-STP Interfaces to Prevent STP Miscalculations on J-EX Series Switches

Spanning-tree protocols support loop-free network communication through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, when STP-BPDUs are communicated to non-STP devices that recognize BPDUs, this can lead to network outages. You can, however, enable BPDU protection on non-STP switch interfaces and prevent STP-BPDUs from passing through that interface. When protection is enabled, an interface shuts down when a BPDU is encountered, thereby preventing the STP-BPDU from reaching a device that could be shut down by STP-BPDUs.

This example configures BPDU protection on non-STP switch downstream interfaces that connect to two PCs:

- Requirements on page 312
- Overview and Topology on page 312

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch in an RSTP topology
- One J-EX Series switch that is not in any spanning-tree topology

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- RSTP operating on Switch 1.
- Disabled RSTP on Switch 2.

NOTE: **By default, RSTP is enabled on all J-EX Series switches.**

Overview and Topology

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). All spanning-tree protocols use a special type of frame called a bridge protocol data unit (BPDU) to communicate. Other devices also use BPDUs—PC bridging applications, for example, generate their own BPDUs. These different BPDUs are not compatible. When STP-BPDUs are transmitted to a device that is not using a spanning-tree protocol but uses another type of BPDU, they can cause problems on the device. Therefore, you should configure BPDU protection on a non-STP switch between an STP-enabled switch and devices that use different BPDUs-–for example PCs. This blocks STP-BPDUs at the switch in the middle and prevents them from ever reaching the devices that could be damaged.

This example explains how to block STP-generated BPDUs from reaching a switch port connected to non-STP devices, thereby protecting the non-STP devices. If BPDUs attempt to access a BPDU-protected interface on a switch, the interface transitions to a blocking state that shuts down the interface.

Two J-EX Series switches are displayed in Figure 14 on page 313. In this example, Switch 1 and Switch 2 are connected through a trunk interface. Switch 1 is configured for RSTP, but Switch 2 has no spanning-tree protocol.

This example configures downstream BPDU protection on switch interfaces **ge-0/0/5** and **ge-0/0/6**. When BPDU protection is enabled, the switch interfaces will shut down if STP-BPDUs attempt to access the laptops. Figure 14 on page 313 shows the topology for this example.

CAUTION: When configuring BPDU protection on a non-STP configured port connected to an STP-configured switch, be careful that you do not configure BPDU protection on all interfaces. Doing so could prevent BPDUs being received on switch interfaces (such as a trunk interface) that should be receiving BPDUs from an STP-configured switch.

Figure 14: BPDU Protection Topology

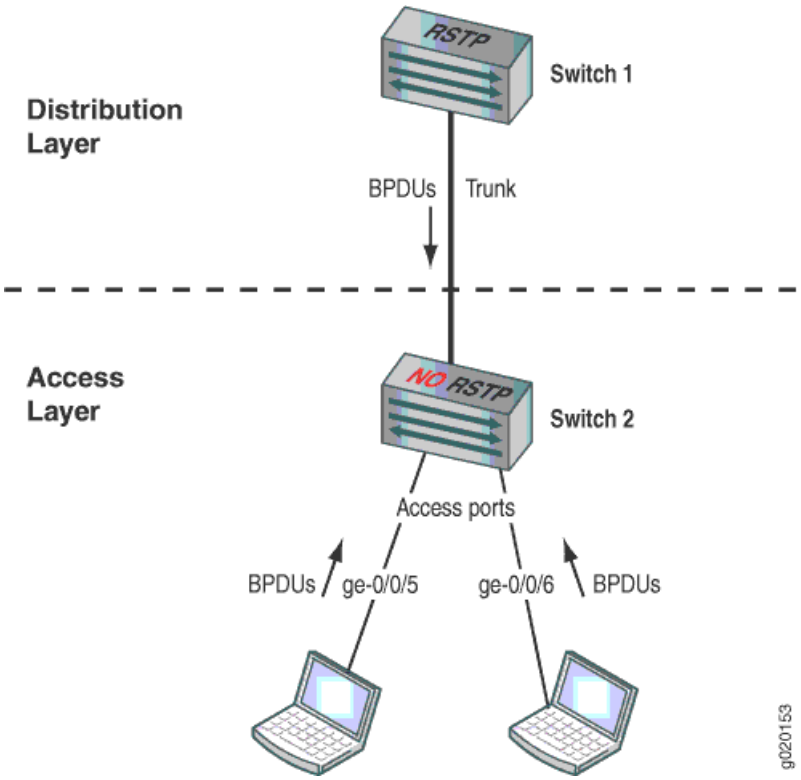

Table 35 on page 313 shows the components that will be configured for BPDU protection.

Table 35: Components of the Topology for Configuring BPDU Protection on J-EX Series Switches

Property	Settings
Switch 1 (Distribution Layer)	Switch 1 is connected to Switch 2 through a trunk interface. Switch 1 is configured for RSTP. Switch 2 is not configured for any spanning-tree protocol.
Switch 2 (Access Layer)	Switch 2 has the default RSTP disabled and has two downstream access ports connected to laptops that require BPDU protection: • ge-0/0/5 • ge-0/0/6

Configuration

To configure BPDU protection on the interfaces:

CLI Quick Configuration

To quickly configure BPDU protection on non-STP Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options bpdu-block interface ge-0/0/5
[edit]
set ethernet-switching-options bpdu-block interface ge-0/0/6
```

Step-by-Step Procedure

To configure BPDU protection:

1. Configure bdpu-block on the downstream interface **ge-0/0/5** on Switch 2:

   ```
   [edit ethernet-switching-options]

   user@switch#set bpdu-block interface ge-0/0/5
   ```

2. Configure bdpu-block on the downstream interface **ge-0/0/6** on Switch 2:

   ```
   [edit ethernet-switching-options]

   user@switch#set bpdu-block interface ge-0/0/6
   ```

Results

Check the results of the configuration:

```
user@switch> show ethernet-switching-options
bpdu-block {
   interface ge-0/0/5.0;
   interface ge-0/0/6.0;
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Displaying the Interface State Before BPDU Protection Is Triggered on page 314
- Verifying That BPDU Protection Is Working Correctly on page 315

Displaying the Interface State Before BPDU Protection Is Triggered

Purpose

Before any BPDUs can be received from Switch 1 on either interface **ge-0/0/5** or interface **ge-0/0/6**, confirm the state of those interfaces.

Action

Use the operational mode command **show ethernet-switching interfaces**:

```
user@switch>  show ethernet-switching interfaces

Interface   State    VLAN members          Blocking
ge-0/0/0.0  down     default               unblocked
ge-0/0/1.0  down     default               unblocked
ge-0/0/2.0  down     default               unblocked
ge-0/0/3.0  up       default               unblocked
ge-0/0/4.0  up       v1                    unblocked
ge-0/0/5.0  up       v1                    unblocked
ge-0/0/6.0  up       default               unblocked
[output truncated]
```

Meaning

The output from the operational mode command **show ethernet-switching interfaces** shows that **ge-0/0/5.0** and interface **ge-0/0/6.0** are **up** and unblocked.

Verifying That BPDU Protection Is Working Correctly

Purpose In this example, RSTP-enabled Switch 1 sends BPDUs to non-STP Switch 2 and Switch 2 tries to forward them to the laptops through interfaces **ge-0/0/5** and **ge-0/0/6** . This shuts down the two interfaces because **bpdu-block** has been configured on those interfaces.

Action Use the operational mode command **show ethernet-switching interfaces** again to see what happened when the BPDUs reached the two interfaces:

```
user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  up       default                unblocked
ge-0/0/1.0  up       default                unblocked
ge-0/0/2.0  up       default                unblocked
ge-0/0/3.0  up       default                unblocked
ge-0/0/4.0  up       v1                     unblocked
ge-0/0/5.0  down     v1                     blocked - blocked by bpdu-control
ge-0/0/6.0  down     default                blocked - blocked by bpdu-control
[output truncated]
```

Meaning When the BPDUs sent from Switch 1 reached interfaces **ge-0/0/5** and **ge-0/0/6** the interfaces transitioned to a BPDU inconsistent state, shutting down the two interfaces to prevent BPDUs from reaching the laptops.

The blocked interfaces need to be re-enabled. There are two ways to do this. If you included the statement **disable-timeout** in the BPDU configuration, the interface returns to service after the timer expires. Otherwise, use the operational mode command **clear ethernet-switching bpdu-error** to unblock and re-enable **ge-0/0/5** and **ge-0/0/5**.

If BPDUs reach the downstream interfaces on Switch 2 again, BPDU protection is triggered again and the interfaces shut down. In such cases, you need to find and repair the misconfiguration that is sending BPDUs to interfaces **ge-0/0/5** and **ge-0/0/6**.

Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would result in a loop opening up in the network.

This example describes how to configure loop protection for an interface on a J-EX Series switch in an RSTP topology:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Three J-EX Series switches in an RSTP topology

Before you configure the interface for loop protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop opens up in the spanning tree. Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted and the ultimate result is a network outage.

CAUTION: An interface can be configured for either loop protection or root protection, but not for both.

Three J-EX Series switches are displayed in Figure 15 on page 317. In this example, they are configured for RSTP and create a loop-free topology. Interface **ge-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **ge-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **ge-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

Figure 15: Network Topology for Loop Protection

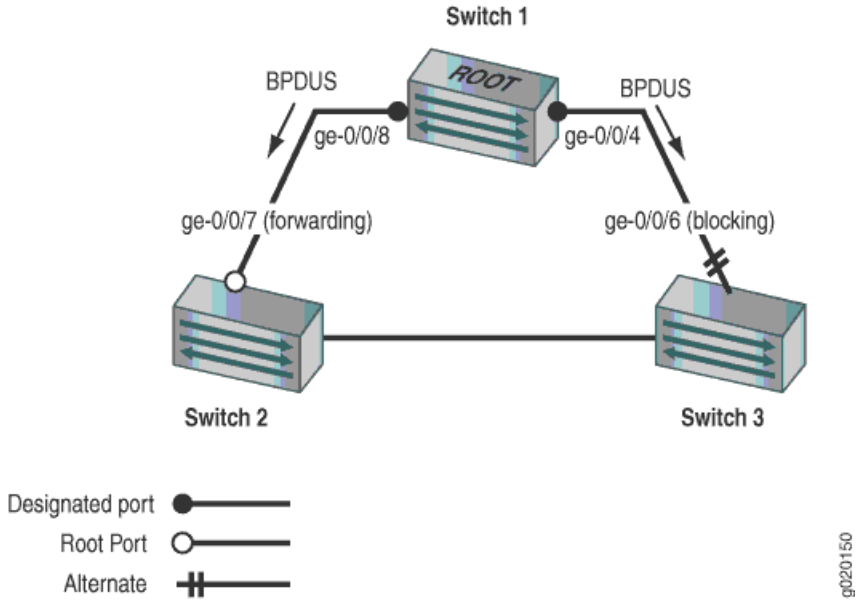

Table 36 on page 317 shows the components that will be configured for loop protection.

Table 36: Components of the Topology for Configuring Loop Protection on J-EX Series Switches

Property	Settings
Switch 1	Switch 1 is the root bridge.
Switch 2	Switch 2 has the root port **ge-0/0/7**.
Switch 3	Switch 3 is connected to Switch 1 through interface **ge-0/0/6**.

A spanning-tree topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.

- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure loop protection for STP or MSTP topologies at the [**edit protocols** (**mstp** | **stp**)] hierarchy level.

Configuration

To configure loop protection on an interface:

CLI Quick Configuration

To quickly configure loop protection on interface **ge-0/0/6**:

```
[edit]
set protocols rstp interface ge-0/0/6 bpdu-timeout-action block
```

Step-by-Step Procedure

To configure loop protection:

1. Configure interface **ge-0/0/6** on Switch 3:

```
[edit protocols rstp]
user@switch# set interface ge-0/0/6 bpdu-timeout-action block
```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/6.0 {
  bpdu-timeout-action {
    block;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Displaying the Interface State Before Loop Protection Is Triggered on page 318
- Verifying That Loop Protection Is Working on an Interface on page 319

Displaying the Interface State Before Loop Protection Is Triggered

Purpose

Before loop protection is triggered on interface **ge-0/0/6**, confirm that the interface is blocking.

Action

Use the operational mode command:

```
user@switch>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
```

```
ge-0/0/3.0      128:516      128:516  32768.0019e2503f00      20000  FWD    DESG
ge-0/0/4.0      128:517      128:517  32768.0019e2503f00      20000  FWD    DESG
ge-0/0/5.0      128:518      128:518  32768.0019e2503f00      20000  FWD    DESG
ge-0/0/6.0      128:519        128:2  16384.00aabbcc0348      20000  BLK    ALT
[output truncated]
```

Meaning The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/6.0** is the alternate port and in a blocking state.

Verifying That Loop Protection Is Working on an Interface

Purpose Verify the loop protection configuration on interface **ge-0/0/6**. RSTP has been disabled on interface **ge-0/0/4** on Switch 1. This will stop BPDUs from being sent to interface **ge-0/0/6** and trigger loop protection on the interface.

Action Use the operational mode command:

```
user@switch>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00      20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00      20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00      20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00      20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00      20000  FWD    DESG
ge-0/0/5.0     128:518      128:518  32768.0019e2503f00      20000  FWD    DESG
ge-0/0/6.0     128:519      128:519  32768.0019e2503f00      20000  BLK    DIS
(Loop-Incon)
[output truncated]
```

Meaning The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to manually enforce the root bridge placement in the network.

This example describes how to configure root protection on an interface on a J-EX Series switch:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Four J-EX Series switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election.

To prevent this from happening, enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.

- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

CAUTION: **An interface can be configured for either root protection or loop protection, but not for both.**

Four J-EX Series switches are displayed in Figure 16 on page 321. In this example, they are configured for RSTP and create a loop-free topology. Interface **ge-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **ge-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **ge-0/0/7** to prevent it from transitioning to become the root port.

Figure 16: Network Topology for Root Protection

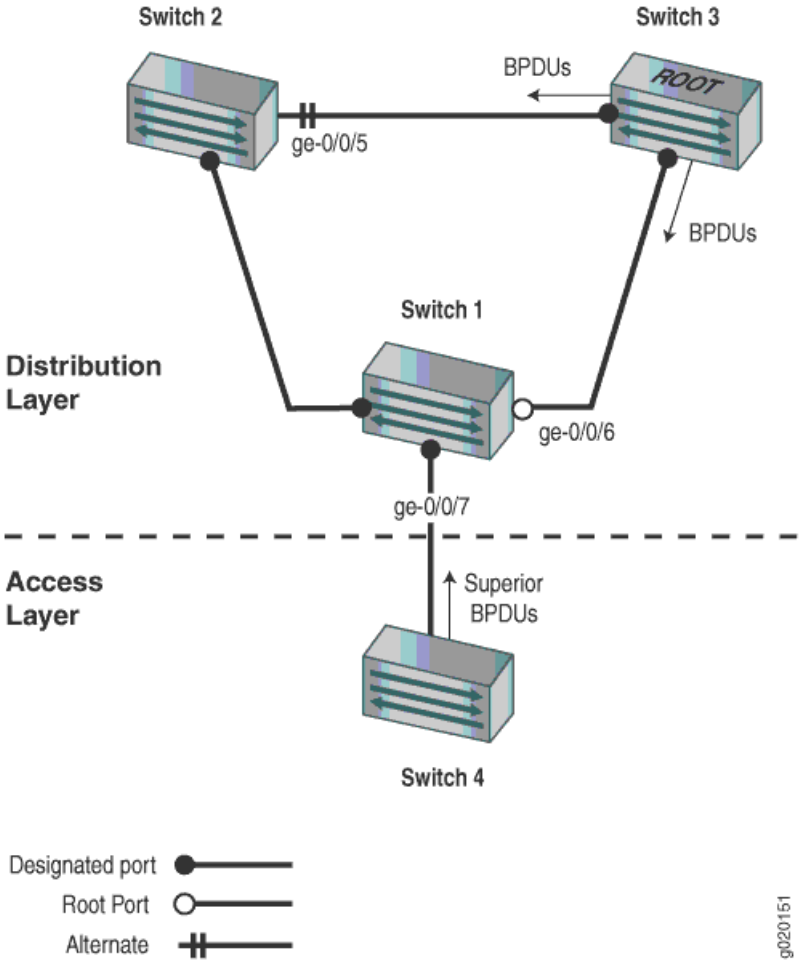

Table 37 on page 322 shows the components that will be configured for root protection.

Table 37: Components of the Topology for Configuring Root Protection on J-EX Series Switches

Property	Settings
Switch 1	Switch 1 is connected to Switch 4 through interface **ge-0/0/7**.
Switch 2	Switch 2 is connected to Switch 1 and Switch 3. Interface **ge-0/0/4** is the alternate port in the RSTP topology.
Switch 3	Switch 3 is the root bridge and is connected to Switch 1 and Switch 2.
Switch 4	Switch 4 is connected to Switch 1. After loop protection is configured on interface **ge-0/0/7**, Switch 4 will send superior BPDUs that will trigger loop protection on interface **ge-0/0/7**.

A spanning tree topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure root protection for STP or MSTP topologies at the [**edit protocols** (**mstp** | **stp**)] hierarchy level.

Configuration

To configure root protection on an interface:

CLI Quick Configuration

To quickly configure root protection on interface **ge-0/0/7**, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/7 no-root-port
```

Step-by-Step Procedure

To configure root protection:

1. Configure interface **ge-0/0/7**:

```
[edit protocols rstp]

user@switch#
set interface ge-0/0/7 no-root-port
```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/7.0 {
  no-root-port;
}
```

Verification

To confirm that the configuration is working properly:

Displaying the Interface State Before Root Protection Is Triggered

Purpose Before root protection is triggered on interface **ge-0/0/7**, confirm the interface state.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518        128:2  16384.00aabbcc0348     20000  BLK    ALT
ge-0/0/6.0     128:519        128:1  16384.00aabbcc0348     20000  FWD    ROOT
ge-0/0/7.0     128:520      128:520  32768.0019e2503f00     20000  FWD    DESG
[output truncated]
```

Meaning The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/7.0** is a designated port in a forwarding state.

Verifying That Root Protection Is Working on the Interface

Purpose A configuration change takes place on Switch 4. A smaller bridge priority on the Switch 4 causes it to send superior BPDUs to interface **ge-0/0/7**. Receipt of superior BPDUs on interface **ge-0/0/7** will trigger root protection. Verify that root protection is operating on interface **ge-0/0/7**.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518        128:2  16384.00aabbcc0348     20000  BLK    ALT
ge-0/0/6.0     128:519        128:1  16384.00aabbcc0348     20000  FWD    ROOT
ge-0/0/7.0     128:520      128:520  32768.0019e2503f00     20000  BLK    DIS
```

```
(Root–Incon)
[output truncated]
```

Meaning The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/7.0** has transitioned to a loop inconsistent state. The loop inconsistent state makes the interface block and prevents the interface from becoming a candidate for the root port. When the root bridge no longer receives superior STP BPDUs from the interface, the interface will recover and transition back to a forwarding state. Recovery is automatic.

CHAPTER 10

Configuring Spanning-Tree Protocols

Unblocking an Interface That Receives BPDUs in Error (CLI Procedure)

J-EX Series switches use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

After the misconfiguration that triggered the BPDUs being sent to an interface is fixed in the topology, the interface can be unblocked and returned to service.

To unblock an interface and return it to service using the CLI:

- Automatically unblock an interface by configuring a timer that expires (here, the interface is **ge-0/0/6**):

```
[edit ethernet-switching-options]
user@switch# set bpdu-block disable-timeout 30 interface ge-0/0/6
```

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpdu-error interface ge-0/0/6
```

Configuring STP (CLI Procedure)

The default spanning-tree protocol for J-EX Series switches is Rapid Spanning Tree Protocol (RSTP). RSTP provides faster convergence times than Spanning Tree Protocol (STP). However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. When you explicitly configure STP, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP.

To configure STP using the CLI:

1. Delete the RSTP configuration on the interface:

```
[edit]
user@switch# delete protocols rstp interface interface
```

2. Configure STP on the interface:

```
[edit]
user@switch# set protocols stp interface interface
```

Configuring Spanning-Tree Protocols (J-Web Procedure)

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). You can configure STP, RSTP, and MSTP using the J-Web interface. You can configure bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

To configure STP, MSTP, or RSTP for a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Switching** > **Spanning Tree**.

   The Spanning Tree Configuration page displays the spanning-tree protocol configuration parameters and a list of interfaces configured for each spanning-tree protocol configuration.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Creates a spanning-tree protocol configuration.
     a. Select a protocol name.
     b. Enter information as described in Table 38 on page 327.
     c. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
   - **Edit**—Modifies a selected spanning-tree protocol configuration.
     a. Enter information as described in Table 38 on page 327.
     b. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
   - **Delete**—Deletes a selected spanning-tree protocol configuration.

Table 38: Spanning-Tree Protocol Configuration Parameters

Field	Function	Your Action
General		
Protocol Name	Specifies the spanning-tree protocol type: STP, MSTP, or RSTP.	None.
Disable	Disables spanning-tree protocol on the interface.	To enable this option, select the check box.
BPDU Protect	Specifies BPDU protection on all edge interfaces on the switch.	To enable this option, select the check box.
Bridge Priority	Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.	Select a value from the list.
Forward Delay	Specifies the number of seconds an interface waits before changing from spanning-tree learning and listening states to the forwarding state.	Type a value.

Table 38: Spanning-Tree Protocol Configuration Parameters *(continued)*

Field	Function	Your Action
Hello Time	Specifies the time interval in seconds at which the root bridge transmits configuration BPDUs.	Type a value.
Max Age	Specifies the maximum-aging time in seconds for all MST instances. The maximum aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration.	Type a value.
Max Hops	(MSTP only) Specifies the number of hops in a region before the BPDU is discarded.	Type a value.
Configuration Name	(MSTP only) Specifies the MSTP region name carried in the MSTP BPDUs.	Type a name.
Revision Level	(MSTP only) Specifies the revision number of the MSTP configuration.	Type a value.
Ports		
Interface Name	Specifies an interface for the spanning-tree protocol.	1. Click the **Ports** tab. 2. Choose one: • Click **Add** and select an interface from the list. • Select an interface in the **Port/State** table and click **Edit**. • To delete an interface from the configuration, select it in the **Port/State** table and click **Remove**.
Cost	Specifies the link cost to determine which bridge is the designated bridge and which interface is the designated interface.	Type a value.
Priority	Specifies the interface priority to determine which interface is elected as the root port.	Select a value from the list.
Disable Port	Disables the spanning-tree protocol on the interface.	To enable the option, select the check box.
Edge	Configures the interface as an edge interface. Edge interfaces immediately transition to a forwarding state.	To enable the option, select the check box.

Table 38: Spanning-Tree Protocol Configuration Parameters *(continued)*

Field	Function	Your Action
No Root Port	Specifies an interface as a spanning-tree designated port. If the bridge receives superior STP BPDUs on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.	To enable the option, select the check box.
Interface Mode	Specifies the link mode.	1. To enable the option, select the check box. 2. Select one: • **Point to Point**–For a full-duplex link, the default link mode is point-to-point. • **Shared**–For a half-duplex link, the default link mode is shared.
BPDU Timeout Action	Specifies the BPDU timeout action for the interface.	Select one: • **Alarm** • **Block**
MSTI (MSTP only)		
MSTI Name	Specifies a name (an MSTI ID) for the MST instance.	1. Click the **MSTI** tab. 2. Choose one: • Click **Add**. • Select an MSTI ID and click **Edit**. • To delete an MSTI from the configuration, select the MSTI ID and slick **Remove**.
Bridge Priority	Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.	Select a value from the list.
VLAN ID	Specifies the VLAN for the MST instance.	In the VLAN box, choose one: • Click **Add**, select a VLAN from the list and click **OK**. • To remove a VLAN association, select the VLAN ID, click **Remove**, and click **OK**.

Table 38: Spanning-Tree Protocol Configuration Parameters *(continued)*

Field	Function	Your Action
Interfaces	Specifies an interface for the MST instance.	1. In the Interfaces box, click **Add** and select an interface from the list, or select an interface from the list and click **Edit**. 2. Specify the link cost to determine which bridge is the designated bridge and which interface is the designated interface. 3. Specify the interface priority to determine which interface is elected as the root port. 4. If you want to disable the interface, select the check box. 5. Click OK. To delete an interface configuration, select the interface, click **Remove**, and click **OK**.

Related Documentation

Configuring VLAN Spanning Tree Protocol (CLI Procedure)

VLAN Spanning Tree Protocol (VSTP) improves intelligent tree spanning by defining the best packet forwarding paths within a limited number of VLANs. The other spanning-tree protocols (STP, RSTP, and MSTP) apply to the entire network. VSTP is limited to 253 VLANS on J-EX Series switches, so VSTP and RSTP can be run concurrently to allow RSTP to be applied to VLANs 254 and greater. These are the only two spanning-tree protocols that can be run concurrently.

To configure VSTP:

1. (Optional—complete this step when you specify **all** in Step 2.) Enable RSTP:

```
[edit protocols]
user@switch# set rstp
```

   Because VSTP can run on a maximum of 253 VLANs per switch, completing this step means that RSTP runs on VLANs 254 and greater, thereby ensuring that a spanning-tree protocol runs on all VLANs.

2. Enable VSTP:

   - To enable VSTP on multiple VLANs using a VLAN group:

     ```
     [edit protocols]
     user@switch# set vstp vlan-group group group-name vlan vlan-id-range
     ```

     VSTP can run on a maximum of 253 VLANs per switch.

   - To enable VSTP on all VLANs:

     ```
     [edit protocols]
     user@switch# set vstp vlan all
     ```

     

     NOTE: Complete Step 1 if you use this version of the statement to ensure that all VLANs on this switch use a spanning-tree protocol. Because a configuration with more than 253 VSTP VLANs per switch cannot be committed, RSTP must be enabled for VLANs 254 and above.

   - To enable VSTP on a VLAN using a single VLAN ID:

     ```
     [edit protocols]
     user@switch# set vstp vlan vlan-id
     ```

   - To enable VSTP on a VLAN using a single VLAN name:

     ```
     [edit protocols]
     user@switch# set vstp vlan vlan-name
     ```

CHAPTER 11

Verifying Spanning-Tree Protocols

Monitoring Spanning-Tree Protocols

Purpose Use the monitoring feature to view status and information about the spanning-tree protocol parameters on your J-EX Series switch.

Action To display spanning-tree protocol parameter details in the J-Web interface, select **Monitor** > **Switching** > **STP**.

To display spanning-tree protocol parameter details in the CLI, enter the following commands:

- **show spanning-tree interface**
- **show spanning-tree bridge**

Meaning Table 39 on page 333 summarizes the spanning-tree protocol parameters.

Table 39: Summary of Spanning-Tree Protocols Output Fields

Field	Values
Bridge Parameters	
Context ID	An internally generated identifier.
Enabled Protocol	Spanning-tree protocol type enabled.
Root ID	Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Bridge ID	Locally configured bridge ID.
Hello Time	The time for which the bridge interface remains in the listening or learning state.
Forward Delay	The time for which the bridge interface remains in the listening or learning state before transitioning to the forwarding state.

Table 39: Summary of Spanning-Tree Protocols Output Fields *(continued)*

Field	Values
Extended System ID	The system ID.
Inter Instance ID	An internally generated instance identifier.
Maximum Age	Maximum age of received bridge protocol data units (BPDUs).
Number of topology changes	Total number of STP topology changes detected since the switch last booted.
Spanning Tree Interface Details	
Interface Name	Interface configured to participate in the STP instance.
Port ID	Logical interface identifier configured to participate in the STP instance.
Designated Port ID	Port ID of the designated port for the LAN segment to which the interface is attached.
Designated Bridge ID	ID of the designated bridge to which the interface is attached.
Port Cost	Configured cost for the interface.
Port State	STP port state: • Forwarding (FWD) • Blocking (BLK) • Listening • Learning • Disabled
Role	MSTP or RSTP port role, Designated (DESG), backup (BKUP), alternate (ALT), or root.
Spanning Tree Statistics of Interface	
Interface	Interface for which statistics is being displayed.
BPDUs Sent	Total number of BPDUs sent.
BPDUs Received	Total number of BPDUs received.
Next BPDU Transmission	Number of seconds until the next BPDU is scheduled to be sent.

block

Syntax block;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*) **bpdu-timeout-action**],
[edit protocols **rstp interface** (all | *interface-name*) **bpdu-timeout-action**],
[edit protocols **stp interface** (all | *interface-name*) **bpdu-timeout-action**],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*) **bpdu-timeout-action**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure loop protection on a specific interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

bpdu-block

Syntax

```
bpdu-block {
  interface (all | [interface-name]);
  disable-timeout timeout;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure BPDU protection on an interface. If the interface receives BPDUs, it is disabled.

The statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

bpdu-block-on-edge

Syntax bpdu-block-on-edge;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **vstp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure bridge protocol data unit (BPDU) protection on all edge ports of a switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**

bpdu-timeout-action

Syntax

```
bpdu-timeout-action {
  block;
  log;
}
```

Hierarchy Level

[edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the BPDU timeout action on a specific interface. You must configure at least one action (**log**, **block**, or both).

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**
- **show spanning-tree interface on page 386**

- Understanding VSTP for J-EX Series Switches on page 272

bridge-priority

Syntax bridge-priority *priority*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **mstp msti** *msti-id*],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.

Default 32,768

Options ***priority***—Bridge priority. It can be set only in increments of 4096.

Range: 0 through 61,440

Default: 32,768

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**
- **show spanning-tree interface on page 386**
- Example: Configuring Network Regions for VLANs with MSTP on J-EX Series Switches on page 286

- Understanding VSTP for J-EX Series Switches on page 272

configuration-name

Syntax configuration-name *configuration-name*;

Hierarchy Level [edit protocols **mstp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the configuration name. The configuration name is the MSTP region name carried in the MSTP BPDUs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**
- **show spanning-tree interface on page 386**
- Example: Configuring Network Regions for VLANs with MSTP on J-EX Series Switches on page 286
- Example: Configuring Faster Convergence and Improving Network Stability with RSTP on J-EX Series Switches on page 273
- Understanding MSTP for J-EX Series Switches on page 267

cost

Syntax cost *cost*;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link cost to control which bridge is the designated bridge and which interface is the designated interface.

Default The link cost is determined by the link speed.

Options ***cost***—Link cost associated with the port.

Range: 1 through 200,000,000

Default: Link cost is determined by the link speed.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

disable

Syntax disable;

Hierarchy Level
[edit protocols **mstp**],
[edit protocols **mstp interface** *interface-name*],
[edit protocols **mstp msti** *msti-id* **vlan** (*vlan-id* | *vlan-name*) **interface** *interface-name*],
[edit protocols **rstp**],
[edit protocols **rstp interface** *interface-name*],
[edit protocols **stp**],
[edit protocols **stp interface** *interface-name*],
[edit protocols **vstp**],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable STP, MSTP, RSTP, or VSTP on the switch or on a specific interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**

- Understanding VSTP for J-EX Series Switches on page 272

disable-timeout

Syntax disable-timeout *timeout*;

Hierarchy Level [edit **ethernet-switching-options bpdu-block**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled.

Default The disable timeout is not enabled.

Options ***timeout*** —Amount of time, in seconds, the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service.

Range: 10 through 3600 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

edge

Syntax edge;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge interfaces. Edge interfaces immediately transition to a forwarding state.

Default Edge interfaces are not enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 272

force-version

Syntax force-version stp;

Hierarchy Level [edit protocols vstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Force VLAN Spanning Tree Protocol (VSTP) to use the STP protocol instead of the default protocol, RSTP.

Options **stp**—Spanning Tree Protocol

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 272
- **show spanning-tree bridge on page 382**

forward-delay

Syntax forward-delay *seconds*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify how long a bridge interface remains in the listening and learning states before transitioning to the forwarding state.

Default 15 seconds

Options ***seconds***—Number of seconds the bridge interface remains in the listening and learning states.

Range: 4 through 30 seconds

Default: 15 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

hello-time

Syntax hello-time *seconds*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the time interval at which the root bridge transmits configuration BPDUs.

Default 2 seconds

Options ***seconds***—Number of seconds between transmissions of configuration BPDUs.

Range: 1 through 10 seconds

Default: 2 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface

Syntax interface (all | [*interface-name*]);

Hierarchy Level [edit **ethernet-switching-options bpdu-block**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply BPDU protection to all interfaces or one or more interfaces.

Options **all**—All interfaces.

interface-name —Name of a Gigabit Ethernet interface.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface interface-name {
    disable;
    cost cost;
    edge;
    mode mode;
    no-root-port;
    priority priority;
}
```

Hierarchy Level

[edit protocols **mstp**],
[edit protocols **mstp msti** *msti-id*],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure an interface.

The **edge**, **mode**, and **no-root-port** options are not available at the [**edit protocols mstp msti** ***msti-id***] hierarchy level.

Options

interface-name—Name of a Gigabit Ethernet interface.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

log

Syntax log;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*) **bpdu-timeout-action**],
[edit protocols **rstp interface** (all | *interface-name*) **bpdu-timeout-action**],
[edit protocols **stp interface** (all | *interface-name*) **bpdu-timeout-action**],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*) **bpdu-timeout-action**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For interfaces configured for loop protection, configure the software to generate a message to be sent to the system log file **/var/log/messages** to record the loop-protection event.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

max-age

Syntax max-age *seconds*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the maximum age of received protocol BPDUs.

Default 20 seconds

Options ***seconds***—The maximum age of received protocol BPDUs.
Range: 6 through 40 seconds
Default: 20 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**

max-hops

Syntax max-hops *hops*;

Hierarchy Level [edit protocols mstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple Spanning Tree Protocol (MSTP), configure the maximum number of hops a BPDU can be forwarded in the MSTP region.

Default 20 hops

Options ***hops*** — Number of hops the BPDU can be forwarded.
Range: 1 through 255 hops
Default: 20 hops

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

mode

Syntax mode *mode*;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link mode to identify point-to-point links.

Default For a full-duplex link, the default link mode is **point-to-point**. For a half-duplex link, the default link mode is **shared**.

Options *mode*—Link mode:

- **point-to-point**—Link is point to point.
- **shared**—Link is shared media.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 272

msti

Syntax

```
msti msti-id {
  vlan (vlan-id | vlan-name);
  interface interface-name {
    disable;
    cost cost;
    priority priority;
  }
}
```

Hierarchy Level [edit protocols mstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Multiple Spanning Tree Instance (MSTI) identifier for Multiple Spanning Tree Protocol (MSTP). MSTI IDs are local to each region, so you can reuse the same MSTI ID in different regions.

Default MSTI is disabled.

Options *msti-id* —MSTI identifier.

Range: 1 through 4094. The Common Instance Spanning Tree (CIST) is always MSTI 0.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**
- **show spanning-tree interface on page 386**
- Example: Configuring Network Regions for VLANs with MSTP on J-EX Series Switches on page 286

mstp

Syntax

```
mstp {
  bpdu-block-on-edge;
  bridge-priority priority;
  configuration-name name;
  disable;
  forward-delay seconds;
  hello-time seconds;
  interface ( all | interface-name {
    bpdu-timeout-action {
      block;
      log;
    }
    cost cost;
    disable;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  max-hops hops;
  msti msti-id {
    vlan (vlan-id | vlan-name);
    interface interface-name {
      disable;
      cost cost;
      priority priority;
    }
  }
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
  revision-level revision-level;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning tree regions.

The statements are explained separately.

Default MSTP is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**

no-root-port

Syntax

no-root-port;

Hierarchy Level

[edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure an interface to be a spanning tree designated port. If the bridge receives superior STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 272

priority

Syntax priority *priority*;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the interface priority to control which interface is elected as the root port.

Default The default value is 128.

Options ***priority***—Interface priority. The interface priority must be set in increments of 16.
Range: 0 through 240

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding STP for J-EX Series Switches on page 263
- Understanding VSTP for J-EX Series Switches on page 272

revision-level

Syntax revision-level *revision-level*;

Hierarchy Level [edit protocols **mstp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple Spanning Tree Protocol (MSTP), set the revision number of the MSTP configuration.

Default The revision level is disabled.

Options ***revision-level*** —Revision number of the MSTP region configuration.

Range: 0 through 65535

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

rstp

Syntax

```
rstp {
  bpdu-block-on-edge;
  bridge-priority priority;
  disable;
  forward-delay seconds;
  hello-time seconds;
  interface (all | interface-name) {
    bpdu-timeout-action{
      block;
      log;
    }
    cost cost;
    disable;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | no-world-readable |
      world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, which results in shorter convergence times than those provided by basic Spanning Tree Protocol (STP).

VSTP and RSTP can be configured concurrently. You can selectively configure up to 253 VLANs using VSTP; the remaining VLANs will be configured using RSTP. VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on the switch. See “Configuring VLAN Spanning Tree Protocol (CLI Procedure)” on page 330 for more information on configuring VSTP and RSTP concurrently.

BEST PRACTICE: **Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than 253 VLANs.**

The remaining statements are explained separately.

Default RSTP is enabled on all Ethernet switching interfaces.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**
- **show spanning-tree interface on page 386**
- Example: Configuring Faster Convergence and Improving Network Stability with RSTP on J-EX Series Switches on page 273

stp

Syntax

```
stp {
  bpdu-block-on-edge ;
  bridge-priority priority;
  disable;
  forward-delay seconds;
  hello-time seconds;
  interface (all | interface-name) {
    bpdu-timeout-action {
      block;
      log;
    }
    cost  cost;
    disable;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description When you explicitly configure STP, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).

The remaining statements are explained separately.

Default STP is disabled. By default, RSTP is enabled on all Ethernet switching ports.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 382**
- **show spanning-tree interface on page 386**
- Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on J-EX Series Switches on page 307

- Understanding STP for J-EX Series Switches on page 263

traceoptions

Syntax

```
traceoptions {
  file name <replace> <size size> <files number> <no-stamp>
    <(world-readable | no-world-readable)>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set protocol-level tracing options for STP, RSTP, MSTP, and VSTP.

Default Traceoptions is disabled.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name*** —Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file **/var/log/stp-log**.

files ***number*** —(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*** **.0**, then ***trace-file*** **.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 1 trace file only

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all** —Trace all operations.
- **all-failures**—Trace all failure conditions.
- **bpdu** —Trace BPDU reception and transmission. Note that you must also use **port-transmit-state-machine** in order to log transmit operations.
- **bridge-detection-state-machine** —Trace the bridge detection state machine.
- **events** —Trace events of the protocol state machine.

- **port-information-state-machine** —Trace the port information state machine.
- **port-migration-state-machine** —Trace the port migration state machine.
- **port-receive-state-machine** —Trace the port receive state machine.
- **port-role-select-state-machine** —Trace the port role selection state machine.
- **port-role-transit-state-machine** —Trace the port role transit state machine.
- **port-state-transit-state-machine** —Trace the port state transit state machine.
- **port-transmit-state-machine** —Trace the port transmit state machine
- **ppmd** —Trace the state and events for the ppmd process
- **state-machine-variables** —Trace when the state machine variables change
- **timers** —Trace protocol timers
- **topology-change-state-machine** —Trace the topology change state machine.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size ***size*** —(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*** **.0.** When the ***trace-file*** again reaches its maximum size, ***trace-file*** **.0** is renamed ***trace-file*** **.1** and ***trace-file*** is renamed ***trace-file*** **.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

vlan

Syntax

```
vlan (vlan-id | vlan-name) {
  bridge-priority priority;
  forward-delay seconds;
  hello-time seconds;
  interface interface-name {
    bpdu-timeout-action {
      block;
      log;
    }
    cost  cost;
    disable;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols mstp msti *msti-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLANs for a Multiple Spanning Tree Instance (MSTI).

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Default Not enabled.

Options ***vlan-id***—Numeric VLAN identifier.

vlan-name—Name of the VLAN.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols vstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure VSTP VLAN parameters.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options **all**—All VLANs.

vlan-id—Numeric VLAN identifier.

vlan-name—Name of the VLAN.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 272

vstp

Syntax

```
vstp {
  bpdu-block-on-edge;
  disable;
  force-version stp;
  vlan (vlan-id | vlan-name) {
    bridge-priority priority;
    forward-delay seconds;
    hello-time seconds;
    interface (all | interface-name) {
      disable;
      bpdu-timeout-action{
        block;
        log;
      }
      cost  cost;
      edge;
      mode mode;
      no-root-port;
      priority priority;
    }
    max-age seconds;
    traceoptions {
      file filename <files number > <size size> <no-stamp | no-world-readable |
        world-readable>;
      flag flag;
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

VSTP VLANs are limited on individual switches as shown in Table 40 on page 377.

Table 40: Maximum VSTP VLANs per Switch

Switch	Maximum VSTP VLANS
J-EX8200	253
J-EX4500	253
J-EX4200	253

If the number of VLANs on your switch exceeds the VSTP VLAN limit, you must use the **vlan** statement to specify which VLANs or VLAN groups should use VSTP. You also cannot use the **vlan all** option to configure VSTP when your switch has more than the maximum

allowed VSTP VLANs. To ensure all VLANs are running a spanning-tree protocol, run RSTP for networks with large numbers of VLANs .

BEST PRACTICE: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than the maximum number of allowed VSTP VLANs.

The remaining statements are explained separately.

Default VSTP is not enabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```
user@switch> clear ethernet-switching bpdu-error interface ge-0/0/1.0
```

clear spanning-tree statistics

Syntax clear spanning-tree statistics
<interface *interface-name* unit *logical-unit-number*>;

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Reset STP statistics for the all interfaces or a specified interface.

Options none—Reset STP counters for all interfaces.

interface-name —(Optional) The name of the interface for which statistics should be reset.

logical-unit-number —(Optional) The logical unit number of the interface.

Required Privilege Level clear

Output Fields This command produces no output.

Sample Output

clear spanning-tree statistics

```
user@switch> clear spanning-tree statistics
```

show spanning-tree bridge

Syntax

show spanning-tree bridge
<brief | detail>
<msti *msti-id*>
<vlan *vlan-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the configured or calculated spanning-tree protocol (can be either STP, RSTP, or MSTP) parameters.

Options

none—(Optional) Display brief STP bridge information for all Multiple Spanning Tree Instances (MSTIs).

brief | detail—(Optional) Display the specified level of output.

msti *msti-id*—(Optional) Display STP bridge information for the specified MSTP instance ID or Common and Internal Spanning Tree (CIST). Specify **0** for CIST. Specify a value from **1** through **4094** for an MSTI.

vlan *vlan-id*—(Optional) Display STP bridge information for the specified VLAN. Specify a VLAN tag identifier from **1** through **4094**.

show spanning-tree bridge detail on page 385

Output Fields

Table 41 on page 382 lists the output fields for the **show spanning-tree bridge** command. Output fields are listed in the approximate order in which they appear.

Table 41: show spanning-tree bridge Output Fields

Field Name	Field Description	Output
Context ID	An internally generated identifier.	VSTP all, RSTP all, MSTP all

Table 41: show spanning-tree bridge Output Fields *(continued)*

Field Name	Field Description	Output
Enabled protocol	Spanning-tree protocol type enabled.	VSTP all, RSTP all, MSTP all
Root ID	Bridge ID of the elected spanning tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.	VSTP all, RSTP all, MSTP
Root cost	Calculated cost to reach the root bridge from the bridge where the command is entered.	VSTP
Root port	Interface that is the current elected root port for this bridge.	VSTP
CIST regional root	Bridge ID of the elected MSTP regional root bridge.	MSTP
CIST internal root cost	Calculated cost to reach the regional root bridge from the bridge where the command is entered.	MSTP
Hello time	Configured number of seconds between transmissions of configuration BPDUs.	VSTP, RSTP, MSTP
Maximum age	Maximum age of received protocol BPDUs.	VSTP, RSTP, MSTP
Forward delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.	VSTP, RSTP, MSTP
Hop count	Configured maximum number of hops a BPDU can be forwarded in the MSTP region.	
Message age	Number of seconds elapsed since the most recent BPDU was received.	VSTP, RSTP
Number of topology changes	Total number of STP topology changes detected since the switch last booted.	VSTP, RSTP, MSTP
Time since last topology change	Number of seconds elapsed since the most recent topology change.	
Topology change initiator	Interface name of the interface that received the topology change request.	
Topology change last recvd. from	Bridge ID of the bridge that requested the last topology change.	
Bridge ID (Local)	Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.	VSTP, RSTP, MSTP

Table 41: show spanning-tree bridge Output Fields *(continued)*

Field Name	Field Description	Output
Extended system ID	Internally generated system identifier.	VSTP, RSTP, MSTP
MSTI regional root	Bridge ID of the elected MSTP regional root bridge.	
Internal instance ID	An internally generated identifier.	VSTP, RSTP, MSTP
Path Cost Method	Bridges supporting 802.1D (legacy) implement only 16-bit values for path cost. Newer versions of this standard support 32-bit values.	

Sample Output

show spanning-tree bridge

show spanning-tree interface

Syntax

show spanning-tree interface
<brief | detail>
<interface-name *interface-name*>
<msti *msti-id*>
<vlan-id *vlan-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the configured or calculated interface-level spanning-tree protocol (can be either STP, RSTP, or MSTP) parameters. In **brief** mode, will not display interfaces that are administratively disabled or do not have a physical link.

Options

none—(Optional) Display brief STP interface information.

brief | detail—(Optional) Display the specified level of output.

interface-name *interface-name*—(Optional) Name of an interface.

msti *msti-id*—(Optional) Display STP bridge information for the specified MSTP instance ID or Common and Internal Spanning Tree (CIST). Specify **0** for CIST. Specify a value from **1** through **4094** for an MSTI.

vlan-id *vlan-id*—(Optional) For MSTP interfaces, display interface information for the specified VLAN. Specify a value from **0** through **4094**.

Output Fields

Table 42 on page 387 lists the output fields for the **show spanning-tree Interface** command. Output fields are listed in the approximate order in which they appear.

Table 42: show spanning-tree interface Output Fields

Field Name	Field Description
Interface name	Interface configured to participate in the STP, RSTP, or MSTP instance.
Port ID	Logical interface identifier configured to participate in the MSTP instance.
Designated port ID	Port ID of the designated port for the LAN segment this interface is attached to.
Designated bridge ID	Bridge ID of the designated bridge for the LAN segment this interface is attached to.
Port Cost	Configured cost for the interface.
Port State	STP port state. Forwarding (FWD), blocking (BLK), listening, learning, or disabled.
Port Role	MSTP or RSTP port role. Designated (DESG), backup (BKUP), alternate (ALT), or root.
Link type	MSTP or RSTP link type. Shared or point-to-point (pt-pt) and edge or non edge.
Alternate	Identifies the interface as an MSTP or RSTP alternate root port (yes) or non-alternate root port (no).
Boundary Port	Identifies the interface as an MSTP regional boundary port (yes) or non-boundary port (no).
Edge delay while expiry count	Number of times the edge delay timer expired on that interface.
Rcvd info while expiry count	Number of times the rcvd info timer expired on that interface.

Sample Output

show spanning-tree interface

show spanning-tree mstp configuration

Syntax show spanning-tree mstp configuration
<brief | detail>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the MSTP configuration.

Options none—Display MSTP configuration information.

brief | detail—(Optional) Display the specified level of output.

Required Privilege Level view

List of Sample Output **show spanning-tree mstp configuration on page 390**

Output Fields Table 43 on page 390 lists the output fields for the **show spanning-tree mstp configuration** command. Output fields are listed in the approximate order in which they appear.

Table 43: show spanning-tree mstp configuration Output Fields

Field Name	Field Description
Context identifier	Internally generated identifier.
Region name	MSTP region name carried in the MSTP BPDUs.
Revision	Revision number of the MSTP configuration.
Configuration digest	Numerical value derived from the VLAN-to-instance mapping table.
MSTI	MSTI instance identifier.
Member VLANs	Identifiers for VLANs associated with the MSTI.

Sample Output

show spanning-tree mstp configuration

```
user@host> show spanning-tree mstp configuration
MSTP configuration information
Context identifier     : 0
Region name            : region1
Revision               : 0
Configuration digest   : 0xc92e7af9febb44d8df928b87f16b

MSTI     Member VLANs
   0 0-100,105-4094
   1 101-102
   2 103-104
```

show spanning-tree statistics

Syntax
show spanning-tree statistics
interface *interface-name*
vlan *vlan-id*
<brief | detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display STP statistics on an interface, or for a VLAN when VSTP is enabled.

Options
none—Display brief STP statistics.

brief | detail—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) The name of the interface.

vlan *vlan-id*—(Optional) The name of a VLAN.

PART 3

Layer 3 Protocols

CHAPTER 14

Layer 3 Protocols—Overview

Layer 3 Protocols Supported on J-EX Series Switches

J-EX Series switches support the Junos OS Layer 3 features and configuration statements listed in Table 45 on page 395:

Table 45: Supported Junos OS Layer 3 Protocol Statements and Features

Protocol	Notes	For More Information
BGP	Fully supported.	*Junos OS Routing Protocols Configuration Guide*
BFD	Fully supported.	*Junos OS Routing Protocols Configuration Guide*
ICMP	Fully supported.	*Junos OS Routing Protocols Configuration Guide*
IGMPv1, v2 and v3	Fully supported.	*Junos OS Multicast Protocols Configuration Guide*
IS-IS	Supported, with the exceptions noted in "Layer 3 Protocols Not Supported on J-EX Series Switches" on page 396.	*Junos OS Routing Protocols Configuration Guide*
MLD	Supported on J-EX4200 and J-EX8200 switches (MLD versions 1 and 2).	*Junos OS Multicast Protocols Configuration Guide*
MPLS	Supported, with the exceptions noted in "Layer 3 Protocols Not Supported on J-EX Series Switches" on page 396.	*Junos OS MPLS Applications Configuration Guide*
OSPFv1, v2 and v3	Supported, with the exceptions noted in "Layer 3 Protocols Not Supported on J-EX Series Switches" on page 396.	*Junos OS Routing Protocols Configuration Guide*

Table 45: Supported Junos OS Layer 3 Protocol Statements and Features *(continued)*

Protocol	Notes	For More Information
PIM	Fully supported on J-EX4200 and J-EX8200 switches.	*Junos OS Multicast Protocols Configuration Guide*
RIP	Fully supported.	*Junos OS Routing Protocols Configuration Guide*
RIPng	Fully supported.	*Junos OS Routing Protocols Configuration Guide*
SNMP	Fully supported.	*Junos OS Network Management Configuration Guide*
VRRP	Fully supported.	See Understanding VRRP on J-EX Series Switches. See also the *Junos OS High Availability Guide*.

