show pim source

Syntax

show pim source
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*source-prefix*>

Syntax (J-EX Series Switch)

show pim source
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<*source-prefix*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.

Options

none—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

source-prefix—(Optional) Display the state for source RPF states in the given range.

Required Privilege Level

view

List of Sample Output

show pim source on page 1209
show pim source brief on page 1209
show pim source detail on page 1209

Output Fields

Table 143 on page 1208 describes the output fields for the **show pim source** command. Output fields are listed in the approximate order in which they appear.

Table 143: show pim source Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
RPF Address	Address of the source or reverse path.

Table 143: show pim source Output Fields *(continued)*

Field Name	Field Description
Prefix/length	Prefix and prefix length for the route used to reach the RPF address.
Upstream interface	RPF interface toward the source address.
Neighbor address	Address of the RPF neighbor used to reach the source address.

Sample Output

show pim source

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
    Prefix 10.255.14.144/32
    Upstream interface Local
    Upstream neighbor Local

Source 10.255.70.15
    Prefix 10.255.70.15/32
    Upstream interface so-1/0/0.0
    Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command.

show pim source detail

```
user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
    Prefix 10.255.14.144/32
    Upstream interface Local
    Upstream neighbor Local
    Active groups:228.0.0.0
        239.1.1.1
        239.1.1.1

Source 10.255.70.15
    Prefix 10.255.70.15/32
    Upstream interface so-1/0/0.0
    Upstream neighbor 10.111.10.2
    Active groups:239.1.1.1

Instance: PIM.master Family: INET6
```

show pim statistics

Syntax

show pim statistics
<inet |inet6)>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim statistics
<inet |inet6)>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display Protocol Independent Multicast (PIM) statistics.

Options

none—Display PIM statistics.

inet | inet6—(Optional) Display IPv4 or IPv6 PIM statistics.

instance *instance-name*—(Optional) Display statistics for a specific routing instance enabled by Protocol Independent Multicast (PIM).

interface *interface-name*—(Optional) Display statistics about the specified interface.

logical-system (all | *logical-system-name)*—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 144 on page 1211 describes the output fields for the **show pim statistics** command. Output fields are listed in the approximate order in which they appear.

Table 144: show pim statistics Output Fields

Field Name	Field Description
Instance	Name of the routing instance. This field only appears if you specify an interface, for example: • **inet interface *interface-name*** • **inet6 interface *interface-name*** • **interface *interface-name***
Family	Output is for IPv4 or IPv6 PIM statistics. **INET** indicates IPv4 statistics, and **INET6** indicates IPv6 statistics. This field only appears if you specify an interface, for example: • **inet interface *interface-name*** • **inet6 interface *interface-name*** • **interface *interface-name***
PIM statistics	PIM statistics for all interfaces or for the specified interface.
PIM message type	Message type for which statistics are displayed.
Received	Number of received statistics.
Sent	Number of messages sent of a certain type.
Rx errors	Number of received packets that contained errors.
V2 Hello	PIM version 2 hello packets.
V2 Register	PIM version 2 register packets.
V2 Register Stop	PIM version 2 register stop packets.
V2 Join Prune	PIM version 2 join and prune packets.
V2 Bootstrap	PIM version 2 bootstrap packets.
V2 Assert	PIM version 2 assert packets.
V2 Graft	PIM version 2 graft packets.
V2 Graft Ack	PIM version 2 graft acknowledgement packets.
V2 Candidate RP	PIM version 2 candidate RP packets.
V1 Query	PIM version 1 query packets.
V1 Register	PIM version 1 register packets.

Table 144: show pim statistics Output Fields *(continued)*

Field Name	Field Description
V1 Register Stop	PIM version 1 register stop packets.
V1 Join Prune	PIM version 1 join and prune packets.
V1 RP Reachability	PIM version 1 RP reachability packets.
V1 Assert	PIM version 1 assert packets.
V1 Graft	PIM version 1 graft packets.
V1 Graft Ack	PIM version 1 graft acknowledgement packets.
AutoRP Announce	Auto-RP announce packets.
AutoRP Mapping	Auto-RP mapping packets.
AutoRP Unknown type	Auto-RP packets with an unknown type.
Anycast Register	Auto-RP announce packets.
Anycast Register Stop	Auto-RP announce packets.
Global Statistics	Summary of PIM statistics for all interfaces.
Hello dropped on neighbor policy	Number of hello packets dropped because of a configured neighbor policy.
Unknown type	Number of PIM control packets received with an unknown type.
V1 Unknown type	Number of PIM version 1 control packets received with an unknown type.
Unknown Version	Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.
Neighbor unknown	Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.
Bad Length	Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.
Bad Checksum	Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet.
Bad Receive If	Number of PIM control packets received on an interface that does not have PIM configured.

Table 144: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Rx Bad Data	Number of PIM control packets received that contain data for TCP. Bad register packets.
Rx Intf disabled	Number of PIM control packets received on an interface that has PIM disabled.
Rx V1 Require V2	Number of PIM version 1 control packets received on an interface configured for PIM version 2.
Rx V2 Require V1	Number of PIM version 2 control packets received on an interface configured for PIM version 1.
Rx Register not RP	Number of PIM register packets received when the router is not the RP for the group.
Rx Register no route	Number of PIM register packets received when the RP does not have a unicast route back to source.
Rx Register no decap if	Number of PIM register packets received when the RP does not have a de-encapsulation interface.
Null Register Timeout	Number of NULL register timeout packets.
RP Filtered Source	Number of PIM packets received when the router has a source address filter configured for the RP.
Rx Unknown Reg Stop	Number of register stop messages with an unknown type.
Rx Join/Prune no state	Number of join and prune messages received for which the router has no state.
Rx Join/Prune on upstream if	Number of join and prune messages received on the interface used to reach the upstream router, toward the RP.
Rx Join/Prune messages dropped	Number of join and prune messages received and dropped.
Rx sparse join for dense group	Number of PIM sparse mode join messages received for a group that is configured for dense mode.
Rx Graft/Graft Ack no state	Number of graft and graft acknowledgement messages received for which the router has no state.
Rx Graft on upstream if	Number of graft messages received on the interface used to reach the upstream router, toward the RP.
Rx CRP not BSR	Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.

Table 144: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Rx BSR when BSR	Number of BSR messages received in which the PIM message type is Bootstrap.
Rx BSR not RPF if	Number of BSR messages received on an interface that is not the RPF interface.
Rx unknown hello opt	Number of PIM hello packets received with options that Junos does not support.
Rx data no state	Number of PIM control packets received for which the router has no state for the data type.
Rx RP no state	Number of PIM control packets received for which the router has no state for the RP.
Rx aggregate	Number of PIM aggregate MDT packets received.
Rx malformed packet	Number of PIM control packets received with a malformed IP unicast or multicast address family.
No RP	Number of PIM control packets received with no RP address.
No register encap if	Number of PIM register packets received when the first-hop router does not have an encapsulation interface.
No route upstream	Number of PIM control packets received when the router does not have a unicast route to the the interface used to reach the upstream router, toward the RP.
Nexthop Unusable	Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.
RP mismatch	Number of PIM control packets received for which the router has an RP mismatch.
RPF neighbor unknown	Number of PIM control packets received for which the router has an unknown RPF neighbor for the source.
Rx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Tx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Embedded-RP invalid addr	Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.

Table 144: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Embedded-RP limit exceed	Number of times the limit configure with the **maximum-rps** statement is exceeded. The **maximum-rps** statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.
Embedded-RP added	Number of packets in which the embedded RP for IPv6 is added. The following receive events trigger extraction of an IPv6 embedded RP address on the router: • Multicast Listener Discovery (MLD) report for an embedded RP multicast group address • PIM join message with an embedded RP multicast group address • Static embedded RP multicast group address associated with an interface • Packets sent to an embedded RP multicast group address received on the DR An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.
Embedded-RP removed	Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.
Rx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.
Tx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.

Sample Output

show pim statistics

```
user@host> show pim statistics
PIM Message type        Received       Sent  Rx errors
V2 Hello                      15         32          0
V2 Register                    0        362          0
V2 Register Stop             483          0          0

PART 5

Access Control

CHAPTER 25

802.1X and MAC RADIUS Authentication Overview

Understanding Authentication on J-EX Series Switches

You can control access to your network through a J-EX Series Switch using several different authentication methods—802.1X, MAC RADIUS, or captive portal. Authentication prevents unauthorized devices and users from gaining access to your LAN. For 802.1X and MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server. For captive portal authentication, the switch allows the end devices to get an IP address and allows forwarding of DHCP, DNS, and ARP packets.

You can allow end devices to access the network without authentication by including the MAC address of the end device in the static MAC bypass list or, for captive portal, by including the MAC address of the end device in the authentication whitelist.

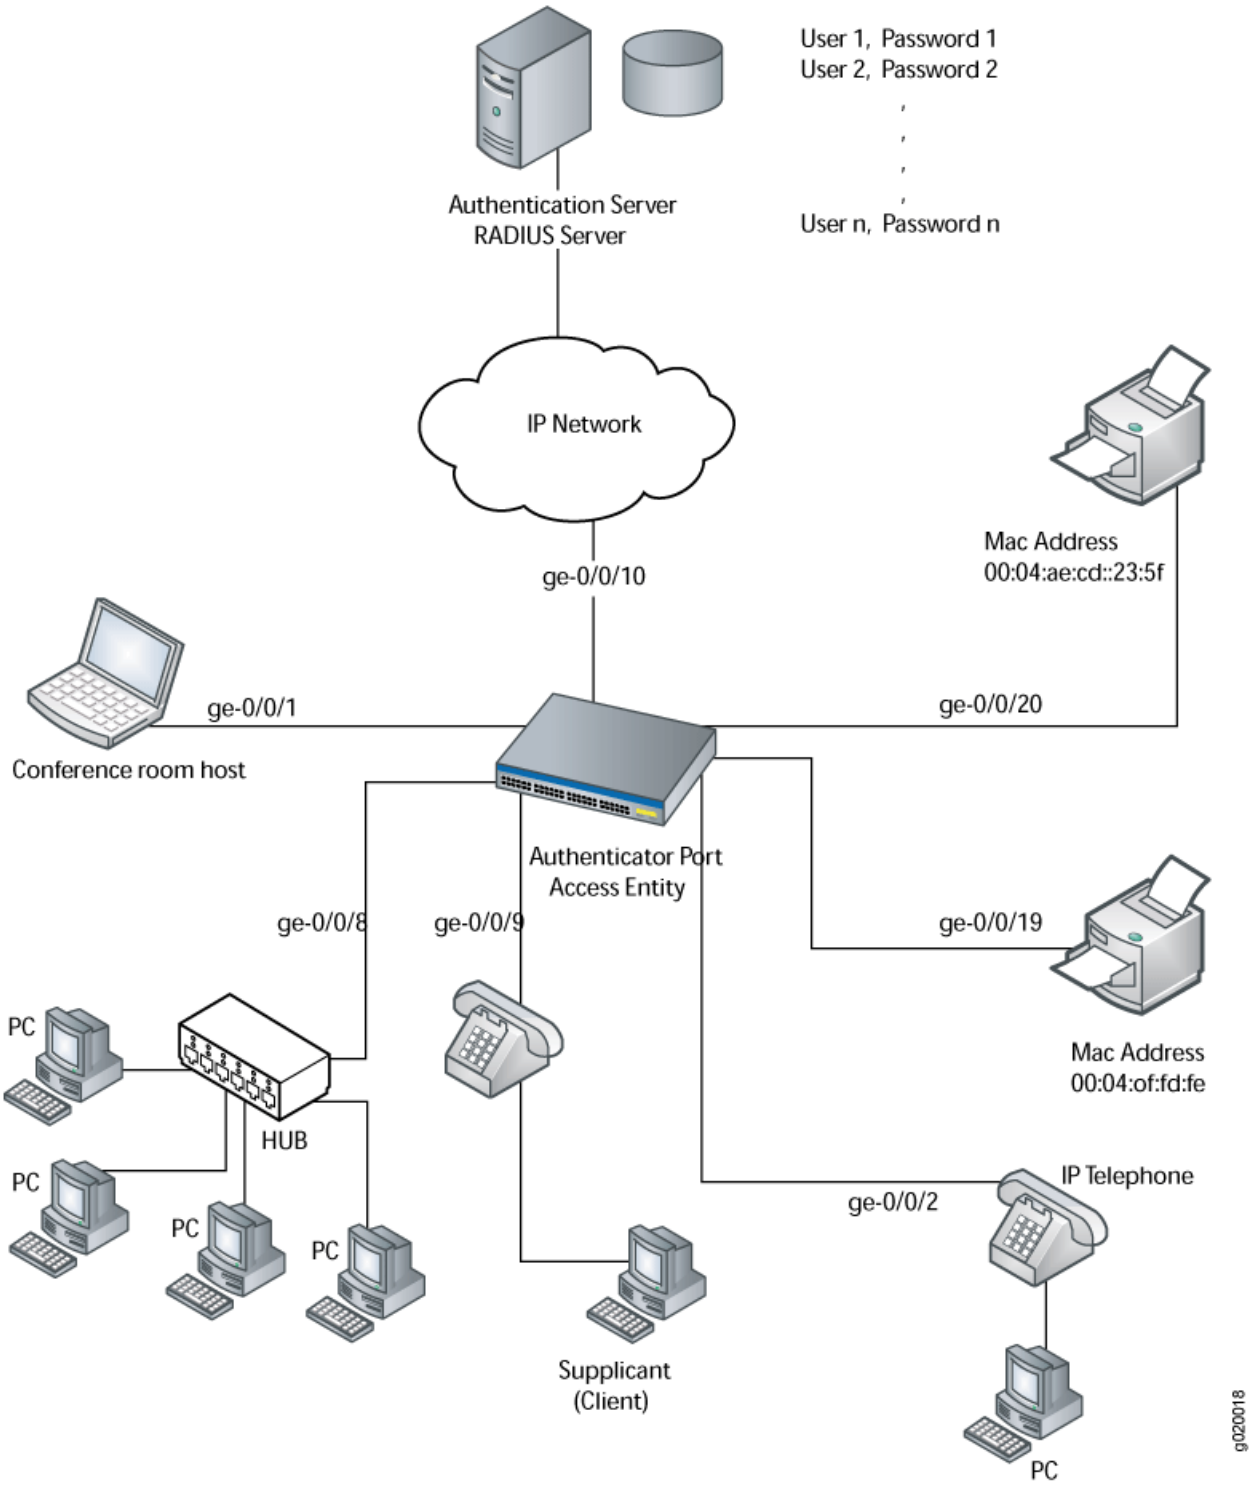
You can configure 802.1X, MAC RADIUS, and captive portal on the same interface and in any combination, except that you cannot configure MAC RADIUS and captive portal on an interface without also configuring 802.1X. If you configure multiple authentication methods on a single interface, the switch falls back to another method if the first method is unsuccessful. For a description of the process flow when multiple authentication methods are configured on an interface, see “Authentication Process Flow for J-EX Series Switches” on page 1229.

This topic covers:

A Basic Authentication Topology

Figure 25 on page 1223 illustrates a basic deployment topology for authentication on a J-EX Series switch:

Figure 25: Example Authentication Topology



802.1X Authentication

802.1X is an IEEE standard for port-based network access control (PNAC). It provides an authentication mechanism to allow devices to access a LAN. The 802.1X authentication feature on a J-EX Series switch is based upon the IEEE 802.1D standard *Port-Based Network Access Control*.

The communication protocol between the end device and the switch is Extensible Authentication Protocol Over LAN (EAPOL). EAPOL is a version of EAP designed to work with Ethernet networks. The communication protocol between the authentication server and the switch is RADIUS.

During the authentication process, the switch completes multiple message exchanges between the end device and the authentication server. While 802.1X authentication is in process, only 802.1X traffic is allowed. Other traffic, such as DHCP and HTTP, is blocked at the data link layer.

NOTE: You can configure both the maximum number of times an EAPOL request packet is retransmitted and the timeout period between attempts. For information, see "Configuring 802.1X Interface Settings (CLI Procedure)" on page 1307.

An 802.1X authentication configuration for a LAN contains three basic components:

- *Supplicant* (also called end device)—Supplicant is the IEEE term for an end device that requests to join the network. The end device can be responsive or nonresponsive. A responsive end device is 802.1X-enabled and provides authentication credentials—specifically, a username and password for EAP MD5 or a username and client certificates for EAP-TLS, EAP-TTLS, and EAP-PEAP. A nonresponsive end device is not 802.1X-enabled, but it can be authenticated through MAC RADIUS authentication.
- *Authenticator port access entity*—The IEEE term for the authenticator. The J-EX Series switch is the authenticator, and it controls access by blocking all traffic to and from end devices until they are authenticated.
- *Authentication server*—The authentication server contains the backend database that makes authentication decisions. It contains credential information for each end device that is allowed to connect to the network. The authenticator forwards credentials supplied by the end device to the authentication server. If the credentials forwarded by the authenticator match the credentials in the authentication server database, access is granted. If the credentials forwarded do not match, access is denied. The J-EX Series switches support RADIUS authentication servers.

MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices that are not 802.1X-enabled but that you want to allow to access the LAN.

The EAP method supported for MAC RADIUS authentication on J-EX Series switches is EAP-MD5.

If both 802.1X-enabled end devices and end devices that are not 802.1X-enabled connect to an interface, you can configure both 802.1X and MAC RADIUS authentication methods on the interface. In this case, the switch first attempts to authenticate using 802.1X, and if that method fails, it attempts to authenticate the end device using MAC RADIUS authentication.

If you know that only non-802.1X-enabled end devices connect on that interface, you can eliminate the delay that occurs while the switch determines that the end device is non-802.1X-enabled by configuring the **mac-radius restrict** option. When this option is configured, the switch does not attempt to authenticate the end device through 802.1X but instead immediately sends a request to the RADIUS server for authentication of the MAC address of the end device. If the MAC address of an end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device on the interface to which it is connected.

This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface. When you configure **mac-radius restrict** on an interface to eliminate this delay, the switch drops all 802.1X packets.

Captive Portal Authentication

Captive portal authentication (hereafter referred to as captive portal) allows you to authenticate users on J-EX Series switches by redirecting Web browser requests to a login page that requires users to input a username and password before they are allowed access to the network. Captive portal controls network access by requiring users to provide information that is authenticated against a RADIUS server database using EAP-MD5. You can also use captive portal to display an acceptable-use policy to users before they access your network.

The Junos operating system (Junos OS) for J-EX Series switches provides a template that allows you to easily design and modify the look of the captive portal login page. You enable specific interfaces for captive portal. The first time an end device connected to a captive portal interface attempts to access a web page, the switch presents the captive portal login page. Upon successful authentication, the user is allowed access to the network and to continue to the original page requested.

NOTE: If Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) is enabled, Hypertext Transfer Protocol (HTTP) requests are redirected to an HTTPS connection for the captive portal authentication process. After authentication, the end device is returned to the HTTP connection.

If there are end devices that are not HTTP-enabled connected to the captive portal interface, you can allow them to bypass captive portal authentication by adding their MAC addresses to an authentication whitelist.

When the user is authenticated by the RADIUS server, any per-user policies (attributes) associated with that user are also sent to the switch.

Captive portal on J-EX Series switches has the following limitations:

- The captive portal interface must be configured for **family ethernet-switching** and set to port mode **access**.
- Captive portal does not support dynamic assignment of VLANs downloaded from the RADIUS server.
- If the user is idle for more than about 5 minutes and there is no traffic passed, the user must log back in to the captive portal.

Static MAC Bypass of Authentication

You can allow end devices to access the LAN without authentication on a RADIUS server by including their MAC addresses in the static MAC bypass list (also known as the exclusion list).

You might choose to include a device in the bypass list to:

- Allow non-802.1X-enabled devices access to the LAN.
- Eliminate the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

When you configure static MAC on the switch, the MAC address of the end device is first checked in a local database (a user-configured list of MAC addresses). If a match is found, the end device is successfully authenticated and the interface is opened up for it. No further authentication is done for that end device. If a match is not found and 802.1X authentication is enabled on the switch, the switch attempts to authenticate the end device through the RADIUS server.

For each MAC address, you can also configure the VLAN to which the end device is moved or the interfaces on which the host connects.

Fallback of Authentication Methods

You can configure multiple authentication methods on a single interface to enable fallback to another method if one method fails.

If an interface is configured in multiple supplicant mode, all end devices connecting through the interface must use either captive portal or a combination of 802.1X and MAC RADIUS, captive portal cannot be mixed with 802.1X or MAC RADIUS. Therefore, if there is already an end device on the interface that was authenticated through 802.1X or MAC RADIUS authentication, then additional end devices authenticating do not fall back to captive portal. If only 802.1X authentication or MAC RADIUS authentication is configured, some end devices can be authenticated using 802.1X and others can still be authenticated using MAC RADIUS.

Fallback of authentication methods occurs in the following order:

1. 802.1X authentication—If 802.1X is configured on the interface, the switch sends EAPOL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the switch checks whether MAC RADIUS authentication is configured on the interface.

2. MAC RADIUS authentication—If MAC RADIUS authentication is configured on the interface, the switch sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the switch checks whether captive portal is configured on the interface.
3. Captive portal authentication—If captive portal is configured on the interface, the switch attempts to authenticate using this method after attempting any other configured authentication methods. If an end device is authenticated on the interface using captive portal, this becomes the active authentication method on the interface. When captive portal is the active authentication method, the switch falls back to 802.1X authentication if there are no sessions in the authenticated state and if the interface receives an EAP packet.

802.1X for J-EX Series Switches Overview

IEEE 802.1X provides network edge security, protecting Ethernet LANs from unauthorized user access.

How 802.1X Authentication Works

802.1X authentication works by using an *Authenticator Port Access Entity* (the switch) to block all traffic to and from a supplicant (end device) at the port until the supplicant's credentials are presented and matched on the *Authentication server* (a RADIUS server). When authenticated, the switch stops blocking traffic and opens the port to the supplicant.

The end device is authenticated in either *single* mode, *single-secure* mode, or *multiple* mode:

- **single**—Authenticates only the first end device. All other end devices that connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the end devices’ authentication.
- **single-secure**—Allows only one end device to connect to the port. No other end device is allowed to connect until the first logs out.
- **multiple**—Allows multiple end devices to connect to the port. Each end device will be authenticated individually.

Network access can be further defined using VLANs and firewall filters, which both act as filters to separate and match groups of end devices to the areas of the LAN they require. For example, you can configure VLANs to handle different categories of authentication failures depending upon:

- Whether or not the end device is 802.1-X enabled.
- Whether or not MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected.
- Whether the RADIUS authentication server becomes unavailable or sends an Extensible Authentication Over LAN (EAPOL) Access-Reject message. See “Configuring Server Fail Fallback (CLI Procedure)” on page 1314.

802.1X Features Overview

802.1X features on J-EX Series Switches are:

- Guest VLAN—Provides limited access to a LAN, typically just to the Internet, for end devices that are not 802.1X enabled when MAC RADIUS authentication has not been configured on the switch interfaces to which the hosts are connected .
- Server-reject VLAN—Provides limited access to a LAN, typically just to the Internet, for end devices that are 802.1X enabled but have sent the wrong credentials.
- Server-fail VLAN—Provides limited access to a LAN, typically just to the internet, for 802.1X end devices during a RADIUS server timeout.
- Dynamic VLAN—Enables an end device, after authentication, to be a member of a VLAN dynamically.
- Private VLAN—Enables configuration of 802.1X authentication on interfaces that are members of private VLANs (PVLANs).
- Dynamic changes to a user session—Allows the switch administrator to terminate an already authenticated session. This feature is based on support of the RADIUS Disconnect Message defined in RFC 3576.
- Support for VoIP—Supports IP telephones. If the phone is 802.1X-enabled, it is authenticated like any other supplicant. If the phone is not 802.1X-enabled, but has another 802.1X-compatible device connected to its data port, that device is authenticated, and then VoIP traffic can flow to and from the phone (providing that the interface is configured in single mode and not in single-secure mode).

  

  NOTE: **Configuring a VoIP VLAN on private VLAN (PVLAN) interfaces is not supported.**

- RADIUS accounting—Sends accounting information to the RADIUS accounting server. Accounting information is sent to the server whenever a subscriber logs in or logs out and whenever a subscriber activates or deactivates a subscription.
- Vendor Specific Attributes (VSAs)—Supports the **Juniper-Switching-Filter** attribute on the RADIUS authentication server that can be used further define a supplicant's access

during the 802.1X authentication process. Centrally configuring VSAs on the authentication server does away with the need to configure these same attributes in the form of firewall filters on every switch in the LAN to which the supplicant may connect to the LAN. This feature is based on RLI 4583, AAA RADIUS BRAS VSA Support.

Supported Features Related to 802.1X Authentication

802.1X does not replace other security technologies. 802.1X works together with port security features, such as DHCP snooping, dynamic ARP inspection (DAI), and MAC limiting, to guard against spoofing.

Supported features related to authentication include:

- Static MAC bypass—Provides a bypass mechanism to authenticate devices that are not 802.1X-enabled (such as printers). Static MAC bypass connects these devices to 802.1X-enabled ports, bypassing 802.1X authentication.
- MAC RADIUS authentication—Provides a means to enable or disable MAC authentication independently of whether 802.1X authentication is enabled.

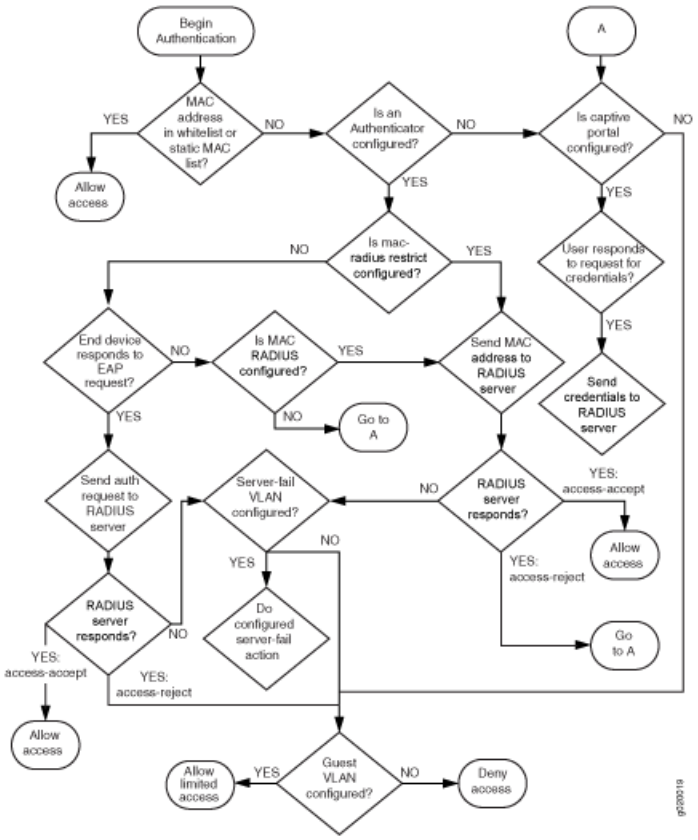
Authentication Process Flow for J-EX Series Switches

You can control access to your network through a J-EX Series switch by using several different authentication methods—802.1X, MAC RADIUS, or captive portal.

Figure 26 on page 1230 illustrates the authentication process:

Figure 26: Authentication Process Flow for a J-EX Series Switch



The basic authentication process works like this:

1. Authentication is initiated by an end device sending an EAP request or a data packet.
2. If the MAC address of the end device is in the static MAC bypass list or the authentication whitelist, the switch accepts the end device without querying the authentication server and allows the end device to access the LAN.
3. If the MAC address is not in the static MAC bypass list or the authentication whitelist, the switch checks whether an **authenticator** statement is configured on the interface. If an authenticator is not configured, the switch checks for captive portal configuration—skip to Step 6.

   If an authenticator is configured:

   a. The switch checks whether the **mac-radius restrict** statement is configured on the interface. If **mac-radius restrict** is configured, the switch does not attempt 802.1X authentication—skip to Step 5. If it is configured, go on to Step 2.

   b. The switch sends either an EAP request (if the end device initiated contact with a data packet) or an EAP response (if the end device initiated contact with an EAPOL-start message).

   c. If there is no response, the switch tries sending an EAP request two more times.

NOTE: You can configure both the maximum number of times an EAPOL request packet is retransmitted and the timeout period between attempts. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1307.

d. If the end device does not respond to the EAP messages sent by the switch, the switch checks for MAC RADIUS configuration—skip to Step 4. If it does respond, go on to step 5.

e. When an EAP request is received from the end device, the switch sends an authentication request message to the authentication server.

   If the authentication server does not respond, the switch checks whether there is a server fail VLAN configured. If there is a server fail VLAN, the switch performs the configured server fail fallback operation. If there is no server fail VLAN, skip to Step 6.

f. The authentication server sends an access-accept or access-reject message. If the authentication server sends an access-reject message, skip to Step 8.

4. If the end device does not respond to the EAP messages, the switch checks whether MAC RADIUS authentication is configured on the interface. If it is not configured, skip to Step 6.
5. If MAC RADIUS authentication is configured on the interface:
   a. The switch sends a MAC RADIUS authentication request to the authentication server. The switch sends only one such request.

      If the authentication server does not respond, the switch checks whether there is a server fail VLAN configured on the switch. If there is a server fail VLAN, the switch performs the configured server fail fallback operation. If there is no server fail VLAN, skip to Step 8.

   b. The authentication server sends an access-accept or access-reject message. If the authentication server sends an access-reject message, go on to Step 6.
6. If MAC RADIUS authentication is not configured on the interface or if the authentication server responds with an access-reject message for MAC RADIUS authentication, the switch checks whether captive portal is configured on the interface. If captive portal is not configured on the interface, skip to Step 8.
7. If captive portal authentication is configured on the interface:
   a. The switch sends a request to the user on the end device for captive portal authentication information.

   b. The switch sends the captive portal authentication information to the authentication server.

   c. The authentication server sends an access-accept or access-reject message.

      If the server sends an access-reject message, go on to Step 8.

NOTE: If an end device is authenticated on the interface using captive portal, this becomes the active authentication method on the interface. When captive portal is the active authentication method, the switch falls back to 802.1X authentication if there are no sessions in the authenticated state and if the interface receives an EAP packet.

8. The switch checks whether there is a guest VLAN configured on the switch. If a guest VLAN is configured, the switch allows the end device limited access to the LAN.

Understanding Server Fail Fallback and Authentication on J-EX Series Switches

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends an Extensible Authentication Protocol Over LAN (EAPOL) access-reject message.

J-EX Series Switches use authentication to implement access control in an enterprise network. If 802.1X, MAC RADIUS, or captive portal authentication are configured on the interface, end devices are evaluated at the initial connection by an authentication (RADIUS) server. If the end device is configured on the authentication server, the device is granted access to the LAN and the J-EX Series switch opens the interface to permit access.

A RADIUS server timeout occurs if no RADIUS authentication servers are reachable when an end device logs in and attempts to access the LAN. Server fail fallback allows you to specify one of four actions to be taken toward end devices awaiting authentication when the server is timed out:

- *Permit* authentication, allowing traffic to flow from the end device through the interface as if the end device were successfully authenticated by the RADIUS server.
- *Deny* authentication, preventing traffic from flowing from the end device through the interface. This is the default.
- *Move* the end device to a specified VLAN. (The VLAN must already exist on the switch.)
- *Sustain* authenticated end devices that already have LAN access and *deny* unauthenticated end devices. If the RADIUS servers time out during reauthentication, previously authenticated end devices are reauthenticated and new users are denied LAN access.

Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by an end device's first attempt at authentication through the RADIUS server.

Server fail fallback allows you to specify that an end device be moved to a specified VLAN if the switch receives an EAPOL accept-reject message. The configured VLAN name overrides any attributes sent by the server.

- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307

Understanding Dynamic VLANs for 802.1X on J-EX Series Switches

Dynamic VLANs, in conjunction with the 802.1X authentication process, provide secure access to the LAN for end devices belonging to different VLANs on a single port.

When this feature is configured on the RADIUS server, an end device or user authenticating on the RADIUS server is assigned to the VLAN configured for it. The end device or user becomes a member of a VLAN dynamically after successful 802.1X authentication. For information on configuring dynamic VLANs on your RADIUS server, see the documentation for your RADIUS server.

Successful authentication requires that the VLAN ID or VLAN name exist on the switch and match the VLAN ID or VLAN name sent by the RADIUS server during authentication. If neither exists, the end device is unauthenticated. If a guest VLAN is established, the unauthenticated end device is automatically moved to the guest VLAN.

- Understanding Guest VLANs for 802.1X on J-EX Series Switches on page 1233

Understanding Guest VLANs for 802.1X on J-EX Series Switches

Guest VLANs can be configured on switches that are using 802.1X authentication to provide limited access for corporate guests and end devices that are not 802.1X enabled.

When a corporate visitor attempts to authenticate on the LAN and authentication fails, the visitor is moved to a guest VLAN. A guest VLAN typically provides access only to the Internet.

For end devices that are not 802.1X-enabled, a guest VLAN can allow limited access to a server from which the non-802.1X-enabled end device can download the supplicant software and attempt authentication again.

A guest VLAN is not used when MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected. Some end devices, such as a printer, cannot be enabled for 802.1X. The hosts for such devices should be connected to switch interfaces that are configured for MAC RADIUS authentication. See "Configuring MAC RADIUS Authentication (CLI Procedure)" on page 1312.

Understanding 802.1X and RADIUS Accounting on J-EX Series Switches

J-EX Series Switches support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on a J-EX Series switch permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. In the event that the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos operating system (Junos OS).

The RADIUS accounting process between a switch and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The switch forwards an accounting-request packet containing an event record to the accounting server. For example, a supplicant is authenticated through 802.1X authentication and connected to the LAN. The event record associated with this supplicant contains an Acct-Status-Type attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request will contain an Acct-Status-Type attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events as start-accounting or stop-accounting records. The records are in a file. On FreeRADIUS, the file name is the server's address; for example, 122.69.1.250.

4. The accounting server sends an accounting-response packet back to the switch confirming it has received the accounting request.
5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches

J-EX Series Switches use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to quickly identify a variety of devices, resulting in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in the Junos operating system (Junos OS).

LLDP-MED goes one step further, exchanging IP-telephony messages between the switch and the IP telephone.

NOTE: If your IP telephone is configured for voice over IP, the switch automatically detects the configuration and assigns the telephone to the voice VLAN. The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

These TLV messages also provide detailed information on PoE policy. The PoE Management TLVs let the switch ports advertise the power level and power priority needed.

The switch also uses these protocols to ensure that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p CoS and 802.1Q tag information can be sent to the IP telephone.

J-EX Series switches support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information is not configurable, but taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports; for example, bridge or router. This information is not configurable, but based on the model of the product.
- **Management Address**—The IP management address of the local system.

J-EX Series switches support the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises MDI power support, PSE power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is not configurable, but based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises if the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

J-EX Series switches support the following LLDP-MED TLVs:

- **LLDP MED Capabilities**—A TLV that advertises the primary function of the port. The capabilities values range 0 through 15:
  - **0**—Capabilities
  - **1**—Network Policy
  - **2**—Location Identification
  - **3**—Extended Power via MDI-PSE
  - **4**—Inventory
  - **5–15**—Reserved
- LLDP-MED Device Class Values:

  - **0**—Class not defined.
  - **1**—Class 1 Device.
  - **2**—Class 2 Device.
  - **3**—Class 3 Device.
  - **4**—Network Connectivity Device
  - **5–255**—Reserved.
- **Network Policy**—A TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.
- **Endpoint Location**— A TLV that advertises the physical location of the endpoint.
- **Extended Power via MDI**— A TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

Understanding 802.1X and VoIP on J-EX Series Switches

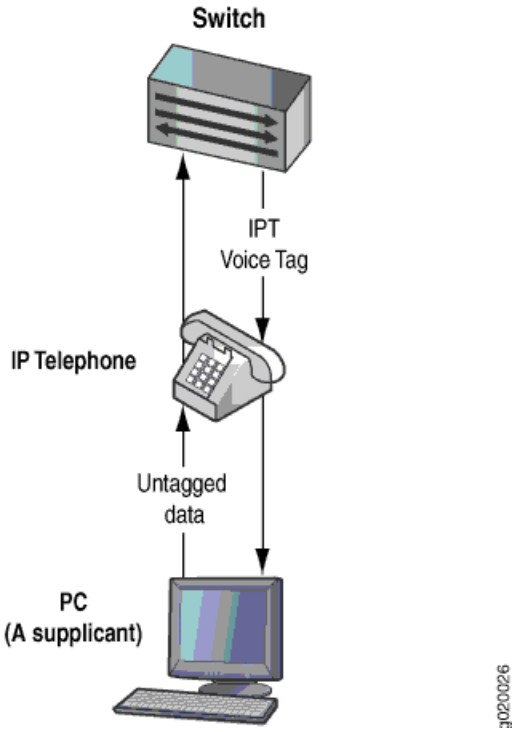
When you use Voice over IP (VoIP), you can connect IP telephones to the switch and configure IEEE 802.1X authentication for 802.1X-compatible IP telephones. The 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access.

VoIP is a protocol used for the transmission of voice through packet-switched networks. VoIP transmits voice calls using a network connection instead of an analog phone line.

When VoIP is used with 802.1X, the RADIUS server authenticates the phone, and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) provides the class-of-service (CoS) parameters to the phone.

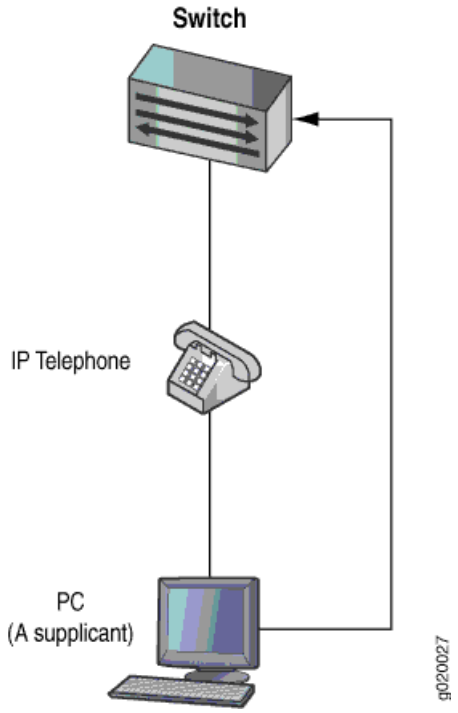
You can configure 802.1X authentication to work with VoIP in multiple supplicant or single supplicant mode. In *multiple-supplicant* mode, the 802.1X process allows multiple supplicants to connect to the interface. Each supplicant will be authenticated individually. For an example of a VoIP multiple supplicant topology, see Figure 27 on page 1238.

Figure 27: VoIP Multiple Supplicant Topology



If an 802.1X-compatible IP telephone does not have an 802.1X host but has another 802.1X-compatible device connected to its data port, you can connect the phone to an interface in single-supplicant mode. In *single-supplicant* mode, the 802.1X process authenticates only the first supplicant. All other supplicants who connect later to the interface are allowed full access without any further authentication. They effectively "piggyback" on the first supplicant's authentication. For an example of a VoIP single supplicant topology, see Figure 28 on page 1239 .

Figure 28: VoIP Single Supplicant Topology



If an IP telephone does not support 802.1X, you can configure VoIP to bypass 802.1X and LLDP-MED and have the packets forwarded to a VoIP VLAN,

Understanding 802.1X and VSAs on J-EX Series Switches

J-EX Series Switches support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS). Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are clear text fields sent from the RADIUS server to the switch as a result of the 802.1X authentication success or failure. The 802.1X authentication prevents unauthorized user access by blocking a supplicant at the port until the supplicant is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with 802.1X authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the 802.1X authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches. For more information, see “Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch” on page 1272.

VSAs are only supported for 802.1X single-supplicant configurations and multiple-supplicant configurations.

Understanding Authentication Session Timeout

You can specify authentication session timeout values for captive portal authentication sessions and 802.1X and MAC RADIUS authentication sessions.

For captive portal authentication, the length of the session depends on the value configured for the **session-expiry** statement. The remainder of this topic pertains only to 802.1X and MAC RADIUS authentication sessions.

For 802.1X and MAC RADIUS authentication sessions, the timeout of the session depends on the value of **reauthentication interval** for **dot1x authentication**. The authentication session might also end when the MAC table aging time expires because, unless you configure it not to, the session is removed from the authentication session table when the MAC address is removed from the Ethernet switching table.

Information about each 802.1X and MAC RADIUS authentication session—including the associated interfaces and VLANs for each MAC address that is authenticated by 802.1X authentication or MAC RADIUS authentication—is stored in the authentication session table. The authentication session table is tied to the Ethernet switching table (also called the MAC table). Each time the switch detects traffic from a MAC address, it updates the timestamp for that network node in the Ethernet switching table. A timer on the switch periodically checks the timestamp and if its value exceeds the user-configured **mac-table-aging-time** value, the switch removes the MAC address from the Ethernet switching table. When a MAC address ages out of the Ethernet switching table, the entry for that MAC address is also removed from the authentication database, with the result that the session ends.

You can control variables affecting timeout of authentication sessions in the following ways:

- Set the authentication session timeout on all interfaces or on selected interfaces using the **reauthentication** statement.
- Disassociate the authentication session table from the Ethernet switching table using the **no-mac-table-binding** statement. This setting prevents the termination of the authentication session when the associated MAC address ages out of the Ethernet switching table.

Understanding NetBIOS Snooping

NetBIOS snooping allows J-EX Series Switches to discover NetBIOS hosts that are connected to the switch.

What Is a NetBIOS Name?

A NetBIOS name is a key element in communications between NetBIOS resources. A NetBIOS name identifies a NetBIOS resource on the network. A NetBIOS name is either a unique (exclusive) name or a group (nonexclusive) name. When a NetBIOS resource communicates with one other NetBIOS resource, a unique name is used in that communication. When a NetBIOS resource communicates with multiple resources, a group name is used.

The NetBIOS name of each NetBIOS resource is stored on the NetBIOS Name Server (NBNS). The NetBIOS name of a NetBIOS resource is mapped to its IP address.

A NetBIOS name is a 16-byte address. The first 15 bytes contain the name and the last byte contains the name type.

The NetBIOS name service is supported over UDP port 137.

How NetBIOS Snooping Works

You can enable NetBIOS snooping on the switch so that the switch can identify NetBIOS resources that are connected to it.

When a host connected to the switch initializes itself, it attempts to register its NetBIOS name by sending a NetBIOS name registration request message. The host can opt for either a unique or a group NetBIOS name. For a unique NetBIOS name, the host either broadcasts a NetBIOS name query message on the local network or unicasts it to the NBNS to check whether the requested name is already being used by another host. If so, the host that previously registered the name or the NBNS responds with a negative name registration response. If the host receives no negative response, it broadcasts the NetBIOS name registration packet to confirm the name. For a NetBIOS group name, the host sends a NetBIOS name registration packet, which generates no responses from other hosts because multiple hosts can use the same group name at the same time.

The NetBIOS snooping-enabled switch extracts the host details from the NetBIOS name registration packet and stores the details in the LLDP neighbor database.

CHAPTER 26

Examples: Access Control Configuration

Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch

802.1X is the IEEE standard for Port-Based Network Access Control (PNAC). You use 802.1X to control network access. Only users and devices providing credentials that have been verified against a user database are allowed access to the network. You can use a RADIUS server as the user database for 802.1X authentication, as well as for MAC RADIUS authentication.

This example describes how to connect a RADIUS server to a J-EX Series switch, and configure it for 802.1X:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Configured users on the RADIUS authentication server.

Overview and Topology

The J-EX Series switch acts as an authenticator Port Access Entity (PAE). It blocks all traffic and acts as a control gate until the supplicant (client) is authenticated by the server. All other users and devices are denied access.

Figure 29 on page 1245 shows one J-EX4200 switch that is connected to the devices listed in Table 145 on page 1246.

Figure 29: Topology for Configuration

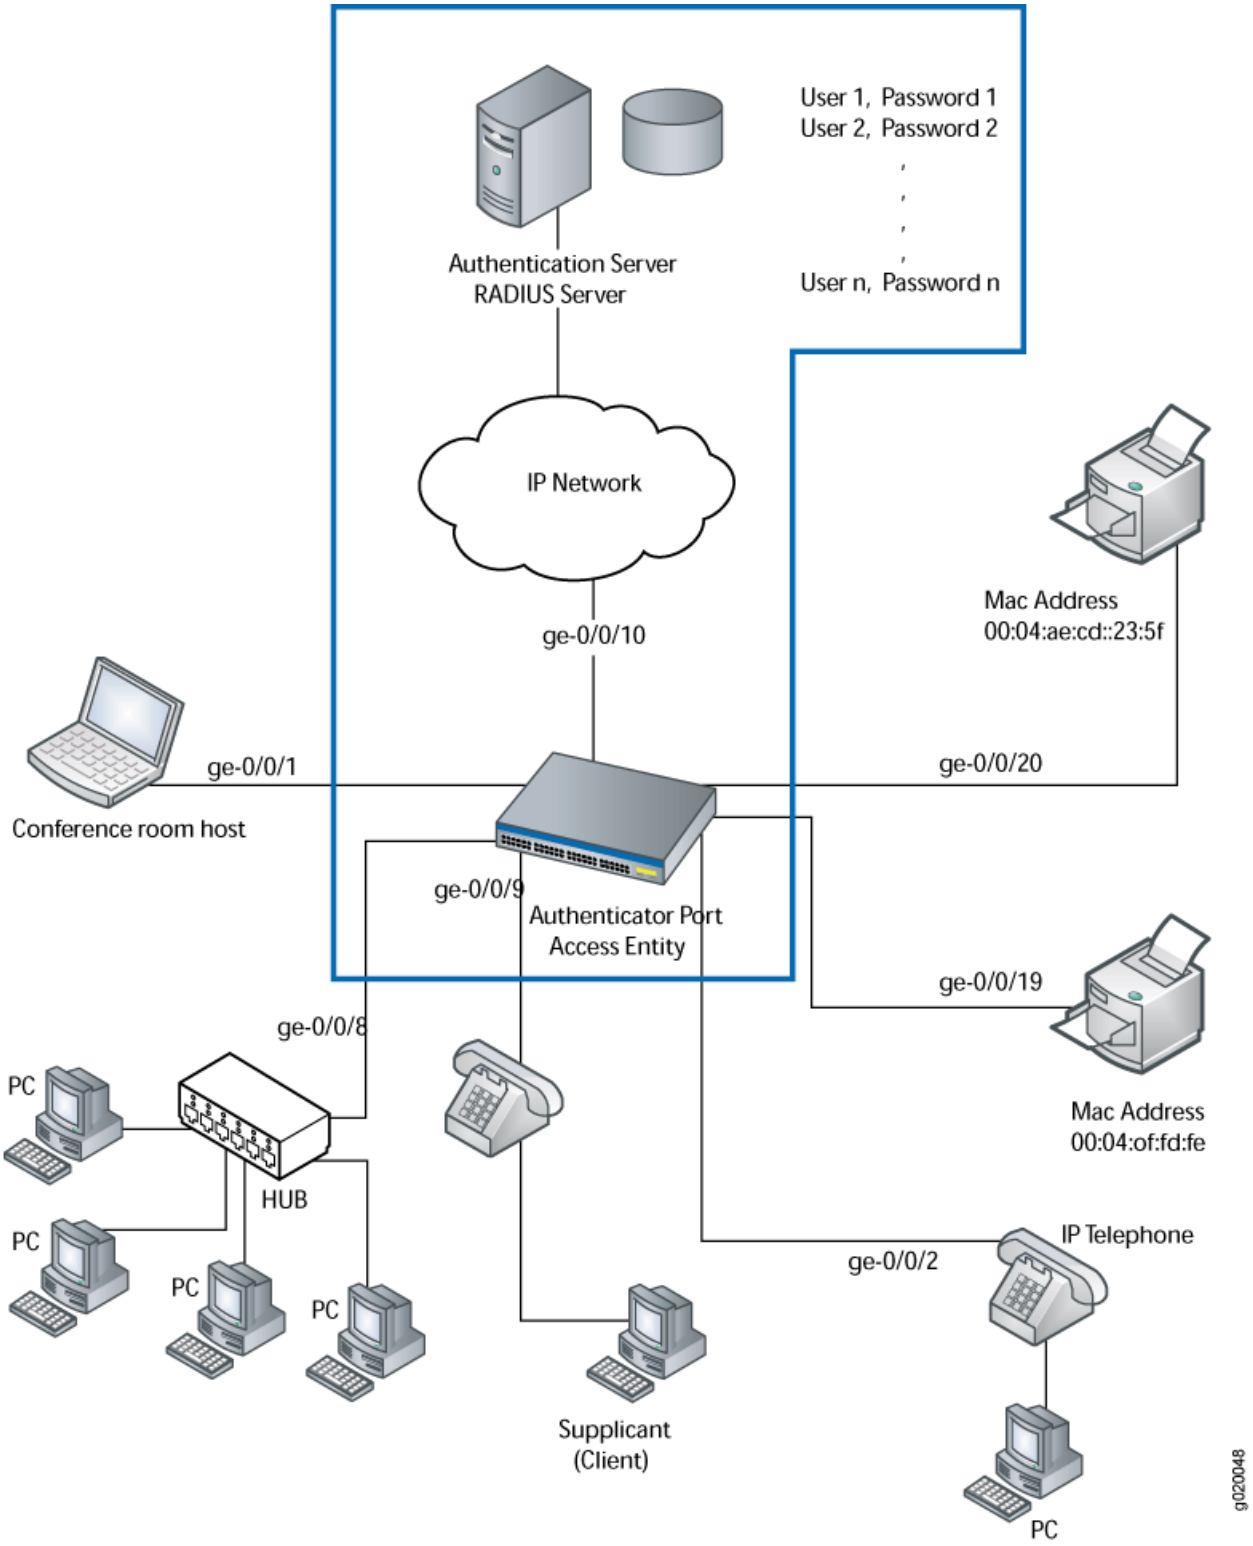

Table 145: Components of the Topology

Property	Settings
Switch hardware	J-EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE ports (**ge-0/0/8** through **ge-0/0/23**)
VLAN name	**default**
One RADIUS server	Backend database with an address of **10.0.0.100** connected to the switch at port **ge-0/0/10**

In this example, connect the RADIUS server to access port **ge-0/0/10** on the J-EX4200 switch. The switch acts as the authenticator and forwards credentials from the supplicant to the user database on the RADIUS server. You must configure connectivity between the J-EX4200 and the RADIUS server by specifying the address of the server and configuring the secret password. This information is configured in an access profile on the switch.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see the *Junos OS System Basics Configuration Guide*.

Configuration

CLI Quick Configuration

To quickly connect the RADIUS server to the switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set access radius-server 10.0.0.100 secret juniper
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server 10.0.0.100 10.2.14.200
```

Step-by-Step Procedure

To connect the RADIUS server to the switch:

1. Define the address of the server, and configure the secret password. The secret password on the switch must match the secret password on the server:

   ```
   [edit access]
   user@switch# set radius-server 10.0.0.100 secret juniper
   ```

2. Configure the authentication order, making **radius** the first method of authentication:

   ```
   [edit access profile]
   user@switch# set profile1 authentication-order radius
   ```

3. Configure a list of server IP addresses to be tried in order to authenticate the supplicant:

   ```
   [edit access profile]
   user@switch# set profile1 radius authentication-server 10.0.0.100 10.2.14.200
   ```

Results

Display the results of the configuration:

```
user@switch> show configuration access
```

```
radius-server {
  10.0.0.100
    port 1812;
    secret "$9$qPT3ApBSrv69rvWLVb.P5"; ## SECRET-DATA
    }
  }
  profile profile1{
    authentication-order radius;
    radius {
      authentication-server 10.0.0.100 10.2.14.200;
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verify That the Switch and RADIUS Server are Properly Connected on page 1247

Verify That the Switch and RADIUS Server are Properly Connected

Purpose Verify that the RADIUS server is connected to the switch on the specified port.

Action Ping the RADIUS server to verify the connection between the switch and the server:

```
user@switch> ping 10.0.0.100
PING 10.0.0.100 (10.0.0.100): 56 data bytes
64 bytes from 10.93.15.218: icmp_seq=0 ttl=64 time=9.734 ms
64 bytes from 10.93.15.218: icmp_seq=1 ttl=64 time=0.228 ms
```

Meaning ICMP echo request packets are sent from the switch to the target server at 10.0.0.100 to test whether it is reachable across the IP network. ICMP echo responses are being returned from the server, verifying that the switch and the server are connected.

Related Documentation

- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 1266
- Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on a J-EX Series Switch on page 1252

- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316
- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1317

Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to a J-EX Series Switch

Server fail fallback allows you to specify how 802.1X supplicants connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends an EAP Access-Reject message.

You use 802.1X to control network access. Only users and devices (supplicants) providing credentials that have been verified against a user database are allowed access to the network. You use a RADIUS server as the user database.

This example describes how to configure an interface to move a supplicant to a VLAN in the event of a RADIUS server timeout:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- Disable firewall filters on the interface. Firewall filters interfere with server fail fallback operation.
- Configured users on the authentication server.

Overview and Topology

A RADIUS server timeout occurs if no authentication RADIUS servers are reachable when a supplicant logs in and attempts to access the LAN. Using server fail fallback, configure alternative options for supplicants attempting LAN access. You can configure the switch to accept or deny access to supplicants or to maintain the access already granted towards supplicants before the RADIUS server timeout. Additionally, you can configure the switch to move supplicants to a specific VLAN if a RADIUS timeout occurs or if the RADIUS server sends an EAP Access-Reject message. Figure 30 on page 1249 shows the topology used for this example. The RADIUS server is connected to the J-EX4200 switch on access port **ge-0/0/10**. The switch acts as the authenticator Port Access Entity (PAE) and forwards credentials from the supplicant to the user database on the RADIUS server. The switch blocks all traffic and acts as a control gate until the supplicant is authenticated

by the authentication server. A supplicant is connected to the switch through interface **ge-0/0/1**.

Figure 30: Topology for Configuration

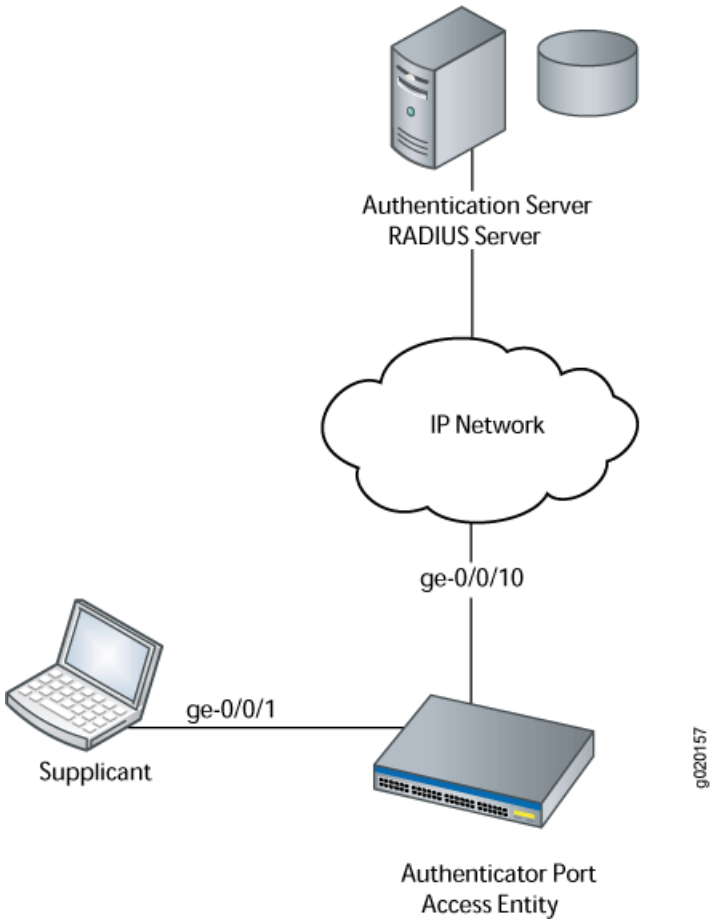

Table 146 on page 1249 describes the components in this topology.

Table 146: Components of the Topology

Property	Settings
Switch hardware	J-EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports.
VLAN names	**default** VLAN **vlan-sf** VLAN
Supplicant	Supplicant attempting access on interface **ge-0/0/1**
One RADIUS server	Backend database with an address of **10.0.0.100** connected to the switch at port **ge-0/0/10**

In this example, configure interface **ge-0/0/1** to move a supplicant attempting access to the LAN during a RADIUS timeout to another VLAN. A RADIUS timeout prevents the

normal exchange of EAP messages that carry information from the RADIUS server to the switch and permit the authentication of a supplicant. The **default** VLAN is configured on interface **ge-0/0/1**. When a RADIUS timeout occurs, supplicants on the interface will be moved from the **default** VLAN to the VLAN named **vlan-sf**.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see *Junos OS System Basics Configuration Guide*.

Configuration

To configure server fail fallback on the switch:

CLI Quick Configuration

To quickly configure server fail fallback on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit protocols dot1x authenticator]
set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

Step-by-Step Procedure

To configure an interface to divert supplicants to a specific VLAN when a RADIUS timeout occurs (here, the VLAN is **vlan-sf**):

1. Define the VLAN to which supplicants are diverted:

```
[edit protocols dot1x authenticator]
user@switch# set interface server-fail vlan-name vlan-sf
```

Results

Display the results of the configuration:

```
user@switch> show configuration
  interfaces {
    ge-0/0/1 {
      unit 0 {
        family ethernet-switching {
          vlan {
            members default;
          }
        }
      }
    }
  protocols {
    dot1x {
      authenticator {
        authentication-profile-name profile52;
        interface {
          ge-0/0/1.0 {
            server-fail vlan-name vlan-sf;
          }
        }
      }
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout on page 1251

Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout

Purpose Verify that the interface moves supplicants to an alternative VLAN during a RADIUS timeout.