- J-EX Series Switch Software Features Overview

Layer 3 Protocols Not Supported on J-EX Series Switches

J-EX Series switches do not support the Junos OS Layer 3 protocols and features listed in Table 46 on page 396:

Table 46: Junos OS Layer 3 Protocol Statements and Features That Are Not Supported

Feature	Configuration Statements Not Supported on J-EX Series Switches
DVMRP	• **dvmrp** and subordinate statements
Flow aggregation (cflowd)	• **cflow** and subordinate statements
GRE	• Not supported
IPSec	• **[edit services]** statements related to IPSec
IS-IS: • ES-IS • IPv6 in multicast routing protocols	• **clns-routing** statement • **ipv6-multicast** statement • **lsp-interval** statement • **label-switched-path** statement • **lsp-lifetime** statement • **te-metric** statement
Logical routers	• **logical-routers** and subordinate statements
MLD	• **mld** and all subordinate statements (J-EX4500 switches)

Table 46: Junos OS Layer 3 Protocol Statements and Features That Are Not Supported *(continued)*

Feature	Configuration Statements Not Supported on J-EX Series Switches
MPLS: • Fast Reroute (FRR) • Label Distribution Protocol (LDP) (except on J-EX8200 switches) • Layer 3 VPNs (except on J-EX8200 switches) • Multiprotocol BGP (MP-BGP) for VPN-IPv4 family • Pseudowire emulation (PWE3) • Routing policy statements related to Layer 3 VPNs and MPLS (except on J-EX8200 switches) • Virtual Private LAN Service (VPLS)	• **ldp** and all subordinate statements (except on J-EX8200 switches)
Network Address Translation (NAT)	• **nat** and subordinate statements • Policy statements related to NAT
OSPF	• **demand-circuit** statement • **label-switched-path** and subordinate statements • **neighbor** statement within an OSPF area • **peer-interface** and subordinate statements within an OSPF area • **sham-link** statement • **te-metric** statement
PIM DM	• Not supported on J-EX4500 switches
PIM: • IPv6	• **inet6** family (J-EX4500 switches)
Routing instances: • Routing instance forwarding	• **l2vpn** and subordinate statements (except on J-EX8200 switches) • **ldp** and subordinate statements (except on J-EX8200 switches) • **vpls** and subordinate statements
SAP and SDP	• **sap** and all subordinate statements
General routing options in the **routing-options** hierarchy: • MPLS and label-switched-paths	• **auto-export** and subordinate statements • **dynamic-tunnels** and subordinate statements • **lsp-next-hop** and subordinate statements • **multicast** and subordinate statements • **p2mp-lsp-next-hop** and subordinate statements • **route-distinguisher-id** statement (except on J-EX8200 switches)

Table 46: Junos OS Layer 3 Protocol Statements and Features That Are Not Supported *(continued)*

Feature	Configuration Statements Not Supported on J-EX Series Switches

Traffic sampling and fowarding in the **forwarding-options** hierarchy	• **accounting** and subordinate statements
	• **family mpls** and **family multiservice** under **hash-key** hierarchy
	• Under **monitoring** *group-name* **family inet output** hierarchy:
	  ◦ **cflowd** statement
	  ◦ **export-format-cflowd-version-5** statement
	  ◦ **flow-active-timeout** statement
	  ◦ **flow-export-destination** statement
	  ◦ **flow-inactive-timeout** statement
	  ◦ **interface** statement
	• **port-mirroring** statement (On J-EX Series switches, port mirroring is implemented using the **analyzer** statement.)
	• **sampling** and subordinate statements

Understanding Distributed Periodic Packet Management on J-EX Series Switches

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the J-EX Series Switch can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocols, and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on J-EX4200 switches) or the line cards (on J-EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Dell advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

Understanding IPsec Authentication for OSPF Packets on J-EX Series Switches

IP Security (IPsec) provides a secure way to authenticate senders and encrypt IP version 4 (IPv4) traffic between network devices. IPsec offers network administrators for J-EX Series Switches and their users the benefits of data confidentiality, data integrity, sender authentication, and anti-replay services.

IPsec is a framework for ensuring secure private communication over IP networks and is based on standards developed by the International Engineering Task Force (IETF). IPsec provides security services at the network layer of the Open Systems Interconnection (OSI) model by enabling a system to select required security protocols, determine the algorithms to use for the security services, and implement any cryptographic keys required to provide the requested services. You can use IPsec to protect one or more paths between a pair of hosts, between a pair of security gateways (such as switches), or between a security gateway and a host.

OSPF version 3 (OSPFv3), unlike OSPF version 2 (OSPFv2), does not have a built-in authentication method and relies on IPsec to provide this functionality. You can secure specific OSPFv3 interfaces and protect OSPFv3 virtual links.

Authentication Algorithms

Authentication is the process of verifying the identity of the sender. Authentication algorithms use a shared key to verify the authenticity of the IPsec devices. The Junos operating system (Junos OS) uses the following authentication algorithms:

- Message Digest 5 (MD5) uses a one-way hash function to convert a message of arbitrary length to a fixed-length message digest of 128 bits. Because of the conversion process, it is mathematically infeasible to calculate the original message by computing it backwards from the resulting message digest. Likewise, a change to a single character in the message will cause it to generate a very different message digest number.

  To verify that the message has not been tampered with, Junos OS compares the calculated message digest against a message digest that is decrypted with a shared key. Junos OS uses the MD5 hashed message authentication code (HMAC) variant that provides an additional level of hashing. MD5 can be used with an authentication header (AH) and Encapsulating Security Payload (ESP).

- Secure Hash Algorithm 1 (SHA-1) uses a stronger algorithm than MD5. SHA-1 takes a message of less than 264 bits in length and produces a 160-bit message digest. The

large message digest ensures that the data has not been changed and that it originates from the correct source. Junos OS uses the SHA-1 HMAC variant that provides an additional level of hashing. SHA-1 can be used with AH, ESP, and Internet Key Exchange (IKE).

Encryption Algorithms

Encryption encodes data into a secure format so that it cannot be deciphered by unauthorized users. As with authentication algorithms, a shared key is used with encryption algorithms to verify the authenticity of IPsec devices. Junos OS uses the following encryption algorithms:

- Data Encryption Standard cipher-block chaining (DES-CBC) is a symmetric secret-key block algorithm. DES uses a key size of 64 bits, where 8 bits are used for error detection and the remaining 56 bits provide encryption. DES performs a series of simple logical operations on the shared key, including permutations and substitutions. CBC takes the first block of 64 bits of output from DES, combines this block with the second block, feeds this back into the DES algorithm, and repeats this process for all subsequent blocks.
- Triple DES-CBC (3DES-CBC) is an encryption algorithm that is similar to DES-CBC but provides a much stronger encryption result because it uses three keys for 168-bit (3 x 56-bit) encryption. 3DES works by using the first key to encrypt the blocks, the second key to decrypt the blocks, and the third key to reencrypt the blocks.

IPsec Protocols

IPsec protocols determine the type of authentication and encryption applied to packets that are secured by the switch. Junos OS supports the following IPsec protocols:

- AH—Defined in *RFC 2402*, AH provides connectionless integrity and data origin authentication for IPv4. It also provides protection against replays. AH authenticates as much of the IP header as possible, as well as the upper-level protocol data. However, some IP header fields might change in transit. Because the value of these fields might not be predictable by the sender, they cannot be protected by AH. In an IP header, AH can be identified with a value of 51 in the Protocol field of an IPv4 packet.
- ESP—Defined in *RFC 2406*, ESP can provide encryption and limited traffic flow confidentiality or connectionless integrity, data origin authentication, and an anti-replay service. In an IP header, ESP can be identified with a value of 50 in the Protocol field of an IPv4 packet.

Security Associations

An IPsec consideration is the type of security association (SA) that you wish to implement. An SA is a set of IPsec specifications that are negotiated between devices that are establishing an IPsec relationship. These specifications include preferences for the type of authentication, encryption, and IPsec protocol to be used when establishing the IPsec connection. An SA can be either unidirectional or bidirectional, depending on the choices made by the network administrator. An SA is uniquely identified by a Security Parameter

Index (SPI), an IPv4 or IPv6 destination address, and a security protocol (AH or ESP) identifier.

IPsec Modes

Junos OS supports the following IPsec modes:

- Tunnel mode is supported for both AH and ESP in Junos OS. In tunnel mode, the SA and associated protocols are applied to tunneled IPv4 or IPv6 packets. For a tunnel mode SA, an outer IP header specifies the IPsec processing destination and an inner IP header specifies the ultimate destination for the packet. The security protocol header appears after the outer IP header and before the inner IP header. In addition, there are slight differences for tunnel mode when you implement it with AH and ESP:
  - For AH, portions of the outer IP header are protected, as well as the entire tunneled IP packet.
  - For ESP, only the tunneled packet is protected, not the outer header.

  When one side of an SA is a security gateway (such as a switch), the SA must use tunnel mode. However, when traffic (for example, SNMP commands or BGP sessions) is destined for a switch, the system acts as a host. Transport mode is allowed in this case because the system does not act as a security gateway and does not send or receive transit traffic.

  

  NOTE: **Tunnel mode is not supported for OSPF v3 control packet authentication.**

- Transport mode provides an SA between two hosts. In transport mode, the protocols provide protection primarily for upper-layer protocols. A transport mode security protocol header appears immediately after the IP header and any options and before any higher-layer protocols (for example, TCP or UDP). There are slight differences for transport mode when you implement it with AH and ESP:
  - For AH, selected portions of the IP header are protected, as well as selected portions of the extension headers and selected options within the IPv4 header.
  - For ESP, only the higher-layer protocols are protected, not the IP header or any extension headers preceding the ESP header.

CHAPTER 15

Configuring Layer 3 Protocols

Configuring BGP Sessions (J-Web Procedure)

You can use the J-Web interface to create BGP peering sessions on a routing device.

NOTE: To configure BGP sessions, you must have a license for BGP installed on the J-EX Series switch.

To configure a BGP peering session:

1. Select **Configure** > **Routing** > **BGP**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds a BGP group. Enter information into the configuration page as described in Table 47 on page 404.
   - **Edit**—Modifies an existing BGP group. Enter information into the configuration page as described in Table 47 on page 404.
   - **Delete**—Deletes an existing BGP group.
   - **Disable**—Disables BGP configuration.
3. To modify BGP global settings, click **Edit** in the Global Information section. Enter information as described in Table 48 on page 406.

Table 47: BGP Routing Configuration Summary

Field	Function	Your Action
General tab		
Group Type	Specifies whether the group is an internal BGP (IBGP) group or an external BGP (EBGP) group.	Select the option: **Internal** or **External**.
Group Name	Specifies the name for the group.	Type a new name or select and edit the name.
ASN	Sets the unique numeric identifier of the AS in which the routing device is configured.	Type the routing device's 32-bit AS number, in dotted decimal notation. If you enter an integer, the value is converted to a 32-bit equivalent. For example, if you enter **3**, the value assigned to the AS is **0.0.0.3**.
Preference	Specifies the degree of preference for an external route. The route with the highest local preference value is preferred.	Type or select and edit the value.
Cluster Id	Specifies the cluster identifier to be used by the route reflector cluster in an internal BGP group.	Type or select and edit the IPv6 or IPv4 address to be used as the identifier.
Description	Specifies the text description of the global, group, or neighbor configuration.	Type or select and edit the description.
Damping	Specifies whether route flap damping is enabled or not.	To enable route flap damping, select the check box. To disable route flap damping do not select the check box.
Advertise Inactive Routes	Specifies whether BGP advertises the best route even if the routing table did not select it to be an active route.	To enable advertising inactive routes, select the check box. To disable advertising inactive routes, do not select the check box.

Table 47: BGP Routing Configuration Summary *(continued)*

Field	Function	Your Action
Advertise Peer AS Routes	Specifies whether to disable the default behavior of suppressing AS routes.	To enable advertising peer AS routes, select the check box. To disable advertising peer AS routes, do not select the check box.
Neighbors tab		
Dynamic Neighbors	Configures a neighbor (peer).	Type the IPv4 address of the peer.
Static Neighbors	Configures the system's peers statically.	To configure a static neighbor: 1. Specify the IP address. 2. Specify the address of the local end of a BGP session. 3. Specify the degree of preference for an external route. 4. Enter a description. 5. Specify the hold-time value to use when negotiating a connection with the peer. 6. Specify how long a route must be present in the routing table before it is exported to BGP. Use this time delay to help bundle routing updates. 7. Select **Passive** if you do not want to send active open messages to the peer. 8. Select the option to compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer. 9. Specify an import policy and export policy. 10. Click **OK**.
Policies tab		
Import Policy	Specifies one or more routing policies to routes being imported into the routing table from BGP.	Click **Add** to add an import policy. Select the policy and click **OK**. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Select the policy and click **Remove**.
Export Policy	Specifies one or more policies to routes being exported from the routing table into BGP.	Click **Add** to add an export policy. Select the policy and click **OK**. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Select the policy and click **Remove**.

Table 48: BGP Global Settings

Field	Function	Your Action
General tab		
Router ASN	Specifies the routing device's AS number.	Type or select and edit the value.
Router Identifier	Specify the routing device's IP address.	Type or select and edit the IP address.
BGP Status	Enables or disables BGP.	• To enable BGP, select **Enabled**. • To disable BGP, select **Disabled**.
Description	Describes of the global, group, or neighbor configuration.	Type or select and edit the description.
Confederation Number	Specifies the routing device's confederation AS number.	Type or select and edit the value.
Confederation Members	Specifies the AS numbers for the confederation members.	To add a member AS number, click **Add** and enter the number in the **Member ASN** box. Click **OK**. To modify a confederation member's AS number, select the member click **Edit** and, enter the number and click **OK**. To delete a confederation member, select the member and click **Remove**.
Advance Options	You can configure the following: • **Keep routes**—Specifies whether routes learned from a BGP peer must be retained in the routing table even if they contain an AS number that was exported from the local AS. • **TCP MSS**—Configures the maximum segment size (MSS) for the TCP connection for BGP neighbors. • **MTU Discovery**—Select to configure MTU discovery. • **Remove Private ASN**—Select to have the local system strip private AS numbers from the AS path when advertising AS paths to remote systems. • **Graceful Restart**—Specifies the time period when the restart is expected to be complete. Specify the maximum time that stale routes are kept during restart. • **Multihop**—Configures the maximum time-to-live (TTL) value for the TTL in the IP header of BGP packets. • **Authentication Type**—Select the authentication algorithm: None, MD5, SHA1, AES.	Select **All** or **None** to configure Keep Routes. Enter a value in the **TCP MSS** box. Click to enable **MTU Discovery**. Click to enable **Remove Private ASN**. Enter the time period for a graceful restart and the maximum time that stale routes must be kept. To configure Multihop, select **Nexthop Change** to allow unconnected third-party next hops. Enter a TTL value. Select the authentication algorithm. If you select None, specify an authentication key (password).
Policies tab		

Table 48: BGP Global Settings *(continued)*

Field	Function	Your Action
Import Policy	Specifies one or more routing policies to routes being imported into the routing table from BGP.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Specifies one or more policies to routes being exported from the routing table into BGP.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.
Trace Options tab		
File Name	Specifies the name of the file to receive the output of the tracing operation.	Type or select and edit the name.
Number of Files	Specifies the maximum number of trace files.	Type or select and edit the value.
File Size	Specifies the maximum size for each trace file.	Type or select and edit the value.
World Readable	Specifies whether the trace file can be read by any user or not.	Select **True** to allow any user to read the file. Select **False** to disallow all users being able to read the file.
Flags	Specifies the tracing operation to perform.	Select a value from the list.

Configuring an OSPF Network (J-Web Procedure)

You can use the J-Web interface to create multiarea OSPF networks on a J-EX Series switch.

To configure a multiarea OSPF network:

1. Select **Configure** > **Routing** > **OSPF**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds an OSPF area. Enter information into the configuration page as described in Table 49 on page 408.
   - **Edit**—Modifies an existing OSPF area. Enter information into the configuration page as described in Table 49 on page 408.
   - **Delete**—Deletes an existing OSPF area.
3. To modify OSPF global settings, click **Edit**. Enter information as described in Table 50 on page 410.
4. To disable OSPF, click **Disable**.

Table 49: OSPF Routing Configuration Summary

Field	Function	Your Action
General tab		
Area Id	Uniquely identifies the area within its AS.	Type a 32-bit numeric identifier for the area. Type an integer or select and edit the value. If you enter an integer, the value is converted to a 32-bit equivalent. For example, if you enter 3, the value assigned to the area is **0.0.0.3**.

Table 49: OSPF Routing Configuration Summary *(continued)*

Field	Function	Your Action
Area Ranges	Specifies a range of IP addresses for an area when sending summary link advertisements (within an area).	To add a range: 1. Click **Add**. 2. Type the area range. 3. Specify the subnet mask. 4. To override the metric for the IP address range, type a specific metric value. 5. If you do not want to display the routes that are contained within a summary, select **Restrict advertisements of this area range**. 6. If you want a summary of a route to be advertised only when an exact match is made with the configured summary range, select **Enforce exact match for advertisement of this area range**. 7. Click **OK**. To modify an existing area range, select the area range, click **Edit**, and edit the value. Click **OK**. To delete an area range, select the area range and click **Delete**.
Area Type	Designates the type of OSPF area. • **regular**—A regular OSPF area, including the backbone area • **stub**—A stub area • **nssa**—A not-so-stubby area (NSSA)	Select the type of OSPF area you are creating from the list. If you select **stub**: 1. Enter the default metric. 2. To flood summary LSAs into the stub area, select the check box. If you select **nssa**: 1. Specify the metric type. 2. Enter the default metric. 3. To flood summary LSAs into the nssa area, select the check box. 4. To flood Type-7 LSAs into the nssa area, select the check box.
Interfaces tab		

Table 49: OSPF Routing Configuration Summary *(continued)*

Field	Function	Your Action
Interfaces	Specifies the interfaces to be associated with the OSPF configuration	To associate an interface with the configuration, select the interface from the list, select **Associate** and click **OK**. To edit an interface's configuration: 1. Select the interface from the list and click **Edit**. 2. Specify the cost of an OSPF interface. 3. Specify the traffic engineering metric. 4. Specify how often the routing device sends hello packets from the interface. 5. Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors. 6. To enable OSPF on the interface, select the check box. 7. To inform other protocols about neighbor down events, select the check box. 8. To treat the interface as a secondary interface, select the check box. 9. To only advertise OSPF, select the check box. 10. Click **OK**.
Policies tab		
Import Policy	Specifies one or more policies to control which routes learned from an area are used to generate summary link-state advertisements (LSAs) into other areas.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Specifies one or more policies to control which summary LSAs are flooded into an area.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.

Table 50: Edit OSPF Global Settings

Field	Function	Your Action
General tab		
Router Id	Specifies the ID for the routing device.	Type or select and edit the value.
RIB Group	Installs the routes learned from OSPF routing instances into routing tables in the OSPF routing table group.	Select a value.
Internal Route Preference	Specifies the route preference for internal groups.	Type or select and edit the value.

Table 50: Edit OSPF Global Settings *(continued)*

Field	Function	Your Action
External Route Preference	Specifies the route preference for external groups.	Type or select and edit the value.
Graceful Restart	Configures graceful restart for OSPF.	To configure graceful restart: 1. Specify the estimated time to send out purged grace LSAs over all the interfaces. 2. Specified the estimated time to reacquire a full OSPF neighbor from each area. 3. To disable **No Strict LSA Checking**, select the check box. 4. To disable graceful restart helper capability, select the check box. Helper mode is enabled by default. 5. Click **OK**.
SPF Options	Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a hold-down interval after the SPF algorithm runs the maximum number of times.	To configure SPF: 1. Specify the time interval between the detection of a topology change and when the SPF algorithm runs. 2. Specify the time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession. 3. Specify the maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the hold-down interval begins.
Policies tab		
Import Policy	Specifies one or more policies to control which routes learned from an area are used to generate summary link-state advertisements (LSAs) into other areas.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Specifies one or more policies to control which summary LSAs are flooded into an area.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.
Trace Options tab		
File Name	Specifies the name of the file to receive the output of the tracing operation.	Type or select and edit the name.
Number of Files	Specifies the maximum number of trace files.	Type or select and edit the name.
File Size	Specifies the maximum size for each trace file.	Type or select and edit the name.

Table 50: Edit OSPF Global Settings *(continued)*

Field	Function	Your Action
World Readable	Specifies whether the trace file can be read by any user or not.	Select **True** to allow any user to read the file. Select **False** to disallow all users being able to read the file.
Flags	Specifies the tracing operation to perform.	Select a value from the list.

Configuring a RIP Network (J-Web Procedure)

You can use the J-Web interface to create RIP networks.

To configure a RIP network:

1. Select **Configure** > **Routing** > **RIP**.

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Configures a RIP instance. Enter information into the RIP Configuration page as described in Table 51 on page 412.
   - **Edit**—Modifies an existing RIP instance. Enter information into the configuration page for RIP as described in Table 51 on page 412.
   - **Delete**—Deletes an existing RIP instance.
3. To modify RIP global settings, click **Edit**. Enter information in the configuration as described in Table 52 on page 413.

Table 51: RIP Routing Configuration Summary

Field	Function	Your Action
General tab		
Routing instance name	Specifies a name for the routing instance.	Type or select and edit the name.

Table 51: RIP Routing Configuration Summary *(continued)*

Field	Function	Your Action
Preference	Specifies the preference of external routes learned by RIP as compared to those learned from other routing protocols.	Type or select and edit the value.
Metric Out	Specifies the metric value to add to routes transmitted to the neighbor.	Type or select and edit the value.
Update interval	Specifies an update time interval to periodically send out routes learned by RIP to neighbors.	Type or select and edit the value.
Route timeout	Specifies the route timeout interval for RIP.	Type or select and edit the value.
Policies tab		
Import Policy	Applies one or more policies to routes being imported into the local routing device from the neighbors.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Applies a policy to routes being exported to the neighbors.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.
Neighbors tab		
RIP-Enabled Interfaces	Selects the interfaces to be associated with the RIP instance.	To enable RIP on an interface, click the check box next to the interface name. Click Edit if you want to modify an interface's settings.

Table 52: Edit RIP Global Settings

Field	Function	Your Action
General tab		
Send	Specifies RIP send options.	Select a value.
Receive	Configure RIP receive options.	Select a value.
Route timeout (sec)	Specifies the route timeout interval for RIP.	Type a value.
Update interval (sec)	Specifies the update time interval to periodically send out routes learned by RIP to neighbors.	Type or select and edit the value.
Hold timeout (sec)	Specifies the time period the expired route is retained in the routing table before being removed.	Type or select and edit the value.

Table 52: Edit RIP Global Settings *(continued)*

Field	Function	Your Action
Metric in	Specifies the metric to add to incoming routes when advertising into RIP routes that were learned from other protocols.	Type or select and edit the value.
RIB Group	Specifies a routing table group to install RIP routes into multiple routing tables.	Select and edit the name of the routing table group.
Message size	Specifies the number of route entries to be included in every RIP update message.	Type or select and edit the value.
Check Zero	Specifies whether the reserved fields in a RIP packet are zero. Options are: • **check-zero**—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications. • **no-check-zero**—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.	Select a value.
Graceful switchover	Configures graceful switchover for OSPF.	To disable graceful restart, select **Disable**. Type or select and edit the estimated time for the restart to finish, in seconds.
Authentication Type	Specifies the type of authentication for RIP route queries received on an interface. Options are: • None • MD5 • Simple	Select the authentication type. Enter the authentication key for MD5.
Policies tab		
Import Policy	Applies one or more policies to routes being imported into the local routing device from the neighbors.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Applies a policy to routes being exported to the neighbors.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.

Table 52: Edit RIP Global Settings *(continued)*

Field	Function	Your Action
Trace Options tab		
File Name	Specifies the name of the file to receive the output of the tracing operation.	Type or select and edit the name.
Number of Files	Specifies the maximum number of trace files.	Type or select and edit the name.
File Size	Specifies the maximum size for each trace file.	Type or select and edit the name.
World Readable	Specifies whether the trace file can be read by any user or not.	Select **True** to allow any user to read the file. Select **False** to disallow all users being able to read the file.
Flags	Specifies the tracing operation to perform.	Select a value from the list.

Configuring Static Routing (CLI Procedure)

Static routes are routes that are manually configured and entered into the routing table. Dynamic routes, in contrast, are learned by the J-EX Series switch and added to the routing table using a protocol such as OSPF or RIP.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) *preference* value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, **0** is the lowest and **255** is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:

```
[edit]
user@switch# set routing–options static route 0.0.0.0/0 next-hop 10.0.1.1
```

- To configure a static route and specify the next address to be used when routing traffic to the static route:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
```

- To always keep the static route in the forwarding table:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 retain
```

- To prevent the static route from being readvertised:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
```

- To remove inactive routes from the forwarding table:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 active
```

Configuring Static Routing (J-Web Procedure)

You can use the J-Web interface to configure static routes for J-EX Series switches.

To configure static routes:

1. Select **Configure** > **Routing** > **Static Routing**. The Static Routing page displays details of the configured routes.

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:

   - **Add**—To configure a route. Enter information into the routing page as described in Table 53 on page 417.
   - **Edit**—To modify an existing route. Enter information into the routing page as described in Table 53 on page 417.
   - **Delete**—To delete an existing route.

Table 53: Static Routing Configuration Summary

Field	Function	Your Action
Default Route		
Default Route	Specifies the default gateway for the switch. NOTE: IPv6 is not supported on J-EX4500 switches.	To specify an IPv4 address: 1. Select **IPv4**. 2. Type an IP address—for example, **10.10.10.10**. 3. Enter the subnet mask or address prefix. For example, 24 bits represents **255.255.255.0**. To specify an IPv6 address: 1. Select **IPv6**. 2. Type an IP address—for example, **2001:ab8:85a3::8a2e:370:7334**. 3. Enter the subnet mask or address prefix.
Static Routes		

Table 53: Static Routing Configuration Summary *(continued)*

Field	Function	Your Action
Nexthop	Specifies the next-hop address or addresses to be used when routing traffic to the static route.	To add an address: 1. Click **Add**. 2. In the IP address dialog, enter the IP address. NOTE: If a route has multiple next-hop addresses, traffic is routed across each address in round-robin fashion. 3. Click **OK**. To delete a next-hop address, select it from the list and click **Delete**.

Configuring Routing Policies (J-Web Procedure)

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes are advertised in the protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table on the routing device.

To configure routing policies for a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Routing** > **Policies**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Global Options**—Configures global options for policies. Enter information into the configuration page as described in Table 54 on page 419.
   - **Add**—Configures a new policy. Select **New** and specify a policy name. To add terms, enter information into the configuration page as described in Table 55 on page 420. Select **Clone** to create a copy of an existing policy.

- **Edit**—Edits an existing policy. To modify an existing term, enter information into the configuration page as described in Table 55 on page 420.
- **Term Up**—Moves a term up in the list.
- **Term Down**—Moves a term down in the list.
- **Delete**—Deletes the selected policy.
- **Test Policy**—Tests the policy. Use this option to check whether the policy produces the results that you expect.

Table 54: Policies Global Configuration Parameters

Field	Function	Your Action
Prefix List	Specifies a list of IPv4 address prefixes for use in a routing policy statement.	To add a prefix list: 1. Click **Add**. 2. Enter a name for the prefix list. 3. To add an IP address, click **Add**. 4. Enter the IP address and the subnet mask and click **OK**. 5. Click **OK**. To edit a prefix list, click **Edit**. Edit the settings and click **OK**. To delete a prefix list, select it and click **Delete**.
BGP Community	Specifies a BGP community.	To add a BGP community: 1. Click **Add**. 2. Enter a name for the community. 3. To add a community, click **Add**. 4. Enter the community ID and click **OK**. 5. Click **OK**. To edit a BGP community, click **Edit**. Edit the settings and click **OK**. To delete a BGP community, select it and click **Delete**.
AS Path	Specifies an AS path. This is applicable to BGP only.	To add an AS path: 1. Click **Add**. 2. Enter the AS path name. 3. Enter the regular expression and click **OK**. 4. Click **OK**. To edit an AS path, click **Edit**. Edit the settings and click **OK**. To delete an AS path, select it and click **Delete**.

Table 55: Terms Configuration Parameters

Field	Function	Your Action
Term Name	Specifies a term name.	Type or select and edit the name.
Source tab		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list
Preference	Specifies the individual preference value for the route.	Type or select and edit the value.
Metric	Specifies a metric value. You can specify up to four metric values.	Type or select and edit the value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select **Add** > **Interface**. Select the interface from the list. To add an address, select **Add** > **Address**. Select the address from the list. To remove an interface, select it and click **Remove**.
Prefix List	Specifies a named list of IP addresses. You can specify an exact match with incoming routes.	Click **Add**. Select the prefix list from the list and click **OK**. To remove a prefix list, select it and click **Remove**.
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click **Add** and select the protocol from the list. To remove a protocol, select it and click **Remove**.
Policy	Specifies the name of a policy to evaluate as a subroutine.	Click **Add**. Select the policy from the list. To remove a policy, select it and click **Remove**.
More	Specifies advanced configuration options for policies.	Click **More** for advanced configuration.
OSPF Area ID	Specifies the area identifier.	Type the IP address.
BGP Origin	Specifies the origin of the AS path information.	Select a value from the list.
Local Preference	Specifies the BGP local preference.	Type a value.
Route	Specifies the type of route.	Select **External**. Select the OSPF type from the list.

Table 55: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
AS Path	Specifies the name of an AS path regular expression.	Click **Add**. Select the AS path from the list.
Community	Specifies the name of one or more communities.	Click **Add**. Select the community from the list.
Destination tab		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list.
Preference	Specifies the individual preference value for the route.	Type a value.
Metric	Specifies a metric value.	Type a value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select **Add** > **Interface**. Select the interface from the list. To add an address, select **Add** > **Address**. Select the address from the list. To delete an interface, select it and click **Remove**.
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click **Add** and select the protocol from the list. To delete a protocol, select it and click **Remove**.
Action tab		
Action	Specifies the action to take if the conditions match.	Select a value from the list.
Default Action	Specifies that any action that is intrinsic to the protocol is overridden. This action is also nonterminating, so that various policy terms can be evaluated before the policy is terminated.	Select a value from the list.
Next	Specifies the default control action if a match occurs, and there are no further terms in the current routing policy.	Select a value from the list.
Priority	Specifies a priority for prefixes included in an OSPF import policy. Prefixes learned through OSPF are installed in the routing table based on the priority assigned to the prefixes.	Select a value from the list.
BGP Origin	Specifies the BGP origin attribute.	Select a value from the list.

Table 55: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
AS Path Prepend	Affixes an AS number at the beginning of the AS path. The AS numbers are added after the local AS number has been added to the path. This action adds an AS number to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS number is placed within a confederation sequence. Otherwise, the affixed AS number is placed with a nonconfederation sequence.	Enter a value.
AS Path Expand	Extracts the last AS number in the existing AS path and affixes that AS number to the beginning of the AS path *n* times, where *n* is a number from 1 through 32. The AS number is added before the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS numbers are placed within a confederation sequence. Otherwise, the affixed AS numbers are placed within a nonconfederation sequence. This option is typically used in non-IBGP export policies.	Select the type and type a value.
Load Balance Per Packet	Specifies that all next-hop addresses in the forwarding table must be installed and have the forwarding table perform per-packet load balancing. This policy action allows you to optimize VPLS traffic flows across multiple paths.	Select the check box to enable the option.
Tag	Specifies the tag value. The tag action sets the 32-bit tag field in OSPF external link-state advertisement (LSA) packets.	Select the action and type a value.
Metric	Changes the metric (MED) value by the specified negative or positive offset. This action is useful only in an external BGP (EBGP) export policy.	Select the action and type a value.
Route	Specifies whether the route is external.	Select the **External** check box to enable the option, and select the OSPF type.
Preference	Specifies the preference value.	Select the preference action and type a value.
Local Preference	Specifies the BGP local preference attribute.	Select the action and type a value.
Class of Service	Specifies and applies the class-of-service parameters to routes installed into the routing table. • Source class The value entered here maintains the packet counts for a route passing through your network, based on the source address. • Destination class The value entered here maintains packet counts for a route passing through your network, based on the destination address in the packet. • Forwarding class	Type the source class. Type the destination class. Type the forwarding class.

Configuring Distributed Periodic Packet Management on a J-EX Series Switch (CLI Procedure)

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes on the J-EX Series switch can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on J-EX4200 switches) or the line cards (on J-EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

BEST PRACTICE: **We recommend that, generally, you disable distributed PPM only if Dell advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.**

This topic describes:

- Disabling or Enabling Distributed Periodic Packet Management Globally on page 423
- Disabling or Enabling Distributed Periodic Packet Management for LACP Packets on page 424

Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:

```
[edit routing-options]
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:

```
[edit routing-options]
user@switch# delete ppm no-delegate-processing
```

Disabling or Enabling Distributed Periodic Packet Management for LACP Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:

```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:

```
[edit protocols]
user@switch# delete lacp ppm centralized
```

Using IPsec to Secure OSPFv3 Networks (CLI Procedure)

OSPF version 3 (OSPFv3) does not have a built-in authentication method and relies on IP Security (IPsec) to provide this functionality. You can use IPsec to secure OSPFv3 interfaces on J-EX Series switches.

This topic includes:

Configuring Security Associations

When you configure a security association (SA), include your choices for authentication, encryption, direction, mode, protocol, and security parameter index (SPI).

To configure a security association:

1. Specify a name for the security association:

   ```
   [edit security ipsec]
   user@switch# set security-association sa-name
   ```

2. Specify the mode of the security association:

   ```
   [edit security ipsec security-association sa-name]
   user@switch# set mode transport
   ```

3. Specify the type of security association:

   ```
   [edit security ipsec security-association sa-name]
   user@switch# set type manual
   ```

4. Specify the direction of the security association:

   ```
   [edit security ipsec security-association sa-name]
   user@switch# set direction bidirectional
   ```

5. Specify the value of the security parameter index:

```
[edit security ipsec security-association sa-name]
user@switch# set spi spi-value
```

6. Specify the type of authentication to be used:

```
[edit security ipsec security-association sa-name]
user@switch# set authentication algorithm type
```

7. Specify the encryption algorithm and key:

```
[edit security ipsec security-association sa-name]
user@switch# set encryption algorithm algorithm key type
```

Securing OPSFv3 Networks

You can secure the OSPFv3 network by applying the SA to the OSPFv3 configuration.

To secure the OSPFv3 network:

```
[edit protocols ospf3 area area-number interface interface-name]
user@switch# set ipsec-sa sa-name
```

CHAPTER 16

Verifying Layer 3 Protocols Configuration

Monitoring BGP Routing Information

Purpose Use the monitoring functionality to monitor BGP routing information on the routing device.

Action To view BGP routing information in the J-Web interface, select **Monitor** > **Routing** > **BGP Information**.

To view BGP routing information in the CLI, enter the following commands:

- **show bgp summary**
- **show bgp neighbor**

Meaning Table 56 on page 427 summarizes key output fields in the BGP routing display in the J-Web interface.

Table 56: Summary of Key BGP Routing Output Fields

Field	Values	Additional Information
BGP Peer Summary		
Total Groups	Number of BGP groups.	
Total Peers	Number of BGP peers.	
Down Peers	Number of unavailable BGP peers.	
Unconfigured Peers	Address of each BGP peer.	
RIB Summary tab		
RIB Name	Name of the RIB group.	

Table 56: Summary of Key BGP Routing Output Fields *(continued)*

Field	Values	Additional Information
Total Prefixes	Total number of prefixes from the peer, both active and inactive, that are in the routing table.	
Active Prefixes	Number of prefixes received from the EBGP peers that are active in the routing table.	
Suppressed Prefixes	Number of routes received from EBGP peers currently inactive because of damping or other reasons.	
History Prefixes	History of the routes received or suppressed.	
Dumped Prefixes	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	
Pending Prefixes	Number of pending routes.	
State	Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete.	
BGP Neighbors		
Details	Click this button to view the selected BGP neighbor details.	
Peer Address	Address of the BGP neighbor.	
Autonomous System	AS number of the peer.	

Table 56: Summary of Key BGP Routing Output Fields *(continued)*

Field	Values	Additional Information
Peer State	Current state of the BGP session: • **Active**—BGP is initiating a TCP connection in an attempt to connect to a peer. If the connection is successful, BGP sends an open message. • **Connect**—BGP is waiting for the TCP connection to become complete. • **Established**—The BGP session has been established, and the peers are exchanging BGP update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.	Generally, the most common states are **Active**, which indicates a problem establishing the BGP connection, and **Established**, which indicates a successful session setup. The other states are transition states, and BGP sessions normally do not stay in those states for extended periods of time.
Elapsed Time	Elapsed time since the peering session was last reset.	
Description	Description of the BGP session.

Monitoring OSPF Routing Information

Purpose Use the monitoring functionality to monitor OSPF routing information on routing devices.

Action To view OSPF routing information in the J-Web interface, select **Monitor** > **Routing** > **OSPF Information**.

To view OSPF routing information in the CLI, enter the following CLI commands:

- **show ospf neighbor**
- **show ospf interface**
- **show ospf statistics**

Meaning Table 57 on page 430 summarizes key output fields in the OSPF routing display in the J-Web interface.

Table 57: Summary of Key OSPF Routing Output Fields

Field	Values	Additional Information
OSPF Interfaces		
Interface	Name of the interface running OSPF.	
State	State of the interface: **BDR**, **Down**, **DR**, **DRother**, **Loop**, **PtToPt**, or **Waiting**.	The **Down** state, indicating that the interface is not functioning, and **PtToPt** state, indicating that a point-to-point connection has been established, are the most common states.
Area	Number of the area that the interface is in.	
DR ID	Address of the area's designated device.	
BDR ID	Address of the area's backup designated device.	
Neighbors	Number of neighbors on this interface.	
Adjacency Count	Number of devices in the area using the same area identifier.	
Stub Type	The areas into which OSPF does not flood AS external advertisements	
Passive Mode	In this mode the interface is present on the network but does not transmit or receive packets.	
Authentication Type	The authentication scheme for the backbone or area.	
Interface Address	The IP address of the interface.	
Address Mask	The subnet mask or address prefix.	
MTU	The maximum transmission unit size.	
Interface Cost	The path cost used to calculate the root path cost from any given LAN segment is determined by the total cost of each link in the path.	
Hello Interval	How often the routing device sends hello packets out of the interface.	
Dead Interval	The interval during which the routing device receives no hello packets from the neighbor.	
Retransmit Interval	The interval for which the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors.	

Table 57: Summary of Key OSPF Routing Output Fields *(continued)*

Field	Values	Additional Information
OSPF Statistics		
Packets tab		
Sent	Displays the total number of packets sent.	
Received	Displays the total number of packets received.	
Details tab		
Flood Queue Depth	Number of entries in the extended queue.	
Total Retransmits	Number of retransmission entries enqueued.	
Total Database Summaries	Total number of database description packets.	
OSPF Neighbors		
Address	Address of the neighbor.	
Interface	Interface through which the neighbor is reachable.	
State	State of the neighbor: **Attempt**, **Down**, **Exchange**, **ExStart**, **Full**, **Init**, **Loading**, or **2way**.	Generally, only the **Down** state, indicating a failed OSPF adjacency, and the **Full** state, indicating a functional adjacency, are maintained for more than a few seconds. The other states are transitional states that a neighbor is in only briefly while an OSPF adjacency is being established.
ID	ID of the neighbor.	
Priority	Priority of the neighbor to become the designated router.	
Activity Time	The activity time.	
Area	Area that the neighbor is in.	
Options	Option bits received in the hello packets from the neighbor.	
DR Address	Address of the designated router.	
BDR Address	Address of the backup designated router.	
Uptime	Length of time since the neighbor came up.	

Table 57: Summary of Key OSPF Routing Output Fields *(continued)*

Field	Values	Additional Information
Adjacency	Length of time since the adjacency with the neighbor was established.	

Related Documentation

Monitoring RIP Routing Information

Purpose Use the monitoring functionality to monitor RIP routing on routing devices.

Action To view RIP routing information in the J-Web interface, select **Monitor** > **Routing** > **RIP Information**.

To view RIP routing information in the CLI, enter the following CLI commands:

- **show rip statistics**
- **show rip neighbor**

Meaning Table 58 on page 432 summarizes key output fields in the RIP routing display in the J-Web interface.

Table 58: Summary of Key RIP Routing Output Fields

Field	Values	Additional Information
RIP Statistics		
Protocol Name	The RIP protocol name.	
Port number	The port on which RIP is enabled.	
Hold down time	The interval during which routes are neither advertised nor updated.	
Global routes learned	Number of RIP routes learned on the logical interface.	
Global routes held down	Number of RIP routes that are not advertised or updated during the hold-down interval.	
Global request dropped	Number of requests dropped.	
Global responses dropped	Number of responses dropped.	

Table 58: Summary of Key RIP Routing Output Fields *(continued)*

Field	Values	Additional Information
RIP Neighbors		
Neighbor	Name of the RIP neighbor.	This value is the name of the interface on which RIP is enabled. Click the name to see the details for this neighbor.
State	State of the RIP connection: **Up** or **Dn** (Down).	
Source Address	Local source address.	This value is the configured address of the interface on which RIP is enabled.
Destination Address	Destination address.	This value is the configured address of the immediate RIP adjacency.
Send Mode	The mode of sending RIP messages.	
Receive Mode	The mode in which messages are received.	
In Metric	Value of the incoming metric configured for the RIP neighbor.

Monitoring Routing Information

Purpose Use the monitoring functionality to view the **inet.0** routing table on the routing device.

Action To view the routing tables in the J-Web interface, select **Monitor** > **Routing** > **Route Information**. Apply a filter or a combination of filters to view messages. You can use filters to display relevant events.

To view the routing table in the CLI, enter the following commands in the CLI interface:

- **show route terse**
- **show route detail**

Meaning Table 59 on page 434 describes the different filters, their functions, and the associated actions.

Table 60 on page 434 summarizes key output fields in the routing information display.

Table 59: Filtering Route Messages

Field	Function	Your Action
Destination Address	Specifies the destination address of the route.	Enter the destination address.
Protocol	Specifies the protocol from which the route was learned.	Enter the protocol name.
Next hop address	Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.	Enter the next hop address.
Receive protocol	Specifies the dynamic routing protocol using which the routing information was received through a particular neighbor.	Enter the routing protocol.
Best route	Specifies only the best route available.	Select the view details of the best route.
Inactive routes	Specifies the inactive routes.	Select the view details of inactive routes.
Exact route	Specifies the exact route.	Select the view details of the exact route.
Hidden routes	Specifies the hidden routes.	Select the view details of hidden routes.
Search	Applies the specified filter and displays the matching messages.	To apply the filter and display messages, click **Search**.

Table 60: Summary of Key Routing Information Output Fields

Field	Values	Additional Information
Static Route Addresses	The list of static route addresses.	
Protocol	Protocol from which the route was learned: **Static**, **Direct**, **Local**, or the name of a particular protocol.	
Preference	The preference is the individual preference value for the route.	The route preference is used as one of the route selection criteria.

Table 60: Summary of Key Routing Information Output Fields *(continued)*

Field	Values	Additional Information
Next-Hop	Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.	If a next hop is listed as **Discard**, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the **discard** attribute has been set. If a next hop is listed as **Reject**, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected. If a next hop is listed as **Local**, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).
Age	How long the route has been active.	
State	Flags for this route.	There are many possible flags.
AS Path	AS path through which the route was learned. The letters of the AS path indicate the path origin: • **I**—IGP. • **E**—EGP. • **?**—Incomplete. Typically, the AS path was aggregated.

[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether static, aggregate, or generated routes are removed from the routing and forwarding tables when they become inactive. Routes that have been configured to remain continually installed in the routing and forwarding tables are marked with **reject** next hops when they are inactive.

- **active**—Remove a route from the routing and forwarding tables when it becomes inactive.
- **passive**—Have a route remain continually installed in the routing and forwarding tables even when it becomes inactive.

Default **active**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *neighbor-address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Have BGP advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.

Options

conditional—(Optional) Advertise the best external path only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. As a result, an external path with an AS path worse than that of the active path is not advertised.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

aggregate

Syntax

```
aggregate {
  defaults {
    ... aggregate-options ...
  }
  route destination-prefix {
    policy policy-name;
    ... aggregate-options ...
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],
[edit logical-systems *logical-system-name* routing-options],
[edit logical-systems *logical-system-name* routing-options **rib** *routing-table-name*],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],
[edit routing-options],
[edit routing-options **rib** *routing-table-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure aggregate routes.

Options ***aggregate-options***—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in ***aggregate-options***. Each option is explained separately.

- **(active | passive);**
- **as-path <***as-path***> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator** *as-number in-address***>**;
- **(brief | full)**;
- **community [** *community-ids* **]**;
- **discard**;
- **(metric | metric2 | metric3 | metric4)** *value* **<type** *type***>**;
- **(preference | preference2 | color | color2)** *preference* **<type** *type***>**;
- **tag** *string*;

defaults—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults and apply to all the aggregate routes you configure in the **aggregate** statement. This part of the **aggregate** statement is optional.

route ***destination-prefix***—Configure a nondefault aggregate route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length*—*destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

allow

Syntax allow (all | [*network/mask-length*]);

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Implicitly configure BGP peers, allowing peer connections from any of the specified networks or hosts. To configure multiple BGP peers, configure one or more networks and hosts within a single **allow** statement or include multiple **allow** statements.

Options **all**—Allow all addresses, which is equivalent to **0.0.0.0/0** (or **::/0**).

network/mask-length—IPv6 or IPv4 network number of a single address or a range of allowable addresses for BGP peers, followed by the number of significant bits in the subnet mask.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

area

Syntax area *area-id*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.

Specify multiple **area** statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas; use the **area-range** statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the **virtual-link** statement.

To specify that the routing device is directly connected to the OSPF and OSPFv3 backbone, include the **area 0.0.0.0** statement.

All routing devices on the backbone must be contiguous. If they are not, use the **virtual-link** statement to create the appearance of connectivity to the backbone.

Options *area-id*—Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number **0.0.0.0** is reserved for the OSPF and OSPFv3 backbone area.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit protocols (ospf | ospf3) area *area-id* **nssa**],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id*],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **nssa**],
[edit routing-instances *routing-instance-name* **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple **area-range** statements.

For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple **area-range** statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.

Default By default, area border routers do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.

Options **exact**—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.

mask-length—Number of significant bits in the network mask.

network—IP address. You can specify one or more IP addresses.

override-metric *metric*—(Optional) Override the metric for the IP address range and configure a specific metric value.

restrict—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

Range: 1 through 16,777,215

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.

NOTE: The **as-override** statement is specific to a particular BGP group. This statement does not affect peers from the same remote AS configured in different groups.

Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The **as-override** statement overrides this default behavior.

Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options (**aggregate | generate | static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate | generate | static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.

The numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. For more information, see Configuring AS Numbers for BGP. All releases of the Junos OS support 2-byte AS numbers.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.

Options
aggregator—(Optional) Attach the BGP **aggregator** path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for ***as-number***, followed by the IP address of the BGP system that formed the aggregate route for ***in-address***.

as-path—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ([ ]). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for ***as-path***; you must use a full, valid AS path.

atomic-aggregate—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

origin egp—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

origin igp—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

origin incomplete—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Syntax authentication-key *key*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isislevel *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis level *level-number*],
[edit protocols isis level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Authentication key (password). Neighboring routing devices use the password to verify the authenticity of packets sent from this interface. For the key to work, you also must include the **authentication-type** statement.

All routing devices must use the same password. If you are using the Junos IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces adjacent to the routing device.

Default If you do not include this statement and the **authentication-type** statement, IS-IS authentication is disabled.

Options *key*—Authentication password. The password can be up to 1024 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).

CAUTION: A simple password for authentication is truncated if it exceeds 254 characters.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Require authentication for RIP route queries received on an interface.

Options ***password***—Authentication password. If the password does not match, the packet is rejected. The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

authentication-key-chains

Syntax

```
authentication-key-chains {
  key-chain key-chain-name {
    description text-string;
    key key {
      secret secret-data;
      start-time yyyy-mm-dd.hh:mm:ss;
    }
    tolerance seconds;
  }
}
```

Hierarchy Level [edit security]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure authentication key updates for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, and the Bidirectional Forwarding Detection (BFD) protocol. When the **authentication-key-chains** statement is configured at the **[edit security]** hierarchy level, and is associated with the BGP and LDP protocols at the **[edit protocols]** hierarchy level or with the BFD protocol using the **bfd-liveness-detection** statement, authentication key updates can occur without interrupting routing and signaling protocols such as Open Shortest Path First (OSPF), and Resource Reservation Setup Protocol (RSVP).

Options

key-chain *key-chain-name*—Keychain name. This name is configured at the **[edit protocols bgp]** or the **[edit protocols ldp]** hierarchy level to associate unique **authentication key-chain** attributes with each protocol as specified using the following options:

- **description *text-string***—A text string of the **authentication-key-chain**. Put the text string in quotes (“text description”).
- **key *key***—Each key within a keychain is identified by a unique integer value.

  Range: 0 through **63**

  - **secret *secret-data***—Each key must specify a secret in encrypted text or plain text format. The secret always appears in encrypted format.
  - **start-time *yyyy–mm-dd.hh:mm:ss***—Start times are specified in UTC (Coordinated Universal Time), and must be unique within the keychain.
- **tolerance *seconds***—Specify the clock skew tolerance, in seconds.

  Range: 0 through **999999999**

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

authentication-type (IS-IS)

Syntax authentication-type *authentication*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **level** *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **level** *level-number*],
[edit protocols isis **level** *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **level** *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable authentication and specify the authentication scheme for IS-IS. If you enable authentication, you must specify a password by including the **authentication-key** statement.

Default If you do not include this statement and the **authentication-key** statement, IS-IS authentication is disabled.

Options ***authentication***—Authentication scheme:

- **md5**—Use HMAC authentication in combination with MD5. HMAC-MD5 authentication is defined in RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*.
- **simple**—Use a simple password for authentication. The password is included in the transmitted packet, making this method of authentication relatively insecure. We recommend that you *not* use this authentication method.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

authentication-type (RIP)

Syntax authentication-type *type*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit protocols **rip**],
[edit protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the type of authentication for RIP route queries received on an interface.

Default If you do not include this statement and the **authentication-key** statement, RIP authentication is disabled.

Options *type*—Authentication type:

- **md5**—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.
- **none**—Disable authentication. If **none** is configured, the configured authentication key is ignored.
- **simple**—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

autonomous-system

Syntax

```
autonomous-system autonomous-system <asdot-notation> <loops number> {
    independent-domain <no-attrset>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
no-attrset option introduced in Junos OS Release 10.4.

Description

Specify the routing device's AS number.

The numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options

autonomous-system—AS number. Use a number assigned to you by the Network Information Center (NIC).

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format for 4-byte AS numbers

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

Default: Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

number—(Optional) Maximum number of times this AS number can appear in an AS path.

Range: 1 through 10

Default: 1 (AS number can appear once)

NOTE: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the **loops** statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the **loops** statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, the Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.

Options

bandwidth *value*—Specify the bandwidth threshold in bits per second.

Range: 9600 through 1,000,000,000,000,000

metric *number*—Specify a metric value to associate with a specific bandwidth value.

Range: 1 through 65,535

NOTE: You must also configure a static metric value for the OSPF interface or topology with the metric statement. The Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

For IBGP and multihop EBGP support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

authentication key-chain ***key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

holddown-interval ***milliseconds***—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.

Range: 0 through 255,000

Default: 0

NOTE: You can configure the holddown-interval option only for EBGP peers.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-interval ***milliseconds***— Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval *milliseconds*—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Configure the BFD version to detect.

Range: **1** or **automatic** (autodetect the BFD version)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

full-neighbors-only—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

minimum-receive-interval ***milliseconds***—Configure only the minimum interval at which the routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval ***milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Specify the BFD version to detect.

Range: **1** (BFD version 1) or **automatic** (autodetect version)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold *milliseconds*—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

minimum-receive-interval ***milliseconds***—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval ***milliseconds***—Configure only a minimum interval at which the local routing device transmits hello packets to a neighbor.

Range: 1 through 255,000

version—Specify the BFD version to detect.