Action Display the VLANs configured on the switch; the interface **ge-0/0/1.0** is a member of the **default** VLAN:

```
user@switch> show vlans
Name            Tag     Interfaces
default
                        ge-0/0/0.0, ge-0/0/1.0*, ge-0/0/5.0*, ge-0/0/10.0,
                        ge-0/0/12.0*, ge-0/0/14.0*, ge-0/0/15.0, ge-0/0/20.0
v2              77
                        None
vlan-sf         50
                        None
mgmt
                        me0.0*
```

Display 802.1X protocol information on the switch to view supplicants that are authenticated on interface **ge-0/0/1.0**:

```
user@switch> show dot1x interface brief
802.1X Information:
Interface     Role           State           MAC address          User
ge-0/0/1.0    Authenticator  Authenticated   00:00:00:00:00:01    abc
ge-0/0/10.0   Authenticator  Initialize
ge-0/0/14.0   Authenticator  Connecting
ge-0/0/15.0   Authenticator  Initialize
ge-0/0/20.0   Authenticator  Initialize
```

A RADIUS server timeout occurs. Display the Ethernet switching table to show that the supplicant with the MAC address **00:00:00:00:00:01** previously accessing the LAN through the **default** VLAN is now being learned on the VLAN named **vlan-sf**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 1 learned
  VLAN              MAC address       Type         Age Interfaces
  v1                *                 Flood          - All-members
  vlan-sf           00:00:00:00:00:01 Learn       1:07 ge-0/0/1.0
  default           *                 Flood          - All-members
```

Display 802.1X protocol information to show that interface **ge-0/0/1.0** is connecting and will open LAN access to supplicants:

```
user@switch> show dot1x interface brief
```

```
802.1X Information:
Interface     Role           State          MAC address          User
ge-0/0/1.0    Authenticator  Connecting
ge-0/0/10.0   Authenticator  Initialize
ge-0/0/14.0   Authenticator  Connecting
ge-0/0/15.0   Authenticator  Initialize
ge-0/0/20.0   Authenticator  Initialize
```

Meaning The command **show vlans** displays interface **ge-0/0/1.0** as a member of the **default** VLAN. The command **show dot1x interface brief** shows that a supplicant (**abc**) is authenticated on interface **ge-0/0/1.0** and has the MAC address **00:00:00:00:00:01**. A RADIUS server timeout occurs, and the authentication server cannot be reached by the switch. The command **show-ethernet-switching table** shows that MAC address **00:00:00:00:00:01** is learned on VLAN **vlan-sf**. The supplicant has been moved from the **default** VLAN to the **vlan-sf** VLAN. The supplicant is then connected to the LAN through the VLAN named **vlan-sf**.

Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on a J-EX Series Switch

802.1X on J-EX Series switches provides LAN access to users who do not have credentials in the RADIUS database. These users, referred to as guests, are authenticated and typically provided with access to the Internet.

This example describes how to create a guest VLAN and configure 802.1X authentication for it.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches

- One J-EX Series switch acting as an authenticator interface access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure guest VLAN authentication, be sure you have:

- Installed your J-EX Series switch. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guides at http://www.support.dell.com/manuals.
- Performed the initial software configuration on the switch. See connection and configuration instructions in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.

Overview and Topology

As part of IEEE 802.1X Port-Based Network Access Control (PNAC), you can provide limited network access to supplicants who do not belong to a VLAN authentication group by configuring authentication to a guest VLAN. Typically, guest VLAN access is used to provide Internet access to visitors to a corporate site. However, you can also use the guest VLAN feature to provide supplicants that fail 802.1X authentication to a corporate LAN with access to a VLAN with limited resources.

Figure 31 on page 1254 shows the conference room connected to the switch at interface **ge-0/0/1**.

Figure 31: Topology for Guest VLAN Example

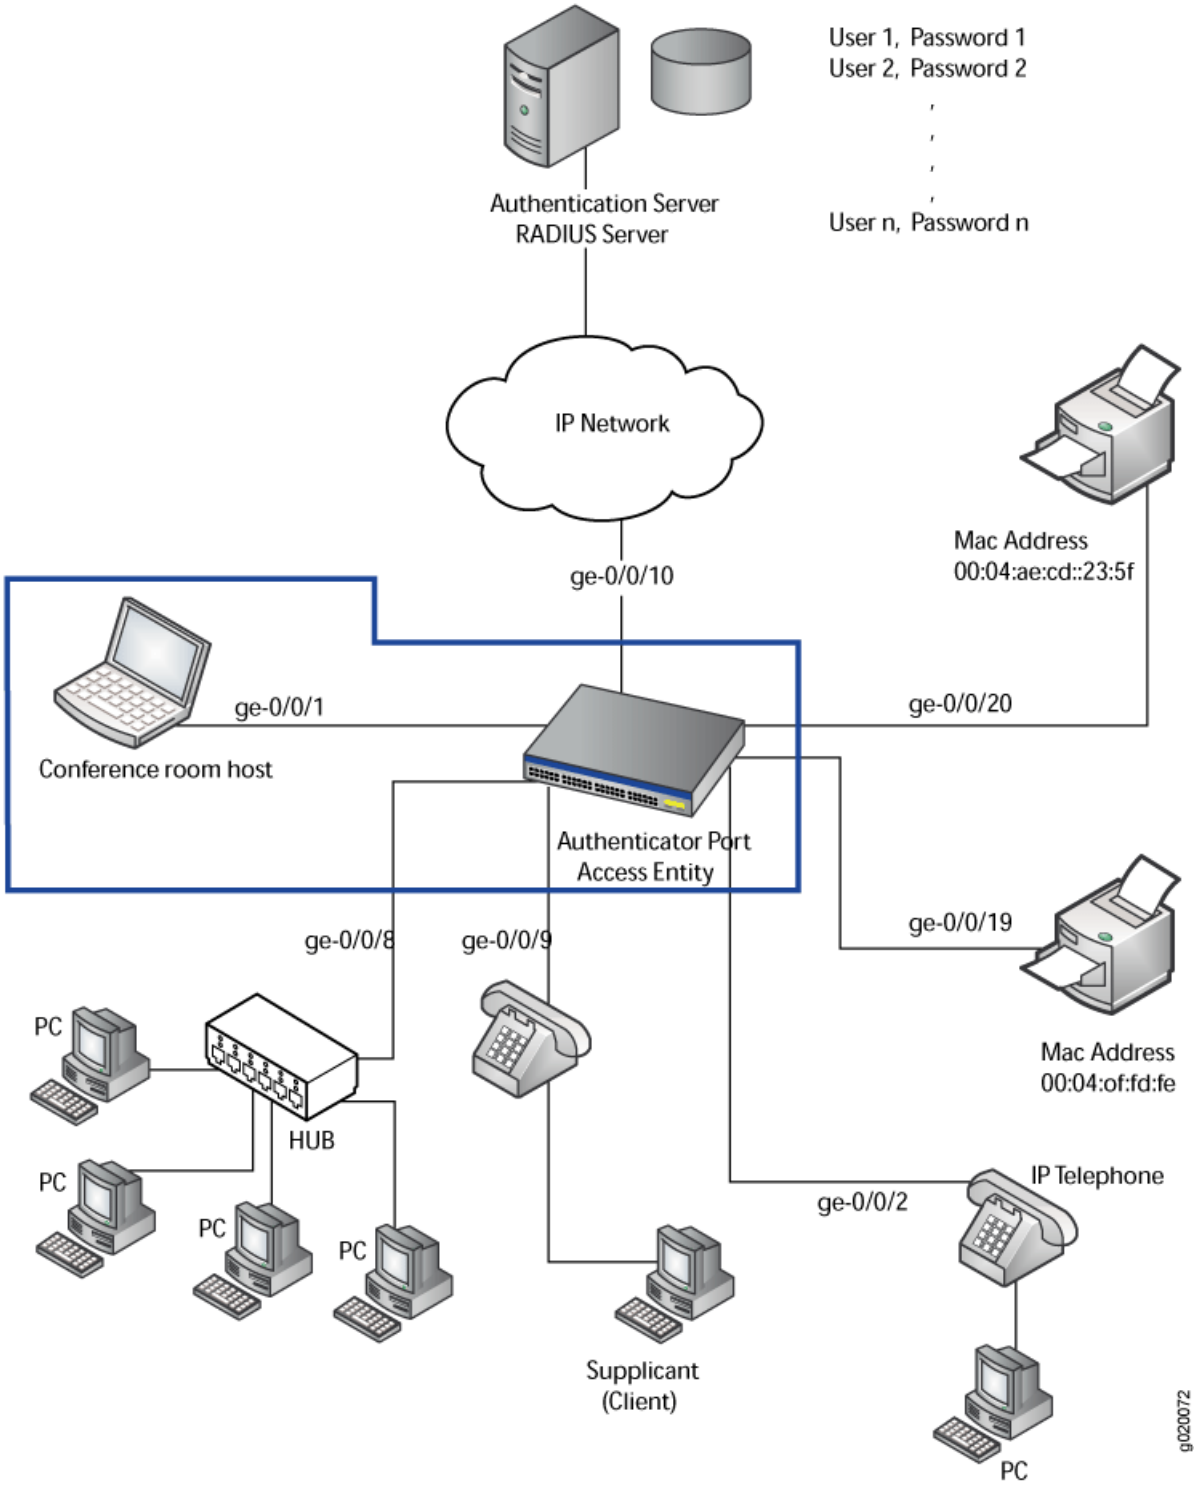

Table 147: Components of the Guest VLAN Topology

Property	Settings
Switch hardware	J-EX4200 switch, 24 Gigabit Ethernet interfaces: 8 PoE interfaces (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE interfaces (**ge-0/0/8** through **ge-0/0/23**)
VLAN names and tag IDs	**sales**, tag **100** **support**, tag **200** **guest-vlan**, tag **300**
One RADIUS server	Backend database connected to the switch through interface **ge-0/0/10**

In this example, access interface **ge-0/0/1** provides LAN connectivity in the conference room. Configure this access interface to provide LAN connectivity to visitors in the conference room who are not authenticated by the corporate VLAN.

Configuration of a Guest VLAN That Includes 802.1X Authentication

To create a guest VLAN and configure 802.1X authentication, perform these tasks:

CLI Quick Configuration

To quickly configure a guest VLAN, with 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans guest-vlan vlan-id 300
set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

Step-by-Step Procedure

To configure a guest VLAN that includes 802.1X authentication on a J-EX Series switch:

1. Configure the VLAN ID for the guest VLAN:

   ```
   [edit]

   user@switch# set vlans guest-vlan vlan-id 300
   ```

2. Configure the guest VLAN under **dot1x** protocols:

   ```
   [edit]

   user@switch# set protocols dot1x authenticator interface all guest-vlan guest-vlan
   ```

Results

Check the results of the configuration:

```
user@switch> show configuration
protocols {
    dot1x {
        authenticator {
            interface {
                all {
                    guest-vlan {
                        guest-vlan;
                    }
                }
            }
        }
    }
}
```

```
}
vlans {
  guest-vlan {
    vlan-id 300;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Guest VLAN is Configured on page 1256

Verifying That the Guest VLAN is Configured

Purpose Verify that the guest VLAN is created and that an interface has failed authentication and been moved to the guest VLAN.

Action Use the operational mode commands:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/3.0*
dynamic         40
                        None
guest           30
                        None
guest-vlan      300
                        ge-0/0/1.0*
vlan_dyn
                        None
```

```
user@switch> show dot1x interface ge-0/0/1.0 detail
ge-0/0/1.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: guest-vlan
  Number of connected supplicants: 1
    Supplicant: user1, 00:00:00:00:13:23
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
```

```
Session Reauth interval: 60 seconds
Reauthentication due in 50 seconds
```

Meaning The output from the **show vlans** command shows **guest-vlan** as the the name of the VLAN and the VLAN ID as **300**.

The output from the **show dot1x interface ge-0/0/1.0 detail** command displays the **Guest VLAN membership** field, indicating that a supplicant at this interface failed 802.1X authentication and was passed through to the **guest-vlan**.

Related Documentation

- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307

Example: Configuring Static MAC Bypass of Authentication on a J-EX Series Switch

To allow devices to access your LAN through 802.1X-configured interfaces without authentication, you can configure a static MAC bypass list on the J-EX Series switch. The static MAC bypass list, also known as the exclusion list, specifies MAC addresses that are allowed on the switch without a request to an authentication server.

You can use static MAC bypass of authentication to allow connection for devices that are not 802.1X-enabled, such as printers. If a host's MAC address is compared and matched against the static MAC address list, the nonresponsive host is authenticated and an interface opened for it.

This example describes how to configure static MAC bypass of authentication for two printers:

- Requirements on page 1257
- Overview and Topology on page 1258
- Configuration on page 1260
- Verification on page 1261

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

Before you configure static MAC authentication, be sure you have:

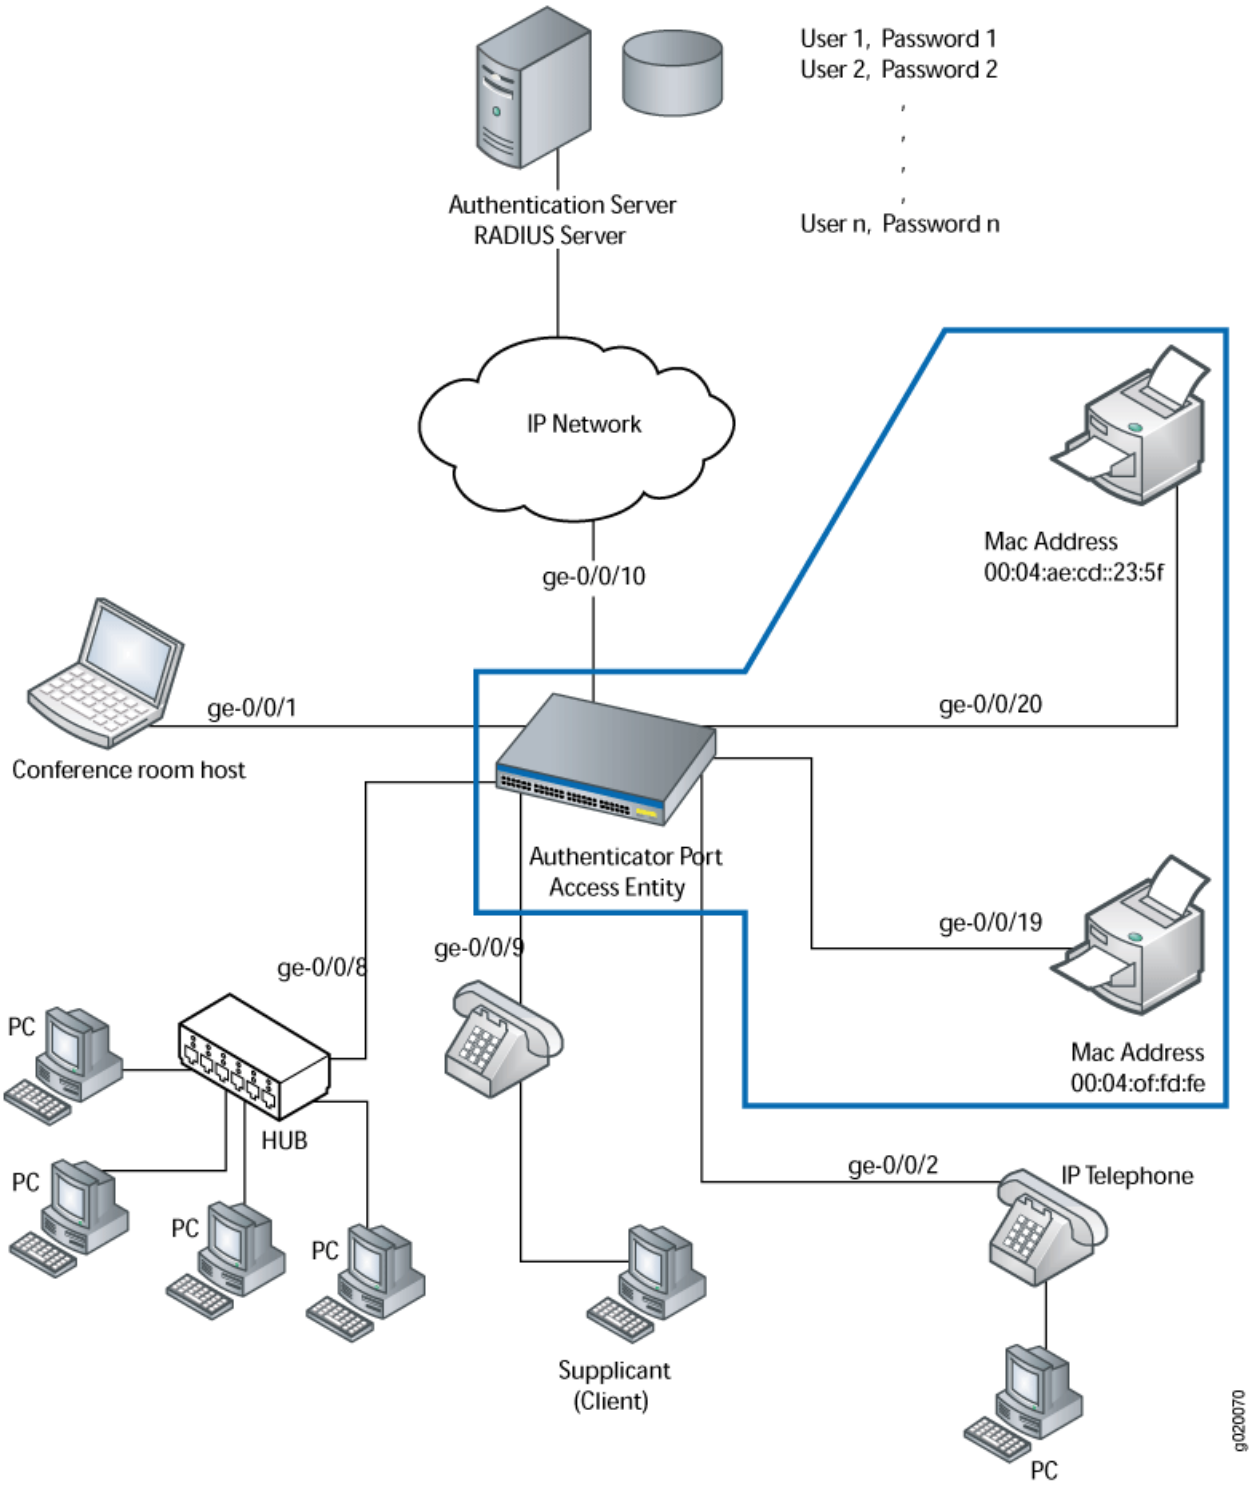
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.

Overview and Topology

To permit printers access to the LAN, add them to the static MAC bypass list. The MAC addresses on this list are permitted access without authentication from the RADIUS server.

Figure 32 on page 1259 shows the two printers connected to the J-EX4200.

Figure 32: Topology for Static MAC Authentication Configuration



The interfaces shown in Table 148 on page 1260 will be configured for static MAC authentication.

Table 148: Components of the Static MAC Authentication Configuration Topology

Property	Settings
Switch hardware	J-EX4200, 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/23**)
VLAN name	**default**
Connections to integrated printer/fax/copier machines (no PoE required)	**ge-0/0/19**, MAC address 00:04:0f:fd:ac:fe **ge-0/0/20**, MAC address 00:04:ae:cd:23:5f

The printer with the MAC address 00:04:0f:fd:ac:fe is connected to access interface **ge-0/0/19**. A second printer with the MAC address 00:04:ae:cd:23:5f is connected to access interface **ge-0/0/20**. Both printers will be added to the static list and bypass 802.1X authentication.

Configuration

To configure static MAC authentication, perform these tasks:

CLI Quick Configuration

To quickly configure static MAC authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator authenticaton-profile-name profile1
set protocols dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
set protocols dot1x interface all supplicant multiple
```

Step-by-Step Procedure

Configure static MAC authentication:

1. Configure the authentication profile name (access profile name) to use for authentication:

   ```
   [edit protocols]
   user@switch# set dot1x authenticator authentication-profile-name profile1
   ```

2. Configure MAC addresses **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f** as static MAC addresses:

   ```
   [edit protocols]
   user@switch# set dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
   ```

3. Configure the 802.1X authentication method:

   ```
   [edit protocols]
   user@switch# set dot1x interface all supplicant multiple
   ```

Results

Display the results of the configuration:

```
user@switch> show
interfaces {
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        vlan members default;
      }
    }
```

```
    }
    ge-0/0/20 {
      unit 0 {
        family ethernet-switching {
          vlan members default;
        }
      }
    }
  }
  protocols {
    dot1x {
      authenticator {
        authentication-profile-name profile1
        static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f];
        interface {
          all {
            supplicant multiple;
          }
        }
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying Static MAC Bypass of Authentication on page 1261

Verifying Static MAC Bypass of Authentication

Purpose Verify that the MAC address for both printers is configured and associated with the correct interfaces.

Action Use the operational mode command:

```
user@switch> show dot1x static-mac-address

MAC address           VLAN-Assignment          Interface
00:04:0f:fd:ac:fe     default                  ge-0/0/19.0
00:04:ae:cd:23:5f     default                  ge-0/0/20.0
```

Meaning The output field **MAC address** shows the MAC addresses of the two printers.

The output field **Interface** shows that the MAC address **00:04:0f:fd:ac:fe** can connect to the LAN through interface **ge-0/0/19.0** and that the MAC address **00:04:ae:cd:23:5f** can connect to the LAN through interface **ge-0/0/20.0**.

Example: Configuring MAC RADIUS Authentication on a J-EX Series Switch

To permit hosts that are not 802.1X-enabled to access the LAN, you can configure MAC RADIUS authentication on the switch interfaces to which the non-802.1X-enabled hosts are connected. When MAC RADIUS authentication is configured, the switch will attempt to authenticate the host with the RADIUS server using the host's MAC address.

This example describes how to configure MAC RADIUS authentication for two non-802.1X-enabled hosts:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches.
- A J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- A RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the J-EX Series switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch" on page 1243.
- Performed basic bridging and VLAN configuration on the switch. See "Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch" on page 29.
- Performed basic 802.1X configuration. See "Configuring 802.1X Interface Settings (CLI Procedure)" on page 1307.

Overview and Topology

IEEE 802.1X Port-Based Network Access Control (PNAC) authenticates and permits devices access to a LAN if the devices can communicate with the switch using the 802.1X protocol (are 802.1X-enabled). To permit non-802.1X-enabled end devices to access the LAN, you can configure MAC RADIUS authentication on the interfaces to which the end devices are connected. When the MAC address of the end device appears on the interface, the switch consults the RADIUS server to check whether it is a permitted MAC address. If the MAC address of the end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device.

You can configure both MAC RADIUS authentication and 802.1X authentication methods on an interface configured for multiple supplicants. Additionally, if an interface is only connected to a non-802.1X-enabled host, you can enable MAC RADIUS and not enable 802.1X authentication using the **mac-radius restrict** option, and thus avoid the delay that occurs while the switch determines that the device is does not respond to EAP messages.

Figure 33 on page 1263 shows the two printers connected to the switch.

Figure 33: Topology for MAC RADIUS Authentication Configuration

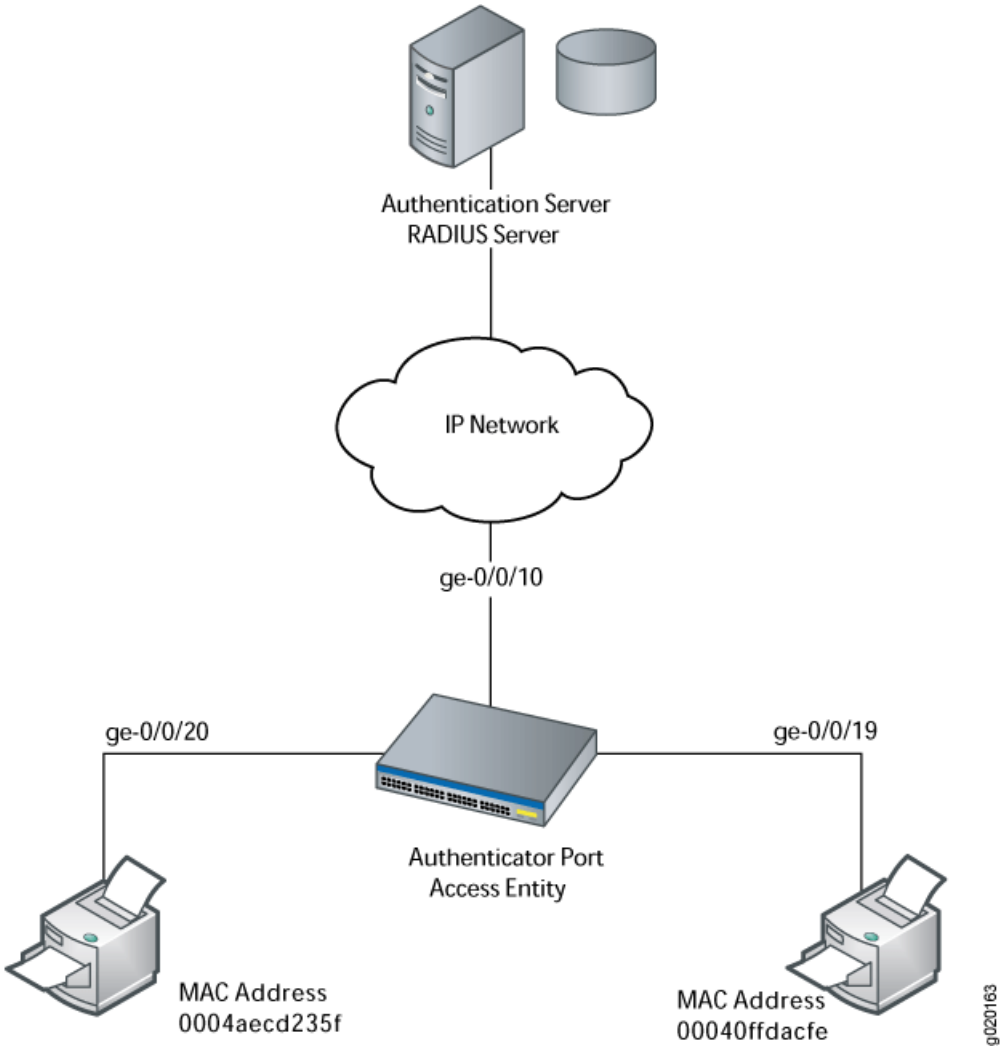

Table 149 on page 1263 shows the components in the example for MAC RADIUS authentication.

Table 149: Components of the MAC RADIUS Authentication Configuration Topology

Property	Settings
Switch hardware	J-EX4200 ports (**ge-0/0/0** through **ge-0/0/23**)
VLAN name	**default**

Table 149: Components of the MAC RADIUS Authentication Configuration Topology *(continued)*

Property	Settings
Connections to printers (no PoE required)	**ge-0/0/19**, MAC address 00040ffdacfe **ge-0/0/20**, MAC address 0004aecd235f
RADIUS server	Connected to the switch on interface **ge-0/0/10**

The printer with the MAC address 00040ffdacfe is connected to access interface **ge-0/0/19**. A second printer with the MAC address 0004aecd235f is connected to access interface **ge-0/0/20**. In this example, both interfaces are configured for MAC RADIUS authentication on the switch, and the MAC addresses (without colons) of both printers are configured on the RADIUS server. Interface **ge-0/0/20** is configured to eliminate the normal delay while the switch attempts 802.1X authentication; MAC RADIUS authentication is enabled and 802.1X authentication is disabled using the **mac-radius restrict** option.

Configuration

To configure MAC RADIUS authentication on the switch, perform these tasks:

CLI Quick Configuration

To quickly configure MAC RADIUS authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/19 mac-radius
set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

NOTE: You must also configure the two MAC addresses as usernames and passwords on the RADIUS server, as is done in step 2 of the Step-by-Step Procedure.

Step-by-Step Procedure

Configure MAC RADIUS authentication on the switch and on the RADIUS server:

1. On the switch, configure the interfaces to which the printers are attached for MAC RADIUS authentication, and configure the **restrict** option on interface **ge-0/0/20**, so that only MAC RADIUS authentication is used:

   ```
   [edit]
   user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
   user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
   ```

2. On the RADIUS server, configure the MAC addresses **00040ffdacfe** and **0004aecd235f** as usernames and passwords:

   ```
   [root@freeradius]#
   edit /etc/raddb
   vi users
   00040ffdacfe Auth-type:=EAP, User-Password = "00040ffdacfe"
   0004aecd235f Auth-type:=EAP, User-Password = "0004aecd235f"
   ```

Results

Display the results of the configuration on the switch:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile52;
      interface {
        ge-0/0/19.0 {
          mac-radius;
        }
        ge-0/0/20.0 {
          mac-radius {
            restrict;
          }
        }
      }
    }
  }
}
```

Verification

Verify that the supplicants are authenticated:

- Verifying That the Supplicants Are Authenticated on page 1265

Verifying That the Supplicants Are Authenticated

Purpose After supplicants are configured for MAC RADIUS authentication on the switch and on the RADIUS server, verify that they are authenticated and display the method of authentication:

Action Display information about 802.1X-configured interfaces **ge-0/0/19** and **ge-0/0/20**:

```
user@switch> show dot1x interface ge-0/0/19.0 detail
ge-0/0/19.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
```

```
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds

user@switch> show dot1x interface ge-0/0/20.0 detail
ge-0/0/20.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Enabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user102, 00:04:ae:cd:23:5f
      Operational state: Authenticated
      Authentcation method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The sample output from the **show dot1x interface detail** command displays the MAC address of the connected end device in the **Supplicant** field. On interface **ge-0/0/19**, the MAC address is **00:04:0f:fd:ac:fe**, which is the MAC address of the first printer configured for MAC RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**. On interface **ge-0/0/20**, the MAC address is **00:04:ae:cd:23:5f**, which is the MAC address of the second printer configured for MAC RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**.

Related Documentation

- Configuring MAC RADIUS Authentication (CLI Procedure) on page 1312
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307
- Configuring 802.1X Authentication (J-Web Procedure) on page 1308
- Understanding Authentication on J-EX Series Switches on page 1222

Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch

802.1x Port-Based Network Access Control (PNAC) authentication on J-EX Series switches provides three types of authentication to meet the access needs of your enterprise LAN:

- Authenticate the first end device (supplicant) on an authenticator port, and allow all others also connecting to have access.
- Authenticate only one end device on an authenticator port at one time.

- Authenticate multiple end devices on an authenticator port. Multiple supplicant mode is used in VoIP configurations.

This example configures a J-EX4200 switch to use IEEE 802.1X to authenticate end devices that use three different administrative modes:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from end devices until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for end devices (supplicants) that have permission to connect to the network.

Before you configure the ports for 802.1X authentication, be sure you have:

- Installed your J-EX Series switch. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guides at http://www.support.dell.com/manuals.
- Performed the initial software configuration on the switch. See connection and configuration instructions in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Configured users on the authentication server.

Overview and Topology

As shown in Figure 34 on page 1268, the topology contains a J-EX4200 access switch connected to the authentication server on port **ge-0/0/10**. Interfaces **ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/11** will be configured for three different administrative modes.

Figure 34: Topology for Configuring Supplicant Modes

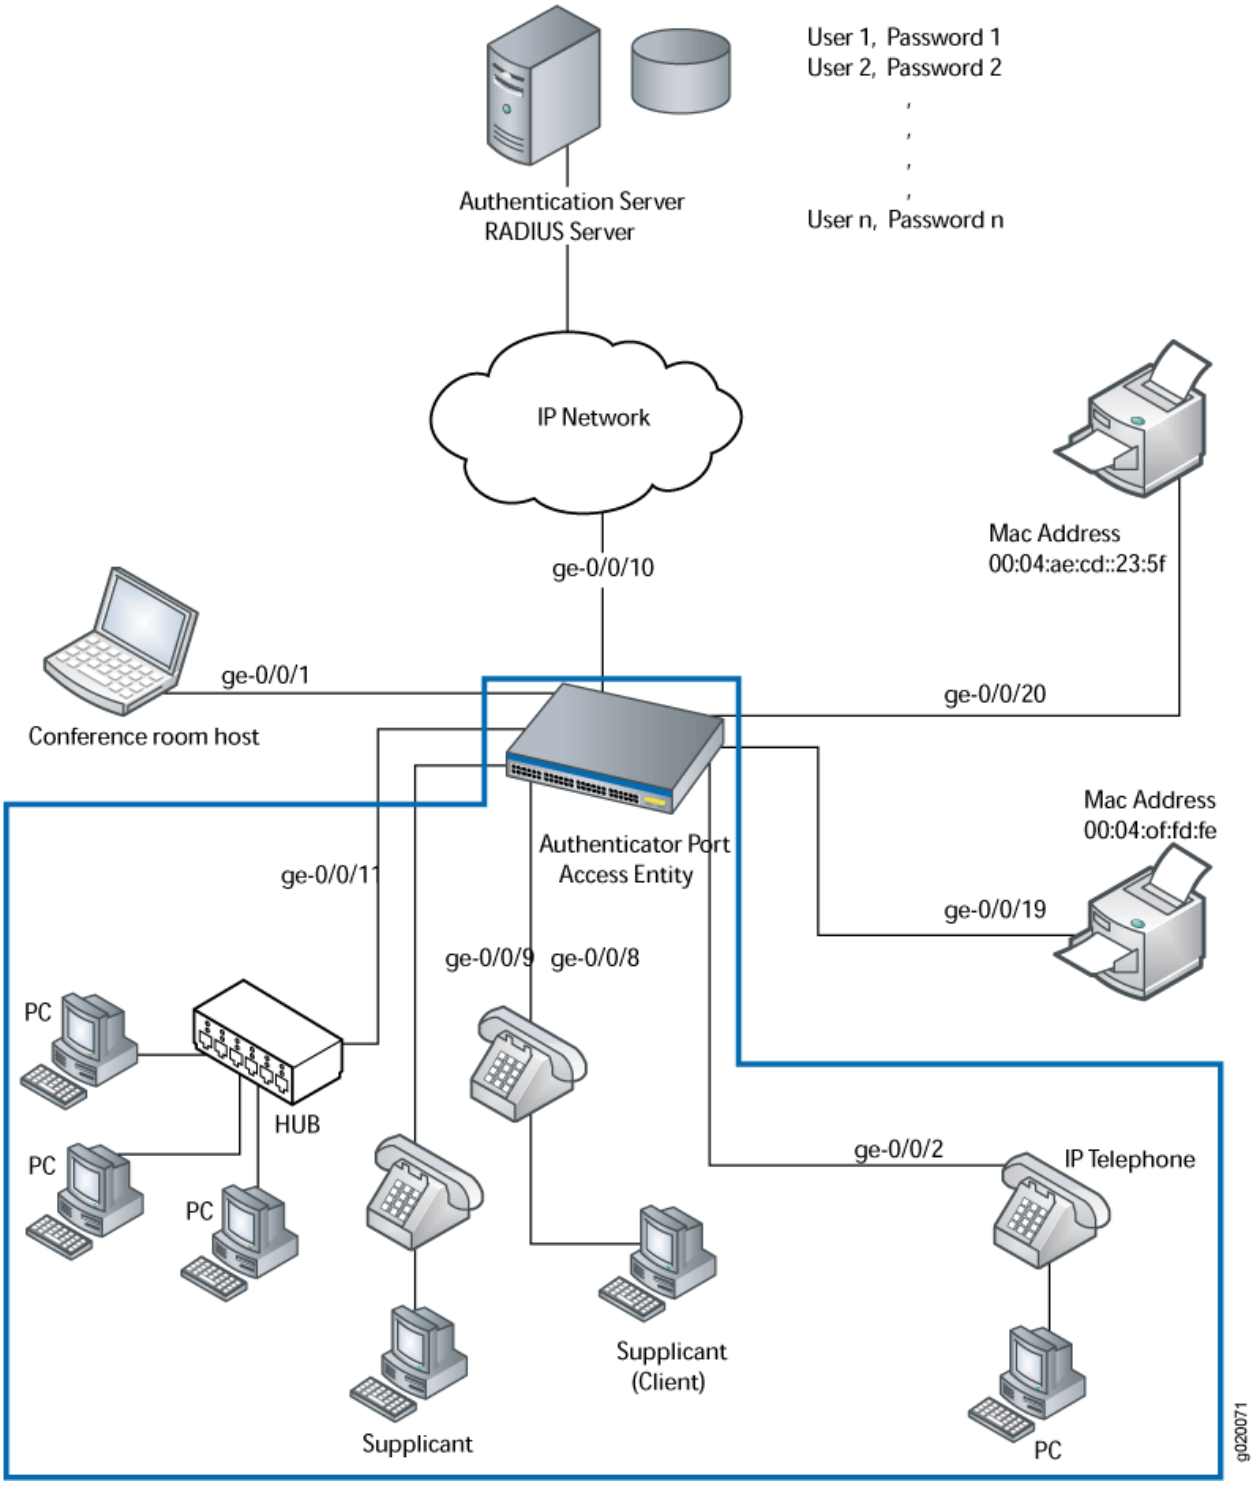

Table 150: Components of the Supplicant Mode Configuration Topology

Property	Settings
Switch hardware	J-EX4200 switch, 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE ports (**ge-0/0/8** through **ge-0/0/23**)
Connections to Avaya phones—with integrated hub, to connect phone and desktop PC to a single port; (requires PoE)	**ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/11**

To configure the administrative modes to support supplicants in different areas of the Enterprise network:

- Configure access port **ge-0/0/8** for single supplicant mode authentication.
- Configure access port **ge-0/0/9** for single secure supplicant mode authentication.
- Configure access port **ge-0/0/11** for multiple supplicant mode authentication.

Single supplicant mode authenticates only the first end device that connects to an authenticator port. All other end devices connecting to the authenticator port after the first has connected successfully, whether they are 802.1X-enabled or not, are permitted free access to the port without further authentication. If the first authenticated end device logs out, all other end devices are locked out until an end device authenticates.

Single-secure supplicant mode authenticates only one end device to connect to an authenticator port. No other end device can connect to the authenticator port until the first logs out.

Multiple supplicant mode authenticates multiple end devices individually on one authenticator port. If you configure a maximum number of devices that can be connected to a port through port security, the lesser of the configured values is used to determine the maximum number of end devices allowed per port.

Configuration of 802.1X to Support Multiple Supplicant Modes

To configure 802.1X authentication to support multiple end devices, perform these tasks:

CLI Quick Configuration

To quickly configure the ports with different 802.1X authentication modes, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/8 supplicant single
set protocols dot1x authenticator interface ge-0/0/9 supplicant single-secure
set protocols dot1x authenticator interface ge-0/0/11 supplicant multiple
```

Step-by-Step Procedure

Configure the administrative mode on the interfaces:

1. Configure the supplicant mode as single on interface **ge-0/0/8**:

   ```
   [edit protocols]
   user@switch# set dot1x authenticator interface ge-0/0/8 supplicant single
   ```

2. Configure the supplicant mode as single secure on interface **ge-0/0/9**:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/9 supplicant single-secure
```

3. Configure multiple supplicant mode on interface **ge-0/0/11**:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/11 supplicant multiple
```

Results Check the results of the configuration:

```
[edit]
user@access-switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
        )
        ge-0/0/9.0 {
          supplicant single-secure;
        )
        ge-0/0/11.0 {
          supplicant multiple;
        )
      }
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the 802.1X Configuration on page 1270

Verifying the 802.1X Configuration

Purpose Verify the 802.1X configuration on interfaces **ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/5**.

Action Verify the 802.1X configuration with the operational mode command **show dot1x interface**:

```
user@switch> show dot1x interface ge-0/0/8.0 detail
ge-0/0/8.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
```

```
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>

user@switch> show dot1x interface ge-0/0/9.0 detail
ge-0/0/9.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single-Secure
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0

user@switch> show dot1x interface ge-0/0/11.0 detail
ge-0/0/11.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

Meaning The **Supplicant mode** output field displays the configured administrative mode for each interface. Interface **ge-0/0/8.0** displays **Single** supplicant mode. Interface **ge-0/0/9.0** displays **Single Secure** supplicant mode. Interface **ge-0/0/11.0** displays **Multiple** supplicant mode.

Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch

You can use RADIUS server attributes and a port firewall filter to centrally apply terms to multiple supplicants (end devices) connected to a J-EX Series switch in your enterprise. Terms are applied after a device is successfully authenticated through 802.1X.

J-EX Series switches support port firewall filters. Port firewall filters are configured on a single J-EX Series switch, but in order for them to operate throughout an enterprise, they have to be configured on multiple switches. To reduce the need to configure the same port firewall filter on multiple switches, you can instead apply the filter centrally on the RADIUS server using RADIUS server attributes.

The following example uses FreeRADIUS to apply a port firewall filter on a RADIUS server. For specifics on configuring your server, consult the documentation that was included with your RADIUS server.

This example describes how to configure a port firewall filter with terms, create counters to count packets for the supplicants, apply the filter to user profiles on the RADIUS server, and display the counters to verify the configuration:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1307 and “Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch” on page 1266.

- Configured users on the RADIUS authentication server (in this example, the user profiles for Supplicant 1 and Supplicant 2 in the topology are modified on the RADIUS server).

Overview and Topology

When the 802.1X configuration on an interface is set to **multiple** supplicant mode, you can apply a single port firewall filter configured through the Junos OS CLI on the J-EX Series switch to any number of end devices (supplicants) on one interface by adding the filter centrally to the RADIUS server. Only a single filter can be applied to an interface; however, the filter can contain multiple terms for separate end devices.

For more information about firewall filters, see “Firewall Filters for J-EX Series Switches Overview” on page 1707.

RADIUS server attributes are applied to end devices after the devices are successfully authenticated using 802.1X. To authenticate an end device, the switch forwards the end device’s credentials to the RADIUS server. The RADIUS server matches the credentials against preconfigured information about the supplicant located in the supplicant’s user profile on the RADIUS server. If a match is found, the RADIUS server instructs the switch to open an interface to the end device. Traffic then flows from and to the end device on the LAN. Further instructions configured in the port firewall filter and added to the end device’s user profile using a RADIUS server attribute further define the access that the end device is granted. Filtering terms configured in the port firewall filter are applied to the end device after 802.1X authentication is complete.

Figure 35 on page 1274 shows the topology used for this example. The RADIUS server is connected to a J-EX4200 switch on access port **ge-0/0/10**. Two end devices (supplicants) are accessing the LAN on interface **ge-0/0/2**. Supplicant 1 has the MAC address **00:50:8b:6f:60:3a**. Supplicant 2 has the MAC address **00:50:8b:6f:60:3b**.

Figure 35: Topology for Firewall Filter and RADIUS Server Attributes Configuration

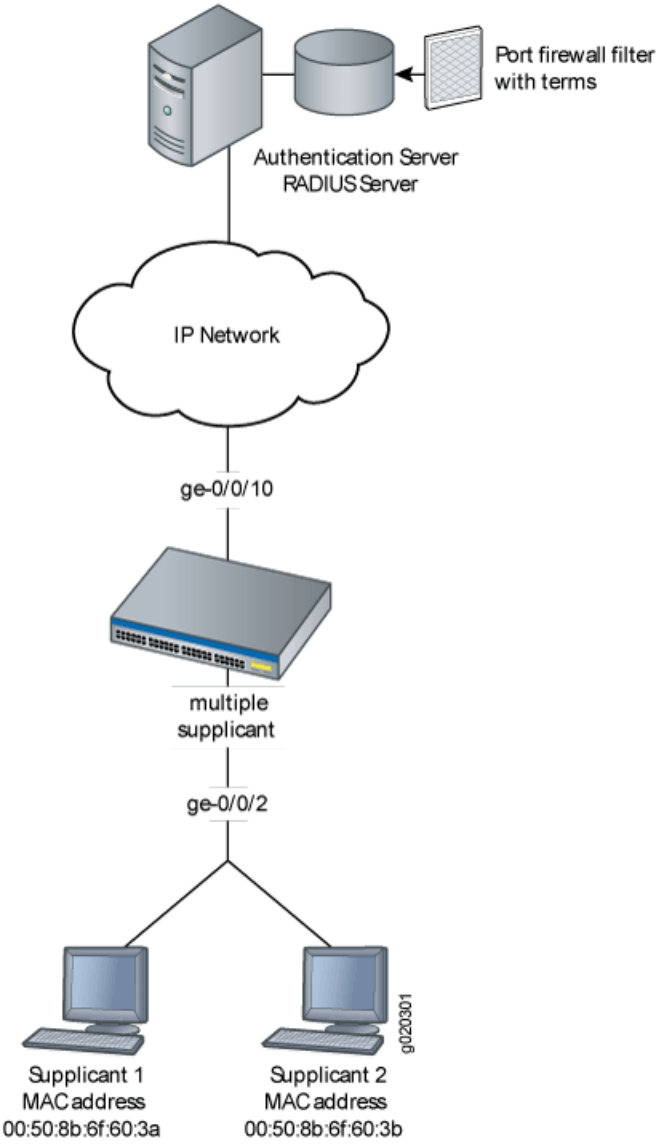

Table 151 on page 1274 describes the components in this topology.

Table 151: Components of the Firewall Filter and RADIUS Server Attributes Topology

Property	Settings
Switch hardware	J-EX4200 access switch, 24 Gigabit Ethernet ports, 8 PoE ports.
One RADIUS server	Backend database with the address **10.0.0.100** connected to the switch at port **ge-0/0/10**.
802.1X supplicants connected to the switch on interface **ge-0/0/2**	• **Supplicant 1** has MAC address **00:50:8b:6f:60:3a**. • **Supplicant 2** has MAC address **00:50:8b:6f:60:3b**.

Table 151: Components of the Firewall Filter and RADIUS Server Attributes Topology *(continued)*

Property	Settings
Port firewall filter to be applied on the RADIUS server	**filter1**
Counters	**counter1** counts packets from Supplicant 1, and **counter2** counts packets from Supplicant 2.
Policer	**policer p1**
User profiles on the RADIUS server	• Supplicant 1 has the user profile **supplicant1**. • Supplicant 2 has the user profile **supplicant2**.

In this example, you configure a port firewall filter named **filter1**. The filter contains terms that will be applied to the end devices based on the MAC addresses of the end devices. When you configure the filter, you also configure the counters **counter1** and **counter2**. Packets from each end device are counted, which helps you verify that the configuration is working. Policer **policer p1** limits the traffic rate based on the values for **exceeding** and **discard** parameters. Then, you check to see that the RADIUS server attribute is available on the RADIUS server and apply the filter to the user profiles of each end device on the RADIUS server. Finally, you verify the configuration by displaying output for the two counters.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see the *Junos OS System Basics Configuration Guide*.

Configuring the Port Firewall Filter and Counters

Configure a port firewall filter and counters:

CLI Quick Configuration

To quickly configure a port firewall filter with terms for Supplicant 1 and Supplicant 2 and create parallel counters for each supplicant, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term supplicant1 from source-mac-address
00:50:8b:6f:60:3a
set firewall family ethernet-switching filter filter1 term supplicant2 from source-mac-address
00:50:8b:6f:60:3b
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall family ethernet-switching filter filter1 term supplicant1 then count counter1
set firewall family ethernet-switching filter filter1 term supplicant1 then policer p1
set firewall family ethernet-switching filter filter1 term supplicant2 then count counter2
```

Step-by-Step Procedure

To configure a port firewall filter and counters on the switch:

1. Configure a port firewall filter (here, **filter1**) with terms for each end device based upon the MAC address of each end device:

   ```
   [edit firewall family ethernet-switching]
   ```

```
user@switch# set filter filter1 term supplicant1 from source-mac-address
00:50:8b:6f:60:3a
user@switch# set filter filter1 term supplicant2 from source-mac-address
00:50:8b:6f:60:3b
```

2. Set policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
```

3. Create two counters that will count packets for each end device and a policer which limits the traffic rate:

```
[edit firewall family ethernet-switching]

user@switch# set filter filter1 term supplicant1 then count counter1
user@switch# set filter filter1 term supplicant1 then policer p1
user@switch# set filter filter1 term supplicant2 then count counter2
```

Results Display the results of the configuration:

```
user@switch> show configuration
  firewall {
    family ethernet-switching {
      filter filter1 {
        term supplicant1 {
          from {
            source-mac-address {
              00:50:8b:6f:60:3a;
            }
          }
          then count counter1;
          then policer p1;
        }
        term supplicant2 {
          from {
            source-mac-address {
              00:50:8b:6f:60:3b;
            }
          }
          then count counter2;
        }
      }
    }
  }
  policer p1 {
    if-exceeding {
      bandwidth-limit 1m;
        burst-size-limit 1k;
      }
      then discard;
    }
```

Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server

Verify that the RADIUS server attribute needed to apply a filter on the RADIUS server is on the server and then apply the port firewall filter to each end device's user profile on the RADIUS server:

Step-by-Step Procedure

To verify that the RADIUS server attribute **Filter-ID** is on the RADIUS server and to apply the filter to the user profiles:

1. Display the dictionary **dictionary.rfc2865** on the RADIUS server, and verify that the attribute **Filter-ID** is in the dictionary:

   ```
   [root@freeradius]# cd usr/share/freeradius/dictionary.rfc2865
   ```

2. Close the dictionary file.

3. Display the local user profiles of the end devices to which you want to apply the filter (here, the user profiles are called **supplicant1** and **supplicant2**):

   ```
   [root@freeradius]# cat /usr/local/etc/raddb/users
   ```

   The output shows:

   ```
   supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
           Tunnel-Type = VLAN,
           Tunnel-Medium-Type = IEEE-802,
           Tunnel-Private-Group-Id = "1005"

   supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
           Tunnel-Type = VLAN,
           Tunnel-Medium-Type = IEEE-802,
           Tunnel-Private-Group-Id = "1005"
   ```

4. Apply the filter to both user profiles by adding the line **Filter-Id = "filter1"** to each profile, and then close the file:

   ```
   [root@freeradius]# cat /usr/local/etc/raddb/users
   ```

   After you paste the line into the files, the files look like this:

   ```
   supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
           Tunnel-Type = VLAN,
           Tunnel-Medium-Type = IEEE-802,
           Tunnel-Private-Group-Id = "1005",
           Filter-Id = "filter1"

   supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
           Tunnel-Type = VLAN,
           Tunnel-Medium-Type = IEEE-802,
           Tunnel-Private-Group-Id = "1005",
           Filter-Id = "filter1"
   ```

Verification

Verify that the filter has been applied to the end devices:

- Verifying That the Filter Has Been Applied to the Supplicants on page 1278

Verifying That the Filter Has Been Applied to the Supplicants

Purpose After the end devices are authenticated, verify that the filter configured on the switch and added to each end device's user profile on the RADIUS server has been applied:

Action Display information about firewall filter **filter1**:

```
user@switch> show firewall filter filter1
Filter: filter1
Counters:
Name                                                Bytes              Packets
counter1                                              128                    2
counter2                                               64                    1
```

Meaning The output of the command **show firewall filter filter1** displays **counter1** and **counter2**. Packets from Supplicant 1 are counted using **counter1**, and packets from Supplicant 2 are counted using **counter2**. The output displays packets incrementing for both counters. The filter has been applied to both end devices.

- Understanding Authentication on J-EX Series Switches on page 1222
- Understanding 802.1X and VSAs on J-EX Series Switches on page 1240

Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch

You can configure voice over IP (VoIP) on a J-EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol forwards VoIP parameters from the switch to the phone. You also configure 802.1X authentication to allow the telephone access to the LAN. Authentication is done through a backend RADIUS server.

This example describes how to configure VoIP on a J-EX Series switch to support an Avaya IP phone, as well as the LLDP-MED protocol and 802.1X authentication:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An Avaya 9620 IP telephone that supports LLDP-MED and 802.1X

Before you configure VoIP, be sure you have:

- Installed your J-EX Series switch. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guides at http://www.support.dell.com/manuals.
- Performed the initial software configuration on the switch. See connection and configuration instructions in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see “Configuring PoE (CLI Procedure)” on page 2029.

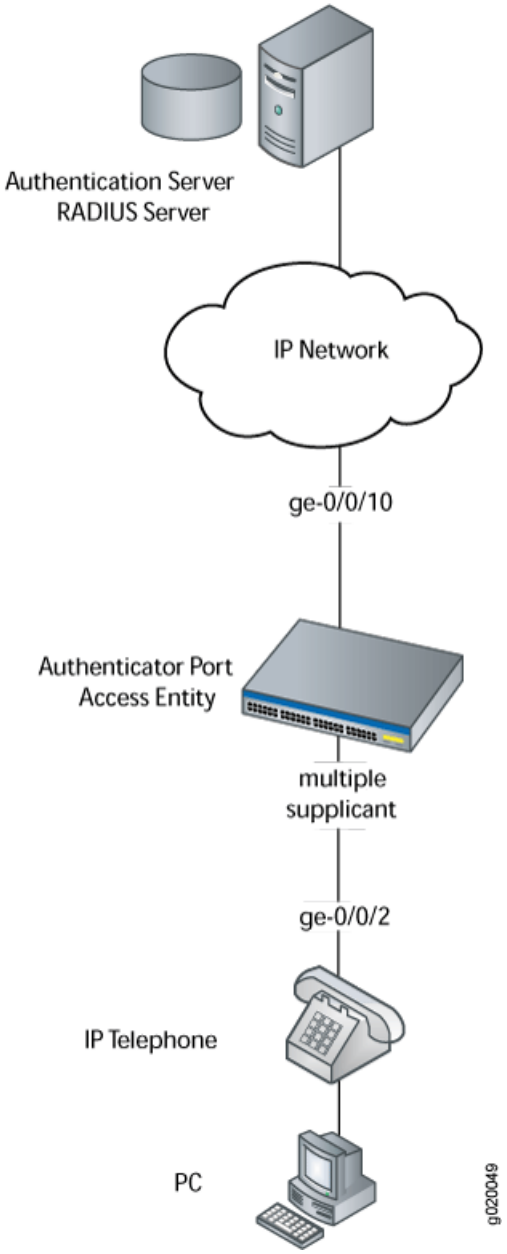
NOTE: If the IP address isn't configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the voip statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN’s ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

Overview and Topology

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface **ge-0/0/2** on the J-EX4200 switch is connected to an Avaya 9620 IP telephone. Avaya phones have a built-in bridge that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one interface on the switch. The J-EX Series switch is connected to a RADIUS server on interface **ge-0/0/10** (see Figure 36 on page 1281).

Figure 36: VoIP Topology



In this example, you configure VoIP parameters and specify the forwarding class **assured-forward** for voice traffic to provide the highest quality of service.

Table 152 on page 1281 describes the components used in this VoIP configuration example.

Table 152: Components of the VoIP Configuration Topology

Property	Settings
Switch hardware	J-EX4200 switch

Table 152: Components of the VoIP Configuration Topology *(continued)*

Property	Settings
VLAN names	**data-vlan** **voice-vlan**
Connection to Avaya phone—with integrated hub, to connect phone and desktop PC to a single interface (requires PoE)	**ge-0/0/2**
One RADIUS server	Provides backend database connected to the switch through interface **ge-0/0/10**.

As well as configuring a VoIP for interface **ge-0/0/2**, you configure:

- 802.1X authentication. Authentication is set to **multiple** supplicant to support more than one supplicant's access to the LAN through interface **ge-0/0/2**.
- LLDP-MED protocol information. The switch uses LLDP-MED to forward VoIP parameters to the phone. Using LLDP-MED ensures that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p class of service and 802.1Q tag information can be sent to the IP telephone.

NOTE: A PoE configuration is not necessary if an IP telephone is using a power adapter.

Configuration

To configure VoIP, LLDP-MED, and 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, LLDP-MED, and 802.1X, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2.0
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Step-by-Step Procedure

To configure VoIP with LLDP-MED and 802.1X:

1. Configure the VLANs for voice and data:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

2. Associate the VLAN **data-vlan** with the interface:

```
[edit vlans]
user@switch# set data-vlan interface ge-0/0/2.0
```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

5. Configure LLDP-MED protocol support:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2.0
```

6. To authenticate an IP phone and a PC connected to the IP phone on the interface, configure 802.1X authentication support and specify **multiple** supplicant mode:

NOTE: If you do not want to authenticate any device, skip the 802.1X configuration on this interface.

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Results Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
protocols {
  lldp-med {
    interface ge-0/0/2.0;
  }
  dot1x {
    authenticator {
      interface {
        ge-0/0/2.0 {
          supplicant multiple;
        }
      }
```

```
        }
      }
    }
    vlans {
      data-vlan {
        vlan-id 77;
        interface {
          ge-0/0/2.0;
        }
      }
      voice-vlan {
        vlan-id 99;
      }
    }
    ethernet-switching options {
      voip {
        interface ge-0/0/2.0 {
          vlan voice-vlan;
          forwarding-class assured-forwarding;
        }
      }
    }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying LLDP-MED Configuration on page 1284
- Verifying 802.1X Authentication for IP Phone and Desktop PC on page 1285
- Verifying the VLAN Association with the Interface on page 1286

Verifying LLDP-MED Configuration

Purpose Verify that LLDP-MED is enabled on the interface.

Action

```
user@switch> show lldp detail
LLDP                     : Enabled
Advertisement interval   : 30 Second(s)
Transmit delay           : 2 Second(s)
Hold timer               : 2 Second(s)
Config Trap Interval     : 300 Second(s)
Connection Hold timer    : 60 Second(s)

LLDP MED                 : Enabled
MED fast start count     : 3 Packet(s)

Interface      LLDP       LLDP-MED    Neighbor count
all            Enabled    -           0
ge-0/0/2.0     -          Enabled     0

Interface     VLAN-id     VLAN-name
ge-0/0/0.0    0           default
ge-0/0/1.0    0           employee-vlan
ge-0/0/2.0    0           data-vlan
ge-0/0/2.0    99          voice-vlan
ge-0/0/3.0    0           employee-vlan
```

```
ge-0/0/8.0    0          employee-vlan
ge-0/0/10.0   0          default
ge-0/0/11.0   20         employee-vlan
ge-0/0/23.0   0          default

LLDP basic TLVs supported:
Chassis identifier, Port identifier, Port description, System name, System
description, System capabilities, Management address.

LLDP 802 TLVs supported:
Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port
VLAN name.

LLDP MED TLVs supported:
LLDP MED capabilities, Network policy, Endpoint location, Extended power
Via MDI.
```

Meaning The **show lldp detail** output shows that both LLDP and LLDP-MED are configured on the **ge-0/0/2.0** interface. The end of the output shows the list of supported LLDP basic TLVs, 802.3 TLVs, and LLDP-MED TLVs that are supported.

Verifying 802.1X Authentication for IP Phone and Desktop PC

Purpose Display the 802.1X configuration to confirm that the VoIP interface has access to the LAN.

Action

```
user@switch> show dot1x interface ge/0/0/2.0 detail
ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

Verifying the VLAN Association with the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch> show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  down     default                unblocked
ge-0/0/1.0  down     employee-vlan          unblocked
ge-0/0/5.0  down     employee-vlan          unblocked
ge-0/0/3.0  down     employee-vlan          unblocked
ge-0/0/8.0  down     employee-vlan          unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     employee-vlan          unblocked
ge-0/0/23.0 down     default                unblocked
ge-0/0/2.0  up       voice-vlan             unblocked
                     data-vlan              unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

- Defining CoS Forwarding Classes (J-Web Procedure) on page 1919
- Configuring LLDP-MED (CLI Procedure) on page 1324

Example: Configuring VoIP on a J-EX Series Switch Without Including 802.1X Authentication

You can configure voice over IP (VoIP) on a J-EX Series switch to support IP telephones.

To configure VoIP on a J-EX Series switch to support an IP phone that does not support 802.1X authentication, you must either add the MAC address of the phone to the static MAC bypass list or enable MAC RADIUS authentication on the switch.

This example describes how to configure VoIP on a J-EX Series switch without 802.1X authentication using static MAC bypass of authentication:

- Requirements on page 1287
- Overview on page 1287
- Configuration on page 1288
- Verification on page 1290

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- An IP telephone

Before you configure VoIP, be sure you have:

- Installed your J-EX Series switch. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guides at http://www.support.dell.com/manuals.
- Performed the initial software configuration on the switch. See connection and configuration instructions in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see “Configuring PoE (CLI Procedure)” on page 2029.