Range: (BFD version 1), or **automatic** (autodetect the version)

Default: automatic

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options static route *destination-prefix* qualified-next-hop (*interface-name* | *address*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure bidirectional failure detection timers and authentication criteria for static routes.

Options

authentication algorithm ***algorithm-name*** —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain ***key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the Bidirectional Forwarding Detection (BFD) protocol session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

holddown-interval ***milliseconds***—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.

Range: 0 through 255,000

Default: 0

local-address ***ip-address***—Enable a multihop BFD session and configure the source address for the BFD session.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-interval ***milliseconds***—Configure the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-ttl ***number***—Configure the time-to-live (TTL) for the multihop BFD session.

Range: 1 through 255

Default: 255

multiplier ***number***—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

neighbor ***address***—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

no-adaptation—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold *milliseconds*—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295

transmit-interval minimum-interval *milliseconds*—Configure the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Configure the BFD protocol version to detect.

Range: 1 or **automatic**

Default: **automatic** (autodetect the BFD protocol version)

The remaining statements are explained separately.

bmp

Syntax

```
bmp {
  memory limit bytes;
  station-address (ip-address | name);
  station-port port-number;
  statistics-timeout seconds;
}
```

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP **Adjacency-RIB-In** routing tables and periodically send that data to a monitoring station.

Options

memory-limit *bytes*—(Optional) Specify a threshold at which to stop collecting BMP data if the limit is exceeded.

Default: 10 MB

Range: 1,048,576 through 52,428,800

station-address (*ip-address* | *name*)—Specify the IP address or a valid URL for the monitoring where BMP data should be sent.

station-port *port-number*—Specify the port number of the monitoring station to use when sending BMP data.

statistics-timeout *seconds*—(Optional) Specify how often to send BMP data to the monitoring station.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure all AS numbers from all contributing paths to be included in the aggregate or generated route's path.

- **brief**—Include only the longest common leading sequences from the contributing AS paths. If this results in AS numbers being omitted from the aggregate route, the BGP **ATOMIC_ATTRIBUTE** path attribute is included with the aggregate route.
- **full**—Include all AS numbers from all contributing paths in the aggregate or generated route's path.

Default **full**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **aggregate on page 442**
- **generate on page 517**
- Configuring Aggregate Routes
- Configuring Generated Routes

centralized

Syntax centralized;

Hierarchy Level [edit protocols lacp **ppm**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.

This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the **no-delegate-processing** statement in the **[edit routing-options ppm]** hierarchy.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Dell advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

Default Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit protocols **rip**],
[edit protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Check whether the reserved fields in a RIP packet are zero:

- **check-zero**—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.
- **no-check-zero**—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.

Default **check-zero**

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Accepting RIP Packets with Nonzero Values in Reserved Fields

checksum

Syntax checksum;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable checksum for packets on this interface. The checksum cannot be enabled with MD5 hello authentication on the same interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling Packet Checksum on IS-IS Interfaces

cluster

Syntax cluster *cluster-identifier*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* neighbor *address*],

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.

CAUTION:

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

NOTE: If you change the address family specified in the **[edit protocols bgp family]** hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

Options ***cluster-identifier***—IPv6 or IPv4 address to use as the cluster identifier.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate BGP community information with a static, aggregate, or generated route.

Options ***community-ids***—One or more community identifiers. The ***community-ids*** format varies according to the type of attribute that you use.

The BGP community attribute format is ***as-number:community-value***:

- ***as-number***—AS number of the community member. It can be a value from 1 through 65,535. The AS number can be a decimal or hexadecimal value.
- ***community-value***—Identifier of the community member. It can be a number from 0 through 65,535.

For more information about BGP community attributes, see the "Configuring the Extended Communities Attribute" section in the *Junos OS Policy Framework Configuration Guide*.

For specifying the BGP community attribute only, you also can specify ***community-ids*** as one of the following well-known community names defined in RFC 1997:

- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export**—Routes containing this community name are not advertised outside a BGP confederation boundary.
- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.
- **none**—Explicitly exclude BGP community information with a static route. Include this option when configuring an individual route in the **route** portion to override a **community** option specified in the **defaults** portion.

NOTE: Extended community attributes are not supported at the **[edit routing-options]** hierarchy level. You must configure extended communities at the **[edit policy-options]** hierarchy level. For information about configuring extended communities, see the *Junos OS Policy Framework Configuration Guide*.

Required Privilege Level
routing—To view this statement in the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long OSPF waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor.

Options ***seconds***—Interval to wait.

Range: 1 through 65,535 seconds

Default: 40 seconds (four times the hello interval)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

On area border routers only, for an NSSA, inject a default LSA with a specified metric value into the area. The default route matches any destination that is not explicitly reachable from within the area.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols **isis**],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis traffic-engineering]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IS-IS on the routing device, on an interface, or on a level. At the **[edit protocols isis traffic-engineering]** hierarchy level, disable IS-IS support for traffic engineering.

Enabling IS-IS on an interface (by including the **interface** statement at the **[edit protocols isis]** or the **[edit routing-instances *routing-instance-name* protocols isis]** hierarchy level), disabling it (by including the **disable** statement), and not actually having IS-IS run on an interface (by including the **passive** statement) are mutually exclusive states.

Default IS-IS is enabled for Level 1 and Level 2 routers on all interfaces on which an International Organization for Standardization (ISO) protocol family is enabled.

IS-IS support for traffic engineering is enabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

Default When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

domain-id

Syntax domain-id *domain-id*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a domain ID for a route. The domain ID identifies the OSPF domain from which the route originated.

Options ***domain-id***—You can specify either an IP address or an IP address and a local identifier using the following format: ***ip-address*:*local-identifier***. If you do not specify a local identifier with the IP address, the identifier is assumed to have a value of 0.

Default: If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.

Options

any—Configure the family type to be both unicast and multicast.

inet—Configure NLRI parameters for IPv4.

inet6—Configure NLRI parameters for IPv6.

inet-mdt—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.

inet-mvpn—Configure NLRI parameters for IPv4 for multicast VPNs.

inet6-mvpn—Configure NLRI parameters for IPv6 for multicast VPNs.

inet-vpn—Configure NLRI parameters for IPv4 for Layer 3 VPNs.

inet6-vpn—Configure NLRI parameters for IPv6 for Layer 3 VPNs.

iso-vpn—Configure NLRI parameters for IS-IS for Layer 3 VPNs.

l2vpn—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.

labeled-unicast—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.

loops ***number***—(Optional) Specify the maximum number of times that the AS number can appear in the AS path received from a BGP peer for the specified address family. For ***number***, include a value from 1 through 10.

NOTE: **When you configure the loops statement for a specific BGP address family, that value is used to evaluate the AS path for routes received by a BGP peer for the specified address family rather than the loops value configured for the global AS number.**

multicast—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.

unicast—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes.

Default: unicast

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

fate-sharing

Syntax

```
fate-sharing {
  group group-name {
    cost value;
    from address <to address>;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-instances *routing-instance-name* routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify groups of objects that share characteristics resulting in backup paths to be used if primary paths fail. All objects are treated as **/32** host addresses. You specify one or more objects within a group. The objects can be LAN interfaces, router IDs, or point-to-point links. The sequence is insignificant.

Options

cost *value*—Cost assigned to the group.

Range: 1 through 65,535

Default: 1

from *address*—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate **from** addresses in the group.

group *group-name*—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.

to *address*—(Optional) Address of egress router. For point-to-point link objects, you must specify both a **from** and a **to** address.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

flow

Syntax

```
flow {
  route name {
    match {
      match-conditions;
    }
    term-order (legacy | standard);
    then {
      actions;
    }
  }
  validation {
    traceoptions {
      file filename <files number> <size size> <world-readable | no-world-readable>;
      flag flag <flag-modifier> <disable>;
    }
  }
}
```

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a flow route.

Default legacy

Options

actions—An action to take if conditions match.

match-conditions—Match packets to these conditions.

route *name*—Name of the flow route.

standard—Specify to use version 7 or later of the flow-specification algorithm.

term-order (legacy | standard)—Specify the version of the flow-specification algorithm.

- **legacy**—Use version 6 of the flow-specification algorithm.
- **standard**—Use version 7 of the flow-specification algorithm.

then—Actions to take on matching packets.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

forwarding-cache (Flow Maps)

Syntax

```
forwarding-cache {
  timeout (minutes | never non-discard-entry-only );
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multicast forwarding cache properties for the flow map.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

forwarding-cache (Multicast)

Syntax

```
forwarding-cache {
    threshold suppress value <reuse value>;
    timeout minutes;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name
    routing-options multicast],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]
```

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits and timeout values.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring the Multicast Forwarding Cache

forwarding-table

Syntax

```
forwarding-table {
    export [ policy--names ];
    (indirect-next-hop | no-indirect-next-hop);
    unicast-reverse-path (active-paths | feasible-paths);
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options],
[edit routing-options]
```

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure information about the routing device's forwarding table.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Per-Packet Load Balancing

generate

Syntax

```
generate {
  defaults {
    generate-options;
  }
  route destination-prefix {
    policy policy-name;
    generate-options;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],
[edit routing-options],
[edit routing-options **rib** *routing-table-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure generated routes, which are used as routes of last resort.

Options

generate-options—Additional information about generated routes, which is included with the route when it is installed in the routing table. Specify zero or more of the following options in ***generate-options***. Each option is explained separately.

- **(active | passive);**
- **as-path <***as-path***> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator** *as-number in-address***>;**
- **community [** *community-ids* **];**
- **discard;**
- **(brief | full);**
- **(metric | metric2 | metric3 | metric4)** *value* **<type** *type***>;**
- **(preference | preference2 | color | color2)** *preference* **<type** *type***>;**
- **tag** *string***;**

defaults—Specify global generated route options. These options only set default attributes inherited by all newly created generated routes. These are treated as global defaults and apply to all the generated routes you configure in the **generate** statement. This part of the **generate** statement is optional.

route ***destination-prefix***—Configure a non-default generated route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.

- ***destination-prefix/prefix-length***—/***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

graceful-restart (BGP)

Syntax
```
graceful-restart {
  disable;
  restart-timeseconds;
  stale-routes-time seconds;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure graceful restart for BGP.

Options
disable—Disable graceful restart for BGP.

restart-time *seconds*—Time period when the restart is expected to be complete.
Range: 1 through 600 seconds

stale-routes-time *seconds*—Maximum time that stale routes are kept during restart.
Range: 1 through 600 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

graceful-restart (IS-IS)

Syntax

```
graceful-restart {
  disable;
  helper-disable;
  restart-duration seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols isis],
[edit protocols isis]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure graceful restart for IS-IS.

Options

disable—Disable graceful restart.

helper-disable—Disable graceful restart helper capability. Helper mode is enabled by default.

restart-duration *seconds*—Configure the time period for the restart to last, in seconds.

Range: 30 through 300 seconds

Default: 30 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

graceful-restart (OSPF)

Syntax

```
graceful-restart {
  disable;
  helper-disable;
  notify-duration seconds;
  restart-duration seconds;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure graceful restart for OSPF.

Options

disable—Disable graceful restart for OSPF.

helper-disable—Disable graceful restart helper capability. Helper mode is enabled by default.

notify-duration *seconds*—Estimated time to send out purged grace LSAs over all the interfaces.

Range: 1 through 3600 seconds

Default: 30 seconds

restart-duration *seconds*—Estimated time to reacquire a full OSPF neighbor from each area.

Range: 1 through 3600 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define a BGP peer group. BGP peer groups share a common type, peer autonomous system (AS) number, and cluster ID, if present. To configure multiple BGP groups, include multiple **group** statements.

By default, the group's options are identical to the global BGP options. To override the global options, include group-specific options within the **group** statement.

The **group** statement is one of the statements you must include in the configuration to run BGP on the routing device. See Minimum BGP Configuration.

Options

group-name—Name of the BGP group.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit protocols **rip**],
[edit routing-instances *routing-instance-name* protocols **rip**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a set of RIP neighbors that share an export policy and metric. The export policy and metric govern what routes to advertise to neighbors in a given group.

Options

group-name—Name of a group, up to 16 characters long.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Group-Specific RIP Properties

group (RIPng)

Syntax

```
group group-name {
  export [ policy-names ];
  metric-out metric;
  preference number;
  route-timeout seconds;
  update-interval seconds;
  neighbor neighbor-name {
    import policy-name;
    metric-in metric;
    receive <none>;
    route-timeout seconds;
    send <none>;
    update-interval seconds;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a set of RIPng neighbors that share an export policy and metric. The export policy and metric govern what routes to advertise to neighbors in a given group.

Options

group-name—Name of a group, up to 16 characters long.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hello-authentication-key

Syntax hello-authentication-key *password*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name*level *number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*],
[edit protocols isis interface *interface-name* level *number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an authentication key (password) for hello packets. Neighboring routing devices use the password to verify the authenticity of packets sent from an interface. For the key to work, you also must include the **hello-authentication-type** statement.

Default By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.

Options ***password***—Authentication password. The password can be up to 255 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hello-authentication-type

Syntax hello-authentication-type (md5 | simple);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*],
[edit protocols isis interface *interface-name* level *number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable authentication on an interface for hello packets. If you enable authentication on hello packets, you must specify a password by including the **hello-authentication-key** statement.

Default By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.

Options **md5**—Specifies Message Digest 5 as the packet verification type.

simple—Specifies simple authentication as the packet verification type.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hello-interval (IS-IS)

Syntax hello-interval *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Frequency with which the routing device sends hello packets out of an interface, in seconds.

Options ***seconds***—Frequency of transmission for hello packets.

Range: 1 through 20,000 seconds

Default: 3 seconds (for designated intersystem [DIS] routers), 9 seconds (for non-DIS routers)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- hold-time
- Configuring Levels on IS-IS Interfaces

hello-interval (OSPF)

Syntax hello-interval *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols ospf area *area-id* peer-interface *interface-name*],
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* **virtual-link**],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **virtual-link**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*],
[edit protocols ospf area *area-id* peer-interface *interface-name*],
[edit protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit protocols (ospf | ospf3) area *area-id* **virtual-link**],

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **virtual-link**],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.

Options ***seconds***—Time between hello packets, in seconds.

Range: 1 through 255 seconds

Default: 10 seconds; 120 seconds (nonbroadcast networks)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **dead-interval on page 492**
- Configuring OSPF Timers

hello-padding

Syntax hello-padding (adaptive | loose | strict);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.

Options **adaptive**—Configure padding until state of neighbor adjacency is up.

loose—Configure padding until state of adjacency is initialized.

strict—Configure padding for all adjacency states.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling Padding of IS-IS Hello Packets

holddown (RIP)

Syntax holddown *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit protocols **rip**],
[edit routing-instances *routing-instance-name* protocols **rip**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the time period the expired route is retained in the routing table before being removed.

When the hold-down timer runs on RIP demand circuits, routes are advertised as unreachable on other interfaces. When the hold-down timer expires, the route is removed from the routing table if all destinations are aware that the route is unreachable or the remaining destinations are down.

Options ***seconds***—Estimated time to wait before making updates to the routing table.

Range: 10 through 180 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- RIP Demand Circuits Overview

holddown (RIPng)

Syntax holddown *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the time period the expired route is retained in the routing table before being removed.

Options ***seconds***—Estimated time to wait before making updates to the routing table.

Default: 180 seconds

Range: 10 through 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring RIPng Timers

hold-time

Syntax hold-time *seconds*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* vrrp-inet6-group *group-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the time in seconds after which a backup router with the highest priority preempts the master router.

Options ***seconds***—Hold-time period.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring VRRP for IPv6 (CLI Procedure)

hold-time (BGP)

Syntax hold-time *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.

The hold time is three times the interval at which keepalive messages are sent.

Options ***seconds***—Hold time.

Range: 20 through 65,535 seconds

Default: 90 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Delay Before BGP Peers Mark the Routing Device as Down

hold-time (IS-IS)

Syntax hold-time *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name*level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the length of time a neighbor considers this router to be operative (up) after receiving a hello packet. If the neighbor does not receiver another hello packet within the specified time, it marks this routing device as inoperative (down). The hold time itself is advertised in the hello packets.

Options ***seconds***—Hold-time value, in seconds.

Range: 3 through 65,535 seconds, or 1 to send out hello packets every 333 milliseconds

Default: 9 seconds (for DIS routers), 27 seconds (for non-DIS routers; three times the default hello interval)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

idle-after-switch-over

Syntax idle-after-switch-over (forever | *seconds*);

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address*],
[edit protocols bgp],
[edit protocols bgp group *group-name*],
[edit protocols bgp group *group-name* neighbor *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device not to automatically reestablish BGP peering sessions after a nonstop active routing (NSR) switchover. This feature is particularly useful if you are using dynamic routing policies because the dynamic database is not synchronized with the backup Routing Engine when NSR is enabled.

Options

forever—Do not reestablish a BGP peering session after an NSR switchover until the **clear bgp neighbor** command is issued.

seconds—Do not reestablish a BGP peering session after an NSR switchover until after the specified period.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ignore-attached-bit

Syntax ignore-attached-bit;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement allows the routing device to ignore the attached bit on incoming Level 1 LSPs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.

Default The **ignore-attached-bit** statement is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS

ignore-lsp-metrics

Syntax ignore-lsp-metrics;

Hierarchy Level [edit logical-systems *logical-system-name* protocols ospf **traffic-engineering shortcuts**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf **traffic-engineering shortcuts**],
[edit protocols ospf **traffic-engineering shortcuts**],
[edit routing-instances *routing-instance-name* protocols ospf **traffic-engineering shortcuts**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Ignore RSVP LSP metrics in OSPF traffic engineering shortcut calculations.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling OSPF Traffic Engineering Support

import (BGP)

import-rib

Syntax import-rib [*routing-table--names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib-group** *group-name*],
[edit logical-systems *logical-system-name* routing-options **rib-group** *group-name*],
[edit routing-instances *routing-instance-name* routing-options **rib-group** *group-name*],
[edit routing-options **rib-group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Name of the routing table into which the Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be **inet.0** or **routing-instance-name.inet.0**. For IPv6 import routing tables, the primary routing table must be **inet6.0**.

You can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4.

Options ***routing-table-names***—Name of one or more routing tables.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

include-mp-next-hop

Syntax include-mp-next-hop;

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],
[edit protocols bgp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable multiprotocol updates to contain next-hop reachability information.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Including Next-Hop Reachability Information in Multiprotocol Updates

indirect-next-hop

Syntax (indirect-next-hop | no-indirect-next-hop);

Hierarchy Level [edit logical-systems *logical-system-name* routing-options **forwarding-table**],
[edit routing-options **forwarding-table**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable indirectly connected next hops for route convergence.

NOTE: When virtual private LAN service (VPLS) is configured on the routing device, the **indirect-next-hop** statement is not supported.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling Indirect Next Hops

install

Syntax (install | no-install);

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit routing-options rib *routing-table-name* **static** (defaults | route)]
[edit routing-options **static** (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether the Junos OS installs all static routes into the forwarding table. Even if you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols.

Options
install—Explicitly install all static routes into the forwarding table.

no-install—Do not install the route into the forwarding table, even if it is the route with the lowest preference.

Default: **install**

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface (IS-IS)

Syntax

```
interface (all | interface-name) {
    disable;
    bfd-liveness-detection {
        authentication {
            algorithm algorithm-name;
            key-chain key-chain-name;
            loose-check;
        }
        detection-time {
            threshold milliseconds;
        }
        minimum-interval milliseconds;
        minimum-receive-interval milliseconds;
        transmit-interval {
            threshold milliseconds;
            minimum-interval milliseconds;
        }
        multiplier number;
    }
    checksum;
    csnp-interval (seconds | disable);
    hello-padding (adaptive | loose | strict);
    ldp-synchronization {
        disable;
        hold-time seconds;
    }
    lsp-interval milliseconds;
    mesh-group (value | blocked);
    no-adjacency-holddown;
    no-ipv4-multicast;
    no-ipv6-multicast;
    no-ipv6-unicast;
    no-unicast-topology;
    passive;
    point-to-point;
    level level-number {
        disable;
        hello-authentication-type authentication;
        hello-authentication-key key;
        hello-interval seconds;
        hold-time seconds;
        ipv4-multicast-metric number;
        ipv6-multicast-metric number;
        ipv6-unicast-metric number;
        metric metric;
        passive;
        priority number;
        te-metric metric;
    }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis],
[edit protocols isis],
[edit routing-instances *routing-instance-name* protocols isis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interface-specific IS-IS properties. To configure more than one interface, include the **interface** statement multiple times.

Enabling IS-IS on an interface (by including the **interface** statement at the **[edit protocols isis]** or the **[edit routing-instances *routing-instance-name* protocols isis]** hierarchy level), disabling it (by including the **disable** statement), and not actually having IS-IS run on an interface (by including the **passive** statement) are mutually exclusive states.

Options **all**—Have the Junos OS create IS-IS interfaces automatically.

interface-name—Name of an interface. Specify the full interface name, including the physical and logical address components.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Support for the **no-interface-state-traps** statement introduced in Junos OS Release 10.3.
This statement is supported only for OSPFv2.

Description Enable OSPF routing on a routing device interface.

You must include at least one **interface** statement in the configuration to enable OSPF on the routing device.

Options *interface-name*—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify **all**. Specifying a particular interface and **all** produces an invalid configuration.

NOTE: For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as *interface-name*.

The remaining statements are explained separately.

NOTE: You cannot run both OSPF and ethernet-tcc encapsulation between two routing devices.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define the maximum bandwidth for an interface on which you want to apply bandwidth management.

Options

interface-name—Names of the physical or logical interface.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface (Multicast via Static Routes)

Syntax

```
interface interface-names {
  maximum-bandwidth bps;
  no-qos-adjust;
  reverse-oif-mapping {
    no-qos-adjust;
  }
  subscriber-leave-timer seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **multicast**],
[edit logical-systems *logical-system-name* routing-options **multicast**],
[edit routing-instances *routing-instance-name* routing-options **multicast**],
[edit routing-options **multicast**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable multicast traffic on an interface.

NOTE: You cannot enable multicast traffic on an interface using the enable statement and configure PIM on the same interface simultaneously.

Options

interface-name—Name of the interface on which to enable multicast traffic. Specify the ***interface-name*** to enable multicast traffic on the interface.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface-routes

Syntax

```
interface-routes {
  family (inet | inet6) {
    export {
      lan;
      point-to-point;
    }
  }
  rib-group group-name;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Associate a routing table group with the routing device's interfaces and specify routing table groups into which interface routes are imported.

Options

inet—Specify the IPv4 address family.

inet6—Specify the IPv6 address family.

lan—Export LAN routes.

point-to-point—Export point-to-point routes.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-multicast | ipv4-unicast | ipv6-multicast) area *area-id* interface *interface-name*],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the type of interface.

By default, the software chooses the correct interface type based on the type of physical interface. Therefore, you should never have to set the interface type. The exception to this is for NBMA interfaces, which default to an interface type of point-to-multipoint. To have these interfaces explicitly run in NBMA mode, configure the **nbma** interface type, using the IP address of the local ATM interface.

A point-to-point interface can be an Ethernet interface without a subnet.

Default The software chooses the correct interface type based on the type of physical interface.

Options **nbma** (OSPFv2 only)—Nonbroadcast multiaccess (NBMA) interface.

p2mp (OSPFv2 only)—Point-to-multipoint interface.

p2p—Point-to-point interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify whether routes learned from a BGP peer are retained in the routing table even if they contain an AS number that was exported from the local AS.

Default If you do not include this statement, most routes are retained in the routing table.

Options **all**—Retain all routes.

none—Retain none of the routes. When **keep none** is configured for the BGP session and the inbound policy changes, the Junos OS forces readvertisement of the full set of routes advertised by the peer.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

local-address

Syntax local-address *address*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.

Default If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

Options ***address***—IPv6 or IPv4 address of the local end of the connection.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **router-id on page 669**

local-address

Syntax local-address *address*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **backup-pe-group** *group-name*],
[edit logical-systems *logical-system-name* routing-options multicast **backup-pe-group** *group-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **backup-pe-group** *group-name*],
[edit routing-options multicast **backup-pe-group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the address of the local PE for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.

Options ***address***—Address of local PEs in the backup group.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

local-as

Syntax local-as *autonomous-system* <loops *number*> <private | alias> <no-prepend-global-as>;

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* neighbor *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the local AS number.

The autonomous system (AS) numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

autonomous-system—AS number.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format

Range: 0.0 through 65535.65535 in AS-dot notation format

loops *number*—(Optional) Specify the maximum number of times that the local AS number can appear in an AS path received from a BGP peer. For ***number***, include a value from 1 through 10.

no-prepend-global-as—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

private—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

NOTE: The private and alias options are mutually exclusive. You cannot configure both options with the same local-as statement.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

local-interface

Syntax
local-interface *interface-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *ipv6-link-local-address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *ipv6-link-local-address*],
[edit protocols bgp group *group-name* neighbor *ipv6-link-local-address*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *ipv6-link-local-address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify the interface name of the peer for IPv6 peering using link-local addresses. This peer is link-local in scope.

Options
interface-name—Interface name of the EBGP IPv6 peer.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring EBGP Peering Using IPv6 Link-Local Addresses

local-preference

Syntax local-preference *local-preference*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Modify the value of the **LOCAL_PREF** path attribute, which is a metric used by IBGP sessions to indicate the degree of preference for an external route. The route with the highest local preference value is preferred.

The **LOCAL_PREF** path attribute always is advertised to internal BGP peers and to neighboring confederations. It is never advertised to external BGP peers.

Default If you omit this statement, the **LOCAL_PREF** path attribute, if present, is not modified.

Options *local-preference*—Preference to assign to routes learned from BGP or from the group or peer.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: If the **LOCAL_PREF** path attribute is present, do not modify its value. If a BGP route is received without a **LOCAL_PREF** attribute, the route is handled locally (it is stored in the routing table and advertised by BGP) as if it were received with a **LOCAL_PREF** value of 100. By default, non-BGP routes that are advertised by BGP are advertised with a **LOCAL_PREF** value of 100.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **preference on page 632**

loose-authentication-check

Syntax loose-authentication-check;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allow the use of MD5 authentication without requiring network-wide deployment.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling Authentication for IS-IS Without Network-Wide Deployment

lsp-interval

Syntax lsp-interval *milliseconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the link-state PDU interval time.

Options ***milliseconds***—Number of milliseconds between the sending of link-state PDUs. Specifying a value of 0 blocks all link-state PDU transmission.

Range: 0 through 1000 milliseconds

Default: 100 milliseconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces

lsp-lifetime

Syntax lsp-lifetime *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.

Options ***seconds***—link-state PDU lifetime, in seconds.

Range: 350 through 65,535 seconds

Default: 1200 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Link-State PDU Lifetime for IS-IS

lsp-metric-into-summary

Syntax lsp-metric-into-summary;

Hierarchy Level [edit logical-systems *logical-system-name* protocols (ospf | ospf3) **traffic-engineering shortcuts**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **traffic-engineering shortcuts**],
[edit protocols (ospf | ospf3) **traffic-engineering shortcuts**],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **traffic-engineering shortcuts**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Advertise the LSP metric in summary LSAs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options],
[edit routing-options **rib** *routing-table-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure martian (invalid and ignored) addresses.

Options

allow—(Optional) Explicitly allow a subset of a range of addresses that has been disallowed.

destination-prefix—Destination route you are configuring:

- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.
- **default**—Default route to use when routing packets do not match a network or host in the routing table. This is equivalent to specifying the IP address **0.0.0.0/0**.

match-type—Criteria that the destination must match:

- **exact**—Exactly match the route's mask length.
- **longer**—The route's mask length is greater than the specified mask length.
- **orlonger**—The route's mask length is equal to or greater than the specified mask length.
- **through *destination-prefix***—The route matches the first prefix, the route matches the second prefix for the number of bits in the route, and the number of bits in the route is less than or equal to the number of bits in the second prefix.
- **upto *prefix-length***—The route's mask length falls between the two destination prefix lengths, inclusive.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Martian Addresses

max-areas

Syntax max-areas *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**]
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Modify the maximum number of IS-IS areas advertised.

Options ***number***—Maximum number of areas to include in the IS-IS hello (IIH) PDUs and link-state PDUs.

Range: 3 through 36

Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Limiting the Number of Advertised IS-IS Areas

maximum-bandwidth

Syntax maximum-bandwidth *bps*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-options multicast **interface** *interface-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit routing-options multicast **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the multicast bandwidth for the interface.

Options ***bps***—Bandwidth rate, in bits per second, for the multicast interface.

Range: 0 through any amount of bandwidth

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Defining Interface Bandwidth Maximums

maximum-paths

Syntax maximum-paths *path-limit* <log-interval *seconds*> <log-only | threshold *value*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit for the number of routes installed in a routing table based upon the route path.

Options

log-interval *seconds*—(Optional) Minimum time interval (in seconds) between log messages.

Range: 5 through 86,400

log-only—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.

path-limit—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

Default: No default

threshold *value*—(Optional) Percentage of the maximum number of routes that starts triggering warning. You can configure a percentage of the ***path-limit*** value that starts triggering the warnings.

Range: 1 through 100

NOTE: When the number or routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number or routes reaches the *path-limit* value, then additional routes are rejected.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Route Limits for Routing Tables

maximum-prefixes

Syntax maximum-prefixes *prefix-limit* <log-interval *seconds*> <log-only | threshold *value*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit for the number of routes installed in a routing table based upon the route prefix.

Options

log-interval *seconds*—(Optional) Minimum time interval (in seconds) between log messages.

Range: 5 through 86,400

log-only—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.

prefix-limit—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.

Range: 1 through 4,294,967,295

Default: No default

threshold *value*—(Optional) Percentage of the maximum number of prefixes that starts triggering warning. You can configure a percentage of the ***prefix-limit*** value that starts triggering the warnings.

Range: 1 through 100

NOTE: When the number or routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number or routes reaches the *prefix-limit* value, then additional routes are rejected.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Route Limits for Routing Tables

med-igp-update-interval

Syntax med-igp-update-interval *minutes*;

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a timer for how long to delay updates for the multiple-exit discriminator (MED) path attribute for BGP groups and peers configured with the **metric-out igp *offset* delay-med-update** statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

Options ***minutes***—Interval to delay MED updates.

Default: 10 minutes

Range: 10 through 600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **metric-out on page 588**
- Delaying Updates of the MED Path Attribute for BGP

mesh-group

Syntax mesh-group (blocked | *value*);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an interface to be part of a mesh group, which is a set of fully connected nodes.

Options **blocked**—Configure the interface so that it does not flood link-state PDU packets.

value—Number that identifies the mesh group.

Range: 1 through 4,294,967,295 (2^{32} – 1; 32 bits are allocated to identify a mesh group)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Mesh Groups of IS-IS Interfaces

message-size

Syntax message-size *number*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],

[edit protocols **rip**],
[edit protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of route entries to be included in every RIP update message. To ensure interoperability with other vendors' equipment, use the standard of 25 route entries per message.

Options ***number***—Number of route entries per update message.

Range: 25 through 255 entries

Default: 25 entries

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Number of Route Entries in RIP Update Messages

metric (IS-IS)

Syntax metric *metric*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the metric value for the level.

Options *metric*—Metric value.

Range: 1 through 63, or 1 through 16,777,215 (if you have configured wide metrics)

Default: 10 (for all interfaces except **lo0**), 0 (for the **lo0** interface)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- te-metric
- **wide-metrics-only on page 714**

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],
[edit routing-instances *routing-instance-name* protocols ospf area *area-id* sham-link-remote],
[edit routing-instances *routing-instance-name* protocols ospf area *area-id* interface *interface-name* topology (ipv4-multicast | *name*)],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the cost of an OSPF interface. The cost is a routing metric that is used in the link-state calculation.

To set the cost of routes exported into OSPF, configure the appropriate routing policy.

Options *metric*—Cost of the route.

Range: 1 through 65,535

Default: By default, the cost of an OSPF route is calculated by dividing the reference-bandwidth value by the bandwidth of the physical interface. Any specific value you configure for the **metric** overrides the default behavior of using the reference-bandwidth value to calculate the cost of route for that interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

metric (Aggregate, Generated, or Static Route)

Syntax (metric | metric2 | metric3 | metric4) *metric* <type *type*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Metric value for an aggregate, generated, or static route. You can specify up to four metric values, starting with **metric** (for the first metric value) and continuing with **metric2**, **metric3**, and **metric4**.

Options *metric*—Metric value.
Range: 0 through 4,294,967,295 ($2^{32} - 1$)

type *type*—(Optional) Type of route.
Range: 1 through 16

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the metric to add to incoming routes when advertising into RIP routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIP routes learned through a specific neighbor.

Options ***metric***—Metric value.

Range: 1 through 16

Default: 1

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Metric for all routes sent using the multiple exit discriminator (MED, or **MULTI_EXIT_DISC**) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.

You can specify a constant metric value by including the ***metric*** option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the **multihop** command—you can specify a variable metric by including the **minimum-igp** or **igp** option.

You can increase or decrease the variable metric calculated from the IGP metric (either from the **igp** or **igp-minimum** statement) by specifying a value for ***offset***. The metric is increased by specifying a positive value for ***offset***, and decreased by specifying a negative value for ***offset***.

In Junos OS Release 9.0 and later, you can specify for a BGP group or peer not to advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the **med-igp-update-interval** ***minutes*** at the **[edit routing-options]** hierarchy level.

Options
delay-med-update—Specify for a BGP group or peer configured with the **metric-out igp** statement not to advertise MED updates when the value worsens, that is, unless the value is lower.

NOTE: You cannot configure **delay-med–update** statement at the global BGP level.

igp—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop.

metric—Primary metric on all routes sent to peers.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: No metric is sent.

minimum-igp—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value.

offset—(Optional) Increases or decreases the metric by this value.

Range: -2^{31} through $2^{31} - 1$

Default: None

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure generic multicast properties.

NOTE: You cannot apply a scoping policy to a specific routing instance. All scoping policies are applied to all routing instances. However, you can apply the scope statement to a specific routing instance.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure an EBGP multihop session.

External confederation peering is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case; multihop behavior is implied.

If you have confederation external BGP peer-to-loopback addresses, you still need the multihop configuration.

Default

If you omit this statement, all EBGP peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or "regular," BGP session), and the default time-to-live (TTL) value is 1.

Options

no-nexthop-change—Specify not to change the BGP next-hop value; for route advertisements, specify the **no-nexthop-self** option.

ttl-value—Configure the maximum TTL value for the TTL in the IP header of BGP packets.

Range: 1 through 255

Default: 64 (for multihop EBGP sessions, confederations, and IBGP sessions)

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring EBGP Multihop Sessions

multipath

Syntax

```
multipath {
  multiple-as;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Allow load sharing among multiple EBGP paths and multiple IBGP paths. A path is considered a BGP equal-cost path (and will be used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor, are considered.

Options

multiple-as—Disable the default check requiring that paths accepted by BGP multipath must have the same neighboring AS.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple **neighbor** statements.

By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the **neighbor** statement.

The **neighbor** statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an **allow all** statement in place of a **neighbor** statement.)

Options ***address***—IPv6 or IPv4 address of a single peer.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the router ID in the BGP aggregator path attribute to zero. (This is one of the path attributes included in BGP update messages.) Doing this prevents different routing devices within an AS from creating aggregate routes that contain different AS paths.

Default If you omit this statement, the router ID is included in the BGP aggregator path attribute.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-authentication-check

Syntax no-authentication-check;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis],
[edit protocols isis],
[edit routing-instances *routing-instance-name* protocols isis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Generate authenticated packets and check the authentication on received packets, but do not reject packets that cannot be authenticated.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable intracluster route redistribution by the system acting as the route reflector. Include this statement when the client cluster is fully meshed to prevent the sending of redundant route advertisements.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **cluster on page 486**

no-hello-authentication

Syntax no-hello-authentication;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **level** *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **level** *level-number*],
[edit protocols isis **level** *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **level** *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Suppress authentication check on complete sequence number hello packets.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **hello-authentication-type on page 531**
- Configuring IS-IS Authentication

no-ipv4-multicast

Syntax no-ipv4-multicast;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv4 multicast topologies.

Default Multicast topologies are disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Multicast Topologies

no-ipv4-routing

Syntax no-ipv4-routing;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IP version 4 (IPv4) routing.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling IPv4 Routing for IS-IS

no-ipv6-multicast

Syntax no-ipv6-multicast;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv6 multicast topologies.

Default Multicast topologies are disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Multicast Topologies

no-ipv6-routing

Syntax no-ipv6-routing;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IP version 6 (IPv6) routing.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling IPv6 Routing for IS-IS

no-ipv6-unicast

Syntax no-ipv6-unicast;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv6 unicast topologies.

Default IPv6 unicast topologies are disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS IPv6 Unicast Topologies

no-nssa-abr

Syntax no-nssa-abr;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable exporting Type 7 link-state advertisements into not-so-stubby-areas (NSSAs) for an autonomous system boundary router (ASBR) or an area border router (ABR).

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling Export of LSAs into NSSAs Attached to ASBR ABRs

no-psnp-authentication

Syntax no-psnp-authentication;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **level** *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **level** *level-number*],
[edit protocols isis **level** *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **level** *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Suppress authentication check on partial sequence number PDU (PSNP) packets.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Authentication

no-qos-adjust

Syntax no-qos-adjust;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name* **reverse-oif-mapping**],
[edit logical-systems *logical-system-name* routing-options multicast **interface** *interface-name*],

[edit routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name* **reverse-oif-mapping**],
[edit routing-options multicast **interface** *interface-name*],
[edit routing-options multicast **interface** *interface-name* **reverse-oif-mapping**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable hierarchical bandwidth adjustment for all subscriber interfaces that are identified by their MLD or IGMP request from a specific multicast interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Multicast with Subscriber VLANs

no-rfc-1583

Syntax no-rfc-1583;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable compatibility with RFC 1583, *OSPF Version 2*. If the same external destination is advertised by AS boundary routers that belong to different OSPF areas, disabling compatibility with RFC 1583 can prevent routing loops.

Default Compatibility with RFC 1583 is enabled by default.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control-level—To add this statement to the configuration.

Related Documentation
- Disabling OSPFv2 Compatibility with RFC 1583

no-unicast-topology

Syntax no-unicast-topology;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv4 unicast topologies.

Default IPv4 unicast topologies are disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Multicast Topologies

no-validate

Syntax no-validate *policy-name*;

Hierarchy Level [edit protocols bgp group *group-name* **family** (inet | inet flow)],
[edit protocols bgp group *group-name* neighbor *address* **family** (inet | inet flow)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (inet | inet flow)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (inet | inet flow)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Omits the flow route validation procedure after packets are accepted by a policy.

Options ***policy-name***—Import policy to match NLRI messages.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling BGP to Carry Flow-Specification Routes

node-link-protection

Syntax node-ink-protection;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name*],
[edit logical-routers *logical-router-name* routing-instances *routing-instance-name* protocols isis interface *interface-name*],
[edit protocols isis interface *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable node-link protection on the specified IS-IS interface. The Junos OS creates an alternate loop-free path to the primary next hop for all destination routes that traverse a protected interface. This alternate path avoids the primary next-hop routing device altogether and establishes a path through a different routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **link-protection on page 567**

nssa

Syntax

```
nssa {
  area-range network/mask-length <restrict> <exact> <override-metric metric>;
  default-lsa {
    default-metric metric;
    metric-type type;
    type-7;
  }
  (no-summaries | summaries);
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id*],
[edit logical-systems *logical-system-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (ospf | ospf3) area *area-id*],
[edit protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id*],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a not-so-stubby area (NSSA). An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas.

You cannot configure an area as being both a stub area and an NSSA.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **stub on page 682**
- Configuring OSPF Areas

options

Syntax

```
options {
    syslog (level level | upto level level);
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the types of system logging messages sent about the routing protocols process to the system message logging file. These messages are also displayed on the system console. You can log messages at a particular level, or up to and including a particular level.

Options

level *level*—Severity of the message. It can be one or more of the following levels, in order of decreasing urgency:

- **alert**—Conditions that should be corrected immediately, such as a corrupted system database.
- **critical**—Critical conditions, such as hard drive errors.
- **debug**—Software debugging messages.
- **emergency**—Panic or other conditions that cause the system to become unusable.
- **error**—Standard error conditions.
- **info**—Informational messages.
- **notice**—Conditions that are not error conditions, but might warrant special handling.
- **warning**—System warning messages.

upto level *level*—Log all messages up to a particular level.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **syslog** in the *Junos OS System Basics Configuration Guide*
- Configuring System Logging for the Routing Protocol Process

ospf

Syntax ospf { ... }

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable OSPF routing on the routing device.

You must include the **ospf** statement to enable OSPF on the routing device.

Default OSPF is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum OSPF Configuration

ospf3

Syntax ospf3 { ... }

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable OSPFv3 routing on the routing device.

You must include the **ospf3** statement to enable OSPFv3.

Default OSPFv3 is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum OSPF Configuration

out-delay

Syntax out-delay *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp],

[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long a route must be present in the Junos routing table before it is exported to BGP. Use this time delay to help bundle routing updates.

Default If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

Options *seconds*—Output delay time.

Range: 0 through 65,535 seconds

Default: 0 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Applying Policies to BGP Routes

outbound-route-filter

Syntax

```
outbound-route-filter {
  bgp-orf-cisco-mode;
  prefix-based {
    accept {
      (inet | inet6);
    }
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name*],

[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a BGP peer to accept outbound route filters from a remote peer.

Options

accept—Specify that outbound route filters from a BGP peer be accepted.

inet—Specify that IPv4 prefix-based outbound route filters be accepted.

inet6—Specify that IPv6 prefix-based outbound route filters be accepted.

NOTE: You can specify that both IPv4 and IPv6 outbound route filters be accepted.

prefix-based—Specify that prefix-based filters be accepted.

The **bgp-orf-cisco-mode** statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Applying Filters Provided by BGP Peers to Outbound Routes

overload (IS-IS)

Syntax

```
overload {
  advertise-high-metrics;
  allow-route-leaking;
  timeout seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the local routing device so that it appears to be overloaded. You might want to do this when you want the routing device to participate in IS-IS routing, but do not want it to be used for transit traffic. Note that traffic to immediately attached interfaces continues to transit the routing device. You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.

NOTE: If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set.

Options

advertise-high-metrics—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

allow-route-leaking—Enable leaking of route information into the network even if the overload bit is set.

NOTE: The **allow-route-leaking** option will not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit.

timeout *seconds*—Number of seconds at which the overloading is reset.

Default: 0 seconds

Range: 60 through 1800 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring IS-IS to Make Routing Devices Appear Overloaded

overload (OSPF)

Syntax

```
overload {
  timeout seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf topology (default | ipv4-multicast | *name*)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf topology (default | ipv4-multicast | *name*)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf topology (default | ipv4-multicast | *name*)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)]
[edit routing-instances *routing-instance-name* protocols ospf topology (default | ipv4-multicast | *name*],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the local routing device so that it appears to be overloaded. You might do this when you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic.

NOTE: Traffic destined to immediately attached interfaces continues to reach the routing device.

Options

timeout ***seconds***—(Optional) Number of seconds at which the overloading is reset. If no timeout interval is specified, the routing device remains in overload state until the **overload** statement is deleted or a timeout is set.

Range: 60 through 1800 seconds

Default: 0 seconds

NOTE: Multitopology Routing does not support the **timeout** option.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Do not send active open messages to the peer. Rather, wait for the peer to issue an open request.

Default
If you omit this statement, all explicitly configured peers are active, and each peer periodically sends open requests until its peer responds.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling Transmission of Open Requests to BGP Peers

passive (IS-IS)

Syntax passive;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis **interface** *interface-name*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Advertise the direct interface addresses on an interface or into a level on the interface without actually running IS-IS on that interface or level.

This statement effectively prevents IS-IS from running on the interface. To enable IS-IS on an interface, include the **interface** statement at the **[edit protocols isis]** or the **[edit routing-instances *routing-instance-name* protocols isis]** hierarchy level. To disable it, include the **disable** statement at those hierarchy levels. The three states are mutually exclusive.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Advertise the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.

To configure an interface in OSPF passive traffic engineering mode, include the **traffic-engineering** statement. Configuring OSPF passive traffic engineering mode enables the dynamic discovery of OSPF AS boundary routers.

Enable OSPF on an interface by including the **interface** statement at the **[edit protocols (ospf | ospf3) area *area-id*]** or the **[edit routing-instances *routing-instance-name* protocols ospf area *area-id*]** hierarchy levels. Disable it by including the **disable** statement, To prevent OSPF from running on an interface, include the **passive** statement. These three states are mutually exclusive.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the neighbor (peer) AS number.

The autonomous system (AS) numeric range in plain-number format provides BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduced two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduced a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options ***autonomous-system***—AS number.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format for 4-byte AS numbers

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

pim-to-igmp-proxy

Syntax

```
pim-to-igmp-proxy {
  upstream-interface [ interface-names ];
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name
  routing-options multicast],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]
```

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Internet Group Management Protocol (IGMP) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the **pim-to-igmp-proxy** statement enables you to use IGMP to forward IPv4 multicast traffic across the PIM sparse mode domains.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM-to-IGMP Message Translation

pim-to-mld-proxy

Syntax
```
pim-to-mld-proxy {
    upstream-interface [ interface-names ];
}
```

Hierarchy Level
```
[edit logical-systems logical-system-name routing-instances routing-instance-name
    routing-options multicast],
[edit logical-systems logical-system-name routing-options multicast],
[edit routing-instances routing-instance-name routing-options multicast],
[edit routing-options multicast]
```

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Multicast Listener Discovery (MLD) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the **pim-to-mld-proxy** statement enables you to use MLD to forward IPv6 multicast traffic across the PIM sparse mode domains.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM-to-MLD Message Translation

point-to-point

Syntax
```
point-to-point;
```

Hierarchy Level
```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
    isis interface interface-name],
[edit protocols isis interface interface-name],
[edit routing-instances routing-instance-name protocols isis interface interface-name]
```

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an IS-IS interface to behave like a point-to-point connection.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Point-to-Point Interfaces for IS-IS

policy

Syntax policy *policy-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a routing policy when configuring an aggregate or generated route's destination prefix in the **routes** part of the **aggregate** or **generate** statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route and, if the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or *primary*, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.

Options ***policy-name***—Name of a routing policy.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

policy (Flow Maps)

Syntax policy [*policy-names*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a flow map policy.

Options ***policy-names***—Name of one or more policies for flow mapping.

Required Privilege Level routing—To view this statement in the configuration.

policy (SSM Maps)

Syntax policy [*policy-names*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-options multicast **ssm-map** *ssm-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to an SSM map.

Options ***policy-names***—Name of one or more policies for SSM mapping.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To view this statement in the configuration.

Related Documentation
- Example: Configuring SSM Mapping

ppm (LACP)

Syntax

```
ppm {
  centralized;
}
```

Hierarchy Level [edit protocols lacp]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure PPM processing options for Link Aggregation Control Protocol (LACP) packets.

This command configures the PPM processing options for LACP packets only. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by entering the **no-delegate-processing** configuration statement in the **[edit routing-options ppm]** statement hierarchy.

Default Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Distributed Periodic Packet Management on a J-EX Series Switch (CLI Procedure) on page 423

ppm

Syntax

```
ppm {
  no-delegate-processing;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.
no-delegate-processing statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Disable distributed periodic packet management (PPM) to the Packet Forwarding Engine (on routers), to access ports (on J-EX4200 switches), or line cards (on J-EX8200 switches).

After you disable PPM, PPM processing continues to run on the Routing Engine.

Default enabled

Options **no-delegate-processing**—Disable PPM to the Packet Forwarding Engine, access ports, or line cards. Distributed PPM is enabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the preference for routes learned from BGP.

At the BGP global level, the preference statement sets the preference for routes learned from BGP. You can override this preference in a BGP group or peer preference statement.

At the group or peer level, the preference statement sets the preference for routes learned from the group or peer. Use this statement to override the preference set in the BGP global preference statement when you want to favor routes from one group or peer over those of another.

Options ***preference***—Preference to assign to routes learned from BGP or from the group or peer.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: 170 for the primary preference

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit to the number of prefixes exported into OSPF.

Options *number*—Prefix limit.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: None

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (inet | inet6) (any | flow | labeled-unicast | multicast | unicast)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Limit the number of prefixes received on a BGP peering session and a rate-limit logging when injected prefixes exceed a set limit.

Options

maximum *number*—When you set the maximum number of prefixes, a message is logged when that number is exceeded.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

teardown <*percentage*>—If you include the **teardown** statement, the session is torn down when the maximum number of prefixes is reached. If you specify a percentage, messages are logged when the number of prefixes exceeds that percentage. After the session is torn down, it is reestablished in a short time unless you include the **idle-timeout** statement. Then the session can be kept down for a specified amount of time, or forever. If you specify **forever**, the session is reestablished only after you issue a **clear bgp neighbor** command.

Range: 1 through 100

idle-timeout (forever | *timeout-in-minutes*)—(Optional) If you include the **idle-timeout** statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify **forever**, the session is reestablished only after you intervene with a **clear bgp neighbor** command.

Range: 1 through 2400

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- accepted-prefix-limit
- Enabling Multiprotocol BGP

priority (IS-IS)

Syntax
priority *number*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
The interface's priority for becoming the designated router. The interface with the highest priority value becomes that level's designated router.

The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.

Options
number—Priority value.

Range: 0 through 127

Default: 64

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Levels on IS-IS Interfaces

priority (OSPF)

Syntax priority *number*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],
[edit logical-systems *logical-system-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)] area *area-id* interface *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)] area *area-id* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the routing device's priority for becoming the designated routing devices. The routing device that has the highest priority value on the logical IP network or subnet becomes the network's designated router. You must configure at least one routing device on each logical IP network or subnet to be the designated router. You also should specify a routing device's priority for becoming the designated router on point-to-point interfaces.

Options *number*—Routing device's priority for becoming the designated router. A priority value of 0 means that the routing device never becomes the designated router. A value of 1 means that the routing device has the least chance of becoming a designated router.

Range: 0 through 255

Default: 128

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

qualified-next-hop

Syntax

```
qualified-next-hop (address | interface-name) {
    interface interface-name;
    metric metric;
    preference preference;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* **routing-options static** route *destination-prefix*],
[edit logical-systems *logical-system-name* **routing-options** rib inet6.0 **static** route *destination-prefix*],
[edit logical-systems *logical-system-name* **routing-options static** route *destination-prefix*],
[edit routing-instances *routing-instance-name* **routing-options static** route *destination-prefix*],
[edit **routing-options** rib inet6.0 **static** route *destination-prefix*],
[edit **routing-options static** route *destination-prefix*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure an independent metric or preference on a static route.

Options

address—IPv4, IPv6, or ISO network address of the next hop.

interface-name—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered Ethernet interface as the next-hop interface for a static route, specify **qualified-next-hop *interface-name***, where ***interface-name*** is the name of the IPv4 or IPv6 unnumbered Ethernet interface.

metric—Metric value.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

preference—Preference value. A lower number indicates a more preferred route.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: 5

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring an Independent Preference for Static Routes

readvertise

Syntax (readvertise | no-readvertise);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-options **static** (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether static routes are eligible to be readvertised by routing protocols:

- **readvertise**—Readvertise static routes.
- **no-readvertise**—Mark a static route as being ineligible for readvertisement; include the **no-readvertise** option when configuring the route.