NOTE: If the IP address isn't configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the voip statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN’s ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface **ge-0/0/2** on the J-EX4200 switch is connected to a non-802.1X IP phone.

To configure VoIP on a J-EX Series switch to support an IP phone that does not support 802.1X authentication, add the MAC address of the phone as a static entry in the authenticator database and set the supplicant mode to multiple.

Configuration

To configure VoIP without 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2.0
set protocols dot1x authenticator authentication-profile-name auth-profile
set protocols dot1x authenticator static 00:04:f2:11:aa:a7
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Step-by-Step Procedure

To configure VoIP without 802.1X:

1. Configure the VLANs for voice and data:

   ```
   [edit vlans]
   user@switch# set data-vlan vlan-id 77
   user@switch# set voice-vlan vlan-id 99
   ```

2. Associate the VLAN **data-vlan** with the interface:

   ```
   [edit vlans]
   user@switch# set data-vlan interface ge-0/0/2.0
   ```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
   user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
   ```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

   ```
   [edit ethernet-switching-options]
   user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
   user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
   ```

5. Configure LLDP-MED protocol support:

   ```
   [edit protocols]
   user@switch# set lldp-med interface ge-0/0/2.0
   ```

6. Set the authentication profile (see “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1307 and “Configuring 802.1X RADIUS Accounting (CLI Procedure)” on page 1316):

   ```
   [edit protocols]
   set dot1x authenticator authentication-profile-name auth-profile
   ```

7. Add the MAC address of the phone to the static MAC bypass list:

```
[edit protocols]
set dot1x authenticator static 00:04:f2:11:aa:a7
```

8. Set the supplicant mode to multiple:

```
[edit protocols]
set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Results Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
protocols {
  lldp-med {
    interface ge-0/0/2.0;
  }
  dot1x {
    authenticator {
      authentication-profile-name auth-profile;
        static {
          00:04:f2:11:aa:a7;
        }
      }
      interface {
        ge-0/0/2.0 {
          supplicant multiple;
        }
    }
  }
}
vlans {
  data-vlan {
    vlan-id 77;
    interface {
      ge-0/0/2.0;
    }
  }
  voice-vlan {
    vlan-id 99;
  }
}
ethernet-switching options {
  voip {
    interface ge-0/0/2.0 {
```

```
        vlan voice-vlan;
        forwarding-class assured-forwarding;
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying LLDP-MED Configuration on page 1290
- Verifying Authentication for the Desktop PC on page 1291
- Verifying the VLAN Association with the Interface on page 1291

Verifying LLDP-MED Configuration

Purpose Verify that LLDP-MED is enabled on the interface.

Action

```
user@switch> show lldp detail
LLDP                     : Enabled
Advertisement interval   : 30 Second(s)
Transmit delay           : 2 Second(s)
Hold timer               : 2 Second(s)
Config Trap Interval     : 300 Second(s)
Connection Hold timer    : 60 Second(s)

LLDP MED                 : Enabled
MED fast start count     : 3 Packet(s)

Interface      LLDP       LLDP-MED    Neighbor count
all            Enabled    -           0
ge-0/0/2.0     -          Enabled     0

Interface     VLAN-id     VLAN-name
ge-0/0/0.0    0           default
ge-0/0/1.0    0           employee-vlan
ge-0/0/2.0    0           data-vlan
ge-0/0/2.0    99          voice-vlan
ge-0/0/3.0    0           employee-vlan
ge-0/0/8.0    0           employee-vlan
ge-0/0/10.0   0           default
ge-0/0/11.0   20          employee-vlan
ge-0/0/23.0   0           default

LLDP basic TLVs supported:
Chassis identifier, Port identifier, Port description, System name, System
description, System capabilities, Management address.

LLDP 802 TLVs supported:
Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port
VLAN name.

LLDP MED TLVs supported:
LLDP MED capabilities, Network policy, Endpoint location, Extended power
Via MDI.
```

Meaning The **show lldp detail** output shows that both LLDP and LLDP-MED are configured on the **ge-0/0/2.0** interface. The end of the output shows the list of supported LLDP basic TLVs, 802.3 TLVs, and LLDP-MED TLVs that are supported.

Verifying Authentication for the Desktop PC

Purpose Display the 802.1X configuration for the desktop PC connected to the VoIP interface through the IP phone.

Action

```
user@switch>  show dot1x interface ge/0/0/2.0 detail
ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

Verifying the VLAN Association with the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch>  show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  down     default                unblocked
ge-0/0/1.0  down     employee-vlan          unblocked
ge-0/0/5.0  down     employee-vlan          unblocked
ge-0/0/3.0  down     employee-vlan          unblocked
ge-0/0/8.0  down     employee-vlan          unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     employee-vlan          unblocked
ge-0/0/23.0 down     default                unblocked
```

```
ge-0/0/2.0   up       voice-vlan              unblocked
                      data-vlan               unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278
- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 1292
- Understanding 802.1X and VoIP on J-EX Series Switches on page 1237
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support

You can configure voice over IP (VoIP) on a J-EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol is sometimes used with IP phones to forward VoIP parameters from the switch to the phone. Not all IP phones support LLDP-MED, however.

This example describes how to configure VoIP on a J-EX Series switch without LLDP-MED and without 802.1X:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches.
- One J-EX4200 switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An IP phone that does not support LLDP-MED.

Before you configure VoIP, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Configured the IP phone as a member of the voice VLAN.

- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. See "Configuring PoE (CLI Procedure)" on page 2029.

Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

To configure VoIP on a J-EX Series switch to support an IP phone that does not support LLDP-MED, add the port to which you want to connect the IP phone as a member of the voice VLAN and configure the data VLAN as the native VLAN on the J-EX Series switch. This configuration ensures that the voice traffic and data traffic do not affect each other.

In this example, the interface ge-0/0/2 on the J-EX4200 switch is connected to a non-LLDP-MED IP phone.

NOTE: The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

Configuration

To configure VoIP without LLDP-MED or 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members voice-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan
```

Step-by-Step Procedure

Configure VoIP:

1. Configure the VLANs for data and voice:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

2. Configure the VLAN **data-vlan** on the interface:

```
[edit vlans]
user@switch# set data-vlan interface ge-0/0/2.0
```

3. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

4. Add the interface as a member of the voice VLAN:

```
[edit interfaces]
set ge-0/0/2 unit 0 family ethernet-switching vlan members voice-vlan
```

5. Configure **data-vlan** as native to this trunk interface:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan
```

Results Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members voice-vlan;
        }
        native-vlan-id data-vlan;
      }
    }
  }
}
vlans {
  data-vlan {
    vlan-id 77;
    interface {
      ge-0/0/2.0;
    }
  }
  voice-vlan {
    vlan-id 99;
  }
}
ethernet-switching options {
  voip {
    interface ge-0/0/2.0 {
      vlan voice-vlan;
      forwarding-class assured-forwarding;
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform the following task:

- Verifying the VLAN Association With the Interface on page 1295

Verifying the VLAN Association With the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch>  show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  down     default                unblocked
ge-0/0/1.0  down     employee-vlan          unblocked
ge-0/0/5.0  down     employee-vlan          unblocked
ge-0/0/3.0  down     employee-vlan          unblocked
ge-0/0/8.0  down     employee-vlan          unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     employee-vlan          unblocked
ge-0/0/23.0 down     default                unblocked
ge-0/0/2.0  up       voice-vlan             unblocked
                     data-vlan              unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278
- Example: Configuring VoIP on a J-EX Series Switch Without Including 802.1X Authentication on page 1286
- Understanding 802.1X and VoIP on J-EX Series Switches on page 1237
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

On J-EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10,2 or later for J-EX Series switches
- One J-EX Series switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

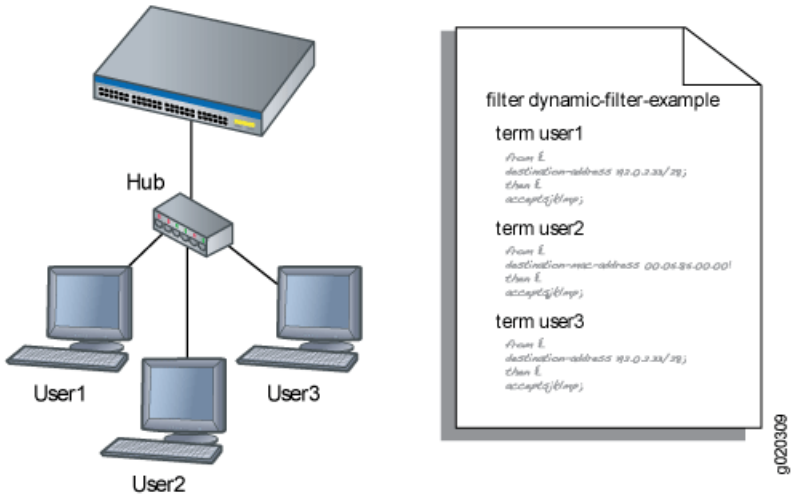
- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1307 and “Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch” on page 1266.
- Configured users on the RADIUS authentication server.

Overview and Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in Figure 37 on page 1297, when User1 is authenticated by the J-EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User2 is authenticated, another term is added to the firewall filter, and so on.

Figure 37: Conceptual Model: Dynamic Filter Updated for Each New User

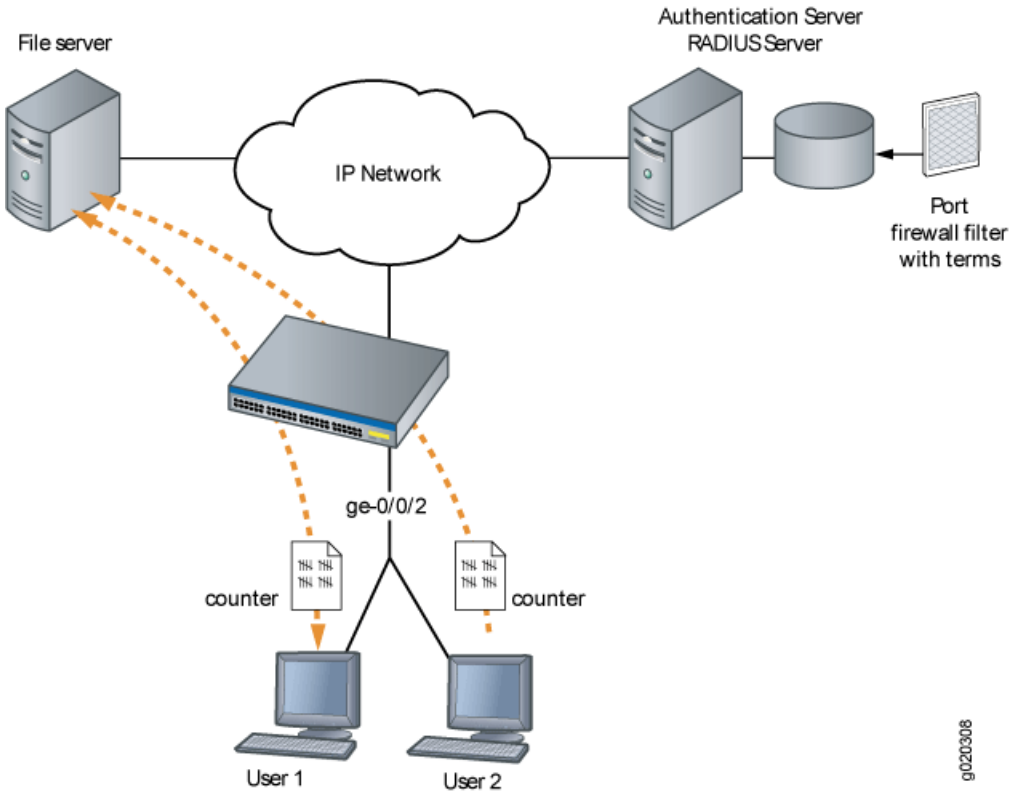


This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

NOTE: If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface **ge-0/0/2** to the file server, which is located on subnet **192.0.2.16/28**, and set policer definitions to rate limit the traffic. Figure 38 on page 1298 shows the network topology for this example.

Figure 38: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server



Configuration

To configure firewall filters for multiple supplicants on 802.1X-enabled interfaces:

- Configuring Firewall Filters on Interfaces with Multiple Supplicants on page 1298

Configuring Firewall Filters on Interfaces with Multiple Supplicants

CLI Quick Configuration

To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/2 supplicant multiple
set firewall family ethernet-switching filter filter1 term term1 from destination-address
192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

Step-by-Step Procedure

To configure firewall filters on an interface enabled for multiple supplicants:

1. Configure interface **ge-0/0/2** for multiple supplicant mode authentication:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/2 supplicant multiple
   ```

2. Set policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
```

3. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

Results Check the results of the configuration:

```
user@switch> show configuration

firewall {
    family ethernet-switching {
        filter filter1 {
            term term1 {
                from {
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then count counter1;
                term term2 {
                from {
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then policer p1;
            }
        }
    }
    policer p1 {
        if-exceeding {
            bandwidth-limit 1m;
                burst-size-limit 1k;
            }
            then discard;
        }
}
protocols {
    dot1x {
        authenticator
            interface ge-0/0/2 {
                supplicant multiple;
            }
        }
    }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying Firewall Filters on Interfaces with Multiple Supplicants on page 1300

Verifying Firewall Filters on Interfaces with Multiple Supplicants

Purpose Verify that firewall filters are functioning on the interface with multiple supplicants.

Action

1. Check the results with one user authenticated on the interface. In this case, the user is authenticated on **ge-0/0/2**:

```
user@switch> show dot1x firewall

Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```

2. When a second user, User2, is authenticated on the same interface, **ge-0/0/2**, you can verify that the filter includes the results for both of the users authenticated on the interface:

```
user@switch> show dot1x firewall

Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```

Meaning The results displayed by the **show dot1x firewall** command output reflect the dynamic filter created with the authentication of each new user. User1 accessed the file server located at the specified destination address 100 times, while User2 accessed the same file server 400 times.

Related Documentation

- Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch on page 1272

- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1317

Example: Setting Up Captive Portal Authentication on a J-EX Series Switch

You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

This example describes how to set up captive portal on a J-EX Series switch:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- A J-EX4200 Series switch

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See "Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch" on page 29.
- Generated an SSL certificate and installed it on the switch. See Generating SSL Certificates to Be Used for Secure Web Access.
- Configured basic access between the J-EX Series switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch" on page 1243.
- Designed your captive portal login page. See "Designing a Captive Portal Authentication Login Page on a J-EX Series Switch" on page 1329.

Overview and Topology

This example shows the configuration required on the switch to enable captive portal on an interface. To permit a printer connected to the captive portal interface to access the LAN, add its MAC address to the authentication whitelist. The MAC addresses on this list are permitted access on the interface without captive portal authentication.

The topology for this example consists of one J-EX Series switch connected to a RADIUS authentication server. One interface on the switch is configured for captive portal. In this example, the interface is configured in single supplicant mode.

Configuration

To configure captive portal on your switch:

CLI Quick Configuration

To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window:

```
[edit]
set system services web-management https local-certificate my-signed-cert
set services captive-portal secure-authentication https
set services captive-portal interface ge-0/0/10.0
set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
set custom-options post-authentication-url http://www.my-home-page.com
```

Step-by-Step Procedure

To configure captive portal on the switch:

1. To create a secure channel for Web access to the switch, configure captive portal for HTTPS:

   a. Associate the security certificate with the Web server and enable HTTPS on the switch:

   ```
   [edit]
   user@switch# set system services web-management https local-certificate
   my-signed-cert
   ```

   

   NOTE: You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

   b. Configure captive portal to use HTTPS:

   ```
   [edit]
   user@switch# set services captive-portal secure-authentication https
   ```

2. Enable an interface for captive portal:

   ```
   [edit]
   user@switch# set services captive-portal interface ge-0/0/10
   ```

3. (Optional) Allow specific clients to bypass captive portal authentication:

   

   NOTE: If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the clear captive-portal mac-address *mac-address* command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the ethernet switching table and the authentication bypass will not be allowed.

   ```
   [edit]
   user@switch# set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
   ```

   

   NOTE: Optionally, you can use set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0 to limit the scope to the interface.

4. (Optional) To redirect clients to a specified page rather than the page they originally requested, configure the post-authentication URL:

   ```
   [edit services captive-portal]
   user@switch# set custom-options post-authentication-url
   http://www.my-home-page.com
   ```

Results

Display the results of the configuration:

```
[edit]
user@switch# show
system {
    services {
        web-management {
            https {
                local-certificate my-signed-cert;
            }
        }
    }
}
security {
    certificates {
        local {
            my-signed-cert {
                "-----BEGIN RSA PRIVATE KEY-----\nMIICXwIBAAKBgQDk8sUggnXdDUmr7T
                    vLv63yJq/LRpDASfIDZlX3z9ZDe1Kfk5C9\nr/tkyvzv
                    ...
                    Pt5YmvWDoGo0mSjoE/liH0BqYdh9YGqv3T2IEUfflSTQQHEOShS0ogWDHF\
                    nnyOb1O/vQtjk20X9NVQg JHBwidssY9eRp\n-----END CERTIFICATE-----\n";
                    ## SECRET-DATA
            }
        }
    }
}
services {
    captive-portal {
        interface {
            ge-0/0/10.0;
        }
        secure-authentication https;
    }
}
ethernet-switching-options {
    authentication-whitelist {
        00:10:12:e0:28:22/48;
    }
}
```

Verification

To confirm that captive portal authentication is configured and working properly, perform these tasks:

- Verifying That Captive Portal Is Enabled on the Interface on page 1303
- Verify That Captive Portal Is Working Correctly on page 1304

Verifying That Captive Portal Is Enabled on the Interface

Purpose Verify that captive portal is configured on interface **ge-0/0/10**.

Action Use the operational mode command **show captive-portal interface *interface-name* detail**:

```
user@switch> show captive-portal interface ge-0/0/10.0 detail
```

```
ge-0/0/10.0
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Configured CP session timeout: 3600 seconds
  Server timeout: 15 seconds
```

Meaning The output confirms that captive portal is configured on interface ge-0/0/10 with the default settings for number of retries, quiet period, CP session timeout, and server timeout.

Verify That Captive Portal Is Working Correctly

Purpose Verify that captive portal is working on the switch.

Action Connect a client to interface ge-0/0/10. From the client, open a Web browser and request a webpage. The captive portal login page that you designed should be displayed. After you enter your login information and are authenticated against the RADIUS server, the Web browser should display either the page you requested or the post-authentication URL that you configured.

Troubleshooting

To troubleshoot captive portal, perform these tasks:

Troubleshooting Captive Portal

Problem The switch does not return the captive portal login page when a user connected to a captive portal interface on the switch requests a Web page.

Solution You can examine the ARP, DHCP, HTTPS, and DNS counters—if one or more of these counters are not incrementing, this provides an indication of where the problem lies. For example, if the client cannot get an IP address, you might check the switch interface to determine whether the DHCP counter is incrementing—if the counter increments, the DHCP packet was received by the switch.

```
user@switch> show captive-portal firewall ge-0/0/10.0
ge-0/0/10.0
  Filter name: dot1x_ge-0/0/10
Counters:
Name                          Bytes              Packets
dot1x_ge-0/0/10_CP_arp         7616                  119
dot1x_ge-0/0/10_CP_dhcp           0                    0
dot1x_ge-0/0/10_CP_http           0                    0
dot1x_ge-0/0/10_CP_https          0                    0
dot1x_ge-0/0/10_CP_t_dns          0                    0
dot1x_ge-0/0/10_CP_u_dns          0                    0
```

CHAPTER 27

Configuring Access Control

Specifying RADIUS Server Connections on a J-EX Series Switch (CLI Procedure)

IEEE 802.1X and MAC RADIUS authentication both provide network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from devices at the interface until the supplicant's credentials or MAC address are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

To use 802.1X or MAC RADIUS authentication, you must specify the connections on the switch for each RADIUS server to which you will connect.

To configure a RADIUS server on the switch:

1. Define the IP address of the RADIUS server, the RADIUS server authentication port number, and the secret password. You can define more than one RADIUS server. The secret password on the switch must match the secret password on the server:

```
[edit access]
user@switch# set radius-server 10.0.0.100 port 1812 secret abc
```

NOTE: Specifying the authentication port is optional, and port 1812 is the default. However, we recommend that you configure it in order to avoid confusion as some RADIUS servers might refer to an older default.

2. (Optional) Specify the IP address by which the switch is identified by the RADIUS server. If you do not specify this, the RADIUS server uses the address of the interface sending the RADIUS request. We recommend that you specify this IP address because if the request gets diverted on an alternate route to the RADIUS server, the interface relaying the request might not be an interface on the switch.

```
[edit access]
user@switch# set access radius-server source-address 10.93.14.100
```

3. Configure the authentication order, making **radius** the first method of authentication:

```
[edit access]
user@switch# set profile profile1 authentication-order radius
```

4. Create a profile and specify the list of RADIUS servers to be associated with the profile. For example, you might choose to group your RADIUS servers geographically by city. This feature enables easy modification whenever you want to change to a different sent of authentication servers.

```
[edit access profile]
user@switch# set atlanta radius authentication-server 10.0.0.100 10.2.14.200
```

5. Specify the group of servers to be used for 802.1X or MAC RADIUS authentication by identifying the profile name:

```
[edit access profile]
user@switch# set protocols dot1x authenticator authentication-profile-name denver
```

6. Configure the IP address of the J-EX Series switch in the list of clients on the RADIUS server. For specifics on configuring the RADIUS server, consult the documentation for your server.

Related Documentation

- Configuring 802.1X Authentication (J-Web Procedure) on page 1308
- Configuring MAC RADIUS Authentication (CLI Procedure) on page 1312
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316

Configuring 802.1X Interface Settings (CLI Procedure)

IEEE 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from a supplicant (client) at the interface until the supplicant's credentials are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

NOTE:

- You can also specify an 802.1X exclusion list to specify supplicants can that can bypass authentication and be automatically connected to the LAN. See “Configuring Static MAC Bypass of Authentication (CLI Procedure)” on page 1311.
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

Before you begin, specify the RADIUS server or servers to be used as the authentication server. See “Specifying RADIUS Server Connections on a J-EX Series Switch (CLI Procedure)” on page 1306.

To configure 802.1X on an interface:

1. Configure the supplicant mode as **single** (authenticates the first supplicant), **single-secure** (authenticates only one supplicant), or **multiple** (authenticates multiple supplicants):

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 supplicant multiple
```

2. Enable reauthentication and specify the reauthentication interval:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5/0 reauthentication interval 5
```

3. Configure the interface timeout value for the response from the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 supplicant-timeout 5
```

4. Configure the timeout for the interface before it resends an authentication request to the RADIUS server:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 server-timeout 5
```

5. Configure how long, in seconds, the interface waits before retransmitting the initial EAPOL PDUs to the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 transmit-period 60
```

6. Configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 maximum-requests 5
```

7. Configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 retries 1
```

NOTE: This setting specifies the number of tries before the switch puts the interface in a “HELD” state.

Related Documentation

- Understanding Authentication on J-EX Series Switches on page 1222

Configuring 802.1X Authentication (J-Web Procedure)

To configure 802.1X settings on a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Security** > **802.1X**.

   The 802.1X screen displays a list of interfaces, whether 802.1X security has been enabled, and the assigned port role.

   When you select an interface, the **Details of 802.1x configuration on port** section displays 802.1X details for that interface.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - RADIUS Servers—Specifies the RADIUS server to be used for authentication. Select the check box to specify a server. Click **Add** or **Edit** to add or modify the RADIUS server settings. Enter information as specified in Table 153 on page 1309.
   - Exclusion List—Excludes hosts from the 802.1X authentication list by specifying the MAC address. Click **Add** or **Edit** in the Exclusion list screen to include or modify the MAC addresses. Enter information as specified in Table 154 on page 1310.
   - Edit—Specifies 802.1X settings for the selected interface
     - Apply 802.1X Profile—Applies an 802.1X profile based on the port role. If a message appears asking whether you want to configure a RADIUS server, click **Yes**.
     - 802.1X Configuration—Configures custom 802.1X settings for the selected interface. If a message appears asking if you want to configure a RADIUS server, click **Yes**. Enter information as specified in Table 153 on page 1309. To configure 802.1X settings, enter information as specified in Table 155 on page 1310.
   - Delete—Deletes 802.1X authentication configuration on the selected interface.

Table 153: RADIUS Server Settings

Field	Function	Your Action
IP Address	Specifies the IP address of the server.	Enter the IP address in dotted decimal notation.
Password	Specifies the login password.	Enter the password.
Confirm Password	Verifies the login password for the server.	Reenter the password.
Server Port Number	Specifies the port with which the server is associated.	Type the port number.
Source Address	Specifies the source address of the switch using which the switch can communicate with the server.	Type the IP address in dotted decimal notation.
Retry Attempts	Specifies the number of login retries allowed after a login failure.	Type the number.
Timeout	Specifies the time interval to wait before the connection to the server is closed.	Type the interval in seconds.

Table 154: 802.1X Exclusion List

Field	Function	Your Action
MAC Address	Specifies the MAC address to be excluded from 802.1X authentication.	Enter the MAC address.
Exclude if connected through the port	Specifies that the host can bypass authentication if it is connected through a particular interface.	Select to enable the option. Select the port through which the host is connected.
Move the host to the VLAN	Specifies moving the host to a specific VLAN once the host is authenticated.	Select to enable the option. Select the VLAN from the list.

Table 155: 802.1X Port Settings

Field	Function	Your Action
Supplicant Mode		
Supplicant Mode	Specifies the mode to be adopted for supplicants: • Single—allows only one host for authentication. • Multiple—allows multiple hosts for authentication. Each host is checked before being admitted to the network. • Single authentication for multiple hosts—Allows multiple hosts but only the first is authenticated.	Select a mode.
Authentication		
Enable re-authentication	Specifies enabling reauthentication on the selected interface.	1. Select to enable reauthentication. 2. Enter the timeout for reauthentication in seconds.
Action on authentication failure	Specifies the action to be taken in case the host does not respond, leading to an authentication failure.	Select one: • Move to the Guest VLAN—Select the VLAN to move the interface to. • Deny—The host is not permitted access.
Timeouts	Specifies timeout values for each action.	Enter the value in seconds for: • Port waiting time after an authentication failure • EAPOL retransmitting interval • Max. EAPOL requests • Maximum number of retries • Port timeout value for the response from the supplicant • Port timeout value for the response from the RADIUS server

Related Documentation

- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307

- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 1266
- Understanding Authentication on J-EX Series Switches on page 1222

Configuring Static MAC Bypass of Authentication (CLI Procedure)

You can configure a static MAC bypass list (sometimes called the exclusion list) on the switch to specify MAC addresses of devices allowed access to the LAN without 802.1X or MAC RADIUS authentication requests to the RADIUS server.

To configure the static MAC bypass list:

- Specify a MAC address to bypass authentication:

```
[edit protocols dot1x]
user@switch# set authenticator static 00:04:0f:fd:ac:fe
```

- Configure a supplicant to bypass authentication if connected through a particular interface:

```
[edit protocols dot1x]
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5
```

- You can configure a supplicant to be moved to a specific VLAN after it is authenticated:

```
[edit protocols dot1x]
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5
vlan-assignment default-vlan
```

Related Documentation

- Example: Configuring Static MAC Bypass of Authentication on a J-EX Series Switch on page 1257
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307
- Configuring 802.1X Authentication (J-Web Procedure) on page 1308

Configuring MAC RADIUS Authentication (CLI Procedure)

You can permit devices that are not 802.1X-enabled LAN access by configuring MAC RADIUS authentication on the J-EX Series switch interfaces to which the hosts are connected.

NOTE: You can also allow non-802.1X-enabled devices to access the LAN by configuring their MAC address for static MAC bypass of authentication.

You can configure MAC RADIUS authentication on an interface that also allows 802.1X authentication, or you can configure either authentication method alone.

If both MAC RADIUS and 802.1X authentication are enabled on the interface, the switch first sends the host three EAPOL requests to the host. If there is no response from the host, the switch sends the host's MAC address to the RADIUS server to check whether it is a permitted MAC address. If the MAC address is configured as permitted on the RADIUS server, the RADIUS server sends a message to the switch that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.

If MAC RADIUS authentication is configured on the interface but 802.1X authentication is not (by using the **mac-radius restrict** option), the switch attempts to authenticate the MAC address with the RADIUS server without delaying by attempting 802.1X authentication first.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the J-EX Series switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch" on page 1243.

To configure MAC RADIUS authentication using the CLI:

- On the switch, configure the interfaces to which the nonresponsive hosts are attached for MAC RADIUS authentication, and add the **restrict** qualifier for interface **ge-0/0/20** to have it use only MAC RADIUS authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

- On a RADIUS authentication server, create user profiles for each nonresponsive host using the MAC address (without colons) of the nonresponsive host as the username and password (here, the MAC addresses are **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f**):

```
[root@freeradius]#
edit /etc/raddb
vi users
00040ffdacfe Auth-type:=Local, User-Password = "00040ffdacfe"
0004aecd235f Auth-type:=Local, User-Password = "0004aecd235f"
```

- Understanding Authentication on J-EX Series Switches on page 1222

Configuring Server Fail Fallback (CLI Procedure)

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends an Extensible Authentication Protocol Over LAN (EAPOL) access-reject message.

802.1X and MAC RADIUS authentication work by using an *authenticator port access entity* (the J-EX Series switch) to block all traffic to and from an end device at the interface until the end device's credentials are presented and matched on the *authentication server* (a RADIUS server). When the end device has been authenticated, the switch stops blocking and opens the interface to the end device.

When you set up 802.1X or MAC RADIUS authentication on the switch, you specify a primary authentication server and one or more backup authentication servers. If the primary authentication server cannot be reached by the switch and the secondary authentication servers are also unreachable, a RADIUS server timeout occurs. Because the authentication server grants or denies access to the end devices awaiting authentication, the switch does not receive access instructions for end devices attempting access to the LAN and normal authentication cannot be completed. Server fail fallback allows you to configure authentication alternatives that permit the switch to take appropriate actions toward end devices awaiting authentication or reauthentication.

To configure basic server fail fallback options using the CLI:

- Configure an interface to allow traffic to flow from a supplicant to the LAN if a RADIUS server timeout occurs (as if the end device had been successfully authenticated by a RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail permit
```

- Configure an interface to prevent traffic flow from an end device to the LAN (as if the end device had failed authentication and had been rejected by the RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail deny
```

- Configure an interface to move an end device to a specified VLAN if a RADIUS server timeout occurs (in this case, the VLAN name is **vlan1**):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail vlan-name vlan1
```

- Configure an interface to recognize already connected end devices as reauthenticated if there is a RADIUS timeout during reauthentication (new users will be denied access):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail use-cache
```

- Configure an interface that receives an EAPOL access-reject message from the authentication server to move end devices attempting LAN access on the interface to a specified VLAN already configured on the switch (in this case, the VLAN name is **vlan-sf**):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-reject-vlan vlan-sf
```

Configuring 802.1X RADIUS Accounting (CLI Procedure)

RADIUS accounting permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure basic RADIUS accounting using the CLI:

1. Specify the accounting servers to which the switch will forward accounting statistics:

```
[edit access]
user@switch# set profile profile1 radius accounting-server [122.69.1.250 122.69.1.252]
```

2. Define the RADIUS accounting servers:

```
[edit access]
user@switch# set radius-server 122.69.1.250 secret juniper

user@switch# set radius-server 122.69.1.252 secret juniper1
```

3. Enable accounting for an access profile:

```
[edit access]
user@switch# set profile profile1 accounting
```

4. Configure the RADIUS servers to use while sending accounting messages and updates:

```
[edit access]
user@switch# set profile profile1 accounting order radius none
```

5. Configure the statistics to be collected on the switch and forwarded to the accounting server:

```
[edit access]
user@switch# set profile profile1 accounting order accounting-stop-on-access-deny
user@switch# set profile profile1 accounting order accounting-stop-on-failure
```

6. Display accounting statistics collected on the switch:

```
user@switch> show network-access aaa statistics accounting

Accounting module statistics
  Requests received: 1
  Accounting Response failures: 0
  Accounting Response Success: 1
  Requests timedout: 0
```

7. Open an accounting log on the RADIUS accounting server using the server's address, and view accounting statistics:

```
[root@freeradius]# cd /usr/local/var/log/radius/radacct/122.69.1.250
[root@freeradius 122.69.1.250]# ls

detail-20071214

[root@freeradius 122.69.1.250]# vi details-20071214
```

```

Filtering 802.1X Supplicants Using RADIUS Server Attributes

There are two ways to configure the RADIUS server with port firewall filters:

- Include a match statement and corresponding action in the **Juniper-Firewall-Filter** attribute. The **Juniper-Firewall-Filter** attribute is a vendor-specific attribute (VSA) in the Juniper dictionary on the RADIUS server. Use this attribute to configure simple filter conditions for authenticated users. Nothing needs to be configured on the switch; all of the configuration is on the RADIUS server.
- Apply a local firewall filter to users authenticated through the RADIUS server. Use this method for more complex filters. The firewall filter must be configured on each switch.

This example describes using FreeRADIUS software to configure VSAs. For specifics on configuring your server, consult the AAA documentation that was included with your server.

This topic includes the following tasks:

1. Configuring Match Statements on the RADIUS Server on page 1318
2. Applying a Port Firewall Filter from the RADIUS Server on page 1320

Configuring Match Statements on the RADIUS Server

You can configure simple filter conditions using the **Juniper-Switching-Filter** attribute in the Juniper dictionary on the RADIUS server. These filters are then sent to a switch whenever a new user is authenticated successfully. The filters are created and applied on all J-EX Series switches that authenticate users through that RADIUS server without the need to configure anything on each individual switch.

To configure the **Juniper-Switching-Filter** attribute, enter one or more match conditions and a resulting action using the CLI for the RADIUS server. Enter the match statement plus an action statement enclosed within quotes (" ") using the following syntax:

```
match <destination-mac mac-address> <source-vlan vlan-name> <source-dot1q-tag
  tag> <destination-ip ip-address> <ip-protocol protocol-id> <source-port port>
  <destination-port port>
}
action [allow | deny] <forwarding-class class-of-service> <loss-priority (low | medium |
  high)>
}
```

See “VSA Match Conditions and Actions for J-EX Series Switches” on page 1325 for definitions of match statement options.

To configure match conditions on the RADIUS server:

1. Verify that the Juniper dictionary is loaded on your RADIUS server and includes the filtering attribute **Juniper-Switching-Filter**, attribute ID 48:

   ```
   [root@freeradius]# cat /usr/local/share/freeradius/dictionary.juniper

   #  dictionary.juniper
   #
   # Version:      $Id: dictionary.juniper,v 1.2.6.1 2005/11/30 22:17:25
   aland Exp
   $
   #  VENDOR          Juniper                          2636
   BEGIN-VENDOR    Juniper
   ATTRIBUTE       Juniper-Local-User-Name               1       string
   ATTRIBUTE       Juniper-Allow-Commands                2       string
   ATTRIBUTE       Juniper-Deny-Commands                 3       string
   ATTRIBUTE       Juniper-Allow-Configuration           4       string
   ATTRIBUTE       Juniper-Deny-Configuration            5       string
   ATTRIBUTE       Juniper-Switching-Filter              48      string
   <–
   ```

2. Enter the match conditions and actions. For example:

   - To deny authentication based on the 802.1Q tag (here, the 802.1Q tag is **10**):

     ```
     [root@freeradius]#
     cd /usr/local/etc/raddb
     vi users
     ```

     For each relevant user, add the **Juniper-Switching-Filter** attribute:

     ```
     Juniper-Switching-Filter = "match source-dot1q-tag 10 action deny"
     ```

- To deny access based on a destination IP address:

  ```
  [root@freeradius]# cd /usr/local/etc/raddb
  vi users
  ```

  For each relevant user, add the **Juniper-Switching-Filter** attribute:

  ```
  Juniper-Switching-Filter = “match destination-ip 192.168.1.0/31 action deny”
  ```

- To set the packet loss priority (PLP) to **high** based on a destination MAC address and the IP protocol:

  ```
  [root@freeradius]# cd /usr/local/etc/raddb
  vi users
  ```

  For each relevant user, add the **Juniper-Switching-Filter** attribute:

  ```
  Juniper-Switching-Filter = "match destination-mac 00:04:0f:fd:ac:fe, ip-protocol 2,
  forwarding-class high, action loss-priority high"
  ```

  

  NOTE: For the forwarding-class option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored. You must specify both the forwarding class and the packet loss priority.

3. Stop and restart the RADIUS process to activate the configuration.

Applying a Port Firewall Filter from the RADIUS Server

You can apply a firewall filter to user policies on the RADIUS server. The RADIUS server can then specify the firewall filters that are to be applied to each user that requests to authenticate. Use this method when the firewall filter has more extensive conditions or you want to use different conditions for the same filter on different switches. The firewall filters must be configured on each switch.

For more information about firewall filters, see “Firewall Filters for J-EX Series Switches Overview” on page 1707.

To apply a port firewall filter centrally from the RADIUS server:

NOTE: If port firewall filters are also configured locally for the interface, then VSAs take precedence if they conflict with the filters. If the VSAs and the local port firewall filters do not conflict, they are merged.

1. Create the firewall filter on the local switch. In this example, the filter is called **filter1**.
2. Open the users file on the RADIUS server:

```
[root@freeradius]#
cd /usr/local/pool/raddb
vi users
```

3. For each relevant user, add the filter (here, the filter ID is **filter1**):

```
Filter-Id = "filter1"
```

NOTE: Multiple filters are not supported on a single interface. However, you can support multiple filters for multiple users that are connected to the switch on the same interface by configuring a single filter with policies for each of those users.

4. Stop and restart the RADIUS process to activate the configuration.

Configuring LLDP (CLI Procedure)

Devices use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the device to quickly identify a variety of other devices, resulting in a LAN that interoperates smoothly and efficiently.

This topic describes:

Enabling LLDP on Interfaces

LLDP is enabled on all interfaces by default. If it is disabled, you can enable LLDP by configuring it on all interfaces or on specific interfaces.

- To configure LLDP on all interfaces:

```
[edit protocols lldp]
user@switch# set interface all
```

- To configure LLDP on a specific interface:

```
[edit protocols lldp]
user@switch# set interface ge-0/0/3
```

Adjusting LLDP Advertisement Settings

You can adjust the following settings for LLDP advertisements for troubleshooting or verification purposes. The default values are applied when LLDP is enabled. For normal operations, we recommend that you do not adjust these settings from the default values.

- To specify the frequency at which LLDP advertisements are sent (in seconds):

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

- To specify the number of seconds that LLDP information is held before it is discarded (the multiplier value is used in combination with the **advertisement-interval** value):

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

- To specify the number of seconds the device delays before sending advertisements to neighbors after a change is made in a TLV (type, length, or value) element in LLDP or in the state of the local system, such as a change in hostname or management address, set the transmit delay. The transmit delay is enabled by default on switches to reduce the delay in notifying neighbors of a change in the local system. The default value is 2 seconds if the **advertisement-interval** value is set to 8 seconds or more or 1 second if the **advertisement-interval** value is set to less than 8 seconds.

```
[edit protocols lldp]
user@switch# set transmit-delay 2
```

NOTE: The advertisement-interval value must be greater than or equal to four times the transmit-delay value, or an error will be returned when you attempt to commit the configuration.

Adjusting SNMP Notification Settings of LLDP Changes

You can adjust the following settings for SNMP notifications of LLDP changes. If the values are not specified or if the interval values are set to **0**, the notifications are disabled.

- To specify the frequency at which LLDP database changes are sent (in seconds):

  ```
  [edit protocols lldp]
  user@switch# set lldp-configuration-notification-interval 600
  ```

- To specify the frequency at which changes in topology global statistics are sent (in seconds):

  ```
  [edit protocols lldp]
  user@switch# set ptopo-configuration-trap-interval 600
  ```

- To specify the holding time (used in combination with the **ptopo-configuration-trap-interval** value) to determine the length of time that topology global statistics are held before they are is discarded (in seconds):

  ```
  [edit protocols lldp]
  user@switch# set ptopo-configuration-maximum-hold-time 2147483647
  ```

Specifying a Management Address for the LLDP Management TLV

You can configure an IP management address to be used in the LLDP Management type, length, and value (TLV).

To configure the management address:

```
[edit protocols lldp]
user@switch# set management-address 192.168.0.1
```

- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

Configuring LLDP (J-Web Procedure)

Use the LLDP Configuration page to configure LLDP global and port settings for a J-EX Series switch on the J-Web interface.

To configure LLDP:

1. Select **Configure** > **Switching** > **LLDP**.

   The LLDP Configuration page displays LLDP Global Settings and Port Settings.

   The second half of the screen displays operational details for the selected port.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. To modify LLDP Global Settings, click **Global Settings**.

   Enter information as described in Table 156 on page 1323.

3. To modify Port Settings, click **Edit** in the Port Settings section.

   Enter information as described in Table 157 on page 1323.

Table 156: Global Settings

Field	Function	Your Action
Advertising interval	Specifies the frequency of outbound LLDP advertisements. You can increase or decrease this interval.	Type the number of seconds.
Hold multiplier	Specifies the multiplier factor to be used by an LLDP-enabled switch to calculate the time-to-live (TTL) value for the LLDP advertisements it generates and transmits to LLDP neighbors.	Type the required number in the field.
Fast start count	Specifies the number of LLDP advertisements sent in the first second after the device connects. The default is 3. Increasing this number results in the port initially advertising LLDP–MED at a faster rate for a limited time.	Type the Fast start count.

Table 157: Edit Port Settings

Field	Function	Your Action
LLDP Status	Specifies whether LLDP has been enabled on the port.	Select one: **Enabled**, **Disabled**, or **None**.
LLDP-MED Status	Specifies whether LLDP–MED has been enabled on the port.	Select **Enable** from the list.

Related Documentation

- Configuring LLDP (CLI Procedure) on page 1321
- Configuring LLDP-MED (CLI Procedure) on page 1324

- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

Configuring LLDP-MED (CLI Procedure)

Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) is an extension of LLDP. The J-EX Series switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations.

LLDP-MED is turned on by default on J-EX Series switches.

This topic describes:

- Enabling LLDP-MED on Interfaces on page 1324
- Configuring Location Information Advertised by the Switch on page 1324
- Configuring for Fast Start on page 1325

Enabling LLDP-MED on Interfaces

LLDP-MED is enabled on all interfaces by default. If it is disabled, you can enable LLDP-MED by configuring it on all interfaces or on specific interfaces.

To configure LLDP-MED on all interfaces or on a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0
```

Configuring Location Information Advertised by the Switch

You can configure the location information that is advertised from the switch to the LLDP-MED device. You can specify a civic-based location (geographic location) or a location based on an elin (emergency location identification string):

- To specify a location by geography:

```
[edit protocols lldp-med]

user@switch# set interface ge-0/0/2.0 location civic-based country-code US

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 1 ca-value “El Dorado County”

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 2 ca-value CA

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 3 ca-value Somerset

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 6 ca-value “Mount Aukum Road”

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 19 ca-value 6450

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 21 ca-value “Holiday Market”
```

- To specify a location using an **elin** string:

```
[edit protocols lldp-med]
```

```
user@switch# set interface ge-0/0/2.0 location elin 4085551212
```

Configuring for Fast Start

You can specify the number of LLDP-MED advertisements sent from the switch in the first second after it has detected an LLDP-MED device. The default is 3; to set it to another value:

```
[edit protocols lldp-med]
user@switch# set fast-start 6
```

VSA Match Conditions and Actions

J-EX Series switches support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match **10.1.1.0/24** OR **11.1.1.0/24**), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

Table 158 on page 1326 describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

Table 158: Match Conditions

Option	Description
destination-mac *mac-address*	Destination media access control (MAC) address of the packet.
source-vlan *source-vlan*	Name of the source VLAN.
source-dot1q-tag *tag*	Tag value in the dot1q header, in the range **0** through **4095**.
destination-ip *ip-address*	Address of the final destination node.
ip-protocol *protocol-id*	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms: **ah**, **egp (8)**, **esp (50**, **gre (47)**, **icmp (1)**, **igmp (2)**, **ipip (4)**, **ipv6 (41)**, **ospf (89)**, **pim (103)**, **rsvp (46)**, **tcp (6)**, or **udp (17)**
source-port *port*	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the **ip-protocol** match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under **destination-port**.
destination-port *port*	TCP or UDP destination port field. Normally, you specify this match in conjunction with the **ip-protocol** match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): **afs (1483)**, **bgp (179)**, **biff (512)**, **bootpc (68)**, **bootps (67)**, **cvspserver (2401)**, **cmd (514)**, **dhcp (67)**, **domain (53)**, **eklogin (2105)**, **ekshell (2106)**, **exec (512)**, **finger (79)**, **ftp (21)**, **ftp-data (20)**, **http (80)**, **https (443)**, **ident (113)**, **imap (143)**, **kerberos-sec (88)**, **klogin (543)**, **kpasswd (761)**, **krb-prop (754)**, **krbupdate (760)**, **kshell (544)**, **ldap (389)**, **login (513)**, **mobileip-agent (434)**, **mobilip-mn (435)**, **msdp (639)**, **netbios-dgm (138)**, **netbios-ns (137)**, **netbios-ssn (139)**, **nfsd (2049)**, **nntp (119)**, **ntalk (518)**, **ntp (123)**, **pop3 (110)**, **pptp (1723)**, **printer (515)**, **radacct (1813)**, **radius (1812)**, **rip (520)**, **rkinit (2108)**, **smtp (25)**, **snmp (161)**, **snmptrap (162)**, **snpp (444)**, **socks (1080)**, **ssh (22)**, **sunrpc (111)**, **syslog (514)**, **telnet (23)**, **tacacs-ds (65)**, **talk (517)**, **tftp (69)**, **timed (525)**, **who (513)**, **xdmcp (177)**, **zephyr-clt (2103)**, **zephyr-hm (2104)**

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. Table 159 on page 1326 shows the actions that you can specify in a term.

Table 159: Actions for VSAs

Option	Description
(**allow** | **deny**)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.

Table 159: Actions for VSAs *(continued)*

Option	Description
forwarding-class *class-of-service*	(Optional) Classify the packet in one of the following forwarding classes: • **assured-forwarding** • **best-effort** • **expedited-forwarding** • **network-control**
loss-priority (**low** | **medium** | **high**)	(Optional) Set the packet loss priority (PLP) to **low**, **medium**, or **high**. Specify both the forwarding class and loss priority.

Configuring Captive Portal Authentication (CLI Procedure)

Configure captive portal authentication (hereafter referred to as captive portal) on a J-EX Series switch so that users connected to the switch are authenticated before being allowed to access the network. When the user requests a webpage, a login page is displayed that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 29.
- Generated an SSL certificate and installed it on the switch. See Generating SSL Certificates to Be Used for Secure Web Access.
- Configured basic access between the J-EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- Designed your captive portal login page. See “Designing a Captive Portal Authentication Login Page on a J-EX Series Switch” on page 1329.

This topic includes the following tasks:

- Configuring Secure Access for Captive Portal on page 1327
- Enabling an Interface for Captive Portal on page 1328
- Configuring Bypass of Captive Portal Authentication on page 1328

Configuring Secure Access for Captive Portal

To configure secure access for captive portal:

1. Associate the security certificate with the Web server and enable HTTPS on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate
my-signed-cert
```

NOTE: You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

2. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

Enabling an Interface for Captive Portal

To enable an interface for use with captive portal authentication:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10
```

Configuring Bypass of Captive Portal Authentication

You can allow specific clients to bypass captive portal authentication:

```
[edit]
user@switch# set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
```

NOTE: Optionally, you can use **set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0** to limit the scope to the interface.

NOTE: If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the **clear captive-portal mac-address** *mac-address* command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the ethernet switching table and the authentication bypass will not be allowed.

Designing a Captive Portal Authentication Login Page on a J-EX Series Switch

You can set up captive portal authentication on your switch to redirect all Web browser requests to a login page that requires the user to input a username and password before they are allowed access. Upon successful authentication, the user is allowed access to the network and to continue to the original page requested.

Junos OS provides a customizable template for the captive portal window that allows you to easily design and modify the look of the captive portal login page. You can modify the design elements in the template to change the look of your captive portal login page and to add instructions or information to the page. You can also modify any of the design elements of an existing captive portal login page.

Figure 39 on page 1329 shows an example of a captive portal login page:

Figure 39: Example of a Captive Portal Login Page

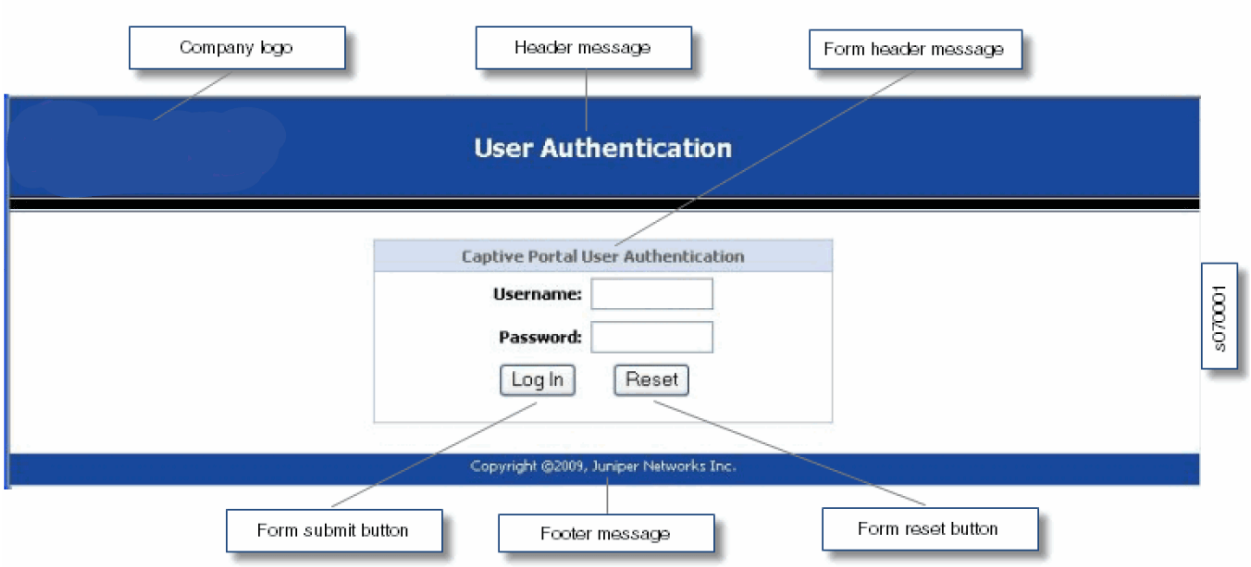

Table 160 on page 1329 summarizes the configurable elements of a captive portal login page.

Table 160: Configurable Elements of a Captive Portal Login Page

Element	CLI Statement	Description
Banner message	**banner-message** *text-string*	The first screen displayed before the captive portal login page is displayed (not shown). The page header says "**Terms and Conditions of Use: Please read the following terms of use and disclaimers carefully before using this network.**" The configurable banner message appears in the body of the page. The default text is "**Terms and Conditions**." A button labeled **Agree** gives the user access to the captive portal login page.

Table 160: Configurable Elements of a Captive Portal Login Page *(continued)*

Element	CLI Statement	Description
Footer background color	**footer-bgcolor** ***hex-color***	The HTML hexadecimal code for the background color of the captive portal login page footer.
Footer message	**footer-message** ***text-string***	For example, you can include copyright information and links to additional information such as help instructions, legal notices, or a privacy policy. The default text shown in the footer is **Copyright @2009, Juniper Networks Inc.**
Form header background color	**form-header-bgcolor** ***hex-color***	The HTML hexadecimal code for the background color of the header bar across the top of the form area of the captive portal login page.
Form header message	**form-header-message** ***text-string***	Text displayed in the header bar across the top of the form area of the captive portal login page. For example, **Welcome to My Cafe**. The default text is **Captive Portal User Authentication**.
Form reset button label	**form-reset-label** ***label-name***	Label appearing in the button that the user can select to clear the username and password fields on the form, for example, **Reset** or **Clear**.
Form submit button label	**form-submit-label** ***label-name***	Label appearing in the button that user selects to submit their login information—for example, **Log In** or **OK**.
Header background color	**header-bgcolor** ***hex-color***	The HTML hexadecimal code for the background color of the captive portal login page header.
Header logo	**header-logo** ***filename***	Filename of the file containing the image of the logo that you want to appear at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format. You can upload a logo image file to the switch. Copy the logo to the /var/tmp directory on the switch (during the commit the files are saved to persistent locations). If you do not specify a logo image, the Juniper Networks logo is displayed.
Header message	**header-message** ***text-string***	Text displayed in the page header. The default text is **User Authentication**.
Post-authentication URL	**post-authentication-url** ***url***	URL to which the users are directed upon successful authentication. The default is to redirect users to the page they had originally requested.

To design the captive portal login page:

1. (Optional) Upload your logo image file to the switch:

   ```
   user@switch> file copy
   ftp://username:prompt@ftp.hostname.net/var/tmp/my-logo.jpeg
   ```

2. Configure the custom options to specify the background colors and text displayed in the captive portal page:

   ```
   [edit system services captive-portal]
   ```

```
user@switch# set custom-options header-bgcolor #006600
set custom-options header-message “Welcome to Our Network”
set custom-options banner-message “Please enter your username and password:”
set custom-options footer-message “Copyright ©2009, Our Network”
```

NOTE: For the custom options that you do not specify, the value is taken from the standard template.

Related Documentation

- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300

Controlling Authentication Session Timeouts (CLI Procedure)

For 802.1X and MAC RADIUS authentication sessions, the timeout of the session depends on the **reauthentication** value that you configure. Additionally, unless you configure it not to, the session is removed from the authentication session table when the MAC address ages out of the Ethernet switching table (when the value specified for the **mac-table-aging-time** is exceeded).

Before you begin:

- Specify the RADIUS server or servers to be used as the authentication server. See “Specifying RADIUS Server Connections on a J-EX Series Switch (CLI Procedure)” on page 1306.
- Configure 802.1X authentication on the switch. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 1307.

To configure the authentication session time on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator interface all seconds ;
```

To configure the authentication session time on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name seconds ;
```

To disable removal of authentication sessions from the authentication session table when a MAC address ages out of the Ethernet switching table, remove the binding of the authentication table to the Ethernet switching table

To remove the binding on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator interface all no-mac-table-binding;
```

To remove the binding on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name no-mac-table-binding;
```

Configuring NetBIOS Snooping (CLI Procedure)

NetBIOS snooping enables a J-EX Series switch to learn information about NetBIOS hosts that are connected to the switch.

This topic describes:

- Enabling NetBIOS Snooping on page 1332
- Disabling NetBIOS Snooping on page 1332

Enabling NetBIOS Snooping

To enable NetBIOS snooping:

```
[edit protocols lldp]
user@switch# set netbios-snooping
```

Disabling NetBIOS Snooping

To disable NetBIOS snooping:

```
[edit protocols lldp]
user@switch# delete netbios-snooping
```

CHAPTER 28

Verifying 802.1X and MAC RADIUS Authentication

Monitoring 802.1X Authentication

Purpose Use the monitoring feature to display details of authenticated users and users who have failed authentication.

Action To display authentication details in the J-Web interface, select **Monitoring** > **Security** > **802.1X**.

To display authentication details in the CLI, enter the following commands:

- **show dot1x interface detail | display xml**
- **show dot1x interface detail <*interface*> | display xml**
- **show dot1x auth-failed-users**

Meaning The details displayed include:

- A list of authenticated users.
- The total number of users connected.
- A list of users who have failed authentication

You can also specify an interface for which the details must be displayed.

Related Documentation

- Configuring 802.1X Authentication (J-Web Procedure) on page 1308
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307
- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 1266

Verifying 802.1X Authentication

Purpose Verify that supplicants are being authenticated on an interface on a J-EX Series switch with the interface configured for 802.1X authentication, and display the method of authentication being used.

Action Display detailed information about an interface configured for 802.1X (here, the interface is **ge-0/0/16**):

```
user@switch> show dot1x interface ge-0/0/16.0 detail
ge-0/0/16.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Strict: Disabled
  Reauthentication: Enabled Reauthentication interval: 40 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 1
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user5, 00:30:48:8C:66:BD
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: v200
      Reauthentication due in 17 seconds
```

Meaning The sample output from the **show dot1x interface detail** command shows that the **Number of connected supplicants** is 1. The supplicant that was authenticated and is now connected to the LAN is known as **user5** on the RADIUS server and has the MAC address **00:30:48:8C:66:BD**. The supplicant was authenticated by means of the 802.1X authentication method called **Radius** authentication. When the **Radius** authentication method is used, the supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. The sample output also shows that the supplicant is connected to VLAN **v200**.

Other 802.1X authentication methods supported on J-EX Series switches in addition to the **RADIUS** method are:

- **Guest VLAN**—A nonresponsive host is granted Guest-VLAN access.
- **MAC Radius**—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.
- **Server-fail deny**—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default.

- **Server-fail permit**—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server.
- **Server-fail use-cache**—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are granted access, but new supplicants are denied LAN access.
- **Server-fail VLAN**—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)

access

Syntax

```
access {
  profile profile-name {
    authentication-order [ldap radius | none];
    accounting {
      order [radius | none];
      accounting-stop-on-access-deny;
      accounting-stop-on-failure;
    }
    radius {
      accounting-server [server-addresses];
      authentication-server [server-addresses];
    }
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure authentication, authorization, and accounting (AAA) services.

The statements are explained separately.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316

accounting

Syntax

```
accounting {
  order radius | none;
    accounting-stop-on-access-deny;
    accounting-stop-on-failure;
  }
}
```

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication order for authentication, authorization, and accounting (AAA) services.

Default Not enabled

Options **none**—Use no authentication for specified subscribers.

radius—Use RADIUS authentication for specified subscribers.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Accounting

accounting (Access Profile)

Syntax

```
accounting {
  accounting-stop-on-access-deny;
  accounting-stop-on-failure;
  coa-immediate-update;
  immediate-update;
  order [ accounting-method ];
  statistics (time | volume-time);
  update-interval minutes;
}
```

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS accounting parameters and enable RADIUS accounting for an access profile.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access

accounting

Syntax

```
accounting {
  events [ login change-log interactive-commands ];
  destination {
    radius {
      server {
        server-address {
          accounting-port port-number;
          secret password;
          source-address address;
          retry number;
          timeout seconds;
        }
      }
    }
    tacplus {
      server {
        server-address {
          port port-number;
          secret password;
          single-connection;
          timeout seconds;
        }
      }
    }
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure audit of TACACS+ or RADIUS authentication events, configuration changes, and interactive commands.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting
- Configuring TACACS+ System Accounting

accounting-port

Syntax accounting-port *port-number*;

Hierarchy Level [edit system accounting destination radius server *server-address*],
[edit system radius-server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the accounting port number on which to contact the RADIUS server.