Default readvertise

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

realm

Syntax

```
realm (ipv4-unicast | ipv4-multicast | ipv6-unicast) {
    area area-id {
        interface interface-name;
    }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **ospf3**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **ospf3**],
[edit protocols **ospf3**],
[edit routing-instances *routing-instance-name* protocols **ospf3**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure OSPFv3 to advertise address families other than unicast IPv6. The Junos OS maps each address family you configure to a separate realm with its own set of neighbors and link-state database.

Options

ipv4-unicast—Configure a realm for IPv4 unicast routes.

ipv4-multicast—Configure a realm for IPv4 multicast routes.

ipv6-multicast—Configure a realm for IPv6 multicast routes.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Multiple Address Families for OSPFv3

receive (RIP)

Syntax receive *receive-options*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit protocols **rip**],
[edit protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RIP receive options.

Options ***receive-options***—One of the following:

- **both**—Accept both RIP version 1 and version 2 packets.
- **none**—Do not receive RIP packets.
- **version-1**—Accept only RIP version 1 packets.
- **version-2**—Accept only RIP version 2 packets.

Default: both

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **send on page 672**
- Configuring RIP Update Messages

receive (RIPng)

Syntax receive <none>;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* protocols ripng group *group-name* neighbor *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng group *group-name* neighbor *neighbor-name*],
[edit protocols ripng],
[edit protocols ripng group *group-name* neighbor *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng group *group-name* neighbor *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable or disable receiving of update messages.

Options **none**—(Optional) Disable receiving update messages.

Default: Enabled

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **send on page 673**
- Configuring RIPng Update Messages

redundant-sources

Syntax redundant-sources [*addresses*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a list of redundant sources for multicast flows defined by a flow map.

Options ***addresses***—List of IPv4 or IPv6 addresses for use as redundant (backup) sources for multicast flows defined by a flow map.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring a Multicast Flow Map

reference-bandwidth (IS-IS)

Syntax reference-bandwidth *reference-bandwidth*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the reference bandwidth used in calculating the default interface cost. The cost is calculated using the following formula:

```
cost = reference-bandwidth/bandwidth
```

Options ***reference-bandwidth***—Reference bandwidth, in megabits per second.

Default: 10 Mbps

Range: 9600 through 1,000,000,000,000 Mbps

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Reference Bandwidth Used in IS-IS Metric Calculations

reference-bandwidth (OSPF)

Syntax reference-bandwidth *reference-bandwidth*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the reference bandwidth used in calculating the default interface cost. The cost is calculated using the following formula:

```
cost = ref-bandwidth/bandwidth
```

Options ***ref-bandwidth***—Reference bandwidth, in bits per second.

Default: 100 Mbps (100,000,000 bits)

Range: 9600 through 1,000,000,000,000 bits

NOTE: The default behavior is to use the reference-bandwidth value to calculate the cost of OSPF interfaces. You can override this behavior for any OSPF interface by configuring a specific cost with the metric statement.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. This operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.

The set of reserved AS numbers is in the range from 64,512 through 65,535.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Removing Private AS Numbers from AS Paths

resolution

Syntax

```
resolution {
  rib routing-table-name {
    import [ policy-names ];
    resolution-ribs [ routing-table-names ];
  }
}
```

Hierarchy Level

restart-duration

Syntax restart-duration *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* **routing-options** graceful-restart],
[edit logical-systems *logical-system-name* **routing-options** graceful-restart],
[edit routing-instances *routing-instance-name* **routing-options** graceful-restart],
[edit **routing-options** graceful-restart]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the restart timer for graceful restart.

Options **restart-duration *seconds***—Configure the time period for the restart to last.

Range: 120 through 900 seconds

Default: 90 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Graceful Restart

retain

Syntax (retain | no-retain);

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-options **static** (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure statically configured routes to be deleted from or retained in the forwarding table when the routing protocol process shuts down normally:

- **retain**—Have a static route remain in the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.
- **no-retain**—Delete statically configured routes from the forwarding table when the routing protocol process shuts down normally.

Default **no-retain**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **static on page 680**
- Configuring Static Routes

retransmit-interval

Syntax retransmit-interval *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols ospf area *area-id* peer-interface *interface-name*],
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* **virtual-link**],

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **virtual-link**],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors.

Options ***seconds***—Interval to wait.

Range: 1 through 65,535 seconds

Default: 5 seconds

NOTE: You must configure link-state advertisement (LSA) retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because the Junos OS delays LSA acknowledgments by up to 2 seconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

    }
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Create a routing table.

Explicitly creating a routing table with the ***routing-table-name*** statement is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group. Simply including the **passive** statement to indicate that a routing table is part of a routing table group is sufficient to create it.

NOTE: The IPv4 multicast routing table (inet.1) and the IPv6 multicast routing table (inet6.1) are not supported for this statement.

Default If you do not specify a routing table name with the ***routing-table-name*** statement, the software uses the default routing tables, which are **inet.0** for unicast routes and **inet.1** for the multicast cache.

Options ***routing-table-name***—Name of the routing table, in the following format:
protocol [.***identifier***].

In a routing instance, the routing table name must include the routing instance name. For example, if the routing instance name is **link0**, the routing table name might be **link0.inet6.0**.

- ***protocol*** is the protocol family. It can be **inet6** for the IPv6 family, **inet** for the IPv4 family, **iso** for the ISO protocol family, or ***instance-name*.iso.0** for an ISO routing instance.
- ***identifier*** is a positive integer that specifies the instance of the routing table.

Default: inet.0

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- passive

rib (Route Resolution)

Syntax

```
rib routing-table-name {
    import [ policy-names ];
    resolution-ribs [ routing-table-names ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **resolution**],
[edit logical-systems *logical-system-name* routing-options **resolution**],
[edit routing-instances *routing-instance-name* routing-options **resolution**],
[edit routing-options **resolution**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify a routing table name for route resolution.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

- Configuring Route Resolution

rib-group (BGP)

Syntax rib-group *group-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit routing-instances *routing-instance-name* protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Add unicast prefixes to unicast and multicast tables.

Options *group-name*—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens. You generally specify only one routing table group.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

rib-group (IS-IS)

Syntax

```
rib-group {
    inet group-name;
    inet6 group-name;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Install routes learned from IS-IS routing instances into routing tables in the IS-IS routing table group. You can install IPv4 routes or IPv6 routes.

Support for IPv6 routing table groups in IS-IS enables IPv6 routes that are learned from IS-IS routing instances to be installed into other routing tables defined in an IS-IS routing table group.

Options

group-name—Name of the routing table group.

inet—Install IPv4 IS-IS routes.

inet6—Install IPv6 IS-IS routes.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

rib-group (RIP)

Syntax rib-group *group-name*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit protocols **rip**],
[edit routing-instances *routing-instance-name* protocols **rip**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Install RIP routes into multiple routing tables by configuring a routing table group.

Options ***group-name***—Name of the routing table group.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Routing Table Groups for RIP

rib-group

Syntax rib-group *group-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **interface-routes**],
[edit logical-systems *logical-system-name* routing-options **interface-routes**],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* static],
[edit logical-systems *logical-system-name* routing-options static],
[edit routing-instances *routing-instance-name* routing-options **interface-routes**],
[edit routing-options **interface-routes**],
[edit routing-options rib *routing-table-name* static],
[edit routing-options static]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure which routing table groups interface routes are imported into.

Options ***group-name***—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens. It generally does not make sense to specify more than a single routing table group.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

rib-groups

Syntax

```
rib-groups {
  group-name {
    export-rib group-name;
    import-policy [ policy-names ];
    import-rib [ group-names ];
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.

Each routing table group must contain one or more routing tables that the Junos OS uses when importing routes (specified in the **import-rib** statement) and optionally can contain one routing table group that the Junos OS uses when exporting routes to the routing protocols (specified in the **export-rib** statement).

Options ***group-name***—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **rib-group on page 663**
- Creating Routing Table Groups

rip

Syntax rip {...}

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable RIP routing on the routing device.

Default RIP is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum RIP Configuration

ripng

Syntax ripng {...}

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable RIPng routing on the routing device.

Default RIPng is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum RIPng Configuration

route-distinguisher-id

Syntax route-distinguisher-id *address*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a route distinguisher identifier for a routing instance, specifying an IP address. If a route distinguisher is configured for a particular routing instance, that value supersedes the route distinguisher configured by this statement.

Options ***address***—IP address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Route Distinguishers for VRF and Layer 2 VPN Instances

route-record

Syntax route-record;

Hierarchy Level [edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Export the AS path and routing information to the traffic sampling process.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Route Recording for Flow Aggregation
- *Junos OS Services Interfaces Configuration Guide*

route-timeout (RIP)

Syntax route-timeout *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip **group** *group-name*],
[edit protocols **rip**],
[edit protocols rip **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the route timeout interval for RIP.

Options ***seconds***—Estimated time to wait before making updates to the routing table.

Range: 30 through 360 seconds

Default: 180 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring RIP Timers
- RIP Demand Circuits Overview

route-timeout

Syntax route-timeout *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the route timeout interval for RIPng.

Options ***seconds***—Estimated time to wait before making updates to the routing table.

Range: 30 through 360 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring RIPng Timers

route-type-community

Syntax route-type-community (iana | vendor);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an extended community value to encode the OSPF route type. Each extended community is coded as an eight-octet value. This statement sets the most significant bit to either an IANA or vendor-specific route type.

Options **iana**—Encode a route type with the value **0x0306**. This is the default value.

vendor—Encode the route type with the value **0x8000**.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring OSPF Domain IDs for VPNs

router-id

Syntax router-id *address*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the routing device's IP address.

NOTE: We strongly recommend that you configure the router identifier under the **[edit routing-options]** hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

Options ***address***—IP address of the routing device.

Default: Address of the first interface encountered by the Junos OS

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Router Identifiers for BGP and OSPF

routing-options

Syntax routing-options { ... }

Hierarchy Level [edit],
[edit logical-systems *logical-system-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],
[edit routing-instances *routing-instance-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure protocol-independent routing properties.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Protocol-Independent Routing Properties Configuration Statements

rpf-check-policy

Syntax rpf-check-policy [*policy-names*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply policies for disabling RPF checks on arriving multicast packets. The policies must be correctly configured.

Options ***policy-names***—Name of one or more multicast RPF check policies.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring RPF Policies

scope

Syntax
```
scope scope-name {
    interface [ interface-names ];
    prefix destination-prefix;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multicast scoping.

Options ***scope-name***—Name of the multicast scope.

The remaining statements are explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Creating a Named Scope for Multicast Scoping

scope-policy

Syntax scope-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-options multicast]

NOTE: You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the **scope** statement to a specific routing instance at the **[edit routing-instances *routing-instance-name* routing-options multicast]** or **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast]** hierarchy level.

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply policies for scoping. The policy must be correctly configured at the **edit policy-options policy-statement** hierarchy level.

Options ***policy-names***—Name of one or more multicast scope policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **scope on page 670**
- Example: Using a Scope Policy for Multicast Scoping

send (RIP)

Syntax send *send-options*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit protocols **rip**],
[edit protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RIP send options.

Options ***send-options***—One of the following:

- **broadcast**—Broadcast RIP version 2 packets (RIP version 1 compatible).
- **multicast**—Multicast RIP version 2 packets. This is the default.
- **none**—Do not send RIP updates.
- **version-1**—Broadcast RIP version 1 packets.

Default: multicast

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **receive on page 645**
- Configuring RIP Update Messages

send (RIPng)

Syntax send <none>;

Hierarchy Level [edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* protocols ripng group *group-name* neighbor *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instances-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng group *group-name* neighbor *neighbor-name*],
[edit protocols ripng],
[edit protocols ripng group *group-name* neighbor *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng group *group-name* neighbor *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable or disable sending of update messages.

Options **none**—(Optional) Disable sending of update messages.

Default: Enabled

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **receive on page 646**
- Configuring RIPng Update Messages

shortcuts

Syntax
```
shortcuts;
  lsp-metric-into-summary;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) **traffic-engineering**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **traffic-engineering**],
[edit protocols (ospf | ospf3) **traffic-engineering**],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3)**traffic-engineering**]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure OSPF to use MPLS label-switched paths (LSPs) as shortcut next hops. By default, shortcut routes calculated through OSPFv2 are installed in the**inet.3** routing table, and shortcut routes calculated through OSPFv3 are installed in the **inet6.3** routing table.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling OSPF Traffic Engineering Support

source

Syntax
source [*addresses*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-options multicast **ssm-map** *ssm-map-name*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify IPv4 or IPv6 source addresses for an SSM map.

Options
addresses—IPv4 or IPv6 source addresses.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To view this statement in the configuration.

Related Documentation
- Example: Configuring SSM Mapping

source-routing

Syntax

```
source-routing {
   (ip | ipv6)
}
```

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable source routing.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling Source Routing

spf-options

Syntax

```
spf-options {
    delay milliseconds;
    holddown milliseconds;
    rapid-runs number;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols isis],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis],
[edit protocols isis],
[edit routing-instances *routing-instance-name* protocols isis]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a holddown interval after SPF algorithm runs the maximum number of times.

Options

delay *milliseconds*—Time interval between the detection of a topology change and when the SPF algorithm runs.

Range: 50 through 1000 milliseconds

Default: 200 milliseconds

holddown *milliseconds*—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.

Range: 2000 through 10,000 milliseconds

Default: 5000 milliseconds

rapid-runs *number*—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the holddown interval begins.

Range: 1 through 5

Default: 3

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a hold-down interval after the SPF algorithm runs the maximum number of times.

Options

delay ***milliseconds***—Time interval between the detection of a topology change and when the SPF algorithm runs.

Range: 50 through 8000 milliseconds

Default: 200 milliseconds

holddown ***milliseconds***—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.

Range: 2000 through 20,000 milliseconds

Default: 5000 milliseconds

rapid-runs ***number***—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the holddown interval begins.

Range: 1 through 5

Default: 3

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

ssm-groups

Syntax
ssm-groups [*ip-addresses*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure source-specific multicast (SSM) groups.

By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the **ssm-groups** statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the **ssm-groups** statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.

Options
ip-addresses—List of one or more additional SSM group addresses separated by a space.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

ssm-map

Syntax

```
ssm-map ssm-map-name {
    policy [ policy-names ];
    source [ addresses ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure SSM mapping.

Options

ssm-map-name—Name of the SSM map.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

static

Syntax

```
static {
  defaults {
    static-options;
  }
  rib-group group-name;
  route destination-prefix {
    bfd-liveness-detection {
      authentication {
        algorithm algorithm-name;
        key-chain key-chain-name;
        loose-check;
      }
      detection-time {
        threshold milliseconds;
      }
      local-address ip-address;
      minimum-interval milliseconds;
      minimum-receive-interval milliseconds;
      minimum-receive-ttl number;
      multiplier number;
      neighbor address;
      no-adaptation;
      transmit-interval {
        threshold milliseconds;
        minimum-interval milliseconds;
      }
      version (1 | automatic);
    }
    next-hop address;
    next-hop options;
    qualified-next-hop address {
      metric metric;
      preference preference;
    }
    static-options;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-options],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name*],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-options rib *routing-table-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure static routes to be installed in the routing table. You can specify any number of routes within a single **static** statement, and you can specify any number of **static** options in the configuration.

Options **defaults**—Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the **static** statement. This part of the **static** statement is optional.

route ***destination-prefix***—Destination of the static route.

- **defaults**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.
- **next-hop** ***address***—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).
- ***nsap-prefix***—***nsap-prefix*** is the network service access point (NSAP) address for ISO.

next-hop options—Additional information for how to manage forwarding of packets to the next hop.

- **discard**—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.
- ***iso-net***—Reach the next-hop routing device by specifying an ISO NSAP.
- **next-table** ***routing-table-name***—Name of the next routing table to the destination.
- **receive**—Install a receive route for this destination into the routing table.
- **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

static-options—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in ***static-options***. Each of the options is explained separately.

- **(active | passive)**;
- **as-path <***as-path***> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator** ***as-number in-address*****>**;
- **community [** ***community-ids*** **]**;
- **(install | no-install)**;
- **(metric | metric2 | metric3 | metric4)** ***value*** **<type** ***type*****>**;
- **(preference | preference2 | color | color2)** ***preference*** **<type** ***type*****>**;
- **(readvertise | no-readvertise)**;

- **(resolve | no-resolve)**;
- **(no-retain | retain)**;
- **tag** *string*;

The remaining statements are explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

stub

Syntax
stub <**default-metric** *metric*> <(no-summaries | summaries)>;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) **area** *area-id*],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (ospf | ospf3) **area** *area-id*],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id*],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify that this area not be flooded with AS external link-state advertisements (LSA)s. You must include the **stub** statement when configuring all routing devices that are in the stub area.

The backbone cannot be configured as a stub area.

You cannot configure an area to be both a stub area and a not-so-stubby area (NSSA).

Options
no-summaries—(Optional) Do not advertise routes into the stub area. If you include the **default-metric** option, only the default route is advertised.

summaries—(Optional) Flood summary LSAs into the stub area.

The remaining statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

subscriber-leave-timer

Syntax subscriber-leave-timer *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-options multicast **interface** *interface-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit routing-options multicast **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Length of time before the multicast VLAN updates QoS data (for example, available bandwidth) for subscriber interfaces after it receives an IGMP leave message.

Options ***seconds***—Length of time before the multicast VLAN updates QoS data (for example, available bandwidth) for subscriber interfaces after it receives an IGMP leave message. Specifying a value of 0 results in an immediate update. This is the same as if the statement were not configured.

Range: 0 through 30

Default: 0 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Multicast with Subscriber VLANs

summaries

Syntax (summaries | no-summaries);

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**],
[edit protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)] area *area-id* **nssa**],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether or not area border routers advertise summary routes into an not-so-stubby area (NSSA):

- **summaries**—Flood summary link-state advertisements (LSAs) into the NSSA.
- **no-summaries**—Prevent area border routers from advertising summaries into an NSSA. If **default-metric** is configured for an NSSA, a Type 3 LSA is injected into the area by default.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

threshold

Syntax threshold suppress *value* <reuse *value*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **multicast** forwarding-cache],
[edit logical-systems *logical-system-name* routing-options **multicast** forwarding-cache],
[edit routing-instances *routing-instance-name* routing-options **multicast** forwarding-cache],
[edit routing-options **multicast** forwarding-cache]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the suppression and reuse thresholds for multicast forwarding cache limits.

Options

reuse *value*—Value at which to begin creating new multicast forwarding cache entries. This value is optional. If configured, this number should be less than the **suppress** value.

Range: 1 through 200,000

suppress *value*—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the **reuse** value.

Range: 1 through 200,000

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

timeout (Flow Maps)

Syntax timeout (never non-discard-entry-only | *minutes*);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the timeout value for multicast forwarding cache entries associated with the flow map.

Options ***minutes***—Length of time that the forwarding cache entry remains active.

Range: 1 through 720

never non-discard-entry-only—Specify that the forwarding cache entry always remain active. If you omit the **non-discard-entry-only** option, all multicast forwarding entries, including those in forwarding and pruned states, are kept forever. If you include the **non-discard-entry-only** option, entries with forwarding states are kept forever, and entries with pruned states time out.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

timeout (Multicast)

Syntax timeout *minutes*;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **forwarding-cache**],
[edit logical-systems *logical-system-name* routing-options multicast **forwarding-cache**],

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.

Default

The default BGP protocol-level tracing options are inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level. The default group-level trace options are inherited from the BGP protocol-level **traceoptions** statement. The default peer-level trace options are inherited from the group-level **traceoptions** statement.

Options

disable—(Optional) Disable the tracing operation. You can use this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *name*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place BGP tracing output in the file **bgp-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

BGP Tracing Flags

- **4byte-as**—4-byte AS events
- **bfd**—BFD protocol events
- **damping**—Damping operations
- **graceful-restart**—Graceful restart events
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets
- **refresh**—BGP refresh packets
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **filter**—Filter trace information. Applies only to **route** and **damping** tracing flags.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation

- **log-updown on page 573** statement

traceoptions (IS-IS)

Syntax

```
traceoptions {
    file name <size size> <files number> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple **flag** statements.

Default

The default IS-IS protocol-level tracing options are those inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory **/var/log**. We recommend that you place IS-IS tracing output in the file **isis-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag ***flag***—Tracing operation to perform. To specify more than one flag, include multiple **flag** statements.

IS-IS Protocol-Specific Tracing Flags

- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets

- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDU packets
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation
- Tracing IS-IS Protocol Traffic

traceoptions (OSPF)

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure OSPF protocol-level tracing options.

To specify more than one tracing operation, include multiple **flag** statements.

Default

The default OSPF protocol-level tracing options are those inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place OSPF tracing output in the file **ospf-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis packets
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **spf**—Shortest-path-first (SPF) calculations.

Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations.

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

traceoptions (RIP)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit protocols **rip**],
[edit routing-instances *routing-instance-name* protocols **rip**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set RIP protocol-level tracing options.

Default The default RIP protocol-level trace options are inherited from the global **traceoptions** statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file **/var/log/rip-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.
If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets
- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets

- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **receive-detail**—Provide detailed trace information for packets being received
- **send**—Packets being transmitted
- **send-detail**—Provide detailed trace information for packets being transmitted

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions (RIPng)

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set RIPng protocol-level tracing options.

Default The default RIPng protocol-level trace options are inherited from the global **traceoptions** statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIPng tracing output in the file **/var/log/ripng-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

RIPng Tracing Options

- **error**—RIPng error packets
- **expiration**—RIPng route expiration processing
- **holddown**—RIPng hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIPng packets
- **request**—RIPng information packets such as request, poll, and poll entry packets

- **trigger**—RIPng triggered updates
- **update**—RIPng update packets

Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **receive-detail**—Provide detailed trace information for packets being received
- **send**—Packets being transmitted
- **send-detail**—Provide detailed trace information for packets being transmitted

no-world-readable—(Optional) Do not allow any user to read the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-options flow]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations that track all routing protocol functionality in the routing device.

To specify more than one tracing operation, include multiple **flag** statements.

Default If you do not include this statement, no global tracing operations are performed.

Options **Values:**

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place global routing protocol tracing output in the file **routing-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals

- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-synchronization**—Nonstop active routing synchronization
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

traffic-engineering (OSPF)

Syntax

```
traffic-engineering {
  <advertise-unnumbered-interfaces>;
  <credibility-protocol-preference>;
  ignore-lsp-metrics;
  multicast-rpf-routes;
  no-topology;
  shortcuts {
    lsp-metric-into-summary;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (**ospf** | ospf3)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | ospf3)],
[edit protocols (**ospf** | ospf3)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | ospf3)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable the OSPF traffic engineering features.

Default

Traffic engineering support is disabled.

Options

advertise-unnumbered-interfaces—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. You do not need to include this statement if RSVP is able to signal unnumbered interfaces as defined in RFC 3477.

credibility-protocol-preference—(Optional) (OSPFv2 only) Specify to use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior of having the traffic engineering database prefer IS-IS routes even if OSPF routes are configured a with a lower, that is, preferred, preference value.

multicast-rpf-routes—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the **inet.2** routing table.

no-topology—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the estimated time required to transmit a link-state update on the interface. When calculating this time, make sure to account for transmission and propagation delays.

You should never have to modify the transit delay time.

Options ***seconds***—Estimated time, in seconds.

Range: 1 through 65,535 seconds

Default: 1 second

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-options multicast **pim-to-igmp-proxy**],
[edit routing-options multicast **pim-to-mld-proxy**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the **pim-to-igmp-proxy** statement), or into corresponding MLD report or leave messages (if you include the **pim-to-mld-proxy** statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.

Options *interface-names*—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ([ ]).

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

virtual-link

Syntax

```
virtual-link neighbor-id router-id transit-area area-id {
    disable;
    authentication key <key-id identifier>;
    dead-interval seconds;
    hello-interval seconds;
    ipsec-sa name;
    retransmit-interval seconds;
    transit-delay seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf area *area-id*],
[edit protocols (ospf | ospf3) area *area-id*],
[edit routing-instances *routing-instance-name* protocols ospf area *area-id*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For backbone areas only, create a virtual link to use in place of an actual physical link. All area border routers and other routing devices on the backbone must be contiguous. If this is not possible and there is a break in OSPF connectivity, use virtual links to create connectivity to the OSPF backbone. When configuring virtual links, you must configure links on the two routing devices that form the end points of the link, and both these two routing devices must be area border routers. You cannot configure links through stub areas.

Options

neighbor-id *router-id*—IP address of the routing device at the remote end of the virtual link.

transit-area *area-id*—Area identifier of the area through which the virtual link transits. Virtual links are not allowed to transit the backbone area.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

<purge>
<router>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine. You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries.

CAUTION: This command is useful only for testing. Use it with care, because it causes significant network disruption.

Options

none—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

advertising-router (*router-id* | self)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

area *area-id*—(Optional) Discard entries for the LSAs in the specified area.

asbrsummary—(Optional) Discard summary AS boundary router LSA entries.

external—(Optional) Discard external LSAs.

instance *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.

inter-area-prefix—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

inter-area-router—(OSPFv3 only) (Optional) Discard interarea router LSAs.

intra-area-prefix—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

link-local—(Optional) Delete link-local LSAs.

lsa-id *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.

netsummary—(Optional) Discard summary network LSAs.

network—(Optional) Discard network LSAs.

nssa—(Optional) Discard not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Discard opaque area-scope LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

Syntax (J-EX Series Switch)

clear (ospf | ospf3) neighbor
<area *area-id*>
<instance *instance-name*>
<interface *interface-name*>
<neighbor>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Tear down Open Shortest Path First (OSPF) neighbor connections.

Options

none—Tear down OSPF connections with all neighbors for all routing instances.

area *area-id*—(Optional) Tear down neighbor connections for the specified area only.

instance *instance-name*—(Optional) Tear down neighbor connections for the specified routing instance only.

interface *interface-name*—(Optional) Tear down neighbor connections for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear the state of the specified neighbor only.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Clear the state of the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

clear bgp neighbor

Syntax

clear bgp neighbor
<as *as-number*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>
<soft | soft-inbound>
<soft-minimum-igp>

Syntax (J-EX Series Switch)

clear bgp neighbor
<as *as-number*>
<instance *instance-name*>
<*neighbor*>
<soft | soft-inbound>
<soft-minimum-igp>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Perform one of the following tasks:

- Change the state of one or more Border Gateway Protocol (BGP) neighbors to **IDLE**. For neighbors in the **ESTABLISHED** state, this command drops the TCP connection to the neighbors and then reestablishes the connection.
- (**soft** or **soft-inbound** keyword only) Reapply export policies or import policies, respectively, and send refresh updates to one or more BGP neighbors without changing their state.

Options

none—Change the state of all BGP neighbors to **IDLE**.

as *as-number*—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

instance *instance-name*—(Optional) Apply this command only to neighbors for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

soft—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

soft-inbound—(Optional) Reapply any import policies and send refresh updates to neighbors without clearing the state.

soft-minimum-igp—(Optional) Provides soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

Required Privilege Level	clear

```
user@host> clear bgp neighbor
```

clear bgp table

Syntax clear bgp table *table-name*
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) clear bgp table *table-name*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Request BGP to refresh routes in a specified routing table.

Options logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table-name—Request that BGP refresh routes in the specified table.

Additional Information In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the **clear bgp table** command to request that BGP refresh routes in a VPN instance table.

Required Privilege Level clear

List of Sample Output
clear bgp table private.inet.0 on page 726
clear bgp table inet.6 logical-system all on page 726
clear bgp table private.inet.6 logical-system ls1 on page 726
clear bgp table logical-system all inet.0 on page 726
clear bgp table logical-system ls2 private.inet.0 on page 727

Output Fields This command produces no output.

Sample Output

clear bgp table private.inet.0

```
user@host> clear bgp table private.inet.0
```

clear bgp table inet.6 logical-system all

```
user@host> clear bgp table inet.6 logical-system all

<logical-system (all | *logical-system-name*)>
<*neighbor*>

Syntax (J-EX Series Switch)

clear isis adjacency
<instance *instance-name*>
<interface *interface-name*>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Remove entries from the Intermediate System-to-Intermediate System (IS-IS) adjacency database.

Options

none—Remove all entries from the adjacency database.

instance *instance-name*—(Optional) Clear all adjacencies for the specified routing instance only.

interface *interface-name*—(Optional) Clear all adjacencies for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear adjacencies for the specified neighbor only.

Required Privilege Level

clear isis database

Syntax

clear isis database
<*entries*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<purge>

Syntax (J-EX Series Switch)

clear isis database
<*entries*>
<instance *instance-name*>
<purge>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Remove the entries from the Intermediate System-to-Intermediate System (IS-IS) link-state database, which contains prefixes and topology information. You can also use **purge** with any of the options to initiate a network-wide purge of link-state PDUs (LSPs) rather than the local deletion of entries from the IS-IS link-state database.

CAUTION: In a production network, the purge command option may cause short-term network-wide traffic disruptions. Use with caution!

Options

none—Remove all entries from the IS-IS link-state database for all routing instances.

entries—(Optional) Name of the database entry.

instance *instance-name*—(Optional) Clear all entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

purge—(Optional) Discard all entries in the IS-IS link-state database.

clear isis overload

Syntax
clear isis overload
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear isis overload
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Reset the Intermediate System-to-Intermediate System (IS-IS) dynamic overload bit. This command can appear to not work, continuing to display **overload** after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.

Options
none—Reset the IS-IS dynamic overload bit.

instance *instance-name*—(Optional) Reset the IS-IS dynamic overload bit for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

clear ospf overload

Syntax
clear ospf overload
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear ospf overload
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear the Open Shortest Path First version 2 (OSPFv2) overload bit and rebuild link-state advertisements (LSAs).

Options
none—Clear the overload bit and rebuild LSAs for all routing instances.

instance *instance-name*—(Optional) Clear the overload bit and rebuild LSAs for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

List of Sample Output
clear ospf overload on page 737

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ospf overload

```
user@host> clear ospf overload
```

clear rip general-statistics

Syntax clear rip general-statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) clear rip general-statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear Routing Information Protocol (RIP) general statistics.

Options none—Clear RIP general statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level clear

Related Documentation

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear rip general-statistics

```
user@host> clear rip general-statistics
```

clear rip statistics

Syntax
clear rip statistics
<instance (all | *instance-name*)>
<logical-system (all | *logical-system-name*)>
<*neighbor*>

Syntax (J-EX Series Switch)
clear rip statistics
<instance (all | *instance-name*)>
<*neighbor*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Routing Information Protocol (RIP) statistics.

Options
none—Reset RIP counters for all neighbors for all routing instances.

instance (all | *instance-name*)—(Optional) Clear RIP statistics for all instances or for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear RIP statistics for the specified neighbor only.

Required Privilege Level
clear

user@host> clear ripng general-statistics
```

clear ripng statistics

Syntax
clear ripng statistics
<*instance* | *name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear ripng statistics
<*instance* | *name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Routing Information Protocol next-generation (RIPng) statistics.

Options
none—Reset RIPng counters for all neighbors for all routing instances.

instance—(Optional) Reset RIPng counters for the specified instance.

name—(Optional) Reset RIPng counters for the specified neighbor.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

show (ospf | ospf3) interface

Syntax

show (ospf | ospf3) interface
<brief | detail | extensive>
<area *area-id*>
<*interface-name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ip4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) interface
<brief | detail | extensive>
<area *area-id*>
<*interface-name*>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the status of Open Shortest Path First (OSPF) interfaces.

Options

none—Display standard information about the status of all OSPF interfaces for all routing instances

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the interfaces that belong to the specified area.

interface-name—(Optional) Display information for the specified interface.

instance *instance-name*—(Optional) Display all OSPF interfaces under the named routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the interfaces for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Required Privilege Level

view

show ospf interface brief on page 744
show ospf interface detail on page 744
show ospf3 interface detail on page 745
show ospf interface detail(When Multiarea Adjacency Is Configured) on page 745
show ospf interface area area-id on page 746
show ospf interface extensive (When Flooding Reduction Is Enabled) on page 746

Output Fields Table 61 on page 743 lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

Table 61: show (ospf | ospf3) interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface running OSPF version 2 or OSPF version 3.	All levels
State	State of the interface: **BDR**, **Down**, **DR**, **DRother**, **Loop**, **PtToPt**, or **Waiting**.	All levels
Area	Number of the area that the interface is in.	All levels
DR ID	Address of the area's designated router.	All levels
BDR ID	Backup designated router for a particular subnet.	All levels
Nbrs	Number of neighbors on this interface.	All levels
Type	Type of interface: **LAN**, **NBMA**, **P2MP**, **P2P**, or **Virtual**.	**detail extensive**
Address	IP address of the neighbor.	**detail extensive**
Mask	Netmask of the neighbor.	**detail extensive**
Prefix-length	(OSPFv3) IPv6 prefix length, in bits.	**detail extensive**
OSPF3-Intf-Index	(OSPFv3) OSPF version 3 interface index.	**detail extensive**
MTU	Interface's maximum transmission unit (MTU).	**detail extensive**
Cost	Interface's cost (metric).	**detail extensive**
DR addr	Address of the designated router.	**detail extensive**
BDR addr	Address of the backup designated router.	**detail extensive**
Adj count	Number of adjacent neighbors.	**detail extensive**
Secondary	Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface only for one area.	**detail extensive**
Flood Reduction	Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the **DoNotAge** bit set. As a result, LSAs are refreshed only when a change occurs.	**extensive**
Priority	Router priority used in designated router (DR) election on this interface.	**detail extensive**
Flood list	List of link-state advertisements (LSAs) that might be about to flood this interface.	**extensive**

Table 61: show (ospf | ospf3) interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Ack list	Acknowledgment list. List of pending acknowledgments on this interface.	**extensive**
Descriptor list	List of packet descriptors.	**extensive**
Hello	Configured value for the Hello timer.	**detail extensive**
Dead	Configured value for the Dead timer.	**detail extensive**
Auth type	(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: • **MD5**—MD5 mechanism is configured in accordance with RFC 2328. • **None**—No authentication method is configured. • **Password**—Simple password (RFC 2328) is configured.	**detail extensive**
Topology	(Multiarea adjacency) Name of topology: **default** or ***name***	
IPSec SA name	(OSPFv2) Name of the IPSec security association name	**detail extensive**
Active key ID	(OSPFv2 and MD5) Number from **0** to **255** that uniquely identifies an MD5 key.	**detail extensive**
Start time	(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as **Start time 1970 Jan 01 00:00:00 PST.**	**detail extensive**
ReXmit	Configured value for the Retransmit timer.	**detail extensive**
Stub, **Not Stub**, or **Stub NSSA**	Type of area.	**detail extensive**

List of Sample Output **show ospf io-statistics on page 747**

Output Fields Table 62 on page 747 lists the output fields for the **show ospf io-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 62: show (ospf | ospf3) io-statistics Output Fields

Field Name	Field Description
Packets read	Number of OSPF packets read since the last time the routing protocol was started.
average per run	Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.
max run	Maximum number of packets for a given run among all scheduled runs.
Receive errors	Number of faulty packets received with errors.

Sample Output

show ospf io-statistics

```
user@host> show ospf io-statistics

Packets read: 7361, average per run: 1.00, max run: 1
Receive errors:
  None
```

show (ospf | ospf3) log

Syntax

show (ospf | osfp3) log
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<topology *topology-name*>

Syntax (J-EX Series Switch)

show (ospf | osfp3) log
<instance *instance-name*>
<topology *topology-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

Options

none—Display entries in the OSPF log of SPF calculations for all routing instances.

instance *instance-name*—(Optional) Display entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology *topology-name*—(Optional) Display entries for the specified topology.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show ospf log topology voice on page 749

Output Fields

Table 63 on page 748 lists the output fields for the **show (ospf | ospf3) log** command. Output fields are listed in the approximate order in which they appear.

Table 63: show (ospf | ospf3) log Output Fields

Field Name	Field Description
When	Time, in weeks (**w**) and days (**d**), since the SPF calculation was made.
Type	Type of calculation: **Cleanup**, **External**, **Interarea**, **NSSA**, **Redist**, **SPF**, **Stub**, **Total**, or **Virtuallink**.
Elapsed	Amount of time, in seconds, that elapsed during the operation, or the time required to complete the SPF calculation. The start time is the time displayed in the **When** field.

Sample Output

show ospf log

```
user@host> show ospf log

show (ospf | ospf3) neighbor

Syntax

show (ospf | ospf3) neighbor
<brief | detail | extensive>
<area *area-id*>
<instance (all | *instance-name*)>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) neighbor
<brief | detail | extensive>
<area *area-id*>
<instance (all | *instance-name*)>
<interface *interface-name*>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Open Shortest Path First (OSPF) neighbors.

Options

none—Display standard information about all OSPF neighbors for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the OSPF neighbors for the specified area.

instance (all | *instance-name*—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

interface *interface-name*—(Optional) Display information about OSPF neighbors for the specified logical interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Display information about the specified OSPF neighbor.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields Table 64 on page 752 lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 64: show (ospf | ospf3) neighbor Output Fields

Field Name	Field Description	Level of Output
Address	Address of the neighbor.	All levels
Interface	Interface through which the neighbor is reachable.	All levels
State	State of the neighbor: • **Attempt**—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor. • **Down**—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the **Down** state, although at a reduced frequency. • **Exchange**—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged. • **ExStart**—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number. • **Full**—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements. • **Init**—A Hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor's hello packet. • **Loading**—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the **Exchange** state. • **2Way**—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state **2Way** or greater.	All levels
ID	Router ID of the neighbor.	All levels
Pri	Priority of the neighbor to become the designated router.	All levels
Dead	Number of seconds until the neighbor becomes unreachable.	All levels

Table 64: show (ospf | ospf3) neighbor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Link state acknowledgment list	Number of link-state acknowledgments received.	**extensive**
Link state retransmission list	Total number of link-state advertisements retransmitted. For **extensive** output only, the following information is also displayed: • **Type**—Type of link advertisement: **ASBR**, **Sum**, **Extern**, **Network**, **NSSA**, **OpaqArea**, **Router**, or **Summary**. • **LSA ID**—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. • **Adv rtr**—Address of the routing device that sent the advertisement. • **Seq**—Link sequence number of the advertisement.	**detail extensive**
Neighbor-address	(OSPFv3 only) If the neighbor uses virtual links, the **Neighbor-address** is the site-local, local, or global address. If the neighbor uses a physical interface, the **Neighbor-address** is an IPv6 link-local address.	**detail extensive**
area	Area that the neighbor is in.	**detail extensive**
OSPF3-Intf-Index	(OSPFv3 only) Displays the OSPFv3 interface index.	**detail extensive**
opt	Option bits received in the hello packets from the neighbor.	**detail extensive**
DR or **DR-ID**	Address of the designated router.	**detail extensive**
BDR or **BDR-ID**	Address of the backup designated router.	**detail extensive**
Up	Length of time since the neighbor came up.	**detail extensive**
adjacent	Length of time since the adjacency with the neighbor was established.	**detail extensive**

show (ospf | ospf3) overview

Syntax
show (ospf | ospf3) overview
<brief | extensive>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)
show (ospf | ospf3) overview
<brief | extensive>
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.
Database protection introduced in Junos 10.2.

Description
Display Open Shortest Path First (OSPF) overview information.

Options
none—Display standard information about all OSPF neighbors for all routing instances.

brief | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display all OSPF interfaces under the named routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields
Table 65 on page 757 lists the output fields for the **show ospf overview** command. Output fields are listed in the approximate order in which they appear.

Table 65: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels

Table 65: show ospf overview Output Fields *(continued)*

Field name	Field Description	Level of Output
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the holddown timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: **Current**, **Warning** (threshold), and **Allowed**.	All levels
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: **Current** and **Allowed**.	All levels
Restart	Graceful restart capability: **enabled** or **disabled**.	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels
Helper mode	Graceful restart helper capability: **enabled** or **disabled**.	All levels
Trace options	OSPF-specific trace options.	**extensive**
Trace file	Name of the file to receive the output of the tracing operation.	**extensive**
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: **Normal Stub**, **Not Stub**, or **Not so Stubby Stub**.	All levels

Table 65: show ospf overview Output Fields *(continued)*

Field name	Field Description	Level of Output
Authentication Type	Type of authentication: **None**, **Password**, or **MD5**.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

Sample Output

show ospf overview

```
user@host> show ospf overview
Instance: master
    Router ID: 10.255.245.6
    Route table index: 0
   Configured overload, expires in 118 seconds
    LSA refresh time: 50 minutes
  Restart: Enabled
     Restart duration: 20 sec
     Restart grace period: 40 sec
     Helper mode: enabled
  Area: 0.0.0.0
      Stub type: Not Stub
      Authentication Type: None

show (ospf | ospf3) route

Syntax

show (ospf | ospf3) route
<brief | detail | extensive>
<abr | asbr | extern | inter | intra>
<instance *instance-name*
<logical-system (all | *logical-system-name*)>
<network>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<router>
<topology *topology-name*>
<transit>

Syntax (J-EX Series Switch)

show (ospf | ospf3) route
<brief | detail | extensive>
<abr | asbr | extern | inter | intra>
<instance *instance-name*
<network>
<router>
<topology *topology-name*>
<transit>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First (OSPF) routing table.

Options

none—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

brief | detail | extensive—(Optional) Display the specified level of output.

abr—(Optional) Display routes to area border routers.

asbr—(Optional) Display routes to autonomous system border routers.

extern—(Optional) Display external routes.

inter—(Optional) Display interarea routes.

intra—(Optional) Display intra-area routes.

instance *instance-name*—(Optional) Display entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

network—(Optional) Display routes to networks.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Display routes to all routers.

topology *topology-name*—(OSPF only) (Optional) Display routes for a particular topology.

transit—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

Output Fields Table 66 on page 762 list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

Table 66: show (ospf | ospf3) route Output Fields

Field Name	Field Description	Output Level
Topology	Name of the topology.	All levels
Prefix	Destination of the route.	All levels
Path type	How the route was learned: • **Inter**—Interarea route • **Ext1**—External type 1 route • **Ext2**—External type 2 route • **Intra**—Intra-area route	All levels
Route type	The type of routing device from which the route was learned: • **AS BR**—Route to AS border router • **Area BR**—Route to area border router • **Area/AS BR**—Route to router that is both an **Area BR** and **AS BR**. • **Network**—Network router. • **Router**—Route to a router that is neither an **Area BR** nor an **AS BR**. • **Transit**—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link. • **Discard**—Route to a summary discard.	All levels
NH Type	Next-hop type: **LSP** or **IP**.	All levels
Metric	Route's metric value.	All levels
NH-interface	(OSPFv3 only) Interface through which the route's next hop is reachable.	All levels
NH-addr	(OSPFv3 only) IPv6 address of the next hop.	All levels

Table 66: show (ospf | ospf3) route Output Fields *(continued)*

Field Name	Field Description	Output Level
NextHop Interface	(OSPFv2 only) Interface through which the route's next hop is reachable.	All levels
Nexthop addr/label	(OSPFv2 only) If the **NH Type** is **IP**, then it is the address of the next hop. If the **NH Type** is **LSP**, then it is the name of the label-switched path.	All levels
Area	Area ID of the route.	**detail**
Origin	Router from which the route was learned.	**detail**
Type 7	Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).	**detail**
P-bit	Route was learned through NSSA LSA and the propagate bit was set.	**detail**
Fwd NZ	Forwarding address is nonzero. **Fwd NZ** is only displayed if the route is learned through an NSSA LSA.	**detail**
optional-capability	Optional capabilities propagated in the router LSA. This field is in the output for intraarea router routes only (when **Route Type** is **Area BR**, **AS BR**, **Area/AS BR**, or **Router**), not for interarea router routes or network routes. Three bits in this field are defined as follows: • **0x4 (V)**—Routing device is at the end of a virtual active link. • **0x2 (E)**—Routing device is an autonomous system boundary router. • **0x1 (B)**—Routing device is an area border router.	**detail**
priority	The priority assigned to the prefix: • **high** • **medium** • **low** NOTE: The **priority** field applies only to routes of type **Network**.	**detail**

show (ospf | ospf3) statistics

Syntax

show (ospf | ospf3) statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) statistics
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display OSPF statistics.

Options

none—Display OSPF statistics for all routing instances.

instance *instance-name*—(Optional) Display all statistics for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields

Table 67 on page 766 lists the output fields for the **show (ospf | ospf3) statistics** command. Output fields are listed in the approximate order in which they appear.

Table 67: show (ospf | ospf3) statistics Output Fields

Field Name	Field Description
Packet type	Type of OSPF packet.
Total Sent/Total Received	Total number of packets sent and received.
Last 5 seconds Sent/Last 5 seconds Received	Total number of packets sent and received in the last 5 seconds.
LSAs retransmitted	Total number of link-state advertisements transmitted, and number retransmitted in the last 5 seconds.
Receive errors	Number and type of receive errors.

Sample Output

show ospf statistics

```
user@host> show ospf statistics
Packet type              Total                 Last 5 seconds
                       Sent      Received        Sent      Received
   Hello             505739        990495           4             5
     DbD                 20            26           0             0
   LSReq                  6             5           0             0
LSUpdate              27060         15319           0             0

LSAs retransmitted: 16, last 5 seconds: 0

Receive errors:
  862 no interface found
  115923 no virtual link found
```

show as-path

Syntax
show as-path
<brief | detail>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show as-path
<brief | detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the **as-path-prepend** action) or through aggregation.

Options
none—Display basic information about AS paths that the local routing device is using (same as brief).

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

show as-path on page 769
show as-path detail on page 770

Output Fields
Table 68 on page 768 lists the output fields for the **show as-path** command. Output fields are listed in the approximate order in which they appear.

Table 68: show as-path Output Fields

Field Name	Field Description	Level of Output
Total AS paths	Total number of AS paths.	**brief** none
Bucket	Bucket value. This value represents a traffic classification on the interface.	All levels
Count	Path reference count.	All levels
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. • **Atomic**—Route is an aggregate of several route prefixes. • **Aggregator**—Routing device has summarized a range of prefixes.	All levels

Table 68: show as-path Output Fields *(continued)*

Field Name	Field Description	Level of Output
domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.	**detail**
neighbor as	AS peer address.	**detail**
length	Length of the AS path.	**detail**
segments	Length of the AS segment descriptor.	**detail**
references	Path reference count.	**detail**

show as-path domain

Syntax
show as-path domain
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show as-path domain

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display autonomous system (AS) path domain information.

Options
none—(Optional) Display AS path domain information for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show as-path domain on page 773

Output Fields
Table 69 on page 772 lists the output fields for the **show as-path domain** command. Output fields are listed in the approximate order in which they appear

Table 69: show as-path domain Output Fields

Field Name	Field Description
Domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.
Primary	Primary AS number.
References	Path reference count.
***Number* Paths**	Number of known AS paths.
Flags	Information about the AS path: • **ASLoop**—Path contains an AS loop. • **Atomic**—Path includes the ATOMIC_AGGREGATE path attribute. • **Local**—Path was created by local aggregation. • **Master**—Path was created by the master routing instance.
Local AS	AS number of the local routing device.
Loops	How many times this AS number can appear in an AS path.

Sample Output

show as-path domain

```
user@host> show as-path domain
Domain: 1        Primary: 10458
    References:          3 Paths:      30383
    Flags: Master
    Local AS: 10458  Loops: 1
```

Output Fields
Table 70 on page 774 lists the output fields for the **show as-path summary** command. Output fields are listed in the approximate order in which they appear.

Table 70: show as-path summary Output Fields

Field Name	Field Description
AS Path	AS path number.
Buckets	Bucket value. This value represents a traffic classification on the interface.
Max	Maximum limit for the number of AS numbers.
Min	Minimum limit for the number of AS numbers.
Avg	Average number of AS numbers.
Std deviation	Standard deviation for the number of AS numbers.

Sample Output

show as-path summary

```
user@host> show as-path summary
AS Paths  Buckets     Max    Min    Avg   Std deviation
   30425     1024      95     12     29        6.481419
```

show bgp bmp

Syntax **show bgp bmp**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about the BGP Monitoring Protocol (BMP).

Options This command has no options.

Required Privilege Level view

List of Sample Output **show bgp bmp on page 775**

Output Fields Table 71 on page 775 lists the output fields for the **show bgp bmp** command. Output fields are listed in the approximate order in which they appear.

Table 71: show bgp bmp Output Fields

Field Name	Field Description
BMP station address/port:	IP address and port number of monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.
BMP session state	Status of the BMP session: **UP** or **DOWN**.
Memory consumed by BMP	Memory used by the active BMP session.
Statistics timeout	Amount of time, in seconds, between transmissions of BMP data to the monitoring station.
Memory limit	Threshold, in bytes, at which the routing device stops collecting BMP data if it is exceeded.
Memory-connect retry timeout	Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded.

Sample Output

show bgp bmp

```
user@host> show bgp bmp
  BMP station address/port: 172.24.24.157+5454
  BMP session state: DOWN
  Memory consumed by BMP: 0
  Statistics timeout: 15
  Memory limit: 10485760
  Memory connect retry timeout: 600
```

show bgp group

Syntax

show bgp group
<brief | detail | summary>

<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<rtf>

Syntax (J-EX Series Switch)

show bgp group
<brief | detail | summary>
<*group-name*>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the configured Border Gateway Protocol (BGP) groups.

Options

none—Display group information about all BGP groups.

brief | detail | summary—(Optional) Display the specified level of output.

group-name—(Optional) Display group information for the specified group.

instance *instance-name*—(Optional) Display information about a particular BGP peer in the specified instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rtf—(Optional) Display BGP group route targeting information.

Required Privilege Level

Output Fields

Table 72 on page 776 describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

Table 72: show bgp group Output Fields

Field Name	Field Description	Level of Output
Group type or **Group**	Type of BGP group: **Internal** or **External**.	All levels

Table 72: show bgp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
AS	AS number of the peer. For internal BGP (IBGP), this number is the same as **Local AS**.	**brief detail** none
Local AS	AS number of the local routing device.	**brief detail** none
Name	Name of a specific BGP group.	**brief detail** none
Flags	Flags associated with the BGP group. This field is used by Dell support.	**brief detail** none
Export	Export policies configured for the BGP group with the **export** statement.	**brief detail** none
MED tracks IGP metric update delay	Time interval, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire	All
Total peers	Total number of peers in the group.	**brief detail** none
Established	Number of peers in the group that are in the established state.	All levels
Active/Received/Accepted/Damped	Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether an established session was established in the main routing device or in a routing instance. • If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**. • If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the **inet.0** (main) and **inet.2** (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following: ◦ 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the **inet.0** routing table. ◦ 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the **inet.2** routing table.	**summary**
ip-addresses	List of peers who are members of the group. The address is followed by the peer's port number.	All levels
Route Queue Timer	Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.	**detail**

Table 72: show bgp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
Route Queue	Number of prefixes that are queued up for sending to the peers in the group.	**detail**
inet.*number*	Number of active, received, accepted, and damped routes in the routing table. For example, **inet.0: 7/10/9/0** indicates the following: • 7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the **inet.0** routing table.	none
Table inet.*number*	Information about the routing table. • **Received prefixes**—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • **Active prefixes**—Number of prefixes received from the peer that are active in the routing table. • **Suppressed due to damping**—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. • **Advertised prefixes**—Number of prefixes advertised to a peer. • **Received external prefixes**—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table. • **Active external prefixes**—Number of prefixes received from the EBGP peers that are active in the routing table. • **Externals suppressed**—Number of routes received from EBGP peers currently inactive because of damping or other reasons. • **Received internal prefixes**—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table. • **Active internal prefixes**—Number of prefixes received from the IBGP peers that are active in the routing table. • **Internals suppressed**—Number of routes received from IBGP peers currently inactive because of damping or other reasons. • **RIB State**—Status of the graceful restart process for this routing table: **BGP restart is complete**, **BGP restart in progress**, **VPN restart in progress**, or **VPN restart is complete**.	**detail**
Groups	Total number of groups.	All levels
Peers	Total number of peers.	All levels
External	Total number of external peers.	All levels
Internal	Total number of internal peers.	All levels
Down peers	Total number of unavailable peers.	All levels
Flaps	Total number of flaps that occurred.	All levels
Table	Name of a routing table.	**brief**, none

Table 72: show bgp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tot Paths	Total number of paths.	**brief**, none
Act Paths	Number of active routes.	**brief**, none
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	**brief**, none
History	Number of withdrawn routes stored locally to keep track of damping history.	**brief**, none
Damp State	Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.	**brief**, none
Pending	Routes being processed by BGP import policy.	**brief**, none
Group	Group the peer belongs to in the BGP configuration.	**detail**
Receive mask	Mask of the received target included in the advertised route.	**detail**
Entries	Number of route entries received.	**detail**
Target	Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer.	**detail**
Mask	Mask which specifies that the peer receive routes with the given route target.	**detail**

show bgp neighbor

Syntax

show bgp neighbor
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor-address*>
<orf (detail | *neighbor-address*)

Syntax (J-EX Series Switch)

show bgp neighbor
<instance *instance-name*>
<*neighbor-address*>
<orf (*neighbor-address* | detail)

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Border Gateway Protocol (BGP) peers.