Options *number*—Port number on which to contact the RADIUS server.
Default: 1813

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Authentication
- Configuring RADIUS System Accounting

accounting-server

Syntax accounting-server[*server-addresses*];

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Default Not enabled

Options ***server-addresses***—One or more addresses of RADIUS authentication servers.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- **show network-access aaa statistics authentication on page 1490**

accounting-session-id-format

Syntax accounting-session-id-format (decimal | description);

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the format the router or switch uses to identify the accounting session.

Default **decimal**

Options **decimal**—Use the decimal format.

description—Use the generic format, in the form: **jnpr** *interface-specifier*:*subscriber-session-id*.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Server Options for Subscriber Access
- Configuring Authentication and Accounting Parameters for Subscriber Access

accounting-stop-on-access-deny

Syntax accounting-stop-on-access-deny;

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if the AAA server denies access to a supplicant.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316
- **show network-access aaa statistics authentication on page 1490**

accounting-stop-on-access-deny

Syntax accounting-stop-on-access-deny;

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS accounting to send an Acct-Stop message when the AAA server refuses a client request for access.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access

accounting-stop-on-failure

Syntax accounting-stop-on-failure;

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if a supplicant fails AAA authorization, but the RADIUS server grants access. For example, a supplicant might fail AAA authentication because of an internal error such as a timeout.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316

accounting-stop-on-failure

Syntax accounting-stop-on-failure;

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS accounting to send an Acct-Stop message when client access fails AAA but the AAA server grants access.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access

address

Syntax address *address-or-prefix*;

Hierarchy Level [edit access **address-pool** *pool-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the IP address or prefix value for clients.

Options ***address-or-prefix***—An address or prefix value.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring the Address Pool for L2TP Network Server IP Address Allocation

address-pool

Syntax

```
address-pool pool-name {
    address address-or-prefix;
    address-range <low lower-limit> <high upper-limit>;
}
```

Hierarchy Level [edit access]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allocate IP addresses for clients.

Options ***pool-name***—Name assigned to an address pool.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Address Pool for L2TP Network Server IP Address Allocation

address-range

Syntax address-range <low *lower-limit*> <high *upper-limit*>;

Hierarchy Level [edit access **address-pool** *pool-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the address range.

Options

- **high** ***upper-limit***—Upper limit of an address range.
- **low** ***lower-limit***—Lower limit of an address range.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Address Pool for L2TP Network Server IP Address Allocation

advertisement-interval

Syntax advertisement-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.

The **advertisement-interval** value must be greater than or equal to four times the **transmit-delay** value, or an error will be returned when you attempt to commit the configuration.

NOTE: The default value of **transmit-delay** is 2 seconds. If you configure the **advertisement-interval** as less than 8 seconds and you do not configure a value for **transmit-delay**, the default value of **transmit-delay** is automatically changed to 1 second in order to satisfy the requirement that the **advertisement-interval** value must be greater than or equal to four times the **transmit-delay** value.

Default Disabled.

Options *seconds*—(Optional) The number of seconds.
Range: 5 through 32,768 seconds
Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

attributes

Syntax

```
attributes {
  exclude {
    accounting-authentic [ accounting-on | accounting-off ];
    accounting-delay-time [ accounting-on | accounting-off ];
    accounting-session-id [ access-request | accounting-on | accounting-off | accounting-stop
      ];
    accounting-terminate-cause [ accounting-off ];
    called-station-id [ access-request | accounting-start | accounting-stop ];
    calling-station-id [ access-request | accounting-start | accounting-stop ];
    class [ accounting-start | accounting-stop ];
    dhcp-gi-address [ access-request | accounting-start | accounting-stop ];
    dhcp-mac-address [ access-request | accounting-start | accounting-stop ];
    output-filter [ accounting-start | accounting-stop ];
    event-timestamp [ accounting-on | accounting-off | accounting-start | accounting-stop
      ];
    framed-ip-address [ accounting-start | accounting-stop ];
    framed-ip-netmask [ accounting-start | accounting-stop ];
    input-filter [ accounting-start | accounting-stop ];
    input-gigapackets [ accounting-stop ];
    input-gigawords [ accounting-stop ];
    interface-description [ access-request | accounting-start | accounting-stop ];
    nas-identifier [ access-request | accounting-on | accounting-off | accounting-start |
      accounting-stop ];
    nas-port [ access-request | accounting-start | accounting-stop ];
    nas-port-id [ access-request | accounting-start | accounting-stop ];
    nas-port-type [ access-request | accounting-start | accounting-stop ];
    output-gigapackets [ accounting-stop ];
    output-gigawords [ accounting-stop ];
  }
  ignore {
    framed-ip-netmask;
    input-filter;
    logical-system-routing-instance;
    output-filter;
  }
}
```

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how the router or switch processes RADIUS attributes.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring How RADIUS Attributes Are Used for Subscriber Access

authentication-order

Syntax authentication-order [**ldap radius | none**];

Hierarchy Level [edit **access profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series only) Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

Default Not enabled

Options **none**—No authentication for specified subscribers.

ldap—Lightweight Directory Access Protocol.

radius—RADIUS authentication.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316

authentication-order

Syntax authentication-order [*authentication-methods*];

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the order in which the Junos OS tries different authentication methods when verifying that a client can access the router or switch. For each login attempt, the software tries the authentication methods in order, from first to last.

Default password

Options **password**—Verify the client using the information configured at the **[edit access profile *profile-name* client *client-name*]** hierarchy level.

radius—Verify the client using RADIUS authentication services.

NOTE: For subscriber access management, you must always specify the radius method. Subscriber access management does not support the password keyword (the default), and authentication fails when no method is specified.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CHAP Authentication with RADIUS
- Specifying the Authentication and Accounting Methods for Subscriber Access
- Configuring Access Profiles for L2TP or PPP Parameters

authentication-profile-name

Syntax authentication-profile-name *access-profile-name*;

Hierarchy Level [edit protocols **dot1x authenticator**],
[edit services **captive-portal**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the name of the access profile to be used for 802.1X, MAC RADIUS, or captive portal authentication.

Default No access profile is specified.

Options ***access-profile-name***—Name of the access profile. The access profile is configured at the [**edit access profile**] hierarchy level and contains the RADIUS server IP address and other information used for authentication.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

authentication-server

Syntax authentication-server [*server-addresses*];

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the RADIUS server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Default Not enabled

Options ***server-addresses***—Configure one or more RADIUS server addresses.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243
- **show network-access aaa statistics authentication on page 1490**

authentication-whitelist

Syntax
```
authentication-whitelist {
  mac-address {
  interface interface-name;
  vlan-assignment ( vlan-id |vlan-name);
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MAC addresses for which RADIUS authentication is to be bypassed.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

authenticator

Syntax

```
authenticator {
  authentication-profile-name access-profile-name;
  interface (all | [ interface-names ]) {
    disable;
    guest-vlan ( vlan-id | vlan-name);
    mac-radius <restrict>;
    maximum-requests number;
    no-reauthentication;
    quiet-period seconds;
    reauthentication {
      interval seconds;
    }
    retries number;
    server-fail (deny | permit | use-cache | vlan-id | vlan-name);
    server-reject-vlan (vlan-id | vlan-name);
    server-timeout seconds;
    supplicant (single | single-secure | multiple);
    supplicant-timeout seconds;
    transmit-period seconds;
  }
  no-mac-table-binding;
  static mac-address {
    vlan-assignment vlan-identifier;
  }
}
```

Hierarchy Level [edit protocols dot1x]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an authenticator for 802.1X authentication.

The statements are explained separately.

NOTE: You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

Default No static MAC address or VLAN is configured.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

captive-portal

Syntax

```
captive-portal {
  authentication-profile-name authentication-profile-name
  custom-options {
    banner-message string;
    footer-bgcolor color;
    footer-message string;
    form-header-bgcolor color;
    form-header-message string;
    form-reset-label label name;
    form-submit-label label name;
    header-bgcolor color;
    header-logo filename;
    header-message string;
    post-authentication-url url-string;
  }
  interface (all | [interface-names]) {
    quiet-period seconds;
    retries number-of-retries;
    server-timeout seconds;
    session-expiry seconds;
    supplicant (multiple | single | single-secure);
  }
  secure-authentication (http | https);
}
```

Hierarchy Level [edit services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure captive portal to authenticate clients connected to the switch for access to the network.

The remaining statements are explained separately.

Default Captive portal is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

ca-type

Syntax

```
ca-type {
  number {
    ca-value value;
  }
}
```

Hierarchy Level [edit protocols lldp-med interface (all | *interface-name* location civic-based)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the address elements. These elements are included in the location information to be advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

For further information about the values that can be used to comprise the location,, refer to RFC 4776, *Dynamic Host Configuration Protocol (DHCPv4 and DHCPv6) Option for Civic Addresses Configuration Information*. A subset of those values is provided below.

The **ca-value** statement is explained separately.

Default Disabled.

Options **value**—Civic address elements that represent the civic or postal address. Values are:

- **0**—A code that specifies the language used to describe the location.
- **16**—The leading-street direction, such as “N”.
- **17**—A trailing street suffix, such as “SW”.
- **18**—A street suffix or type, such as “Ave” or “Platz”.
- **19**—A house number, such as “6450”.
- **20**—A house-number suffix, such as “A” or “1/2”.
- **21**—A landmark, such as “Stanford University”.
- **22**—Additional location information, such as “South Wing”.
- **23**—The name and occupant of a location, such as “Carrillo's Holiday Market”.
- **24**—A house-number suffix, such as “95684”.
- **25**—A building structure, such as “East Library”.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278
- Configuring LLDP-MED (CLI Procedure) on page 1324

ca-value

Syntax ca-value *value*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*) **location civic-based ca-type** *number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure location information, such as street address and city, that is indexed by the **ca-type** code. This information is advertised from the switch to the MED and is used during emergency calls to identify the location of the MED.

Default Disabled.

Options *value*—Specify a value that correlates to the **ca-type**. See **ca-type** for a list of codes and suggested values.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278
- Configuring LLDP-MED (CLI Procedure) on page 1324

civic-based

Syntax

```
civic-based {
  what number;
  country-code code;
  ca-type {
    number {
      ca-value value;
    }
  }
}
```

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*) **location**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the geographic location to be advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

The statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278

country-code

Syntax country-code *code*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the two-letter country code to include in the location information. Location information is advertised from the switch to the MED, and is used during emergency calls to identify the location of the MED. The country code is required when configuring LLDP-MED based on location.

Default Disabled.

Options ***code***—Two-letter ISO 3166 country code in capital ASCII letters; for example, US or DE.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278

custom-options

Syntax

```
custom-options {
  banner-message string;
  footer-bgcolor color;
  footer-message string;
  form-header-bgcolor color;
  form-header-message string;
  form-reset-label label name;
  form-submit-label label name;
  header-bgcolor color;
  header-logo filename;
  header-message string;
  post-authentication-url url-string;
}
```

Hierarchy Level [edit services **captive-portal**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the design elements of a captive portal login page.

Options

banner-message—The first screen displayed before the captive portal login page is displayed—for example, a disclaimer message.

Range: 1–2047 characters

footer-bgcolor —The hexadecimal color code for the color of the footer bar across the bottom of the captive portal login page—for example, #2E8B57 (sea green).

Values: # symbol followed by six characters.

footer-message—Text message displayed in the footer bar across the bottom of the captive portal login page.

Range: 1–2047 characters

Default: **Copyright @2010, Juniper Networks Inc.**

form-header-bgcolor —The hexadecimal color code for the background color of the header bar across the top of the form area of the captive portal login page.

Values: # symbol followed by six characters.

form-header-message—Text message displayed in the header bar across the top of the form area of the captive portal login page.

Range: 1–255 characters

Default: **Captive Portal User Authentication**

form-reset-label—Label displayed in the button that the user can select to clear the username and password fields on the form.

Range: 1–255 characters

Default: **Reset**

form-submit-label —Label displayed in the button that the user selects to submit their login information—for example, **Log In** or **OK**.

Range: 1–255 characters

Default: **Log In**

header-bgcolor—The hexadecimal color code for the color of the header bar across the top of the captive portal login page.

Values: # symbol followed by six characters.

header-logo—Filename of the file containing the image of the logo displayed at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.

Default: The Juniper Networks logo

header-message—Text displayed in the header bar across the bottom of the captive portal login page.

Range: 1–2047 characters

Default: **User Authentication**

post-authentication-url—URL to which the users are directed upon successful authentication—for example **www.mycafe.com**.

Range: 1–255 characters

Default: The page originally requested by the user.

Required Privilege Level

routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

destination

Syntax

```
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        secret password;
        source-address address;
        retry number;
        timeout seconds;
      }
    }
  }
  tacplus {
    server {
      server-address {
        port port-number;
        secret password;
        single-connection;
        timeout seconds;
      }
    }
  }
}
```

Hierarchy Level [edit system accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication server.

Options The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting
- Configuring TACACS+ System Accounting

disable (802.1X)

Syntax disable;

Hierarchy Level [edit protocols **dot1x authenticator** interface (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable 802.1X authentication on a specified interface or all interfaces.

Default 802.1X authentication is disabled on all interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

disable (LLDP)

Syntax disable;

Hierarchy Level [edit protocols lldp],

[edit protocols interface lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the LLDP configuration on the switch or on one or more interfaces.

Default If you do not configure LLDP, it is disabled on the switch and on specific switch interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

dot1x

Syntax

```
dot1x {
  authenticator {
    authentication-profile-name access-profile-name;
    interface (all | [ interface-names ]) {
      disable;
      guest-vlan (vlan-id | vlan-name);
      mac-radius <restrict>;
      maximum-requests number;
      no-reauthentication;
      quiet-period seconds;
      reauthentication {
        interval seconds;
      }
      retries number;
      server-fail (deny | permit | use-cache | vlan-id | vlan-name);
      server-reject-vlan (vlan-id | vlan-name);
      server-timeout seconds;
      supplicant (single | single-secure | multiple);
      supplicant-timeout seconds;
      transmit-period seconds;
    }
    static mac-address {
      interface interface-names;
      vlan-assignment (vlan-id |vlan-name);
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure 802.1X authentication for Port-Based Network Access Control. 802.1X authentication is supported on interfaces that are members of private VLANs (PVLANs).

The remaining statements are explained separately.

Default 802.1X is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

elin

Syntax elin *number*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name* **location**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the Emergency Line Identification Number (ELIN) as location information. Location information is advertised from the switch to the MED device and is used during emergency calls to identify the location of the MED device.

Default Disabled.

Options ***number***—Configure a 10-digit number (area code and telephone number).

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

events

Syntax events [*events*];

Hierarchy Level [edit system **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the types of events to track and log.

Options ***events***—Event types; can be one or more of the following:

- **change-log**—Audit configuration changes.
- **interactive-commands**—Audit interactive commands (any command-line input).
- **login**—Audit logins.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

  output-gigawords [ accounting-stop ];
}
```

Hierarchy Level [edit access profile *profile-name* radius **attributes**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to exclude the specified attributes from the specified type of RADIUS message.

Not all attributes are available in all types of RADIUS messages. By default, the router or switch includes the specified attributes in RADIUS Access-Request, Acct-On, Acct-Off, Acct-Start, and Acct-Stop messages.

Options RADIUS attribute type—RADIUS attribute or Juniper Networks VSA number and name.

- **accounting-authentic**—RADIUS attribute 45, Acct-Authentic.
- **accounting-delay-time**—RADIUS attribute 41, Acct-Delay-Time.
- **accounting-session-id**—RADIUS attribute 44, Acct-Session-Id.
- **accounting-terminate-cause**—RADIUS attribute 49, Acct-Terminate-Cause.
- **called-station-id**—RADIUS attribute 30, Called-Station-Id.
- **calling-station-id**—RADIUS attribute 31, Calling-Station-Id.

- **class**—RADIUS attribute 25, Class.
- **dhcp-gi-address**—Juniper VSA 26-57, DHCP-GI-Address.
- **dhcp-mac-address**—Juniper VSA 26-56, DHCP-MAC-Address.
- **event-timestamp**—RADIUS attribute 55, Event-Timestamp.
- **framed-ip-address**—RADIUS attribute 8, Framed-IP-Address.
- **framed-ip-netmask**—RADIUS attribute 9, Framed-IP-Netmask.
- **input-filter**—Juniper VSA 26-10, Ingress-Policy-Name.
- **input-gigapackets**—Juniper VSA 26-42, Acct-Input-Gigapackets.
- **input-gigawords**—RADIUS attribute 52, Acct-Input-Gigawords.
- **interface-description**—Juniper VSA 26-53, Interface-Desc.
- **nas-identifier**—RADIUS attribute 32, NAS-Identifier.
- **nas-port**—RADIUS attribute 5, NAS-Port.
- **nas-port-id**—RADIUS attribute 87, NAS-Port-Id.
- **nas-port-type**—RADIUS attribute 61, NAS-Port-Type.
- **output-filter**—Juniper VSA 26-11, Egress-Policy-Name.
- **output-gigapackets**—Juniper VSA 25-43, Acct-Output-Gigapackets.
- **output-gigawords**—RADIUS attribute 53, Acct-Output-Gigawords.

RADIUS message type

- **access-request**—RADIUS Access-Accept messages.
- **accounting-off**—RADIUS Accounting-Off messages.
- **accounting-on**—RADIUS Accounting-On messages.
- **accounting-start**—RADIUS Accounting-Start messages.
- **accounting-stop**—RADIUS Accounting-Stop messages.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access

fast-start

Syntax fast-start *count*;

Hierarchy Level [edit protocols lldp-med]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) advertisements sent from the switch in the first second after it has detected an LLDP-MED device (such as an IP telephone).

Options **count**—Number of advertisements.

Range: 1 through 10

Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Configuring LLDP-MED (CLI Procedure) on page 1324

forwarding-class

Syntax forwarding-class < assured-forwarding | best-effort | expedited-forwarding |network-control >;

Hierarchy Level [edit **ethernet-switching-options voip interface** <all | *interface-name* | access-ports]>

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches, configure the forwarding class used to handle packets on the VoIP interface.

Default Disabled.

Options *class*—Forwarding class:

- **assured-forwarding**— Assured forwarding (AF)—Provides a group of values you can define and includes four subclasses: AF1, AF2, AF3, and AF4, each with three drop probabilities: low, medium, and high.
- **best-effort**—Provides no service profile. For the best effort forwarding class, loss priority is typically not carried in a class-of-service (CoS) value, and random early detection (RED) drop profiles are more aggressive.
- **expedited-forwading**—Provides a low loss, low latency, low jitter, assured bandwidth, end-to-end service.
- **network-control**—Provides a typically high priority because it supports protocol control.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

guest-vlan

Syntax guest-vlan (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the VLAN to which an interface is moved when no 802.1X supplicants are connected on the interface. The VLAN specified must already exist on the switch.

Default None

Options ***vlan-id***—VLAN tag identifier of the guest VLAN.

vlan-name—Name of the guest VLAN.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on a J-EX Series Switch on page 1252
- Understanding Guest VLANs for 802.1X on J-EX Series Switches on page 1233

hold-multiplier

Syntax hold-multiplier *number*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded. The default value is 4 (or 120 seconds).

Default Disabled.

Options *number*—A number used as a multiplier.
Range: 2 through 10
Default: 4 (or 120 seconds)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ignore

Syntax

```
ignore {
  framed-ip-netmask;
  input-filter;
  logical-system-routing-instance;
  output-filter;
}
```

Hierarchy Level [edit access profile *profile-name* radius **attributes**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. By default, the router or switch processes the attributes it receives from the external server.

Options

framed-ip-netmask—Framed-IP-Netmask (RADIUS attribute 9).

input-filter—Ingress-Policy-Name (VSA 26-10).

logical-system-routing-instance—Virtual-Router (VSA 26-1).

output-filter—Egress-Policy-Name (VSA 26-11).

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access

immediate-update

Syntax

```
immediate-update;
```

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to send an Acct-Update message to the RADIUS accounting server on receipt of a response (for example, an ACK or timeout) to the Acct-Start message.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access

interface (802.1X)

Syntax

```
interface (all | [ interface-names ]) {
  disable;
  guest-vlan (vlan-name | vlan-id);
  mac-radius <restrict>;
  maximum-requests number;
  no-reauthentication;
  quiet-period seconds;
  reauthentication {
    interval seconds;
  }
  retries number;
  server-fail (deny | permit | use-cache | vlan-id | vlan-name);
  server-reject-vlan (vlan-id | vlan-name);
  server-timeout seconds;
  supplicant (single | single-secure | multiple);
  supplicant-timeout seconds;
  transmit-period seconds;
}
```

Hierarchy Level [edit protocols **dot1x authenticator**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure 802.1X authentication for Port-Based Network Access Control for all interfaces or for specific interfaces.

Options **all**—Configure all interfaces for 802.1X authentication.

[***interface-names***]— List of names of interfaces to configure for 802.1X authentication.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface-description-format

Syntax

```
interface-description-format {
  exclude-adapter;
  exclude-sub-interface;
}
```

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
exclude-adapter and **exclude-sub-interface** options added in JUNOS Release 10.4.

Description Specify the information that is excluded from the interface description that the device passes to RADIUS for inclusion in the RADIUS attribute 87 (NAS-Port-Id). By default, the device includes both the subinterface and the adapter in the interface description.

Options

exclude-adapter—Exclude the adapter from the interface description.

exclude-sub-interface—Exclude the subinterface from the interface description.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access

interface (Captive Portal)

Syntax

```
interface (all | [interface-names]) {
  quiet-period seconds;
  session-expiry seconds;
  retries number-of-retries;
  server-timeout seconds;
  supplicant ( multiple | single | single-secure);
}
```

Hierarchy Level [edit service captive-portal]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure captive portal authentication for all interfaces or for specific interfaces.

Options

all—All interfaces to be configured for captive portal authentication.

[*interface-names*]—List of names of interfaces to be configured for captive portal authentication.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

interface (LLDP)

Syntax

```
interface (all | interface-name) {
  disable;
}
```

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol (LLDP) on all interfaces or on a specific interface.

Default None

Options

all—All interfaces on the switch.

interface-name—Name of a specific interface.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring LLDP (CLI Procedure) on page 1321
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

interface (LLDP-MED)

Syntax

```
interface (all | interface-name) {
  disable;
  location {
    elin number;
    civic-based {
      what number;
      country-code code;
      ca-type {
        number {
          ca-value value;
        }
      }
    }
  }
}
```

Hierarchy Level [edit protocols lldp-med]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) on all interfaces or on a specific interface.

Default Not enabled

Options **all**—All interfaces on the switch.

interface-name—Name of a specific interface.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface (Static MAC Bypass)

Syntax interface [*interface-names*];

Hierarchy Level [edit protocols **dot1x authenticator authentication-profile-name static** *mac-address*], [edit **ethernet-switching-options authentication-whitelist**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interfaces on which the specified MAC addresses are allowed to bypass RADIUS authentication and allowed to connect to the LAN without authentication.

Options ***interface-names***—List of interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface (VoIP)

Syntax

```
interface (all | [interface-name] | access-ports) {
  vlan vlan-name );
  forwarding-class <assured-forwarding | best-effort | expedited-forwarding |
    network-control>;
}
```

Hierarchy Level [edit ethernet-switching-options voip]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable voice over IP (VoIP) for all interfaces or specific interfaces.

Options **all** | ***interface-name*** | **access-ports**—Enable VoIP on all interfaces, on a specific interface, or on all access ports.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278

- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 1292

lldp

Syntax

```
lldp {
  advertisement-interval seconds;
  disable;
  hold-multiplier number;
  interface (all | [interface-name]) {
    disable;
  }
  lldp-configuration-notification-interval seconds;
  management-address ip-management-address;
  netbios-snooping;
  ptopo-configuration-maximum-hold-time seconds;
  ptopo-configuration-trap-interval seconds;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>
      <no-stamp> <replace>;
    flag flag <disable>;
  }
  transmit-delay seconds;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

Default LLDP is enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Configuring LLDP (CLI Procedure) on page 1321

lldp-configuration-notification-interval

Syntax lldp-configuration-notification-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often SNMP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, trap notifications of database changes are disabled.

Default SNMP trap notifications of LLDP database changes are disabled.

Options ***seconds***—Interval between trap notifications about LLDP database changes.
Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show lldp on page 1471**

lldp-med

Syntax

```
lldp-med {
    disable;
    fast-start number;
    interface (all | interface-name) {
        disable;
        location {
            elin number;
            civic-based {
                what number;
                country-code code;
                ca-type {
                    number {
                        ca-value value;
                    }
                }
            }
        }
    }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol–Media Endpoint Discovery. LLDP-MED is an extension of LLDP. The switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations for emergency services. LLDP-MED is defined in the standard ANSI/TIA-1057 by the Telecommunications Industry Association (TIA).

The statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278
- Configuring LLDP-MED (CLI Procedure) on page 1324

location

Syntax

```
location {
  elin number;
  civic-based {
    what number;
    country-code code;
    ca-type{
      number {
        ca-value value;
      }
    }
  }
}
```

Hierarchy Level [edit protocols lldp-med interface (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the location information. Location information is advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

The statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278
- Configuring LLDP-MED (CLI Procedure) on page 1324

mac-radius

Syntax mac-radius <flap-on-disconnect> <restrict>;

Hierarchy Level [edit protocols **dot1x authenticator interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.

If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.

To restrict authentication to MAC RADIUS only, use the **restrict** option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.

Options

flap-on-disconnect—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the **restrict** option is also set.

restrict—(Optional) Restricts authentication to MAC RADIUS only. When **mac-radius restrict** is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

management-address

Syntax management-address *ip-management-address*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the management address of the switch to be used in the LLDP Management type, length, and value (TLV) .

Default LLDP Management TLV uses the IP address of the switch's management Ethernet interface (**me0**) or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis.

Options *ip-management-address*—You can specify either an IPv4 or IPv6 management address for the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

maximum-requests

Syntax maximum-requests *number*;

Hierarchy Level [edit protocols dot1x authenticator interface (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out.

Default Two retransmission attempts

Options ***number***—Number of retransmission attempts.
Range: 1 through 10
Default: 2

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307
- Configuring 802.1X Authentication (J-Web Procedure) on page 1308

nas-identifier

Syntax nas-identifier *identifier-value*;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the value for the client RADIUS attribute 32 (NAS-Identifier). This attribute is used for authentication and accounting requests.

Options ***identifier-value***—String to use for authentication and accounting requests.
Range: 1 to 64 characters

Required Privilege Level admin—To view this statement in the configuration.
admin–control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Server Options for Subscriber Access
- Configuring RADIUS Server Parameters for Subscriber Access

nas-port-extended-format

Syntax

```
nas-port-extended-format {
  adapter-width width;
  port-width width;
  slot-width width;
  stacked-vlan-width width;
  vlan-width width;
}
```

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute.

Options

adapter-width *width*—Number of bits in the adapter field.

port-width *width*—Number of bits in the port field.

slot-width *width*—Number of bits in the slot field.

stacked-vlan-width *width*—Number of bits in the SVLAN ID field.

vlan-width *width*—Number of bits in the VLAN ID field.

NOTE: The total of the widths must not exceed 32 bits, or the configuration will fail.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access
- Configuring RADIUS Server Parameters for Subscriber Access

netbios-snooping

Syntax netbios-snooping;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Enable NetBIOS snooping on the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring NetBIOS Snooping (CLI Procedure) on page 1332

no-mac-table-binding

Syntax no-mac-table-binding;

Hierarchy Level [edit protocols dot1x authenticator interface (all | [*interface-names*])]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description For 802.1X authentication, disable the removal of the session from the authentication session table when the MAC address ages out of the Ethernet switching table.

Default Not enabled

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Controlling Authentication Session Timeouts (CLI Procedure) on page 1331

no-reauthentication

Syntax no-reauthentication;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, disables reauthentication.

Default Not disabled

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

options

Syntax

```
options {
  accounting-session-id-format (decimal | description);
  client-accounting-algorithm (direct | round-robin);
  client-authentication-algorithm (direct | round-robin);
  ethernet-port-type-virtual;
  interface-description-format {
    exclude-adapter;
    exclude-sub-interface;
  }
  nas-identifier identifier-value;
  nas-port-extended-format {
    adapter-width width;
    port-width width;
    slot-width width;
    stacked-vlan-width width;
    vlan-width width;
  }
  revert-interval interval;
  vlan-nas-port-stacked-format;
}
```

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the options used by RADIUS authentication and accounting servers.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access
- RADIUS Server Options for Subscriber Access

order

Syntax order [**radius | none**];

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending accounting messages and updates.

Default Not enabled

Options **none**—No accounting for specified subscribers.

radius—Remote Authentication Dial-In User Service accounting for specified subscribers.

[radius | none]— Use multiple types of accounting in the order specified. RADIUS accounting is initially used. However, if RADIUS servers are not available, no accounting is done.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1316

order

Syntax order [*accounting-method*];

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the order in which the Junos OS tries different accounting methods for client activity. When a client logs in, the software tries the accounting methods in the specified order.

Options ***accounting-method***—One or more accounting methods. When a client logs in, the software tries the accounting methods in the following order, from first to last. The only valid value is **radius** for RADIUS accounting.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access

port (RADIUS Access)

Syntax port *port-number*;

Hierarchy Level [edit access **radius-server***server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the RADIUS server.

Options ***port-number***—Port number on which to contact the RADIUS server.
Default: 1812 (as specified in RFC 2865)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Router or Switch Interaction with RADIUS Servers
- Configuring Authentication and Accounting Parameters for Subscriber Access

port (RADIUS Accounting)

Syntax port *port-number*;

Hierarchy Level [edit system radius-server *address*],
[edit system accounting destination radius server *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the RADIUS server.

Options ***number***—Port number on which to contact the RADIUS server.
Default: **1812** (as specified in RFC 2865)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Authentication

port (TACACS+ Server)

Syntax port *port-number*;

Hierarchy Level [edit system accounting destination tacplus server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the TACACS+ server.

Options *number*—Port number on which to contact the TACACS+ server.
Default: 49

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ System Accounting

profile

Syntax

```
profile profile-name {
  accounting {
    order [radius | none];
    accounting-stop-on-access-deny;
    accounting-stop-on-failure;
  }
  authentication-order [authentication-method];
  radius {
    accounting-server [server-addresses];
    authentication-server [server-addresses];
  }
}
```

Hierarchy Level [edit access]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

Default Not enabled

Options ***profile-name*** —Profile name of up to 32 characters.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

ptopo-configuration-maximum-hold-time

Syntax ptopo-configuration-maximum-hold-time *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure how long to maintain the physical topology database entries. The physical topology identifies the devices on the network and their physical interconnections.

Options ***seconds***—Time to maintain physical topology database entries.

Default: 300

Range: 1 through 2147483647

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

ptopo-configuration-trap-interval

Syntax ptopo-configuration-trap-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often SNMP trap notifications are sent regarding changes in physical topology global statistics.

Default SNMP trap notifications of changes in physical topology global statistics are disabled.

Options ***seconds***—Interval between SNMP trap notifications about physical topology global statistics.

Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

quiet-period

Syntax quiet-period *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the number of seconds the interface remains in the wait state following a failed authentication attempt by a supplicant before reattempting authentication.

Default 60 seconds

Options ***seconds***—Number of seconds the interface remains in the wait state.
Range: 0 through 65,535 seconds
Default: 60 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show network-access aaa statistics authentication on page 1490**
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243

quiet-period (Captive Portal)

Syntax quiet-period *seconds*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure time, in seconds, after a user exceeds the maximum number of retries before they can attempt to authenticate.

Options ***seconds***—Number of seconds.
Range: 1–65535
Default: 60

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

radius

Syntax

```
radius {
  accounting-server [server-addresses];
  authentication-server [server-addresses];
}
```

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the the Remote Authentication Dial-In User Service (RADIUS) servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple **radius** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

radius (Access Profile)

Syntax

```
radius {
    accounting-server [ ip-address ];
    attributes {
        exclude
            accounting-authentic [ accounting-on | accounting-off ];
            accounting-delay-time [ accounting-on | accounting-off ];
            accounting-session-id [ access-request | accounting-on | accounting-off |
                accounting-stop ];
            accounting-terminate-cause [ accounting-off ];
            called-station-id [ access-request | accounting-start | accounting-stop ];
            calling-station-id [ access-request | accounting-start | accounting-stop ];
            class [ accounting-start | accounting-stop ];
            dhcp-gi-address [ access-request | accounting-start | accounting-stop ];
            dhcp-mac-address [ access-request | accounting-start | accounting-stop ];
            output-filter [ accounting-start | accounting-stop ];
            event-timestamp [ accounting-on | accounting-off | accounting-start | accounting-stop
                ];
            framed-ip-address [ accounting-start | accounting-stop ];
            framed-ip-netmask [ accounting-start | accounting-stop ];
            input-filter [ accounting-start | accounting-stop ];
            input-gigapackets [ accounting-stop ];
            input-gigawords [ accounting-stop ];
            interface-description [ access-request | accounting-start | accounting-stop ];
            nas-identifier [ access-request | accounting-on | accounting-off | accounting-start |
                accounting-stop ];
            nas-port [ access-request | accounting-start | accounting-stop ];
            nas-port-id [ access-request | accounting-start | accounting-stop ];
            nas-port-type [ access-request | accounting-start | accounting-stop ];
            output-gigapackets [ accounting-stop ];
            output-gigawords [ accounting-stop ];
        }
        ignore {
            framed-ip-netmask;
            input-filter;
            logical-system-routing-instance;
            output-filter;
        }
    }
    authentication-server [ ip-address ];
    options {
        accounting-session-id-format (decimal | description);
        client-accounting-algorithm (direct | round-robin);
        client-authentication-algorithm (direct | round-robin);
        ethernet-port-type-virtual;
        interface-description-format {
            exclude-adapter;
            exclude-sub-interface;
        }
        nas-identifier identifier-value;
        nas-port-extended-format {
            adapter-width width;
            port-width width;
```

```
        slot-width width;
        stacked-vlan-width width;
        vlan-width width;
      }
      revert-interval interval;
      vlan-nas-port-stacked-format;
    }
}
```

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the RADIUS parameters that the router uses for AAA authentication and accounting for subscribers.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access

radius

Syntax

```
radius {
  server {
    server-address {
      accounting-port port-number;
      secret password;
      source-address address;
      retry number;
      timeout seconds;
    }
  }
}
```

Hierarchy Level [edit system accounting destination]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the RADIUS accounting server.

Options ***server-address***—Address of the RADIUS accounting server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting

radius-server

Syntax

```
radius-server server-address {
    accounting-port port-number;
    port port-number;
    retry attempts;
    routing-instance routing-instance-name;
    secret password;
    source-address source-address;
    timeout seconds;
}
```

Hierarchy Level

[edit access],
[edit access profile *profile-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure RADIUS for subscriber access management, L2TP, or PPP.

To configure multiple RADIUS servers, include multiple **radius-server** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Options

server-address—Address of the RADIUS authentication server.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication for L2TP
- Configuring the PPP Authentication Protocol
- Configuring RADIUS Authentication
- Configuring Authentication and Accounting Parameters for Subscriber Access

reauthentication

Syntax

```
reauthentication {
    interval seconds;
}
```

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, specify the number of seconds before an authentication session times out.

Options **disable**—Disables the periodic reauthentication of the end device.

interval *seconds*—Sets the periodic reauthentication time interval.

Range: 1 through 4,294,967,296 seconds

Default: 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307

retries

Syntax retries *number*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

Default 3 retries

Options ***number*** —Number of retries.
Range: 1 through 10
Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

retries (Captive Portal)

Syntax retries *number-of-tries*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of times the user can attempt to submit authentication information.

Options ***number-of-tries***—Number of authentication attempts by user.
Range: 1–65535
Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

retry

Syntax retry *attempts*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of times that the router or switch is allowed to attempt to contact a RADIUS authentication or accounting server.

Options ***attempts***—Number of times that the router is allowed to attempt to contact a RADIUS server.

Range: 1 through 10

Default: 3

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Router or Switch Interaction with RADIUS Servers
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP
- **timeout on page 1435**

retry

Syntax retry *number*;

Hierarchy Level [edit system radius-server *server-address*],
[edit system accounting destination radius server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.

Options *number*—Number of retries allowed for contacting a RADIUS server.

Range: 1 through 10

Default: 3

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication
- Configuring RADIUS System Accounting
- **timeout on page 1434**

revert-interval

Syntax revert-interval *interval*;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time the router or switch waits after a server has become unreachable. The router or switch rechecks the connection to the server when the specified interval expires. If the server is then reachable, it is used in accordance with the order of the server list.

Options *interval*—Amount of time to wait.

Range: 0 through 4294967295 seconds

Default: 60 seconds

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access
- Configuring Authentication and Accounting Parameters for Subscriber Access

routing-instance

Syntax routing-instance *routing-instance-name*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing instance used to send RADIUS packets to the RADIUS server.

Options ***routing-instance-name***—Routing instance name.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the PPP Authentication Protocol
- Configuring Authentication and Accounting Parameters for Subscriber Access

secret

Syntax secret *password*;

Hierarchy Level [edit access profile *profile-name* **radius-server** *server-address*],
[edit access radius-disconnect *client-address*],
[edit access **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the password to use with the RADIUS server. The secret password used by the local router or switch must match that used by the server.

Options ***password***—Password to use; it can include spaces if the character string is enclosed in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access
- Configuring Router or Switch Interaction with RADIUS Servers
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP
- Configuring the RADIUS Disconnect Server for L2TP

secret

Syntax secret *password*;

Hierarchy Level [edit system accounting destination radius **server** *server-address*],
[edit system accounting destination tacplus **server** *server-address*],
[edit system radius-server *server-address*],
[edit system tacplus-server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the password to use with the RADIUS or TACACS+ server. The secret password used by the local router or switch must match that used by the server.

Options ***password***—Password to use; can include spaces included in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication
- Configuring TACACS+ Authentication
- Configuring TACACS+ System Accounting
- Configuring RADIUS System Accounting

secure-authentication

Syntax secure-authentication (http | https);

Hierarchy Level [edit services **captive-portal**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable HTTP or HTTPS access on the captive portal interface.

Default **http**

Options **http**—Enables HTTP access on the captive portal interface.

https—Enables HTTPS access on the captive portal interface. HTTPS is recommended.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

server (RADIUS Accounting)

Syntax

```
server {
  server-address {
    accounting-port port-number;
    retry number
    secret password;
    source-address address;
    timeout seconds;
  }
}
```

Hierarchy Level [edit system accounting destination radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS logging.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS System Accounting

server (TACACS+ Accounting)

Syntax

```
server {
  server-address {
    port port-number;
    secret password;
    single-connection;
    timeout seconds;
  }
}
```

Hierarchy Level [edit system accounting destination tacplus]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure TACACS+ logging.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ System Accounting

server-fail

Syntax server-fail (deny | permit | use-cache | *vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches configured for 802.1X authentication, specify the server fail fallback action the switch takes when all RADIUS authentication servers are unreachable.

When you specify the action ***vlan-name*** or ***vlan-id***, the VLAN must already be configured on the switch.

Default Authentication is denied.

Options

deny—Force fail the supplicant authentication. No traffic will flow through the interface.

permit—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.

use-cache—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.

vlan-id—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

vlan-name—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

server-reject-vlan

Syntax server-reject-vlan (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPOL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPOL Access-Reject message is ignored.

When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.

Default None

Options ***vlan-id*** —Numeric identifier of the VLAN to which the supplicant is moved.

vlan-name—Name of the VLAN to which the supplicant is moved.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding Server Fail Fallback and Authentication on J-EX Series Switches on page 1232

server-timeout

Syntax server-timeout *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-name*])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the amount of time a port will wait for a reply when relaying a response from the supplicant to the authentication server before timing out and invoking the server-fail action.

Default 30 seconds

Options ***seconds*** —Number of seconds.
Range: 1 through 60 seconds
Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **clear dot1x on page 1448**
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 1243
- 802.1X for J-EX Series Switches Overview on page 1227

server-timeout (Captive Portal)

Syntax server-timeout *seconds*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the time in seconds an interface will wait for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.

Options ***seconds***—Number of seconds.
Range: 1–65535
Default: 20

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

session-expiry

Syntax session-expiry *seconds*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum duration in seconds of a session.

Options ***seconds***—Duration of session.
Range: 1 through 65535
Default: 3600

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

single-connection

Syntax single-connection;

Hierarchy Level [edit system accounting destination tacplus-server *server-address*]
[edit system tacplus-server *server-address*],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ Authentication
- Configuring TACACS+ System Accounting

source-address

Syntax source-address *source-address*;

Hierarchy Level [edit access radius-server *server-address*],
[edit access profile *profile-name* radius-server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a source address for each configured RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address.

Options *source-address*—A valid IPv4 address configured on one of the router or switch interfaces. On M Series routers only, the source address can be an IPv6 address and the UDP source port is 514.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Router or Switch Interaction with RADIUS Servers
- Configuring Authentication and Accounting Parameters for Subscriber Access
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP

source-address (NTP, RADIUS, System Logging, or TACACS+)

Syntax source-address *source-address*;

Hierarchy Level [edit system accounting destination radius **server** *server-address*],
[edit system accounting destination tacplus **server** *server-address*],
[edit system ntp],
[edit system radius-server *server-address*],
[edit system syslog],
[edit system tacplus-server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine.

Options ***source-address***—A valid IP address configured on one of the router or switch interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all **host *hostname*** statements at the **[edit system syslog]** hierarchy level, but not for messages directed to the other Routing Engine.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication
- Synchronizing and Coordinating Time Distribution Using NTP
- Specifying an Alternative Source Address for System Log Messages

static

Syntax

```
static mac-address {
  interface interface-names;
  vlan-assignment (vlan-id |vlan-name );
}
```

Hierarchy Level [edit protocols **dot1x authenticator authentication-profile-name**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.

Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.

You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.

Options ***mac-address*** —The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding Authentication on J-EX Series Switches on page 1222

statistics

Syntax statistics (time | volume-time);

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to collect time statistics, or both volume and time statistics, for the sessions being managed by AAA.

Options **time**—Collect uptime statistics only.

volume-time—Collect both volume and uptime statistics. This option is not available for Mobile IP.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access

supplicant

Syntax supplicant (multiple | single | single-secure);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])],
[edit services **captive-portal interface** (all | *interface-names*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the method used to authenticate clients for 802.1X or captive portal authentication.

Default **single**

Options

single—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.

single-secure—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.

multiple—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

supplicant-timeout

Syntax supplicant-timeout *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-name*])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure how long the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request.

Default 30 seconds

Options ***seconds*** —Number of seconds.
Range: 1 through 60 seconds
Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

tacplus

Syntax

```
tacplus {
  server {
    server-address {
      port port-number;
      secret password;
      single-connection;
      timeout seconds;
    }
  }
}
```

Hierarchy Level [edit system accounting destination]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Terminal Access Controller Access Control System Plus (TACACS+).

Options ***server-address***—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ System Accounting

timeout

Syntax timeout *seconds*;

Hierarchy Level [edit system radius-server *server-address*],
[edit system tacplus-server *server-address*],
[edit system accounting destination radius server server-address],
[edit system accounting destination tacplus server server-address]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time that the local router or switch waits to receive a response from a RADIUS or TACACS+ server.

Options ***seconds***—Amount of time to wait.

Range: 1 through 90 seconds

Default: 3 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication
- Configuring TACACS+ Authentication
- **retry on page 1419**

timeout (RADIUS)

Syntax timeout *seconds*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time that the local router or switch waits to receive a response from a RADIUS server.

Options ***seconds***—Amount of time to wait.

Range: 1 through 90 seconds

Default: 3 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP

traceoptions (802.1X)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag ;
}
```

Hierarchy Level [edit protocols dot1x]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for the 802.1X protocol.

Default Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

file *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size**option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **config-internal**—Trace internal configuration operations.
- **general**—Trace general operations.
- **normal**—Trace normal operations.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **state**—Trace protocol state changes.
- **task**—Trace protocol task operations.
- **timer**—Trace protocol timer operations.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restricted file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabyte

Range: 10 KB through 1gigabyte

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

traceoptions (LLDP)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <no-stamp>
    <replace>;
  flag flag <disable>;
}
```

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.

Default Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **configuration**—Trace configuration operations.
- **interface**—Trace interface update events.
- **netbios**—Trace NetBIOS events.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.
- **vlan**—Trace VLAN update events.

no-stamp—(Optional) Do not timestamp the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending output to it.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

Default: If you do not include this option, tracing output is appended to an existing trace file.

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

transmit-period

Syntax
transmit-period *seconds*;

Hierarchy Level
[edit protocols **dot1x authenticator interface** (all | [*interface-name*])

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
For 802.1X authentication, how long the port waits before retransmitting the initial EAPOL PDUs to the supplicant.

Default
30 seconds

Options
seconds—Number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant.

Range: 1 through 65,535 seconds

Default: 30 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring 802.1X Interface Settings (CLI Procedure) on page 1307
- 802.1X for J-EX Series Switches Overview on page 1227

update-interval

Syntax update-interval *minutes*;

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time that the router or switch waits before sending a new accounting update.

Options ***minutes***—Amount of time between updates, in minutes.

Range: 10 through 1440 minutes

Default: No updates

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access

vlan-assignment

Syntax vlan-assignment (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator authentication-profile-name static** *mac-address*], [edit **ethernet-switching-options authentication-whitelist**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.

Options ***vlan-id*** | ***vlan-name***—The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

vlan-nas-port-stacked-format

Syntax vlan-nas-port-stacked-format;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS attribute 5 (NAS-Port) to include the S-VLAN ID, in addition to the VLAN ID, for subscribers on Ethernet interfaces.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Server Options for Subscriber Access
- Configuring Authentication and Accounting Parameters for Subscriber Access

vlan

Syntax vlan (*vlan-id* | *vlan-name* | untagged);

Hierarchy Level [edit **ethernet-switching-options voip interface** (all | [*interface-name* | access-ports])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches, specify the VLAN name or VLAN tag identifier associated with the VLAN to be sent from the authenticating server to the IP phone.

Options *vlan-name*—Name of a VLAN.

vlan-id—The VLAN tag identifier.

Range: 0 through 4095. Tags 0 and 4095 are reserved by Junos OS, and you should not configure them.

untagged—Allow untagged VLAN traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 1292

voip

Syntax

```
voip {
  interface (all | [interface-name | access-ports]) {
    vlan vlan-name );
    forwarding-class <assured-forwarding | best-effort | expedited-forwarding |
      network-control>;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure voice over IP (VoIP) interfaces.

The statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278

- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 1292

what

Syntax what *number*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*) **location civic-based**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the location to which the DHCP entry refers. This information is advertised, along with other location information, from the switch to the MED. It is used during emergency calls to identify the location of the MED.

Options **0** and **1** should not be used unless it is known that the DHCP client is in close physical proximity to the server or network element.

Default 1

Options *number*—Location:

- **0**—Location of the DHCP server.
- **1**—Location of a network element believed to be closest to the client.
- **2**—Location of the client.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 1471**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 1278

CHAPTER 30

Operational Commands for Access Control

clear captive-portal

Syntax **clear captive-portal (firewall [*interface-names*] | interface (all | [*interface-names*]) | mac-address [*mac-addresses*])**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Reset the authentication state of a captive portal interface or captive-portal firewall statistics on one or more interfaces.

Options

firewall [*interface-names*]—Resets captive portal statistics on all interfaces or on the specified interface.

interface (all | *interface-names*)—Resets the authentication state of users connected to all interfaces or the specified interfaces.

mac-address *mac-addresses*—Resets the authentication state for the specified MAC addresses.

Required Privilege Level view

Related Documentation

- **show captive-portal authentication-failed-users on page 1452**
- **show captive-portal interface on page 1455**
- **show captive-portal firewall on page 1453**
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

List of Sample Output

clear captive-portal interface on page 1447
clear captive-portal interface on page 1447
clear captive-portal mac-address on page 1447
clear captive-portal firewall on page 1447

Output Fields Table 161 on page 1446 lists the output fields for the **clear captive-portal interface** command. (The **clear captive-portal firewall** and **clear captive-portal mac-address** commands have no output). Output fields are listed in the approximate order in which they appear.

Table 161: clear captive-portal interface Output Fields

Field Name	Field Description
Interface	Interface on which captive portal has been configured.

Table 161: clear captive-portal interface Output Fields *(continued)*

Field Name	Field Description
State	The state of the port: • **Authenticated**—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback. • **Authenticating**—The client is authenticating through the RADIUS server. • **Connecting**—Switch is attempting to contact the RADIUS server. • **Initialize**—The interface link is down. • **Held**—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.
MAC address	The MAC address of the connected client on the interface.
User	Users connected to the captive portal interface.

Sample Output

clear captive-portal interface

```
user@switch> clear captive-portal interface
ge-0/0/3.0
```

clear captive-portal interface

```
user@switch> clear captive-portal interface
Captive Portal Information:
Interface      State          MAC address          User
ge-0/0/3.0     Authenticated  00:03:47:e1:ba:b9    aclallow
ge-0/0/5.0     Connecting
ge-0/0/7.0     Connecting
ge-0/0/9.0     Connecting
```

clear captive-portal mac-address

```
user@switch> clear captive-portal mac-address 00:03:47:e1:ba:b9
```

This command has no output.

clear captive-portal firewall

```
user@switch> clear captive-portal firewall
```

This command has no output.

clear dot1x

Syntax **clear dot1x (firewall** <*counter-name*> **| interface** <[*interface-name*]> **| mac-address** [*mac-addresses*] **| statistics** <**interface** *interface-name*>)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Reset the authentication state of an interface or delete 802.1X statistics from the switch. When you reset an interface using the **interface** or **mac-address** options, reauthentication on the interface is also triggered. The switch sends out a multicast message on the interface to restart the authentication of all connected supplicants. If a MAC address is reset, then the switch sends out a unicast message to that specific MAC address to restart authentication.

If a supplicant is sending traffic when the **clear dot1x interface** command is issued, the authenticator immediately initiates reauthentication. This process happens quickly, and it might seem that reauthentication did not occur. To verify that reauthentication has happened, issue the **show dot1x interface detail** command. The values for **Reauthentication due** and **Reauthentication interval** will be about the same.

Options

firewall <*counter-name*>—Clear 802.1X firewall counter statistics. If the *counter-name* option is specified, clear 802.1X firewall statistics for that counter.

interface <[*interface-name*]>—Reset the authentication state of all supplicants connected to the specified interfaces (when the interface is an authenticator) or reset the authentication state for the interface itself (when the interface is a supplicant).

mac-address [*mac-addresses*]—Reset the authentication state of the specified MAC addresses.

statistics <interface *interface-name*>—Clear 802.1X statistics on all 802.1X-enabled interfaces. If the **interface** option is specified, clear 802.1X firewall statistics for that interface or interfaces.

Required Privilege Level view

Related Documentation

clear dot1x mac-address 00:04:ae:cd:23:5f on page 1449
clear dot1x statistics interface ge-1/0/1 on page 1449

Sample Output

clear dot1x firewall c1	`user@switch>` clear dot1x firewall c1
clear dot1x interface ge-1/0/0 ge-2/0/0 ge-2/0/0 ge5/0/0	`user@switch>` clear dot1x interface ge-1/0/0 ge-2/0/0 ge-2/0/0 ge5/0/0
clear dot1x mac-address 00:04:ae:cd:23:5f	`user@switch>` clear dot1x mac-address 00:04:ae:cd:23:5f
clear dot1x statistics interface ge-1/0/1	`user@switch>` clear dot1x statistics interface ge-1/0/1

clear lldp neighbors

Syntax clear lldp neighbors
<interface *interface*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear the learned remote neighbor information on all or selected interfaces.

Options none—Clear the remote neighbor information on all interfaces.

interface *interface*—(Optional) Clear the remote neighbor information from one or more selected interfaces.

Required Privilege Level view

Related Documentation

- **show lldp on page 1471**
- Configuring LLDP (CLI Procedure) on page 1321
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 1235

List of Sample Output

Sample Output

clear lldp neighbors

```
user@switch> clear lldp neighbors
```

clear lldp neighbors interface ge-0/1/1.0

```
user@switch> clear lldp neighbors interface ge-0/1/1.0
```

clear lldp statistics

Syntax clear lldp statistics
<interface *interface*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear LLDP statistics on one or more interfaces.

Options none—Clears LLDP statistics on all interfaces.

interface *interface-names*—(Optional) Clear LLDP statistics on one or more interfaces.

Required Privilege Level view

Related Documentation

clear lldp statistics
```
user@switch> clear lldp statistics
```

clear lldp statistics interface ge-0/1/1.0
```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

show captive-portal authentication-failed-users

Syntax **show captive-portal authentication-failed-users**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the users that have failed captive portal authentication.

Required Privilege Level view

Related Documentation

- **show captive-portal interface on page 1455**
- **show captive-portal firewall on page 1453**
- **clear captive-portal on page 1446**
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

List of Sample Output **show captive-portal authentication-failed-users on page 1452**

Output Fields Table 162 on page 1452 lists the output fields for the **show captive-portal authentication-failed-users** command. Output fields are listed in the approximate order in which they appear.

Table 162: show captive-portal authentication-failed-users Output Fields

Field Name	Field Description	Level of Output
Interface	The MAC address configured to bypass captive portal authentication.	**all**
MAC address	The MAC address configured statically on the interface.	**all**
User	Name of the user that has failed captive portal authentication.	**all**

Sample Output

show captive-portal authentication-failed-users

```
user@switch> show captive-portal authentication-failed-users

Interface     MAC address          User            Failure Count
ge-0/0/8.0    00:30:48:98:5b:47    md5user02
ge-0/0/8.0    00:30:48:98:5e:a5    md5user05
```

show captive-portal firewall

Syntax
show captive-portal firewall
<brief | detail>
<*interface-name*>
<*interface-name* detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about the firewall filters for each user that is authenticated on each captive portal interface.

Options
none—Display all the firewall filters on all captive portal interfaces.

brief | detail—(Optional) Display the specified level of output.

interface-name—(Optional) Display all the terms of the firewall filters for the specified interface.

interface-name detail—(Optional) Display all of the terms of the firewall filters for the specified interface.

Required Privilege Level
view

Related Documentation
- **show captive-portal authentication-failed-users on page 1452**
- **show captive-portal interface on page 1455**
- **clear captive-portal on page 1446**
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 1300
- Configuring Captive Portal Authentication (CLI Procedure) on page 1327

List of Sample Output
show captive-portal firewall brief on page 1453
show captive-portal firewall ge-0/0/10.0 on page 1454
show captive-portal firewall on page 1454

Output Fields
Output fields for the **show captive-portal firewall** command include any action modifier specified in firewall filters except policers. Policers are not supported in the terms of the internally generated dynamic firewall filters that are created when multiple supplicants authenticate on 802.1X-enabled interfaces.

Sample Output

show captive-portal firewall brief

```
user@switch> show captive-portal firewall brief
Captive Portal Information:
Interface      State           MAC address          User
ge-0/0/1.0     Connecting
ge-0/0/10.0    Connecting      00:30:48:8c:66:bd    No User
```

show captive-portal firewall ge-0/0/10.0

```
user@switch> show captive-portal firewall ge-0/0/10.0
Filter name: dot1x_ge-0/0/10
Counters:

show captive-portal interface

Syntax
show captive-portal interface
<interface-name>
detail

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the current operational state of all captive portal interfaces with the list of connected users and the configured values of captive portal attributes on the interfaces.

Options
none—Display all captive portal interfaces.

interface-name—(Optional) Display the state for the specified captive portal interface and lists the MAC address and user names of any clients authenticated on the interface.

interface-name detail—(Optional) Displays the configured values of captive portal attributes on the specified captive portal interface.

Required Privilege Level
view

show captive-portal interface detail on page 1456

Output Fields
Table 163 on page 1455 lists the output fields for the **show captive-portal interface** command. Output fields are listed in the approximate order in which they appear.

Table 163: show captive-portal interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface on which captive portal has been configured.	All levels

Table 163: show captive-portal interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	The state of the interface: • **Authenticated**—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback. • **Authenticating**—The client is authenticating through the RADIUS server. • **Connecting**—Switch is attempting to contact the RADIUS server. • **Initialize**—The interface link is down. • **Held**—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.	All levels
MAC address	The MAC address of the connected client on the interface..	brief
User	Users connected to the captive portal interface.	brief
Supplicant mode	Mode used to authenticate clients—multiple, single, or single-supplicant.	detail
Number of retries	Number of times the user can attempt to submit authentication information.	detail
Quiet period	Time, in seconds, after a user exceeds the maximum number of retries before they can attempt to authenticate.	detail
Configured CP session timeout	Time, in seconds, that a client can be idle before the session expires.	detail
Server timeout	Time, in seconds, that an interface will wait for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.	detail
Number of connected supplicants	Number of users connecting through the captive portal interface. Information for each user includes: • **Supplicant**—User name and MAC address. • **Operational state**—See State (above). • **Dynamic CP session timeout**—Timeout value dynamically downloaded from the RADIUS server for this user, if any. • **CP Session expiration due in**—Time remaining in session.	detail

Sample Output

show captive-portal interface

```
user@switch> show captive-portal interface
Captive Portal Information:
Interface      State           MAC address          User
ge-0/0/1.0     Connecting
ge-0/0/10.0    Connecting      00:30:48:8c:66:bd    No User
```

Output Fields

Table 164 on page 1458 lists the output fields for the **show dot1x** command. Output fields are listed in the approximate order in which they appear.