Options

none—Display information about all BGP peers.

instance *instance-name*—(Optional) Display information about BGP peers for only the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—(Optional) Display information for only the BGP peer at the specified IP address.

orf (detail | *neighbor-address*)—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the **detail** option to display detailed output.

Additional Information

For information about the **local-address, nlri**, **hold-time,** and **preference** statements, see the *Junos Routing Protocols Configuration Guide*.

Output Fields Table 73 on page 783 describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 73: show bgp neighbor Output Fields

Field Name	Field Description
Peer	Address of the BGP neighbor. The address is followed by the neighbor's port number.
AS	AS number of the peer.
Local	Address of the local routing device. The address is followed by the peer's port number.
Type	Type of peer: **Internal** or **External**.
State	Current state of the BGP session: • **Active**—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • **Connect**—BGP is waiting for the transport protocol connection to be completed. • **Established**—The BGP session has been established, and the peers are exchanging update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.
Flags	Internal BGP flags: • **Aggregate Label**—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • **CleanUp**—The peer session is being shut down. • **Delete**—This peer has been deleted. • **Idled**—This peer has been permanently idled. • **ImportEval**—At the last commit, this peer was identified as needing to reevaluate all received routes. • **Initializing**—The peer session is initializing. • **SendRtn**—Messages are being sent to the peer. • **Sync**—This peer is synchronized with the rest of the peer group. • **TryConnect**—Another attempt is being made to connect to the peer. • **Unconfigured**—This peer is not configured. • **WriteFailed**—An attempt to write to this peer failed.

Table 73: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Last state	Previous state of the BGP session: • **Active**—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • **Connect**—BGP is waiting for the transport protocol connection to be completed. • **Established**—The BGP session has been established, and the peers are exchanging update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.
Last event	Last activity that occurred in the BGP session: • **Closed**—The BGP session closed. • **ConnectRetry**—The transport protocol connection failed, and BGP is trying again to connect. • **HoldTime**—The session ended because the hold timer expired. • **KeepAlive**—The local routing device sent a BGP keepalive message to the peer. • **Open**—The local routing device sent a BGP open message to the peer. • **OpenFail**—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • **RecvKeepAlive**—The local routing device received a BGP keepalive message from the peer. • **RecvNotify**—The local routing device received a BGP notification message from the peer. • **RecvOpen**—The local routing device received a BGP open message from the peer. • **RecvUpdate**—The local routing device received a BGP update message from the peer. • **Start**—The peering session started. • **Stop**—The peering session stopped. • **TransportError**—A TCP error occurred.
Last error	Last error that occurred in the BGP session: • **Cease**—An error occurred, such as a version mismatch, that caused the session to close. • **Finite State Machine Error**—In setting up the session, BGP received a message that it did not understand. • **Hold Time Expired**—The session's hold time expired. • **Message Header Error**—The header of a BGP message was malformed. • **Open Message Error**—A BGP open message contained an error. • **None**—No errors occurred in the BGP session. • **Update Message Error**—A BGP update message contained an error.
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.

Table 73: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Options	Configured BGP options: • **AddressFamily**—Configured address family: **inet** or **inet-vpn**. • **AutheKeyChain**—Authentication key change is enabled. • **DropPathAttributes**—Certain path attributes are configured to be dropped from neighbor updates during inbound processing. • **GracefulRestart**—Graceful restart is configured. • **HoldTime**—Hold time configured with the **hold-time** statement. The hold time is three times the interval at which keepalive messages are sent. • **IgnorePathAttributes**—Certain path attributes are configured to be ignored in neighbor updates during inbound processing. • **Local Address**—Address configured with the **local-address** statement. • **Multihop**—Allow BGP connections to external peers that are not on a directly connected network. • **NLRI**—Configured MBGP state for the BGP group: **multicast**, **unicast**, or both if you have configured **nlri any**. • **Peer AS**—Configured peer autonomous system (AS). • **Preference**—Preference value configured with the **preference** statement. • **Refresh**—Configured to refresh automatically when the policy changes. • **Rib-group**—Configured routing table group.
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Authentication key change	Name of the authentication key chain enabled.
Authentication algorithm	Type of authentication algorithm enabled: **hmac** or **md5**
Address families configured	Names of configured address families for the VPN.
Local Address	Address of the local routing device.
Holdtime	Hold time configured with the **hold-time** statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: • **TrafficStatistics**—Collection of statistics for labeled-unicast traffic is enabled.

Table 73: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Traffic statistics	Information about labeled-unicast traffic statistics: • **Options**—Options configured for collecting statistics about labeled-unicast traffic. • **File**—Name and location of statistics log files. • **size**—Size of all the log files, in bytes. • **files**—Number of log files.
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the **preference** statement.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Peer Index	A unique index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which the direct EBGP peering is established.
NLRI for restart configured on peer	Names of address families configured for restart.
NLRI advertised by peer	Address families supported by the peer: **unicast** or **multicast**.
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, *Route Refresh Capability for BGP-4*.
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.

Table 73: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting) and this peer should not wait for the **end-of-rib** marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Table inet.*number*	Information about the routing table: • **RIB State**—BGP is in the graceful restart process for this routing table: **restart is complete** or **restart in progress**. • **Bit**—Number that represents the entry in the routing table for this peer. • **Send state**—State of the BGP group: **in sync**, **not in sync**, or **not advertising**. • **Active prefixes**—Number of prefixes received from the peer that are active in the routing table. • **Received prefixes**—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • **Accepted prefixes**—Total number of prefixes from the peer that have been accepted by a routing policy. • **Suppressed due to damping**—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.

Table 73: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Input dropped path attributes	Information about dropped path attributes: • Code—Path attribute code. • Count—Path attribute count.
Input ignored path attributes	Information about ignored path attributes: • Code—Path attribute code. • Count—Path attribute count.
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue **0** is for unicast NLRIs, and queue **1** is for multicast NLRIs.
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates recv	(**orf** option only) Number of outbound-route filters received for each configured address family. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Immediate	(**orf** option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Filter	(**orf** option only) Type of prefix filter received: **prefix-based** or **extended-community**.
Received filter entries	(**orf** option only) List of received filters displayed.
seq	(**orf** option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(**orf** option only) Address for the prefix entry that matches the filter.
minlength	(**orf** option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(**orf** option only) Maximum prefix length, in bits, required to match this prefix.
match	(**orf** option only) For this prefix match, whether to **permit** or **deny** route updates.

show bgp summary

Syntax
show bgp summary
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show bgp summary
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Border Gateway Protocol (BGP) summary information.

Options
none—Display BGP summary information for all routing instances.

instance *instance-name*—(Optional) Display information for the specified instance only. The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show bgp summary (When a Peer Is Not Established) on page 797
show bgp summary (When a Peer Is Established) on page 797
show bgp summary (CLNS) on page 797
show bgp summary (Layer 2 VPN) on page 797
show bgp summary (Layer 3 VPN) on page 798

Output Fields
Table 74 on page 795 describes the output fields for the **show bgp summary** command. Output fields are listed in the approximate order in which they appear.

Table 74: show bgp summary Output Fields

Field Name	Field Description
Groups	Number of BGP groups.
Peers	Number of BGP peers.
Down peers	Number of down BGP peers.
Table	Name of routing table.
Tot Paths	Total number of paths.
Act Paths	Number of active routes.
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.

Table 74: show bgp summary Output Fields *(continued)*

Field Name	Field Description
History	Number of withdrawn routes stored locally to keep track of damping history.
Damp State	Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.
Pending	Routes in process by BGP import policy.
Peer	Address of each BGP peer. Each peer has one line of output.
AS	Peer's AS number.
InPkt	Number of packets received from the peer.
OutPkt	Number of packets sent to the peer.
OutQ	Count of the number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is **0** because the queue usually is emptied quickly.
Flaps	Number of times the BGP session has gone down and then come back up.
Last Up/Down	Last time since the neighbor transitioned to or from the established state.
State|#Active /Received/Accepted /Damped	Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether an established session was established in the main routing device or in a routing instance. • If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**. • If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the **inet.0** (main) and **inet.2** (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following: ◦ 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the **inet.0** routing table. ◦ 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the **inet.2** routing table. • If a BGP session is established in a routing instance, the field indicates the established **(Establ)** state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, **Establ VPN-AB.inet.0: 2/4/0** indicates the following: ◦ The BGP session is established. ◦ Routes are received in the **VPN-AB.inet.0** routing table. ◦ The local routing device has two active routes, four received routes, and no damped routes from a BGP peer. When a BGP session is established, the peers are exchanging update messages.

List of Sample Output
show ipv6 neighbors on page 799
show ipv6 neighbors on page 799

Output Fields Table 75 on page 799 describes the output fields for the **show ipv6 neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 75: show ipv6 neighbors Output Fields

Field Name	Field Description
IPv6 Address	Name of the IPv6 interface.
Linklayer Address	Link-layer address.
State	State of the link: **up**, **down**, **incomplete**, **reachable**, **stale**, or **unreachable**.
Exp	Number of seconds until the entry expires.
Rtr	Whether the neighbor is a routing device: **yes** or **no**.
Secure	Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: **yes** or **no**.
Interface	Name of the interface.

Sample Output

show ipv6 neighbors

```
user@host> show ipv6 neighbors
IPv6 Address                 Linklayer Address  State       Exp  Rtr  Interface

show isis adjacency

Syntax
show isis adjacency
<brief | detail | extensive>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis adjacency
<brief | detail | extensive>
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about Intermediate System-to-Intermediate System (IS-IS) neighbors.

Options
none—Display standard information about IS-IS neighbors for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display adjacencies for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show isis adjacency extensive on page 804

Output Fields
Table 76 on page 801 describes the output fields for the **show isis adjacency** command. Output fields are listed in the approximate order in which they appear.

Table 76: show isis adjacency Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the neighbor is reachable.	All levels
System	System identifier (**sysid**), displayed as a name, if possible.	**brief**

Table 76: show isis adjacency Output Fields *(continued)*

Field Name	Field Description	Level of Output
L or Level	Level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2 An exclamation point (**!**) preceding the level number indicates that the adjacency is missing an IP address.	All levels
State	State of the adjacency: **Up**, **Down**, **New**, **One-way**, **Initializing**, or **Rejected**.	All levels
Hold (secs)	Remaining hold time of the adjacency.	**brief**
SNPA	Subnetwork point of attachment (MAC address of the next hop).	**brief**
Expires in	How long until the adjacency expires, in seconds.	**detail**
Priority	Priority to become the designated intermediate system.	**detail extensive**
Up/Down transitions	Count of adjacency status changes from **Up** to **Down** or from **Down** to **Up**.	**detail**
Last transition	Time of the last **Up/Down** transition.	**detail**
Circuit type	Bit mask of levels on this interface: **L1**=Level 1 router; **L2**=Level 2 router; **L1/L2**=both Level 1 and Level 2 router.	**detail**
Speaks	Protocols supported by this neighbor.	**detail extensive**
MAC address	MAC address of the interface.	**detail extensive**
Topologies	Supported topologies.	**detail extensive**
Restart capable	Whether a neighbor is capable of graceful restart: **Yes** or **No**.	**detail extensive**
Adjacency advertisement: Advertise	This router has signaled not to advertise this interface to its neighbors in their label-switched paths (LSPs).	**detail extensive**
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise the interface in the router's outbound LSPs.	**detail extensive**
IP addresses	IP address of this neighbor.	**detail extensive**

Table 76: show isis adjacency Output Fields *(continued)*

Field Name	Field Description	Level of Output

Transition log	List of recent transitions, including:
	• **When**—Time at which an IS-IS adjacency transition occurred.
	• **State**—Current state of the IS-IS adjacency (**up**, **down**, or **rejected**).
	  • **Up**—Adjacency is up and operational.
	  • **Down**—Adjacency is down and not available.
	  • **Rejected**—Adjacency has been rejected.
	• **Event**—Type of transition that occurred.
	  • **Seenself**—Possible routing loop has been detected.
	  • **Interface down**—IS-IS interface has gone down and is no longer available.
	  • **Error**—Adjacency error.
	• **Down reason**—Reason that an IS-IS adjacency is down:
	  • **3-Way Handshake Failed**—Connection establishment failed.
	  • **Address Mismatch**—Address mismatch caused link failure.
	  • **Aged Out**—Link expired.
	  • **ISO Area Mismatch**—IS-IS area mismatch caused link failure.
	  • **Bad Hello**—Unacceptable hello message caused link failure.
	  • **BFD Session Down**—Bidirectional failure detection caused link failure.
	  • **Interface Disabled**—IS-IS interface is disabled.
	  • **Interface Down**—IS-IS interface is unavailable.
	  • **Interface Level Disabled**—IS-IS level is disabled.
	  • **Level Changed**—IS-IS level has changed on the adjacency.
	  • **Level Mismatch**—Levels on adjacency are not compatible.
	  • **MPLS LSP Down**—Label-switched path (LSP) is unavailable.
	  • **MT Topology Changed**—IS-IS topology has changed.
	  • **MT Topology Mismatch**—IS-IS topology is mismatched.
	  • **Remote System ID Changed**—Adjacency peer system ID changed.
	  • **Protocol Shutdown**—IS-IS protocol is disabled.
	  • **CLI Command**—Adjacency brought down by user.
	  • **Unknown**—Unknown.
		extensive

Sample Output

show isis adjacency

```
user@host> show isis adjacency
Interface             System         L State       Hold (secs) SNPA
at-2/3/0.0            ranier         3  Up                  23
```

show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see **show isis adjacency on page 803**.

show isis authentication

Syntax

show isis authentication
<brief | detail | extensive>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show isis authentication
<brief | detail | extensive>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Intermediate System-to-Intermediate System (IS-IS) authentication.

Options

none—Display information about IS-IS authentication.

brief | detail | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display IS-IS authentication for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 77 on page 805 describes the output fields for the **show isis authentication** command. Output fields are listed in the approximate order in which they appear.

Table 77: show isis authentication Output Fields

Field Name	Field Description
Interface	Interface name.
Level	IS-IS level.
IIH Auth	IS-IS Hello (IIH) packet authentication type.
CSN Auth	Complete sequence number authentication type.
PSN Auth	Partial sequence number authentication type.
L1 LSP Authentication	Layer 1 link-state PDU authentication type.

Table 77: show isis authentication Output Fields *(continued)*

Field Name	Field Description
L2 LSP Authentication	Layer 2 link-state PDU authentication type.

Sample Output

show isis authentication

```
user@host> show isis authentication
Interface             Level IIH Auth  CSN Auth  PSN Auth
at-2/3/0.0            1     Simple    Simple    Simple
                      2     MD5       MD5       MD5

L1 LSP Authentication: Simple
L2 LSP Authentication: MD5
```

show isis backup coverage

Syntax
show isis backup coverage
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis backup coverage
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about the level of backup coverage available.

Options
none—Display information about the level of backup coverage available for all the nodes and prefixes in the network.

instance *instance-name*—(Optional) Display information about the level of backup coverage for a specific IS-IS routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields
Table 78 on page 807 lists the output fields for the **show isis backup coverage** command. Output fields are listed in the approximate order in which they appear.

Table 78: show isis backup coverage Output Fields

Field Name	Field Description
Topology	Type of topology or address family: **IPV4 Unicast** or **IPV6 Unicast**.
Level	IS-IS level: • **1**—Level 1 • **2**—Level 2
Node	By topology, the percentage of all routes configured on the node that are protected through backup coverage.
IPv4 Unicast	Percentage of IPv4 unicast routes that are protected through backup coverage.
IPv6 Unicast	Percentage of IPv6 unicast routes that are protected through backup coverage.

Table 78: show isis backup coverage Output Fields *(continued)*

Field Name	Field Description
CLNS	Percentage of Connectionless Network Service (CLNS) routes that are protected through backup coverage.

Sample Output

show isis backup coverage

```
user@host> show isis backup coverage
Backup Coverage:
    Topology        Level   Node    IPv4    IPv6    CLNS
    IPV4 Unicast        2  28.57%  22.22%   0.00%   0.00%
    IPV6 Unicast        2   0.00%   0.00%   0.00%   0.00%
```

show isis backup label-switched-path

Syntax **show isis backup label-switched-path**
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) **show isis backup label-switched-path**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about MPLS label-switched-paths (LSPs) designated as backup routes for IS-IS routes.

Options none—Display information about MPLS LSPs designated as backup routes for IS-IS routes.

logical-system (all | *logical-system-name*—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields Table 79 on page 809 lists the output fields for the **show isis backup label-switched-path** command. Output fields are listed in the approximate order in which they appear.

Table 79: show isis backup label-switched-path Output Fields

Field Name	Field Description
Backup MPLS LSPs	List of MPLS LSPs designated as backup paths for IS-IS routes.
Egress	IP address of the egress routing device for the LSP.

Status	State of the LSP:
	• **Up**—The router can detect RSVP hello messages from the neighbor.
	• **Down**—The router has received one of the following indications:
	  • Communication failure from the neighbor.
	  • Communication from IGP that the neighbor is unavailable.
	  • Change in the sequence numbers in the RSVP hello messages sent by the neighbor.
	• **Deleted**—LSP is no longer available as a backup path.

Last change	Time elapsed since the neighbor state changed either from up or down or from down to up. The format is ***hh*:*mm*:*ss***.
TE-metric	Configured traffic engineering metric.

Table 79: show isis backup label-switched-path Output Fields *(continued)*

Field Name	Field Description
Metric	Configured metric.

Sample Output

show isis backup label-switched-path

```
user@host> show isis backup label-switched-path
 Backup MPLS LSPs:
 f-to-g, Egress: 192.168.1.4, Status: up, Last change: 06:12:03
    TE-metric: 9, Metric: 0
```

<**level (1 | 2)**>
<**logical-system (all | *logical-system-name*)**>
<**no-coverage**>
<**topology (ipv4-unicast | ipv6-multicast | ipv6-unicast | unicast)**>

Syntax (J-EX Series Switch)

show isis backup spf results
<**instance** *instance-name*>
<**level (1 | 2)**>
<**no-coverage**>
<**topology (ipv4-unicast | unicast)**>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about IS-IS shortest-path-first (SPF) calculations for backup paths.

Options

none—Display information about IS-IS shortest-path-first (SPF) calculations for all backup paths for all destination nodes.

instance *instance-name*—(Optional) Display SPF calculations for backup paths for the specified routing instance.

level (1 | 2)—(Optional) Display SPF calculations for the backup paths for the specified IS-IS level.

logical-system *logical-system-name*—(Optional) Display SPF calculations for the backup paths for all logical systems or on a particular logical system.

no-coverage—(Optional) Display SPF calculations only for destinations that do not have backup coverage.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display SPF calculations for backup paths for the specified topology only.

Output Fields

Table 80 on page 811 lists the output fields for the **show isis backup spf results** command. Output fields are listed in the approximate order in which they appear.

Table 80: show isis backup spf results Output Fields

Field Name	Field Description
node-name	Name of the destination node.

Table 80: show isis backup spf results Output Fields *(continued)*

Field Name	Field Description
Address	Address of the destination node.
Primary next-hop	Interface and name of the node of the primary next hop to reach the destination.
Root	Name of the next-hop neighbor.
Metric	Metric to the node.
Eligible	Indicates that the next-hop neighbor has been designated as a backup path to the destination node.
Backup next-hop	Name of the interface of the backup next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
LSP	Name of the MPLS LSP designated as a backup path.
Not eligible	Indicates that the next-hop neighbor cannot function as a backup path to the destination.
Reason	Describes why the next-hop neighbor is designated as **Not eligible** as a backup path.

Output Fields

Table 81 on page 815 describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your Dell support representative.

Table 81: show isis database Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface on which the LSP has been received; always **IS-IS** for this command.	All levels
level	Level of intermediate system: • **1**—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system. • **2**—Intermediate system routes between areas and toward other ASs.	All levels
LSP ID	Link-state PDU identifier.	All levels
Sequence	Sequence number of the link-state PDU.	All levels
Checksum	Checksum value of the link-state PDU.	All levels
Lifetime (secs)	Remaining lifetime of the link-state PDU, in seconds.	All levels
Attributes	Attributes of the specified database: **L1**, **L2**, **Overload**, or **Attached** (L1 only).	none **brief**
# LSPs	Total number of LSPs in the specified link-state database.	none **brief**
IP prefix	Prefix advertised by this link-state PDU.	**detail extensive**
IS neighbor	IS-IS neighbor of the advertising system.	**detail extensive**
IP prefix	IPv4 prefix advertised by this link-state PDU.	**detail extensive**
V6 prefix	IPv6 prefix advertised by this link-state PDU.	**detail extensive**
Metric	Metric of the prefix or neighbor.	**detail extensive**
Header	• **LSP ID**—Link state PDU identifier of the header. • **Length**—Header length. • **Allocated Length**—Amount of length available for the header. • **Router ID**—Address of the local routing device. • **Remaining Lifetime**—Remaining lifetime of the link-state PDU, in seconds.	**extensive**
Packet	• **LSP ID**—The identifier for the link-state packet. • **Length**—Packet length. • **Lifetime**—Remaining lifetime, in seconds. • **Checksum**—The checksum of the LSP. • **Sequence**—The sequence number of the LSP. Every time the LSP is updated, this number increments. • **Attributes**—Packet attributes. • **NLPID**—Network layer protocol identifier. • **Fixed length**—Specifies the set length for the packet.	**extensive**

Table 81: show isis database Output Fields *(continued)*

Field Name	Field Description	Level of Output
TLVs	• **Area Address**—Area addresses that the routing device can reach. • **Speaks**—Supported routing protocols. • **IP router id**—ID of the routing device (usually the IP address). • **IP address**—IPv4 address. • **Hostname**—Assigned name of the routing device. • **IP prefix**—IP prefix of the routing device. • **Metric**—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device. • **IP extended prefix**—Extended IP prefix of the routing device. • **IS neighbor**—Directly attached neighbor's name and metric. • **IS extended neighbor**—Directly attached neighbor's name, metric, and IP address.	**extensive**

Sample Output

show isis database

```

show isis hostname

Syntax show isis hostname
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show isis hostname

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Intermediate System-to-Intermediate System (IS-IS) hostname database information.

Options none—Display IS-IS hostname database information.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show isis hostname on page 821**

Output Fields Table 82 on page 821 describes the output fields for the **show isis hostname** command. Output fields are listed in the approximate order in which they appear.

Table 82: show isis hostname Output Fields

Field Name	Field Description
System Id	System identifier mapped to the hostname.
Hostname	Hostname mapped to the system identifier.
Type	Type of mapping between system identifier and hostname. • **Dynamic**—Hostname mapping determined as described in RFC 2763, *Dynamic Hostname Exchange Mechanism for IS-IS*. • **Static**—Hostname mapping configured by user.

Sample Output

show isis hostname

```
user@host> show isis hostname
   IS-IS hostname database:
   System Id      Hostname                                        Type
   1921.6800.4201 isis1                                           Dynamic
   1921.6800.4202 isis2                                           Static
   1921.6800.4203 isis3                                           Dynamic
```

show isis interface

Syntax
show isis interface
<brief | detail | extensive>
<*interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis interface
<brief | detail | extensive>
<*interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display status information about Intermediate System-to-Intermediate System (IS-IS)-enabled interfaces.

Options
none—Display standard information about all IS-IS-enabled interfaces.

brief | detail | extensive—(Optional) Display the specified level of output.

interface-name—(Optional) Display information about the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show isis interface on page 824
show isis interface brief on page 824
show isis interface detail on page 824
show isis interface extensive on page 825
show isis interface extensive (with LDP) on page 825

Output Fields
Table 83 on page 822 describes the output fields for the **show isis interface** command. Output fields are listed in the approximate order in which they appear.

Table 83: show isis interface Output Fields

Field Name	Field Description	Level of Output
interface-name	Name of the interface.	**detail**
Designated router	Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.	**detail**
Index	Interface index assigned by the Junos kernel.	**detail**
State	Internal implementation information.	**detail**
Circuit id	Circuit identifier.	**detail**

Table 83: show isis interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Circuit type	Circuit type: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2	**detail**
LSP interval	Interval between link-state PDUs sent from the interface.	**detail**
CSNP interval	Interval between complete sequence number PDUs sent from the interface.	**detail extensive**
Sysid	System identifier.	**detail**
Interface	Interface through which the adjacency is made.	none **brief**
L or Level	Level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2	All levels
CirID	Circuit identifier.	none **brief**
Level 1 DR	Level 1 designated intermediate system.	none **brief**
Level 2 DR	Level 2 designated intermediate system.	none **brief**
L1/L2 Metric	Interface's metric for Level 1 and Level 2. If there is no information, the metric is **0**.	none **brief**
Adjacency advertisement: Advertise	This routing device has signaled not to advertise this interface to its neighbors in their label-switched paths (LSPs).	**detail extensive**
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.	**detail extensive**
Adjacencies	Number of adjacencies established on this interface.	**detail**
Priority	Priority value for this interface.	**detail**
Metric	Metric value for this interface.	**detail**
Hello(s) / Hello Interval	Interface's hello interval.	**detail extensive**
Hold(s) / Hold Time	Interface's hold time.	**detail extensive**

Table 83: show isis interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Designated Router	Router responsible for sending network link-state advertisements, which describe all the routers attached to the network.	**detail**
Hello padding	Type of hello padding: • **Adaptive**—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. • **Loose**—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. • **Strict**—Padding is performed on all interface types and for all adjacency states, and is continuous.	**extensive**
LDP sync state	Current LDP synchronization state: **in sync**, **in holddown**, or **not supported**.	**extensive**
reason	Reason for being in the LDP sync state.	**extensive**
config holdtime	Configured value of the hold timer.	**extensive**
remaining	If the state is not in sync and the hold time is not infinity, then this field displays the number of seconds remaining.	**extensive**

Sample Output

show isis interface

```
user@host> show isis interface
IS-IS interface database:

show isis overview

Syntax **show isis overview**
<instance *instance-name*>
<**logical-system (all | *logical-system-name*)**>

Syntax (J-EX Series Switch) **show isis overview**
<instance *instance-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Intermediate System-to Intermediate System (IS-IS) overview information.

Options none—Display standard overview information about IS-IS for all routing instances.

instance *instance-name*—(Optional) Display overview information for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show isis overview on page 827**

Output Fields Table 84 on page 826 lists the output fields for the **show isis overview** command. Output fields are listed in the approximate order in which they appear.

Table 84: show isis overview Output Fields

Field Name	Field Description
instance	The IS-IS routing intance.
Router ID	Router ID of the routing device.
Adjacency holddown	Adjacency holddown capability: **enabled** or **disabled**.
Maximum Areas	Maximum number of IS-IS areas advertised by the routing device.
LSP life time	Lifetime of the link-state PDU, in seconds.
Attached bit evaluation	Attached bit capability: **enabled** or **disabled**.
SPF delay	Delay before performing consecutive Shortest Path First calculations.
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the holddown timer begins.

Table 84: show isis overview Output Fields *(continued)*

Field Name	Field Description
Overload bit at startup is set	Overload bit capability is enabled.
Overload high metrics	Overload high metrics capability: **enabled** or **disabled**.
Overload timeout	Time period after which overload is reset and the time that remains before the timer is set to expire.
Traffic engineering	Traffic engineering capability: **enabled** or **disabled**.
Restart	Graceful restart capability: **enabled** or **disabled**.
Restart duration	Time period for complete reacquisition of IS-IS neighbors.
Helper mode	Graceful restart helper capability: **enalbed** or **disabled**.
Level	IS-IS level: • **1**—Level 1 information • **2**—Level 2 information
IPv4 is enabled	IP Protocol version 4 capability is enabled.
IPv6 is enabled	IP Protocol version 6 capability is enabled.
CLNS is enabled	OSI CLNP Protocol capability is enabled. (J Series routers only)
Internal route preference	Preference value of internal routes.
External route preference	Preference value of external routes.
Wide area metrics are enabled	Wide area metrics capability is enabled.
Narrow metrics is enabled	Narrow metrics capability is enabled.

Sample Output

show isis overview `user@host> show isis overview`

Sample Output

```
Instance: master
  Router ID: 192.168.1.220
  Adjacency holddown: enabled
  Maximum Areas: 3
  LSP life time: 65535
```

```
Attached bit evaluation: enabled
SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
Overload bit at startup is set
  Overload high metrics: disabled
  Overload timeout: 300 sec, expires in 295 seconds
IPv4 is enabled, IPv6 is enabled
Traffic engineering: enabled
Restart: Enabled
  Restart duration: 210 sec
  Helper mode: Enabled
Level 1
  Internal route preference: 15
  External route preference: 160
  Wide metrics are enabled, Narrow metrics are enabled
Level 2
  Internal route preference: 18
  External route preference: 165
  Wide metrics are enabled
```

show isis route

Syntax

show isis route
<*destination*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Syntax (J-EX Series Switch)

show isis route
<*destination*>
<inet | inet6>
<instance *instance-name*>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the routes in the Intermediate System-to-Intermediate System (IS-IS) routing table.

Options

none—Display all routes in the IS-IS routing table for all supported address families for all routing instances.

destination—(Optional) Destination address for the route.

inet | inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.

instance *instance-name*—(Optional) Display routes for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.

List of Sample Output

show isis route logical-system on page 830
show isis route (CLNS) on page 830

Output Fields

Table 85 on page 830 describes the output fields for the **show isis route** command. Output fields are listed in the approximate order in which they appear.

Table 85: show isis route Output Fields

Field Name	Field Description
Current version	Number of the current version of the IS-IS routing table.
L1	Version of Level 1 SPF that was run.
L2	Version of Level 2 SPF that was run.
Prefix	Destination of the route.
L	IS-IS level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2
Version	Version of SPF that generated the route.
Metric	Metric value associated with the route.
Type	Metric type: **int** (internal) or **ext** (external).
Interface	Interface to the next hop.
Via	System identifier of the next hop, displayed as a name if possible.
ISO Routes	ISO routing table entries.
snpa	MAC address.

Sample Output

show isis route logical-system

```
user@host> show isis route logical-system ls1
IS-IS routing table            Current version: L1: 8 L2: 11
Prefix             L Version Metric Type Interface    Via

show isis spf

Syntax

show isis spf (brief | log | results)
<instance *instance-name*>
<level (1 | 2)>
<logical-system (all | *logical-system-name*)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Syntax (J-EX Series Switch)

show isis spf (brief | log | results)
<instance *instance-name*>
<level (1 | 2)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Intermediate System-to-Intermediate System (IS-IS) shortest-path-first (SPF) calculations.

Options

brief—Display an overview of SPF calculations.

log—Display the log of SPF calculations.

results—Display the results of SPF calculations.

instance *instance instance-name*—(Optional) Display SPF calculations for the specified routing instance.

level (1 | 2)—(Optional) Display SPF calculations for the specified IS-IS level.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display SPF calculations for the specified topology only.

Output Fields

Table 86 on page 832 describes the output fields for the **show isis spf** command. Output fields are listed in the approximate order in which they appear.

Table 86: show isis spf Output Fields

Field Name	Field Description
Node	System ID of a node.
Metric	Metric to the node.

Table 86: show isis spf Output Fields *(continued)*

Field Name	Field Description
Interface	Interface of the next hop.
Via	System ID of the next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
Start time	(**log** option only) Time that the SPF computation started.
Elapsed (secs)	(**log** option only) Length of time, in seconds, required to complete the SPF computation.
Count	(**log** option only) Number of times the SPF was triggered.
Reason	(**log** option only) Reason that the SPF computation was completed.

show isis statistics

Syntax
show isis statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis statistics
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display statistics about Intermediate System-to-Intermediate System (IS-IS) traffic.

Options
none—Display IS-IS traffic statistics for all routing instances.

instance *instance-name*—(Optional) Display statistics for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show isis statistics on page 838

Output Fields
Table 87 on page 837 describes the output fields for the **show isis statistics** command. Output fields are listed in the approximate order in which they appear.

Table 87: show isis statistics Output Fields

Field Name	Field Description
PDU type	Protocol data unit type: • **CSNP**—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU. • **IIH**—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems. • **LSP**—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area. • **PSNP**—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU; that is, when its link-state PDU database is out of date. The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device. • **Unknown**—The PDU type is unknown.
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.

Table 87: show isis statistics Output Fields *(continued)*

Field Name	Field Description
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.
SNP queue length	Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always **0**.
LSP queue length	Number of link-state PDUs waiting in the queue for processing. This value is almost always **0**.
SPF runs	Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.
Fragments rebuilt	Number of link-state link-state PDU fragments that the local system has computed.
LSP regenerations	Number of link-state PDUs that have been regenerated. A link state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
Purges initiated	Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.

Sample Output

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

Options

none—Display standard information about all entries in the OSPFv3 link-state database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (*address* | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about interarea-prefix LSAs.

inter-area-router—(Optional) Display information about interarea-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

show ospf3 database extensive on page 845
show ospf3 database summary on page 848

Output Fields Table 88 on page 840 lists the output fields for the **show ospf3 database** command. Output fields are listed in the approximate order in which they appear.

Table 88: show ospf3 database Output Fields

Field Name	Field Description	Level of Output
OSPF link state database, area *area-number*	Entries in the link-state database for this area.	**brief detail extensive**
OSPF AS SCOPE link state database	Entries in the AS scope link-state database.	**brief detail extensive**

Table 88: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
OSPF Link-Local link state database, interface *interface-name*	Entries in the link-local link-state database for this interface.	**brief detail extensive**
area	Area number. Area **0.0.0.0** is the backbone area.	All levels
Type	Type of link advertisement: **Extern**, **InterArPfx**, **InterArRtr**, **IntraArPrx** , **Link**, **Network**, **NSSA**, or **Router**.	**brief detail extensive**
ID	Link identifier included in the advertisement. An asterisk (*) preceding the identifier marks database entries that originated from the local routing device.	**brief detail extensive**
Adv Rtr	Address of the routing device that sent the advertisement.	**brief detail extensive**
Seq	Link sequence number of the advertisement.	**brief detail extensive**
Age	Time elapsed since the LSA was originated, in seconds.	**brief detail extensive**
Cksum	Checksum value of the LSA.	**brief detail extensive**
Len	Length of the advertisement, in bytes.	**brief detail extensive**
Router (Router Link-State Advertisements)		
bits	Flags describing the routing device that generated the LSP.	**detail extensive**
Options	Option bits carried in the router LSA.	**detail extensive**
For Each Router Link		
Type	Type of interface. The value of all other output fields describing a routing device interface depends on the interface's type: • **PointToPoint (1)**—Point-to-point connection to another routing device. • **Transit (2)**—Connection to a transit network. • **Virtual (4)**—Virtual link.	**detail extensive**
Loc-if-id	Local interface ID assigned to the interface that uniquely identifies the interface with the routing device.	**detail extensive**
Nbr-if-id	Interface ID of the neighbor's interface for this routing device link.	**detail extensive**
Nbr-rtr-id	Router ID of the neighbor routing device (for type 2 interfaces, the attached link's designated router).	**detail extensive**
Metric	Cost of the router link.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**

Table 88: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn*:*nn*:*nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn*:*nn*:*nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn*:*nn*:*nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
Network (Network Link-State Advertisements)		
Options	Option bits carried in the network LSA.	**detail extensive**
Attached Router	Router IDs of each of the routing devices attached to the link. Only routing devices that are fully adjacent to the designated router are listed. The designated router includes itself in this list.	**detail extensive**
InterArPfx (Interarea-Prefix Link-State Advertisements)		
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn*:*nn*:*nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn*:*nn*:*nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn*:*nn*:*nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
InterArRtr (Interarea-Router Link-State Advertisements)		
Dest-router-id	Router ID of the routing device described by the LSA.	**detail extensive**
options	Optional capabilities supported by the routing device.	**detail extensive**

Table 88: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	**detail extensive**
Prefix	IPv6 address prefix.	**extensive**
Prefix-options	Option bit associated with the prefix.	**extensive**
Extern (External Link-State Advertisements)		
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of the route, which depends on the value of **Type**.	**detail extensive**
Type *n*	Type of external metric: **Type 1** or **Type 2**.	**detail extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn:nn:nn* **ago**	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn:nn:nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn:nn:nn* **ago**	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Link (Link-State Advertisements)		
IPv6-Address	IPv6 link-local address on the link for which this link LSA originated.	**detail extensive**
Options	Option bits carried in the link LSA.	**detail extensive**
priority	Router priority of the interface attaching the originating routing device to the link.	**detail extensive**
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	**detail extensive**
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**

Table 88: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Installed *nn:nn:nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn:nn:nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn:nn:nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
IntraArPfx (Intra-Area-Prefix Link-State Advertisements)		
Ref-lsa-type	LSA type of the referenced LSA. • **Router**—Address prefixes are associated with a router LSA. • **Network**—Address prefixes are associated with a network LSA.	**detail extensive**
Ref-lsa-id	Link-state ID of the referenced LSA.	**detail extensive**
Ref-router-id	Advertising router ID of the referenced LSA.	**detail extensive**
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	**detail extensive**
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of this prefix. Expressed in the same units as the interface costs in the router LSAs.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *hh:mm:ss* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *hh:mm:ss*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *hh:mm:ss* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
***n* Router LSAs**	Number of router LSAs in the link-state database.	**summary**
***n* Network LSAs**	Number of network LSAs in the link-state database.	**summary**
***n* InterArPfx LSAs**	Number of interarea-prefix LSAs in the link-state database.	**summary**

Table 88: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
***n* InterArRtr LSAs**	Number of interarea-router LSAs in the link-state database.	**summary**
***n* IntraArPfx LSAs**	Number of intra-area-prefix LSAs in the link-state database.	**summary**
Externals	Display of the external LSA database.	**summary**
***n* Extern LSAs**	Number of external LSAs in the link-state database.	**summary**
Interface ***interface-name***	Name of the interface for which link-local LSA information is displayed.	**summary**
***n* Link LSAs**	Number of link LSAs in the link-state database.	**summary**

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

Options

none—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (*address* | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

asbrsummary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

Output Fields Table 89 on page 850 describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

Table 89: show ospf database Output Fields

Field Name	Field Description	Level of Output
area	Area number. Area **0.0.0.0** is the backbone area.	All levels
Type	Type of link advertisement: **ASBRSum**, **Extern**, **Network**, **NSSA**, **OpaqArea**, **Router**, or **Summary**.	All levels
ID	LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.	All levels
Adv Rtr	Address of the routing device that sent the advertisement.	All levels
Seq	Link sequence number of the advertisement.	All levels
Age	Time elapsed since the LSA was originated, in seconds.	All levels
Cksum	Checksum value of the LSA.	All levels

Table 89: show ospf database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Len	Length of the advertisement, in bytes.	All levels
Router	Router link-state advertisement information: • **bits**—Flags describing the routing device that generated the LSP. • **link count**—Number of links in the advertisement. • **id**—ID of a routing device or subnet on the link. • **data**—For stub networks, the subnet mask; otherwise, the IP address of the routing device that generated the LSP. • **type**—Type of link. It can be **PointToPoint**, **Transit**, **Stub**, or **Virtual**. • **TOS count**—Number of type-of-service (ToS) entries in the advertisement. • **TOS 0 metric**—Metric for ToS 0. • **TOS**—Type-of-service (ToS) value. • **metric**—Metric for the ToS.	**detail extensive**
Network	Network link-state advertisement information: • **mask**—Network mask. • **attached router**—ID of the attached neighbor.	**detail extensive**
Summary	Summary link-state advertisement information: • **mask**—Network mask. • **TOS**—Type-of-service (ToS) value. • **metric**—Metric for the ToS.	**detail extensive**
Gen timer	How long until the LSA is regenerated.	**extensive**
Aging time	How long until the LSA expires.	**extensive**
Installed *hh*:*mm*:*ss* ago	How long ago the route was installed.	**extensive**
expires in *hh*:*mm*:*ss*	How long until the route expires.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
Router LSAs	Number of router link-state advertisements in the link-state database.	**summary**
Network LSAs	Number of network link-state advertisements in the link-state database.	**summary**
Summary LSAs	Number of summary link-state advertisements in the link-state database.	**summary**

show policy damping

Syntax
show policy damping
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show policy damping

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about Border Gateway Protocol (BGP) route flap damping parameters.

Options
none—Display information about BGP route flap damping parameters.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information
In the output from this command, figure-of-merit values correlate to the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.

Required Privilege Level

show policy damping on page 858

Output Fields
Table 90 on page 857 describes the output fields for the **show policy damping** command. Output fields are listed in the approximate order in which they appear.

Table 90: show policy damping Output Fields

Field Name	Field Description
Halflife	Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.

Table 90: show policy damping Output Fields *(continued)*

Field Name	Field Description
Reuse merit	Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.
Suppress/cutoff merit	Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.
Maximum suppress time	Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.
Computed values	• **Merit ceiling**—Maximum merit that a flapping route can collect. • **Maximum decay**—Maximum decay half-life, in minutes.

Sample Output

show policy damping

```
user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453
```

show rip general-statistics

Syntax show rip general-statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show rip general-statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display brief Routing Information Protocol (RIP) statistics.

Options none—Display brief RIP statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields Table 91 on page 859 lists the output fields for the **show rip general-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 91: show rip general-statistics Output Fields

Field Name	Field Description
bad msgs	Number of invalid messages received.
no recv intf	Number of packets received with no matching interface.
curr memory	Amount of memory currently used by RIP.
max memory	Most memory used by RIP.

Sample Output

show rip general-statistics

```
user@host> show rip general-statistics
RIPv2 I/O info:
     bad msgs       :         0
     no recv intf   :         0
     curr memory    :         0
     max memory     :         0
```

show rip neighbor

Syntax

show rip neighbor
<instance (all | *instance-name*)>
<logical-system (all | *logical-system-name*)>
<*name*>

Syntax (J-EX Series Switch)

show rip neighbor
<instance (all | *instance-name*)>
<*name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Routing Information Protocol (RIP) neighbors.

Options

none—Display information about all RIP neighbors for all instances.

instance (all | *instance-name*)—(Optional) Display RIP neighbor information for all instances or for only the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name—(Optional) Display detailed information about only the specified RIP neighbor.

List of Sample Output

show rip neighbor on page 861
show rip neighbor (With Demand Circuits Configured) on page 861

Output Fields

Table 92 on page 860 lists the output fields for the **show rip neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 92: show rip neighbor Output Fields

Field Name	Field Description
Neighbor	Name of RIP neighbor. NOTE: Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a DC flag next to neighbor interfaces configured for demand circuits. If you configure demand circuits at the neighbor hierarchy level, the output shows only the neighbor interface that you specifically configured as a demand circuit. If you configure demand circuits at the group hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.
State	State of the connection: **Up** or **Dn** (Down).
Source Address	Source address.

Table 92: show rip neighbor Output Fields *(continued)*

Field Name	Field Description
Destination Address	Destination address.
Send Mode	Send options: **broadcast**, **multicast**, **none**, or **version 1**.
Receive Mode	Type of packets to accept: **both**, **none**, **version 1**, or **version 2**.
In Met	Metric added to incoming routes when advertising into RIP routes that were learned from other protocols.

Sample Output

show rip neighbor

```
user@host> show rip neighbor

show route extensive on page 873

Output Fields
Table 97 on page 870 describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

Table 97: show route Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
number **destinations**	Number of destinations for which there are routes in the routing table.

Table 97: show route Output Fields *(continued)*

Field Name	Field Description
***number* routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active). • **holddown** (routes that are in the pending state before being declared inactive). • **hidden** (routes that are not used because of a routing policy).

destination-prefix	Route destination (for example:**10.0.0.1/24**). Sometimes the route information is presented in another format, such as:
	• ***MPLS-label*** (for example, **80001**).
	• ***interface-name*** (for example, **ge-1/0/2**).
	• ***neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id* :*source*** (Layer 2 circuit only; for example, **10.1.1.195:NoCtrlWord:1:1:Local/96**):
	  • ***neighbor-address***—Address of the neighbor.
	  • ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**.
	  • ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.
	  • ***vc-id***—Virtual circuit identifier.
	• ***source***—Source of the advertisement: **Local** or **Remote**.

[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
weeks:days hours:minutes:seconds	How long the route been known (for example, **2w4d 13:11:14**, or 2 weeks, 4 days, 13 hours, 11 minutes and 14 seconds).
metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
localpref	Local preference value included in the route.
from	Interface from which the route was received.

Table 97: show route Output Fields *(continued)*

Field Name	Field Description
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • **Weight**—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • **Balance**—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing. • ***lsp-path-name***—Name of the label-switched path (LSP) used to reach the next hop. • ***label-action***—MPLS label and operation occurring at the next hop. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).

Sample Output

show route

```
user@host> show route

show route active-path

Syntax
show route active-path
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route active-path
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.

Options
none—Display all active routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route active-path on page 875
show route active-path brief on page 876
show route active-path detail on page 876
show route active-path extensive on page 877
show route active-path terse on page 878

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail**, the **show route extensive**, or the **show route terse**.

Sample Output

show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

show route all

Syntax show route all
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show route all

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about all routes in all routing tables, including private, or internal, tables.

Options none—Display information about all routes in all routing tables, including private, or internal, tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show route all on page 880**

Output Fields Only the output fields for the **show route all** command display all routing tables, including private, or hidden, routing tables. The output field table of the **show route** command does not display entries for private, or hidden, routing tables.

Sample Output

show route all The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0                  *[MPLS/0] 2d 02:24:39, metric 1
                      Receive
1                  *[MPLS/0] 2d 02:24:39, metric 1
                      Receive
2                  *[MPLS/0] 2d 02:24:39, metric 1
                      Receive
800017             *[VPLS/7] 1d 14:00:16
                    > via vt-3/2/0.32769, Pop
800018             *[VPLS/7] 1d 14:00:26
                    > via vt-3/2/0.32772, Pop

user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0                  *[MPLS/0] 2d 02:19:12, metric 1
                      Receive
1                  *[MPLS/0] 2d 02:19:12, metric 1
```

```
                   Receive
2                 *[MPLS/0] 2d 02:19:12, metric 1
                   Receive
800017            *[VPLS/7] 1d 13:54:49
                    > via vt-3/2/0.32769, Pop
800018            *[VPLS/7] 1d 13:54:59
                    > via vt-3/2/0.32772, Pop
vt-3/2/0.32769     [VPLS/7] 1d 13:54:49
                   Unusable
vt-3/2/0.32772     [VPLS/7] 1d 13:54:59
                   Unusable
```

show route aspath-regex

Syntax

show route aspath-regex *regular-expression*
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show route aspath-regex *regular-expression*

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.

Options

regular-expression—Regular expression that matches an entire AS path.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

You can specify a regular expression as:

- An individual AS number
- A period wildcard used in place of an AS number
- An AS path regular expression that is enclosed in parentheses

You also can include the operators described in the table of AS path regular expression operators in the *Junos Policy Framework Configuration Guide*. The following list summarizes these operators:

- ***{m,n}***—At least *m* and at most *n* repetitions of the AS path term.
- ***{m}***—Exactly *m* repetitions of the AS path term.
- ***{m,}***—*m* or more repetitions of the AS path term.
- *******—Zero or more repetitions of an AS path term.
- ***+***—One or more repetitions of an AS path term.
- ***?***—Zero or one repetition of an AS path term.
- ***aspath_term | aspath_term***—Match one of the two AS path terms.

  When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:

  ```
  show route aspath-regex ".* 234 .*"
  ```

Required Privilege Level

view

List of Sample Output

show route aspath-regex (Matching a Specific AS Number) on page 883
show route aspath-regex (Matching Any Path with Two AS Numbers) on page 883

Output Fields

For information about output fields, see the output field table for the **show route** command.

Sample Output

show route aspath-regex (Matching a Specific AS Number)

```
user@host> show route aspath-regex 65477
inet.0: 46411 destinations, 46411 routes (46409 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

111.222.1.0/25     *[BGP/170] 00:08:48, localpref 100, from 111.222.2.24
                   AS Path: [65477] ({65488 65535}) IGP
                     to 111.222.18.225 via fpa0.0(111.222.18.233)

                     to 192.156.169.1 via 192.156.169.14(so-0/0/0)
...
```

show route best

Syntax
show route best *destination-prefix*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route best *destination-prefix*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.

Options
destination-prefix—Address or range of addresses.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show route community

Syntax
show route community *as-number:community-value*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route community *as-number:community-value*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

Options
as-number:community-value—One or more community identifiers. ***as-number*** is the AS number, and ***community-value*** is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information
Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

show route damping

Syntax
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the Border Gateway Protocol (BGP) routes for which updates might have been reduced because of route flap damping.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

decayed—Display route damping entries that might no longer be valid, but are not suppressed.

history—Display entries that have already been withdrawn, but have been logged.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

suppressed—Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.

Output Fields
Table 98 on page 893 lists the output fields for the **show route damping** command. Output fields are listed in the approximate order in which they appear.

Table 98: show route damping Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example,**inet.0**.	All levels
destinations	Number of destinations for which there are routes in the routing table.	All levels

Table 98: show route damping Output Fields *(continued)*

Field Name	Field Description	Level of Output
***number* routes**	Number of routes in the routing table and total number of routes in the following states: • **active** • **holddown** (routes that are in a pending state before being declared inactive) • **hidden** (the routes are not used because of a routing policy)	All levels
***destination-prefix* (entry, announced)**	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • ***—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.	All levels
Next-hop reference count	Number of references made to the next hop.	**detail extensive**
Source	IP address of the route source.	**detail extensive**
Next hop	Network layer address of the directly reachable neighboring system.	**detail extensive**
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**.	**detail extensive**
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.	**detail extensive**
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.	**detail extensive**
State	Flags for this route. For a description of possible values for this field, see the output field table for the **show route detail** command.	**detail extensive**
Local AS	AS number of the local routing device.	**detail extensive**
Peer AS	AS number of the peer routing device.	**detail extensive**

Table 98: show route damping Output Fields *(continued)*

Field Name	Field Description	Level of Output
Age	How long the route has been known.	**detail extensive**
Metric	Metric for the route.	**detail extensive**
Task	Name of the protocol that has added the route.	**detail extensive**
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Dell support only.	**detail extensive**
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: The AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.	All levels
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	**brief** none
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**.	**brief** none
Communities	Community path attribute for the route. See the output field table for the **show route detail** command.	**detail extensive**
Localpref	Local preference value included in the route.	All levels
Router ID	BGP router ID as advertised by the neighbor in the open message.	**detail extensive**
Merit (last update/now)	Last updated and current figure-of-merit value.	**detail extensive**

Table 98: show route damping Output Fields *(continued)*

Field Name	Field Description	Level of Output
damping-parameters	Name that identifies the damping parameters used, which is defined in the damping statement at the **[edit policy-options]** hierarchy level.	**detail extensive**
Last update	Time of most recent change in path attributes.	**detail extensive**
First update	Time of first change in path attributes, which started the route damping process.	**detail extensive**
Flaps	Number of times the route has gone up or down or its path attributes have changed.	**detail extensive**
Suppressed	(**suppressed** keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it.	All levels
Reusable in	(**suppressed** keyword only) Time when a suppressed route will again be available.	All levels
Preference will be	(**suppressed** keyword only) Preference value that will be applied to the route when it is again active.	All levels

Sample Output

show route detail

Syntax
show route detail
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route detail
<*destination-prefix*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display detailed information about the active entries in the routing tables.

Options
none—Display all active entries in the routing table on all systems.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output
show route detail on page 907

Output Fields
Table 99 on page 898 describes the output fields for the **show route detail** command. Output fields are listed in the approximate order in which they appear.

Table 99: show route detail Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
number **destinations**	Number of destinations for which there are routes in the routing table.
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)

Table 99: show route detail Output Fields *(continued)*

Field Name	Field Description
route-destination **(entry, announced)**	Route destination (for example:**10.0.0.1/24**). The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as: • ***MPLS-label*** (for example, **80001**). • ***interface-name*** (for example, **ge-1/0/2**). • ***neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id*:*source*** (Layer 2 circuit only; for example, **10.1.1.195:NoCtrlWord:1:1:Local/96**). • ***neighbor-address***—Address of the neighbor. • ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**. • ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport • ***vc-id***—Virtual circuit identifier. • ***source***—Source of the advertisement: **Local** or **Remote**.
label stacking	**(**Next-to-the-last-hop routing device for MPLS only) Depth of the Multiprotocol Label Switching (MPLS) label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area; when the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 100 on page 902.

Table 99: show route detail Output Fields *(continued)*

Field Name	Field Description
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing.
Label-switched-path *lsp-path-name*	Name of the label-switched path (LSP) used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 101 on page 904.
Local AS	AS number of the local routing device.
Age	How long the route has been known.
Metric*n*	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.

Table 99: show route detail Output Fields *(continued)*

Field Name	Field Description
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signalled and LDP-signalled LSPs or for specific VRF routing instances. For sample output, see **show route table**.
Task	Name of the protocol that has added the route.
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Dell support only.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 102 on page 906 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or **Site Down**.
mtu	Maximum transmission unit (MTU) information.

Table 99: show route detail Output Fields *(continued)*

Field Name	Field Description
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

Table 100 on page 902 describes all possible values for the **Next-hop Types** output field.

Table 100: Next-Hop Types Output Field Values

Next-Hop Type	Description
broadcast (bcast)	Broadcast next hop.
deny	Deny next hop.
flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by P2MP RSVP, P2MP LDP, P2MP CCC, and multicast.
hold	Next hop is waiting to be resolved into a unicast or multicast type.
indexed (idxd)	Indexed next hop.
indirect (indr)	Indirect next hop.
local (locl)	Local address on an interface.
routed multicast (mcrt)	Regular multicast next hop.
multicast (mcst)	Wire multicast next hop (limited to the LAN).
multicast discard (mdsc)	Multicast discard.
multicast group (mgrp)	Multicast group member.
receive (recv)	Receive.

Table 100: Next-Hop Types Output Field Values *(continued)*

Next-Hop Type	Description
reject (rjct)	Discard. An ICMP unreachable message was sent.
resolve (rslv)	Resolving next hop.
unicast (ucst)	Unicast.
unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 101 on page 904 describes all possible values for the **State** output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 101: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Clone	Route is a clone.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled and a path with a lower MED is available.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Local Preference	Path with a higher local preference value is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.

Table 101: State Output Field Values *(continued)*

Value	Description
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGP path is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with greater number of next hops is available.
Origin	Path with lower origin code is available.
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available
Router ID	Path through neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: • The route is damped. • The route is rejected by an import policy. • The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.

Table 102 on page 906 describes the possible values for the **Communities** output field.

Table 102: Communities Output Field Values

Value	Description
area-number	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is **0**. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: *local AS number:link-bandwidth-number*	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that identifies the OSPF domain.
link-bandwidth-number	Link-bandwidth number: from **0** through **4,294,967,295** (bytes per second).
local AS number	Local AS number: from **1** through **65,535**.
options	1 byte. Currently this is only used if the route type is **5** or **7**. Setting the least significant bit in the field indicates that the route carries a type 2 metric.
origin	(Used with VPNs) Identifies where the route came from.
ospf-route-type	1 byte, encoded as **1** or **2** for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); **3** for summary routes; **5** for external routes (area number must be **0**); **7** for NSSA routes; or **129** for sham link endpoint addresses.
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x0306**. The format is *area-number:ospf-route-type:options*.
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x8000**. The format is *area-number:ospf-route-type:options*.
target	Defines which VPN the route participates in; **target** has the format *32-bit IP address:16-bit number*. For example, **10.19.0.0:100**.
unknown IANA	Incoming IANA codes with a value between **0x1** and **0x7fff**. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above **0x8000**. This code of the BGP extended community attribute is accepted, but it is not recognized.

show route exact

Syntax show route exact *destination-prefix*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show route exact *destination-prefix*
<brief | detail | extensive | terse>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display only the routes that exactly match the specified address or range of addresses.

Options brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

destination-prefix—Address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

show route export

Syntax
show route export
<brief | detail>
<instance <*instance-name*> | *routing-table-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route export
<brief | detail>
<instance <*instance-name*> | *routing-table-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.

Options
none—(Same as **brief**.) Display standard information about policy-based export for all instances and routing tables on all systems.

brief | detail—(Optional) Display the specified level of output.

instance <*instance-name*>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

routing-table-name—(Optional) Display information about a particular routing table (for example, **inet.0**) for which policy-based export is currently enabled. (For information about the different types of routing tables, see the *Junos Routing Protocols Configuration Guide*.)

Required Privilege Level
view

List of Sample Output
show route export on page 916
show route export detail on page 916
show route export instance detail on page 916

Output Fields
Table 103 on page 915 lists the output fields for the **show route export** command. Output fields are listed in the approximate order in which they appear.

Table 103: show route export Output Fields

Field Name	Field Description	Level of Output
Table or ***table-name***	Name of the routing tables that either import or export routes.	All levels
Routes	Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.	**brief** none
Export	Whether the table is currently exporting routes to other tables: **Y** or **N** (Yes or No).	**brief** none

Table 103: show route export Output Fields *(continued)*

Field Name	Field Description	Level of Output
Import	Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)	**detail**
Flags	(**instance** keyword only) Flags for this feature on this instance: • **config auto-policy**—The policy was deduced from the configured IGP export policies. • **cleanup**—Configuration information for this instance is no longer valid. • **config**—The instance was explicitly configured.	**detail**
Options	(**instance** keyword only) Configured option displays the type of routing tables the feature handles: • **unicast**—Indicates ***instance*.inet.0**. • **multicast**—Indicates ***instance*.inet.2**. • **unicast multicast**—Indicates ***instance*.inet.0** and ***instance*.inet.2**.	**detail**
Import policy	(**instance** keyword only) Policy that **route export** uses to construct the import-export matrix. Not displayed if the instance type is **vrf**.	**detail**
Instance	(**instance** keyword only) Name of the routing instance.	**detail**
Type	(**instance** keyword only) Type of routing instance: **forwarding**, **non-forwarding**, or **vrf**.	**detail**

Sample Output

show route export

```
user@host> show route export
Table                            Export           Routes

```

show route extensive

Syntax
show route extensive
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route extensive
<*destination-prefix*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display extensive information about the active entries in the routing tables.

Options
none—Display all active entries in the routing table.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output
show route extensive on page 922
show route extensive (Access Route) on page 928
show route extensive (Route Reflector) on page 928

Output Fields
Table 104 on page 917 describes the output fields for the **show route extensive** command. Output fields are listed in the approximate order in which they appear.

Table 104: show route extensive Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
***number* destinations**	Number of destinations for which there are routes in the routing table.
***number* routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active). • **holddown** (routes that are in the pending state before being declared inactive). • **hidden** (routes that are not used because of a routing policy).

Table 104: show route extensive Output Fields *(continued)*

Field Name	Field Description
route-destination **(entry, announced)**	Route destination (for example:**10.0.0.1/24**). The **entry** value is the number of route for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as: • ***MPLS-label*** (for example, **80001**). • ***interface-name*** (for example, **ge-1/0/2**). • ***neighbor-address*****:*****control-word-status*****:*****encapsulation type*****:*****vc-id*****:*****source*** (Layer 2 circuit only; for example, **10.1.1.195:NoCtrlWord:1:1:Local/96**). • ***neighbor-address***—Address of the neighbor. • ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**. • ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • ***vc-id***—Virtual circuit identifier. • ***source***—Source of the advertisement: **Local** or **Remote**.
TSI	Protocol header information.
label stacking	(Next-to-the-last-hop routing device for MPLS only) Depth of the Multiprotocol Label Switching (MPLS) label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
Level	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area; when the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.

Table 104: show route extensive Output Fields *(continued)*

Field Name	Field Description
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
Next-hop type	Type of next hop. For a description of possible values for this field, see the Output Field table in the **show route detail** command.
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing.
Label-switched-path *lsp-path-name*	Name of the label-switched path (LSP) used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Offset	Whether the metric has been increased or decreased by an offset value.
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.
label-operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Indirect next hops	When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.

Table 104: show route extensive Output Fields *(continued)*

Field Name	Field Description
State	State of the route (a route can be in more than one state). See the Output Field table in the **show route detail** command.
Inactive reason	If the route is inactive, the reason for its current state is indicated. Typical reasons include: • **Active preferred**—Currently active route was selected over this route. • **Always compare MED**—Path with a lower multiple exit discriminator (MED) is available. • **AS path**—Shorter AS path is available. • **Cisco Non-deterministic MED selection**—Cisco nondeterministic MED is enabled and a path with a lower MED is available. • **Cluster list length**—Path with a shorter cluster list length is available. • **Forwarding use only**—Path is only available for forwarding purposes. • **IGP metric**—Path through the next hop with a lower IGP metric is available. • **IGP metric type**—Path with a lower OSPF link-state advertisement type is available. • **Interior > Exterior > Exterior via Interior**—Direct, static, IGP, or EBGP path is available. • **Local preference**—Path with a higher local preference value is available. • **Next hop address**—Path with a lower metric next hop is available. • **No difference**—Path from a neighbor with a lower IP address is available. • **Not Best in its group**—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed). • **Number of gateways**—Path with a higher number of next hops is available. • **Origin**—Path with a lower origin code is available. • **OSPF version**—Path does not support the indicated OSPF version. • **RIB preference**—Route from a higher-numbered routing table is available. • **Route destinguisher**—64-bit prefix added to IP subnets to make them unique. • **Route metric or MED comparison**—Route with a lower metric or MED is available. • **Route preference**—Route with a lower preference value is available. • **Router ID**—Path through a neighbor with a lower ID is available. • **Unusable path**—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved. • **Update source**—Last tiebreaker is the lowest IP address value.
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signalled and LDP-signalled LSPs or for specific VRF routing instances. For sample output, see **show route table**.

Table 104: show route extensive Output Fields *(continued)*

Field Name	Field Description
Task	Name of the protocol that has added the route.
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Dell support only.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
AS path: I <Originator>	(For route reflected output only) Originator ID attribute set by the route reflector.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the **show route detail** command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or Site Down.
mtu	Maximum transmission unit (MTU) information.

Table 104: show route extensive Output Fields *(continued)*

Field Name	Field Description
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of **inet.0** resolving through **inet.0** and **inet.3**, this field indicates which routing table, **inet.0** or **inet.3**, provided the best path for a particular prefix.
Node path count	Number of nodes in the path.
Forwarding nexthops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

show route flow validation

Syntax
show route flow validation
<brief | detail>
<*ip-prefix*>
<table *table-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route flow validation
<brief | detail>
<*ip-prefix*>
<table *table-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display flow route information.

Options
none—Display flow route information.

brief | detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

ip-prefix—(Optional) IP address for the flow route.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *table-name*—(Optional) Name of the flow route table.

Required Privilege Level
view

List of Sample Output
show route flow validation on page 931

Output Fields
Table 105 on page 930 lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

Table 105: show route flow validation Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table (for example, **inet.0**).	All levels
prefix	Route address.	All levels
Active unicast route	Active route in the routing table.	All levels
Dependent flow destinations	Number of flows for which there are routes in the routing table.	All levels
Origin	Source of the route flow.	All levels

Table 105: show route flow validation Output Fields *(continued)*

Field Name	Field Description	Level of Output
Neighbor AS	Autonomous system identifier of the neighbor.	All levels
Flow destination	Number of entries and number of destinations that match the route flow.	All levels
Unicast best match	Destination that is the best match for the route flow.	All levels
Flags	Information about the route flow.	All levels

Sample Output

show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1

show route inactive-path

Syntax
show route inactive-path
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route inactive-path
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path.

Options
none—Display all inactive routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route inactive-path on page 932
show route inactive-path detail on page 933
show route inactive-path extensive on page 934
show route inactive-path terse on page 934

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route inactive-path

```
user@host> show route inactive-path

inet.0: 25 destinations, 26 routes (24 active, 0 holddown, 1 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

show route inactive-prefix

Syntax
show route inactive-prefix
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route inactive-prefix
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display inactive route destinations in each routing table.

Options
none—Display all inactive route destination.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route inactive-prefix on page 935
show route inactive-prefix detail on page 935
show route inactive-prefix extensive on page 936
show route inactive-prefix terse on page 936

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route inactive-prefix

```
user@host> show route inactive-prefix

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

```

show route instance

Syntax
show route instance
<brief | detail | summary>
<*instance-name*>
<logical-system (all | *logical-system-name*)>
<operational>

Syntax (J-EX Series Switch)
show route instance
<brief | detail | summary>
<*instance-name*>
<operational>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display routing instance information.

Options
none—(Same as **brief**) Display standard information about all routing instances.

brief | detail | summary—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**. (These options are not available with the **operational** keyword.)

instance-name—(Optional) Display information for a specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

operational—(Optional) Display operational routing instances.

Required Privilege Level
view

List of Sample Output
show route instance on page 938
show route instance detail (Graceful Restart Complete) on page 939
show route instance detail (Graceful Restart Incomplete) on page 940
show route instance detail (VPLS Routing Instance) on page 942
show route instance operational on page 942
show route instance summary on page 942

Output Fields
Table 106 on page 937 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

Table 106: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or ***instance-name***	Name of the routing instance.	All levels
Operational Routing Instances	(**operational** keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: **forwarding**, **l2vpn**, **no-forwarding**, **vpls**, or **vrf**.	All levels

Table 106: show route instance Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	State of the routing instance: **active** or **inactive**.	**brief detail** none
Interfaces	Name of interfaces belonging to this routing instance.	**brief detail** none
Restart State	Status of graceful restart for this instance: **Pending** or **Complete**.	**detail**
Path selection timeout	Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is 300.	**detail**
Tables	Tables (and number of routes) associated with this routing instance.	none **brief detail**
Route-distinguisher	Unique route distinguisher associated with this routing instance.	**detail**
Vrf-import	VPN routing and forwarding instance import policy name.	**detail**
Vrf-export	VPN routing and forwarding instance export policy name.	**detail**
Vrf-import-target	VPN routing and forwarding instance import target community name.	**detail**
Vrf-export-target	VPN routing and forwarding instance export target community name.	**detail**
Fast-reroute-priority	Fast reroute priority setting for a VPLS routing instance: **high**, **medium**, or **low**. The default is **low**.	**detail**
Restart State	Restart state: • **Pending:*protocol-name***—List of protocols that have not yet completed graceful restart for this routing table. • **Complete**—All protocols have restarted for this routing table.	**detail**
Primary rib	Primary table for this routing instance.	**brief** none **summary**
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

Sample Output

show route label

Syntax
show route label *label*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route label *label*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the routes based on a specified Multiprotocol Label Switching (MPLS) label value.

Options
label—Value of the MPLS label.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route label on page 944
show route label detail on page 944
show route label extensive on page 945
show route label terse on page 945

Output Fields
For information about output fields, see the output field table for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route label

```
user@host> show route label 100016

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
100016             *[VPN/170] 03:25:41
                    > to 10.12.80.1 via ge-6/3/2.0, Pop
```

show route label detail

```
user@host> show route label 100016 detail

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
100016 (1 entry, 1 announced)
        *VPN    Preference: 170
                Next-hop reference count: 2

Task: BGP.0.0.0.0+179
Announcement bits (1): 0-KRT
AS path: 100 I
Ref Cnt: 2
```

show route label extensive

The output for the show route label extensive command is identical to that of the **show route label detail** command.

show route label terse

```
user@host> show route label 100016 terse

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

A Destination        P Prf   Metric 1   Metric 2  Next hop        AS path
* 100016             V 170                       >10.12.80.1
```

show route label-switched-path

Syntax
show route label-switched-path *path-name*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route label-switched-path *path-name*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the routes used in a Multiprotocol Label Switching (MPLS) label-switched path (LSP).

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output.

path-name—LSP tunnel name.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route label-switched-path on page 946

Output Fields
For information about output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route label-switched-path

```
user@host> show route label-switched-path sf-to-ny
inet.0: 29 destinations, 29 routes (29 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.1.1/32          [MPLS/7] 00:00:06, metric 0
                     > to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny
3.3.3.3/32         *[MPLS/7] 00:00:06, metric 0
                     > to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

4.4.4.4/32         *[MPLS/7] 00:00:06, metric 0
                       to 111.222.1.9 via s0-0/0/0, label-switched-path abc
                     > to 111.222.1.9 via s0-0/0/0, label-switched-path xyz
                       to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny
111.222.1.9/32      [MPLS/7] 00:00:06, metric 0
                     > to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
mpls.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

show route martians

Syntax
show route martians
<logical-system (all | *logical-system-name*)>
<table *routing-table-name*>

Syntax (J-EX Series Switch)
show route martians
<table *routing-table-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the martian (invalid and ignored) entries associated with each routing table.

Options
none—Display standard information about route martians for all routing tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display only the martian entries associated with a particular routing table.

Required Privilege Level
view

List of Sample Output
show route martians on page 948

Output Fields
Table 107 on page 948 lists the output fields for the **show route martians** command. Output fields are listed in the approximate order in which they appear

Table 107: show route martians Output Fields

Field Name	Field Description
table-name	Name of the route table in which the route martians reside.
destination-prefix	Route destination.
match value	Route match parameter.
status	Status of the route: **allowed** or **disallowed**.

Sample Output

show route martians

```
user@host> show route martians

inet.0:
             0.0.0.0/0 exact -- allowed
             0.0.0.0/8 orlonger -- disallowed

                240.0.0.0/4 orlonger -- disallowed

....
```

show route next-hop

Syntax
show route next-hop *next-hop*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route next-hop *next-hop*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the entries in the routing table that are being sent to the specified next-hop address.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of ouput.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

next-hop—Next-hop address.

Required Privilege Level
view

List of Sample Output
show route next-hop on page 950

show route no-community

Syntax
show route no-community
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route no-community
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route entries in each routing table that are not associated with any community.

Options
none—(Same as **brief**) Display the route entries in each routing table that are not associated with any community.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route no-community on page 956
show route no-community detail on page 957
show route no-community extensive on page 957
show route no-community terse on page 958

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route protocol

Syntax
show route protocol *protocol*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route protocol *protocol*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route entries in the routing table that were learned from a particular protocol.

Options
protocol—Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **esis**—End System-to-Intermediate System
- **flow**—Locally defined flow-specification route.
- **isis**—Intermediate System-to-Intermediate System
- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit

show route range

Syntax
show route range
<brief | detail | extensive | terse>
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route range
<brief | detail | extensive | terse>
<*destination-prefix*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display routing table entries using a prefix range.

Options
none—Display standard information about all routing table entries using a prefix range.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

destination-prefix—(Optional) Destination and prefix mask for the range.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route range on page 968
show route range destination-prefix on page 969
show route range detail on page 969
show route range extensive on page 970
show route range terse on page 970

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route receive-protocol

Syntax show route receive-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)

Syntax (J-EX Series Switch) show route receive-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.

Options brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

protocol neighbor-address—Protocol transmitting the route (**bgp**, **dvmrp**, **msdp**, **pim**, **rip**, or **ripng**) and address of the neighboring router from which the route entry was received.

Additional Information The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.

Required Privilege Level view

List of Sample Output
show route receive-protocol bgp on page 974
show route receive-protocol bgp extensive on page 975
show route receive-protocol bgp extensive on page 975

Output Fields Table 108 on page 972 describes the output fields for the **show route receive-protocol** command. Output fields are listed in the approximate order in which they appear.

Table 108: show route receive-protocol Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example, **inet.0**.	All levels
number **destinations**	Number of destinations for which there are routes in the routing table.	All levels

Table 108: show route receive-protocol Output Fields *(continued)*

Field Name	Field Description	Level of Output
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** • **holddown** (routes in that are pending state before being declared inactive) • **hidden** (the routes are not used because of a routing policy)	All levels
Prefix	Destination prefix.	none **brief**
MED	Multiple exit discriminator value included in the route.	none **brief**
destination-prefix **(entry, announced)**	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.	**detail extensive**
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.	**detail extensive**
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.	**detail extensive**
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	All levels
Localpref or **Lclpref**	Local preference value included in the route.	All levels

Table 108: show route receive-protocol Output Fields *(continued)*

Field Name	Field Description	Level of Output
AS path	Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.	All levels
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	**detail extensive**
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	**detail extensive**
Communities	Community path attribute for the route. See the Output Field table in the **show route detail** command for all possible values for this field.	**detail extensive**
Attrset AS	Number, local preference, and path of the AS that originated the route. These values are stored in the **Attrset** attribute at the originating routing device.	**detail extensive**
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	**detail extensive**
control flags	Control flags: **none** or **Site Down**.	**detail extensive**
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	**detail extensive**

Sample Output

show route receive-protocol bgp

show route resolution

Syntax

show route resolution
<brief | detail | extensive | summary>
<index *index*>
<logical-system (all | *logical-system-name*)>
<*prefix*>
<table *routing-table-name*>
<unresolved>

Syntax (J-EX Series Switch)

show route resolution
<brief | detail | extensive | summary>
<index *index*>
<*prefix*>
<table *routing-table-name*>
<unresolved>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

Options

none—Display standard information about all entries in the next-hop resolution database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

index *index*—(Optional) Show the index of the resolution tree.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix network/destination-prefix—(Optional) Display database entries for the specified address.

table *routing-table-name*—(Optional) Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled. (For information about the different types of routing tables, see the *Junos Routing Protocols Configuration Guide*.)

unresolved—(Optional) Display routes that could not be resolved.

Required Privilege Level

view

List of Sample Output

show route resolution detail on page 980
show route resolution summary on page 981
show route resolution unresolved on page 981

Output Fields Table 109 on page 980 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

Table 109: show route resolution Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.
Tree index	Tree index identifier.
Nodes	Number of nodes in the tree.
Reference count	Number of references made to the next hop.
Contributing routing tables	Routing tables used for next-hop resolution.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of **inet.0** resolving via **inet.0** and **inet.3**, this field indicates which routing table, **inet.0** or **inet.3**, provided the best path for a particular prefix.
Metric	Metric associated with the forwarding next hop.
Node path count	Number of nodes in the path.
Forwarding next hops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

Sample Output

show route resolution detail

```
user@host> show route resolution detail
Tree Index: 1, Nodes 0, Reference Count 1
Contributing routing tables: inet.3
Tree Index: 2, Nodes 23, Reference Count 1

show route snooping

Syntax

show route snooping
<brief | detail | extensive | terse>
<all>
<best *address/prefix*>
<exact *address*>
<range *prefix-range*>
<summary>
<table *table-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the routing table that were learned from snooping.

Options

none—Display the entries in the routing table that were learned from snooping.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

all—(Optional) Display all entries, including hidden entries.

best *address/prefix*—(Optional) Display the longest match for the provided address and optional prefix.

exact *address/prefix*—(Optional) Display exact matches for the provided address and optional prefix.

range *prefix-range*—(Optional) Display information for the provided address range.

summary—(Optional) Display route snooping summary statisitics.

table *table-name*—(Optional) Display information for the named table.

Required Privilege Level

view

List of Sample Output

show route snooping detail on page 982

Output Fields

For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route snooping detail

```
user@host> show route snooping detail
__+domainAll__.inet.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
 224.0.0.2/32 (1 entry, 1 announced)

show route source-gateway

Syntax
show route source-gateway *address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route source-gateway *address*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the entries in the routing table that were learned from a particular address. The **Source** field in the **show route detail** command output lists the source for each route, if known.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

address—IP address of the system.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route source-gateway on page 990
show route source-gateway detail on page 991
show route source-gateway extensive on page 993

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

Sample Output

show route source-gateway

```
user@host> show route source-gateway 10.255.70.103

show route summary

Syntax show route summary
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show route summary

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display summary statistics about the entries in the routing table.

Options none—Display summary statistics about the entries in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show route summary on page 996**

Output Fields Table 110 on page 996 lists the output fields for the **show route summary** command. Output fields are listed in the approximate order in which they appear.

Table 110: show route summary Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
destinations	Number of destinations for which there are routes in the routing table.
routes	Number of routes in the routing table: • **active**—Number of routes that are active. • **holddown**—Number of routes that are in the hold-down state before being declared inactive. • **hidden**—Number of routes not used because of routing policy.
Direct	Routes on the directly connected network.
Local	Local routes.
protocol-name	Name of the protocol from which the route was learned. For example, **OSPF**, **RSVP**, and **Static**.

Sample Output

show route summary

```
user@host> show route summary
Autonomous system number: 69
Router ID: 10.255.71.52
```

```
Maximum-ECMP: 32
inet.0: 24 destinations, 25 routes (23 active, 0 holddown, 1 hidden)
Restart Complete
              Direct:      6 routes,      5 active
               Local:      4 routes,      4 active
                OSPF:      5 routes,      4 active
              Static:      7 routes,      7 active
                IGMP:      1 routes,      1 active
                 PIM:      2 routes,      2 active

inet.3: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
Restart Complete
                RSVP:      2 routes,      2 active

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
Restart Complete
              Direct:      1 routes,      1 active

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
                MPLS:      3 routes,      3 active
                VPLS:      4 routes,      2 active

inet6.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
Restart Complete
              Direct:      2 routes,      2 active
                 PIM:      2 routes,      2 active
                 MLD:      1 routes,      1 active

green.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
                 BGP:      2 routes,      2 active
               L2VPN:      2 routes,      2 active

red.l2vpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Restart Complete
                 BGP:      2 routes,      2 active
               L2VPN:      1 routes,      1 active

bgp.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
                 BGP:      4 routes,      4 active
```

show route table

Syntax
show route table *routing-table-name*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route table *routing-table-name*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route entries in a particular routing table.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

routing-table-name—Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled. (For information about the different types of routing tables, see the *Junos OS Routing Protocols Configuration Guide*.)

show route terse

Syntax show route terse
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show route terse

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display a high-level summary of the routes in the routing table.

NOTE: For BGP routes, the **show route terse** command displays the local preference attribute and MED instead of metric1 and metric2 values. This is mostly due to historical reasons.To display the metric1 and metric2 value of a BGP route, use the **show route extensive** command.

Options none—Display a high-level summary of the routes in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show route terse on page 1007**

Output Fields Table 111 on page 1006 describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

Table 111: show route terse Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
number **destinations**	Number of destinations for which there are routes in the routing table.
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)
route key	Key for the state of the route: • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route.

Table 111: show route terse Output Fields *(continued)*

Field Name	Field Description
A	Active route. An asterisk (*) indicates this is the active route.
Destination	Destination of the route.
P	Protocol through which the route was learned: • **A**—Aggregate • **B**—BGP • **C**—CCC • **D**—Direct • **G**—GMPLS • **I**—IS-IS • **L**—L2CKT, L2VPN, LDP, Local • **K**—Kernel • **M**—MPLS, MSDP • **O**—OSPF • **P**—PIM • **R**—RIP, RIPng • **S**—Static • **T**—Tunnel
Prf	Preference value of the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because if has a higher **LocalPref** value and a lower **Preference2** value.
Metric 1	First metric value in the route. For routes learned from BGP, this is the MED metric.
Metric 2	Second metric value in the route. For routes learned from BGP, this is the IGP metric.
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated.

PART 4

IGMP Snooping and Multicast

CHAPTER 19

Understanding IGMP Snooping and Multicast

IGMP Snooping on J-EX Series Switches Overview

Internet Group Management Protocol (IGMP) snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, a LAN switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member interfaces. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces. J-EX Series Switches support IGMPv1, IGMPv2, and IGMPv3.

For details on IGMPv1, IGMPv2, and IGMPv3, see the following standards:

- For IGMPv1, see RFC 1112, *Host extensions for IP multicasting* at http://www.faqs.org/rfcs/rfc1112.html.
- For IGMPv2, see RFC 2236, *Internet Group Management Protocol, Version 2* at http://www.faqs.org/rfcs/rfc2236.html.
- For IGMPv3, see RFC 3376, *Internet Group Management Protocol, Version 3* at http://www.faqs.org/rfcs/rfc3376.html.

This IGMP snooping topic covers:

How IGMP Snooping Works

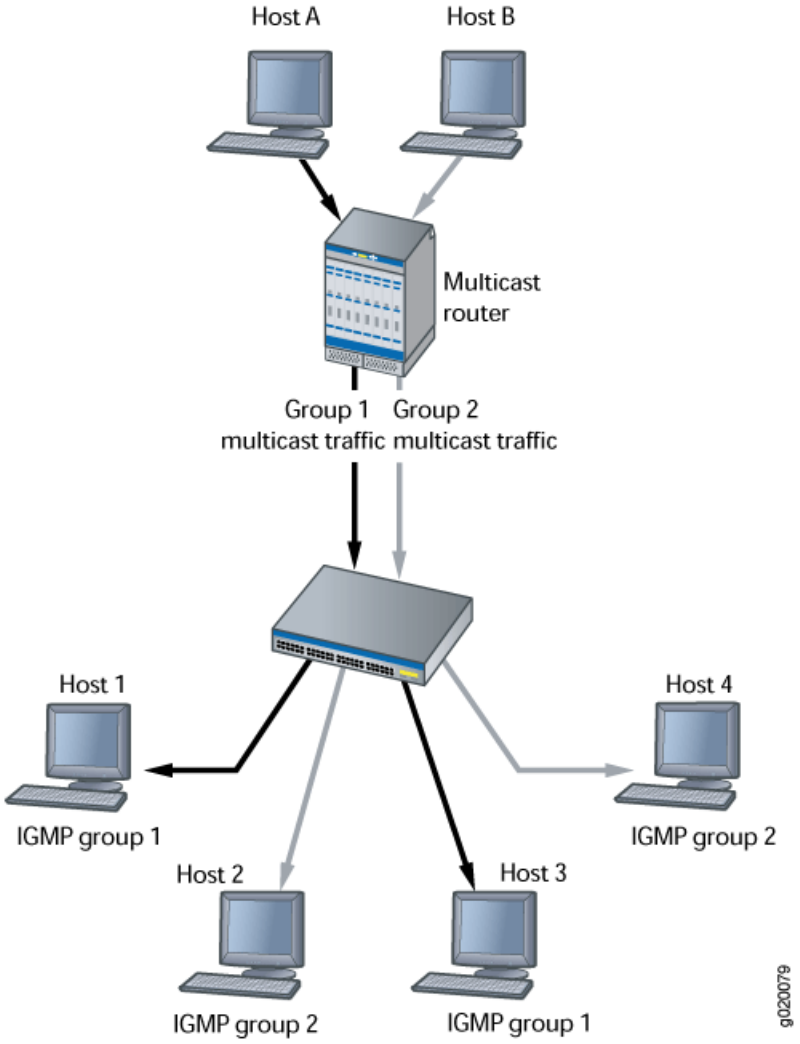
A J-EX Series switch usually learns *unicast* media access control (MAC) addresses by checking the source address field of the frames it receives. However, a *multicast* MAC

address can never be the source address for a packet. As a result, the switch floods multicast traffic on the VLAN, consuming significant amounts of bandwidth.

IGMP snooping regulates multicast traffic on a VLAN to avoid flooding. When IGMP snooping is enabled, the switch intercepts IGMP packets and uses the content of the packets to build a multicast cache table. The cache table is a database of multicast groups and their corresponding member ports. The cache table is then used to regulate multicast traffic on the VLAN.

When the switch receives multicast packets, it uses the cache table to selectively forward the packets only to the ports that are members of the destination multicast group. Figure 17 on page 1012 shows an example of IGMP traffic flow with IGMP snooping enabled.

Figure 17: IGMP Traffic Flow with IGMP Snooping Enabled



How IGMP Snooping Works with Routed VLAN Interfaces

Switches send traffic to hosts that are part of the same broadcast domain, but routers are needed to route traffic from one broadcast domain to another. Switches use a routed

VLAN interface (RVI) to perform these routing functions. IGMP snooping works with Layer 2 interfaces and RVIs to regulate multicast traffic in a switched network.

When a switch receives a multicast packet, the Packet Forwarding Engines in the switch perform an IP multicast lookup on the multicast packet to determine how to forward the packet to its local ports. From the results of the IP multicast lookup, each Packet Forwarding Engine extracts a list of Layer 3 interfaces (which can include VLAN interfaces) that have ports local to the Packet Forwarding Engine. If an RVI is part of this list, the switch provides a bridge multicast group ID for each RVI to the Packet Forwarding Engine.

A bridge multicast ID is assigned to direct Layer 3 interfaces and to RVIs. For VLANs that include multicast receivers, the bridge multicast ID includes a sub-next-hop ID. The sub-next-hop ID identifies the multicast Layer 2 interfaces in that VLAN that are interested in receiving the multicast stream. The switch ultimately assigns a next hop after it does a route lookup. The next hop includes all direct Layer 3 interfaces and RVIs. The Packet Forwarding Engine then forwards multicast traffic to the bridge multicast ID that includes all Layer 3 interfaces and RVIs that are multicast receivers for a given multicast group.

Figure 18 on page 1014 shows how multicast traffic is forwarded on a multilayer switch. In this illustration, multicast traffic is coming in through the **xe-0/1/0.0** interface. A multicast group has been formed by the Layer 3 interface **ge-0/0/2.0**, **vlan.0**, and **vlan.1**. The **ge-2/0/0.0** interface is a common trunk interface that belongs to both **vlan.0** and **vlan.1**. The letter "R" next to an interface name in the illustration indicates that a multicast receiver host is associated with that interface.

NOTE: Traffic sent to an access interface is untagged; traffic sent to a trunk interface is tagged. For more information on VLAN tagging, see "Understanding Bridging and VLANs on J-EX Series Switches" on page 3.

Figure 18: IGMP Traffic Flow with Routed VLAN Interfaces

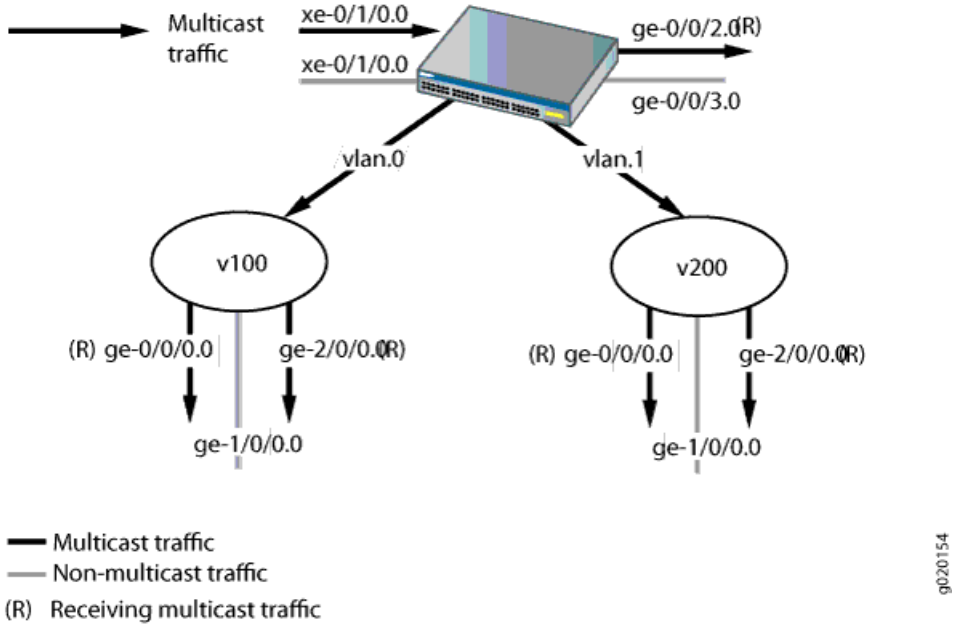


Table 112 on page 1014 shows the bridge multicast IDs and next hops that are created. The term **subnh** refers to a sub-next hop. The Packet Forwarding Engine will forward multicast traffic to bridge multicast ID9.

Table 112: Bridge Multicast IDs and Next Hops

ID Number	Type of Next Hop	Next Hop	Tag Information
ID1	RHN_UNICAST	ge-0/0/0.0	tag=off
ID2	RHN_UNICAST	ge-2/0/0.0	tag=on
ID3	RHN_FLOOD	[ID1, ID2]	
ID4	RHN_UNICAST	ge-0/0/1.0	tag=off
ID5	RHN_FLOOD	[ID4, ID2]	
ID6	RHN_UNICAST	vlan.0	subnh=ID3
ID7	RHN_UNICAST	VLAN.1	subnh=ID5
ID8	RHN_UNICAST	ge-0/0/2.0	
ID9	RHN_FLOOD	[ID6, ID7, ID8]	

How Hosts Join and Leave Multicast Groups

Hosts can join multicast groups in either of two ways:

- By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast group that the host is attempting to join.
- By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

To leave a multicast group, a host can either not respond to the periodic general IGMP queries, which results in a "silent leave" (the only leave option for hosts connected to switches running IGMPv1), or send a group-specific IGMPv2 leave message.

NOTE: A host does not leave a group if its link goes down—for example, if a user disconnects from the port. The host remains a member of the group until group membership times out and a silent leave occurs. This means that if another user connects to the port before the silent leave occurs, the host resumes receiving the group multicast traffic until the silent leave, even though it never sent an IGMP join message.

IGMP Snooping Support for IGMPv3

IGMPv3 allows IGMP snooping to filter multicast streams based on the source address of the multicast stream. Junos operating system (Junos OS) for J-EX Series switches supports IGMPv3 packets that are in INCLUDE or EXCLUDE mode.

When a host sends an IGMPv3 INCLUDE report through a switch interface to indicate that it wants to receive a multicast stream from a source address, the switch adds the source address to the source list. In INCLUDE mode, the switch requests that packets be sent to the specified multicast address only from those IP source addresses listed in the source-list parameter. However, because J-EX Series switches do not support forwarding on a per-source basis, the switch merges all IGMPv3 reports for a VLAN to create a **(*,G,V)** route with the appropriate next hop. This next hop contains all the interfaces on the VLAN that are interested in group **G**.

When IGMP snooping for IGMPv3 is used with an RVI, the same **(*,G,V)** route is added to the snooping information in the RVI's output interface list (**olist**).

When a host sends an IGMPv3 EXCLUDE report, the host indicates that it wants to join a multicast group and receive packets for that group *except* from those IP source addresses in the source-list parameter. However, because J-EX Series switches do not support forwarding on a per-source basis, the switch ignores the source information and creates a **(*,G,V)** route. A host can also send an EXCLUDE report in which the source-list parameter is empty, which is known as an EXCLUDE NULL report. An EXCLUDE NULL

report indicates that the host wants to join the multicast group and receive packets from all sources. The switch creates a **(*, G,V)** route in this case also.

Understanding Multicast VLAN Registration on J-EX Series Switches

Multicast VLAN registration (MVR) allows you to efficiently distribute IPTV multicast streams across an Ethernet ring-based Layer 2 network and reduce the amount of bandwidth consumed by this multicast traffic.

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which IPTV multicast traffic flows throughout the Layer 2 network. The J-EX Series Switch that is enabled for MVR selectively forward IPTV multicast traffic from interfaces on the MVLAN (source interfaces) to hosts that are connected to interfaces that are not part of the MVLAN. These interfaces are known as *MVR receiver ports*. The MVR receiver ports can receive traffic from a port on the MVLAN but cannot send traffic onto the MVLAN, and they remain in their own VLANs for bandwidth and security reasons.

This topic includes:

How MVR Works

In many ways, MVR is similar to IGMP snooping. Both monitor IGMP join and leave messages and build forwarding tables based on the media access control (MAC) addresses of the hosts sending those IGMP messages. Whereas IGMP snooping operates within a given VLAN to regulate multicast traffic, MVR can operate with hosts on different VLANs in a Layer 2 network to selectively deliver IPTV multicast traffic to requesting hosts, thereby reducing the amount of bandwidth needed to forward multicast traffic.

When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs. Interfaces that are on the MVLAN itself cannot be MVR receiver ports for that MVLAN.

NOTE: MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

MVR Modes

MVR operates in two modes: MVR transparent mode and MVR proxy mode. Both modes allow MVR to forward only one copy of a multicast stream to the Layer 2 network.

- MVR Transparent Mode on page 1017
- MVR Proxy Mode on page 1017

MVR Transparent Mode

In MVR transparent mode (the default mode), the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. Transparent mode is the default mode.

The switch handles IGMP packets destined for both the multicast source VLAN and multicast receiver VLANs in the same way that it handles them when MVR is not being used. That is, when a host on a VLAN sends IGMP join and leave messages, the switch floods the messages to all router interfaces in the VLAN. Similarly, when a VLAN receives IGMP queries from its router interfaces, it floods the queries to all interfaces in the VLAN.

If a host on a multicast receiver port joins an MVR group on the multicast receiver VLAN, the appropriate bridging entry is added and the MVLAN forwards that group's IPTV multicast traffic on that port (even though that port is not in the MVLAN). Likewise, if a host on a multicast receiver port leaves an MVR group on the multicast receiver VLAN, the appropriate bridging entry is deleted and the MVLAN stops forwarding that group's IPTV multicast traffic on that port. In addition, you can configure the switch to statically install the bridging entries on the multicast receiver VLAN.

MVR Proxy Mode

When you use MVR in proxy mode, the switch acts as a proxy for any MVR group in both the upstream and downstream directions. In the downstream direction, the switch acts as the querier for the groups in the MVR receiver VLANs. In the upstream direction, the switch originates the IGMP reports and leaves and answers IGMP queries from multicast routers. When the MVR receiver VLANs receive IGMP joins and leaves, the switch creates bridging entries on the MVLAN as needed, as it does in MVR transparent mode. In addition, the switch sends out IGMP joins and leaves on the MVLAN based on these bridging entries.

Configuring MVR proxy mode on the MVLAN automatically enables IGMP snooping proxy mode on all MVR receiver VLANs as well as on the MVLAN.

Understanding IGMP Snooping and Multicast Forwarding

IGMP snooping monitors the Internet Group Management Protocol (IGMP) traffic between hosts and multicast routers. The switch uses what IGMP snooping learns to forward multicast traffic only to interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to hosts that want to receive the traffic, instead of flooding the traffic to all interfaces in the VLAN. This topic describes how J-EX Series Switches forward multicast traffic when IGMP snooping is enabled.

This topic covers:

IGMP Snooping and Forwarding Interfaces

To determine how to forward multicast traffic, IGMP snooping maintains information about the following interfaces in its multicast cache table:

- Multicast-router interfaces—These interfaces lead toward multicast routers or IGMP queriers.
- Group-member interfaces—These interfaces lead toward hosts that are members of multicast groups.

IGMP snooping learns about these interfaces by monitoring IGMP traffic. If an interface receives IGMP queries or Protocol Independent Multicast (PIM) updates, IGMP snooping adds the interface to its multicast cache table as a multicast-router interface. If an interface receives IGMP group membership reports in response to IGMP group queries or receives unsolicited join group messages, IGMP snooping adds the interface to its multicast cache table as a group-member interface.

Interfaces that IGMP snooping learns about are subject to aging. For example, if a multicast-router interface does not receive IGMP queries or PIM hellos within a certain interval, IGMP snooping removes that interface from its multicast cache table.

NOTE: **For a switch to learn multicast-router interfaces and group-member interfaces, an IGMP querier must exist in the network. For the switch itself to function as an IGMP querier, IGMP must be enabled on the switch.**

You can statically configure an interface to be a multicast-router interface or a group-member interface. A statically configured interface is not subject to aging and does not require an IGMP querier for IGMP snooping to learn about the interface. You can have a mix of statically configured and dynamically learned interfaces on a switch.

General Forwarding Rules

Multicast traffic received on a switch interface in a VLAN on which IGMP snooping is enabled is forwarded according to the following rules.

IGMP traffic is forwarded as follows:

- IGMP general queries received on a multicast-router interface are forwarded to all other interfaces in the VLAN.
- IGMP group-specific queries received on a multicast-router interface are forwarded to only those interfaces in the VLAN that are members of the group.
- IGMP reports received on a host interface are forwarded to multicast-router interfaces in the same VLAN, but not to the other host interfaces in the VLAN.

Multicast traffic that is not IGMP traffic is forwarded as follows:

- A multicast packet with a destination address of 224.0.0.0/24 is flooded to all other interfaces on the VLAN.
- An unregistered multicast packet—that is, a packet for a group that has no current members—is forwarded to all multicast-router interfaces in the VLAN.
- A registered multicast packet is forwarded only to those host interfaces in the VLAN that are members of the multicast group and to all multicast-router interfaces in the VLAN.

Examples of IGMP Snooping Multicast Forwarding

The following examples are provided to illustrate how IGMP snooping forwards multicast traffic in different topologies:

Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts

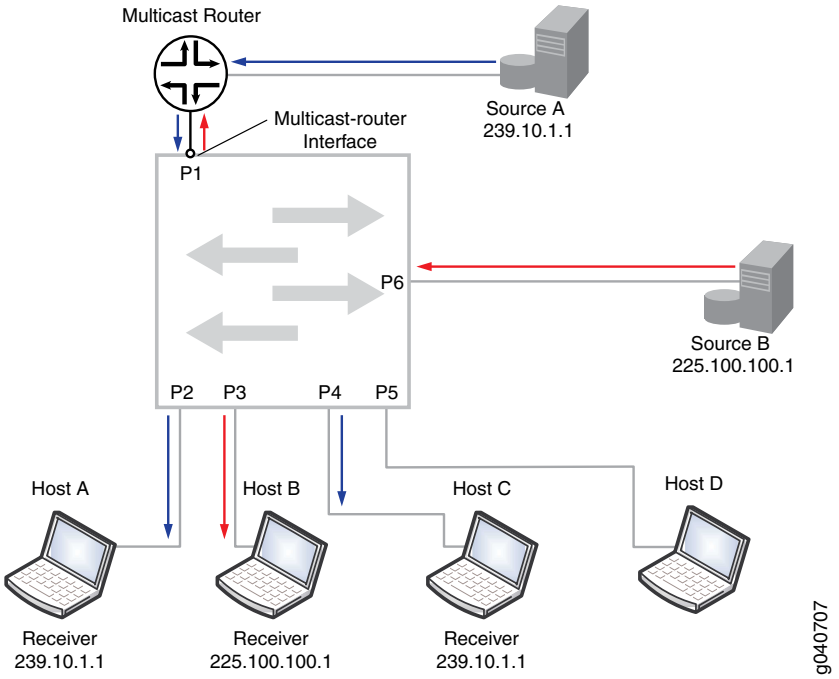
In the topology shown in Figure 19 on page 1020, a switch acting as a pure Layer 2 device receives multicast traffic belonging to multicast group **239.10.1.1** from Source A, which is connected to the multicast router. It also receives multicast traffic belonging to multicast group **225.100.100.1** from Source B, which is connected directly to the switch. All interfaces on the switch belong to the same VLAN.

Because the switch receives IGMP queries from the multicast router on interface P1, IGMP snooping learns that interface P1 is a multicast-router interface and adds the interface to its multicast cache table. It forwards any IGMP general queries it receives on this interface to all host interfaces on the switch, and, in turn, forwards membership reports it receives from hosts to the multicast-router interface.

In the example, Hosts A and C have responded to the membership queries with membership reports for group **239.10.1.1**. IGMP snooping adds interfaces P2 and P4 to its multicast cache table as member interfaces for group **239.10.1.1**. It forwards the group multicast traffic received from Source A to Hosts A and C, but not to Hosts B and D.

Host B has responded to the membership queries with a membership report for group **225.100.100.1**. The switch adds interface P3 to its multicast cache table as a member interface for group **225.100.100.1** and forwards multicast traffic it receives from Source B to Host B. The switch also forwards the multicast traffic it receives from Source B to the multicast-router interface P1.

Figure 19: Scenario 1: Switch Forwarding Multicast Router to a Multicast Router and Hosts



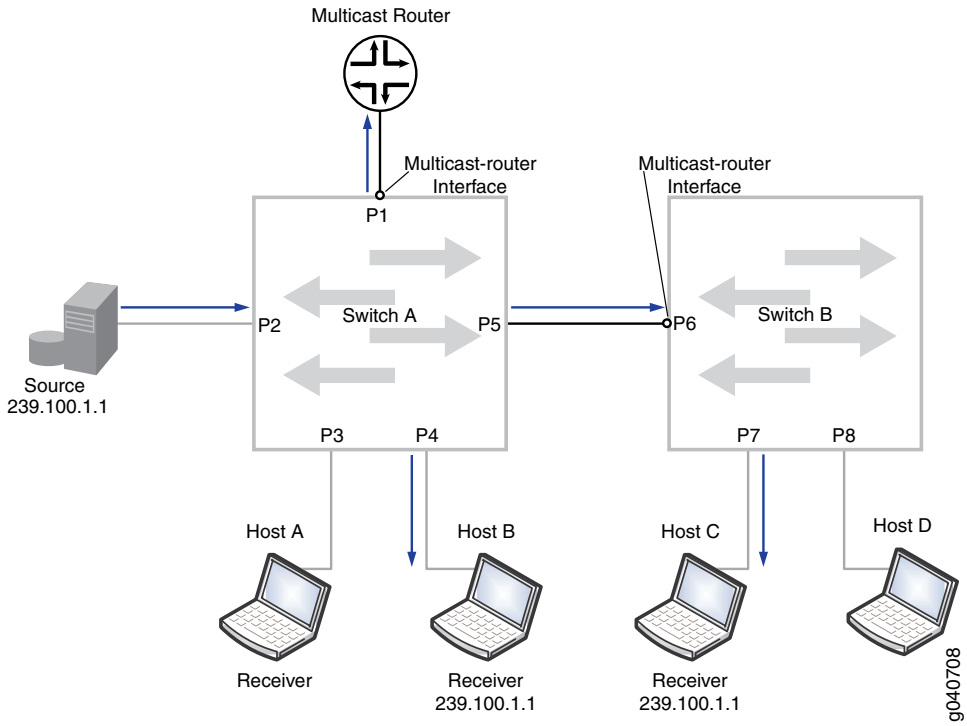
Scenario 2: Switch Forwarding Multicast Traffic to Another Switch

In the topology show in Figure 20 on page 1021, a multicast source is connected to Switch A. Switch A in turn is connected to another switch, Switch B. Hosts on both Switch A and B are potential members of the multicast group. Both switches are acting as Layer 2 devices and all interfaces on the switches are members of the same VLAN.