Table 164: show dot1x Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a port.	All levels
MAC address	The MAC address of the connected supplicant on the port.	All levels

Table 164: show dot1x Output Fields *(continued)*

Field Name	Field Description	Level of Output
Role	The 802.1X authentication role of the interface. When 802.1X is enabled on an interface, the role is **Authenticator**. As **Authenticator**, the interface blocks LAN access until a supplicant is authenticated through 802.1X or MAC RADIUS authentication.	**brief**, **detail**
State	The state of the port: • **Authenticated**—The supplicant has been authenticated through the RADIUS server or has been permitted access through server fail fallback. • **Authenticating**—The supplicant is authenticating through the RADIUS server. • **Held**—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.	**brief**
Administrative state	The administrative state of the port: • **auto**—Traffic is allowed through the port based on the authentication result. (Default) • **force-authorize**—All traffic flows through the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to **dynamic**. • **force-unauthorize**—All traffic drops on the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to **dynamic**.	**detail**
Supplicant	The mode for the supplicant: • **single**—Authenticates only the first supplicant. All other supplicants who connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication. • **single-secure**—Allows only one supplicant to connect to the port. No other supplicant is allowed to connect until the first supplicant logs out. • **multiple**—Allows multiple supplicants to connect to the port. Each supplicant is authenticated individually.	**detail**
Quiet period	The number of seconds the port remains in the wait state following a failed authentication exchange with the supplicant before reattempting the authentication. The default value is 60 seconds. The range is 0 through 65,535 seconds.	**detail**
Transmit period	The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant. The default value is 30 seconds. The range is 1 through 65,535 seconds.	**detail**
MAC radius	MAC RADIUS authentication: • **enabled**—The switch sends an EAPOL request to the connecting host to attempt 802.1X authentication and if the connecting host is unresponsive, the switch tries to authenticate using the MAC address. • **disabled**—The default. The switch will not attempt to authenticate the MAC address of the connecting host.	**detail**

Table 164: show dot1x Output Fields *(continued)*

Field Name	Field Description	Level of Output
MAC radius restrict	The authentication method is restricted to MAC RADIUS only. 802.1X authentication is not enabled.	**detail**
Reauthentication	The reauthentication state: • **disable**—Periodic reauthentication of the client is disabled. • **interval**—Sets the periodic reauthentication time interval. The default value is 3600 seconds. The range is 1 through 65,535 seconds.	**detail**
Supplicant timeout	The number of seconds the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request. The default value is 30 seconds. The range is 1 through 60 seconds.	**detail**
Server timeout	The number of seconds the port waits for a reply when relaying a response from the supplicant to the authentication server before timing out. The default value is 30 seconds. The range is 1 through 60 seconds.	**detail**
Maximum EAPOL requests	The maximum number of retransmission times of an EAPOL request packet to the supplicant before the authentication session times out. The default value is 2. The range is 1 through 10.	**detail**
Number of clients bypassed because of authentication	The number of non-802.1X clients granted access to the LAN by means of static MAC bypass. The following fields are displayed: • **Client**—MAC address of the client. • **vlan** —The name of the VLAN to which the client is connected.	**detail**
Guest VLAN member	The VLAN to which a supplicant is connected when the supplicant is authenticated using a guest VLAN. If a guest VLAN is not configured on the interface, this field displays <**not configured**>.	**detail**
Number of connected supplicants	The number of supplicants connected to a port.	**detail**
Supplicant	The user name and MAC address of the connected supplicant.	**detail**

Table 164: show dot1x Output Fields *(continued)*

Field Name	Field Description	Level of Output
Authentication method	The 802.1X authentication method used for a supplicant: • **Guest VLAN**—A supplicant is connected to the LAN through the guest VLAN. • **MAC Radius**—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected. • **Radius**—A supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. • **Server-fail deny**—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default. • **Server-fail permit**—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server. • **Server-fail use-cache**—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are reauthenticated, but new supplicants are denied LAN access. • **Server-fail VLAN**—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)	**detail**
Authenticated VLAN	The VLAN to which the supplicant is connected.	**detail**
Dynamic filter	User policy filter sent by the RADIUS server.	**detail**
Session Reauth interval	The configured reauthentication interval.	**detail**
Reauthentication due in	The number of seconds in which reauthentication will occur again for the connected supplicant.	**detail**

Sample Output

show dot1x interface brief

```
user@switch> show dot1x interface [ge-0/0/1 ge-0/0/2 ge0/0/3] brief

Interface Role          State          MAC address
--------- ----          -----          ------------------

Output Fields Table 165 on page 1463 lists the output fields for the **show dot1x authentication-failed-users** command. Output fields are listed in the approximate order in which they appear.

Table 165: show dot1x authentication-failed-users Output Fields

Field Name	Field Description	Level of Output
Interface	The MAC address configured to bypass 802.1X authentication.	**all**
MAC address	The MAC address configured statically on the interface.	**all**
User	The user that is configured on the RADIUS server and that has failed 802.1X authentication.	**all**

Sample Output

show dot1x authentication-failed-users

```
user@switch> show dot1x authentication-failed-users

Interface     MAC address          User
ge-0/0/0.0    00:00:00:10:00:02    md5user02
```

show dot1x firewall

Syntax show dot1x firewall <interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Displays information about the firewall filters for each user or nonresponsive host that is authenticated on each 802.1X-enabled interface that is configured for multiple supplicants. For example, if the firewall filter is configured with a term for counters, the command shows the count for each user.

Options interface *interface-names*—(Optional) Display information for the specified interface.

Required Privilege Level view

show ethernet-switching interfaces

Syntax
show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.
In Junos OS Release 11.1 for J-EX Series switches, the **detail** view was updated to include reflective relay information.

Description
Display information about Ethernet switching interfaces.

Options
none—Display brief information for Ethernet switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet switching information for a specific interface.

Required Privilege Level
view

Output Fields
Table 167 on page 1467 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 167: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	none, **brief**, **detail**, **summary**
Index	VLAN index internal to Junos OS.	**detail**
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**

Table 167: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Port mode	**Access mode** is the port mode default and works with a single VLAN. Port mode can also be **trunk**, which accepts tagged packets from multiple VLANs on other switches. The third port mode value is **tagged-access** which accepts tagged packets from access devices.	**detail**
Reflective Relay Status	Reflective relay allows packets to use the same interface for both upstream and downstream traffic. When reflective relay has been configured, the status displayed is always **enabled** . When reflective relay is not configured, this entry does not appear in the command output.	**detail**
Ethertype for the interface	EtherType is a two-octet field in an Ethernet frame used to indicate which protocol is encapsulated in the payload of an incoming Ethernet packet. Both 802.1Q packets and Q in Q packets use this field. The output displayed for this particular field indicates the interface's ethertype which is used to match the ethertype of incoming 802.1Q packets and Q in Q packets. The indicated ethertype field is also added to the interface's outgoing 802.1Q and Q in Q packets.	**detail**
VLAN membership	Names of VLANs that belong to this interface.	none, **brief**, **detail**,
Tag	Number of the 802.1Q-tag.	none, **brief**, **detail**,
Tagging	Specifies whether the interface forwards 802.1Q **tagged** or **untagged** traffic.	none, **brief**, **detail**,
Blocking	The forwarding state of the interface: • **unblocked**—Traffic is forwarded on the interface. • **blocked**—Traffic is not being forwarded on the interface. • **Disabled by bpdu control**—The interface is disabled due to receiving BPDUs on a protected interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. • **blocked by RTG**—The specified redundant trunk group is disabled. • **blocked by STP**—The interface is disabled due to a spanning tree protocol error. • **MAC limit exceeded**—The interface is temporarily disabled due to a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **MAC move limit exceeded**—The interface is temporarily disabled due to a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **Storm control in effect**—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.	none, **brief**, **detail**,
Number of MACs learned on IFL	Number of MAC addresses learned by this interface.	**detail**

Table 167: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
mapping	When mapping is configured, the status is one of the following C-VLAN to S-VLAN mapping types: • **dot1q-tunneled**—The interface maps all traffic to the S-VLAN (all-in-one bundling). • **native**—The interface maps untagged and priority tagged packets to the S-VLAN. • **push**—The interface maps packets to a firewall filter to an S-VLAN. • **policy-mapped**—The interface maps packets to a specifically defined S-VLAN. • *integer*—The interface maps packets to the specified S-VLAN. When mapping is not configured, this entry does not appear in the command output.	**detail**

Sample Output

show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces

Interface    State  VLAN members        Tag   Tagging  Blocking

ae0.0        up     default                   untagged unblocked
ge-0/0/2.0   up     vlan300           300     untagged blocked by RTG (rtggroup)
ge-0/0/3.0   up     default                            blocked by STP
ge-0/0/4.0   down   default                            MAC limit exceeded
ge-0/0/5.0   down   default                            MAC move limit exceeded
ge-0/0/6.0   down   default                            Storm control in effect
ge-0/0/7.0   down   default                            unblocked
ge-0/0/13.0  up     default                   untagged unblocked
ge-0/0/14.0  up     vlan100             100   tagged   unblocked
                    vlan200             200   tagged   unblocked
ge-0/0/15.0  up     vlan100             100   tagged   blocked by STP
                    vlan200             200   tagged   blocked by STP
ge-0/0/16.0  down   default                   untagged unblocked
ge-0/0/17.0  down   vlan100             100   tagged   Disabled by bpdu-control

                    vlan200             200   tagged   Disabled by bpdu-control
```

show ethernet-switching interfaces ge-0/0/15 brief

show lldp

Syntax
show lldp
<detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol–Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

Options
none—Display LLDP information for all interfaces.

detail—(Optional) Display detailed LLDP information for all interfaces.

Required Privilege Level
view

show lldp on page 1474
show lldp detail on page 1474

Output Fields
Table 168 on page 1471 lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 168: show lldp Output Fields

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be **enabled** or **disabled**. NOTE: If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as **disabled**.	All levels
Advertisement interval	Frequency, in seconds, at which LLDP advertisements are sent. This value is set by the **advertisement-interval** configuration statement.	All levels
Transmit delay	Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system. This value is set by the transmit-delay configuration statement.	All levels

Table 168: show lldp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Hold timer	Multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded. This value is set by the **hold-multiplier** configuration statement.	All levels
Notification interval	How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications of database changes are disabled. This value is set by the **lldp-configuration-notification-interval** configuration statement.	All levels
Config Trap Interval	How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications of topology changes are disabled. This value is set by the **ptopo-configuration-trap-interval** configuration statement.	All levels
Connection Hold timer	Amount of time the system maintains dynamic topology entries. This value is set by the **ptopo-configuration-maximum-hold-time** configuration statement.	All levels
LLDP-MED	LLDP-MED operating state. The state can be **enabled** or **disabled**.	All levels
LLDP-MED fast start count	Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second. This value is set by the **fast-start** configuration statement.	All levels
Interface	Name of the interface for which LLDP configuration information is being reported.	All levels
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.	All levels
LLDP	LLDP operating state. The state can be **enabled** or **disabled**.	All levels
Neighbor count	Total number of new LLDP neighbors detected since the last switch reboot.	**detail**
Interface	Name of the interface that is advertising VLAN information.	All levels
Vlan-id	VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.	**detail**
Vlan-name	VLAN name associated with the VLAN ID.	**detail**

Table 168: show lldp Output Fields *(continued)*

Field Name	Field Description	Level of Output
LLDP basic TLVs supported	Basic TLVs supported on the switch: • **Chassis identifier**—TLV that advertises the MAC address associated with the local system. • **Port identifier**—TLV that advertises the port identification for the specified port in the local system. • **Port description**—TLV that advertises the user-configured port description. • **System name**—TLV that advertises the user-configured name of the local system. • **System description**—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable. • **System capabilities**—TLV that advertises the primary functions performed by the system—for example, bridge or router. • **Management address**—TLV that advertises the IP management address of the local system.	**detail**
Supported LLDP 802 TLVs	802.3 TLVs supported on the switch: • **MAC/PHY configuration status**—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable. • **Power via MDI**—TLV that advertises MDI power support, PSE power pair, and power class information. • **Link aggregation**—TLV that advertises if the interface is aggregated and its aggregated interface ID. • **Maximum frame size**—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames. • **Port VLAN tag**—TLV that advertises the VLAN tag configured on the interface. • **Port VLAN name**—TLV that advertises the VLAN name configured on the interface.	**detail**

Table 168: show lldp Output Fields *(continued)*

Field Name	Field Description	Level of Output

Supported LLDP MED TLVs	LLDP-MED TLVs supported on the switch:
	• **LLDP MED capabilities**—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15:
	  • **0**—Capabilities
	  • **1**—Network Policy
	  • **2**—Location Identification
	  • **3**—Extended Power via MDI-PSE
	  • **4**—Inventory
	  • **5–15**—Reserved
	• **Network policy**—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points.
	• **Endpoint location**—TLV that advertises the physical location of the endpoint.
	• **Extended power Via MDI**—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

Output Fields Table 169 on page 1476 lists the output fields for the **show lldp local-information** command. Output fields are listed in the approximate order in which they appear.

Table 169: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information about the local system (the switch): • **Chassis ID**—MAC address associated with the switch. • **System name**—User-configured name of the switch. • **System descr**—System description containing information about the switch model and the current software image running on the switch. This information is taken from the software and is not configurable.
System Capabilities	Capabilities (such as **bridge** or **router**) that are supported or enabled on the system.
Management Information	Details of the management information: **Port Name**, **Port Address** (such as **10.204.34.35**), **Address Type** (such as **ipv4** or **ipv6**), **Port ID** (SNMP interface index), **Port ID Subtype**, and **Port Subtype**. The **Port Subtype** displays: • **ifIndex(2)**— IP address of the switch's management Ethernet interface (**me0**) or virtual management Ethernet (**VME**) interface address (for a Virtual Chassis) is used to manage the switch. • **unknown(1)**—IP management address has been configured with set **protocols lldp management-address**.
Interface name	Name of the local interface which is configured for either LLDP or LLDP-MED.
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the local interface belongs.

Table 169: show lldp local-information Output Fields *(continued)*

Field Name	Field Description
SNMP Index	SNMP interface index.
Interface description	User-configured port description.
Status	Administrative status of the interface: either **up** or **down**.
Tunneling	Status of tunneling on the interface: either **enabled** or **disabled**.

Output Fields Table 170 on page 1478 lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 170: show lldp neighbors Output Fields

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.
Chassis ID	List of chassis identifiers for neighbors.
Port info	List of port information gathered from neighbors. This could be the port identifier or port description.
System name	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both the local system (the switch) and a neighbor system on the interface (appears when the **interface** option is used).

Table 170: show lldp neighbors Output Fields *(continued)*

Field Name	Field Description
Local Information	Information about the local system (appears when the **interface** option is used).
Index	Local interface index (appears when the **interface** option is used).
Time to live	Number of seconds for which this information is valid (appears when the **interface** option is used).
Time mark	Date and timestamp of information (appears when the **interface** option is used).
Local Interface	Name of the local physical interface (appears when the **interface** option is used).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the **interface** option is used).
Local Port ID	Local interface SNMP index (appears when the interface option is used).
Ageout Count	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the interface option is used).
Neighbor Information	Information about a neighbor system on the interface (appears when the **interface** option is used).
Chassis type	Type of chassis identifier supplied, such as **MAC address** (appears when the **interface** option is used).
Chassis ID	Chassis identifier of the chassis type listed (appears when the **interface** option is used).
Port type	Type of port identifier supplied, such as **locally assigned** (appears when the **interface** option is used).
Port ID	Port identifier of the port type listed (appears when the **interface** option is used).
Port description	Port description (appears when the **interface** option is used).
System name	Name supplied by the system on the interface (appears when the **interface** option is used).
System Description	Description supplied by the system on the interface (appears when the **interface** option is used).
System capabilities	Capabilities (such as **Bridge**, **Router**, and **Telephone**) that are supported or enabled by the system on the interface (appears when the **interface** option is used).

Table 170: show lldp neighbors Output Fields *(continued)*

Field Name	Field Description
Management Info	Details of management information: **Type** (such as **ipv4** or **ipv6**), **Address** (such as **10.204.34.35**), **Port ID**, **Subtype**, **Interface Subtype**, and organization identifier (**OID**) (appears when the **interface** option is used). The **Interface Subtype** displays: • **ifIndex(2)**— IP address of the neighbor's management Ethernet interface (**me0**) or virtual management Ethernet (**VME**) interface address (for a Virtual Chassis) is used to manage the switch. • **unknown(1)**—Neighbor's IP management address has been configured with set **protocols lldp management-address**.
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include: **Media endpoint class** (such as Class 3 for communication devices such as IP phones), **MED Hardware revision**, **MED Firmware revision**, **MED Software revision**, **MED Serial number**, **MED Manufacturer name**, **MED Model name**.
Organization Info	One or more entries listing remote information by organizationally unique identifier (**OUI**), **Subtype**, **Index**, and **Info** (appears when the **interface** option is used).
Age	How long the neighbor has been identified (appears when the **interface** option is used and NetBIOS snooping is enabled on the switch).
Local Interface	Name of the local physical interface (appears when the **interface** option is used and NetBIOS snooping is enabled on the switch).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the **interface** option is used and NetBIOS snooping is enabled on the switch).
Chassis ID	Chassis identifier of the chassis type listed (appears when the **interface** option is used and NetBIOS snooping is enabled on the switch).
Port description	Port description (appears when the **interface** option is used and NetBIOS snooping is enabled on the switch).
System name	NetBIOS name of the host (appears when the **interface** option is used and NetBIOS snooping is enabled on the switch).

Output Fields Table 175 on page 1491 lists the output fields for the **show network-access aaa statistics dynamic-requests** command. Output fields are listed in the approximate order in which they appear.

Table 175: show network-access aaa statistics dynamic-requests Output Fields

Field Name	Field Description
Requests received	The number of dynamic requests received by the RADIUS server.
Processed successfully	The number of dynamic requests successfully processed by the RADIUS server.
Errors during processing	The number of errors that occurred while the RADIUS server was processing the dynamic request.
Silently dropped	The number of silently dropped requests.

Sample Output

show network-access aaa statistics authentication

```
user@switch> show network-access aaa statistics dynamic-requests
Dynamic-requests module statistics
  Requests received: 0
  Processed successfully: 0
  Errors during processing: 0
  Silently dropped: 0
```

PART 6

Rate Limiting

CHAPTER 31

Rate Limiting Overview

Understanding Storm Control on J-EX Series Switches

A traffic storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. Storm control enables the switch to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading the LAN. As an alternative to having the switch drop packets, you can configure it to shut down interfaces or temporarily disable interfaces (see the **action-shutdown** statement or the **port-error-disable** statement) when the storm control level is exceeded.

The factory default configuration enables storm control on all switch interfaces, with the storm control level set to 80 percent of the combined broadcast, multicast, and unknown unicast streams. You can change the storm control level for an interface by specifying a bandwidth value for the combined broadcast, multicast, and unknown unicast traffic streams. You can also selectively disable storm control on the broadcast stream, on the multicast stream, or on the unknown unicast stream.

NOTE: **On J-EX8200 switches, you can also selectively disable storm control on registered multicast traffic, on unregistered multicast traffic, or on both types of multicast traffic.**

Broadcast, multicast, and unicast packets are part of normal LAN operation, so to recognize a storm, you must be able to identify when traffic has reached a level that is abnormal for your LAN. Suspect a storm when operations begin timing out and network response times slow down. As more packets flood the LAN, network users might be unable to access servers or e-mail.

Monitor the level of broadcast, multicast, and unknown unicast traffic in the LAN when it is operating normally. Use this data as a benchmark to determine when traffic levels

are too high. Then configure storm control to set the level at which you want to drop broadcast traffic, multicast traffic, unknown unicast traffic, or two or all three of those traffic types.

NOTE: When you configure storm control bandwidth on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control bandwidth of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

Understanding Unknown Unicast Forwarding on J-EX Series Switches

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward all unknown unicast traffic to a specific trunk interface. This channels the unknown unicast traffic to a single interface.

CHAPTER 32

Example: Rate Limiting Configuration

Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on the J-EX Series switch to rate limit broadcast traffic, multicast traffic, and unknown unicast traffic at a specified level and to drop packets when the specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN.

This example shows how to configure storm control on a single J-EX Series switch:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches

Overview and Topology

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the storm control level, of broadcast traffic, multicast traffic, and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast streams.

NOTE: The factory default configuration enables storm control on all interfaces at 80 percent of the combined broadcast, multicast, and unknown unicast streams.

Storm control monitors the incoming broadcast traffic, multicast traffic, and unknown unicast traffic and compares it with the level that you specify. If broadcast traffic, multicast traffic, and unknown unicast traffic exceed the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure it to shut down interfaces or temporarily disable interfaces (see the **action-shutdown** statement or the **port-error-disable** statement) when the storm control level is exceeded.

The topology used in this example consists of one J-EX Series switch with 24 ports. The switch is connected to various network devices. This example shows how to configure the storm control level on interface **ge-0/0/0** by setting the level to a traffic rate of 15,000 Kbps, based on the traffic rate of the combined broadcast, multicast, and unknown unicast streams. If broadcast traffic, multicast traffic, and unknown unicast traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

Configuration

CLI Quick Configuration

To quickly configure storm control based on the traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set ethernet-switching-options storm-control interface ge-0/0/0 bandwidth 15000
```

Step-by-Step Procedure

To configure storm control:

1. Specify the traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast streams on a specific interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface ge-0/0/0 bandwidth 15000
```

Results

Display the results of the configuration:

```
[edit ethernet-switching-options]
user@switch# show storm-control
interface ge-0/0/0.0 {
   bandwidth 15000;
}
```

CHAPTER 33

Configuring Rate Limiting

Configuring Unknown Unicast Forwarding (CLI Procedure)

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific trunk interface. From there, the destination MAC address can be learned and added to the Ethernet switching table. You can configure each VLAN to divert unknown unicast traffic to different trunk interfaces or use one trunk interface for multiple VLANs.

To configure unknown unicast forwarding options:

NOTE: **Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.**

1. Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is **employee**):

```
[edit ethernet-switching-options]
user@switch# set unknown-unicast-forwarding vlan employee
```

2. Specify the trunk interface to which all unknown unicast traffic will be forwarded:

```
[edit ethernet-switching-options]
user@switch# set unknown-unicast-forwarding vlan employee interface ge-0/0/3.0
```

- Understanding Storm Control on J-EX Series Switches on page 1495

Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

An Ethernet switching access interface on a J-EX Series switch might shut down or be disabled as a result of one of the following port-security or storm-control configurations:

- MAC limiting—**mac-limit** statement is configured with action **shutdown**.
- MAC move limiting—**mac-move-limit** statement is configured with action **shutdown**.
- Storm control—**storm-control** statement is configured with the action **shutdown**.

You can configure the switch to automatically restore the disabled interfaces to service after a specified period of time. Autorecovery applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: You must specify the disable timeout value for the interfaces to recover automatically. There is no default disable timeout. If you do not specify a timeout value, you need to use the **clear ethernet-switching port-error** command to clear the errors and restore the interfaces or the specified interface to service.

To configure autorecovery from the disabled state due to MAC limiting, MAC move limiting, or storm control shutdown actions:

```
[edit ethernet-switching-options]
user@switch# set port-error-disable disable-timeout 60
```

- Understanding Storm Control on J-EX Series Switches on page 1495

CHAPTER 34

Verifying Rate Limiting Configuration

Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface

Purpose Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single trunk interface instead of flooding unknown unicast packets across all interfaces that are members of the same VLAN.

Action Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is **v1**):

```
user@switch> show configuration ethernet-switching-options

unknown-unicast-forwarding {
    vlan v1 {
        interface ge-0/0/7.0;
    }
}
```

Display the Ethernet switching table:

```
user@switch> show ethernet-switching table vlan v1
Ethernet-switching table: 3 unicast entries
  VLAN              MAC address       Type         Age Interfaces
  v1                *                 Flood          - All-members
  v1                00:01:09:00:00:00 Learn         24 ge-0/0/7.0
  v1                00:11:09:00:01:00 Learn         37 ge-0/0/3.0
```

Meaning The sample output from the **show configuration ethernet-switching-options** command shows that the unknown unicast forwarding interface for VLAN **v1** is interface **ge-0/0/7**. The **show ethernet-switching table** command shows that an unknown unicast packet is received on interface **ge-0/0/3** with the destination MAC address (DMAC) **00:01:09:00:00:00** and the source MAC address (SMAC) of **00:11:09:00:01:00**. This shows that the SMAC of the packet is learned in the normal way (through the interface **ge-0/0/3.0**), while the DMAC is learned on interface **ge-0/0/7**.

Related Documentation

- Configuring Unknown Unicast Forwarding (CLI Procedure) on page 1499

Verifying That the Port Error Disable Setting Is Working Correctly

Purpose Verify that the port error disable setting is working as expected on MAC limited, MAC move limited, and rate-limited interfaces on a J-EX Series switch.

Action Display information about interfaces:

```
user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  up       T1122                  unblocked
ge-0/0/1.0  down     default                MAC limit exceeded
ge-0/0/2.0  down     default                MAC move limit exceeded
ge-0/0/3.0  down     default                Storm control in effect
ge-0/0/4.0  down     default                unblocked
ge-0/0/5.0  down     default                unblocked
ge-0/0/6.0  down     default                unblocked
ge-0/0/7.0  down     default                unblocked
ge-0/0/8.0  down     default                unblocked
ge-0/0/9.0  up       T111                   unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     default                unblocked
ge-0/0/12.0 down     default                unblocked
ge-0/0/13.0 down     default                unblocked
ge-0/0/14.0 down     default                unblocked
ge-0/0/15.0 down     default                unblocked
ge-0/0/16.0 down     default                unblocked
ge-0/0/17.0 down     default                unblocked
ge-0/0/18.0 down     default                unblocked
ge-0/0/19.0 up       T111                   unblocked
ge-0/1/0.0  down     default                unblocked
ge-0/1/1.0  down     default                unblocked
ge-0/1/2.0  down     default                unblocked
ge-0/1/3.0  down     default                unblocked
```

Meaning The sample output from the **show ethernet-switching interfaces** command shows that three of the down interfaces specify the reason that the interface is disabled:

- **MAC limit exceeded**—The interface is temporarily disabled due to a **mac-limit** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.
- **MAC move limit exceeded**—The interface is temporarily disabled due to a **mac-move-limit** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.
- **Storm control in efffect** —The interface is temporarily disabled due to a **storm-control** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.

action-shutdown

Syntax action-shutdown;

Hierarchy Level [edit **ethernet-switching-options storm-control**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Shut down or disable interfaces when the storm control level is exceeded, as follows:

- If you set both the **action-shutdown** and the **port-error-disable** statements, the interfaces are disabled temporarily and recover automatically when the disable timeout expires.
- If you set the **action-shutdown** statement and do not the specify the **port-error-disable** statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. You must issue the **clear ethernet-switching port-error** command to clear the port error and restore the interfaces to service.

Default The **action-shutdown** option is not enabled. When the storm control level is exceeded, the switch drops unknown unicast, multicast, and broadcast messages on the specified interfaces.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

bandwidth

Syntax bandwidth *bandwidth*;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the storm control level as the bandwidth in kilobits per second of the combined broadcast, multicast, and unknown unicast streams.

NOTE: When you configure storm control bandwidth on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control bandwidth of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

Default If you omit the **bandwidth** statement when you configure storm control on an interface, the storm control level defaults to 80 percent of the combined broadcast, multicast, and unknown unicast streams.

Options **bandwidth**—Traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast streams.

Range: 100 through 10000000

Default: None

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 1497
- Understanding Storm Control on J-EX Series Switches on page 1495

disable-timeout

Syntax disable-timeout *timeout*;

Hierarchy Level [edit **ethernet-switching-options port-error-disable**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the Ethernet-switching interfaces remain in a disabled state due to the MAC limiting, MAC move liming, or storm control errors.

Default The disable timeout is not enabled.

Options ***timeout*** —Amount of time, in seconds, that the disabled state remains in effect. The disabled interface is automatically restored to service when the specified timeout is reached.

Range: 10 through 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface (Storm Control)

Syntax

```
interface (all | interface-name) {
    bandwidth bandwidth;
    no-broadcast;
    no-multicast;
    no-registered-multicast;
    no-unknown-unicast;
    no-unregistered-multicast;
}
```

Hierarchy Level [edit ethernet-switching-options storm-control]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable and configure storm control on all interfaces or on the specified interface.

If you do not include the **bandwidth** statement, the storm control level defaults to 80 percent of the combined broadcast, multicast, and unknown unicast streams.

Default The factory default configuration enables storm control on all switch interfaces at the default level of 80 percent of the combined broadcast, multicast, and unknown unicast streams.

Options **all**—All interfaces. The storm control settings configured with the **all** option affect only those interfaces that have not been individually configured for storm control.

interface-name—Name of an interface. The storm control settings configured with the ***interface-name*** option override any settings configured with the **all** option.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

no-broadcast

Syntax no-broadcast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable storm control for broadcast traffic for the specified interface or for all interfaces.

Default Storm control is enabled for broadcast traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 1497
- Understanding Storm Control on J-EX Series Switches on page 1495

no-multicast

Syntax no-multicast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 10.3 for J-EX Series switches.

Description Disable storm control for all multicast traffic (both registered multicast and unregistered multicast) for the specified interface or for all interfaces.

Default Storm control is enabled for unknown unicast traffic, multicast traffic, and broadcast traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **no-registered-multicast on page 1514**
- **no-unregistered-multicast on page 1515**
- Understanding Storm Control on J-EX Series Switches on page 1495

no-registered-multicast

Syntax no-registered-multicast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 10.3 for J-EX Series switches.

Description (J-EX8200 switches only) Disable storm control for registered multicast traffic for the specified interface or for all interfaces.

Default Storm control is enabled for unknown unicast traffic, multicast traffic, and broadcast traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **no-multicast on page 1514**
- **no-unregistered-multicast on page 1515**

no-unknown-unicast

Syntax no-unknown-unicast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable storm control for unknown unicast traffic for the specified interface or for all interfaces.

Default Storm control is enabled for unknown unicast traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **no-unregistered-multicast on page 1515**
- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 1497

no-unregistered-multicast

Syntax no-unregistered-multicast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 10.3 for J-EX Series switches.

Description (J-EX8200 switches only) Disable storm control for unregistered multicast traffic for the specified interface or for all interfaces.

Default Storm control is enabled for unknown unicast traffic, multicast traffic, and broadcast traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **no-multicast on page 1514**
- **no-registered-multicast on page 1514**

port-error-disable

Syntax

```
port-error-disable {
  disable-timeout timeout ;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, and rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after a specified period of time:

- If you have enabled **mac-limit** with the **shutdown** option and enable **port-error-disable**, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.
- If you have enabled **mac-move-limit** with the **shutdown** option and you enable **port-error-disable**, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.
- If you have enabled **storm-control** with the **action-shutdown** option and you enable **port-error-disable**, the switch disables (rather than shuts down) the interface when broadcast traffic, multicast traffic, and unknown unicast traffic exceeds the specified levels.

NOTE: The port-error-disable configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after port-error-disable has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the clear ethernet-switching port-error command.

Default Not enabled.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

- Configuring Port Security (CLI Procedure) on page 1610
- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 1497

storm-control

Syntax

```
storm-control {
  action-shutdown;
  interface (all | interface-name) {
    bandwidth bandwidth;
    no-broadcast;
    no-multicast;
    no-registered-multicast;
    no-unknown-unicast;
    no-unregistered-multicast;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure storm control on the switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 1497
- Understanding Storm Control on J-EX Series Switches on page 1495

unknown-unicast-forwarding

Syntax

```
unknown-unicast-forwarding {
  vlan (all | vlan-name){
    interface interface-name;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the switch to forward all unknown unicast packets in a VLAN or on all VLANs to a particular interface.

NOTE: Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

The remaining statements are explained separately.

Default Unknown unicast packets are flooded to all interfaces that belong to the same VLAN.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

vlan

Syntax

```
vlan (all | vlan-name) {
  interface interface-name;
}
```

Hierarchy Level [edit **ethernet-switching-options unknown-unicast-forwarding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a VLAN from which unknown unicast packets will be forwarded or specify that the packets will be forwarded from all VLANS. Unknown unicast packets are forwarded from a VLAN to a specific trunk interface.

The **interface** statement is explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options all—All VLANs.

vlan-name—Name of a VLAN.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

CHAPTER 36

Operational Commands for Rate Limiting

show ethernet-switching interfaces

Syntax
show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.
In Junos OS Release 11.1 for J-EX Series switches, the **detail** view was updated to include reflective relay information.

Description
Display information about Ethernet switching interfaces.

Options
none—Display brief information for Ethernet switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet switching information for a specific interface.

Required Privilege Level
view

List of Sample Output
show ethernet-switching interfaces on page 1524
show ethernet-switching interfaces ge-0/0/15 brief on page 1524
show ethernet-switching interfaces ge-0/0/2 detail (Blocked by RTG rtggroup) on page 1524
show ethernet-switching interfaces ge-0/0/15 detail (Blocked by STP) on page 1524
show ethernet-switching interfaces ge-0/0/17 detail (Disabled by bpdu-control) on page 1525
show ethernet-switching interfaces detail (C-VLAN to S-VLAN Mapping) on page 1525
show ethernet-switching interfaces detail (reflective relay is configured) on page 1525

Output Fields
Table 176 on page 1522 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 176: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	none, **brief**, **detail**, **summary**
Index	VLAN index internal to Junos OS.	**detail**
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**

Table 176: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Port mode	**Access mode** is the port mode default and works with a single VLAN. Port mode can also be **trunk**, which accepts tagged packets from multiple VLANs on other switches. The third port mode value is **tagged-access** which accepts tagged packets from access devices.	**detail**
Reflective Relay Status	Reflective relay allows packets to use the same interface for both upstream and downstream traffic. When reflective relay has been configured, the status displayed is always **enabled** . When reflective relay is not configured, this entry does not appear in the command output.	**detail**
Ethertype for the interface	EtherType is a two-octet field in an Ethernet frame used to indicate which protocol is encapsulated in the payload of an incoming Ethernet packet. Both 802.1Q packets and Q in Q packets use this field. The output displayed for this particular field indicates the interface's ethertype which is used to match the ethertype of incoming 802.1Q packets and Q in Q packets. The indicated ethertype field is also added to the interface's outgoing 802.1Q and Q in Q packets.	**detail**
VLAN membership	Names of VLANs that belong to this interface.	none, **brief**, **detail**,
Tag	Number of the 802.1Q-tag.	none, **brief**, **detail**,
Tagging	Specifies whether the interface forwards 802.1Q **tagged** or **untagged** traffic.	none, **brief**, **detail**,
Blocking	The forwarding state of the interface: • **unblocked**—Traffic is forwarded on the interface. • **blocked**—Traffic is not being forwarded on the interface. • **Disabled by bpdu control**—The interface is disabled due to receiving BPDUs on a protected interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. • **blocked by RTG**—The specified redundant trunk group is disabled. • **blocked by STP**—The interface is disabled due to a spanning tree protocol error. • **MAC limit exceeded**—The interface is temporarily disabled due to a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **MAC move limit exceeded**—The interface is temporarily disabled due to a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **Storm control in effect**—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.	none, **brief**, **detail**,
Number of MACs learned on IFL	Number of MAC addresses learned by this interface.	**detail**

Table 176: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
mapping	When mapping is configured, the status is one of the following C-VLAN to S-VLAN mapping types: • **dot1q-tunneled**—The interface maps all traffic to the S-VLAN (all-in-one bundling). • **native**—The interface maps untagged and priority tagged packets to the S-VLAN. • **push**—The interface maps packets to a firewall filter to an S-VLAN. • **policy-mapped**—The interface maps packets to a specifically defined S-VLAN. • *integer*—The interface maps packets to the specified S-VLAN. When mapping is not configured, this entry does not appear in the command output.	**detail**

Sample Output

show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces

Interface    State  VLAN members        Tag   Tagging  Blocking

ae0.0        up     default                   untagged unblocked
ge-0/0/2.0   up     vlan300           300     untagged blocked by RTG (rtggroup)
ge-0/0/3.0   up     default                            blocked by STP
ge-0/0/4.0   down   default                            MAC limit exceeded
ge-0/0/5.0   down   default                            MAC move limit exceeded
ge-0/0/6.0   down   default                            Storm control in effect
ge-0/0/7.0   down   default                            unblocked
ge-0/0/13.0  up     default                   untagged unblocked
ge-0/0/14.0  up     vlan100             100   tagged   unblocked
                    vlan200             200   tagged   unblocked
ge-0/0/15.0  up     vlan100             100   tagged   blocked by STP
                    vlan200             200   tagged   blocked by STP
ge-0/0/16.0  down   default                   untagged unblocked
ge-0/0/17.0  down   vlan100             100   tagged   Disabled by bpdu-control

                    vlan200             200   tagged   Disabled by bpdu-control
```

show ethernet-switching interfaces ge-0/0/15 brief

```
user@switch> show ethernet-switching interfaces ge-0/0/15 brief
Interface   State  VLAN members   Tag   Tagging        Blocking

ge-0/0/15.0 up     vlan100        100   tagged         blocked by STP
                   vlan200        200   tagged         blocked by STP
```

show ethernet-switching interfaces ge-0/0/2 detail (Blocked by RTG rtggroup)

```
user@switch> show ethernet-switching interfaces ge-0/0/2 detail

Interface: ge-0/0/2.0, Index: 65, State: up, Port mode: Access
VLAN membership:
    vlan300, 802.1Q Tag: 300, untagged, msti-id: 0, blocked by RTG(rtggroup)
Number of MACs learned on IFL: 0
```

show ethernet-switching

```
user@switch> show ethernet-switching interfaces ge-0/0/15 detail
```

interfaces ge-0/0/15 detail (Blocked by STP)

```
Interface: ge-0/0/15.0, Index: 70, State: up, Port mode: Trunk
VLAN membership:
    vlan100, 802.1Q Tag: 100, tagged, msti-id: 0, blocked by STP
    vlan200, 802.1Q Tag: 200, tagged, msti-id: 0, blocked by STP

Number of MACs learned on IFL: 0
```

show ethernet-switching interfaces ge-0/0/17 detail (Disabled by bpdu-control)

```
user@switch> show ethernet-switching interfaces ge-0/0/17 detail

Interface: ge-0/0/17.0, Index: 71, State: down, Port mode: Trunk
VLAN membership:
    vlan100, 802.1Q Tag: 100, tagged, msti-id: 1, Disabled by bpdu-control
    vlan200, 802.1Q Tag: 200, tagged, msti-id: 2, Disabled by bpdu-control
Number of MACs learned on IFL: 0
```

show ethernet-switching interfaces detail (C-VLAN to S-VLAN Mapping)

```
user@switch>show ethernet-switching interfaces ge-0/0/6.0 detail
Interface: ge-0/0/6.0, Index: 73, State: up, Port mode: Access
VLAN membership:
    map, 802.1Q Tag: 134, Mapped Tag: native, push, dot1q-tunneled, unblocked
    map, 802.1Q Tag: 134, Mapped Tag: 20, push, dot1q-tunneled, unblocked
```

show ethernet-switching interfaces detail (reflective relay is configured)

```
user@switch1> show ethernet-switching interfaces ge-7/0/2 detail
Interface: ge-7/0/2, Index: 66, State: down, Port mode: Tagged-access
Reflective Relay Status: Enabled
Ether type for the interface: 0x8100
VLAN membership:
    VLAN_Purple VLAN_Orange VLAN_Blue, 802.1Q Tag: 450, tagged, unblocked
Number of MACs learned on IFL: 0
```

show ethernet-switching table

Syntax

show ethernet-switching table
<brief | detail | extensive | summary>
<interface *interface-name*>
<management-vlan>
<sort-by (*name* | *tag*)>
<vlan *vlan-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the Ethernet switching table.

Options

none—(Optional) Display brief information about the Ethernet switching table.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display the Ethernet switching table for a specific interface.

management-vlan—(Optional) Display the Ethernet switching table for a management VLAN.

sort-by (*name* | *tag*)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

vlan *vlan-name*—(Optional) Display the Ethernet switching table for a specific VLAN.

Required Privilege Level

List of Sample Output

show ethernet-switching table on page 1527
show ethernet-switching table brief on page 1528
show ethernet-switching table detail on page 1528
show ethernet-switching table extensive on page 1529
show ethernet-switching table interface ge-0/0/1 on page 1529

Output Fields

Table 177 on page 1526 lists the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

Table 177: show ethernet-switching table Output Fields

Field Name	Field Description	Level of Output
VLAN	The name of a VLAN.	All levels

Table 177: show ethernet-switching table Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tag	The VLAN ID tag name or number.	**extensive**
MAC or **MAC address**	The MAC address associated with the VLAN.	All levels
Type	The type of MAC address. Values are: • **static**—The MAC address is manually created. • **learn**—The MAC address is learned dynamically from a packet's source MAC address. • **flood**—The MAC address is unknown and flooded to all members.	All levels
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
Interfaces	Interface associated with learned MAC addresses or **All-members** (flood entry).	All levels
Learned	For learned entries, the time which the entry was added to the Ethernet switching table.	**detail**, **extensive**
Nexthop index	The next-hop index number.	**detail**, **extensive**

Sample Output

show ethernet-switching table

```
user@switch> show ethernet-switching table
Ethernet-switching table: 57 entries, 17 learned
  VLAN              MAC address       Type         Age Interfaces

PART 7

Port Security

CHAPTER 37

Port Security Overview

Port Security for J-EX Series Switches Overview

Ethernet LANs are vulnerable to attacks such as address spoofing (forging) and Layer 2 denial of service (DoS) on network devices. Port security features help protect the access ports on your switch against the losses of information and productivity that can result from such attacks.

The Junos operating system (Junos OS) on J-EX Series Switches provides features to help secure ports on the switch. The ports can be categorized as either trusted or untrusted. You apply policies appropriate to those categories to protect against various types of attacks.

Port security features can be turned on to obtain the most robust port security level. Basic port security features are enabled in the switch's default configuration. You can configure additional features with minimal configuration steps.

Port security features on J-EX Series switches are:

- DHCP snooping—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP-address/MAC-address binding database (called the DHCP snooping database). You enable this feature on VLANs.
- Dynamic ARP inspection (DAI)—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering

decisions are made based on the results of those comparisons. You enable this feature on VLANs.

- MAC limiting—Protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on access interfaces (ports).
- MAC move limiting—Detects MAC movement and MAC spoofing on access ports. You enable this feature on VLANs.
- Trusted DHCP server—With a DHCP server on a trusted port, protects against rogue DHCP servers sending leases. You enable this feature on interfaces (ports). By default, access ports are untrusted and trunk ports are trusted. (Access ports are the switch ports that connect to Ethernet endpoints such as user PCs and laptops, servers, and printers. Trunk ports are the switch ports that connect to other Ethernet switches or to routers.)
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. You enable this feature on VLANs. With IP source guard enabled, the source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is allowed for further processing if the source IP address to source MAC address binding is valid; if the binding is not valid, the packet is discarded.
- DHCP option 82—Also known as the DHCP relay agent information option. Helps protect the J-EX Series switch against attacks such as spoofing of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

Understanding How to Protect Access Ports on J-EX Series Switches from Common Attacks

Port security features can protect the J-EX Series Switch against various types of attacks. Protection methods against some common attacks are:

- Mitigation of Ethernet Switching Table Overflow Attacks on page 1535
- Mitigation of Rogue DHCP Server Attacks on page 1535

- Protection Against ARP Spoofing Attacks on page 1536
- Protection Against DHCP Snooping Database Alteration Attacks on page 1536
- Protection Against DHCP Starvation Attacks on page 1536

Mitigation of Ethernet Switching Table Overflow Attacks

In an overflow attack on the Ethernet switching table, an intruder sends so many requests from new MAC addresses that the table cannot learn all the addresses. When the switch can no longer use information in the table to forward traffic, it is forced to broadcast messages. Traffic flow on the switch is disrupted, and packets are sent to all hosts on the network. In addition to overloading the network with traffic, the attacker might also be able to sniff that broadcast traffic.

To mitigate such attacks, configure both a MAC limit for learned MAC addresses and some specific allowed MAC addresses. Use the MAC limit feature to control the total number of MAC addresses that can be added to the Ethernet switching table for the specified interface or interfaces. By setting the MAC addresses that are explicitly allowed, you ensure that the addresses of network devices whose network access is critical are guaranteed to be included in the Ethernet switching table. See “Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks” on page 1562.

Mitigation of Rogue DHCP Server Attacks

If an attacker sets up a rogue DHCP server to impersonate a legitimate DHCP server on the LAN, the rogue server can start issuing leases to the network's DHCP clients. The information provided to the clients by this rogue server can disrupt their network access, causing DoS. The rogue server might also assign itself as the default gateway device for the network. The attacker can then sniff the network traffic and perpetrate a man-in-the-middle attack—that is, it misdirects traffic intended for a legitimate network device to a device of its choice.

To mitigate a rogue DHCP server attack, set the interface to which that rogue server is connected as untrusted. That action will block all ingress DHCP server messages from that interface. See “Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks” on page 1566.

NOTE: **The switch logs all DHCP server packets that are received on untrusted ports—for example:**

5 untrusted DHCPOFFER received, interface ge-0/0/0.0[65], vlan v1[10] server ip/mac 12.12.12.1/00:00:00:00:01:12 offer ip/client mac 12.12.12.253/00:AA:BB:CC:DD:01

You can use these messages to detect malicious DHCP servers on the network.

Protection Against ARP Spoofing Attacks

In ARP spoofing, an attacker sends faked ARP messages on the network. The attacker associates its own MAC address with the IP address of a network device connected to the switch. Any traffic sent to that IP address is instead sent to the attacker. Now the attacker can create various types of mischief, including sniffing the packets that were meant for another host and perpetrating man-in-the middle attacks. (In a man-in-the-middle attack, the attacker intercepts messages between two hosts, reads them, and perhaps alters them, all without the original hosts knowing that their communications have been compromised.)

To protect against ARP spoofing on your switch, enable both DHCP snooping and dynamic ARP inspection (DAI). DHCP snooping builds and maintains the DHCP snooping table. That table contains the MAC addresses, IP addresses, lease times, binding types, VLAN information, and interface information for the untrusted interfaces on the switch. DAI uses the information in the DHCP snooping table to validate ARP packets. Invalid ARP packets are blocked and, when they are blocked, a system log message is recorded that includes the type of ARP packet and the sender's IP address and MAC address.

See "Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks" on page 1572.

Protection Against DHCP Snooping Database Alteration Attacks

In an attack designed to alter the DHCP snooping database, an intruder introduces a DHCP client on one of the switch's untrusted access interfaces that has a MAC address identical to that of a client on another untrusted port. The intruder acquires the DHCP lease, which results in changes to the entries in the DHCP snooping table. Subsequently, what would have been valid ARP requests from the legitimate client are blocked.

To protect against this type of alteration of the DHCP snooping database, configure MAC addresses that are explicitly allowed on the interface. See "Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks" on page 1576.

Protection Against DHCP Starvation Attacks

In a DHCP starvation attack, an attacker floods an Ethernet LAN with DHCP requests from spoofed (counterfeit) MAC addresses so that the switch's trusted DHCP servers cannot keep up with requests from legitimate DHCP clients on the switch. The address space of those servers is completely used up, so they can no longer assign IP addresses and lease times to clients. DHCP requests from those clients are either dropped—that is, the result is a denial of service (DoS)—or directed to a rogue DHCP server set up by the attacker to impersonate a legitimate DHCP server on the LAN.

To protect the switch from DHCP starvation attacks, use the MAC limiting feature. Specify the maximum number of MAC addresses that the switch can learn on the access interfaces to which those clients connect. The switch's DHCP server or servers will then be able to supply the specified number of IP addresses and leases to those clients and no more. If a DHCP starvation attack occurs after the maximum number of IP addresses has been

assigned, the attack will fail. See “Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks” on page 1569.

Understanding DHCP Snooping for Port Security on J-EX Series Switches

DHCP snooping allows the switch to monitor and control DHCP messages received from untrusted devices connected to the switch. When DHCP snooping is enabled, the system snoops the DHCP messages to view DHCP lease information and build and maintain a database of valid IP address to MAC address (IP-MAC) bindings called the DHCP snooping database. Only clients with valid bindings are allowed access to the network.

DHCP Snooping Basics

Dynamic Host Configuration Protocol (DHCP) allocates IP addresses dynamically, “leasing” addresses to devices so that the addresses can be reused when no longer needed. Hosts and end devices that require IP addresses obtained through DHCP must communicate with a DHCP server across the LAN.

DHCP snooping acts as a guardian of network security by keeping track of valid IP addresses assigned to downstream network devices by a trusted DHCP server (the server is connected to a trusted network port). By default, all trunk ports on the switch are trusted and all access ports are untrusted for DHCP snooping. You can modify these defaults on each of the switch's interfaces.

When DHCP snooping is enabled, the lease information from the switch (which is a DHCP client) is used to create the DHCP snooping database, a mapping of IP address to VLAN–MAC-address pairs. For each VLAN–MAC-address pair, the database stores the corresponding IP address.

Entries in the DHCP database are updated in these events:

- When a DHCP client releases an IP address (sends a DHCPRELEASE message), the associated mapping entry is deleted from the database.
- If you move a network device from one VLAN to another, typically the device has to acquire a new IP address, so its entry in the database, including the VLAN ID, is updated.
- When the lease time (timeout value) assigned by the DHCP server expires, the associated entry is deleted from the database.

TIP: By default, the IP-MAC bindings are lost when the switch is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the **dhcp-snooping-file** statement to store the database file either locally or remotely.

You can configure the switch to snoop DHCP server responses only from particular VLANs. Doing this prevents spoofing of DHCP server messages.

You configure DHCP snooping for each VLAN, not for each interface (port). By default, DHCP snooping is disabled for all VLANs.

TIP: For private VLANs (PVLANs), enable DHCP snooping on the primary VLAN. If you enable DHCP snooping only on a community VLAN, DHCP messages coming from PVLAN trunk ports are not snooped.

DHCP Snooping Process

The basic process of DHCP snooping entails the following steps:

1. Device sends DHCPDISCOVER to request IP address.
2. Switch forwards the packet to the DHCP server.
3. Server sends DHCPOFFER to offer an address. If the DHCPOFFER is from a trusted interface, switch forwards the packet to the DHCP client.
4. Device sends DHCPREQUEST to accept the IP address. Switch snoops this packet and adds IP-MAC placeholder binding to the database. The entry is considered a placeholder until a DHCPACK is received from the server. Until then, the IP address could still be assigned to some other host.
5. Server sends DHCPACK to assign the IP address or DHCPNAK to deny the address request
6. Switch updates the the DHCP database in accordance with the type of packet received:
   - Upon receipt of DHCPACK, switch updates lease information for the IP-MAC binding in its database.
   - Upon receipt of DHCPNACK, switch deletes the placeholder.

NOTE: DHCPDISCOVER and DHCPOFFER packets are not snooped. The DHCP database is updated only after the DHCPREQEST packet has been sent.

For general information about the messages that the DHCP client and DHCP server exchange during the assignment of an IP address for the client, see the *Junos OS System Basics Configuration Guide*.

DHCP Server Access

Switch access to the DHCP server can be configured in three ways:

- Switch, DHCP Clients, and DHCP Server Are All on the Same VLAN on page 1539
- Switch Acts as DHCP Server on page 1540
- Switch Acts as Relay Agent on page 1541

Switch, DHCP Clients, and DHCP Server Are All on the Same VLAN

When the switch, DHCP clients, and DHCP server are all members of the same VLAN, the DHCP server can be connected to the switch in one of two ways:

- The server is directly connected to the same switch as the one connected to the DHCP clients (the hosts, or network devices, that are requesting IP addresses from the server). You must configure the port that connects the server to the switch as a trusted port. See Figure 40 on page 1540.
- The server is directly connected to a switch that is itself directly connected through a trunk port to the switch that the DHCP clients are connected to. The trunk port is configured by default as a trusted port. The switch that the DHCP server is connected to is not configured for DHCP snooping. See Figure 41 on page 1540—in the figure, **ge-0/0/11** is a trusted trunk port.

Figure 40: DHCP Server Connected Directly to Switch

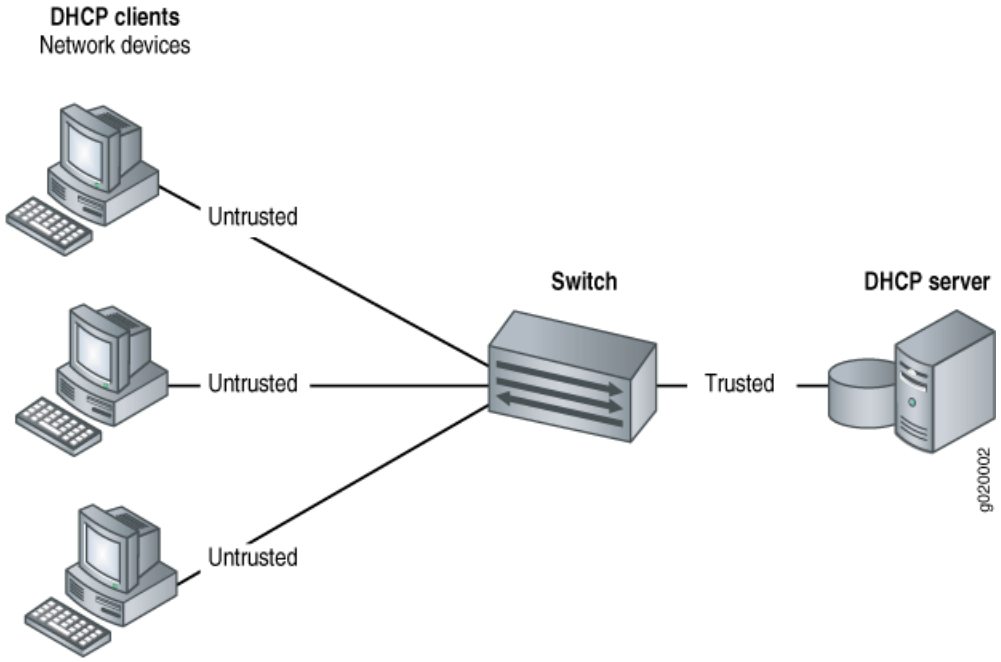

Figure 41: DHCP Server Connected Directly to Switch 2, with Switch 2 Connected to Switch 1 Through a Trusted Trunk Port

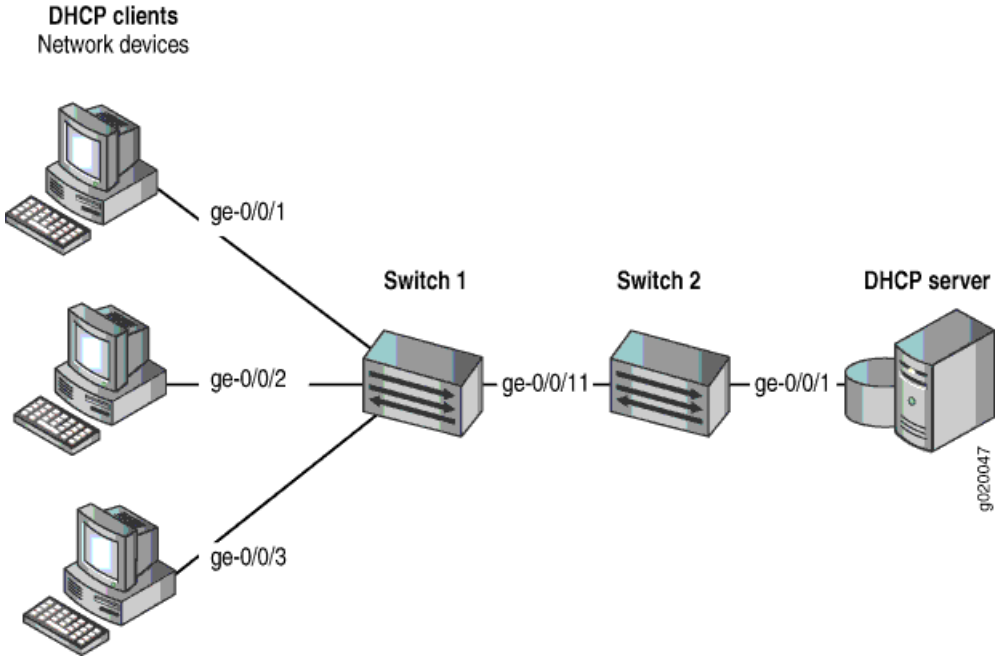
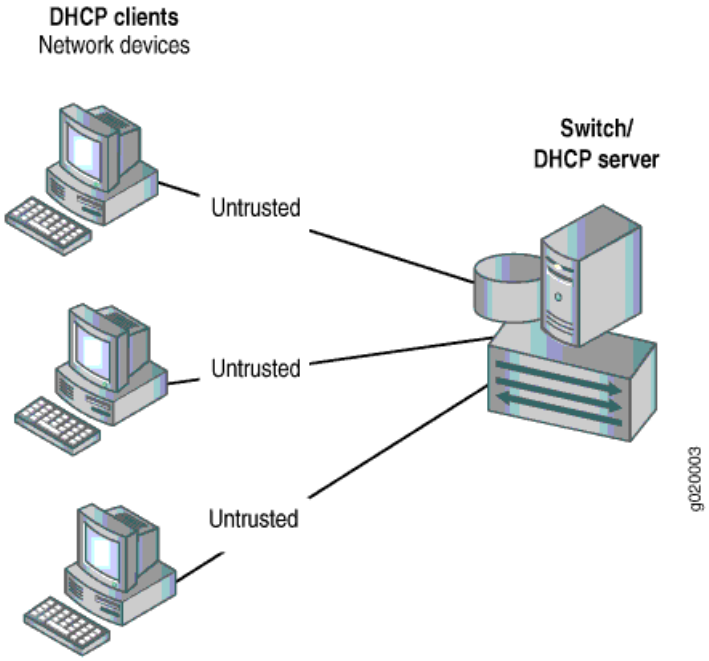


Switch Acts as DHCP Server

The switch itself is configured as a DHCP server; this is known as a “local” configuration. See Figure 42 on page 1541.

Figure 42: Switch Is the DHCP Server



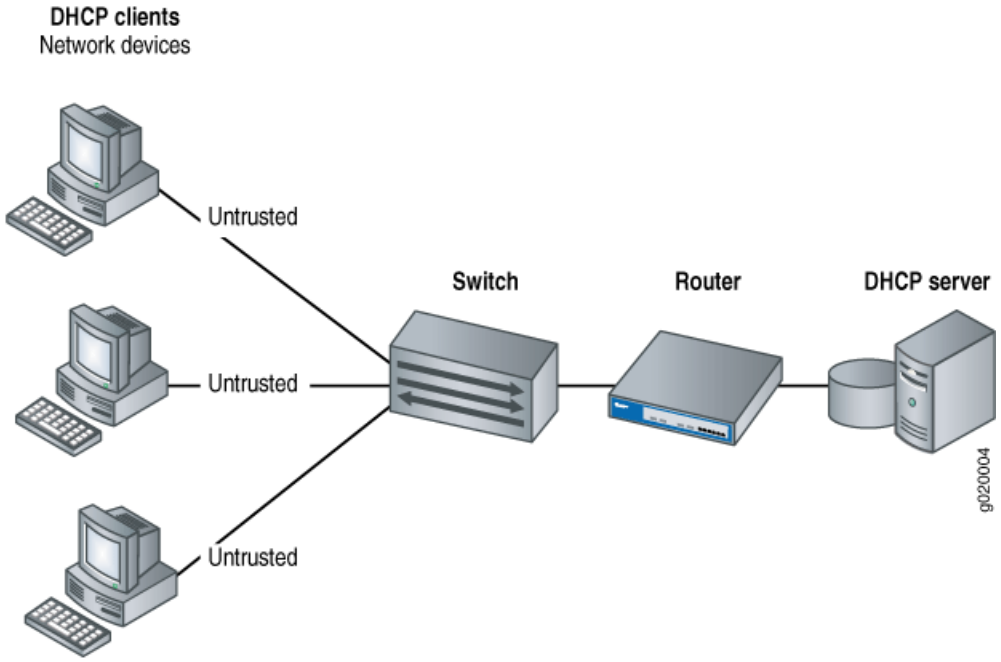
Switch Acts as Relay Agent

The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface (on the switch, these interfaces are configured as routed VLAN interfaces, or RVIs). These trunk interfaces are trusted by default.

These two scenarios illustrate the switch acting as a relay agent:

- The DHCP server and clients are in different VLANs.
- The switch is connected to a router that is in turn connected to the DHCP server. See Figure 43 on page 1542.

Figure 43: Switch Acting as Relay Agent Through Router to DHCP Server



DHCP Snooping Table

The software creates a DHCP snooping information table that displays the content of the DHCP snooping database. The table shows current IP-MAC bindings, as well as lease time, type of binding, names of associated VLANs, and associated interface. To view the table, type **show dhcp snooping binding** at the operational mode prompt:

```
user@switch> show dhcp snooping binding
DHCP Snooping Information:
MAC address        IP address   Lease (seconds)  Type     VLAN      Interface
00:05:85:3A:82:77  192.0.2.17   600              dynamic  employee  ge-0/0/1.0
00:05:85:3A:82:79  192.0.2.18   653              dynamic  employee  ge-0/0/1.0
00:05:85:3A:82:80  192.0.2.19   720              dynamic  employee  ge-0/0/2.0
```

Static IP Address Additions to the DHCP Snooping Database

You can add specific static IP addresses to the database as well as have the addresses dynamically assigned through DHCP snooping. To add static IP addresses, you supply the IP address, the MAC address of the device, the interface on which the device is connected, and the VLAN with which the interface is associated. No lease time is assigned to the entry. The statically configured entry never expires.

Snooping DHCP Packets That Have Invalid IP Addresses

If you enable DHCP snooping on a VLAN and then devices on that VLAN send DHCP packets that request invalid IP addresses, these invalid IP addresses will be stored in the DHCP snooping database until they are deleted when their default timeout is reached. To eliminate this unnecessary consumption of space in the DHCP snooping database,

the switch drops the DCHP packets that request invalid IP addresses, preventing the snooping of these packets. The invalid IP addresses are:

- 0.0.0.0
- 128.0.x.x
- 191.255.x.x
- 192.0.0.x
- 223.255.255.x
- 224.x.x.x
- 240.x.x.x to 255.255.255.255

Understanding DAI for Port Security on J-EX Series Switches

Dynamic ARP inspection (DAI) protects J-EX Series Switches against ARP spoofing.

DAI inspects ARP packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP cache poisoning. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons. When an attacker tries to use a forged ARP packet to spoof an address, the switch compares the address to entries in the database. If the MAC address or IP address in an ARP packet does not match a valid entry in the DHCP snooping database, the packet is dropped.

ARP packets are trapped to the Routing Engine and are rate-limited to protect the switch from CPU overload.

- Address Resolution Protocol on page 1544
- ARP Spoofing on page 1544
- DAI on J-EX Series Switches on page 1544

Address Resolution Protocol

Sending IP packets on a multiaccess network requires mapping an IP address to an Ethernet media access control (MAC) address.

Ethernet LANs use Address Resolution Protocol (ARP) to map MAC addresses to IP addresses.

The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

ARP Spoofing

ARP spoofing (also known as ARP poisoning or ARP cache poisoning) is one way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the LAN. Instead of the switch sending traffic to the proper network device, it sends it to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker's machine, the attacker receives all the traffic from the switch that should have gone to another device. The result is that traffic from the switch is misdirected and cannot reach its proper destination.

One type of ARP spoofing is gratuitous ARP, which is when a network device sends an ARP request to resolve its own IP address. In normal LAN operation, gratuitous ARP messages indicate that two devices have the same MAC address. They are also broadcast when a network interface card (NIC) in a device is changed and the device is rebooted, so that other devices on the LAN update their ARP caches. In malicious situations, an attacker can poison the ARP cache of a network device by sending an ARP response to the device that directs all packets destined for a certain IP address to go to a different MAC address instead.

To prevent MAC spoofing through gratuitous ARP and through other types of spoofing, J-EX Series switches examine ARP responses through DAI.

DAI on J-EX Series Switches

DAI examines ARP requests and responses on the LAN and validates ARP packets. The switch intercepts ARP packets from an access port and validates them against the DHCP snooping database. If no IP-MAC entry in the database corresponds to the information in the ARP packet, DAI drops the ARP packet and the local ARP cache is not updated with the information in that packet. DAI also drops ARP packets when the IP address in the packet is invalid.

The Junos operating system (Junos OS) for EX switches uses DAI for ARP packets received on access ports because these ports are untrusted by default. Trunk ports are trusted by default, so ARP packets bypass DAI on them.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs. You can set an interface to be trusted for ARP packets by setting **dhcp-trusted** on that port.

For packets directed to the switch to which a network device is connected, ARP queries are broadcast on the VLAN. The ARP responses to those queries are subjected to the DAI check.

For DAI, all ARP packets are trapped to the Routing Engine. To prevent CPU overloading, ARP packets destined for the Routing Engine are rate-limited.

If the DHCP server goes down and the lease time for an IP-MAC entry for a previously valid ARP packet runs out, that packet is blocked.

Understanding MAC Limiting and MAC Move Limiting for Port Security on J-EX Series Switches

MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on interfaces (ports). MAC move limiting detects MAC movement and MAC spoofing on access interfaces. You enable this feature on VLANs.

- MAC Limiting on page 1545
- MAC Move Limiting on page 1546
- Actions for MAC Limiting and MAC Move Limiting on page 1546
- MAC Addresses That Exceed the MAC Limit or MAC Move Limit on page 1547

MAC Limiting

MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface or on all the Layer 2 access interfaces on the switch, or on a specific VLAN. Junos operating system (Junos OS) provides two MAC limiting methods:

- Maximum number of MAC addresses—You configure the maximum number of dynamic MAC addresses allowed per interface or per VLAN. When the limit is exceeded, incoming packets with new MAC addresses are treated as specified by the configuration. The incoming packets with new MAC addresses can be ignored, dropped, logged, or the interface can be shut down or temporarily disabled. Note that static MAC addresses do not count toward the limit you specify for dynamic MAC addresses.

- Allowed MAC—You configure specific "allowed" MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned and the switch logs the message. Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

NOTE: If you do not want the switch to log messages received for invalid MAC addresses on an interface that has been configured for specific "allowed" MAC addresses, you can disable the logging by configuring the **no-allowed-mac-log** statement.

MAC Move Limiting

MAC move limiting causes the switch to track the number of times a MAC address can move to a new interface (port). It can help to prevent MAC spoofing, and it can also detect and prevent loops.

If a MAC address moves more than the configured number of times within one second, the switch performs the configured action. You can configure MAC move limiting to apply to all VLANs or to a specific VLAN.

Actions for MAC Limiting and MAC Move Limiting

You can choose to have one of the following actions performed when the limit of MAC addresses or the limit of MAC moves is exceeded:

- **drop**—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.
- **log**—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interface and generate an alarm. If you have configured the switch with the **port-error-disable** statement, the disabled interface or VLAN recovers automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

See descriptions of results of these various action settings in "Verifying That MAC Limiting Is Working Correctly" on page 1643.

If you have set a MAC limit to apply to all interfaces on the switch, you can override that setting for a particular interface by specifying action **none**. See "Setting the none Action on an Interface to Override a MAC Limit Applied to All Interfaces (CLI Procedure)" on page 1628.

MAC Addresses That Exceed the MAC Limit or MAC Move Limit

If you have configured the **port-error-disable** statement, you can view which interfaces are temporarily disabled due to exceeding the MAC limit or MAC move limit in the output for the **show ethernet-switching interfaces** command.

The log messages that indicate the MAC limit or MAC move limit has been exceeded include the offending MAC addresses that have exceeded the limit. See "Troubleshooting Port Security" on page 1651 for details.

Understanding Trusted DHCP Servers for Port Security on J-EX Series Switches

Any interface on the switch that connects to a DHCP server can be configured as a trusted port. Configuring a DHCP server on a trusted port protects against rogue DHCP servers sending leases.

Ensure that the DHCP server interface is physically secure—that is, that access to the server is monitored and controlled at the site—before you configure the port as trusted.

Understanding DHCP Option 82 for Port Security on J-EX Series Switches

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Hosts on untrusted access interfaces on Ethernet LAN switches send requests for IP addresses in order to access the Internet. The switch forwards or relays these requests to DHCP servers, and the servers send offers for IP address leases in response. Attackers can use these messages to perpetrate address spoofing and starvation.

Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client. The Junos operating system (Junos OS) implementation of DHCP option 82 supports RFC 3046, *DHCP Relay Agent Information Option*, at http://tools.ietf.org/html/rfc3046.

This topic covers:

DHCP Option 82 Processing

If DHCP option 82 is enabled on the switch, then when a network device—a DHCP client—that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or another parameter for the client. See “Suboption Components of Option 82” on page 1549 for details about option 82 information.

You can enable DHCP option 82 on a single VLAN or on all VLANs on the switch. You can also configure it on Layer 3 interfaces (in routed VLAN interfaces, or RVIs) when the switch is functioning as a relay agent.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards or relays the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

NOTE: To use the DHCP option 82 feature, you must ensure that the DHCP server is configured to accept option 82. If it is not configured to accept option 82, then when it receives requests containing option 82 information, it does not use the information in setting parameters and it does not echo the information in its response message. For detailed information about configuring DHCP services, see the *Junos OS System Basics Configuration Guide*. The configuration for DHCP service on the J-EX Series Switch includes the **dhcp** statement at the **[edit system services]** hierarchy level.

Suboption Components of Option 82

Option 82 as implemented on the J-EX Series switch comprises the suboptions circuit ID, remote ID, and vendor ID. These suboptions are fields in the packet header:

- circuit ID—Identifies the circuit (interface and/or VLAN) on the switch on which the request was received. The circuit ID contains the interface name and/or VLAN name, with the two elements separated by a colon—for example, **ge-0/0/10:vlan1**, where **ge-0/0/10** is the interface name and **vlan1** is the VLAN name. If the request packet is received on a Layer 3 interface, the circuit ID is just the interface name—for example, **ge-0/0/10**.

  Use the **prefix** option to add an optional prefix to the circuit ID. If you enable the **prefix** option, the hostname for the switch is used as the prefix; for example, **switch1:ge-0/0/10:vlan1**, where **switch1** is the hostname.

  You can also specify that the interface description be used rather than the interface name and/or that the VLAN ID be used rather than the VLAN name.

- remote ID—Identifies the host. By default, the remote ID is the MAC address of the switch. You can specify that the remote ID be the hostname of the switch, the interface description, or a character string of your choice. You can also add an optional prefix to the remote ID.

- vendor ID—Identifies the vendor of the host. If you specify the **vendor-id** option but do not enter a value, the default value **Juniper** is used. To specify a value, you type a character string.

Configurations of the J-EX Series Switch That Support Option 82

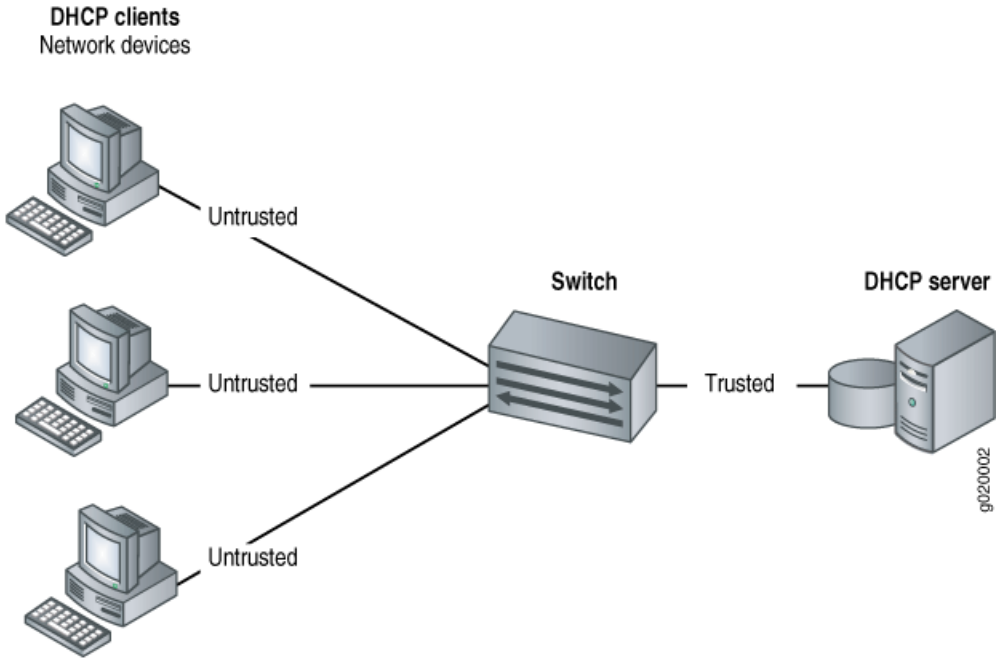
Configurations of the J-EX Series switch that support option 82 are:

- Switch and Clients Are on Same VLAN as DHCP Server on page 1549
- Switch Acts as Relay Agent on page 1550

Switch and Clients Are on Same VLAN as DHCP Server

If the DHCP clients, the switch, and the DHCP server are all on the same VLAN, the switch forwards the requests from the clients on untrusted access interfaces to the server on a trusted interface. See Figure 44 on page 1550.

Figure 44: DHCP Clients, Switch, and DHCP Server Are All on Same VLAN

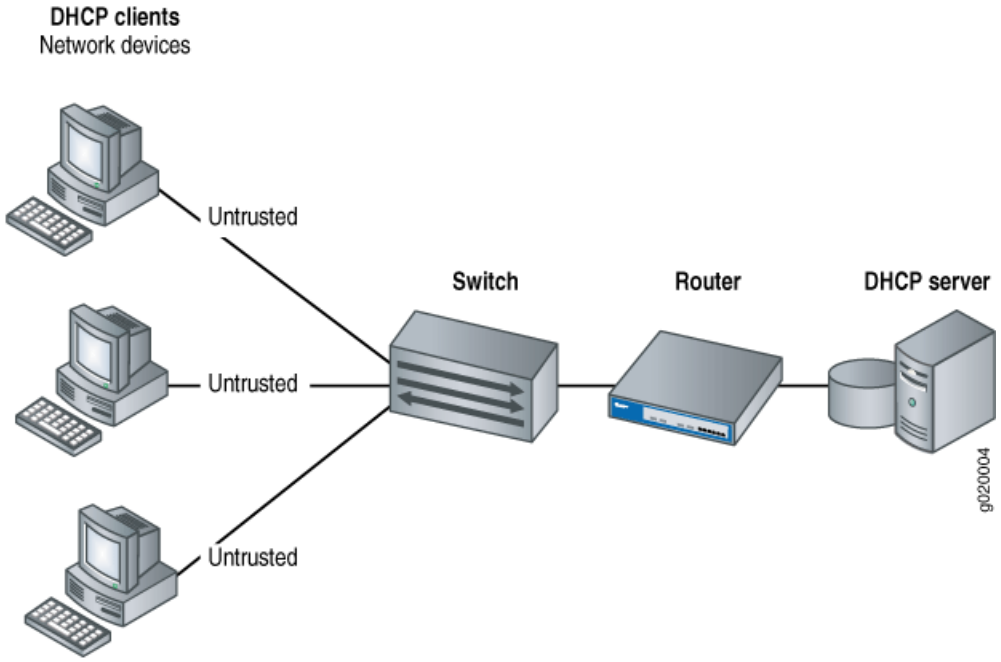


For the configuration shown in Figure 44 on page 1550, you set DHCP option 82 at the **[edit ethernet-switching-options secure-access-port vlan]** hierarchy level.

Switch Acts as Relay Agent

The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as routed VLAN interfaces, or RVIs. Figure 45 on page 1551 illustrates a scenario for the switch-as-relay-agent; in this instance, the switch relays requests through a router to the server.

Figure 45: Switch Relays DHCP Requests to Server



For the configuration shown in Figure 45 on page 1551, you set DHCP option 82 at the **[edit forwarding-options helpers bootp]** hierarchy level.

Understanding IP Source Guard for Port Security on J-EX Series Switches

Ethernet LAN switches are vulnerable to attacks that involve spoofing (forging) of source IP addresses or source MAC addresses. You can use the IP source guard access port security feature on J-EX Series Switches to mitigate the effects of these attacks.

- IP Address Spoofing on page 1552
- How IP Source Guard Works on page 1552
- The IP Source Guard Database on page 1552
- Typical Uses of Other Junos OS Features with IP Source Guard on page 1553

IP Address Spoofing

Hosts on access interfaces can spoof source IP addresses and/or source MAC addresses by flooding the switch with packets containing invalid addresses. Such attacks combined with other techniques such as TCP SYN flood attacks can result in denial-of-service (DoS) attacks. With source IP address or source MAC address spoofing, the system administrator cannot identify the source of the attack. The attacker can spoof addresses on the same subnet or on a different subnet.

How IP Source Guard Works

IP source guard checks the IP source address and MAC source address in a packet sent from a host attached to an untrusted access interface on the switch against entries stored in the DHCP snooping database. If IP source guard determines that the packet header contains an invalid source IP address or source MAC address, it ensures that the switch does not forward the packet—that is, the packet is discarded.

When you configure IP source guard, you enable on it on one or more VLANs. IP source guard applies its checking rules to packets sent from untrusted access interfaces on those VLANs. By default, on J-EX Series switches, access interfaces are untrusted and trunk interfaces are trusted. IP source guard does not check packets that have been sent to the switch by devices connected to either trunk interfaces or to trusted access interfaces—that is, interfaces configured as **dhcp-trusted** so that a DHCP server can be connected to that interface to provide dynamic IP addresses.

NOTE: IP source guard is not supported on trunk interfaces regardless of whether the trunk interface is trusted or untrusted.

IP source guard obtains information about IP-address/MAC-address/VLAN bindings from the DHCP snooping database. It causes the switch to validate incoming IP packets against the entries in that database.

After the DHCP snooping database has been populated either through dynamic DHCP snooping or through configuration of specific static IP address/MAC address bindings, the IP source guard feature builds its database. It then checks incoming packets from access interfaces on the VLANs on which it is enabled. If the source IP addresses and source MAC addresses match the IP source guard binding entries, the switch forwards the packets to their specified destination addresses. If there are no matches, the switch discards the packets.

The IP Source Guard Database

The IP source guard database looks like this:

```
user@switch> show ip-source-guard
IP source guard information:
Interface    Tag  IP Address   MAC Address        VLAN

ge-0/0/12.0  0    10.10.10.7   00:30:48:92:A5:9D  vlan100
```

```
ge-0/0/13.0  0    10.10.10.9   00:30:48:8D:01:3D  vlan100

ge–0/0/13.0  100  *            *                  voice
```

The IP source guard database table shows the untrusted access interfaces in VLANs that have been enabled for IP source guard. The entries include the VLAN 802.1Q tag IDs if there are any, and the IP addresses and MAC addresses that are bound to one another.

If an untrusted access interface is associated with multiple VLANs and some of those VLANs are enabled for IP source guard and others are not, the VLANs that are not enabled for IP source guard have a star (*) in the **IP Address** and **MAC Address** fields. See the entry for the **voice** VLAN in the preceding sample output. If you are using IP source guard together with 802.1X user authentication, you must abide by additional configuration guidelines. See "Typical Uses of Other Junos OS Features with IP Source Guard" on page 1553.

Typical Uses of Other Junos OS Features with IP Source Guard

You can configure IP source guard with various other features on the J-EX Series switch to provide access port security, including:

- VLAN tagging (used for voice VLANs)
- GRES (Graceful Routing Engine switchover)
- Virtual Chassis configurations (multiple J-EX4200 switches that are managed through a single management interface)
- Link-aggregation groups (LAGs)
- 802.1X user authentication in single supplicant, single-secure supplicant, or multiple supplicant mode.

NOTE: If you are implementing 801.X user authentication in single-secure supplicant or multiple supplicant mode, use the following configuration guidelines:

- If the 802.1X interface is part of an untagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has untagged membership.
- If the 802.1X interface is part of a tagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has tagged membership.

CHAPTER 38

Examples: Port Security Configuration

Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch

You can configure DHCP snooping, dynamic ARP inspection (DAI), MAC limiting, and MAC move limiting on the access ports of J-EX Series switches to protect the switch and the Ethernet LAN against address spoofing and Layer 2 denial-of-service (DoS) attacks. You can also configure a trusted DHCP server and specific (allowed) MAC addresses for the switch interfaces.

This example describes how to configure basic port security features—DHCP snooping, DAI, MAC limiting, and MAC move limiting, as well as a trusted DHCP server and allowed

MAC addresses—on a switch. The DHCP server and its clients are all members of a single VLAN on the switch.

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP snooping, DAI, and MAC limiting port security features, be sure you have:

- Connected the DHCP server to the switch.
- Configured the VLAN **employee-vlan** on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

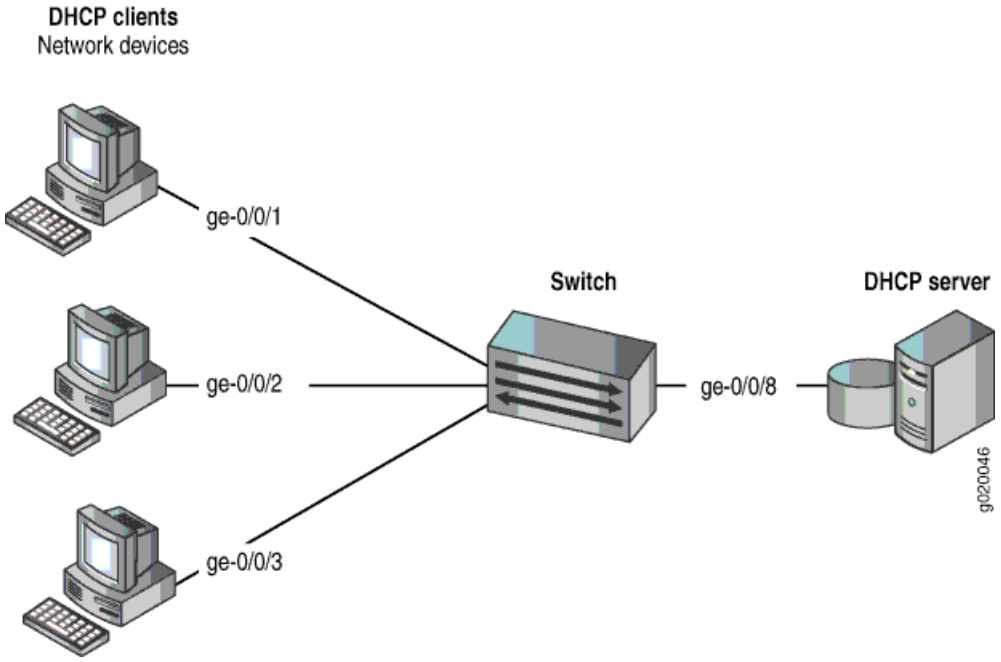
Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. To protect the devices from such attacks, you can configure DHCP snooping to validate DHCP server messages, DAI to protect against MAC spoofing, and MAC cache limiting to constrain the number of MAC addresses the switch adds to its MAC address cache. You can also configure MAC move limiting to help prevent MAC spoofing.

This example shows how to configure these security features on a switch connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36. That procedure is not repeated here. Figure 46 on page 1557 illustrates the topology for this example.

Figure 46: Network Topology for Basic Port Security



The components of the topology for this example are shown in Table 178 on page 1557.

Table 178: Components of the Port Security Topology

Properties	Settings
Switch hardware	
VLAN name and ID	**employee-vlan**, tag **20**
VLAN subnets	**192.0.2.16/28** **192.0.2.17** through **192.0.2.30** **192.0.2.31** is subnet's broadcast address
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**, **ge-0/0/8**
Interface for DHCP server	**ge-0/0/8**

In this example, the switch is initially configured with the default port security setup. In the default switch configuration:

- Secure port access is activated on the switch.
- DHCP snooping and DAI are disabled on all VLANs.
- All access ports are untrusted and all trunk ports are trusted for DHCP snooping.

In the configuration tasks for this example, you set the DHCP server first as untrusted and then as trusted; you enable DHCP snooping, DAI, and MAC move limiting on a VLAN;

you modify the value for the MAC limit; and you configure some specific (allowed) MAC addresses on an interface.

Configuration

To configure basic port security on a switch whose DHCP server and client ports are in a single VLAN:

CLI Quick Configuration

To quickly configure basic port security on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/1 mac-limit 4
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
set interface ge-0/0/2 mac-limit 4
set interface ge-0/0/8 dhcp-trusted
set vlan employee–vlan arp-inspection
set vlan employee-vlan examine-dhcp
set vlan employee-vlan mac-move-limit 5
```

Step-by-Step Procedure

Configure basic port security on the switch:

1. Enable DHCP snooping on the VLAN:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee-vlan examine-dhcp
   ```

2. Specify the interface (port) from which DHCP responses are allowed:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/8 dhcp-trusted
   ```

3. Enable dynamic ARP inspection (DAI) on the VLAN:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee-vlan arp-inspection
   ```

4. Configure the MAC limit of **4** and use the default action, **drop**. (Packets will be dropped and the MAC address will not be added to the Ethernet switching table if the MAC limit has been exceeded on the interfaces):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/1 mac-limit 4
   user@switch# set interface ge-0/0/2 mac-limit 4
   ```

5. Configure a MAC move limit of **5** and use the default action, **drop**. (Packets will be dropped and the MAC address will not be added to the Ethernet switching table if a MAC address has exceeded the MAC move limit):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee-vlan mac-move-limit 5
   ```

6. Configure the allowed MAC addresses:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
   user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
   ```

```
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
```

Results Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/1.0 {
   mac-limit 4 action drop;
}
interface ge-0/0/2.0 {
   allowed-mac [ 00:05:85:3a:82:80 00:05:85:3a:82:81 00:05:85:3a:82:83
      00:05:85:3a:82:85 00:05:85:3a:82:88 ];
   mac-limit 4 action drop;
}
interface ge-0/0/8.0 {
   dhcp-trusted;
}
vlan employee-vlan {
   arp-inspection
   examine-dhcp;
   mac-move-limit 5 action drop;
}
```

Verification

To confirm that the configuration is working properly:

- Verifying That DHCP Snooping Is Working Correctly on the Switch on page 1559
- Verifying That DAI Is Working Correctly on the Switch on page 1560
- Verifying That MAC Limiting and MAC Move Limiting Are Working Correctly on the Switch on page 1560
- Verifying That Allowed MAC Addresses Are Working Correctly on the Switch on page 1561

Verifying That DHCP Snooping Is Working Correctly on the Switch

Purpose Verify that DHCP snooping is working on the switch.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
```

```
DHCP Snooping Information:
MAC Address         IP Address    Lease    Type     VLAN          Interface
-----------------   ----------    -----    ----     ----          ---------
00:05:85:3A:82:77    192.0.2.17    600    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:79    192.0.2.18    653    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:80    192.0.2.19    720    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:81    192.0.2.20    932    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:83    192.0.2.21   1230    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:27:32:88    192.0.2.22   3200    dynamic  employee-vlan   ge-0/0/2.0
```

Meaning When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database and nothing would be shown in the output of the **show dhcp snooping binding** command.

Verifying That DAI Is Working Correctly on the Switch

Purpose Verify that DAI is working on the switch.

Action Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show arp inspection statistics
ARP inspection statistics:
Interface        Packets received  ARP inspection pass   ARP inspection failed
---------------  ----------------  --------------------  ---------------------
ge-0/0/1.0                     7                     5                      2
ge-0/0/2.0                    10                    10                      0
ge-0/0/3.0                    12                    12                      0
```

Meaning The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

Verifying That MAC Limiting and MAC Move Limiting Are Working Correctly on the Switch

Purpose Verify that MAC limiting and MAC move limiting are working on the switch.

Action Suppose that two packets have been sent from hosts on **ge-0/0/1** and five packets from hosts on **ge-0/0/2**, with both interfaces set to a MAC limit of **4** with the default action **drop**.

Display the MAC addresses learned:

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table:  7 entries, 6 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       *                   Flood          -    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:85   Learn          0    ge-0/0/2.0
```

Now suppose packets have been sent from two of the hosts on **ge-0/0/2** after they have been moved to other interfaces more than 5 times in 1 second, with **employee-vlan** set to a MAC move limit of **5** with the default action **drop**.

Display the MAC addresses in the table:

```
user@switch> show ethernet-switching table

Ethernet-switching table:  7 entries, 4 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       *                   Flood          -    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
```

Meaning The first sample output shows that with a MAC limit of **4** for each interface, the fifth MAC address on **ge-0/0/2** was not learned because it exceeded the MAC limit. The second sample output shows that MAC addresses for three of the hosts on **ge-/0/0/2** were not learned, because the hosts had been moved back more than 5 times in 1 second.

Verifying That Allowed MAC Addresses Are Working Correctly on the Switch

Purpose Verify that allowed MAC addresses are working on the switch.

Action Display the MAC cache information after 5 allowed MAC addresses have been configured on interface **ge-0/0/2**:

```
user@switch> show ethernet-switching table
Ethernet-switching table:  5 entries, 4 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:85   Learn          0    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
```

Meaning Because the MAC limit value for this interface has been set to **4**, only 4 of the 5 configured allowed addresses are learned.

Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks

In an Ethernet switching table overflow attack, an intruder sends so many requests from new MAC addresses that the Ethernet switching table fills up and then overflows, forcing the switch to broadcast all messages.

This example describes how to configure MAC limiting and allowed MAC addresses, two port security features, to protect the switch from Ethernet switching table attacks:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure specific port security features to mitigate common access-interface attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured the VLAN **employee-vlan** on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

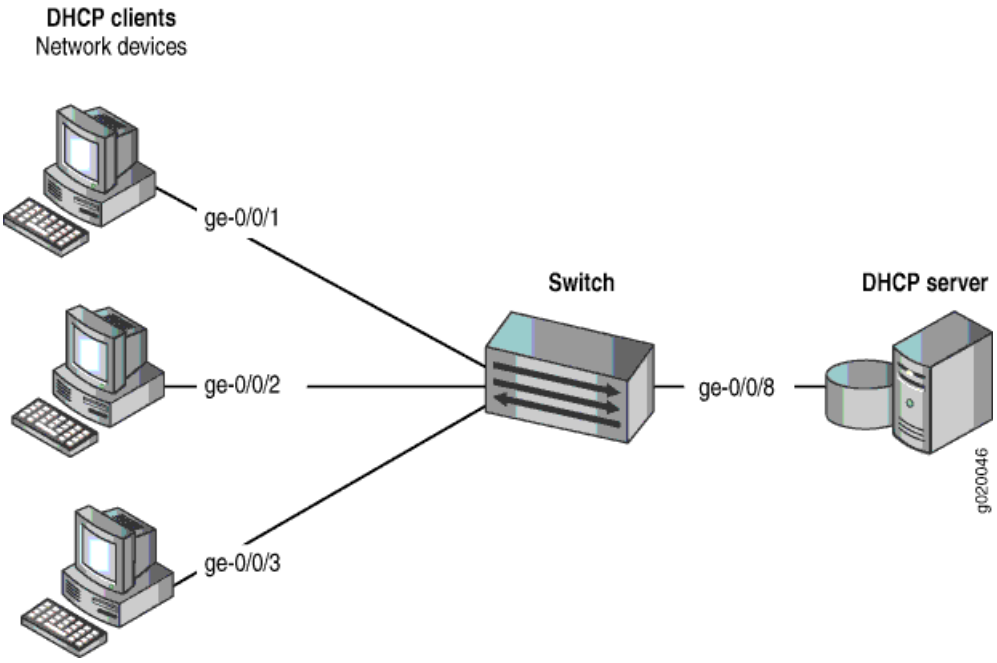
Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch from an attack on the Ethernet switching table that causes the table to overflow and thus forces the switch to broadcast all messages.

This example shows how to configure port security features on a switch connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic "Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches" on page 36. That procedure is not repeated here. Figure 47 on page 1563 illustrates the topology for this example.

Figure 47: Network Topology for Basic Port Security



The components of the topology for this example are shown in Table 179 on page 1563.

Table 179: Components of the Port Security Topology

Properties	Settings
Switch hardware	One J-EX Series switch
VLAN name and ID	**employee-vlan**, tag **20**
VLAN subnets	**192.0.2.16/28** **192.0.2.17** through **192.0.2.30** **192.0.2.31** is subnet's broadcast address
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**, **ge-0/0/8**

Table 179: Components of the Port Security Topology *(continued)*

Properties	Settings
Interface for DHCP server	**ge-0/0/8**

In this example, use the MAC limit feature to control the total number of MAC addresses that can be added to the Ethernet switching table for the specified interface. Use the allowed MAC addresses feature to ensure that the addresses of network devices whose network access is critical are guaranteed to be included in the Ethernet switching table.

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- No MAC limit is set on any of the interfaces.
- All access interfaces are untrusted, which is the default setting.

Configuration

To configure MAC limiting and some allowed MAC addresses to protect the switch against Ethernet switching table overflow attacks:

CLI Quick Configuration

To quickly configure MAC limiting, clear the MAC forwarding table, and configure some allowed MAC addresses, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/1 mac-limit 4 action drop
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
exit
exit
clear ethernet-switching-table interface ge-0/0/1
```

Step-by-Step Procedure

Configure MAC limiting and some allowed MAC addresses:

1. Configure a MAC limit of **4** on **ge-0/0/1** and specify that incoming packets with different addresses be dropped once the limit is exceeded on the interface:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/1 mac-limit 4 action drop
   ```

2. Clear the current entries for interface ge-0/0/1 from the MAC address forwarding table :

   ```
   user@switch# clear ethernet-switching-table interface ge-0/0/1
   ```

3. Configure the allowed MAC addresses on **ge-0/0/2**:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
   user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
   user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
   user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
   ```

Results Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/1.0 {
   mac-limit 4 action drop;
}
interface ge-0/0/2.0 {
   allowed-mac [ 00:05:85:3a:82:80 00:05:85:3a:82:81 00:05:85:3a:82:83 00:05:85
   :3a:82:85 ];
}
```

Verification

To confirm that the configuration is working properly:

- Verifying That MAC Limiting Is Working Correctly on the Switch on page 1565

Verifying That MAC Limiting Is Working Correctly on the Switch

Purpose Verify that MAC limiting is working on the switch.

Action Display the MAC cache information after DHCP requests have been sent from hosts on **ge-0/0/1**, with the interface set to a MAC limit of **4** with the action **drop**, and after four allowed MAC addresses have been configured on interface **ge/0/0/2**:

```
user@switch>  show ethernet-switching table
Ethernet-switching table:  5 entries, 4 learned
  VLAN              MAC address         Type         Age    Interfaces

  employee-vlan     00:05:85:3A:82:71   Learn          0    ge-0/0/1.0
  employee-vlan     00:05:85:3A:82:74   Learn          0    ge-0/0/1.0
  employee-vlan     00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  employee-vlan     00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  employee-vlan     *                   Flood          0    ge-0/0/1.0
  employee-vlan     00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan     00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan     00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
  employee-vlan     00:05:85:3A:82:85   Learn          0    ge-0/0/2.0
  employee-vlan     *                   Flood          -    ge-0/0/2.0
```

Meaning The sample output shows that with a MAC limit of **4** for the interface, the DHCP request for a fifth MAC address on **ge-0/0/1** was dropped because it exceeded the MAC limit and that only the specified allowed MAC addresses have been learned on the **ge-0/0/2** interface.

Related Documentation

- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Configuring MAC Limiting (CLI Procedure) on page 1620
- Configuring MAC Limiting (J-Web Procedure) on page 1623

Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks

In a rogue DHCP server attack, an attacker has introduced a rogue server into the network, allowing it to give IP address leases to the network's DHCP clients and to assign itself as the gateway device.

This example describes how to configure a DHCP server interface as untrusted to protect the switch from a rogue DHCP server:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure an untrusted DHCP server interface to mitigate rogue DHCP server attacks, be sure you have:

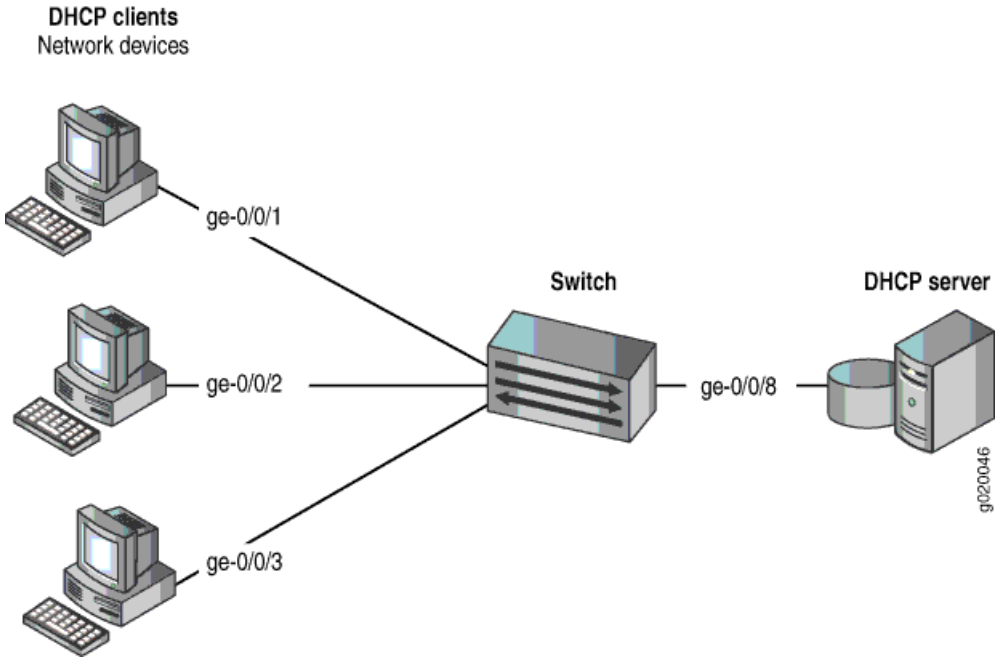
- Connected the DHCP server to the switch.
- Enabled DHCP snooping on the VLAN.
- Configured the VLAN **employee-vlan** on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch from rogue DHCP server attacks.

This example shows how to explicitly configure an untrusted interface on a J-EX4200 switch. Figure 48 on page 1567 illustrates the topology for this example.

Figure 48: Network Topology for Basic Port Security



The components of the topology for this example are shown in Table 180 on page 1567.

Table 180: Components of the Port Security Topology

Properties	Settings
Switch hardware	One J-EX4200 switch with 24 ports (8 PoE ports)
VLAN name and ID	**employee-vlan**, tag **20**
VLAN subnets	**192.0.2.16/28** **192.0.2.17** through **192.0.2.30** **192.0.2.31** is the subnet's broadcast address
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**, **ge-0/0/8**
Interface for DHCP server	**ge-0/0/8**

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- DHCP snooping is enabled on the VLAN **employee-vlan**.
- The interface (port) where the rogue DHCP server has connected to the switch is currently trusted.

Configuration

To configure the DHCP server interface as untrusted because the interface is being used by a rogue DHCP server:

CLI Quick Configuration

To quickly set the rogue DHCP server interface as untrusted, copy the following command and paste it into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/8 no-dhcp-trusted
```

Step-by-Step Procedure

To set the DHCP server interface as untrusted:

Specify the interface (port) from which DHCP responses are not allowed:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/8 no–dhcp-trusted
```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/8.0 {
   no-dhcp-trusted;
}
```

Verification

To confirm that the configuration is working properly:

- Verifying That the DHCP Server Interface Is Untrusted on page 1568

Verifying That the DHCP Server Interface Is Untrusted

Purpose

Verify that the DHCP server is untrusted.

Action

Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the port on which the DHCP server connects to the switch is not trusted.

```
user@switch> show dhcp snooping binding
```

Meaning

There is no output from the command because no entries are added to the DHCP snooping database.

Related Documentation

- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Enabling a Trusted DHCP Server (CLI Procedure) on page 1616
- Enabling a Trusted DHCP Server (J-Web Procedure) on page 1616

Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks

In a DHCP starvation attack, an attacker floods an Ethernet LAN with DHCP requests from spoofed (counterfeit) MAC addresses, causing the switch's overworked DHCP server to stop assigning IP addresses and lease times to legitimate DHCP clients on the switch (hence the name starvation). Requests from those clients are either dropped or directed to a rogue DHCP server set up by the attacker.

This example describes how to configure MAC limiting, a port security feature, to protect the switch against DHCP starvation attacks:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure MAC limiting, a port security feature, to mitigate DHCP starvation attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured the VLAN **employee-vlan** on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

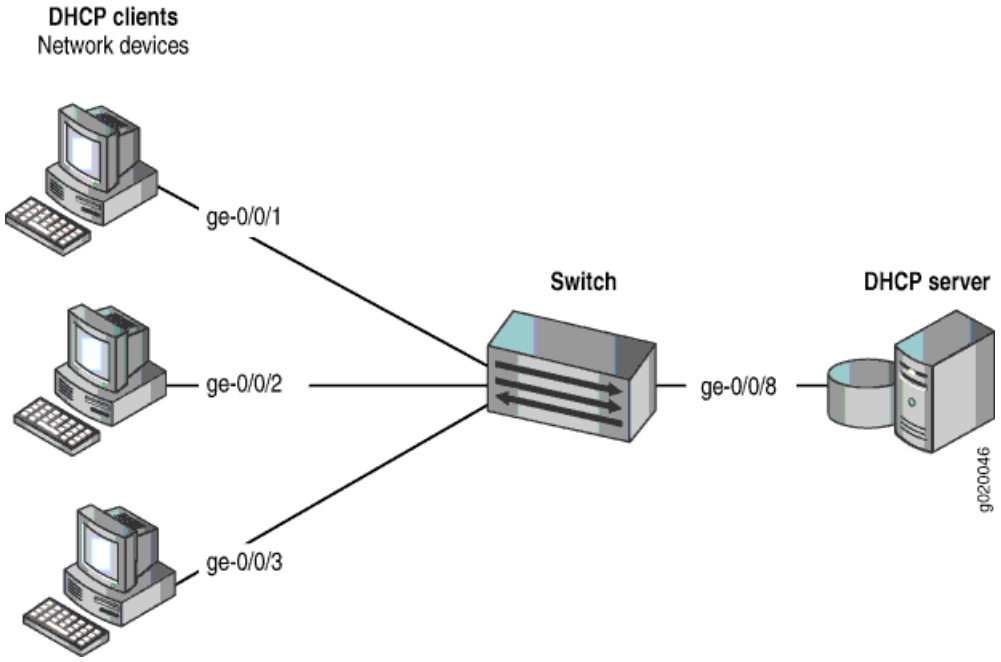
Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch against one common type of attack, a DHCP starvation attack.

This example shows how to configure port security features on a switch connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36. That procedure is not repeated here. Figure 49 on page 1570 illustrates the topology for this example.

Figure 49: Network Topology for Basic Port Security



The components of the topology for this example are shown in Table 181 on page 1570.

Table 181: Components of the Port Security Topology

Properties	Settings
Switch hardware	One J-EX Series switch
VLAN name and ID	**default**
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**, **ge-0/0/8**
Interface for DHCP server	**ge-0/0/8**

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- No MAC limit is set on any of the interfaces.
- DHCP snooping is disabled on the VLAN **employee-vlan**.
- All access interfaces are untrusted, which is the default setting.

Configuration

To configure the MAC limiting port security feature to protect the switch against DHCP starvation attacks:

CLI Quick Configuration

To quickly configure MAC limiting, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/1 mac-limit 3 action drop
set interface ge-0/0/2 mac-limit 3 action drop
```

Step-by-Step Procedure

Configure MAC limiting:

1. Configure a MAC limit of **3** on **ge-0/0/1** and specify that packets with new addresses be dropped if the limit has been exceeded on the interface:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge–0/0/1 mac-limit 3 action drop
   ```

2. Configure a MAC limit of **3** on **ge-0/0/2** and specify that packets with new addresses be dropped if the limit has been exceeded on the interface:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/2 mac-limit 3 action drop
   ```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/1.0 {
  mac-limit 3 action drop;
}
interface ge-0/0/2.0 {
  mac-limit 3 action drop;
}
```

Verification

To confirm that the configuration is working properly:

- Verifying That MAC Limiting Is Working Correctly on the Switch on page 1571

Verifying That MAC Limiting Is Working Correctly on the Switch

Purpose

Verify that MAC limiting is working on the switch.

Action

Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the MAC addresses learned when DHCP requests are sent from hosts on **ge-0/0/1** and from hosts on **ge-0/0/2**, with both interfaces set to a MAC limit of **3** with the action **drop**:

```
user@switch>  show ethernet-switching table
Ethernet-switching table:  7 entries, 6 learned
  VLAN          MAC address         Type         Age    Interfaces

  default       *                   Flood          -    ge-0/0/2.0
  default       00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  default       00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  default       00:05:85:3A:82:80   Learn          0    ge-0/0/1.0
  default       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  default       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
```

```
default        00:05:85:3A:82:85   Learn          0     ge-0/0/2.0
```

Meaning The sample output shows that with a MAC limit of **3** for each interface, the DHCP request for a fourth MAC address on **ge-0/0/2** was dropped because it exceeded the MAC limit.

Because only 3 MAC addresses can be learned on each of the two interfaces, attempted DHCP starvation attacks will fail.

Related Documentation

- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Configuring MAC Limiting (CLI Procedure) on page 1620
- Configuring MAC Limiting (J-Web Procedure) on page 1623

Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks

In an ARP spoofing attack, the attacker associates its own MAC address with the IP address of a network device connected to the switch. Traffic intended for that IP address is now sent to the attacker instead of being sent to the intended destination. The attacker can send faked, or “spoofed,” ARP messages on the LAN.

NOTE: On J-EX Series switches, when dynamic ARP inspection (DAI) is enabled, the switch logs the number of invalid ARP packets that it receives on each interface, along with the sender’s IP and MAC addresses. You can use these log messages to discover ARP spoofing on the network.

This example describes how to configure DHCP snooping and dynamic ARP inspection (DAI), two port security features, to protect the switch against ARP spoofing attacks:

- Requirements on page 1572
- Overview and Topology on page 1573
- Configuration on page 1574
- Verification on page 1575

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP snooping and DAI, two port security features, to mitigate ARP spoofing attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured the VLAN **employee-vlan** on the switch.

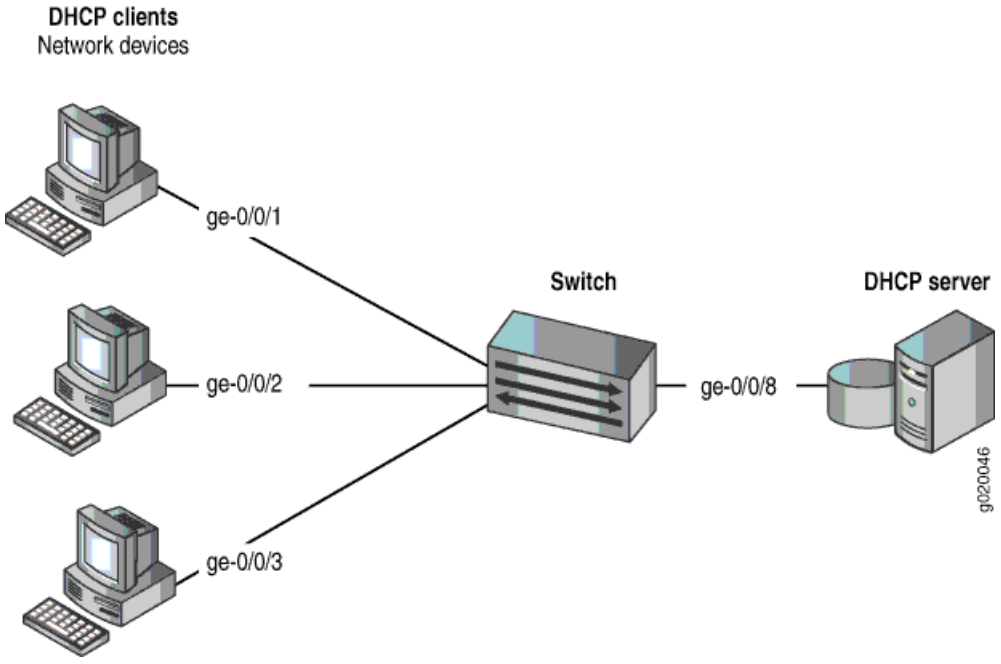
Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch against one common type of attack, an ARP spoofing attack.

In an ARP spoofing attack, the attacker sends faked ARP messages, thus creating various types of mischief on the LAN—for example, the attacker might launch a man-in-the middle attack.

This example shows how to configure port security features on a J-EX4200 switch that is connected to a DHCP server. The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic "Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches" on page 36. That procedure is not repeated here. Figure 50 on page 1573 illustrates the topology for this example.

Figure 50: Network Topology for Basic Port Security



The components of the topology for this example are shown in Table 182 on page 1574.

Table 182: Components of the Port Security Topology

Properties	Settings
Switch hardware	One J-EX4200 switch with 24 ports (8 PoE ports)
VLAN name and ID	**employee-vlan**, tag **20**
VLAN subnets	**192.0.2.16/28** **192.0.2.17** through **192.0.2.30** **192.0.2.31** is subnet's broadcast address
Interfaces in **employee-vlan**	**ge-0/0/1**,**ge-0/0/2**, **ge-0/0/3**, **ge-0/0/8**
Interface for DHCP server	**ge-0/0/8**

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- DHCP snooping is disabled on the VLAN **employee-vlan**.
- All access ports are untrusted, which is the default setting.

Configuration

To configure DHCP snooping and dynamic ARP inspection (DAI) to protect the switch against ARP attacks:

CLI Quick Configuration

To quickly configure DHCP snooping and dynamic ARP inspection (DAI), copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/8 dhcp-trusted
set vlan employee-vlan examine-dhcp
set vlan employee-vlan arp-inspection
```

Step-by-Step Procedure

Configure DHCP snooping and dynamic ARP inspection (DAI) on the VLAN:

1. Set the **ge-0/0/8** interface as trusted:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set interface ge-0/0/8 dhcp-trusted
   ```

2. Enable DHCP snooping on the VLAN:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee-vlan examine-dhcp
   ```

3. Enable DAI on the VLAN:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee-vlan arp-inspection
   ```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
```

```
interface ge-0/0/8.0 {
  dhcp-trusted;
}
vlan employee-vlan {
  arp-inspection;
  examine-dhcp;
}
```

Verification

To confirm that the configuration is working properly:

- Verifying That DHCP Snooping Is Working Correctly on the Switch on page 1575
- Verifying That DAI Is Working Correctly on the Switch on page 1575

Verifying That DHCP Snooping Is Working Correctly on the Switch

Purpose Verify that DHCP snooping is working on the switch.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the port on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
DHCP Snooping Information:
MAC Address         IP Address    Lease    Type     VLAN            Interface
-----------------   ----------    -----    ----     ----            ---------
00:05:85:3A:82:77    192.0.2.17    600    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:79    192.0.2.18    653    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:80    192.0.2.19    720    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:81    192.0.2.20    932    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:83    192.0.2.21   1230    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:27:32:88    192.0.2.22   3200    dynamic  employee-vlan   ge-0/0/3.0
```

Meaning When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

Verifying That DAI Is Working Correctly on the Switch

Purpose Verify that DAI is working on the switch.

Action Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show arp inspection statistics
ARP inspection statistics:
Interface        Packets received  ARP inspection pass   ARP inspection failed
---------------  ---------------   -------------------- ---------------------
```

```
ge-0/0/1.0                7          5          2
ge-0/0/2.0               10         10          0
ge-0/0/3.0               12         12          0
```

Meaning The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

- Enabling Dynamic ARP Inspection (J-Web Procedure) on page 1618

Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks

In one type of attack on the DHCP snooping database, an intruder introduces a DHCP client on an untrusted access interface with a MAC address identical to that of a client on another untrusted interface. The intruder then acquires the DHCP lease of that other client, thus changing the entries in the DHCP snooping table. Subsequently, what would have been valid ARP requests from the legitimate client are blocked.

This example describes how to configure allowed MAC addresses, a port security feature, to protect the switch from DHCP snooping database alteration attacks:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure specific port security features to mitigate common access-inteface attacks, be sure you have:

- Connected the DHCP server to the switch.

- Configured the VLAN **employee-vlan** on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

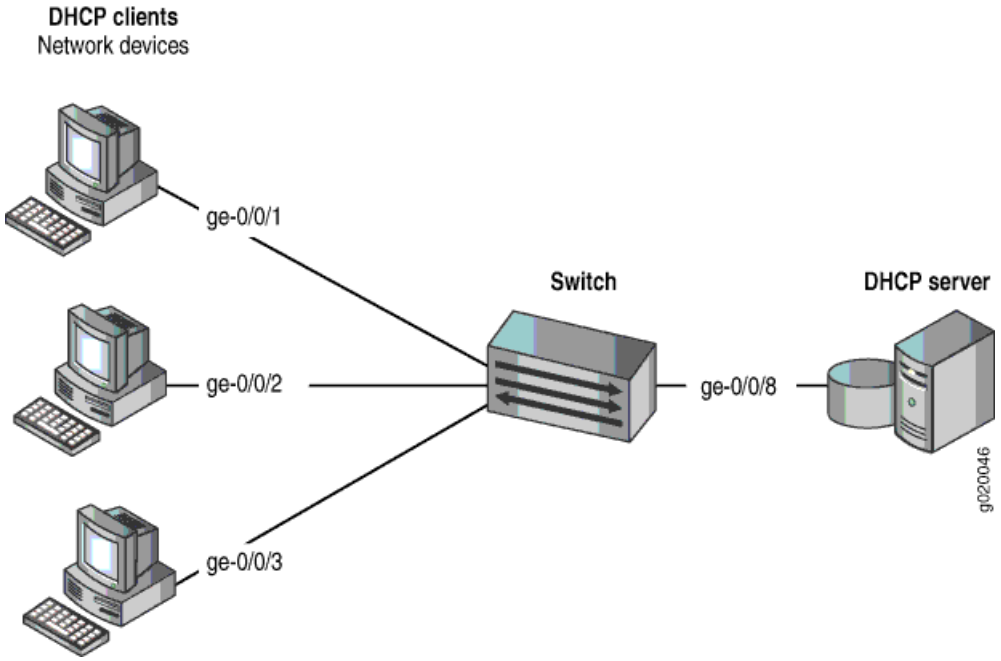
Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch from an attack on the DHCP snooping database that alters the MAC addresses assigned to some clients.

This example shows how to configure port security features on a J-EX4200 switch that is connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36. That procedure is not repeated here. Figure 51 on page 1577 illustrates the topology for this example.

Figure 51: Network Topology for Basic Port Security



The components of the topology for this example are shown in Table 183 on page 1577.

Table 183: Components of the Port Security Topology

Properties	Settings
Switch hardware	One J-EX4200 switch with 24 ports (8 PoE ports)
VLAN name and ID	**employee-vlan**, tag **20**
VLAN subnets	**192.0.2.16/28** **192.0.2.17** through **192.0.2.30** **192.0.2.31** is subnet's broadcast address

Table 183: Components of the Port Security Topology *(continued)*

Properties	Settings
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**, **ge-0/0/8**
Interface for DHCP server	**ge-0/0/8**

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- DHCP snooping is enabled on the VLAN **employee-vlan**.
- All access ports are untrusted, which is the default setting.

Configuration

To configure allowed MAC addresses to protect the switch against DHCP snooping database alteration attacks:

CLI Quick Configuration

To quickly configure some allowed MAC addresses on an interface, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
```

Step-by-Step Procedure

To configure some allowed MAC addresses on an interface:

Configure the five allowed MAC addresses on an interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/2.0 {
   allowed-mac [ 00:05:85:3a:82:80 00:05:85:3a:82:81 00:05:85:3a:82:83 00:05:85
   :3a:82:85 00:05:85:3a:82:88 ];
}
```

Verification

To confirm that the configuration is working properly:

- Verifying That Allowed MAC Addresses Are Working Correctly on the Switch on page 1579

Verifying That Allowed MAC Addresses Are Working Correctly on the Switch

Purpose Verify that allowed MAC addresses are working on the switch.

Action Display the MAC cache information:

```
user@switch> show ethernet-switching table
Ethernet-switching table:  6 entries, 5 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:85   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:88   Learn          0    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
```

Meaning The output shows that the five MAC addresses configured as allowed MAC addresses have been learned and are displayed in the MAC cache. The last MAC address in the list, one that had not been configured as allowed, has not been added to the list of learned addresses.

Related Documentation

- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Configuring MAC Limiting (CLI Procedure) on page 1620
- Configuring MAC Limiting (J-Web Procedure) on page 1623

Example: Configuring DHCP Snooping, DAI , and MAC Limiting on a J-EX Series Switch with Access to a DHCP Server Through a Second Switch

You can configure DHCP snooping, dynamic ARP inspection (DAI), and MAC limiting on the access interfaces of J-EX Series switches to protect the switch and the Ethernet LAN against address spoofing and Layer 2 denial-of-service (DoS) attacks. To obtain those basic settings, you can use the switch's default configuration for port security, configure the MAC limit, and enable DHCP snooping and DAI on a VLAN. You can configure those features when the DHCP server is connected to a different switch from the one to which the DHCP clients (network devices) are connected.

This example describes how to configure port security features on a J-EX Series switch whose hosts obtain IP addresses and lease times from a DHCP server connected to a second switch:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch—“Switch 1” in this example.
- An additional J-EX Series switch—”Switch 2” in this example. You will not configure port security on this second switch.
- Junos OS Release 10.2 or later for J-EX Series switches.
- A DHCP server connected to Switch 2. You will use the server to provide IP addresses to network devices connected to Switch 1.
- At least two network devices (hosts) that you will connect to access interfaces on Switch 1. These devices will be DHCP clients.

Before you configure DHCP snooping, DAI, and MAC limiting port security features, be sure you have:

- Connected the DHCP server to Switch 2.
- Configured the VLAN **employee-vlan** on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36.

Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. To protect the devices from such attacks, you can configure:

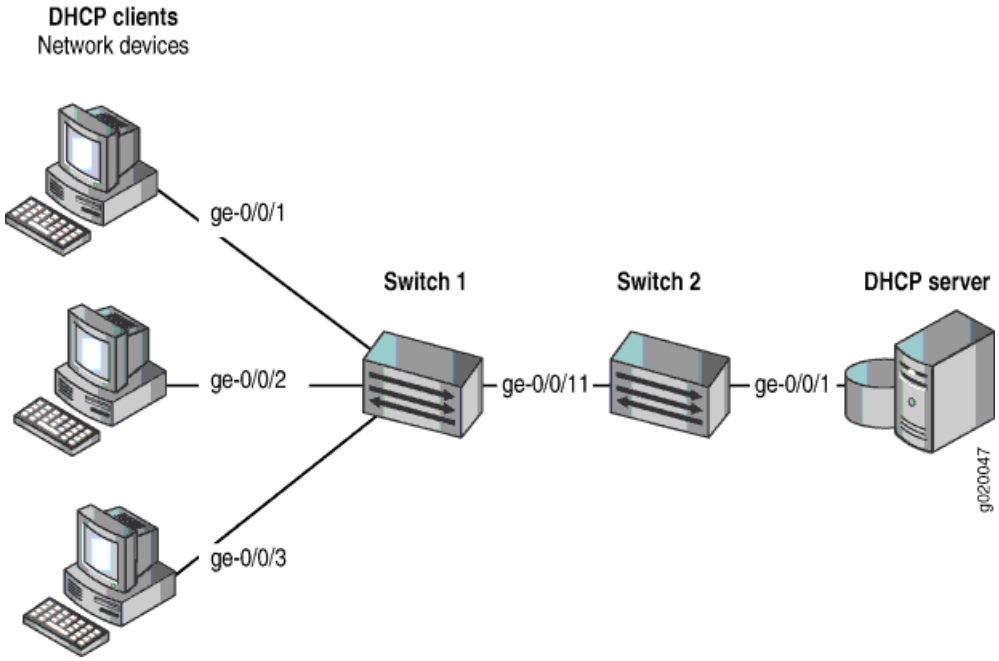
- DHCP snooping to validate DHCP server messages
- DAI to protect against ARP spoofing
- MAC limiting to constrain the number of MAC addresses the switch adds to its MAC address cache

This example shows how to configure these port security features on Switch 1. Switch 1 is connected to another switch (Switch 2) that is not configured with port security features. That second switch is connected to a DHCP server. (See Figure 52 on page 1581.) Network devices (hosts) that are connected to Switch 1 will send requests for IP addresses (that is, the devices will be DHCP clients). Those requests will be transmitted from Switch 1 to Switch 2 and then to the DHCP server connected to Switch 2. Responses to the requests will be transmitted along the reverse path of the one followed by the requests.