Switch A receives IGMP queries from the multicast router on interface P1, making interface P1 a multicast-router interface for Switch A. Switch A forwards all general IGMP queries it receives on this interface to the other interfaces on the switch, including the interface connecting Switch B. Because Switch B receives the forwarded IGMP queries on interface P6, P6 is the multicast-router interface for Switch B. Switch B forwards the group membership report it receives from Host C to Switch A through its multicast-router interface. Switch A forwards the membership report to its multicast-router interface,

includes interface P5 in its multicast cache table as a group-member interface, and forwards multicast traffic from the source to Switch B.

Figure 20: Scenario 2: Switch Forwarding Multicast Traffic to Another Switch



You might have to configure P6 on Switch B as a static multicast-router interface in certain implementations. If Switch B receives unsolicited join messages from its hosts before it learns which interface is its multicast-router interface, it does not forward those reports to Switch A. When Switch A receives multicast traffic, it does not forward the traffic to Switch B, because it has not received any member reports on interface P5. You can statically configure interface P6 as a multicast-router interface to solve this issue.

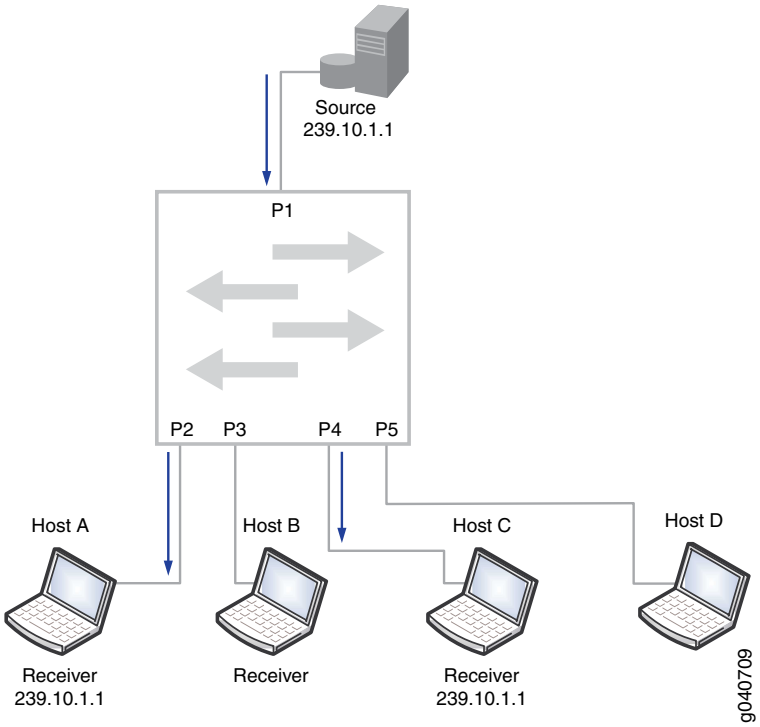
Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)

In the topology shown in Figure 21 on page 1022, a switch is connected to a multicast source and to hosts. There is no multicast router in this topology—hence there is no IGMP querier. Without an IGMP querier to respond to, a host does not send periodic membership reports. As a result, even if the host sends an unsolicited join to join a multicast group, its membership in the multicast group times out.

For IGMP snooping to work correctly in this network so that the switch forwards multicast traffic to Hosts A and C only, you can either:

- Configure interfaces P2 and P4 as static group-member interfaces.
- Configure a routed VLAN interface (RVI) on the VLAN and enable IGMP on it. In this case, the switch itself acts as an IGMP querier, and the hosts can dynamically join the multicast group and refresh their group membership by responding to the queries.

Figure 21: Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)



Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs

In the topology shown in Figure 22 on page 1023, a multicast source, Multicast Router A, and Hosts A and B are connected to the switch and are in VLAN 10. Multicast Router B and Hosts C and D are also connected to the switch and are in VLAN 20.

In a pure Layer 2 environment, traffic is not forwarded between VLANs. For Host C to receive the multicast traffic from the source on VLAN 10, RVIs must be created on VLAN 10 and VLAN 20 to permit routing of the multicast traffic between the VLANs. In addition, PIM must be enabled on the switch to perform the multicast routing.

Figure 22: Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs

CHAPTER 20

Examples: IGMP Snooping and Multicast Configuration

Example: Configuring IGMP Snooping on J-EX Series Switches

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, a LAN switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member ports. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

Configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on J-EX Series switches.

This example describes how to configure IGMP snooping:

Requirements

This example uses the following software and hardware components:

- One EX4200-24T switch
- Junos OS Release 10.2 or later for J-EX Series switches

Before you configure IGMP snooping, be sure you have:

- Configured the **employee-vlan** VLAN on the switch
- Assigned interfaces **ge-0/0/1**, **ge-0/0/2**, and **ge-0/0/3** to **employee-vlan**

See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

Overview and Topology

IGMP snooping controls multicast traffic in a switched network. With IGMP snooping enabled, a J-EX Series switch monitors the IGMP transmissions between a host and a multicast router to keep track of the multicast groups and associated member ports. The switch uses this information to make intelligent decisions and forward multicast traffic to the intended destination interfaces.

You can configure IGMP snooping on all interfaces in a VLAN or on individual interfaces. This example shows how to configure IGMP snooping on a J-EX Series switch.

The configuration setup for this example includes the VLAN **employee-vlan** on the switch.

Table 113 on page 1026 shows the components of the topology for this example.

Table 113: Components of the IGMP Snooping Topology

Properties	Settings
Switch hardware	One EX4200-24T switch
VLAN name	**employee-vlan**, tag **20**
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**
Multicast IP address for **employee-vlan**	**225.100.100.100**

In this example, the switch is initially configured as follows:

- IGMP snooping is disabled on the VLAN.

Configuration

To configure basic IGMP snooping on a switch:

CLI Quick Configuration

To quickly configure IGMP snooping, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set igmp-snooping vlan employee-vlan
set igmp-snooping vlan employee-vlan interface ge-0/0/1 group-limit 50
set igmp-snooping vlan employee-vlan immediate-leave
set igmp-snooping vlan employee-vlan interface ge-0/0/3 static group 225.100.100.100
set igmp-snooping vlan employee-vlan interface ge-0/0/2 multicast-router-interface
set igmp-snooping vlan employee-vlan robust-count 4
```

Step-by-Step Procedure

Configure IGMP snooping:

1. Enable and configure IGMP snooping on the VLAN **employee-vlan**:

   ```
   [edit protocols]
   user@switch# set igmp-snooping vlan employee-vlan
   ```

2. Configure the limit for the number of multicast groups allowed on the **ge-0/0/1** interface to 50.

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/1 group-limit
50
```

3. Configure the switch to immediately remove a group membership from an interface when it receives a leave message from that interface without waiting for any other IGMP messages to be exchanged (IGMPv2 only):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan immediate-leave
```

4. Statically configure IGMP group membership on a port:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/3.0 static (IGMP
Snooping) group 225.100.100.100
```

5. Statically configure an interface as a switching interface toward a multicast router (the interface to receive multicast traffic):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/2
multicast-router-interface
```

6. Change the number of timeout intervals the switch waits before timing out a multicast group to 4:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan robust-count 4
```

Results Check the results of the configuration:

```
user@switch# show protocols igmp-snooping
  vlan employee-vlan {
    robust-count 4;
    immediate-leave;
    interface ge-0/0/1 {
      group-limit 50;
    }
    interface ge-0/0/2 {
      multicast-router-interface;
    }
    interface ge-0/0/3 {
      static {
        group 255.100.100.100
      }
    }
  }
```

Example: Configuring Multicast VLAN Registration on J-EX Series Switches

Multicast VLAN registration (MVR) allows hosts that are not part of a multicast VLAN (MVLAN) to receive multicast streams from the MVLAN, allowing the MVLAN to be shared across the Layer 2 network and eliminating the need to send duplicate multicast streams to each requesting VLAN in the network. Hosts remain in their own VLANs for bandwidth and security reasons.

This example describes how to configure MVR on J-EX Series switches:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches

Before you configure MVR, be sure you have:

- Configured two or more VLANs on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.
- Connected the J-EX Series switch to a network that can transmit IPTV multicast streams from a video server.
- Connected a host that is capable of receiving IPTV multicast streams to an interface in one of the VLANs.

Overview and Topology

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which multicast traffic flows throughout the Layer 2 network. Multicast traffic can then be selectively forwarded from interfaces on the MVLAN (source ports) to hosts that are connected to interfaces (multicast receiver ports) that are not part of the multicast source VLAN. When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs.

You can configure MVR to operate in one of two modes: transparent mode (the default mode) or proxy mode. Both modes allow MVR to forward only one copy of a multicast stream to the Layer 2 network.

In transparent mode, the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. Figure 23 on page 1030 shows how MVR operates in transparent mode.

In proxy mode, the switch acts as a proxy for the IGMP multicast router in the MVLAN for MVR group memberships established in the MVR receiver VLANs and generates and sends IGMP packets into the MVLAN as needed. Figure 24 on page 1031 shows how MVR operates in proxy mode.

This example shows how to configure MVR in both transparent mode and proxy mode on a J-EX Series switch. The topology includes a video server that is connected to a multicast router, which in turn forwards the IPTV multicast traffic in the MVLAN to the Layer 2 network.

Figure 23 on page 1030 shows the MVR topology in transparent mode. Interfaces P1 and P2 on Switch C belong to service VLAN **s0** and MVLAN **mv0**. Interface P4 of Switch C also belongs to service VLAN **s0**. In the upstream direction of the network, only non-IPTV traffic is being carried in individual customer VLANs of service VLAN **s0**. VLAN **c0** is an example of this type of customer VLAN. IPTV traffic is being carried on MVLAN **mv0**. If any host on any customer VLAN connected to port P4 requests an MVR stream, switch C takes the stream from VLAN **mv0** and replicates that stream onto port P4 with tag **mv0**. IPTV traffic, along with other network traffic, flows form port P4 out to the Digital Subscriber Line Access Multiplexer (DSLAM) **D1**.

Figure 23: MVR Topology in Transparent Mode

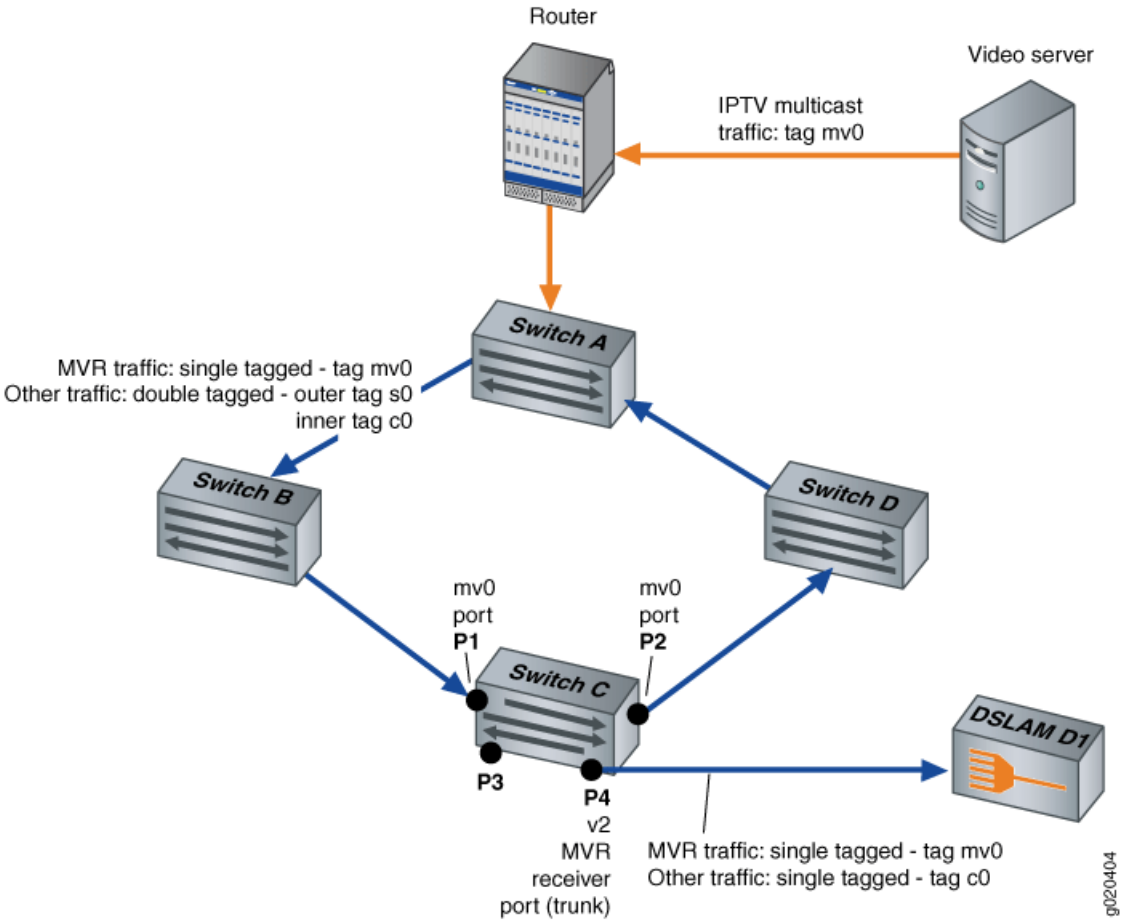

Figure 24 on page 1031 shows the MVR topology in proxy mode. Interfaces P1 and P2 on switch C belong to MVLAN **mv0** and customer VLAN **c0**. Interface P4 on switch C is an access port of customer VLAN **c0**. In the upstream direction of the network, only non-IPTV traffic is being carried on customer VLAN **c0**. Any IPTV traffic requested by hosts on VLAN **c0** is replicated untagged to port P4 based on streams received in MVLAN **mv0**. IPTV traffic flows from port P4 out to an IPTV-enabled device in Host 1. Other traffic, such as data and voice traffic, also flows from port P4 to other network devices in Host 1.

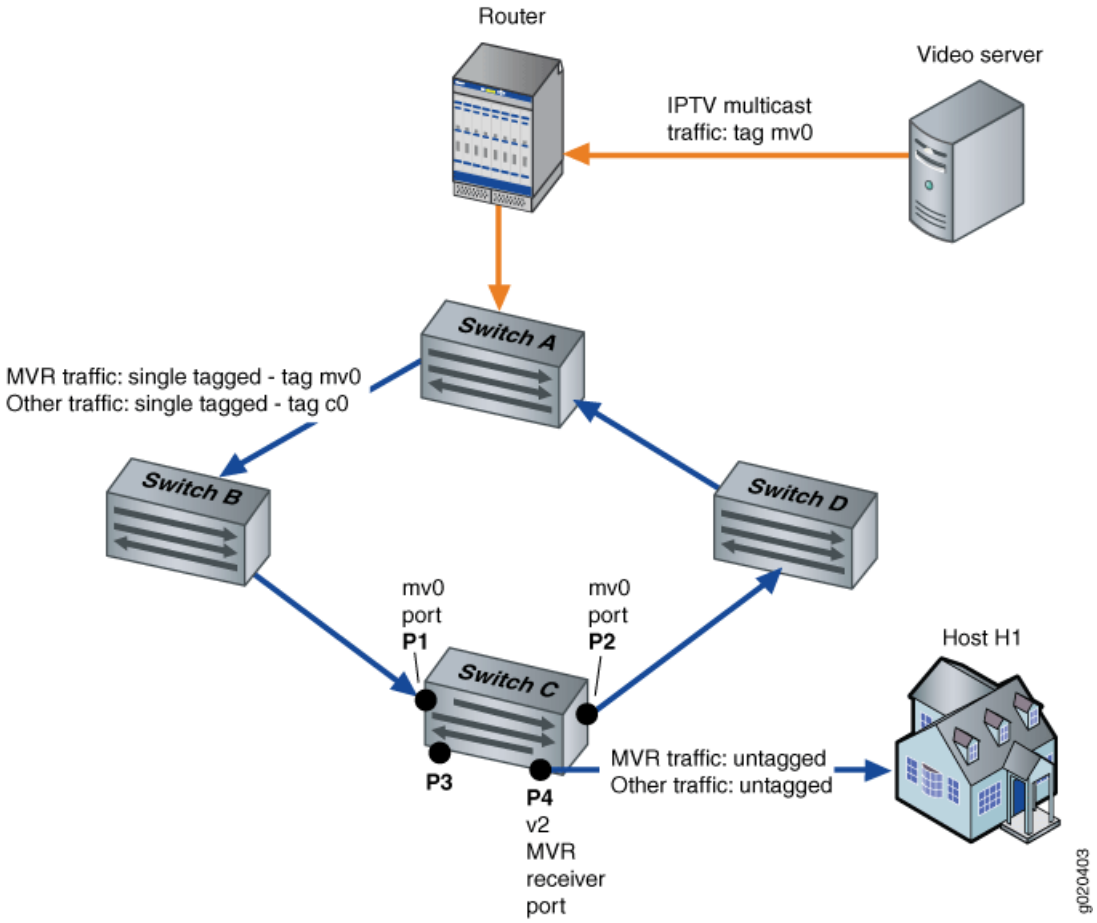
Figure 24: MVR Topology in Proxy Mode



For information on VLAN tagging, see “Understanding Bridging and VLANs on J-EX Series Switches” on page 3.

Configuration

To configure MVR perform these tasks:

CLI Quick Configuration

To quickly configure MVR in proxy mode, copy the following commands and paste them into the switch terminal window. To quickly configure MVR in transparent mode (the default mode), do not copy and paste the final command line in the following block of lines:

```
[edit protocols igmp-snooping]
set vlan mv0 data-forwarding source groups 225.10.0.0/16
set vlan v2 data-forwarding receiver source-vlans mv0
set vlan v2 data-forwarding receiver install
set vlan mv0 proxy source-address 10.1.1.1
```

Step-by-Step Procedure

To configure MVR, perform these tasks:

1. Configure **mv0** to be an MVLAN:

```
[edit protocols igmp-snooping]
user@switch# set vlan mv0 data-forwarding source groups 225.10.0.0/16
```

2. Configure **v2** to be a multicast receiver VLAN with **mv0** as its source:

```
[edit protocols igmp-snooping]
user@switch# set vlan v2 data-forwarding receiver source-vlans mv0
```

3. (Optional) Install forwarding entries in the multicast receiver VLAN **v2**:

```
[edit protocols igmp-snooping]
user@switch# set vlan v2 data-forwarding receiver install
```

4. (Optional) Configure MVR in proxy mode:

```
[edit protocols igmp-snooping]
user@switch# set vlan mv0 proxy source-address 10.1.1.1
```

Results

Check the results of the configuration:

```
[edit protocols igmp-snooping]
user@switch# show
vlan mv0 {
  proxy {
    source-address 10.1.1.1;
  }
  data-forwarding {
    source {
      groups 225.10.0.0/16;
    }
  }
}
vlan v2 {
  data-forwarding {
    receiver {
      source-vlans mv0;
      install;
    }
  }
}
```

CHAPTER 21

Configuring IGMP Snooping and Multicast

Configuring IGMP Snooping (CLI Procedure)

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, a LAN switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member ports. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

You can configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on J-EX Series switches.

NOTE: You cannot configure IGMP snooping on a secondary VLAN.

To enable IGMP snooping and configure individual options as needed for your network by using the CLI:

1. Enable IGMP snooping on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan
```

2. Configure the limit for the number of multicast groups allowed on the **ge-0/0/1** interface to 50.

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/1 group-limit
50
```

3. Configure the switch to immediately remove a group membership from an interface when it receives a leave message from that interface without waiting for any other IGMP messages to be exchanged (IGMPv2 only):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan immediate-leave
```

4. Statically configure IGMP group membership on a port:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/3.0 static (IGMP Snooping) group 225.100.100.100
```

5. Statically configure an interface as a switching interface toward a multicast router (the interface to receive multicast traffic):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/2.0 multicast-router-interface
```

6. Change the number of timeout intervals the switch waits before timing out a multicast group to 4:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan robust-count 4
```

Configuring IGMP Snooping (J-Web Procedure)

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, the J-EX Series switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member interfaces. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

You can configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on J-EX Series switches.

To enable IGMP snooping and configure individual options using the J-Web interface:

1. Select **Configure** > **Switching** > **IGMP Snooping**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Creates an IGMP snooping configuration for the VLAN.
   - **Edit**—Modifies an IGMP snooping configuration for the VLAN.
   - **Delete**—Deletes a selected VLAN from the IGMP snooping configuration.

   When you are adding or editing an IGMP snooping configuration, enter information as described in Table 114 on page 1035
3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

To disable IGMP snooping on a VLAN, select the VLAN from the list and click **Disable**.

Table 114: IGMP Snooping Configuration Fields

Field	Function	Your Action
VLAN Name	Specifies the VLAN on which to enable IGMP snooping.	Select a VLAN from the list to add it to the snooping configuration.
Immediate Leave	Immediately removes a multicast group membership from an interface when it receives a leave message from that interface without waiting for any other IGMP messages to be exchanged (IGMPv2 only).	To enable the option, select the check box. To disable the option, clear the check box.
Robust Count	Specifies the number of timeout intervals the switch waits before timing out a multicast group.	Type a value.

Table 114: IGMP Snooping Configuration Fields *(continued)*

Field	Function	Your Action
Interfaces List	Statically configures an interface as a switching interface toward a multicast router (the interface to receive multicast traffic).	Click one: • Add—Adds an interface to the IGMP snooping configuration. 1. Select an interface from the list. 2. Select **Multicast Router Interface**. 3. Type the maximum number of groups an interface can join. 4. In **Static**, choose one: ◦ Click **Add**, type a group IP address, and click **OK**. ◦ Select a group and click **Remove** to remove the group membership. • Edit—Edits the interface settings for the IGMP snooping configuration. • Remove—Deletes an interface configured for IGMP snooping.

- IGMP Snooping on J-EX Series Switches Overview on page 1011

Changing the IGMP Snooping Group Query Membership Timeout Value (CLI Procedure)

Generally, you do not need to explicitly set the group membership timeout value for IGMP snooping groups on a J-EX Series switch. The group membership timeout value, which determines how long the switch waits before removing an IGMP snooping group from its multicast cache table. is implicitly set to 260 seconds when you configure IGMP snooping.

When you enable IGMP snooping on a switch, the **query-interval** and **query-response-interval** values are set to their default values and are applied to all VLANs created on the switch. The default values are:

- **query-interval**—125 seconds
- **query-response-interval**—10 seconds

The software automatically calculates the group membership timeout value for an IGMP snooping-enabled switch by multiplying the **query-interval** value by 2 and then adding the **query-response-interval** value. For example, using the default values: (125 x 2) + 10) = 260.

If you need to explicitly set the group membership timeout value, you reset the **query-interval** and **query-response-interval** values at the **[edit protocols igmp]** hierarchy level. (Notice that you are not resetting the values at the **[edit protocols igmp-snooping]** hierarchy level.) When you reset these values, the IGMP snooping configuration inherits the new values and recalculates the group membership timeout value accordingly. For more information on changing these values, see the *Junos Multicast Protocols Configuration Guide*.

To change the IGMP snooping group membership timeout value to 350:

1. Configure the **query-interval** value to be 150:

```
[edit protocols]
user@switch# set igmp query-interval 150
```

2. Configure the **query-response-interval** value to be 50:

```
[edit protocols]
user@switch# set igmp query-response-interval 50
```

Configuring Multicast VLAN Registration (CLI Procedure)

Multicast VLAN registration (MVR) allows hosts that are not part of a multicast source VLAN (MVLAN) to still receive multicast streams from the MVLAN, allowing an MVLAN to be shared across a Layer 2 network. Hosts remain in their own VLANs for bandwidth and security reasons but are able to receive multicast streams from the MVLAN.

You can configure one or more VLANs on a switch to be MVLANs or MVR receiver VLANs. By default, MVR is not configured on J-EX Series switches.

NOTE: MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

NOTE: When configuring MVR, the following restrictions apply:

- You cannot enable multicast protocols on VLAN interfaces that are members of MVLANs.
- If you configure an MVLAN in proxy mode, IGMP snooping proxy mode will be automatically enabled on all MVR receiver VLANs of this MVLAN. If a VLAN is an MVR receiver VLAN for multiple MVLANs, all of the MVLANs must have proxy mode enabled or all must have proxy mode disabled. You can enable proxy mode only on VLANs that are configured as MVR source VLANs and that are not configured for Q-in-Q tunneling.
- After you configure a VLAN as an MVLAN, that VLAN is no longer available for other uses.

To configure MVR:

1. Configure the VLAN named **mv0** to be an MVLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 data-forwarding source groups 225.10.0.0/16
```

2. Configure the MVLAN **mv0** to be a proxy VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 proxy source–address 10.0.0.1
```

3. Configure the VLAN named **v2** to be an MVR receiver VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan v2 data-forwarding receiver source-vlans mv0
```

4. Install forwarding entries in the MVR receiver VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 data-forwarding receiver install
```

CHAPTER 22

Verifying IGMP Snooping and Multicast

Monitoring IGMP Snooping

Purpose Use the monitoring feature to view status and information about IGMP snooping configuration on your J-EX Series switch.

Action To display IGMP snooping details in the J-Web interface, select **Monitor** > **Switching** > **IGMP Snooping**.

To display IGMP snooping details in the CLI, enter the following commands:

- **show igmp-snooping vlans**
- **show igmp-snooping statistics**
- **show igmp-snooping route**

Meaning Table 115 on page 1039 summarizes the IGMP snooping details displayed.

Table 115: Summary of IGMP Snooping Output Fields

Field	Values
IGMP Snooping Monitor	
VLAN	The VLAN for which IGMP snooping is enabled.
Interfaces	Indicates the interfaces configured as switching interfaces that are associated with the multicast router.
Groups	Indicates the number of the multicast groups learned by the VLAN.
MRouters	Specifies the multicast router.
Receivers	Specifies the multicast receiver.
IGMP Route Information	

Table 115: Summary of IGMP Snooping Output Fields *(continued)*

Field	Values
VLAN	The VLAN for which IGMP snooping is enabled.
Group	Indicates the multicast groups learned by the VLAN.
Next-Hop	Specifies the next hop assigned by the switch after performing the route lookup.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025

Verifying That the IGMP Snooping Group Query Timeout Value Has Been Changed Correctly

Purpose Verify that the IGMP snooping group query timeout value has been changed correctly from its default value.

Action Display the IGMP protocol information:

```
user@switch> show configuration protocols igmp
query-interval 150;
query-response-interval 50;
accounting;
interface vlan.43 {
    version 2;
}
```

Display the IGMP snooping membership information, which contains the group query timeout value that was derived from the IGMP configuration:

```
user@switch> show show igmp-snooping membership detail
VLAN: v43 Tag: 43 (Index: 4)
      Group: 225.0.0.1
      Receiver count: 1, Flags: <v2-hosts>
          ge-0/0/15.0 Uptime: 00:00:05 timeout: 350
```

Meaning When you enable IGMP snooping on a switch, the **query-interval** and **query-response-interval** values are set to their default values and are applied to all VLANs created on the switch. The IGMP snooping group timeout value is derived from these default settings. Based on the default values, the initial IGMP snooping group query timeout value is 260.

To change the group query timeout value, change the **query-interval** and **query-response-interval** values at the **[edit protocols igmp]** hierarchy level. The IGMP snooping group query timeout value is then recalculated based on the new IGMP configuration settings.

The output from the **show protocols igmp** command shows the revised IGMP configuration settings for **query-interval** and **query-response-interval**. You know that these values have been revised because they are different from the default values. The output from the **show igmp-snooping membership detail** command shows the revised group query timeout value, **350**, which was derived from the new IGMP configuration settings.

[edit protocols **pim rp local** (inet | inet6) **anycast-pim rp-set**],
[edit routing-instances *routing-instance-name* protocols **pim rp local** (inet | inet6) **anycast-pim rp-set**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the anycast rendezvous point (RP) addresses in the RP set. Multiple addresses can be configured in an RP set. If the RP has peer Multicast Source Discovery Protocol (MSDP) connections, then the RP must forward MSDP source active (SA) messages.

Options ***address***—RP address in an RP set.

forward-msdp-sa—(Optional) Forward MSDP SAs to this address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

address (Local RPs)

Syntax address *address*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp local family** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)],
[edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the local rendezvous point (RP) address.

Options ***address***—Local RP address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs

anycast-pim

Syntax

```
anycast-pim {
  rp-set {
    address address <forward-msdp-sa>;
  }
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp local family** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)],
[edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure properties for anycast RP using PIM.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PIM Anycast With or Without MSDP

assert-timeout

Syntax assert-timeout *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds.

Options ***seconds***—Time for routing device to wait before another assert message cycle.

Range: 5 through 210 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring the PIM Assert Timeout

auto-rp

Syntax

```
auto-rp {
  (announce | discovery | mapping);
  (mapping-agent-election | no-mapping-agent-election);
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure automatic rendezvous point (RP) announcement and discovery.

Options

announce—Configures the routing device to listen only for mapping packets and also to advertise itself if it is an RP.

discovery—Configures the routing device to listen only for mapping packets.

mapping—Configures the routing device to announce, listens for and generates mapping packets, and announces that the routing device is eligible to be an RP.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Auto-RP

bootstrap

Syntax

```
bootstrap {
  family (inet | inet6) {
    export [ policy-names ];
    import [ policy-names ];
    priority number;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure parameters to control bootstrap routers and messages.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties for IPv4
- Configuring PIM Bootstrap Properties for IPv4 or IPv6

bootstrap-export

Syntax bootstrap-export [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more export policies to control outgoing PIM bootstrap messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Bootstrap Properties for IPv4
- Configuring PIM Bootstrap Properties for IPv4 or IPv6
- **bootstrap-import on page 1056**

bootstrap-import

Syntax bootstrap-import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more import policies to control incoming PIM bootstrap messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

bootstrap-priority

Syntax bootstrap-priority *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether this routing device is eligible to be a bootstrap router. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap router.

Options *number*—Priority for becoming the bootstrap router. A value of 0 means that the routing device is not eligible to be the bootstrap router.

Range: 0 through 255

Default: 0

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties for IPv4

data-forwarding

Syntax

```
data-forwarding {
  source {
    groups group-prefix;
  }
  receiver {
    source-vlans vlan-list;
    install;
  }
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN to be a multicast source VLAN (MVLAN) or a multicast VLAN registration (MVR) receiver VLAN. Each data-forwarding VLAN, which can be a multicast source VLAN (MVLAN) or a multicast receiver VLAN, must have exactly one source statement or exactly one receiver statement. A data-forwarding VLAN can operate only in IGMPv2 mode.

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

dense-groups

Syntax
```
dense-groups {
  addresses;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure which groups are operating in dense mode.

Options ***addresses***—Address of groups operating in dense mode.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Sparse-Dense Mode Properties

disable (IGMP Snooping)

Syntax
```
disable {
  interface interface-name
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IGMP snooping on all interfaces in a VLAN or on a specific VLAN interface.

Default If you do not specify an interface, all interfaces in the given VLAN are disabled.

Options ***interface-name*** —Name of the interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

disable (PIM)

Syntax disable;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* protocols **pim** family (inet | inet6)],
[edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],

- family (Disable PIM)

disable (IGMP)

Syntax disable;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IGMP on the system.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling IGMP

dr-election-on-p2p

Syntax dr-election-on-p2p;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable PIM designated router (DR) election on point-to-point (P2P) links.

Default No PIM DR election is performed on P2P links.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Designated Router Election on Point-to-Point Links

dr-register-policy

Syntax dr-register-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to control outgoing PIM register messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

embedded-rp

Syntax

```
embedded-rp {
  group-ranges {
    destination-ip-prefix</prefix-length>;
  }
  maximum-rps limit;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure properties for embedded IP version 6 (IPv6) RPs.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Embedded RP for IPv6

export (Bootstrap)

Syntax

export [*policy-names*];

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp bootstrap family** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap family** (inet | inet6)],
[edit protocols **pim rp bootstrap family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap family** (inet | inet6)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply one or more export policies to control outgoing PIM bootstrap messages.

Options

policy-names—Name of one or more import policies.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

graceful-restart

Syntax

```
graceful-restart {
  disable;
  restart-duration seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure PIM sparse mode graceful restart.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Sparse Mode Graceful Restart

group (IGMP Snooping)

Syntax

group *ip-address*;

Hierarchy Level

[edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name* **interface** *interface-name* **static**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a static multicast group using a valid IP multicast address.

Default

None.

Options

ip-address —IP address of the multicast group receiving data on an interface.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

group (IGMP)

Syntax

```
group multicast-group-address {
  exclude;
  group-count number;
  group-increment increment;
  source ip-address {
    source-count number;
    source-increment increment;
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name* **static**], [edit protocols igmp **interface** *interface-name* **static**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the IGMP multicast group address and (optionally) the source address for the multicast group being statically configured on an interface.

NOTE: You must specify a unique address for each group.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP Static Group Membership

group-limit

Syntax group-limit *limit*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit for the number of multicast groups allowed on the specified interface. After this limit is reached, new reports are ignored and related flows are not flooded on the interface.

Default No group limits are configured.

Options ***limit*** —Number that represents the maximum number of multicast groups allowed on the specified interface.

Range: 0 through 65535

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **group on page 1065**

group-ranges

Syntax

```
group-ranges {
    destination-ip-prefix</prefix-length>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp embedded-rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp embedded-rp**],
[edit protocols **pim rp embedded-rp**],
[edit protocols **pim rp local family** (inet | inet6)],
[edit protocols **pim rp static** address *address*],
[edit routing-instances *routing-instance-name* protocols **pim rp embedded-rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp static** address *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the address ranges of the multicast groups for which this routing device can be an RP.

Default

The routing device is eligible to be the RP for all IPv4 or IPv6 groups (**224.0.0.0/4** or **FF70::/12** to **FFF0::/12**).

Options

destination-mask—Addresses or address ranges for which this routing device can be an RP.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs
- Configuring PIM Embedded RP for IPv6

groups

Syntax groups *group-prefix*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding source**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the IP address range of the multicast VLAN (MVLAN) source interfaces.

Default Disabled.

Options ***group-prefix***—IP address range of the source group. Each MVLAN must have exactly one **groups** statement. If there are multiple MVLANs on the switch, their group ranges must be unique.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hello-interval

Syntax hello-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the router sends PIM hello packets out of an interface.

Options ***seconds***—Length of time between PIM hello packets.

Range: 0 through 255

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the PIM Hello Interval

hold-time

Syntax hold-time *seconds*;

Hierarchy Level [edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the time period for which a neighbor is to consider the sending routing device (this routing device) to be operative (up).

Options *seconds*—Hold time.

Range: 0 through 255

Default: 150 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs

igmp-snooping

Syntax

```
igmp-snooping {
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag (detail | disable | receive | send);
  }
  vlan vlan-id | vlan-name {
    data-forwarding {
      source {
        groups group-prefix;
      }
      receiver {
        source-vlans vlan-list;
        install ;
      }
    }
    disable {
      interface interface-name;
    }
    immediate-leave;
    interface interface-name {
      group-limit limit;
      multicast-router-interface;
      static {
        group ip-address;
      }
    }
    proxy ;
    query-interval seconds;
    query-last-member-interval seconds;
    query-response-interval seconds;
    robust-count number;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable and configure IGMP snooping on J-EX Series switches.

The remaining statements are explained separately.

Default IGMP snooping is enabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

immediate-leave

Syntax immediate-leave;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Applies only to switches running IGMPv2.) After the switch receives a leave group membership message from a host, immediately remove the group membership from the interface without waiting for any other IGMP messages to be exchanged.

NOTE: When configuring this statement, ensure that the IGMP interface has only one IGMP host connected. If more than one IGMPv2 host is connected to the switch through the same interface and one of the hosts sends a leave message, the switch removes all hosts on the interface from the multicast group. The switch loses contact with the hosts in the multicast group that did not send a leave message until they send join requests in response to the next general multicast listener query from the router.

Default The immediate-leave feature is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

immediate-leave

Syntax immediate-leave;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*], [edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description When this statement is enabled on a routing device running IGMP version 2 (IGMPv2), after the routing device receives a leave group membership message from a host associated with the interface, the routing device immediately removes the group membership from the interface and suppresses the sending of any group-specific queries for the multicast group.

When this statement is enabled on a routing device running IGMP version 3 (IGMPv3), after the routing device receives a report with the type BLOCK_OLD_SOURCES, the routing device suppresses the sending of group-and-source queries but relies on the Junos OS-supported host tracking mechanism to determine whether or not it removes a particular source group membership from the interface.

NOTE: When issuing this command on IGMPv2 interfaces, ensure that the IGMP interface has only one IGMP host connected. If more than one IGMPv2 host is connected to a LAN through the same interface, and one host sends a done message, the routing device removes all hosts on the interface from the multicast group. The routing device loses contact with the hosts that properly remain in the multicast group until they send join requests in response to the next general multicast listener query from the router.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Specifying Immediate-Leave Host Removal for IGMP

import (Bootstrap)

Syntax import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit protocols **pim rp bootstrap** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more import policies to control incoming PIM bootstrap messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Bootstrap Properties for IPv4
- Configuring PIM Bootstrap Properties for IPv4 or IPv6
- **export (Bootstrap) on page 1062**

import (PIM)

Syntax import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to routes being imported into the routing table from PIM. Use the **import** statement to filter PIM join messages from entering the network.

Options ***policy-names***—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Filtering Incoming PIM Join Messages

infinity

Syntax infinity [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim spt-threshold**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim spt-threshold**],
[edit protocols **pim spt-threshold**],
[edit routing-instances *routing-instance-name* protocols **pim spt-threshold**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to set the SPT threshold to infinity for a source-group address pair. Use the **infinity** statement to prevent the last-hop routing device from transitioning from the RPT rooted at the RP to an SPT rooted at the source for that source-group address pair.

Options ***policy-names***—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring the PIM SPT Threshold Policy

install

Syntax install;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding receiver**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Install forwarding entries in the multicast receiver VLAN. By default, only the multicast VLAN (MVLAN) installs forwarding entries for MVLAN groups.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface (PIM)

Syntax

```
interface (PIM) (all | interface-name) {
  accept-remote-source;
  disable;
  bfd-liveness-detection {
    authentication {
      algorithmalgorithm-name;
      key-chainkey-chain-name;
      loose-check;
    }
    detection-time {
      threshold milliseconds;
    }
    minimum-interval milliseconds;
    minimum-receive-interval milliseconds;
    multiplier number;
    version (0 | 1 | automatic);
  }
  family (inet | inet6) {
    disable;
  }
  hello-interval seconds;
  mode (dense | sparse | sparse-dense);
  neighbor-policy [ policy-names ];
  override-interval milliseconds;
  priority number;
  propagation-delay milliseconds;
  reset-tracking-bit;
  version version;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable PIM on an interface and configure interface-specific properties.

Options

interface-name—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify **all**.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- PIM on Aggregated Interfaces

interface (IGMP Snooping)

Syntax

```
interface interface-name {
  group-limit limit;
  multicast-router-interface;
  static {
    group ip-address;
  }
}
```

Hierarchy Level [edit protocols igmp-snooping vlan *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable IGMP snooping on an interface and configure interface-specific properties

Default None.

Options ***interface-name***—Name of the interface.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show igmp-snooping vlans on page 1158**
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

interface (IGMP)

Syntax

```
interface interface-name {
  disable;
  (accounting | no-accounting);
  group-limit limit;
  group-policy [ policy-names ];
  immediate-leave;
  oif-map map-name;
  passive;
  promiscuous-mode;
  ssm-map ssm-map-name;
  static {
    group multicast-group-address {
      exclude;
      group-count number;
      group-increment increment;
      source ip-address {
        source-count number;
        source-increment increment;
      }
    }
  }
  version version;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable IGMP on an interface and configure interface-specific properties.

Options

interface-name—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify **all**.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP

join-load-balance

Syntax join-load-balance;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable load balancing of PIM join messages across interfaces and routing devices.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Join Load Balancing
- clear pim join-distribution in the *Junos OS Routing Protocols and Policies Command Reference*

local

Syntax

```
local {
  disable;
  address address;
  family (inet | inet6) {
    disable;
    address address;
    anycast-pim {
      local-address address;
        rp-set {
        address address <forward-msdp-sa>;
      }
    }
    group-ranges {
      destination-ip-prefix</prefix-length>;
    }
    hold-time seconds;
    priority number;
  }
  group-ranges {
    destination-ip-prefix</prefix-length>;
  }
  hold-time seconds;
  priority number;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
The remaining statements are explained separately.

Description

Configure the routing device's RP properties.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs

local-address

Syntax local-address *address*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp local family** (inet | inet6) **anycast-pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6) **anycast-pim**],
[edit protocols **pim rp local family** (inet | inet6) **anycast-pim**],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6) **anycast-pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's local address for anycast rendezvous point (RP). If this statement is omitted, the router ID is used as this address.

Options ***address***—Anycast RP IPv4 or IPv6 address, depending on **family** configuration.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring PIM Anycast With or Without MSDP

mapping-agent-election

Syntax (mapping-agent-election | no-mapping-agent-election);

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp auto-rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp auto-rp**],
[edit protocols **pim rp auto-rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp auto-rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's mapping announcements as a mapping agent.

Options **mapping-agent-election**—Mapping agents do not announce mappings when receiving mapping messages from a higher-addressed mapping agent.

no-mapping-agent-election—Mapping agents always announce mappings and do not perform mapping agent election.

Default: mapping-agent-election

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Auto-RP

maximum-rps

Syntax maximum-rps *limit*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp embedded-rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp embedded-rp**],
[edit protocols **pim rp embedded-rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp embedded-rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Limit the number of RPs that the routing device acknowledges.

Options *limit*—Number of RPs.

Range: 1 through 500

Default: 100

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Embedded RP for IPv6

mode

Syntax mode (dense | sparse | sparse-dense);

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure PIM to operate in sparse, dense, or sparse-dense mode.

Options **dense**—Operate in dense mode.

sparse—Operate in sparse mode.

sparse-dense—Operate in sparse-dense mode.

Default: sparse

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Dense Mode Properties
- Configuring PIM Sparse-Dense Mode Properties

multicast-router-interface

Syntax multicast-router-interface;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Statically configure an interface as a switching interface toward a multicast router (the interface to receive multicast traffic).

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

neighbor-policy

Syntax neighbor-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a PIM interface-level policy to filter neighbor IP addresses.

Options ***policy-name***—Name of the policy that filters neighbor IP addresses.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Interface-Level PIM Neighbor Policies

pim

Syntax

```
pim {
  disable;
  assert-timeout seconds;
  dense-groups {
    addresses;
  }
  dr-election-on-p2p;
  export;
  family (inet | inet6) {

[edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable PIM on the routing device.

The statements are explained separately.

Default

PIM is disabled on the routing device.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Dense Mode Properties
- Configuring PIM Sparse-Dense Mode Properties

priority (Bootstrap)

Syntax priority *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit protocols **pim rp bootstrap** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's likelihood to be elected as the bootstrap router.

Options ***number***—Routing device's priority for becoming the bootstrap router. A higher value corresponds to a higher priority.

Range: 0 through a 32-bit number

Default: 0 (The routing device has the least likelihood of becoming the bootstrap router and sends packets with a priority of 0.)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties for IPv4
- Configuring PIM Bootstrap Properties for IPv4 or IPv6
- **bootstrap-priority on page 1057**

priority (PIM Interfaces)

Syntax priority *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's likelihood to be elected as the designated router.

Options ***number***—Routing device's priority for becoming the designated router. A higher value corresponds to a higher priority.

Range: 0 through a 32-bit number

Default: 0 (The routing device has the least likelihood of becoming the designated router.)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Interface Priority to Become the PIM Designated Router

priority (PIM RPs)

Syntax priority *number*;

Hierarchy Level [edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure this routing device's priority for becoming an RP. The bootstrap router uses this field when selecting the list of candidate RPs to send in the bootstrap message. A smaller number increases the likelihood that the routing device becomes the RP for local multicast groups. A priority value of 0 means that bootstrap router can override the group range being advertised by the candidate RP.

Options ***number***—Routing device's priority for becoming an RP. A lower value corresponds to a higher priority.

Range: 0 through 255

Default: 1

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Local PIM RPs

promiscuous-mode

Syntax promiscuous-mode;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that the interface accepts IGMP reports from hosts on any subnetwork.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Accepting IGMP Messages from Remote Subnetworks

proxy

Syntax proxy source-address *source-address*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that the VLAN operates in proxy mode. The proxy option is only accepted for a VLAN acting as a data-forwarding source.

Default Disabled.

Options **source-address *source-address***—IP address of the source VLAN to act as proxy.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Configuring Multicast VLAN Registration on J-EX Series Switches on page 1028

query-interval

Syntax query-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the querier router sends general host-query messages.

Options ***seconds***—Time interval.
Range: 1 through 1024
Default: 125 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Host-Query Message Interval
- **query-last-member-interval on page 1092**
- **query-response-interval on page 1092**

query-last-member-interval

Syntax query-last-member-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the querier router sends group-specific query messages.

Options *seconds*—Time interval, in fractions of a second or seconds.

Range: 0.1 through 0.9, then in 1-second intervals 1 through 999999

Default: 1 second

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Last-Member Query Interval
- **query-interval on page 1091**
- **query-response-interval on page 1092**

query-response-interval

Syntax query-response-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the querier router waits to receive a response to a host-query message from a host.

Options *seconds*—The query response interval must be less than the query interval.

Range: 1 through 1024

Default: 10 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Query Response Interval
- **query-interval on page 1091**
- **query-last-member-interval on page 1092**

receiver

Syntax

```
receiver {
  source-vlans vlan-list;
  install;
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a VLAN as a multicast receiver VLAN of the multicast VLAN (MVLAN).

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

restart-duration

Syntax restart-duration *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim graceful-restart**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim graceful-restart**],
[edit protocols **pim graceful-restart**],
[edit routing-instances *routing-instance-name* protocols **pim graceful-restart**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the duration of the graceful restart interval.

Options ***seconds***—Time the routing device waits (in seconds) to complete PIM sparse mode graceful restart.

Range: 30 through 300

Default: 60

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Sparse Mode Graceful Restart

rib-group

Syntax rib-group *group-name*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a routing table group with PIM.

Options *group-name*—Name of the routing table group. The name must be one that you defined with the **rib-group** statement at the **[edit routing-options]** hierarchy level.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring a PIM RPF Routing Table

robust-count

Syntax robust-count *number*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of intervals the switch waits before removing a multicast group from the multicast forwarding table. The length of each interval is configured using the **query-interval** statement.

Default 2

Options *number* —Number of intervals the switch waits before timing out a multicast group.
Range: 2 through 10

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

robust-count (IGMP)

Syntax robust-count *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Tune the expected packet loss on a subnet. This factor is used to calculate the group member interval, other querier present interval, and last-member query count.

Options *number*—Robustness variable.

Range: 2 through 10

Default: 2

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Robustness Variable

rp

Syntax

```
rp {
    auto-rp {
        (announce | discovery | mapping);
        (mapping-agent-election | no-mapping-agent-election);
    }
    bootstrap {
        family (inet | inet6) {
            export [ policy-names ];
            import [ policy-names ];
            priority number;
        }
    }
    bootstrap-export [ policy-names ];
    bootstrap-import [ policy-names ];
    bootstrap-priority number;
    dr-register-policy [ policy-names ];
    embedded-rp {
        group-ranges {
            destination-ip-prefix</prefix-length>;
        }
        maximum-rps limit;
    }
    local {
        family (inet | inet6) {
            disable;
            address address;
            anycast-pim {
                rp-set {
                    address address <forward-msdp-sa>;
                }
                local-address address;
            }
            group-ranges {
                destination-ip-prefix</prefix-length>;
            }
            hold-time seconds;
            priority number;
        }
    }
    rp-register-policy [ policy-names ];
    static {
        address address {
            version version;
            group-ranges {
                destination-ip-prefix</prefix-length>;
            }
        }
    }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols pim],

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device as an actual or potential RP. A routing device can be an RP for more than one group.

The remaining statements are explained separately.

Default If you do not include the **rp** statement, the routing device can never become the RP.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- PIM Sparse Mode Overview

rp-register-policy

Syntax rp-register-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to control incoming PIM register messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Register Message Filters on a PIM RP and DR
- **dr-register-policy on page 1061**

rp-set

Syntax

```
rp-set {
    address address <forward-msdp-sa>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim local family** (inet | inet6) **anycast-pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim local family** (inet | inet6) **anycast-pim**],
[edit protocols **pim local family** (inet | inet6) **anycast-pim**],
[edit routing-instances *routing-instance-name* protocols **pim local family** (inet | inet6) **anycast-pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a set of rendezvous point (RP) addresses for anycast RP. You can configure up to 15 RPs.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PIM Anycast With or Without MSDP

source (Multicast)

Syntax

```
source {
    groups group-prefix;
}
```

Hierarchy Level

[edit protocols **igmp-snooping vlan** *vlan-number* **data-forwarding**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a VLAN to be a multicast source VLAN (MVLAN).

The remaining statement is explained separately.

Default

Disabled.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Configuring Multicast VLAN Registration on J-EX Series Switches on page 1028
- Configuring Multicast VLAN Registration (CLI Procedure) on page 1038

source (IGMP)

Syntax

```
source ip-address {
    source-count number;
    source-increment increment;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name* **static group** *multicast-group-address*],
[edit protocols igmp **interface** *interface-name* **static group** *multicast-group-address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify the IP version 4 (IPv4) unicast source address for the multicast group being statically configured on an interface.

Options

ip-address—IPv4 unicast address.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP Static Group Membership

source-vlans

Syntax

source-vlans *vlan-list*;

Hierarchy Level

[edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding receiver**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify a list of multicast VLANs (MVLANs) from which this multicast receiver VLAN receives multicast traffic. Either all of these MVLANs must be in proxy mode or none of them can be in proxy mode.

Default

Disabled.

Options

vlan-list—Names of the MVLANs.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Configuring Multicast VLAN Registration on J-EX Series Switches on page 1028

spt-threshold

Syntax

```
spt-threshold {
  infinity [ policy-names ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring the PIM SPT Threshold Policy

ssm-map

Syntax

ssm-map *ssm-map-name*;

Hierarchy Level

[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply an SSM map to an IGMP interface.

Options

ssm-map-name—Name of SSM map.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring SSM Mapping

static (PIM)

Syntax

```
static {
  address address {
    group-ranges {
      destination-ip-prefix</prefix-length>;
    }
    version version;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure static RP addresses. The default static RP address is 224.0.0.0/4. To configure other addresses, include one or more **address** statements. You can configure a static RP in a logical system only if the logical system is not directly connected to a source.

For each static RP address, you can optionally specify the PIM version and the groups for which this address can be the RP. The default PIM version is version 1.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring the Static PIM RP Address on the Non-RP Routing Device

static (IGMP Snooping)

Syntax

```
static {
  group ip-address;
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** (*vlan-id* | *vlan-name*) **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Statically define multicast groups on an interface.

The remaining statement is explained separately.

Default No multicast groups are statically defined.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

static (IGMP)

Syntax

```
static {
  group multicast-group-address {
    exclude;
    group-count number;
    group-increment increment;
    source ip-address {
      source-count number;
      source-increment increment;
    }
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*], [edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Test multicast forwarding on an interface without a receiver host.

The remaining statements are explained separately.

Required Privilege Level routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP Static Group Membership

traceoptions (PIM)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure PIM tracing options.

To specify more than one tracing operation, include multiple **flag** statements.

Default

The default PIM trace options are those inherited from the routing protocol's **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the **pim-log** file.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

Range: 2 through 1000 files

Default: 2 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

PIM Tracing Flags

- **assert**—Assert messages
- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache

- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 0 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

traceoptions (IGMP Snooping)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag (detail | disable | receive | send);
}
```

Hierarchy Level [edit protocols igmp-snooping]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for IGMP snooping.

Default The **traceoptions** feature is disabled by default.

Options

file *filename* —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number* —(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag* —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **general**—Trace general IGMP snooping protocol events.
- **leave**—Trace leave group messages (IGMPv2 only).
- **normal**—Trace normal IGMP snooping protocol events.
- **packets**—Trace all IGMP packets.
- **policy**—Trace policy processing.
- **query**—Trace IGMP membership query messages.
- **report**—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.

match *regex* —(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restricted file access to the user who created the file.

size *size* —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes

Range: 10 KB through 1 gigabytes

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 1025
- Configuring IGMP Snooping (CLI Procedure) on page 1033

traceoptions (IGMP)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure IGMP tracing options.

To specify more than one tracing operation, include multiple **flag** statements.

To trace the paths of multicast packets, use the **mtrace** command.

Default The default IGMP trace options are those inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the file **igmp-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

Range: 2 through 1000 files

Default: 2 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

IGMP Tracing Flags

- **leave**—Leave group messages (for IGMP version 2 only).
- **mtrace**—Mtrace packets. Use the **mtrace** command to troubleshoot the software.
- **packets**—All IGMP packets.
- **query**—IGMP membership query messages, including general and group-specific queries.

- **report**—Membership report messages.

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation
- Tracing IGMP Protocol Traffic

version (IGMP)

Syntax
version *version*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify the version of IGMP.

Options
version—IGMP version number.

Range: 1, 2, or 3

Default: IGMP version 2

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Changing the IGMP Version

version (PIM)

Syntax version *version*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* protocols **pim rp static** address *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp static** address *address*],
[edit protocols **pim interface** *interface-name*],
[edit protocols **pim rp static** address *address*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim rp static** address *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the version of PIM.

Options ***version***—PIM version number.

Range: 1 or 2

Default: PIMv1 for rendezvous point (RP) mode (at the **[edit protocols pim rp static address *address*]** hierarchy level). PIMv2 for interface mode (at the **[edit protocols pim interface *interface-name*]** hierarchy level).

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

vlan

Syntax

```
vlan (vlan-id | vlan-name) {
  data-forwarding {
    source {
      groups group-prefix;
    }
    receiver {
      source-vlans vlan-list;
      install ;
    }
  }
  disable {
    interface interface-name;
  }
  immediate-leave;
  interface interface-name {
    group-limit limit;
    multicast-router-interface;
    static {
      group ip-address;
    }
  }
  proxy ;
  query-interval seconds;
  query-last-member-interval seconds;
  query-response-interval seconds;
  robust-count number;
}
```

Hierarchy Level [edit protocols igmp-snooping]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure IGMP snooping parameters for a VLAN.

The remaining statements are explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range. For IGMP snooping, secondary private VLANs are not listed.

Default IGMP snooping options apply to the specified VLAN.

Options ***vlan-id***—Numeric tag for a VLAN.

Range: 0 through 4095. Tags 0 and 4095 are reserved by Junos OS, and you should not configure them.

vlan-name—Name of a VLAN.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear igmp membership
<group *address-range*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Internet Group Management Protocol (IGMP) group members.

Options

none—Clear all IGMP members on all interfaces and for all address ranges.

group *address-range*—(Optional) Clear all IGMP members that are in a particular address range. An example of a range is **224.2/16**. If you omit the destination prefix length, the default is **/32**.

interface *interface-name*—(Optional) Clear all IGMP group members on an interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

Related Documentation

clear igmp statistics

Syntax
clear igmp statistics
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear igmp statistics
<interface *interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Internet Group Management Protocol (IGMP) statistics.

Options
none—Clear IGMP statistics on all interfaces.

interface *interface-name*—(Optional) Clear IGMP statistics for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

clear multicast bandwidth-admission

Syntax

clear multicast bandwidth-admission
<group *group-address*>
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<source *source-address*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reapply IP multicast bandwidth admissions.

Options

none—Reapply multicast bandwidth admissions for all IPv4 forwarding entries in the master routing instance.

group *group-address*—(Optional) Reapply multicast bandwidth admissions for the specified group.

inet—(Optional) Reapply multicast bandwidth admission settings for IPv4 flows.

inet6—(Optional) Reapply multicast bandwidth admission settings for IPv6 flows.

instance *instance-name*—(Optional) Reapply multicast bandwidth admission settings for the specified instance. If you do not specify an instance, the command applies to the master routing instance.

interface *interface-name*—(Optional) Examines the corresponding outbound interface in the relevant entries and acts as follows:

- If the interface is congested, and it was admitted previously, it is removed.
- If the interface was rejected previously, the **clear multicast bandwidth-admission** command enables the interface to be admitted as long as enough bandwidth exists on the interface.
- If you do not specify an interface, issuing the **clear multicast bandwidth-admission** command readmits any previously rejected interface for the relevant entries as long as enough bandwidth exists on the interface.

To manually reject previously admitted outbound interfaces, you must specify the interface.

source *source-address*—(Optional) Use with the **group** option to reapply multicast bandwidth admission settings for the specified (source, group) entry.

Required Privilege Level

clear

Related Documentation

- **show multicast interface on page 1162**

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear multicast bandwidth-admission

```
user@host> clear multicast bandwidth-admission
```

clear multicast scope

Syntax
clear multicast scope
<inet | inet6>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear multicast scope
<inet | inet6>
<interface *interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear IP multicast scope statistics.

Options
none—(Same as **logical-system all**) Clear multicast scope statistics.

inet—(Optional) Clear multicast scope statistics for IPv4 family addresses.

inet6—(Optional) Clear multicast scope statistics for IPv6 family addresses.

interface *interface-name*—(Optional) Clear multicast scope statistics on a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

Related Documentation

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear multicast scope

```
user@host> clear multicast scope
```

clear multicast sessions

Syntax
clear multicast sessions
<logical-system (all | *logical-system-name*)>
<*regular-expression*>

Syntax (J-EX Series Switch)
clear multicast sessions
<*regular-expression*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear IP multicast sessions.

Options
none—(Same as **logical-system all**) Clear multicast sessions.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Clear only multicast sessions that contain the specified regular expression.

Required Privilege Level
clear

Related Documentation

```
user@host> clear multicast sessions
```

clear multicast statistics

Syntax

clear multicast statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear multicast statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear IP multicast statistics.

Options

none—Clear multicast statistics for all supported address families on all interfaces.

inet—(Optional) Clear multicast statistics for IPv4 family addresses.

inet6—(Optional) Clear multicast statistics for IPv6 family addresses.

instance *instance-name*—(Optional) Clear multicast statistics for the specified instance.

interface *interface-name*—(Optional) Clear multicast statistics on a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

clear pim join

Syntax

clear pim join
<*group-address*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear pim join
<*group-address*>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear the Protocol Independent Multicast (PIM) join and prune states.

Options

none—Clear the PIM join and prune states for all groups, family addresses, and instances.

group-address—(Optional) Clear the PIM join and prune states for a group address.

inet | inet6—(Optional) Clear the PIM join and prune states for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear the join and prune states for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim join** command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level

clear

Related Documentation

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear pim join

```
user@host> clear pim join
```

clear pim register

Syntax

clear pim register
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear pim register
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Protocol Independent Multicast (PIM) register message counters.

Options

none—Clear PIM register message counters for all family addresses, instances, and interfaces.

inet | inet6—(Optional) Clear PIM register message counters for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear register message counters for a specific PIM-enabled routing instance.

interface *interface-name*—(Optional) Clear PIM register message counters for a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim register** command cannot be used to clear the PIM register state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level

clear

clear pim statistics

Syntax

clear pim statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear pim statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Protocol Independent Multicast (PIM) statistics.

Options

none—Clear PIM statistics for all family addresses, instances, and interfaces.

inet | inet6—(Optional) Clear PIM statistics for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear statistics for a specific PIM-enabled routing instance.

interface *interface-name*—(Optional) Clear PIM statistics for a specific interface.

logical-system (all | *logical-system-name)*—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim statistics** command cannot be used to clear the PIM statistics on a backup Routing Engine when nonstop active routing is enabled.

mtrace

Syntax mtrace *source*
<routing-instance *routing-instance-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display trace information about an IP multicast path.

Options *source*—Source hostname or address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

Additional Information The **mtrace** command for multicast traffic is similar to the **traceroute** command used for unicast traffic. Unlike **traceroute**, **mtrace** traces traffic backwards, from the receiver to the source.

Required Privilege Level view

List of Sample Output **mtrace source on page 1133**

Output Fields Table 116 on page 1132 describes the output fields for the **mtrace** command. Output fields are listed in the approximate order in which they appear.

Table 116: mtrace Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

Sample Output

mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

mtrace from-source

Syntax

mtrace from-source source *source*
<brief | detail>
<extra-hops *extra-hops*>
<group *group*>
<interval *interval*>
<loop>
<max-hops *max-hops*>
<max-queries *max-queries*>
<multicast-response | unicast-response>
<no-resolve>
<no-router-alert>
<response *response*>
<routing-instance *routing-instance-name*>
<ttl *ttl*>
<wait-time *wait-time*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, the Junos OS returns additional information, such as packet rates and losses.

Options

brief | detail—(Optional) Display the specified level of output.

extra-hops *extra-hops*—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

group *group*—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

interval *interval*—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

loop—(Optional) Loop indefinitely, displaying rate and loss statistics.

max-hops *max-hops*—(Optional) Maximum hops to trace toward source. The range of values is **0** through **255**. The default value is **32** hops.

max-queries *max-queries*—(Optional) Maximum number of query attempts for any hop. The range of values is **1** through **32**. The default is **3**.

multicast-response—(Optional) Always request the response using multicast.

no-resolve—(Optional) Do not attempt to display addresses symbolically.

no-router-alert—(Optional) Do not use the router-alert IP option.

response *response*—(Optional) Send trace response to a host or multicast address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

source *source*—Source hostname or address.

ttl *ttl*—(Optional) IP time-to-live (TTL) value. You can specify a number between **0** and **255**. Local queries to the multicast group use a value of **1**. Otherwise, the default value is **127**.

unicast-response—(Optional) Always request the response using unicast.

wait-time *wait-time*—(Optional) Number of seconds to wait for a response. The default value is **3**.

List of Sample Output **mtrace from-source on page 1136**

Output Fields Table 117 on page 1135 describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

Table 117: mtrace from-source Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.
source	Source address.
Response Dest	Response destination address.
Overall	Average packet rate for all traffic at each hop.
Packet Statistics for Traffic From	Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop.

Table 117: mtrace from-source Output Fields *(continued)*

Field Name	Field Description
Receiver	IP address receiving the multicast.
Query source	IP address sending the mtrace query.

Sample Output

mtrace from-source

```
user@host> mtrace from-source source 192.1.4.2 group 225.1.1.1
Mtrace from 192.1.4.2 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.

Waiting to accumulate statistics...Results after 10 seconds:

```

mtrace monitor

Syntax mtrace monitor

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Listen passively for IP multicast responses.To exit **mtrace monitor**, type Ctrl+c.

Options none—Trace the master instance.

Required Privilege Level view

List of Sample Output **mtrace monitor on page 1137**

Output Fields Table 118 on page 1137 describes the output fields for the **mtrace monitor** command. Output fields are listed in the approximate order in which they appear.

Table 118: mtrace monitor Output Fields

Field Name	Field Description
Mtrace query at	Date and time of the query.
by	Address of the host issuing the query.
resp to	Response destination.
qid	Query ID number.
packet from...to	IP address of the query source and default group destination.
from...to	IP address of the multicast source and the response address.
via group	IP address of the group to trace.
mxhop	Maximum hop setting.

Sample Output

mtrace monitor

```
user@host> mtrace monitor
Mtrace query at Oct 22 13:36:14 by 192.1.3.2, resp to 224.0.1.32, qid 74a5b8
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:17 by 192.1.3.2, resp to 224.0.1.32, qid 1d07ba
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:20 by 192.1.3.2, resp to same, qid 2fea1d
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)
```

```
Mtrace query at Oct 22 13:36:30 by 192.1.3.2, resp to same, qid 7c88ad
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)
```

mtrace to-gateway

Syntax

mtrace to-gateway gateway *gateway*
<brief | detail>
<extra-hops *extra-hops*>
<group *group*>
<interface *interface-name*>
<interval *interval*>
<loop>
<max-hops *max-hops*>
<max-queries *max-queries*>
<multicast-response | unicast-response>
<no-resolve>
<no-router-alert>
<response *response*>
<routing-instance *routing-instance-name*>
<ttl *ttl*>
<unicast-response>
<wait-time *wait-time*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display trace information about a multicast path from this router or switch to a gateway router or switch.

Options

gateway *gateway*—Send the trace query to a gateway multicast address.

brief | detail—(Optional) Display the specified level of output.

extra-hops *extra-hops*—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between **0** and **255**.

group *group*—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

interface *interface-name*—(Optional) Source address for sending the trace query.

interval *interval*—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10**.

loop—(Optional) Loop indefinitely, displaying rate and loss statistics.

max-hops *max-hops*—(Optional) Maximum hops to trace toward the source. You can specify a number between **0** and **255**.. The default value is **32**.

max-queries *max-queries*—(Optional) Maximum number of query attempts for any hop. You can specify a number between **0** and **255**.. The default value is **3**.

multicast-response—(Optional) Always request the response using multicast.

no-resolve—(Optional) Do not attempt to display addresses symbolically.

no-router-alert—(Optional) Do not use the router-alert IP option.

response *response*—(Optional) Send trace response to a host or multicast address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

ttl *ttl*—(Optional) IP time-to-live value. You can specify a number between **0** and **225**. Local queries to the multicast group use TTL **1**. Otherwise, the default value is **127**.

unicast-response—(Optional) Always request the response using unicast.

wait-time *wait-time*—(Optional) Number of seconds to wait for a response. The default value is **3**.

Required Privilege Level view

List of Sample Output **mtrace to-gateway on page 1140**

Output Fields Table 119 on page 1140 describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

Table 119: mtrace to-gateway Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

Sample Output

mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief

Mrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerA.lab.mycompany.net (192.1.1.2)  PIM  thresh^ 1
 -2  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
```

```
 -3  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

show igmp group

Syntax
show igmp group
<brief | detail>
<*group-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show igmp group
<brief | detail>
<*group-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Internet Group Management Protocol (IGMP) group membership information.

Options
none—Display standard information about membership for all IGMP groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display group membership for the specified IP address only.

logical-system (all | *logical-system-name)*—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

Output Fields
Table 120 on page 1142 describes the output fields for the **show igmp group** command. Output fields are listed in the approximate order in which they appear.

Table 120: show igmp group Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface that received the IGMP membership report. A name of **local** indicates that the local routing device joined the group itself.	All levels
Group	Group address.	All levels
Group Mode	Mode the SSM group is operating in: **Include** or **Exclude**.	All levels
Source	Source address.	All levels

Table 120: show igmp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
Source timeout	Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.	**detail**
Last reported by	Address of the host that last reported membership in this group.	All levels
Timeout	Time remaining until the group membership is removed.	**brief none**
Group timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	**detail**
Type	Type of group membership: • **Dynamic**—Host reported the membership. • **Static**—Membership is configured.	All levels

Sample Output

show igmp group (Include Mode)

```
user@host> show igmp group

show igmp interface

Syntax
show igmp interface
<brief | detail>
<*interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show igmp interface
<brief | detail>
<*interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about Internet Group Management Protocol (IGMP)-enabled interfaces.

Options
none—Display standard information about all IGMP-enabled interfaces.

brief | detail—(Optional) Display the specified level of output.

interface-name—(Optional) Display information about the specified IGMP-enabled interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show igmp interface brief on page 1148
show igmp interface detail on page 1148

Output Fields
Table 121 on page 1146 describes the output fields for the **show igmp interface** command. Output fields are listed in the approximate order in which they appear.

Table 121: show igmp interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
State	State of the interface: **Up** or **Down**.	All levels
Querier	Address of the routing device that has been elected to send membership queries.	All levels
Timeout	How long until the IGMP querier is declared to be unreachable, in seconds.	All levels
Version	IGMP version being used on the interface: **1** , **2** , or **3**.	All levels

Table 121: show igmp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Groups	Number of groups on the interface.	All levels
Immediate Leave	State of the immediate leave option: • **On**—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface. • **Off**—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.	All levels
Promiscuous Mode	State of the promiscuous mode option: • **On**—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces. • **Off**—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.	All levels
Passive	State of the passive mode option: • **On**—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves. • **Off**—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves. The **passive** statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the **on** state declaration: • **send-general-query**—The interface sends general queries. • **send-group-query**—The interface sends group-specific and group-source-specific queries. • **allow-receive**—The interface receives control traffic	All levels
OIF map	Name of the OIF map associated to the interface.	All levels
SSM map	Name of the source-specific multicast (SSM) map (if configured) used on the interface.	All levels
Configured Parameters	Information configured by the user: • **IGMP Query Interval**—Interval (in seconds) at which this router sends membership queries when it is the querier. • **IGMP Query Response Interval**—Time (in seconds) that the router waits for a report in response to a general query. • **IGMP Last Member Query Interval**—Time (in seconds) that the router waits for a report in response to a group-specific query. • **IGMP Robustness Count**—Number of times the router retries a query.	All levels

Table 121: show igmp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Derived Parameters	Derived information: • **IGMP Membership Timeout**—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. • **IGMP Other Querier Present Timeout**—Time (in seconds) that the router waits for the IGMP querier to send a query.	All levels

Sample Output

show igmp interface

```
user@host> show igmp interface
Interface: at-0/3/1.0
    Querier: 10.111.30.1
    State:         Up Timeout:    None Version:  2 Groups:      4
Interface: so-1/0/0.0
    Querier: 10.111.10.1
    State:         Up Timeout:    None Version:  2 Groups:      2
Interface: so-1/0/1.0
    Querier: 10.111.20.1
    State:         Up Timeout:    None Version:  2 Groups:      4
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see **show igmp interface on page 1148**.

show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see **show igmp interface on page 1148**.

show igmp statistics

Syntax

show igmp statistics
<brief | detail>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show igmp statistics
<brief | detail>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display Internet Group Management Protocol (IGMP) statistics.

Options

none—Display IGMP statistics for all interfaces.

brief | detail—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display IGMP statistics about the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show igmp statistics interface on page 1151

Output Fields

Table 122 on page 1149 describes the output fields for the **show igmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 122: show igmp statistics Output Fields

Field Name	Field Description
IGMP packet statistics	Heading for IGMP packet statistics for all interfaces or for the specified interface name.

Table 122: show igmp statistics Output Fields *(continued)*

Field Name	Field Description
IGMP Message type	Summary of IGMP statistics: • **Membership Query**—Number of membership queries sent and received. • **V1 Membership Report**—Number of version 1 membership reports sent and received. • **DVMRP**—Number of DVMRP messages sent or received. • **PIM V1**—Number of PIM version 1 messages sent or received. • **Cisco Trace**—Number of Cisco trace messages sent or received. • **V2 Membership Report**—Number of version 2 membership reports sent or received. • **Group Leave**—Number of group leave messages sent or received. • **Mtrace Response**—Number of Mtrace response messages sent or received. • **Mtrace Request**—Number of Mtrace request messages sent or received. • **Domain Wide Report**—Number of domain-wide reports sent or received. • **V3 Membership Report**—Number of version 3 membership reports sent or received. • **Other Unknown types**—Number of unknown message types received. • **IGMP v3 unsupported type**—Number of messages received with unknown and unsupported IGMP version 3 message types. • **IGMP v3 source required for SSM**—Number of IGMP version 3 messages received that contained no source. • **IGMP v3 mode not applicable for SSM**—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM).
Received	Number of messages received.
Sent	Number of messages sent.
Rx errors	Number of received packets that contained errors.
IGMP Global Statistics	Summary of IGMP statistics for all interfaces. • **Bad Length**—Number of messages received with length errors so severe that further classification could not occur. • **Bad Checksum**—Number of messages received with a bad IP checksum. No further classification was performed. • **Bad Receive If**—Number of messages received on an interface not enabled for IGMP. • **Rx non-local**—Number of messages received from senders that are not local. • **Timed out**—Number of groups that timed out as a result of not receiving an explicit leave message. • **Rejected Report**—Number of reports dropped because of the IGMP group policy. • **Total Interfaces**—Number of interfaces configured to support IGMP.

Sample Output

show igmp statistics

```
user@host> show igmp statistics
IGMP packet statistics for all interfaces
IGMP Message type      Received       Sent  Rx errors
Membership Query           8883        459          0
V1 Membership Report          0          0          0
DVMRP                         0          0          0
PIM V1                        0          0          0
```

```
Cisco Trace                    0          0          0
V2 Membership Report           0          0          0
Group Leave                    0          0          0
Mtrace Response                0          0          0
Mtrace Request                 0          0          0
Domain Wide Report             0          0          0
V3 Membership Report           0          0          0
Other Unknown types                                  0
IGMP v3 unsupported type                             0
IGMP v3 source required for SSM                      0
IGMP v3 mode not applicable for SSM                  0

IGMP Global Statistics
Bad Length                     0
Bad Checksum                   0
Bad Receive If                 0
Rx non-local                1227
Timed out                      0
Rejected Report                0
Total Interfaces               2
```

show igmp statistics interface

```
user@host> show igmp statistics interface fe-1/0/1.0
IGMP interface packet statistics for fe-1/0/1.0
IGMP Message type      Received       Sent  Rx errors
Membership Query              0        230          0
V1 Membership Report          0          0          0
```

Output Fields

Table 123 on page 1152 lists the output fields for the **show igmp-snooping membership** command. Output fields are listed in the approximate order in which they appear.

Table 123: show igmp-snooping membership Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Interfaces	Interfaces that are members of the listed multicast group.	All
Tag	Numerical identifier of the VLAN.	**detail**

Table 123: show igmp-snooping membership Output Fields *(continued)*

Field Name	Field Description	Level of Output
Router interfaces	List of information about multicast router interfaces: • Name of the multicast router interface. • **static** or **dynamic**—Whether the multicast router interface is static or dynamic. • **Uptime**—For static interfaces, amount of time since the interface was configured as a multicast router interface. For dynamic interfaces, amount of time since the first query was received on interface. • **timeout**—Query timeout in seconds.	**detail**
Group	IP multicast address of the multicast group. The following information is provided for the multicast group: • Name of the interface belonging to the multicast group. • **timeout**—Time (in seconds) left until the entry for the multicast group is removed. • **Last reporter**—Last host to report membership for the multicast group. • **Receiver count**—Number of interfaces that have membership in a multicast group. • **Flags**—IGMP version of the host sending a join message. • **Include source**—Source addresses from which multicast streams are allowed based on IGMPv3 reports. Shown only for IGMPv3 joins.	**detail**

Sample Output

show igmp-snooping membership

```
user@switch> show igmp-snooping membership
VLAN: vlan24
    224.1.1.1      *
        Interfaces: ge-0/0/0.0
    224.1.1.100    *
        Interfaces: ge-0/0/0.0
    225.1.1.100    *
        Interfaces: ge-0/0/0.0
```

show igmp-snooping membership detail

```
user@switch> show igmp-snooping membership detail
VLAN: vlan24 Tag: 24 (Index: 3)
  Router interfaces:
    ge-0/0/8.0 dynamic Uptime: 00:08:35 timeout: 254
  Group: 224.1.1.1
    ge-0/0/0.0 timeout: 223 Receiver count: 1, Flags: <V2-hosts Static>
  Group: 224.1.1.100
    ge-0/0/0.0 timeout: 170 Last reporter: 10.10.1.10 Receiver count: 1, Flags:

Output Fields
Table 126 on page 1158 lists the output fields for the **show igmp-snooping vlans** command. Output fields are listed in the approximate order in which they appear.

Table 126: show igmp-snooping vlans Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All levels
Interfaces	Number of interfaces in the VLAN.	All levels
Groups	Number of groups in the VLAN	All levels
MRouters	Number of multicast routers associated with the VLAN.	All levels
Receivers	Number of VLAN interfaces with a receiver for any group. Indicates how many VLAN interfaces would receive data because of IGMP membership.	All levels
RxVlans	Number of MVR receiver VLANs configured for that MVR source VLAN.	All levels
Tag	Numerical identifier of the VLAN.	Detail
vlan-interface	Internal VLAN interface identifier.	Detail

Table 126: show igmp-snooping vlans Output Fields *(continued)*

Field Name	Field Description	Level of Output
Membership timeout	Membership timeout value.	Detail
Querier timeout	Timeout value for interfaces dynamically marked as router interfaces (interfaces that receive queries). When the querier timeout is reached, the switch marks the interface as a host interface.	Detail
Interface	Name of the interface.	Detail
Reporters	Number of dynamic groups on an interface.	Detail

Sample Output

show igmp-snooping vlans

```
user@switch> show igmp-snooping vlans
VLAN           Interfaces Groups MRouters Receivers RxVlans

show multicast flow-map
<brief | detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display configuration information about IP multicast flow maps.

Options
none—Display configuration information about IP multicast flow maps on all systems.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show multicast flow-map on page 1161
show multicast flow-map detail on page 1161

Output Fields
Table 127 on page 1160 describes the output fields for the **show multicast flow-map** command. Output fields are listed in the approximate order in which they appear.

Table 127: show multicast flow-map Output Fields

Field Name	Field Description	Levels of Output
Name	Name of the flow map.	All levels
Policy	Name of the policy associated with the flow map.	All levels
Cache-timeout	Cache timeout value assigned to the flow map.	All levels
Bandwidth	Bandwidth setting associated to the flow map.	All levels
Adaptive	Whether or not adaptive mode is enabled for the flow map.	none
Flow-map	Name of the flow map.	**detail**
Adaptive Bandwidth	Whether or not adaptive mode is enabled for the flow map.	**detail**
Redundant Sources	Redundant sources defined for the same destination group.	**detail**

Sample Output

show multicast flow-map

```
user@host> show multicast flow-map
Instance: master
Name            Policy                  Cache timeout        Bandwidth Adaptive
map2            policy2                         never          2000000 no
map1            policy1                    60 seconds          2000000 no
```

Sample Output

show multicast flow-map detail

```
user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
    Policy:             policy1
    Cache Timeout:      600 seconds
    Bandwidth:          2000000
    Adaptive Bandwidth: yes
    Redundant Sources:  11.11.11.11
    Redundant Sources:  11.11.11.12
    Redundant Sources:  11.11.11.13
```

show multicast interface

Syntax
show multicast interface
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show multicast interface

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display bandwidth information about IP multicast interfaces.

Options
none—Display all interfaces that have multicast configured.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show multicast interface on page 1163

Output Fields
Table 128 on page 1162 describes the output fields for the **show multicast interface** command. Output fields are listed in the approximate order in which they appear.

Table 128: show multicast interface Output Fields

Field Name	Field Description
Interface	Name of the multicast interface.
Maximum bandwidth (bps)	Maximum bandwidth setting, in bits per second, for this interface.
Remaining bandwidth (bps)	Amount of bandwidth, in bits per second, remaining on the interface.
Mapped bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface. NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface. This field does not appear in the output when the no QoS adjustment feature is disabled.
Local bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface. NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface. This field does not appear in the output when the no QoS adjustment feature is disabled.

Table 128: show multicast interface Output Fields *(continued)*

Field Name	Field Description
Reverse OIF mapping	State of the reverse OIF mapping feature (**on** or **off**). NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
Reverse OIF mapping no QoS adjustment	State of the no QoS adjustment feature (**on** or **off**) for interfaces that are using reverse OIF mapping. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
Leave timer	Amount of time a mapped interface remains active after the last mapping ends. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
No QoS adjustment	State (**on**) of the no QoS adjustment feature when this feature is enabled. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.

Sample Output

show multicast interface

```
user@host> show multicast interface
Interface               Maximum bandwidth (bps) Remaining bandwidth (bps)
fe-0/0/3                              10000000                          0
fe-0/0/3.210                          10000000                    -2000000
fe-0/0/3.220                         100000000                  100000000
fe-0/0/3.230                          20000000                   18000000
fe-0/0/2.200                         100000000                  100000000
```

show multicast mrinfo

Syntax show multicast mrinfo
<host>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display configuration information about IP multicast networks, including neighboring multicast router addresses.

Options none—Display configuration information about all multicast networks.

host—(Optional) Display configuration information about a particular host. Replace *host* with a hostname or IP address.

Required Privilege Level view

List of Sample Output **show multicast mrinfo on page 1164**

Output Fields Table 129 on page 1164 describes the output fields for the **show multicast mrinfo** command. Output fields are listed in the approximate order in which they appear.

Table 129: show multicast mrinfo Output Fields

Field Name	Field Description
source-address	Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.
ip-address-1—>ip-address-2	Queried router interface address and directly attached neighbor interface address, respectively.
(*name* or *ip-address*)	Name or IP address of neighbor.

[*metric/threshold/type/flags*]	Neighbor's multicast profile:
	• *metric*—Always has a value of **1**, because **mrinfo** queries the directly connected interfaces of a device.
	• *threshold*—Multicast threshold time-to-live (TTL). The range of values is **0** through **255**.
	• *type*—Multicast connection type: **pim** or **tunnel**.
	• *flags*—Flags for this route:
	  ◦ **querier**—Queried router is the designated router for the neighboring session.
	  ◦ **leaf**—Link is a leaf in the multicast network.
	  ◦ **down**—Link status indicator.

Sample Output

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
```

```
10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

show multicast next-hops

Syntax

show multicast next-hops
<brief | detail>
<*identifier-number*>
<inet | inet6>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show multicast next-hops
<brief | detail>
<*identifier-number*>
<inet | inet6>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
detail option display of next-hop ID number introduced in Junos OS Release 11.1 for J-EX Series switches.

Description

Display the entries in the IP multicast next-hop table.

Options

none—Display standard information about all entries in the multicast next-hop table for all supported address families.

brief | detail—(Optional) Display the specified level of output.

When you include the **detail** option on J-EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form **fe-0/1/2.0-(1048574)** where **1048574** is the next-hop ID number.

identifier-number—(Optional) Show a particular next hop by ID number. The range of values is **1** through **65,535**.

inet | inet6—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show multicast next-hops on page 1167
show multicast next-hops brief on page 1167
show multicast next-hops detail on page 1167

Output Fields

Table 130 on page 1166 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 130: show multicast next-hops Output Fields

Field Name	Field Description
ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.

Table 130: show multicast next-hops Output Fields *(continued)*

Field Name	Field Description
Refcnt	Number of cache entries that are using this next hop.
KRefcount	Kernel reference count for the next hop.
Downstream interface	Interface names associated with each multicast next-hop ID.

Sample Output

show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
262142          4          2 so-1/0/0.0
262143          2          1 mt-1/1/0.49152
262148          2          1 mt-1/1/0.32769

Family: INET6
```

show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see **show multicast next-hops on page 1167**.

show multicast next-hops detail

```
user@host> show multicast next-hops detail
Family: INET
ID          Refcount KRefcount Downstream interface
1048577            2         1 fe-0/1/2.0-(1048574)
                               ge-0/2/3.0-(1048576)
```

show multicast pim-to-igmp-proxy

Syntax
show multicast pim-to-igmp-proxy
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show multicast pim-to-igmp-proxy
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display configuration information about PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy.

Options
none—Display configuration information about PIM-to-IGMP message translation for all routing instances.

instance *instance-name*—(Optional) Display configuration information about PIM-to-IGMP message translation for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show multicast pim-to-igmp-proxy on page 1168
show multicast pim-to-igmp-proxy instance on page 1169

Output Fields
Table 131 on page 1168 describes the output fields for the **show multicast pim-to-igmp-proxy** command. Output fields are listed in the order in which they appear.

Table 131: show multicast pim-to-igmp-proxy Output Fields

Field Name	Field Description
Proxy state	State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: **enabled** or **disabled**.
interface-name	Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured.

Sample Output

show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

show multicast pim-to-mld-proxy

Syntax
show multicast pim-to-mld-proxy
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show multicast pim-to-mld-proxy
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display configuration information about PIM-to-MLD message translation, also known as PIM-to-MLD proxy.

Options
none—Display configuration information about PIM-to-MLD message translation for all routing instances.

instance *instance-name*—(Optional) Display configuration information about PIM-to-MLD message translation for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show multicast pim-to-mld-proxy on page 1170
show multicast pim-to-mld-proxy instance on page 1171

Output Fields
Table 132 on page 1170 describes the output fields for the **show multicast pim-to-mld-proxy** command. Output fields are listed in the order in which they appear.

Table 132: show multicast pim-to-mld-proxy Output Fields

Field Name	Field Description
Proxy state	State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: **enabled** or **disabled**.
interface-name	Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured.

Sample Output

show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

show multicast route

Syntax

show multicast route
<brief | detail | extensive>
<active | all | inactive>
<group *group*>
<inet | inet6>
<instance *instance name*>
<logical-system (all | *logical-system-name*)>
<*regular-expression*>
<source-prefix *source-prefix*>

Syntax (J-EX Series Switch)

show multicast route
<brief | detail | extensive>
<active | all | inactive>
<group *group*>
<inet | inet6>
<instance *instance name*>
<*regular-expression*>
<source-prefix *source-prefix*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

Options

none—Display standard information about all entries in the multicast forwarding table for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

active | all | inactive—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

group *group*—(Optional) Display the cache entries for a particular group.

inet | inet6—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

source-prefix *source-prefix*—(Optional) Display the cache entries for a particular source prefix.

Required Privilege Level view

List of Sample Output
show multicast route on page 1174
show multicast route brief on page 1174
show multicast route detail on page 1174
show multicast route extensive on page 1175
show multicast route instance <instance-name> extensive on page 1175

Output Fields Table 133 on page 1173 describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

Table 133: show multicast route Output Fields

Field Name	Field Description	Level of Output
Address family	IPv4 address family (**INET**) or IPv6 address family (**INET6**).	All levels
Group	Group address.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table.	All levels
Upstream interface	Name of the interface on which the packet with this source prefix is expected to arrive.	All levels
Downstream interface list	List of interface names to which the packet with this source prefix is forwarded.	All levels
Session description	Name of the multicast session.	**detail extensive**
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays **Forwarding statistics are not available**.	**detail extensive**
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the **show multicast nexthops** command.	**detail extensive**
Upstream protocol	Protocol running on the interface on which the packet with this source prefix is expected to arrive.	**detail extensive**
Route state	Whether the group is **Active** or **Inactive**.	**extensive**
Forwarding state	Whether the prefix is pruned or forwarding.	**extensive**
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of **never** indicates a permanent forwarding entry.	**extensive**
Wrong incoming interface notifications	Number of times that the upstream interface was not available.	**extensive**

Sample Output

show multicast route

```
user@host> show multicast route
Family: INET

Group: 228.0.0.0

show multicast rpf

Syntax

show multicast rpf
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*prefix*>
<summary>

Syntax (J-EX Series Switch)

show multicast rpf
<inet | inet6>
<instance *instance-name*>
<*prefix*>
<summary>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about multicast reverse-path-forwarding (RPF) calculations.

Options

none—Display RPF calculation information for all supported address families.

inet | inet6—(Optional) Display the RPF calculation information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about multicast RPF calculations for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Display the RPF calculation information for the specified prefix.

summary—(Optional) Display summary of all multicast RPF information.

Required Privilege Level

show multicast scope

Syntax

show multicast scope
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show multicast scope
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display administratively scoped IP multicast information.

Options

none—Display standard information about administratively scoped multicast information for all supported address families in all routing instances.

inet | inet6—(Optional) Display scoped multicast information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display administratively scoped information for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show multicast scope inet on page 1182
show multicast scope inet6 on page 1182

Output Fields

Table 135 on page 1181 describes the output fields for the **show multicast scope** command. Output fields are listed in the approximate order in which they appear.

Table 135: show multicast scope Output Fields

Field Name	Field Description
Scope name	Name of the multicast scope.
Group Prefix	Range of multicast groups that are scoped.
Interface	Interface that is the boundary of the administrative scope.
Resolve Rejects	Number of kernel resolve rejects.

Sample Output

show multicast scope inet

```
user@host> show multicast scope inet

                                                                Resolve
Scope name           Group Prefix       Interface               Rejects
232-net              232.232.0.0/16     fe-0/0/0.1                    0
local                239.255.0.0/16     fe-0/0/0.1                    0
```

show multicast scope inet6

```
user@host> show multicast scope inet6

                                                                Resolve
Scope name           Group Prefix       Interface               Rejects
local                ff05::/16          fe-0/0/0.1                    0
larry                ff05::1234/128     fe-0/0/0.1                    0
```

show multicast sessions

Syntax
show multicast sessions
<brief | detail | extensive>
<logical-system (all | *logical-system-name*)>
<*regular-expression*>

Syntax (J-EX Series Switch)
show multicast sessions
<brief | detail | extensive>
<*regular-expression*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about announced IP multicast sessions.

Options
none—Display standard information about all multicast sessions for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Display information about announced sessions that match a UNIX-style regular expression.

show multicast usage

Syntax

show multicast usage
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show multicast usage
<brief | detail>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display usage information about the 10 most active Distance Vector Multicast Routing Protocol (DVMRP) or Protocol Independent Multicast (PIM) groups.

Options

none—Display multicast usage information for all supported address families for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display usage information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about the most active DVMRP or PIM groups for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Output Fields

Table 137 on page 1185 describes the output fields for the **show multicast usage** command. Output fields are listed in the approximate order in which they appear.

Table 137: show multicast usage Output Fields

Field Name	Field Description
Instance	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
Group	Group address.

Table 137: show multicast usage Output Fields *(continued)*

Field Name	Field Description
Sources	Number of sources.
Packets	Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays **unavailable**.
Bytes	Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays **unavailable**.
Prefix	IP address.
/len	Prefix length.
Groups	Number of multicast groups.

Sample Output

show multicast usage

```
user@host> show multicast usage
Group           Sources Packets             Bytes
228.0.0.0       1       52847               4439148
239.1.1.1       2       13450               1125530

Prefix          /len Groups Packets             Bytes

show pim bootstrap

Syntax

show pim bootstrap
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim bootstrap
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.

Options

none—Display PIM bootstrap router information for all routing instances.

instance *instance-name*—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show pim bootstrap on page 1189
show pim bootstrap instance on page 1189

Output Fields

Table 138 on page 1188 describes the output fields for the **show pim bootstrap** command. Output fields are listed in the approximate order in which they appear.

Table 138: show pim bootstrap Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
BSR	Bootstrap router.
Pri	Priority of the routing device to be elected to be the bootstrap router.
Local address	Local routing device's address.
Pri	Local routing device's address priority to be elected as the bootstrap router.
State	Local routing device's election state: **Candidate**, **Elected**, or **Ineligible**.
Timeout	How long until the local routing device declares the bootstrap router to be unreachable, in seconds.

Sample Output

show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master

BSR                    Pri Local address           Pri State      Timeout
None                     0 10.255.71.46              0 InEligible       0

```

show pim interfaces

Syntax
show pim interfaces
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show pim interfaces
<inet | inet6>
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.

Options
none—Display interface information for all family addresses for all routing instances.

inet | inet6—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about interfaces for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show pim interfaces inet6 on page 1192

Output Fields
Table 139 on page 1190 describes the output fields for the **show pim interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 139: show pim interfaces Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
Name	Interface name.
State	State of the interface. The state also is displayed in the **show interfaces** command.

Table 139: show pim interfaces Output Fields *(continued)*

Field Name	Field Description
Mode	PIM mode running on the interface: • **Sparse**—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic. • **Dense**—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). • **Sparse-Dense**—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as **dense** is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as **sparse** is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules.
IP	Version number of the address family on the interface: **4** (IPv4) or **6** (IPv6).
V	PIM version running on the interface: **1** or **2**.
State	State of PIM on the interface: • **DR**—Designated router. • **NotDR**—Not the designated router. • **P2P**—Point to point.
NbrCnt	Number of neighbors that have been seen on the interface.
JoinCnt(sg)	Number of (s,g) join messages that have been seen on the interface.
JointCnt(*g)	Number of (*,g) join messages that have been seen on the interface.
DR address	Address of the designated router.

Sample Output

show pim interfaces

```
user@host> show pim interfaces
Instance: PIM.master

Output Fields

Table 140 on page 1194 describes the output fields for the **show pim join** command. Output fields are listed in the approximate order in which they appear.

Table 140: show pim join Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	**brief detail extensive summary** none
Family	Name of the address family: **inet** (IPv4) or **inet6** (IPv6).	**brief detail extensive summary** none
Route type	Type of multicast route: (S,G) or (*,G).	**summary**
Route count	Number of (S,G) routes and number of (*,G) routes.	**summary**
R	Rendezvous Point Tree	**brief detail extensive** none
S	Sparse	**brief detail extensive** none
W	Wildcard	**brief detail extensive** none
Group	Group address.	**brief detail extensive** none
Source	Multicast source: • ***** (wildcard value) • ***ipv4-address*** • ***ipv6-address***	**brief detail extensive** none
RP	Rendezvous point for the PIM group.	**brief detail extensive** none
Flags	PIM flags: • **dense**—Dense mode entry. • **rptree**—Entry is on the rendezvous point tree. • **sparse**—Sparse mode entry. • **spt**—Entry is on the shortest-path tree for the source. • **wildcard**—Entry is on the shared tree.	**brief detail extensive** none
Upstream interface	RPF interface toward the source address for the source-specific state **(S, G)** or toward the rendezvous point (RP) address for the non-source-specific state **(*, G)**.	**brief detail extensive** none
Upstream neighbor	Information about the upstream neighbor: **Direct**, **Local**, **Unknown**, or a specific IP address.	**extensive**

Table 140: show pim join Output Fields *(continued)*

Field Name	Field Description	Level of Output
Upstream state	Information about the upstream interface: • **Join to RP**—Sending a join to the rendezvous point. • **Join to Source**—Sending a join to the source. • **Local RP**—Sending neither joins nor prunes toward the RP, because this router is the rendezvous point. • **Local Source**—Sending neither joins nor prunes toward the source, because the source is locally attached to this routing device. • **Prune to RP**—Sending a prune to the rendezvous point. • **Prune to Source**—Sending a prune to the source.	**extensive**
Downstream neighbors	Information about downstream interfaces: • **Interface**—Interface name for the downstream neighbor. NOTE: A pseudo PIM-SM interface appears for all IGMP-only interfaces. • **Interface address**—Address of the downstream neighbor. • **State**—Information about the downstream neighbor: **join** or **prune**. • **Flags**—PIM join flags: **R (RPtree),S (Sparse)**, **W (Wildcard)**, or **zero**.	**extensive**
Assert Timeout	Length of time between assert cycles on downstream interface. Not displayed if assert timer is null.	**extensive**
Timeout	Time remaining until the downstream join state is updated (in seconds). If the downstream join state is not updated before this keepalive timer reaches zero, the entry is deleted. If there is a directly connected host, **Timeout** is **Infinity**.	**extensive**

Sample Output

show pim join summary

```
user@host> show pim join summary

show pim neighbors

Syntax

show pim neighbors
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim neighbors
<brief | detail>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Protocol Independent Multicast (PIM) neighbors.

Options

none—(Same as **brief**) Display standard information about PIM neighbors for all supported family addresses for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information about PIM neighbors for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about neighbors for the specified PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show pim neighbors on page 1201
show pim neighbors brief on page 1201
show pim neighbors instance on page 1201
show pim neighbors detail on page 1201
show pim neighbors detail (with BFD) on page 1201

Output Fields

Table 141 on page 1199 describes the output fields for the **show pim neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 141: show pim neighbors Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Interface	Interface through which the neighbor is reachable.	All levels
Neighbor addr	Address of the neighboring PIM routing device.	All levels

Table 141: show pim neighbors Output Fields *(continued)*

Field Name	Field Description	Level of Output
IP	IP version: **4** or **6**.	All levels
V	PIM version running on the neighbor: **1** or **2**.	All levels
Mode	PIM mode of the neighbor: **Sparse**, **Dense**, **SparseDense**, or **Unknown**. When the neighbor is running PIM version 2, this mode is always **Unknown**.	All levels
Option	Can be one or more of the following: • **B**—Bidirectional Capable. • **H**—Hello Option Holdtime. • **G**—Generation Identifier. • **P**—Hello Option DR Priority. • **L**—Hello Option LAN Prune Delay.	**brief** none
Uptime	Time the neighbor has been operational since the PIM process was last initialized, in the format ***dd*:*hh*:*mm*:*ss* ago** for less than a week and ***nwnd*:*hh*:*mm*:*ss* ago** for more than a week.	All levels
Address	Address of the neighboring PIM router.	**detail**
BFD	Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: **Enabled**, **Operational state is up**, or **Disabled**.	**detail**
Hello Option Holdtime	Time for which the neighbor is available, in seconds. The range of values is **0** through **65,535.**	**detail**
Hello Default Holdtime	Default holdtime and the time remaining if the **holdtime** option is not in the received hello message.	**detail**
Hello Option DR Priority	Designated router election priority. The range of values is **0** through **255**.	**detail**
Hello Option Generation ID	9- or 10-digit number used to tag hello messages.	**detail**
Hello Option LAN Prune Delay	Time to wait before the neighbor receives prune messages, in the format **delay** ***nnn*** **ms override** ***nnnn*** **ms**.	**detail**
Join Suppression supported	Neighbor is capable of join suppression.	**detail**
Rx Join	Information about joins received from the neighbor. • **Group**—Group addresses in the join message. • **Source**—Address of the source in the join message. • **Timeout**—Time for which the join is valid.	**detail**

Sample Output

show pim neighbors

```
user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface           IP V Mode        Option      Uptime Neighbor addr
so-1/0/0.0           4 2             HPLG      00:07:10 10.111.10.2
```

show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command.

show pim neighbors instance

```
user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface           IP V Mode        Option      Uptime Neighbor addr
at-0/3/1.0           4 2             HPLG      00:07:54 10.111.30.2
mt-1/1/0.32768       4 2             HPLG      00:07:22 10.10.47.101
so-1/0/1.0           4 2             HPLG      00:07:50 10.111.20.2
```

show pim neighbors detail

```
user@host> show pim neighbors detail
Instance: PIM.master
Interface: fe-3/0/2.0
     Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse
 Hello Option Holdtime: 65535 seconds

        Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
    Address: 192.168.11.2,        IPv4, PIM v2
        BFD: Enabled, Operational state is up
        Hello Default Holdtime: 105 seconds 104 remaining
        Hello Option DR Priority: 1
        Hello Option Generation ID: 1907549685
        Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

Interface: fe-1/0/1.0
    Address: 192.168.12.1,        IPv4, PIM v2
        BFD: Disabled
        Hello Default Holdtime: 105 seconds 80 remaining
        Hello Option DR Priority: 1
        Hello Option Generation ID: 1971554705
        Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

show pim rps

Syntax

show pim rps
<brief | detail | extensive>
<*group-address*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim rps
<brief | detail | extensive>
<*group-address*>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Protocol Independent Multicast (PIM) rendezvous points (RPs).

Options

none—Display standard information about PIM RPs for all groups and family addresses for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

group-address—(Optional) Display the RPs for a particular group. If you specify a group address, the output lists the routing device that is the RP for that group.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about RPs for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show pim rps on page 1205
show pim rps brief on page 1205
show pim rps instance on page 1206
show pim rps extensive on page 1206
show pim rps extensive (PIM Anycast RP in Use) on page 1206

Output Fields

Table 142 on page 1203 describes the output fields for the **show pim rps** command. Output fields are listed in the approximate order in which they appear.

Table 142: show pim rps Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels

Table 142: show pim rps Output Fields *(continued)*

Field Name	Field Description	Level of Output
Family	Name of the address family: **inet** (IPv4) or **inet6** (IPv6).	All levels
RP address	Address of the rendezvous point.	All levels
Type	Type of RP: • **auto-rp**—Address of the RP known through the Auto-RP protocol. • **bootstrap**—Address of the RP known through the bootstrap router protocol (BSR). • **embedded**—Address of the RP known through an embedded RP (IPv6). • **static**—Address of RP known through static configuration.	**brief** none
Holdtime	How long to keep the RP active, with time remaining, in seconds.	All levels
Timeout	How long until the local routing device determines the RP to be unreachable, in seconds.	All levels
Groups	Number of groups currently using this RP.	All levels
Group prefixes	Addresses of groups that this RP can span.	**brief** none
Learned via	Address and method by which the RP was learned.	**detail extensive**
Time Active	How long the RP has been active, in the format ***hh*:*mm*:*ss***.	**detail extensive**
Device Index	Index value of the order in which the Junos OS finds and initializes the interface.	**detail extensive**
Subunit	Logical unit number of the interface.	**detail extensive**
Interface	Either the encapsulation or the de-encapsulation logical interface, depending on whether this routing device is a designated router (DR) facing an RP router, or is the local RP, respectively.	**detail extensive**
Group Ranges	Addresses of groups that this RP spans.	**detail extensive**
Active groups using RP	Number of groups currently using this RP.	**detail extensive**
total	Total number of active groups for this RP.	**detail extensive**

Table 142: show pim rps Output Fields *(continued)*

Field Name	Field Description	Level of Output
Register State for RP	Current register state for each group: • **Group**—Multicast group address. • **Source**—Multicast source address for which the PIM register is sent or received, depending on whether this router is a designated router facing an RP router, or is the local RP, respectively: • **First Hop**—PIM-designated routing device that sent the Register message (the source address in the IP header). • **RP Address**—RP to which the Register message was sent (the destination address in the IP header). • **State**: On the designated router: ◦ **Send**—Sending Register messages. ◦ **Probe**—Sent a null register. If a Register-Stop message does not arrive in 5 seconds, the designated router resumes sending Register messages. ◦ **Suppress**—Received a Register-Stop message. The designated router is waiting for the timer to resume before changing to **Probe** state. • On the RP: ◦ **Receive**—Receiving Register messages.	**extensive**
Anycast-PIM rpset	If anycast RP is configured, the addresses of the RPs in the set.	**extensive**
Anycast-PIM local address used	If anycast RP is configured, the local address used by the RP.	**extensive**
Anycast-PIM Register State	If anycast RP is configured, the current register state for each group: • **Group**—Multicast group address. • **Source**—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively. • **Origin**—How the information was obtained: ◦ **DIRECT**—From a local attachment ◦ **MSDP**—From the Multicast Source Discovery Protocol (MSDP) ◦ **DR**—From the designated router	**extensive**

Sample Output