The setup for this example includes the VLAN **employee-vlan** on both switches.

Figure 52 on page 1581 shows the network topology for the example.

Figure 52: Network Topology for Port Security Setup with Two Switches on the Same VLAN



The components of the topology for this example are shown in Table 184 on page 1581.

Table 184: Components of Port Security Setup on Switch 1 with a DHCP Server Connected to Switch 2

Properties	Settings
Switch hardware	One J-EX Series switch (Switch 1), and an additional J-EX Series switch (Switch 2)
VLAN name and ID	**employee-vlan**, tag **20**
VLAN subnets	**192.0.2.16/28** **192.0.2.17** through **192.0.2.30** **192.0.2.31** is subnet's broadcast address
Trunk interface on both switches	**ge-0/0/11**
Access interfaces on Switch 1	**ge-0/0/1**, **ge-0/0/2**, and **ge-0/0/3**
Access interface on Switch 2	**ge-0/0/1**
Interface for DHCP server	**ge-0/0/1** on Switch 2

Switch 1 is initially configured with the default port security setup. In the default configuration on the switch:

- Secure port access is activated on the switch.
- The switch does not drop any packets, which is the default setting.
- DHCP snooping and dynamic ARP inspection (DAI) are disabled on all VLANs.
- All access interfaces are untrusted and trunk interfaces are trusted; these are the default settings.

In the configuration tasks for this example, you configure a VLAN on both switches.

In addition to configuring the VLAN, you enable DHCP snooping on Switch 1. In this example, you will also enable DAI and a MAC limit of **5** on Switch 1.

Because the interface that connects Switch 2 to Switch 1 is a trunk interface, you do not have to configure this interface to be trusted. As noted above, trunk interfaces are automatically trusted, so DHCP messages coming from the DHCP server to Switch 2 and then on to Switch 1 are trusted.

Configuring a VLAN, Interfaces, and Port Security Features on Switch 1

CLI Quick Configuration

To quickly configure a VLAN, interfaces, and port security features, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options secure-access-port interface ge-0/0/1 mac–limit 5
clear ethernet-switching table interface ge-0/0/1
set ethernet-switching-options secure-access-port vlan employee-vlan arp–inspection
set ethernet-switching-options secure-access-port vlan employee-vlan examine–dhcp
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members 20
set vlans employee–vlan vlan-id 20
```

Step-by-Step Procedure

To configure MAC limiting, a VLAN, and interfaces on Switch 1 and enable DAI and DHCP on the VLAN:

1. Configure the VLAN **employee-vlan** with VLAN ID **20**:

   ```
   [edit vlans]
   user@switch1# set employee-vlan vlan-id 20
   ```

2. Configure an interface on Switch 1 as a trunk interface:

   ```
   [edit interfaces]
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
   ```

3. Associate the VLAN with interfaces **ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**, and **ge-0/0/11**:

   ```
   [edit interfaces]
   user@switch1# set ge-0/0/1 unit 0 family ethernet-switching vlan members 20
   user@switch1# set ge-0/0/2 unit 0 family ethernet-switching vlan members 20
   user@switch1# set ge-0/0/3 unit 0 family ethernet-switching vlan members 20
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members 20
   ```

4. Enable DHCP snooping on the VLAN:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch1# set vlan employee-vlan examine-dhcp
   ```

5. Enable DAI on the VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch1# set vlan employee-vlan arp-inspection
```

6. Configure a MAC limit of **5** on **ge-0/0/1** and use the default action, drop (packets with new addresses are dropped if the limit has been exceeded):

```
[edit ethernet-switching-options secure-access-port]
user@switch1# set interface ge-0/0/1 mac-limit 5
```

7. Clear the existing MAC address table entries from interface ge-0/0/1:

```
user@switch1# clear ethernet-switching table interface ge-0/0/1
```

Results Display the results of the configuration:

```
[edit]
user@switch1# show
ethernet-switching-options {
  secure-access-port {
    interface ge-0/0/1.0{
      mac-limit 5 action drop;
    }
    vlan employee-vlan {
      arp-inspection;
      examine-dhcp;
    }
  }
}
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members 20;
        }
      }
    }
  }
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members 20;
        }
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members 20;
        }
      }
    }
```

```
    }
    ge-0/0/11 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members 20;
          }
        }
      }
    }
}
vlans {
    employee-vlan {
      vlan-id 20;
    }
}
```

Configuring a VLAN and Interfaces on Switch 2

To configure the VLAN and interfaces on Switch 2:

CLI Quick Configuration

To quickly configure the VLAN and interfaces on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set vlans employee-vlan vlan-id 20
```

Step-by-Step Procedure

To configure the VLAN and interfaces on Switch 2:

1. Configure an interface on Switch 2 as a trunk interface:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/11 unit 0 ethernet-switching port-mode trunk
   ```

2. Associate the VLAN with interfaces **ge-0/0/1** and **ge-0/0/11**:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/1 unit 0 family ethernet-switching vlan members 20
   user@switch2# set ge-0/0/11 unit 0 family ethernet-switching vlan members 20
   ```

Results

Display the results of the configuration:

```
[edit]
user@switch2# show
interfaces {
    ge-0/0/1 {
      unit 0 {
        family ethernet-switching {
          vlan {
            members 20;
          }
        }
      }
    }
```

```
    ge-0/0/11 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members 20;
          }
        }
      }
    }
  }
  vlans {
    employee-vlan {
      vlan-id 20;
    }
  }
```

Verification

To confirm that the configuration is working properly:

- Verifying That DHCP Snooping Is Working Correctly on Switch 1 on page 1585
- Verifying That DAI Is Working Correctly on Switch 1 on page 1585
- Verifying That MAC Limiting Is Working Correctly on Switch 1 on page 1586

Verifying That DHCP Snooping Is Working Correctly on Switch 1

Purpose Verify that DHCP snooping is working on Switch 1.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface through which Switch 2 sends the DHCP server replies to clients connected to Switch 1 is trusted. The server has provided the IP addresses and leases:

```
user@switch1> show dhcp snooping binding
DHCP Snooping Information:
MAC Address         IP Address    Lease    Type     VLAN          Interface
-----------------   ----------    -----    ----     ----          ---------
00:05:85:3A:82:77    192.0.2.17    600    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:79    192.0.2.18    653    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:80    192.0.2.19    720    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:81    192.0.2.20    932    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:83    192.0.2.21   1230    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:90    192.0.2.20    932    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:91    192.0.2.21   1230    dynamic  employee-vlan   ge-0/0/3.0
```

Meaning The output shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

Verifying That DAI Is Working Correctly on Switch 1

Purpose Verify that DAI is working on Switch 1.

Action Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch1> show arp inspection statistics
ARP inspection statistics:
Interface    Packets received  ARP inspection pass  ARP inspection failed
----------   ----------------  -------------------  ---------------------
ge-0/0/1.0                 7                    5                     2
ge-0/0/2.0                10                   10                     0
ge-0/0/3.0                18                   15                     3
```

Meaning The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

Verifying That MAC Limiting Is Working Correctly on Switch 1

Purpose Verify that MAC limiting is working on Switch 1.

Action Display the MAC addresses that are learned when DHCP requests are sent from hosts on **ge-0/0/1**:

```
user@switch1> show ethernet-switching table

Ethernet-switching table:  6 entries, 5 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/1.0
  employee-vlan       *                   Flood          -    ge-0/0/1.0
```

Meaning The sample output shows that five MAC addresses have been learned for interface **ge-0/0/1**, which corresponds to the MAC limit of **5** set in the configuration. The last line of the output shows that a sixth MAC address request was dropped, as indicated by the asterisk (*) in the **MAC address** column.

Related Documentation

- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Configuring Port Security (CLI Procedure) on page 1610
- Configuring Port Security (J-Web Procedure) on page 1611

Example: Configuring IP Source Guard with Other J-EX Series Switch Features to Mitigate Address-Spoofing Attacks on Untrusted Access Interfaces

Ethernet LAN switches are vulnerable to attacks that involve spoofing (forging) of source IP addresses or source MAC addresses. These spoofed packets are sent from hosts

connected to untrusted access interfaces on the switch. You can enable the IP source guard port security feature on J-EX Series switches to mitigate the effects of such attacks. If IP source guard determines that a source IP address and a source MAC address in a binding in an incoming packet are not valid, the switch does not forward the packet.

You can use IP source guard in combination with other J-EX Series switch features to mitigate address-spoofing attacks on untrusted access interfaces. This example shows two configuration scenarios:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- A J-EX4200-24T switch
- A DHCP server to provide IP addresses to network devices on the switch
- A RADIUS server to provide 802.1X authentication

Before you configure IP source guard for these scenarios, be sure you have:

- Connected the DHCP server to the switch.
- Connected the RADIUS server and configured user authentication on the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- Configured the VLANs on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36 for detailed information about configuring VLANs.

Overview and Topology

IP source guard checks the IP source address and MAC source address in a packet sent from a host attached to an untrusted access interface on the switch. If IP source guard determines that the packet header contains an invalid source IP address or source MAC address, it ensures that the switch does not forward the packet—that is, the packet is discarded.

When you configure IP source guard, you enable on it on one or more VLANs. IP source guard applies its checking rules to untrusted access interfaces on those VLANs. By default, on J-EX Series switches, access interfaces are untrusted and trunk interfaces are trusted. IP source guard does not check packets that have been sent to the switch by devices connected to either trunk interfaces or trusted access interfaces—that is, interfaces

configured with **dhcp-trusted** so that a DHCP server can be connected to that interface to provide dynamic IP addresses.

IP source guard obtains information about IP-address/MAC-address/VLAN bindings from the DHCP snooping database. It causes the switch to validate incoming IP packets against the entries in that database.

The topology for this example includes a J-E4200-24T switch, a connection to a DHCP server, and a connection to a RADIUS server for user authentication.

NOTE: The 802.1X user authentication applied in this example is for single supplicants.

You can also use IP source guard with 802.1X user authentication for single-secure supplicant or multiple supplicant mode. If you are implementing IP source guard with 802.1X authentication in single-secure supplicant or multiple supplicant mode, you must use the following configuration guidelines:

- If the 802.1X interface is part of an untagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has untagged membership.
- If the 802.1X interface is part of a tagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has tagged membership.

In the first example configuration, two clients (network devices) are connected to an access switch. You configure IP source guard and 802.1X user authentication, in combination with two access port security features: DHCP snooping and dynamic ARP inspection (DAI). This setup is designed to protect the switch from IP attacks such as “ping of death” attacks, DHCP starvation, and ARP spoofing.

In the second example configuration, the switch is configured for 802.1X user authentication. If the client fails authentication, the switch redirects the client to a guest VLAN that allows this client to access a set of restricted network features. You configure IP source guard on the guest VLAN to mitigate effects of source IP spoofing.

NOTE: Control-plane rate limiting is achieved by restricting CPU control-plane protection. It can be used in conjunction with storm control (see “Understanding Storm Control on J-EX Series Switches” on page 1495) to limit data-plane activity.

TIP: You can set the **ip-source-guard** flag in the **traceoptions** statement for debugging purposes.

Configuring IP Source Guard with 802.1X Authentication, DHCP Snooping, and Dynamic ARP Inspection

CLI Quick Configuration

To quickly configure IP source guard with 802.1X authentication and with other access port security features, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options secure-access-port interface ge-0/0/24 dhcp-trusted
set ethernet-switching-options secure-access-port vlan data examine-dhcp
set ethernet-switching-options secure-access-port vlan data arp-inspection
set ethernet-switching-options secure-access-port vlan data ip-source-guard
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members data
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members data
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members data
set protocols lldp-med interface ge-0/0/0.0
set protocols dot1x authenticator authentication-profile-name profile52
set protocols dot1x authenticator interface ge-0/0/0.0 supplicant single
set protocols lldp-med interface ge-0/0/1.0
set protocols dot1x authenticator interface ge-0/0/1.0 supplicant single
```

Step-by-Step Procedure

To configure IP source guard with 802.1X authentication and various port security features:

1. Configure the interface on which the DHCP server is connected to the switch as a trusted interface and add that interface to the data VLAN:

   ```
   [edit ethernet-switching-options]
   user@switch# set secure-access-port interface ge-0/0/24 dhcp-trusted
   user@switch# set set ge-0/0/24 unit 0 family ethernet-switching vlan members data
   ```

2. Associate two interfaces with the data VLAN:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members data
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching vlan members data
   ```

3. Configure 802.1X user authentication and LLDP-MED on the two interfaces that you associated with the data VLAN:

   ```
   [edit protocols]
   user@switch# set lldp-med interface ge-0/0/0.0
   user@switch# set dot1x authenticator authentication-profile-name profile52
   user@switch# set dot1x authenticator interface ge-0/0/0.0 supplicant single
   user@switch# set lldp-med interface ge-0/0/1.0
   user@switch# set dot1x authenticator interface ge-0/0/1.0 supplicant single
   ```

4. Configure three access port security features—DHCP snooping, dynamic ARP inspection (DAI), and IP source guard—on the data VLAN:

   ```
   [edit ethernet-switching-options]
   user@switch# set secure-access-port vlan data examine-dhcp
   user@switch# set secure-access-port vlan data arp-inspection
   user@switch# set secure-access-port vlan data ip-source-guard
   ```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options]
secure-access-port {
```

```
    interface ge-0/0/24.0 {
      dhcp-trusted;
    }
    vlan data {
      arp-inspection;
      examine-dhcp;
      ip-source-guard;
    }
}

[edit interfaces]
ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members data;
        }
      }
    }
}
ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members data;
        }
      }
    }
}
ge-0/0/24 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members data;
        }
      }
    }
}

[edit protocols]
lldp-med {
    interface ge-0/0/14.0;
    interface ge-0/0/0.0;
    interface ge-0/0/1.0;
}
dot1x {
    authenticator {
      authentication-profile-name profile52;
    }
    interface {
      ge-0/0/0.0 {
        supplicant single;
      }
      ge-0/0/1.0 {
        supplicant single;
      }
      ge-0/0/14.0 {
```

```
        supplicant single;
      }
    }
  }
```

Configuring IP Source Guard on a Guest VLAN

CLI Quick Configuration

To quickly configure IP source guard on a guest VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options secure-access-port interface ge-0/0/24 dhcp-trusted
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members employee
set ethernet-switching-options secure-access-port vlan employee examine-dhcp
set ethernet-switching-options secure-access-port vlan employee ip-source-guard
set ethernet-switching-options secure-access-port interface ge-0/0/0 static-ip 11.1.1.1 mac
00:11:11:11:11:11 vlan employee
set ethernet-switching-options secure-access-port interface ge-0/0/1 static-ip 11.1.1.2 mac
00:22:22:22:22:22 vlan employee
set interfaces ge-0/0/0 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/1 unit 0 family ethernet-switching port-mode access
set protocols dot1x authenticator authentication-profile-name profile52
set protocols dot1x authenticator interface ge-0/0/0 supplicant single
set protocols dot1x authenticator interface ge-0/0/0 guest-vlan employee
set protocols dot1x authenticator interface ge-0/0/0 supplicant-timeout 2
set protocols dot1x authenticator interface ge-0/0/1 supplicant single
set protocols dot1x authenticator interface ge-0/0/1 guest-vlan employee
set protocols dot1x authenticator interface ge-0/0/1 supplicant-timeout 2
set vlans employee vlan-id 300
```

Step-by-Step Procedure

To configure IP source guard on a guest VLAN:

1. Configure the interface on which the DHCP server is connected to the switch as a trusted interface and add that interface to the **employee** VLAN:

   ```
   [edit ethernet-switching-options]
   user@switch# set secure-access-port interface ge-0/0/24 dhcp-trusted
   user@switch# set ge-0/0/24 unit 0 family ethernet-switching vlan members employee
   ```

2. Configure two interfaces for the access port mode:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0 unit 0 family ethernet-switching port-mode access
   user@switch# set ge-0/0/1 unit 0 family ethernet-switching port-mode access
   ```

3. Configure DHCP snooping and IP source guard on the **employee** VLAN:

   ```
   [edit ethernet-switching-options]
   user@switch# set secure-access-port vlan employee examine-dhcp
   user@switch# set secure-access-port vlan employee ip-source-guard
   ```

4. Configure a static IP address on each of two interfaces on the **employee** VLAN (optional):

   ```
   [edit ethernet-switching-options]
   user@switch# set secure-access-port interface ge-0/0/0 static-ip 11.1.1.1 mac
   00:11:11:11:11:11 vlan employee

   [edit ethernet-switching-options]
   ```

```
user@switch# set secure-access-port interface ge-0/0/1 static-ip 11.1.1.2 mac
00:22:22:22:22:22 vlan employee
```

5. Configure 802.1X user authentication:

```
[edit protocols]
user@switch# set dot1x authenticator authentication-profile-name profile52
user@switch# set dot1x authenticator interface ge-0/0/0 supplicant single
user@switch# set dot1x authenticator interface ge-0/0/1 supplicant single
user@switch# set dot1x authenticator interface ge-0/0/0 supplicant-timeout 2
user@switch# set dot1x authenticator interface ge-0/0/1 supplicant-timeout 2
```

6. Set the VLAN ID for the **employee** VLAN:

```
[edit vlans]
user@switch# set employee vlan-id 100
```

Results Check the results of the configuration:

```
[edit protocols]
  dot1x {
    authenticator {
      authentication-profile-name profile52;
    }
    interface {
      ge-0/0/0.0 {
        guest-vlan employee;
        supplicant single;
        supplicant-timeout 2;
      }
      ge-0/0/1.0 {
        guest-vlan employee;
        supplicant single;
        supplicant-timeout 2;
      }
    }
  }
}

[edit vlans]
employee {
  vlan-id 100;
}

[edit interfaces]
ge-0/0/0 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
```

```
    }
  }
  ge-0/0/24 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members employee;
        }
      }
    }
  }

  [edit ethernet-switching-options]
  secure-access-port {
    interface ge-0/0/0.0 {
      static-ip 11.1.1.1 vlan employee mac 00:11:11:11:11:11;
    }
    interface ge-0/0/1.0 {
      static-ip 11.1.1.2 vlan employee mac 00:22:22:22:22:22;
    }
    interface ge-0/0/24.0 {
      dhcp-trusted;
    }
    vlan employee {
      examine-dhcp;
      ip-source-guard;
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That 802.1X User Authentication Is Working on the Interface on page 1593
- Verifying the VLAN Association with the Interface on page 1593
- Verifying That DHCP Snooping and IP Source Guard Are Working on the VLAN on page 1594

Verifying That 802.1X User Authentication Is Working on the Interface

Purpose Verify that the 802.1X configuration is working on the interface.

Action Use the **show dot1x interface** command to view the 802.1X details.

Meaning The **Supplicant mode** output field displays the configured administrative mode for each interface.

Verifying the VLAN Association with the Interface

Purpose Verity interface states and VLAN memberships.

Action Use the **show ethernet-switching interfaces** command to view the Ethernet switching table entries.

Meaning The field **VLAN members** shows the associations between VLANs and interfaces. The **State** field shows whether the interfaces are up or down.

For the guest VLAN configuration, the interface is associated with the guest VLAN if and when the supplicant fails 802.1X user authentication.

Verifying That DHCP Snooping and IP Source Guard Are Working on the VLAN

Purpose Verify that DHCP snooping and IP source guard are enabled and working on the VLAN.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Use the **show dhcp snooping binding** command to display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. View the MAC addresses from which requests were sent and the IP addresses and leases provided by the server.

Use the **show ip-source-guard** command to view IP source guard information for the VLAN.

Meaning When the interface on which the DHCP server connects to the switch has been set to trusted, the output shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires. Static IP addresses have no assigned lease time. Statically configured entries never expire.

The IP source guard database table contains the VLANs enabled for IP source guard, the untrusted access interfaces on those VLANs, the VLAN 802.1Q tag IDs if there are any, and the IP addresses and MAC addresses that are bound to one another. If a switch interface is associated with multiple VLANs and some of those VLANs are enabled for IP source guard and others are not, the VLANs that are not enabled for IP source guard have a star (*) in the **IP Address** and **MAC Address** fields.

Example: Configuring IP Source Guard on a Data VLAN That Shares an Interface with a Voice VLAN

Ethernet LAN switches are vulnerable to attacks that involve spoofing (forging) of source IP addresses or source MAC addresses. These spoofed packets are sent from hosts connected to untrusted access interfaces on the switch. You can enable the IP source

guard port security feature on J-EX Series switches to mitigate the effects of such attacks. If IP source guard determines that a source IP address and a source MAC address in a binding in an incoming packet are not valid, the switch does not forward the packet.

If two VLANs share an interface, you can configure IP source guard on just one of the VLANs; in this example, you configure IP source guard on an untagged data VLAN but not on the tagged voice VLAN. You can use 802.1X user authentication to validate the device connections on the data VLAN.

This example describes how to configure IP source guard with 802.1X user authentication on a data VLAN, with a voice VLAN on the same interface:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch
- A RADIUS server to provide 802.1X authentication

Before you configure IP source guard for the data VLANs, be sure you have:

- Connected the DHCP server to the switch.
- Connected the RADIUS server to the switch and configured user authentication on the server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 1243.
- Configured the VLANs. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 36 for detailed information about configuring VLANs.

Overview and Topology

IP source guard checks the IP source address and MAC source address in a packet sent from a host attached to an untrusted access interface on the switch. If IP source guard determines that the packet header contains an invalid source IP address or source MAC address, it ensures that the switch does not forward the packet—that is, the packet is discarded.

When you configure IP source guard, you enable on it on one or more VLANs. IP source guard applies its checking rules to untrusted access interfaces on those VLANs. By default, on J-EX Series switches, access interfaces are untrusted and trunk interfaces are trusted. IP source guard does not check packets that have been sent to the switch by devices connected to either trunk interfaces or trusted access interfaces—that is, interfaces

configured with **dhcp-trusted** so that a DHCP server can be connected to that interface to provide dynamic IP addresses.

IP source guard obtains information about IP-address/MAC-address/VLAN bindings from the DHCP snooping database. It causes the switch to validate incoming IP packets against the entries in that database.

The topology for this example includes one EX-3200-24P switch, a PC and an IP phone connected on the same interface, a connection to a DHCP server, and a connection to a RADIUS server for user authentication.

NOTE: The 802.1X user authentication applied in this example is for single supplicants.

You can also use IP source guard with 802.1X user authentication for single-secure supplicant or multiple supplicant mode. If you are implementing IP source guard with 802.1X authentication in single-secure supplicant or multiple supplicant mode, you must use the following configuration guidelines:

- If the 802.1X interface is part of an untagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has untagged membership.
- If the 802.1X interface is part of a tagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has tagged membership.

TIP: You can set the **ip-source-guard** flag in the **traceoptions** statement for debugging purposes.

This example shows how to configure a static IP address to be added to the DHCP snooping database.

Configuration

CLI Quick Configuration

To quickly configure IP source guard on a data VLAN, copy the following commands and paste them into the switch terminal window:

```
set ethernet-switching-options voip interface ge-0/0/14.0 vlan voice
set ethernet-switching-options secure-access-port interface ge-0/0/24.0 dhcp-trusted
set ethernet-switching-options secure-access-port interface ge-0/0/14 static-ip 11.1.1.1 mac
00:11:11:11:11:11 vlan data
set ethernet-switching-options secure-access-port vlan data examine-dhcp
set ethernet-switching-options secure-access-port vlan data ip-source-guard
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members data
set vlans voice vlan-id 100
set protocols lldp-med interface ge-0/0/14.0
```

```
set protocols dot1x authenticator authentication-profile-name profile52
set protocols dot1x authenticator interface ge-0/0/14.0 supplicant single
```

Step-by-Step Procedure

To configure IP source guard on the data VLAN:

1. Configure the VoIP interface:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/14.0 vlan voice
```

2. Configure the interface on which the DHCP server is connected to the switch as a trusted interface and add that interface to the data VLAN:

```
[edit ethernet-switching-options]
user@switch# set secure-access-port interface ge-0/0/24.0 dhcp-trusted
[edit interfaces]
user@switch# set ge-0/0/24 unit 0 family ethernet-switching vlan members data
```

3. Configure a static IP address on an interface on the data VLAN (optional)

```
[edit ethernet-switching-options]
user@switch# set secure-access-port interface ge-0/0/14 static-ip 11.1.1.1 mac
00:11:11:11:11:11 vlan data
```

4. Configure DHCP snooping and IP source guard on the data VLAN:

```
[edit ethernet-switching-options]
user@switch# set secure-access-port vlan data examine-dhcp
user@switch# set secure-access-port vlan data ip-source-guard
```

5. Configure 802.1X user authentication and LLDP-MED on the interface that is shared by the data VLAN and the voice VLAN:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/14.0
user@switch# set dot1x authenticator authentication-profile-name profile52
user@switch# set dot1x authenticator interface ge-0/0/14.0 supplicant single
```

6. Set the VLAN ID for the voice VLAN:

```
[edit vlans]
user@switch# set voice vlan-id 100
```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options]
user@switch# show
voip {
  interface ge-0/0/14.0 {
    vlan voice;
  }
}
secure-access-port {
  interface ge-0/0/14.0 {
    static-ip 11.1.1.1 vlan data mac 00:11:11:11:11:11;
  }
  interface ge-0/0/24.0 {
    dhcp-trusted;
  }
```

```
    vlan data {
      examine-dhcp;
      ip-source-guard;
    }
}

[edit interfaces]
ge-0/0/24 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members data;
        }
      }
    }
}

[edit vlans]
voice {
    vlan-id 100;
}

[edit protocols]
lldp-med {
    interface ge-0/0/14.0;
}
dot1x {
    authenticator {
      authentication-profile-name profile52;
      interface {
        ge-0/0/14.0 {
          supplicant single;
        }
      }
    }
}
```

TIP: If you wanted to configure IP source guard on the voice VLAN as well as on the data VLAN, you would configure DHCP snooping and IP source guard exactly as you did for the data VLAN. The configuration result for the voice VLAN under **secure-access-port** would look like this:

```
secure-access-port {
    vlan voice {
      examine-dhcp;
      ip-source-guard;
    }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That 802.1X User Authentication Is Working on the Interface on page 1599
- Verifying the VLAN Association with the Interface on page 1599
- Verifying That DHCP Snooping and IP Source Guard Are Working on the Data VLAN on page 1600

Verifying That 802.1X User Authentication Is Working on the Interface

Purpose Verify the 802.1X configuration on interface **ge-0/0/14**.

Action Verify the 802.1X configuration with the operational mode command **show dot1x interface**:

```
user@switch> show dot1x interface ge-0/0/14.0 detail
ge-0/0/14.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: <not configured>
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The **Supplicant mode** output field displays the configured administrative mode for each interface. Interface **ge-0/0/14.0** displays **Single** supplicant mode.

Verifying the VLAN Association with the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch> show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members         Blocking
ge-0/0/0.0  down     default              unblocked
ge-0/0/1.0  down     employee             unblocked
ge-0/0/2.0  down     employee             unblocked
ge-0/0/12.0 down     default              unblocked
```

```
ge-0/0/13.0 down     default             unblocked
ge-0/0/13.0 down     vlan100             unblocked
ge-0/0/14.0 up       voice               unblocked
                     data                unblocked
ge-0/0/17.0 down     employee            unblocked
ge-0/0/23.0 down     default             unblocked
ge-0/0/24.0 down     data                unblocked
                     employee            unblocked
                     vlan100             unblocked
                     voice               unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/14.0** interface supports both the **data** VLAN and the **voice** VLAN. The **State** field shows that the interface is up.

Verifying That DHCP Snooping and IP Source Guard Are Working on the Data VLAN

Purpose Verify that DHCP snooping and IP source guard are enabled and working on the data VLAN.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch>  show dhcp snooping binding
DHCP Snooping Information:
MAC address        IP address  Lease (seconds) Type     VLAN      Interface

00:05:85:3A:82:77  192.0.2.17  600             dynamic  employee  ge-0/0/1.0
00:05:85:3A:82:79  192.0.2.18  653             dynamic  employee  ge-0/0/1.0

```

Meaning When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see the preceding sample output for **show dhcp snooping binding**) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires. Static IP addresses have no assigned lease time. Statically configured entries never expire.

The IP source guard database table contains the VLANs enabled for IP source guard, the untrusted access interfaces on those VLANs, the VLAN 802.1Q tag IDs if there are any, and the IP addresses and MAC addresses that are bound to one another. If a switch interface is associated with multiple VLANs and some of those VLANs are enabled for IP source guard and others are not, the VLANs that are not enabled for IP source guard have a star (*) in the **IP Address** and **MAC Address** fields. See the entry for the **voice** VLAN in the preceding sample output.

Example: Setting Up DHCP Option 82 with a J-EX Series Switch as Relay Agent Between Clients and a DHCP Server

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the J-EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

This example describes how to configure DHCP option 82 on a switch that is on the same VLAN with the DHCP clients but on a different VLAN from the DHCP server; the switch acts as a relay agent:

- Requirements on page 1602
- Overview and Topology on page 1602
- Configuration on page 1603

Requirements

This example uses the following hardware and software components:

- One J-EX4200-24T switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP option 82 on the switch, be sure you have:

- Connected and configured the DHCP server.

NOTE: Your DHCP server must be configured to accept DHCP option 82. If it is not configured for DHCP option 82, it does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configured the **employee** VLAN on the switch and associated the interfaces on which the clients connect to the switch with that VLAN. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 112.
- Configured the **corporate** VLAN for the DHCP server.
- Configured the switch as a BOOTP relay agent. See DHCP/BOOTP Relay for J-EX Series Switches Overview.
- Configured the routed VLAN interface (RVI) to allow the switch to relay packets to the server and receive packets from the server. See “Configuring Routed VLAN Interfaces (CLI Procedure)” on page 113.

Overview and Topology

If DHCP option 82 is enabled on the switch, then when a network device—a DHCP client—that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request (in this setting, it relays the request) to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or other parameter for the client.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch relays the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

In this example, you configure option 82 on the J-EX Series switch. The switch is configured as a BOOTP relay agent. The switch connects to the DHCP server through the routed VLAN interface (RVI) that you configured. The switch and clients are members of the **employee** VLAN. The DHCP server is a member of the **corporate** VLAN.

Configuration

To configure DHCP option 82:

CLI Quick Configuration

To quickly configure DHCP option 82, copy the following commands and paste them into the switch terminal window:

```
set forwarding-options helpers bootp dhcp-option82
set forwarding-options helpers bootp dhcp-option82 circuit-id prefix hostname
set forwarding-options helpers bootp dhcp-option82 circuit-id use-vlan-id
set forwarding-options helpers bootp dhcp-option82 remote-id
set forwarding-options helpers bootp dhcp-option82 remote-id prefix mac
set forwarding-options helpers bootp dhcp-option82 remote-id use-string employee-switch1
set forwarding-options helpers bootp dhcp-option82 vendor-id
```

Step-by-Step Procedure

To configure DHCP option 82:

1. Specify DHCP option 82 for the **employee** VLAN:

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82
   ```

2. Configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 circuit-id prefix hostname
   ```

3. Specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 circuit-id use-vlan-id
   ```

4. Specify that the remote ID suboption be included in the DHCP option 82 information:

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id
   ```

5. Configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id prefix mac
   ```

6. Specify that the remote ID suboption value contains a character string (here, the string is **employee-switch1**):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id use-string employee-switch1
   ```

7. Configure a vendor ID suboption value, and use the default value. To use the default value, do not type a character string after the **vendor-id** option keyword:

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 vendor-id
   ```

Results Check the results of the configuration:

```
[edit forwarding-options helpers bootp]
user@switch# show

  dhcp-option82 {
    circuit-id {
      prefix hostname;
      use-vlan-id;
    }
    remote-id {
      prefix mac;
      use-string employee-switch1;
    }
    vendor-id;
  }
```

Related Documentation

- Example: Setting Up DHCP Option 82 on a J-EX Series Switch with No Relay Agent Between Clients and DHCP Server on page 1604
- Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure) on page 1632
- RFC 3046, *DHCP Relay Agent Information Option*, at http://tools.ietf.org/html/rfc3046.

Example: Setting Up DHCP Option 82 on a J-EX Series Switch with No Relay Agent Between Clients and DHCP Server

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the J-EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

This example describes how to configure DHCP option 82 on a switch with DHCP clients, DHCP server, and switch all on the same VLAN:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP option 82 on the switch, be sure you have:

- Connected and configured the DHCP server.

NOTE: Your DHCP server must be configured to accept DHCP option 82. If it is not configured for DHCP option 82, it does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configured the **employee** VLAN on the switch and associated the interfaces on which the clients and the server connect to the switch with that VLAN. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 112.

Overview and Topology

If DHCP option 82 is enabled on the switch, then when a network device—a DHCP client—that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or other parameter for the client.

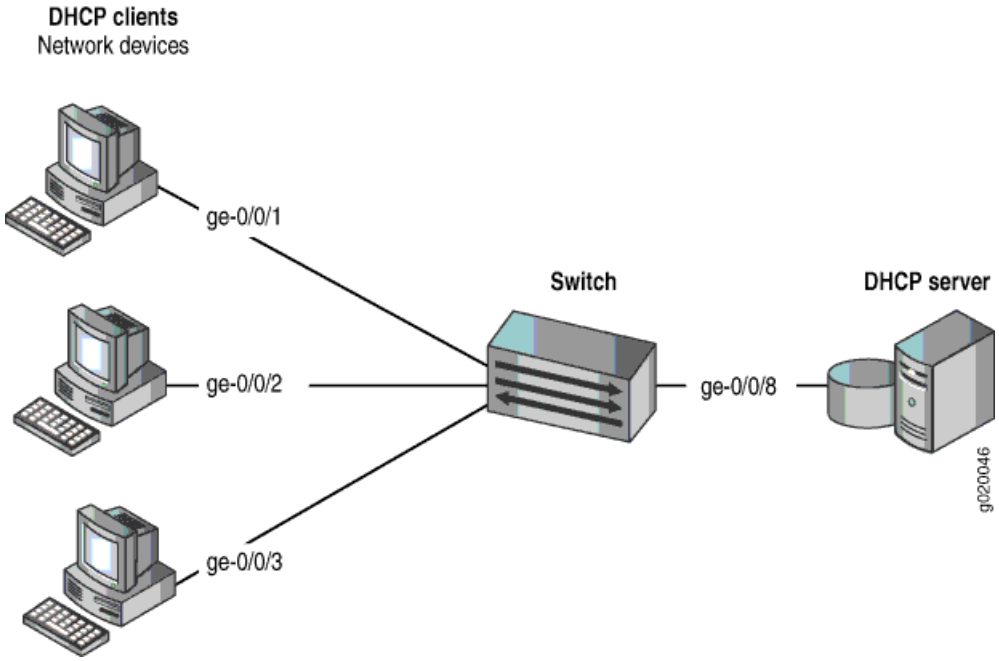
DHCP option 82 is enabled on an individual VLAN or on all VLANs on the switch.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

Figure 53 on page 1606 illustrates the topology for this example.

Figure 53: Network Topology for Configuring DHCP Option 82 on a Switch That Is on the Same VLAN as the DHCP Clients and the DHCP Server



In this example, you configure DHCP option 82 on the J-EX Series switch. The switch connects to the DHCP server on interface **ge-0/0/8**. The DHCP clients connect to the switch on interfaces **ge-0/0/1**, **ge-0/0/2**, and **ge-0/0/3**. The switch, server, and clients are all members of the **employee** VLAN.

Configuration

To configure DHCP option 82:

CLI Quick Configuration

To quickly configure DHCP option 82, copy the following commands and paste them into the switch terminal window:

```
set ethernet-switching-options secure-access-port vlan employee dhcp-option82
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 circuit-id prefix hostname
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 circuit-id use-vlan-id
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 remote-id
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 remote-id prefix mac
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 remote-id use-string employee-switch1
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 vendor-id
```

Step-by-Step Procedure

To configure DHCP option 82:

1. Specify DHCP option 82 for the **employee** VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82
```

2. Configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 circuit-id prefix hostname
```

3. Specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 circuit-id use-vlan-id
```

4. Specify that the remote ID suboption be included in the DHCP option 82 information:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id
```

5. Configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id prefix mac
```

6. Specify that the remote ID suboption value contains a character string (here, the string is **employee-switch1**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id use-string employee-switch1
```

7. Configure a vendor ID suboption value, and use the default value. To use the default value, do not type a character string after the **vendor-id** option keyword:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 vendor-id
```

Results

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show

  vlan employee {
    dhcp-option82 {
      circuit-id {
        prefix hostname;
        use-vlan-id;
      }
      remote-id {
        prefix mac;
        use-string employee-switch1;
      }
      vendor-id;
    }
  }
```

CHAPTER 39

Configuring Port Security

Configuring Port Security (CLI Procedure)

Ethernet LANs are vulnerable to attacks such as address spoofing and Layer 2 denial of service (DoS) on network devices. Port security features such as DHCP snooping, DAI (dynamic ARP inspection), MAC limiting, and MAC move limiting, as well as trusted DHCP server, help protect the access ports on your J-EX Series switch against the losses of information and productivity that can result from such attacks.

To configure port security features using the CLI:

1. Enable DHCP snooping:
   - On a specific VLAN:

     ```
     [edit ethernet-switching-options secure-access port]
     user@switch# set vlan default examine-dhcp
     ```

   - On all VLANs:

     ```
     [edit ethernet-switching-options secure-access port]
     user@switch# set vlan all examine-dhcp
     ```

2. Enable DAI:
   - On a single VLAN (here, the VLAN is **employee-vlan**):

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set vlan employee–vlan arp-inspection
     ```

   - On all VLANs:

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set vlan all arp-inspection
     ```

3. Limit the number of dynamic MAC addresses and specify the action to take if the limit is exceeded—for example, set a MAC limit of **5** with an action of **drop**:
   - On a single interface (here, the interface is **ge-0/0/1**):

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set interface ge–0/0/1 mac-limit 5 action drop
     ```

   - On all interfaces:

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set interface all mac–limit 5 action drop
     ```

4. Specify allowed MAC addresses:
   - On a single interface (here, the interface is **ge-0/0/2**):

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set interface ge–0/0/2 allowed-mac 00:05:85:3A:82:80
     user@switch# set interface ge–0/0/2 allowed-mac 00:05:85:3A:82:81
     user@switch# set interface ge–0/0/2 allowed-mac 00:05:85:3A:82:83
     ```

   - On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all allowed-mac 00:05:85:3A:82:80
user@switch# set interface all allowed-mac 00:05:85:3A:82:81
user@switch# set interface all allowed-mac 00:05:85:3A:82:83
```

5. Limit the number of times a MAC address can move from its original interface in one second—for example, set a MAC move limit of **5** with an action of **drop** if the limit is exceeded:

   - On a single VLAN (here, the VLAN is **employee-vlan**):

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set vlan employee–vlan mac-move-limit 5 action drop
     ```

   - On all VLANs:

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set vlan all mac–move-limit 5 action drop
     ```

6. Configure a trusted DHCP server on an interface (here, the interface is **ge-0/0/8**):

   ```
   [edit ethernet-switching-options secure-access port]
   user@switch# set interface ge–0/0/8 dhcp-trusted
   ```

Configuring Port Security (J-Web Procedure)

To configure port security on a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Security** > **Port Security**.

   The **VLAN List** table lists all the VLAN names, VLAN identifiers, port members, and port security VLAN features.

   The **Interface List** table lists all the ports and indicates whether security features have been enabled on the ports.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:

   - **Edit**—Click this option to modify the security features for the selected port or VLAN.

     Enter information as specified in Table 185 on page 1612 to modify Port Security settings on VLANs.

     Enter information as specified in Table 186 on page 1613 to modify Port Security settings on interfaces.

   - **Activate/Deactivate**—Click this option to enable or disable security on the switch.

Table 185: Port Security Settings on VLANs

Field	Function	Your Action
Enable DHCP Snooping on VLAN	Allows the switch to monitor and control DHCP messages received from untrusted devices connected to the switch. Builds and maintains a database of valid IP addresses/MAC address bindings. (By default, access ports are untrusted and trunk ports are trusted.)	Select to enable DHCP snooping on a specified VLAN or all VLANs. TIP: For private VLANs (PVLANs), enable DHCP snooping on the primary VLAN. If you enable DHCP snooping only on a community VLAN, DHCP messages coming from PVLAN trunk ports are not snooped.
Enable ARP Inspection on VLAN	Uses information in the DHCP snooping database to validate ARP packets on the LAN and protect against ARP cache poisoning.	Select to enable ARP inspection on a specified VLAN or all VLANs. (Configure any port on which you do not want ARP inspection to occur as a trusted DHCP server port.)
MAC Movement	Specifies the number of times per second that a MAC address can move to a new interface.	Enter a number. The default is unlimited.
MAC Movement Action	Specifies the action to be taken if the MAC move limit is exceeded.	Select one: • **Log**—Generate a system log entry, an SNMP trap, or an alarm. • **Drop**—Drop the packets and generate a system log entry, an SNMP trap, or an alarm (default). • **Shutdown**—Shut down the VLAN and generate an alarm. You can mitigate the effect of this option by configuring autorecovery from the disabled state and specifying a **disable timeout** value. See "Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)" on page 1500. • **None**—No action to be taken.

Table 186: Port Security on Interfaces

Field	Function	Your Action
Trust DHCP	Specifies trusting DHCP packets on the selected interface. By default, trunk ports are **dhcp-trusted**.	Select to enable DHCP trust.
MAC Limit	Specifies the number of MAC addresses that can be learned on a single Layer 2 access port. This option is not valid for trunk ports.	Enter a number.
MAC Limit Action	Specifies the action to be taken if the MAC limit is exceeded. This option is not valid for trunk ports.	Select one: • **Log**—Generate a system log entry, an SNMP trap, or an alarm. • **Drop**—Drop the packets and generate a system log entry, an SNMP trap, or an alarm. (Default) • **Shutdown**—Shut down the interface and generate an alarm. You can mitigate the effect of this option by configuring autorecovery from the disabled state and specifying a **disable timeout** value. See "Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)." on page 1500 • **None**—No action to be taken.
Allowed MAC List	Specifies the MAC addresses that are allowed for the interface.	To add a MAC address: 1. Click **Add**. 2. Enter the MAC address. 3. Click **OK**.

- Port Security for J-EX Series Switches Overview on page 1533

Enabling DHCP Snooping (CLI Procedure)

DHCP snooping allows the switch to monitor and control DHCP messages received from untrusted devices connected to the J-EX Series switch. It builds and maintains a database of valid IP-address/MAC-address (IP-MAC) bindings called the DHCP snooping database.

You configure DHCP snooping for each VLAN, not for each interface (port). By default, DHCP snooping is disabled for all VLANs.

To enable DHCP snooping on a VLAN or all VLANs by using the CLI:

- On a specific VLAN (here, the VLAN is **default**):

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan default examine-dhcp
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan all examine-dhcp
```

TIP: By default, the IP-MAC bindings are lost when the switch is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the **dhcp-snooping-file** statement to store the database file either locally or remotely.

TIP: For private VLANs (PVLANs), enable DHCP snooping on the primary VLAN. If you enable DHCP snooping only on a community VLAN, DHCP messages coming from PVLAN trunk ports are not snooped.

Enabling DHCP Snooping (J-Web Procedure)

DHCP snooping allows the J-EX Series switch to monitor and control DHCP messages received from untrusted devices connected to the switch. It builds and maintains a database of valid IP-address/MAC-address (IP-MAC) bindings called the DHCP snooping database.

You configure DHCP snooping for each VLAN, not for each interface (port). By default, DHCP snooping is disabled for all VLANs.

To enable DHCP snooping on one or more VLANs by using the J-Web interface:

1. Select **Configure>Security>Port Security**.
2. Select one or more VLANs from the VLAN list.
3. Click the **Edit** button. If a message appears asking if you want to enable port security, click **Yes**.
4. Select the **Enable DHCP Snooping on VLAN** check box and then click **OK**.
5. Click **OK** after the command has been successfully delivered.

NOTE: You can enable or disable port security on the switch at any time by clicking the **Activate** or **Deactivate** button on the Port Security Configuration page. If security status is shown as **Disabled** when you try to edit settings for any VLANs or interfaces (ports), the message asking if you want to enable port security appears.

Enabling a Trusted DHCP Server (CLI Procedure)

You can configure any interface on the J-EX Series switch that connects to a DHCP server as a trusted interface (port). Configuring a DHCP server on a trusted interface protects against rogue DHCP servers sending leases.

You configure a trusted DHCP server on an interface, not on a VLAN. By default, all access interfaces are untrusted and all trunk interfaces are trusted.

To configure a trusted interface for a DHCP server by using the CLI (here, the interface is **ge-0/0/8**):

```
[edit ethernet-switching-options secure-access port]
user@switch# set interface ge–0/0/8 dhcp-trusted
```

Enabling a Trusted DHCP Server (J-Web Procedure)

You can configure any interface on the J-EX Series switch that connects to a DHCP server as a trusted interface (port). Configuring a DHCP server on a trusted interface protects against rogue DHCP servers sending leases.

You configure a trusted DHCP server on an interface, not on a VLAN. By default, all access interfaces are untrusted and all trunk interfaces are trusted.

To enable a trusted DHCP server on one or more interfaces by using the J-Web interface:

1. Select **Configure>Security>Port Security**.
2. Select one or more interfaces from the Port list.
3. Click the **Edit** button. If a message appears asking if you want to enable port security, click **Yes**.
4. Select the **Trust DHCP** check box and then click **OK**.
5. Click **OK** after the command has been successfully delivered.

NOTE: You can enable or disable port security on the switch at any time by clicking the **Activate** or **Deactivate** button on the Port Security Configuration page. If security status is shown as **Disabled** when you try to edit settings for any VLANs or interfaces (ports), the message asking if you want to enable port security appears.

Enabling Dynamic ARP Inspection (CLI Procedure)

Dynamic ARP inspection (DAI) protects J-EX Series switches against ARP spoofing. DAI inspects ARP packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP cache poisoning.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

To enable dynamic ARP inspection (DAI) on a VLAN or all VLANs using the CLI:

- On a single VLAN (here, the VLAN is **employee-vlan**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan arp-inspection
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all arp-inspection
```

Configuring MAC Limiting (CLI Procedure)

MAC limiting restricts the MAC addresses that can be learned and added to the MAC address forwarding table. You can impose a limit on either a single Layer 2 access interface, on all the Layer 2 access interfaces on the switch, or on a specific VLAN. There are two ways you can limit the MAC addresses added to the MAC address forwarding table:

- Limit the number of MAC addresses added to the table—Configure the maximum number of dynamic MAC addresses that can be added to the MAC address forwarding table. This limit can be set either for the entire switch, for one interface, or for one VLAN. When this limit is exceeded, incoming packets with new MAC addresses are either dropped, logged, ignored, or the interface is shut down. Note that only learned MAC addresses, not static MAC addresses, count toward the limit you specify for dynamic MAC addresses.
- Allow only named MAC addresses to be added to the table—Configure specific "allowed" MAC addresses for an access interface. Any MAC address that is not in the list of configured addresses is not learned and the switch logs a corresponding message. Using this allowed MAC option binds MAC addresses to a VLAN so that the address is not registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

NOTE: If you do not want the switch to log messages received for invalid MAC addresses, disable that logging using the command **no-allowed-mac-log** .

When the configured limit of MAC addresses is exceeded, any one of the following actions can be performed :

- **drop**—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.
- **log**—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interface or VLAN and generate an alarm. If you have configured the switch with the **port-error-disable** statement, the disabled interface (or VLAN) recovers automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces or VLAN using the command **clear ethernet-switching port-error** .

To configure MAC limiting, using the CLI:

1. Limit the number of dynamic MAC addresses to**5**.

Because no action is specified, the switch performs the default action **drop** if the limit is exceeded:

- Limit a single interface (here, the interface is **ge-0/0/1**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge–0/0/1 mac-limit 5
```

- Limit all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all mac–limit 5
```

- Limit a specific VLAN:

```
[edit vlans]
user@switch# set vlan-abc mac–limit 20
```

NOTE: Do not set the mac-limit to 1. The first learned MAC address is often inserted into the forwarding database automatically (for instance, for Routed VLAN Interfaces the first MAC address inserted into the forwarding database is the MAC address of the RVI. For Aggregated Ethernet bundles using LACP, the first MAC address inserted into the forwarding database in the forwarding table is the source address of the protocol packet). The switch will therefore not learn MAC addresses other than the automatic addresses when the mac-limit is set to 1, and this will cause problems with MAC learning and forwarding.

NOTE: You must clear existing entries in the MAC address forwarding table that correspond to the change you make with the command mac-limit. For example, if you change the limit on an interface, clear the MAC address forwarding table entries for that interface. If you change the limit on all interfaces and VLANs, clear all MAC address forwarding table entries. If you change the limit on a VLAN, clear the MAC address forwarding table entries for that VLAN. This action is performed in the next step.

2. Clear the current MAC address forwarding table entries for the MAC limited entity, either the interface, all entries, or a VLAN :

   - Clear MAC address entries from a specific interface (here, the interface is **ge-0/0/1**) in the forwarding table:

```
user@switch# clear ethernet-switching-table interface ge-0/0/1
```

   - Clear all MAC address entries in the forwarding table:

```
user@switch# clear ethernet-switching-table
```

- Clear MAC address entries from a specific VLAN (here, the VLAN is **vlan-abc**) in the forwarding table:

```
user@switch1# clear ethernet-switching-table vlan vlan-abc
```

3. Specify specific allowed MAC addresses:

   - On a single interface (here, the interface is **ge-0/0/2**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge–0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface ge–0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface ge–0/0/2 allowed-mac 00:05:85:3A:82:83
```

   - On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all allowed-mac 00:05:85:3A:82:80
user@switch# set interface all allowed-mac 00:05:85:3A:82:81
user@switch# set interface all allowed-mac 00:05:85:3A:82:83
```

Configuring MAC Limiting (J-Web Procedure)

MAC limiting protects against flooding of the Ethernet switching table on a J-EX Series switch. MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

Junos OS provides two MAC limiting methods:

- Maximum number of dynamic MAC addresses allowed per interface—If the limit is exceeded, incoming packets with new MAC addresses are dropped.
- Specific "allowed" MAC addresses for the access interface—Any MAC address that is not in the list of configured addresses is not learned.

You configure MAC limiting for each interface, not for each VLAN. You can specify the maximum number of dynamic MAC addresses that can be learned on a single Layer 2 access interface or on all Layer 2 access interfaces. The default action that the switch will take if that maximum number is exceeded is **drop**—drop the packet and generate an alarm, an SNMP trap, or a system log entry.

To enable MAC limiting on one or more interfaces using the J-Web interface:

1. Select **Configure>Security>Port Security**.
2. Select one or more interfaces from the **Interface List**.
3. Click the **Edit** button. If a message appears asking whether you want to enable port security, click **Yes**.
4. To set a dynamic MAC limit:
    1. Type a limit value in the **MAC Limit** box.
    2. Select an action from the **MAC Limit Action** box (optional). The switch takes this action when the MAC limit is exceeded. If you do not select an action, the switch applies the default action, **drop**.
        - Log—Generate a system log entry, an SNMP trap, or an alarm.
        - Drop—Drop the packets and generate a system log entry, an SNMP trap, or an alarm. (Default)
        - Shutdown—Shut down the VLAN and generate an alarm. You can mitigate the effect of this option by configuring the switch for autorecovery from the disabled state and specifying a **disable timeout** value. See "Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)" on page 1500. If you have not configured autorecovery from the disabled state, you can bring up the interfaces by running the **clear ethernet-switching port-error** command.
        - None— No action to be taken.
5. To add allowed MAC addresses:

1. Click **Add**.
2. Type the allowed MAC address and click **OK**.

   Repeat this step to add more allowed MAC addresses.

6. Click **OK** when you have finished setting MAC limits.
7. Click **OK** after the configuration has been successfully delivered.

NOTE: You can enable or disable port security on the switch at any time by clicking the **Activate** or **Deactivate** button on the Port Security Configuration page. If security status is shown as **Disabled** when you try to edit settings for any VLANs or interfaces (ports), a message asking whether you want to enable port security appears.

Related Documentation

- Understanding MAC Limiting and MAC Move Limiting for Port Security on J-EX Series Switches on page 1545

Configuring MAC Move Limiting (CLI Procedure)

When MAC move is configured, MAC address movements are tracked by the switch and, if a MAC address changes more than the configured number of times within one second, the changes to MAC addresses are either dropped, logged, ignored, or the interface is shut down.

NOTE: Although you enable this feature on VLANs, the MAC move limitation pertains to the number of movements for each individual MAC address rather than the total number of MAC address moves in the VLAN. For example, If the MAC move limit is set to 1, the switch allows an unlimited number of MAC address movements within the VLAN as long as the same MAC address does not change more than once.

You configure MAC move limiting per VLAN, not per interface (port). In the default configuration, the number of MAC moves permitted is unlimited.

You can choose to have one of the following actions performed when the MAC move limit is exceeded:

- **drop**—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.
- **log**—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interfaces in the VLAN and generate an alarm. If you have configured the switch with the **port-error-disable** statement, the disabled interfaces recover automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

To configure a MAC move limit for MAC addresses within a specific VLAN or for MAC addresses within all VLANs, using the CLI:

- On a single VLAN: To limit the number of MAC address movements that can be made by an individual MAC address within the VLAN **employee-vlan**, set a MAC move limit of **5**:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan employee–vlan mac-move-limit 5
  ```

  The action is not specified, so the switch performs the default action **drop** if it tracks that an individual MAC address within the **employee-vlan** has moved more than 5 times within one second.

- On all VLANs: To limit the number of MAC movements that can be made by individual MAC addresses within all VLANs, set a MAC move limit of **5**:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan all mac–move-limit 5
  ```

  The action is not specified, so the switch performs the default action **drop** if it tracks that an individual MAC address within any of the VLANs has moved more than 5 times within one second.

Related Documentation

Configuring MAC Move Limiting (J-Web Procedure)

MAC move limiting detects MAC address movement and MAC address spoofing on access ports. MAC address movements are tracked, and if a MAC address moves more than the configured number of times within one second, the configured (or default) action is performed. You enable this feature on VLANs.

NOTE: Although you enable this feature on VLANs, the MAC move limitation pertains to the number of movements for each individual MAC address rather than the total number of MAC address moves in the VLAN. For example, If the MAC move limit is set to 1, the switch allows an unlimited number of MAC address movements within the VLAN as long as the same MAC address does not move more than once.

In the default configuration, the MAC move limit within each VLAN is unlimited; the default action that the switch will take if the specified MAC move limit is exceeded is **drop**.

To enable MAC move limiting for MAC addresses within one or more VLANs by using the J-Web interface:

1. Select **Configure>Security>Port Security**.
2. Select one or more VLANs from the **VLAN List**.
3. Click the **Edit** button. If a message appears asking whether you want to enable port security, click **Yes**.
4. To set a MAC move limit:
    1. Type a limit value in the **MAC Movement** box.
    2. Select an action from the **MAC Movement Action** box (optional). The switch takes this action when an individual MAC address exceeds the MAC move limit. If you do not select an action, the switch applies the default action, **drop**.

       Select one:

       - Log—Generate a system log entry, an SNMP trap, or an alarm.
       - Drop—Drop the packets and generate a system log entry, an SNMP trap, or an alarm. (Default)
       - Shutdown—Shut down the VLAN and generate an alarm. You can mitigate the effect of this option by configuring the switch for autorecovery from the disabled state and specifying a **disable timeout** value. See “Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)” on page 1500. If you have not configured autorecovery from the disabled state, you can bring up the interfaces by running the **clear ethernet-switching port-error** command.
       - None— No action to be taken.

3. Click **OK**.

5. Click **OK** after the configuration has been successfully delivered.

NOTE: You can enable or disable port security on the switch at any time by clicking the **Activate** or **Deactivate** button on the Port Security Configuration page. If security status is shown as **Disabled** when you try to edit settings for any VLANs, a message asking whether you want to enable port security appears.

Setting the none Action on an Interface to Override a MAC Limit Applied to All Interfaces (CLI Procedure)

If you set a MAC limit in your port security settings to apply to all interfaces on the J-EX Series switch, you can override that setting for a particular interface by specifying action **none**.

To use the **none** action to override a MAC limit setting:

1. Set the MAC limit—for example, a limit of **5** with action **drop**:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all mac-limit 5 action drop
```

2. Then change the action for one interface (here, **ge-0/0/2**) with this command. You don't need to specify a limit value.

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge–0/0/2 mac-limit action none
```

Related Documentation

- Verifying That MAC Limiting Is Working Correctly on page 1643

Configuring IP Source Guard (CLI Procedure)

You can use the IP source guard access port security feature on J-EX Series switches to mitigate the effects of source IP address spoofing and source MAC address spoofing. If IP source guard determines that a host connected to an access interface has sent a packet with an invalid source IP address or source MAC address in the packet header, it ensures that the switch does not forward the packet—that is, the packet is discarded.

You enable the IP source guard feature on VLANs. You can enable it on a specific VLAN, on all VLANs, or on a VLAN range.

NOTE: IP source guard applies only to access interfaces and only to untrusted interfaces. If you enable IP source guard on a VLAN that includes trunk interfaces or an interface set to **dhcp-trusted**, the CLI shows an error when you try to commit the configuration.

NOTE: You can use IP source guard together with 802.1X user authentication in single supplicant, single-secure supplicant or multiple supplicant mode.

If you are implementing 801.X user authentication in single-secure supplicant or multiple supplicant mode, use the following configuration guidelines:

- If the 802.1X interface is part of an untagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has untagged membership.
- If the 802.1X interface is part of a tagged MAC-based VLAN and you want to enable IP source guard and DHCP snooping on that VLAN, you must enable IP source guard and DHCP snooping on all dynamic VLANs in which the interface has tagged membership.

Before you configure IP source guard, be sure that you have:

Enabled DHCP snooping on the VLAN or VLANs on which you will configure IP source guard. See “Enabling DHCP Snooping (CLI Procedure)” on page 1614.

To enable IP source guard on a VLAN, all VLANs, or a VLAN range (a series of tagged VLANs) by using the CLI:

NOTE: Replace values displayed in italics with values for your configuration.

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access port]
user@switch#set vlan default ip-source-guard
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan all ip-source-guard
```

- On a VLAN range:

  1. Set the VLAN range (the VLAN name is **employee**):

```
[edit vlans]
user@switch# set employeevlan-range 100-101
```

  2. Associate an interface with a VLAN-range number (**100** in the following example) and set the port mode to **access**:

```
[edit interfaces]
user@switch# set ge-0/0/6 unit 0 family ethernet-switching port-mode access vlan
members100
```

  3. Enable IP source guard on the VLAN **employee**:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan employee ip-source-guard
```

NOTE: You can use the **no-ip-source-guard** statement to disable IP source guard for a specific VLAN after you have enabled the feature for all VLANs.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.

Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure)

You can add static (fixed) IP addresses and bind them to fixed MAC addresses in the DHCP snooping database. These bindings are labeled as “static” in the database, while those bindings that have been added through the process of DHCP snooping are labeled “dynamic.”

To configure a static IP address/MAC address binding in the DHCP snooping database (replace **ge-0/0/2**, **10.0.10.12**, **data-vlan**, and **00:05:85:3A:82:80** with values for your configuration):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 static-ip 10.0.10.12 vlan data-vlan mac 00:05:85:3A:82:80
```

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.

Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure)

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the J-EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

You can configure the DHCP option 82 feature in two topologies:

- The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as routed VLAN interfaces, or RVIs. The switch relays the clients' requests to the server and then forwards the server's replies to the clients. This topic describes this configuration.
- The switch, DHCP clients, and DHCP server are all on the same VLAN. The switch forwards the clients' requests to the server and forwards the server's replies to the clients. This configuration is described in “Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)” on page 1635.

Before you configure DHCP option 82 on the switch, perform these tasks:

- Connect and configure the DHCP server.

  NOTE: Your DHCP server must be configured to accept DHCP option 82. If the server is not configured for DHCP option 82, the server does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configure the VLAN on the switch and associate the interfaces on which the clients connect to the switch with that VLAN.
- Configure the routed VLAN interface (RVI) to allow the switch to relay packets to the server and receive packets from the server. See “Configuring Routed VLAN Interfaces (CLI Procedure)” on page 113.
- Configure the switch as a BOOTP relay agent. See DHCP/BOOTP Relay for J-EX Series Switches Overview.

To configure DHCP option 82:

NOTE: Replace values displayed in italics with values for your configuration.

1. Specify DHCP option 82 for the BOOTP server:

   - On all interfaces that connect to the server:

     ```
     [edit forwarding-options helpers bootp]
     user@switch# set dhcp-option82
     ```

   - On a specific interface that connects to the server:

     ```
     [edit forwarding-options helpers bootp]
     user@switch# set interface ge-0/0/10 dhcp-option82
     ```

     The remaining steps are optional. They show configurations for all interfaces; include the specific interface designation to configure any of the following options on a specific interface:

2. To configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 circuit-id prefix hostname
   ```

3. To specify that the circuit ID suboption value contains the interface description rather than the interface name (the default):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 circuit-id use-interface-description
   ```

4. To specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 circuit-id use-vlan-id
   ```

5. To specify that the remote ID suboption is included in the DHCP option 82 information:

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id
   ```

6. To configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id prefix mac
   ```

7. To specify that the prefix for the remote ID suboption is the hostname of the switch rather than the MAC address of the switch (the default):

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id prefix hostname
   ```

8. To specify that the remote ID suboption value contains the interface description:

   ```
   [edit forwarding-options helpers bootp]
   user@switch# set dhcp-option82 remote-id use-interface-description
   ```

9. To specify that the remote ID suboption value contains a character string:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id use-string mystring
```

10. To configure a vendor ID suboption and use the default value (the default value is **Juniper**), do not type a character string after the **vendor-id** option keyword:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 vendor-id
```

11. To specify that the vendor ID suboption value contains a character string value that you specify rather than **Juniper** (the default):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 vendor-id mystring
```

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.

- RFC 3046, *DHCP Relay Agent Information Option*, at http://tools.ietf.org/html/rfc3046.

Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the J-EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

You can configure the DHCP option 82 feature in two topologies:

- The switch, DHCP clients, and DHCP server are all on the same VLAN. The switch forwards the clients' requests to the server and forwards the server's replies to the clients. This topic describes this configuration.
- The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as routed VLAN interfaces, or RVIs. The switch relays the clients' requests to the server and then forwards the server's replies to the clients. This configuration is described in “Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure)” on page 1632.

Before you configure DHCP option 82 on the switch, perform these tasks:

- Connect and configure the DHCP server.

  

  NOTE: Your DHCP server must be configured to accept DHCP option 82. If the server is not configured for DHCP option 82, the server does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configure a VLAN on the switch and associate the interfaces on which the clients and the server connect to the switch with that VLAN.

To configure DHCP option 82:

NOTE: Replace values displayed in italics with values for your configuration.

1. Specify DHCP option 82 for all VLANs associated with the switch or for a specified VLAN. (You can also configure the feature for a VLAN range.)

   - On a specific VLAN:

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set vlan employee dhcp-option82
     ```

   - On all VLANs:

     ```
     [edit ethernet-switching-options secure-access-port]
     user@switch# set vlan all dhcp-option82
     ```

   The remaining steps are optional.

2. To configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 circuit-id prefix hostname
   ```

3. To specify that the circuit ID suboption value contains the interface description rather than the interface name (the default):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 circuit-id use-interface-description
   ```

4. To specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 circuit-id use-vlan-id
   ```

5. To specify that the remote ID suboption is included in the DHCP option 82 information:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 remote-id
   ```

6. To configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 remote-id prefix mac
   ```

7. To specify that the prefix for the remote ID suboption is the hostname of the switch rather than the MAC address of the switch (the default):

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 remote-id prefix hostname
   ```

8. To specify that the remote ID suboption value contains the interface description:

   ```
   [edit ethernet-switching-options secure-access-port]
   user@switch# set vlan employee dhcp-option82 remote-id use-interface-description
   ```

9. To specify that the remote ID suboption value contains a character string:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id use-string mystring
```

10. To configure a vendor ID suboption and use the default value (the default value is **Juniper**), do not type a character string after the **vendor-id** option keyword:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 vendor-id
```

11. To specify that the vendor ID suboption value contains a character string value that you specify rather than **Juniper** (the default):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 vendor-id mystring
```

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.

Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

An Ethernet switching access interface on a J-EX Series switch might shut down or be disabled as a result of one of the following port-security or storm-control configurations:

- MAC limiting—**mac-limit** statement is configured with action **shutdown**.
- MAC move limiting—**mac-move-limit** statement is configured with action **shutdown**.
- Storm control—**storm-control** statement is configured with the action **shutdown**.

You can configure the switch to automatically restore the disabled interfaces to service after a specified period of time. Autorecovery applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: You must specify the disable timeout value for the interfaces to recover automatically. There is no default disable timeout. If you do not specify a timeout value, you need to use the clear ethernet-switching port-error command to clear the errors and restore the interfaces or the specified interface to service.

To configure autorecovery from the disabled state due to MAC limiting, MAC move limiting, or storm control shutdown actions:

```
[edit ethernet-switching-options]
user@switch# set port-error-disable disable-timeout 60
```

CHAPTER 40

Verifying Port Security

Monitoring Port Security

Purpose Use the monitoring functionality to view these port security details:

- DHCP snooping database for a VLAN or all VLANs
- ARP inspection details for all interfaces

Action To monitor port security in the J-Web interface, select **Monitor** > **Security** > **Port Security**.

To monitor and manipulate the DHCP snooping database and ARP inspection statistics in the CLI, enter the following commands:

- **show dhcp snooping binding**
- **clear dhcp snooping binding**—In addition to clearing the whole database, you can clear database entries for specified VLANs or MAC addresses.
- **show arp inspection statistics**
- **clear arp inspection statistics**

Meaning The J-Web Port Security Monitoring page comprises two sections:

- DHCP Snooping—Displays the DHCP snooping database for all the VLANs for which DHCP snooping is enabled. To view the DHCP snooping database for a specific VLAN, select the specific VLAN from the list.

- ARP Inspection—Displays the ARP inspection details for all interfaces. The information includes details of the number of packets that passed ARP inspection and the number of packets that failed the inspection. The pie chart graphically represents these statistics when you select an interface. To view ARP inspection statistics for a specific interface, select the interface from the list.

You have the following options on the page:

- Clear ALL—Clears the DHCP snooping database, either for all VLANs if the option **ALL** has been selected in the Select VLANs list or for the specific VLAN that has been selected in that list.
- Clear—Deletes a specific IP address from the DHCP snooping database.

To clear ARP statistics on the page, click **Clear All** in the ARP Statistics section.

Use the CLI commands to show and clear DHCP snooping database and ARP inspection statistics details.

Verifying That DHCP Snooping Is Working Correctly

Purpose Verify that DHCP snooping is working on the switch and that the DHCP snooping database is correctly populated with both dynamic and static bindings.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch>  show dhcp snooping binding
DHCP Snooping Information:
MAC address        IP address  Lease (seconds) Type     VLAN      Interface

00:05:85:3A:82:77  192.0.2.17  600             dynamic  employee  ge-0/0/1.0
00:05:85:3A:82:79  192.0.2.18  653             dynamic  employee  ge-0/0/1.0
00:05:85:3A:82:80  192.0.2.19  720             dynamic  employee  ge-0/0/2.0
00:05:85:3A:82:81  192.0.2.20  932             dynamic  employee  ge-0/0/2.0
00:05:85:3A:82:83  192.0.2.21  1230            dynamic  employee  ge-0/0/2.0
00:05:85:27:32:88  192.0.2.22  –               static   data      ge-0/0/4.0
```

Meaning When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned

IP address and lease time—that is, the time, in seconds, remaining before the lease expires. Static IP addresses have no assigned lease time. The statically configured entry never expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database and nothing would be shown in the output of the **show dhcp snooping binding** command.

Verifying That a Trusted DHCP Server Is Working Correctly

Purpose Verify that a DHCP trusted server is working on the switch. See what happens when the DHCP server is trusted and then untrusted.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
DHCP Snooping Information:
MAC Address         IP Address    Lease    Type     VLAN          Interface
-----------------   ----------    -----    ----     ----          ---------
00:05:85:3A:82:77    192.0.2.17    600    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:79    192.0.2.18    653    dynamic  employee-vlan   ge-0/0/1.0
00:05:85:3A:82:80    192.0.2.19    720    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:81    192.0.2.20    932    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:3A:82:83    192.0.2.21   1230    dynamic  employee-vlan   ge-0/0/2.0
00:05:85:27:32:88    192.0.2.22   3200    dynamic  employee-vlan   ge-0/0/2.0
```

Meaning When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned

IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database and nothing would be shown in the output of the **show dhcp snooping binding** command.

- Troubleshooting Port Security on page 1651

Verifying That DAI Is Working Correctly

Purpose Verify that dynamic ARP inspection (DAI) is working on the switch.

Action Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show arp inspection statistics
ARP inspection statistics:
Interface        Packets received  ARP inspection pass   ARP inspection failed
---------------  ---------------   -------------------- ---------------------
ge-0/0/1.0                     7                     5                     2
ge-0/0/2.0                    10                    10                     0
ge-0/0/3.0                    12                    12                     0
```

Meaning The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

Verifying That MAC Limiting Is Working Correctly

MAC limiting protects against flooding of the Ethernet switching table. MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

Junos OS provides two MAC limiting methods:

- Maximum number of dynamic MAC addresses allowed per interface—When the limit is exceeded, incoming packets with new MAC addresses are dropped.
- Specific "allowed" MAC addresses for the access interface—Any MAC address that is not in the list of configured addresses is not learned.

To verify MAC limiting configurations:

1. Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly on page 1643
2. Verifying That Allowed MAC Addresses Are Working Correctly on page 1644
3. Verifying Results of Various Action Settings When the MAC Limit Is Exceeded on page 1644
4. Customizing the Ethernet Switching Table Display to View Information for a Specific Interface on page 1646

Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly

Purpose Verify that MAC limiting for dynamic MAC addresses is working on the switch.

Action Display the MAC addresses that have been learned. The following sample output shows the results when two packets were sent from hosts on **ge-0/0/1** and five packets requests were sent from hosts on **ge-0/0/2**, with both interfaces set to a MAC limit of **4** with the action **drop**:

```
user@switch>  show ethernet-switching table
Ethernet-switching table:  7 entries, 6 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       *                   Flood          -    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:85   Learn          0    ge-0/0/2.0
```

Meaning The sample output shows that with a MAC limit of **4** for each interface, the packet for a fifth MAC address on **ge-0/0/2** was dropped because it exceeded the MAC limit. The address was not learned, and thus an asterisk (*) rather than an address appears in the **MAC address** column in the first line of the sample output.

Verifying That Allowed MAC Addresses Are Working Correctly

Purpose Verify that allowed MAC addresses are working on the switch.

Action Display the MAC cache information after allowed MAC addresses have been configured on an interface. The following sample shows the MAC cache after 5 allowed MAC addresses had been configured on interface **ge/0/0/2**. In this instance, the interface was also set to a dynamic MAC limit of **4** with action **drop**.

```
user@switch>  show ethernet-switching table
Ethernet-switching table:  5 entries, 4 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:85   Learn          0    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
```

Meaning Because the MAC limit value for this interface had been set to **4**, only four of the five configured allowed addresses were learned and thus added to the MAC cache. Because the fifth address was not learned, an asterisk (*) rather than an address appears in the **MAC address** column in the last line of the sample output.

Verifying Results of Various Action Settings When the MAC Limit Is Exceeded

Purpose Verify the results provided by the various action settings for MAC limits—**drop**, **log**, **none**, and **shutdown**—when the limits are exceeded.

Action Display the results of the various action settings.

NOTE: You can view log messages by using the **show log messages** command. You can also have the log messages displayed by configuring the monitor start messages with the **monitor start messages** command.

- **drop** action—For MAC limiting configured with a **drop** action and with the MAC limit set to **5**:

```
user@switch>  show ethernet-switching table

Ethernet-switching table: 6 entries, 5 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       *                   Flood          -    ge-0/0/2.0

  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0

  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0

  employee-vlan       00:05:85:3A:82:83   Learn          0    ge-0/0/2.0
```

```
  employee-vlan        00:05:85:3A:82:85   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:88   Learn          0    ge-0/0/2.0
```

- **log** action—For MAC limiting configured with a **log** action and with MAC limit set to **5**:

```
user@switch> show ethernet-switching table

Ethernet-switching table: 74 entries, 73 learned
  VLAN                 MAC address         Type         Age    Interfaces

  employee-vlan        *                   Flood          -    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:80   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:81   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:82   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:83   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:84   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:85   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:87   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:88   Learn          0    ge-0/0/2.0

  . . .
```

- **shutdown** action—For MAC limiting configured with a **shutdown** action and with MAC limit set to **3**:

```
user@switch> show ethernet-switching table

Ethernet-switching table: 4 entries, 3 learned
  VLAN                 MAC address         Type         Age    Interfaces

  employee-vlan        *                   Flood          -    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:82   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:84   Learn          0    ge-0/0/2.0

  employee-vlan        00:05:85:3A:82:87   Learn          0    ge-0/0/2.0
```

- **none** action—If you set a MAC limit to apply to all interfaces on the switch, you can override that setting for a particular interface by specifying this action for that interface. See “Setting the none Action on an Interface to Override a MAC Limit Applied to All Interfaces (CLI Procedure)” on page 1628.

Meaning For the **drop** action results—The sixth MAC address exceeded the MAC limit. The request packet for that address was dropped. Only five MAC addresses have been learned on **ge-0/0/2**.

For the **log** action results—The sixth MAC address exceeded the MAC limit. No MAC addresses were blocked.

For the **shutdown** action results—The fourth MAC address exceeded the MAC limit. Only three MAC addresses have been learned on **ge-0/0/2**. The interface **ge-0/0/1** is shut down.

For more information about interfaces that have been shut down, use the **show ethernet-switching interfaces** command.

```
user@switch> show ethernet-switching interfaces
Interface    State  VLAN members        Tag   Tagging  Blocking

bme0.32770   down   mgmt                     untagged unblocked

ge-1/0/0.0   down   v1                       untagged MAC limit exceeded

ge-1/0/1.0   up     v1                       untagged unblocked

ge-1/0/2.0   up     v1                       untagged unblocked

me0.0        up     mgmt                     untagged unblocked
```

NOTE: You can configure the switch to recover automatically from this type of error condition by specifying the **port-error-disable** statement with a **disable timeout** value. The switch automatically restores the disabled interface to service when the disable timeout expires. The **port-error-disable** configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after **port-error-disable** has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the **clear ethernet-switching port-error** command.

Customizing the Ethernet Switching Table Display to View Information for a Specific Interface

Purpose You can use the **show ethernet-switching table** command to view information for a specific interface.

Action For example, to display the MAC addresses that have been learned on **ge-0/0/2** interface, type:

```
user@switch> show ethernet-switching table interface ge-0/0/2.0
Ethernet-switching table: 1 unicast entries

  VLAN              MAC address       Type         Age Interfaces

  v1                *                 Flood          - All-members

  v1                00:00:06:00:00:00 Learn          0 ge-2/0/0.0
```

Meaning The MAC limit value for **ge-0/0/2** had been set to **1**, and the output shows that only one MAC address was learned and thus added to the MAC cache. An asterisk (*) rather than an address appears in the **MAC address** column in the first line of the sample output.

Verifying That MAC Move Limiting Is Working Correctly

Purpose Verify that MAC move limiting is working on the switch.

Action Display the MAC addresses in the Ethernet switching table when MAC move limiting has been configured for a VLAN. The following sample shows the results after two of the hosts on **ge-0/0/2** sent packets after the MAC addresses for those hosts had moved to other interfaces more than five times in 1 second. The VLAN, **employee-vlan**, was set to a MAC move limit of **5** with the action **drop**:

```
user@switch> show ethernet-switching table

Ethernet-switching table:  7 entries, 4 learned
  VLAN                MAC address         Type         Age    Interfaces

  employee-vlan       00:05:85:3A:82:77   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:79   Learn          0    ge-0/0/1.0
  employee-vlan       00:05:85:3A:82:80   Learn          0    ge-0/0/2.0
  employee-vlan       00:05:85:3A:82:81   Learn          0    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
  employee-vlan       *                   Flood          -    ge-0/0/2.0
```

Meaning The last two lines of the sample output show that MAC addresses for two hosts on **ge-0/0/2** were not learned, because the hosts had been moved back and forth from the original interfaces more than five times in 1 second.

NOTE: For descriptions of the results of the various action settings—**drop**, **log**, **none**, and **shutdown**—see “Verifying That MAC Limiting Is Working Correctly” on page 1643.

Related Documentation

- Monitoring Port Security on page 1639

Verifying That IP Source Guard Is Working Correctly

Purpose Verify that IP source guard is enabled and is mitigating the effects of any source IP spoofing attacks on the J-EX Series switch.

Action Display the IP source guard database.

```
user@switch> show ip-source-guard
IP source guard information:
Interface    Tag  IP Address   MAC Address        VLAN

ge-0/0/12.0  0    10.10.10.7   00:30:48:92:A5:9D  vlan100

ge-0/0/13.0  0    10.10.10.9   00:30:48:8D:01:3D  vlan100

ge–0/0/13.0  100  *            *                  voice
```

Meaning The IP source guard database table contains the VLANs enabled for IP source guard, the untrusted access interfaces on those VLANs, the VLAN 802.1Q tag IDs if there are any, and the IP addresses and MAC addresses that are bound to one another. If a switch interface is associated with multiple VLANs and some of those VLANs are enabled for IP source guard and others are not, the VLANs that are not enabled for IP source guard have a star (*) in the **IP Address** and **MAC Address** fields. See the entry for the **voice** VLAN in the preceding sample output.

Related Documentation

Verifying That the Port Error Disable Setting Is Working Correctly

Purpose Verify that the port error disable setting is working as expected on MAC limited, MAC move limited and rate-limited interfaces on a J-EX Series switch.

Action Display information about interfaces:

```
user@switch>  show ethernet-switching interfaces
Interface   State    VLAN members          Blocking
ge-0/0/0.0  up       T1122                 unblocked
ge-0/0/1.0  down     default               MAC limit exceeded
ge-0/0/2.0  down     default               MAC move limit exceeded
ge-0/0/3.0  down     default               Storm control in effect
ge-0/0/4.0  down     default               unblocked
```

```
ge-0/0/5.0  down     default              unblocked
ge-0/0/6.0  down     default              unblocked
ge-0/0/7.0  down     default              unblocked
ge-0/0/8.0  down     default              unblocked
ge-0/0/9.0  up       T111                 unblocked
ge-0/0/10.0 down     default              unblocked
ge-0/0/11.0 down     default              unblocked
ge-0/0/12.0 down     default              unblocked
ge-0/0/13.0 down     default              unblocked
ge-0/0/14.0 down     default              unblocked
ge-0/0/15.0 down     default              unblocked
ge-0/0/16.0 down     default              unblocked
ge-0/0/17.0 down     default              unblocked
ge-0/0/18.0 down     default              unblocked
ge-0/0/19.0 up       T111                 unblocked
ge-0/1/0.0  down     default              unblocked
ge-0/1/1.0  down     default              unblocked
ge-0/1/2.0  down     default              unblocked
ge-0/1/3.0  down     default              unblocked
```

Meaning The sample output from the **show ethernet-switching interfaces** command shows that three of the down interfaces specify the reason that the interface is disabled:

- **MAC limit exceeded**—The interface is temporarily disabled due to a **mac-limit** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.
- **MAC move limit exceeded**—The interface is temporarily disabled due to a **mac-move-limit** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.
- **Storm control in efffect** —The interface is temporarily disabled due to a **storm-control** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.

CHAPTER 41

Troubleshooting Port Security

Troubleshooting Port Security

Troubleshooting issues for port security on J-EX Series switches:

MAC Addresses That Exceed the MAC Limit or MAC Move Limit Are Not Listed in the Ethernet Switching Table

Problem You see log messages telling you that the MAC limit or MAC move limit has been exceeded, but the specific offending MAC addresses that have been exceeding the limit are not listed in the Ethernet switching table.

Solution

1. Set the MAC limit or MAC move limit action to **log**.

```
[edit ethernet-switching-options secure-access port]
user@switch# set interface ge-0/0/2 mac-limit 5 action log
```

2. Allow some MAC address requests to come in.
3. View the entries in the Ethernet switching table:

```
user@switch> show ethernet-switching table
```

Multiple DHCP Server Packets Have Been Received on Untrusted Interfaces

Problem You see log messages that DHCP server packets were received on an untrusted interface—for example:

```
5 untrusted DHCPOFFER received, interface ge-0/0/0.0[65], vlan v1[10] server
ip/mac 12.12.12.1/00:00:00:00:01:12 offer ip/client mac
12.12.12.253/00:AA:BB:CC:DD:01
```

These messages can signal the presence of a malicious DHCP server on the network.

Solution Configure a firewall filter to block the IP address or MAC address of the malicious DHCP server. See “Configuring Firewall Filters (CLI Procedure)” on page 1771.

allowed-mac

Syntax

```
allowed-mac {
  mac-address-list;
}
```

Hierarchy Level [edit **ethernet-switching-options secure-access-port interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify particular MAC addresses to be added to the MAC address cache.

NOTE: Although this configuration restricts the addresses that can be added to the MAC address cache, it does not block the switch from receiving Layer 2 control packets—such as Link Layer Discovery Protocol (LLDP) packets—transmitted from MAC addresses that are not specified in the list of allowed MAC addresses. Control packets do not undergo the MAC address check and they are therefore included in the statistics of packets received. However, they are not forwarded to another destination. They are trapped within the switch.

Default Allowed MAC addresses take precedence over dynamic MAC values that have been applied with the **mac-limit** statement.

Options *mac-address-list*—One or more MAC addresses configured as allowed MAC addresses for a specified interface or all interfaces.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

- **mac-limit on page 1670**
- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555

- Configuring MAC Limiting (CLI Procedure) on page 1620
- Configuring MAC Limiting (J-Web Procedure) on page 1623

arp-inspection

Syntax (arp-inspection | no-arp-inspection);

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Perform dynamic ARP inspection (DAI) on all VLANs or on the specified VLAN.

- **arp-inspection**—Enable DAI.

  When ARP inspection is enabled, the switch logs invalid ARP packets that it receives on each interface, along with the sender's IP and MAC addresses.

- **no-arp-inspection**—Disable DAI.

Default Disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

circuit-id

Syntax

```
circuit-id {
  prefix hostname;
  use-interface-description;
  use-vlan-id;
}
```

Hierarchy Level

[edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82**]
[edit **forwarding-options helpers bootp dhcp-option82**]
[edit **forwarding-options helpers bootp interface** *interface-name* **dhcp-option82**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the **circuit-id** suboption (suboption 1) of DHCP option 82 (the DHCP relay agent information option) in DHCP packets destined for a DHCP server. This suboption identifies the circuit (interface and/or VLAN) on which the DHCP request arrived.

The format of the **circuit-id** information for Gigabit Ethernet interfaces that use VLANs is ***interface-name*:*vlan-name*** . On a Layer 3 interface, the format is just ***interface-name*.**

The remaining statements are explained separately.

Default

If DCHP option 82 is enabled on the switch, the circuit ID is supplied by default in the format ***interface-name*:*vlan-name*** or, on a Layer 3 interface, just ***interface-name*** .

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

dhcp-option82

Syntax

```
dhcp-option82 {
  circuit-id {
    prefix hostname;
    use-interface-description;
    use-vlan-id;
  }
  remote-id {
    prefix hostname | mac | none;
    use-interface-description;
    use-string string;
  }
  vendor-id <string>;
}
```

Hierarchy Level

[edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*)]
[edit **forwarding-options helpers bootp**]
[edit **forwarding-options helpers bootp interface** *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

When the switch receives a DHCP request from a DHCP client connected on one of the switch's interfaces, have the switch insert DHCP option 82 (also known as the DHCP relay agent information option) information in the DHCP request packet header before it forwards or relays the request to a DHCP server. The server uses the option 82 information, which provides details about the circuit and host the request came from, in formulating the reply; the server does not, however, make any changes to the option 82 information in the packet header. The switch receives the reply and then removes the DHCP option 82 information before forwarding the reply to the client.

The remaining statements are explained separately.

Default

Insertion of DHCP option 82 information is not enabled.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

dhcp-snooping-file

Syntax

```
dhcp-snooping-file {
  location local_pathname | remote_URL;
  timeout seconds;
  write-interval seconds;
}
```

Hierarchy Level [edit ethernet-switching-options secure-access-port]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a local pathname or remote URL for the DHCP snooping database file to maintain persistence of IP-MAC bindings.

The remaining statements are explained separately.

Default The IP-MAC bindings in the DHCP snooping database file are not persistent. If the switch is rebooted, the bindings are lost.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding DHCP Snooping for Port Security on J-EX Series Switches on page 1537

dhcp-trusted

Syntax (dhcp-trusted | no-dhcp-trusted);

Hierarchy Level [edit **ethernet-switching-options secure-access-port interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allow DHCP responses from the specified interfaces (ports) or all interfaces.

- **dhcp-trusted**—Allow DHCP responses.
- **no-dhcp-trusted**—Deny DHCP responses.

Default Trusted for trunk ports, untrusted for access ports.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Enabling a Trusted DHCP Server (J-Web Procedure) on page 1616

disable-timeout

Syntax disable-timeout *timeout*;

Hierarchy Level [edit **ethernet-switching-options port-error-disable**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the Ethernet switching interfaces remain in a disabled state due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: If you modify the timeout value of an existing disable timeout, the new timeout value does not impact the timing of restoration to service of currently disabled interfaces that have been configured for automatic recovery. The new timeout value is applied only during the next occurrence of a port error.

You can bring up the currently disabled interfaces by running the **clear ethernet-switching port-error** command.

Default The disable timeout is not enabled.

Options ***timeout***—Time, in seconds, that the disabled state remains in effect. The disabled interface is automatically restored to service when the specified timeout value is reached.

Range: 10 through 3600 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

examine-dhcp

Syntax (examine-dhcp | no-examine-dhcp);

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable DHCP snooping on all VLANs or on the specified VLAN.

- **examine-dhcp**—Enable DHCP snooping.
- **no-examine-dhcp**—Disable DHCP snooping.

When DHCP snooping is enabled, the switch logs DHCP packets (DHCPOFFER, DHCPDECLINE, DHCPACK, and DHCPNAK packets) that it receives on untrusted ports. You can monitor the log for these messages, which can signal the presence of a malicious DHCP server on the network.

TIP: For Private VLANs (PVLANs), enable DHCP snooping on the primary VLAN. If you enable DHCP snooping only on a community VLAN, DHCP messages coming from PVLAN trunk ports are not snooped.

Default Disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

interface

Syntax

```
interface (all | interface-name) {
  allowed-mac {
    mac-address-list;
  }
  (dhcp-trusted | no-dhcp-trusted);
  fcoe-trusted;
  mac-limit limit action action;
  no-allowed-mac-log;
  static-ip ip-address {
    vlan vlan-name;
    mac mac-address;
  }
}
```

Hierarchy Level [edit ethernet-switching-options secure-access-port]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply port security features to all interfaces or to the specified interface.

The statements are explained separately.

Options **all**—Apply port security features to all interfaces.

interface-name —Apply port security features to the specified interface.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

ip-source-guard

Syntax (ip-source-guard | no-ip-source-guard);

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Perform IP source guard checking on packets sent from access interfaces. Validate source IP addresses and source MAC addresses on all VLANs or on the specified VLAN or VLAN range. Forward packets with valid addresses and drop those with invalid addresses.

- **ip-source-guard**—Enable IP source guard checking.
- **no-ip-source-guard**—Disable IP source guard checking.

Default Disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IP Source Guard on a Data VLANThat Shares an Interface with a Voice VLAN on page 1594
- Example: Configuring IP Source Guard with Other J-EX Series Switch Features to Mitigate Address-Spoofing Attacks on Untrusted Access Interfaces on page 1586
- Configuring IP Source Guard (CLI Procedure) on page 1629

mac

Syntax mac *mac-address*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port interface** (all | *interface-name*) **static-ip** *ip-address* **vlan** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Media access control (MAC) address, or hardware address, for the device connected to the specified interface.

Options ***mac-address*** —Value (in hexadecimal format) for address assigned to this device.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) on page 1631

mac-limit

Syntax mac-limit *limit* action *action*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port interface** (all | *interface-name*)], [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of MAC addresses to dynamically add to the MAC address cache for this access interface (port) or VLAN and the action to be taken by the switch if the MAC address learning limit is exceeded on the interface (port) or VLAN. The MAC address learning limit varies depending on the switch model. Use the ? help with this command to determine the learning limit for a switch.

When you reset the number of MAC addresses, the MAC address table is not automatically cleared. Therefore, if you reduce the number of addresses from the default (unlimited) or a previously set limit, you could already have more entries in the table than the new limit allows. Previous entries remain in the table after you reduce the number of addresses, so you should clear the forwarding table for the specified interface, MAC address, or VLAN. Use the command **clear ethernet-switching table** to clear the existing MAC addresses from the table.

Default The default action is **drop**.

Options *limit*—Maximum number of MAC addresses (varies depending on switch model).

action *action*—(Optional) Action to take when the MAC address limit is exceeded:

- **drop**—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.
- **log**—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.
- **none**—No action.
- **shutdown**—Disable the interface or VLAN and generate an alarm. If you have configured the switch with the **port-error-disable** statement, the disabled interface or VLAN recovers automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces or VLAN by running the **clear ethernet-switching port-error** command.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

mac-move-limit

Syntax mac-move-limit *limit* action *action*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of times a MAC address can move to a new interface (port) in 1 second and the action to be taken by the switch if the MAC address move limit is exceeded.

Default The default move limit is unlimited. The default action is **drop**.

Options ***limit***—Maximum number of moves to a new interface per second.

action *action*—(Optional) Action to take when the MAC address move limit is reached:

- **drop**—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.
- **log**—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.
- **none**—No action.
- **shutdown**—Disable the interface and generate an alarm. If you have configured the switch with the **port-error-disable** statement, the disabled interfaces recover automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

no-allowed-mac-log

Syntax no-allowed-mac-log;

Hierarchy Level [edit **ethernet-switching-options secure-access-port interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that the switch does not log messages when it receives packets from invalid MAC addresses on an interface that has been configured for particular (allowed) MAC addresses.

Default The switch logs messages when it receives packets from invalid MAC addresses on an interface that has been configured for particular (allowed) MAC addresses.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

- **allowed-mac on page 1657**

- Configuring MAC Limiting (J-Web Procedure) on page 1623

no-gratuitous-arp-request

Syntax no-gratuitous-arp-request;

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the switch not to respond to gratuitous ARP requests. You can disable responses to gratuitous ARP requests on both Layer 2 Ethernet switching interfaces and routed VLAN interfaces (RVIs).

Default Gratuitous ARP responses are enabled on all Ethernet switching interfaces and RVIs.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Unrestricted Proxy ARP on a J-EX Series Switch on page 104
- Configuring Unrestricted Proxy ARP (CLI Procedure) on page 130

port-error-disable

Syntax

```
port-error-disable {
  disable-timeout timeout ;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, and rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after a specified period of time:

- If you have enabled **mac-limit** with the **shutdown** option and enable **port-error-disable**, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.
- If you have enabled **mac-move-limit** with the **shutdown** option and you enable **port-error-disable**, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.
- If you have enabled **storm-control** with the **action-shutdown** option and you enable **port-error-disable**, the switch disables (rather than shuts down) the interface when broadcast traffic, multicast traffic, and unknown unicast traffic exceeds the specified levels.

NOTE: The port-error-disable configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after port-error-disable has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the clear ethernet-switching port-error command.

Default Not enabled.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

- Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure) on page 1500
- Configuring Port Security (CLI Procedure) on page 1610
- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 1497

prefix

Syntax prefix hostname;

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82 circuit-id**]
[edit forwarding-options helpers bootp **dhcp-option82 circuit-id**]
[edit forwarding-options helpers bootp interface *interface-name* **dhcp-option82 circuit-id**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an optional prefix for the circuit ID suboption in the DHCP option 82 information that is inserted by the switch into the packet header of a DHCP request before it forwards or relays the request to a DHCP server.

Default If **prefix** is not explicitly specified, no prefix is appended to the circuit ID. When **prefix** is specified, it is specified as **prefix hostname** (and the value is the hostname of the switch).

Options **hostname**—Name of the host system (the switch) that is forwarding or relaying the DHCP request from the DHCP client to the DHCP server.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

prefix

Syntax prefix hostname | mac | none;

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82 remote-id**]
[edit forwarding-options helpers bootp **dhcp-option82 remote-id**]
[edit forwarding-options helpers bootp interface *interface-name* **dhcp-option82 remote-id**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an optional prefix for the remote ID suboption in the DHCP option 82 information that is inserted by the switch into the packet header of a DHCP request before it forwards or relays the request to a DHCP server.

Default If **prefix** is not explicitly specified, no prefix is appended to the remote ID.

Options

hostname—Name of the host system (the switch) that is forwarding or relaying the DHCP request from the DHCP client to the DHCP server.

mac—MAC address of the host system (the switch) that is forwarding or relaying the DHCP request from the DHCP client to the DHCP server.

none—No prefix is applied to the remote ID.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

remote-id

Syntax

```
remote-id {
  prefix hostname | mac | none;
  use-interface-description;
  use-string string;
}
```

Hierarchy Level

[edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82**]
[edit **forwarding-options helpers bootp dhcp-option82**]
[edit **forwarding-options helpers bootp interface** *interface-name* **dhcp-option82**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Insert the **remote-id** suboption of DHCP option 82 (also known as the DHCP relay agent information option) in DHCP request packet headers before forwarding or relaying requests to a DHCP server. This suboption provides a trusted identifier for the host system that has forwarded or relayed requests to the server.

The remaining statements are explained separately.

Default

If **remote-id** is not explicitly set, no remote ID value is inserted in the DHCP request packet header. If the **remote-id** option is specified but is not qualified by a keyword, the MAC address of the host device (the switch) is used as the remote ID.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure port security features, including MAC limiting, dynamic ARP inspection, whether interfaces can receive DHCP responses, DHCP snooping, IP source guard, DHCP option 82, MAC move limiting, and FIP snooping.

The remaining statements are explained separately.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up DHCP Option 82 on a J-EX Series Switch with No Relay Agent Between Clients and DHCP Server on page 1604
- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077

static-ip

Syntax
```
static-ip ip-address {
  vlan  vlan-name;
  mac mac-address;
}
```

Hierarchy Level
[edit **ethernet-switching-options secure-access-port interface** (all|*interface-name*)]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Static (fixed) IP address and static MAC address, with an associated VLAN, added to the DHCP snooping database.

Options
ip-address—IP address assigned to a device connected on the specified interface.

The remaining statements are explained separately.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) on page 1631

timeout

Syntax timeout *seconds*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port dhcp-snooping-file**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a timeout value for remote read and write operations. This value determines the amount of time that the switch waits for a remote system to respond when the DHCP snooping database is stored on a remote FTP site.

Default None

Options ***seconds*** —Value in seconds.

Range: 10 through 3600

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding DHCP Snooping for Port Security on J-EX Series Switches on page 1537

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable |
    no-world-readable>;
  flag flag <disable>;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define global tracing operations for access security features on Ethernet switches.

Default The **traceoptions** feature is disabled by default.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename* —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (***x*k to specify KB, ***x*m to specify MB, or ***x*g to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **access-security**—Trace access security events.
- **all**—All tracing operations.
- **config-internals**—Trace internal configuration operations.
- **forwarding-database**—Trace forwarding database and next-hop events.
- **general**—Trace general events.
- **interface**—Trace interface events.
- **ip-source-guard**—Trace IP source guard events.
- **krt**—Trace communications over routing sockets.
- **lib**—Trace library calls.
- **normal**—Trace normal events.

- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **rtg**—Trace redundant trunk group events.
- **state**—Trace state transitions.
- **stp**—Trace spanning-tree events.
- **task**—Trace Ethernet-switching task processing.
- **timer**—Trace Ethernet-switching timer processing.
- **vlan**—Trace VLAN events.

no-stamp—(Optional) Do not timestamp the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending to it.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes

Range: 10 KB through 1 gigabyte

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

use-interface-description

Syntax use-interface-description;

Hierarchy Level
[edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82 circuit-id**]
[edit forwarding-options helpers bootp **dhcp-option82 circuit-id**]
[edit forwarding-options helpers bootp interface *interface-name* **dhcp-option82 circuit-id**]

[edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82 remote-id**]
[edit forwarding-options helpers bootp **dhcp-option82 remote-id**]
[edit forwarding-options helpers bootp interface *interface-name* **dhcp-option82 remote-id**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Use the interface description rather than the interface name (the default) in the circuit ID or remote ID value in the DHCP option 82 information.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up DHCP Option 82 on a J-EX Series Switch with No Relay Agent Between Clients and DHCP Server on page 1604

use-string

Syntax use-string *string*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82 remote-id**]
[edit forwarding-options helpers bootp **dhcp-option82 remote-id**]
[edit forwarding-options helpers bootp interface *interface-name* **dhcp-option82 remote-id**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Use a string rather than the MAC address of the host system (the default) in the remote ID value in the DHCP option 82 information.

Options ***string***—Character string used as the remote ID value.

Range:1–255 characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up DHCP Option 82 on a J-EX Series Switch with No Relay Agent Between Clients and DHCP Server on page 1604

- [edit forwarding-options] Configuration Statement Hierarchy on page 1656
- RFC 3046, *DHCP Relay Agent Information Option*, at http://tools.ietf.org/html/rfc3046.

use-vlan-id

Syntax use-vlan-id;

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Use the VLAN ID rather than the VLAN name (the default) in the circuit ID value in the DHCP option 82 information.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up DHCP Option 82 on a J-EX Series Switch with No Relay Agent Between Clients and DHCP Server on page 1604

vendor-id

Syntax vendor-id <*string*>;

Hierarchy Level [edit **ethernet-switching-options secure-access-port vlan** (all | *vlan-name*) **dhcp-option82**]
[edit forwarding-options helpers bootp **dhcp-option82**]
[edit forwarding-options helpers bootp interface *interface-name* **dhcp-option82**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Insert a vendor ID in the DHCP option 82 information in a DHCP request packet header before forwarding or relaying the request to a DHCP server.

Default If **vendor-id** is not explicitly configured for DHCP option 82, no vendor ID is set.

Options ***string***—(Optional) A single string that designates the vendor ID.

Range: 1–255 characters

Default: If you specify **vendor-id** with no ***string*** value, the default vendor ID **Juniper** is configured.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

vlan (Security Options)

Syntax

```
vlan (all | vlan-name) {
  (arp-inspection | no-arp-inspection);
  dhcp-option82 {
    circuit-id {
      prefix hostname;
      use-interface-description;
      use-vlan-id;
    }
    remote-id {
      prefix hostname | mac | none;
      use-interface-description;
      use-string string;
    }
    vendor-id <string>;
  }
  (examine-dhcp | no-examine-dhcp);
  examine-fip {
    fc-map fc-map-value;
  }
  (ip-source-guard | no-ip-source-guard);
  mac-move-limit limit action action;
}
```

Hierarchy Level [edit ethernet-switching-options secure-access-port]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply any of the following security options to a VLAN:

- DHCP snooping
- DHCP option 82
- Dynamic ARP inspection (DAI)
- FIP snooping
- IP source guard
- MAC move limiting

The remaining statements are explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options **all**—Apply the feature to all VLANs.

vlan-name—Apply the feature to the specified VLAN.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555

- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077

vlan (Static IP Address)

Syntax **vlan** *vlan-name*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port interface** (all | *interface-name*) **static-ip** *ip-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate the static IP address with the specified VLAN associated with the specified interface.

Options ***vlan-name*** —Name of a specific VLAN associated with the specified interface.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) on page 1631

write-interval

Syntax write-interval *seconds*;

Hierarchy Level [edit **ethernet-switching-options secure-access-port dhcp-snooping-file**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how frequently the switch writes the database entries from memory into the specified DHCP snooping database file.

Default None

Options ***seconds***—Value in seconds.
Range: 60 through 86400

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Understanding DHCP Snooping for Port Security on J-EX Series Switches on page 1537

CHAPTER 43

Operational Commands for Port Security

clear arp inspection statistics

Syntax clear arp inspection statistics
<interface *interface*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear ARP inspection statistics.

Options none—Clears ARP statistics on all interfaces.

interface *interface-names*—(Optional) Clear ARP statistics on one or more interfaces.

Required Privilege Level clear

Related Documentation

- **show arp inspection statistics on page 1695**
- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Verifying That DAI Is Working Correctly on page 1642

List of Sample Output **clear arp inspection statistics on page 1692**

Output Fields This command produces no output.

Sample Output

clear arp inspection statistics

```
user@switch> clear arp inspection statistics
```

clear dhcp snooping binding

Syntax

clear dhcp snooping binding
<mac (all | *mac-address*)>
<vlan (all | *vlan-name*)>
<vlan (all | *vlan-name*) mac (all | *mac-address*)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear the DHCP snooping database information.

Options

mac (all | ***mac-address***)—(Optional) Clear DHCP snooping information for the specified MAC address or all MAC addresses.

vlan (all | ***vlan-name***)—(Optional) Clear DHCP snooping information for the specified VLAN or all VLANs.

Required Privilege Level

clear

Related Documentation

- **show dhcp snooping binding on page 1696**
- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555
- Verifying That DHCP Snooping Is Working Correctly on page 1640

List of Sample Output

clear dhcp snooping binding on page 1693

Output Fields

This command produces no output.

Sample Output

clear dhcp snooping binding

```
user@switch> clear dhcp snooping binding
```

clear dhcp snooping statistics

Syntax **clear dhcp snooping statistics**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear all Dynamic Host Configuration Protocol (DHCP) snooping statistics.

Required Privilege Level view

Related Documentation
- **show dhcp snooping statistics on page 1697**
- Understanding DHCP Snooping for Port Security on J-EX Series Switches on page 1537

List of Sample Output **clear dhcp snooping statistics on page 1694**

Output Fields See **show dhcp snooping statistics** for an explanation of the output fields.

Sample Output

clear dhcp snooping statistics The following sample output displays the DHCP snooping statistics before and after the **clear dhcp snooping statistics** command is issued.

```
user@switch> show dhcp snooping statistics
Successful Transfers :        0   Failed Transfers :       21
Successful Reads     :        0   Failed Reads     :        0
Successful Writes    :        0   Failed Writes    :       21

user@switch> clear dhcp snooping statistics

user@switch> show dhcp snooping statistics
Successful Transfers :        0   Failed Transfers :        0
Successful Reads     :        0   Failed Reads     :        0
Successful Writes    :        0   Failed Writes    :        0
```

show arp inspection statistics

Syntax show arp inspection statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display ARP inspection statistics.

Required Privilege Level view

Related Documentation

- **clear arp inspection statistics on page 1692**
- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555

List of Sample Output **show arp inspection statistics on page 1695**

Output Fields Table 187 on page 1695 lists the output fields for the **show arp inspection statistics** command. Output fields are listed in the approximate order in which they appear.

Table 187: show arp inspection statistics Output Fields

Field Name	Field Description	Level of Output
Interface	Interface on which ARP inspection has been applied.	All levels
Packets received	Total number of packets total that underwent ARP inspection.	All levels
ARP inspection pass	Total number of packets that passed ARP inspection.	All levels
ARP inspection failed	Total number of packets that failed ARP inspection.	All levels

Sample Output

show arp inspection statistics

```
user@switch> show arp inspection statistics

Interface     Packets received     ARP inspection pass  ARP inspection failed
---------     ----------------     -------------------  --------------------
  ge-0/0/0                   0                       0                     0
  ge-0/0/1                   0                       0                     0
  ge-0/0/2                   0                       0                     0
  ge-0/0/3                   0                       0                     0
  ge-0/0/4                   0                       0                     0
  ge-0/0/5                   0                       0                     0
  ge-0/0/6                   0                       0                     0
  ge-0/0/7                 703                     701                     2
```

show dhcp snooping binding

Syntax show dhcp snooping binding

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the DHCP snooping database information.

Required Privilege Level view

Related Documentation

- **clear dhcp snooping binding on page 1693**
- Example: Configuring Port Security, with DHCP Snooping, DAI, MAC Limiting, and MAC Move Limiting, on a J-EX Series Switch on page 1555

List of Sample Output **show dhcp snooping binding on page 1696**

Output Fields Table 188 on page 1696 lists the output fields for the **show dhcp snooping binding** command. Output fields are listed in the approximate order in which they appear.

Table 188: show dhcp snooping binding Output Fields

Field Name	Field Description	Level of Output
MAC Address	MAC address of the network device; bound to the IP address.	All levels
IP Address	IP address of the network device; bound to the MAC address.	All levels
Lease	Lease granted to the IP address.	All levels
Type	How the MAC address was acquired.	All levels
VLAN	VLAN name of the network device whose MAC address is shown.	All levels
Interface	Interface address (port).	All levels

Sample Output

show dhcp snooping binding

```
user@switch> show dhcp snooping binding

DHCP Snooping Information:
MAC Address             IP Address Lease   Type     VLAN    Interface
-----------------       ---------- -----   -------  ----    ---------
00:00:01:00:00:03       192.0.2.0  640     dynamic  guest    ge-0/0/12.0
00:00:01:00:00:04       192.0.2.1  720     dynamic  guest    ge-0/0/12.0
00:00:01:00:00:05       192.0.2.5  800     dynamic  guest    ge-0/0/13.0
```

show dhcp snooping statistics

Syntax **show dhcp snooping statistics**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display statistics for read and write operations to the DHCP snooping database.

Required Privilege Level view

Related Documentation
- **clear dhcp snooping statistics on page 1694**
- Understanding DHCP Snooping for Port Security on J-EX Series Switches on page 1537

List of Sample Output **show dhcp snooping statistics on page 1697**

Output Fields Table 189 on page 1697 lists the output fields for the **show dhcp snooping statistics** command. Output fields are listed in the approximate order in which they appear.

Table 189: show dhcp snooping statistics Output Fields

Field Name	Field Description
Successful Transfers	Number of entries successfully transferred from memory to the DHCP snooping database.
Successful Reads	Number of entries successfully read from memory to the DHCP snooping database.
Successful Writes	Number of entries successfully written from memory to the DHCP snooping database.
Failed Transfers	Number of entries that failed being transferred from memory to the DHCP snooping database.
Failed Reads	Number of entries that failed being read from memory to the DHCP snooping database.
Failed Writes	Number of entries that failed being written from memory to the DHCP snooping database.

Sample Output

show dhcp snooping statistics

```
user@switch> show dhcp snooping statistics
Successful Transfers :        0   Failed Transfers :       21
Successful Reads     :        0   Failed Reads     :        0
Successful Writes    :        0   Failed Writes    :       21
```

show ethernet-switching table

Syntax

show ethernet-switching table
<brief | detail | extensive | summary>
<interface *interface-name*>
<management-vlan>
<sort-by (*name* | *tag*)>
<vlan *vlan-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the Ethernet switching table.

Options

none—(Optional) Display brief information about the Ethernet switching table.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display the Ethernet switching table for a specific interface.

management-vlan—(Optional) Display the Ethernet switching table for a management VLAN.

sort-by (*name* | *tag*)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

vlan *vlan-name*—(Optional) Display the Ethernet switching table for a specific VLAN.

Required Privilege Level

show ethernet-switching table extensive on page 1701
show ethernet-switching table interface ge-0/0/1 on page 1701

Output Fields

Table 190 on page 1698 lists the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

Table 190: show ethernet-switching table Output Fields

Field Name	Field Description	Level of Output
VLAN	The name of a VLAN.	All levels

Table 190: show ethernet-switching table Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tag	The VLAN ID tag name or number.	**extensive**
MAC or **MAC address**	The MAC address associated with the VLAN.	All levels
Type	The type of MAC address. Values are: • **static**—The MAC address is manually created. • **learn**—The MAC address is learned dynamically from a packet's source MAC address. • **flood**—The MAC address is unknown and flooded to all members.	All levels
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
Interfaces	Interface associated with learned MAC addresses or **All-members** (flood entry).	All levels
Learned	For learned entries, the time which the entry was added to the Ethernet switching table.	**detail**, **extensive**
Nexthop index	The next-hop index number.	**detail**, **extensive**

Sample Output

show ethernet-switching table

```
user@switch> show ethernet-switching table

Output Fields Table 191 on page 1702 lists the output fields for the **show ip-source-guard** command. Output fields are listed in the approximate order in which they appear.

Table 191: show ip-source-guard Output Fields

Field Name	Field Description
VLAN	VLAN on which IP source guard is enabled.
Interface	Access interface associated with the VLAN in column 1.
Tag	VLAN ID for the VLAN in column 1. Possible values are: • 0, indicating the VLAN is not tagged. • 1 – 4093
IP Address	Source IP address for a device connected to the interface in column 2. A value of * (star, or asterisk) indicates that IP source guard is not enabled on this VLAN but the interface is shared with a VLAN that is enabled for IP source guard.
MAC Address	Source MAC address for a device connected to the interface in column 2. A value of * (star, or asterisk) indicates that IP source guard is not enabled on this VLAN but the interface is shared with a VLAN that is enabled for IP source guard.

Sample Output

show ip-source-guard

PART 8

Routing Policy and Packet Filtering (Firewall Filters)

CHAPTER 44

Firewall Filters—Overview

Firewall Filters for J-EX Series Switches Overview

Firewall filters provide rules that define whether to permit, deny, or forward packets that are transiting an interface on a J-EX Series Switch from a source address to a destination address. You configure firewall filters to determine whether to permit, deny, or forward traffic before it enters or exits a port, VLAN, or Layer 3 (routed) interface to which the firewall filter is applied. An *ingress* firewall filter is a filter that is applied to packets that are entering a network. An *egress* firewall filter is a filter that is applied to packets that are exiting a network. You can configure firewall filters to subject packets to filtering, class-of-service (CoS) marking (grouping similar types of traffic together, and treating each type of traffic as a class with its own level of service priority), and traffic policing (controlling the maximum rate of traffic sent or received on an interface).

This topic describes:

Firewall Filter Types

The following firewall filter types are supported for J-EX Series switches:

- Port (Layer 2) firewall filter—Port firewall filters apply to Layer 2 switch ports. You can apply port firewall filters in both ingress and egress directions on a physical port.
- VLAN firewall filter—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN. You can apply VLAN firewall filters in both ingress and egress directions on a VLAN. VLAN firewall filters are applied to all packets that are forwarded to or forwarded from the VLAN.
- Router (Layer 3) firewall filter—You can apply a router firewall filter in both ingress and egress directions on Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs). You can apply a router firewall filter in the ingress direction on the loopback interface (**lo0**) also. Firewall filters configured on loopback interfaces are applied only to packets that are sent to the Routing Engine CPU for further processing.

On J-EX4200 and J-EX8200 Ethernet Switches, you can apply port, VLAN, or router firewall filters to both IPv4 and IPv6 traffic, whereas on J-EX4500 Ethernet Switches, you can apply port, VLAN, or router firewall filters to IPv4 traffic only. For information on firewall filters supported on different switches, see “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 1715.

To configure a port firewall filter or a VLAN firewall filter for IPv4 traffic on any switch, you can include either the **ether-type ipv4** or the **ip-version ipv4** match condition. To configure port or VLAN firewall filters for IPv6 traffic on J-EX4200 switches, you must include the **ether-type ipv6** match condition. To configure port or VLAN firewall filters for IPv6 traffic on J-EX8200 switches, you can use either the **ether-type ipv6** or the **ip-version ipv6** match condition.

In addition to specifying the type of supported traffic, the **ip-version** match condition allows you to define certain other match conditions. For a list of match conditions supported in **ip-version**, see “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 1715.

When you include the match condition **ether-type ipv4** or **ip-version ipv4**, ensure that the other match conditions specified in the term are valid for IPv4 traffic. Similarly, if you include **ip-version ipv6** on J-EX8200, ensure that other match conditions specified in the term are valid for IPv6 traffic.

NOTE: On J-EX8200 switches, a port firewall filter term or a VLAN firewall filter term that contains both the **ether-type** and the **ip-version** match conditions applies to IPv4 traffic when both match conditions are set to **ipv4** and to IPv6 traffic when both conditions are set to **ipv6**. If either match condition is set to **ipv6**, then the term applies to IPv6 traffic. To configure a port firewall filter or a VLAN firewall filter for both IPv4 and IPv6 traffic, you must include two separate terms, one for IPv4 and the other for IPv6 traffic.

To apply a firewall filter, you must first configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

Firewall Filter Components

In a firewall filter, you first define the family address type (**ethernet-switching**, **inet**, or **inet6**), and then you define one or more terms that specify the filtering criteria and the action to take if a match occurs.

The maximum number of terms allowed per firewall filter for J-EX Series switches is:

- 7168 for J-EX4200 switches—as allocated by the dynamic allocation of ternary content addressable memory (TCAM) for port, VLAN, and router firewall filters.
- 1536 for J-EX4500 switches
- 32768 for J-EX8200 switches

NOTE: The on-demand dynamic allocation of the shared space TCAM in J-EX8200 switches is achieved by assigning free space blocks to firewall filters. Firewall filters are categorized into two different pools. Port and VLAN filters are pooled together (the memory threshold for this pool is 22K) while router firewall filters are pooled separately (the threshold for this pool is 32K). The assignment happens based on the filter pool type. Free space blocks can be shared only among the firewall filters belonging to the same filter pool type. An error message is generated when you try to configure a firewall filter beyond the TCAM threshold.

Each term consists of the following components:

- Match conditions—Specify the values or fields that the packet must contain. You can define various match conditions, including the IP source address field, IP destination address field, Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) source port field, IP protocol field, Internet Control Message Protocol (ICMP) packet type, TCP flags, and interfaces.
- Action—Specifies what to do if a packet matches the match conditions. Possible actions are to accept or discard the packet or to send the packet to a specific virtual routing interface. In addition, packets can be counted to collect statistical information. If no action is specified for a term, the default action is to accept the packet.

Firewall Filter Processing

The order of the terms within a firewall filter configuration is important. Packets are tested against each term in the order in which the terms are listed in the firewall filter configuration. When a firewall filter contains multiple terms, the switch takes a top-down approach and compares a packet against the first term in the firewall filter. If the packet matches the first term, the switch executes the action defined by that term to either permit or deny the packet, and no other terms are evaluated. If the switch does not find a match between the packet and first term, it compares the packet to the next term in the firewall filter by using the same match process. If no match occurs between the

packet and the second term, the switch continues to compare the packet to each successive term defined in the firewall filter until a match is found. If a packet does not match any terms in a firewall filter, the default action is to discard the packet.

Understanding Planning of Firewall Filters

Before you create a firewall filter and apply it to an interface, determine what you want the firewall filter to accomplish and how to use its match conditions and actions to achieve your goals. You must understand how packets are matched to match conditions, the default and configured actions of the firewall filter, and proper placement of the firewall filter.

You can configure and apply no more than one firewall filter per port, VLAN, or router interface, per direction. The following limits apply for the number of firewall filter terms allowed per filter on various switch models:

- On J-EX4200 switches, the number of terms per filter cannot exceed 7168.
- On J-EX4500 switches, the number of terms per filter cannot exceed 1536.
- On J-EX8200 switches, the number of terms per filter cannot exceed 32768.

In addition, you should try to be conservative in the number of terms (rules) that you include in each firewall filter because a large number of terms requires longer processing time during a commit and also can make firewall filter testing and troubleshooting more difficult. Similarly, applying firewall filters across many switch and router interfaces can make testing and troubleshooting the rules of those filters difficult.

Before you configure and apply firewall filters, answer the following questions for each of those firewall filters:

1. What is the purpose of the firewall filter?

   For example, you can use a firewall filter to limit traffic to source and destination MAC addresses, specific protocols, or certain data rates or to prevent denial of service (DoS) attacks.

2. What are the appropriate match conditions?

   a. Determine the packet header fields that the packet must contain for a match. Possible fields include:

      - Layer 2 header fields—Source and destination MAC addresses, dot1q tag, Ethernet type, and VLAN
      - Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, TTL type)
      - TCP header fields—Source and destination ports and flags
      - ICMP header fields—Packet type and code

   b. Determine the port, VLAN, or router interface on which the packet was received.

3. What are the appropriate actions to take if a match occurs?

   Possible actions to take if a match occurs are accept, discard, and forward to a routing instance.

4. What additional action modifiers might be required?

   Determine whether additional actions are required if a packet matches a match condition; for example, you can specify an action modifier to count, analyze, or police packets.

5. On what interface should the firewall filter be applied?

   Start with the following basic guidelines:

   - If all the packets entering a port need to be exposed to filtering, then use port firewall filters.
   - If all the packets that are bridged need filtering, then use VLAN firewall filters.
   - If all the packets that are routed need filtering, then use router firewall filters.

   Before you choose the interface on which to apply a firewall filter, understand how that placement can impact traffic flow to other interfaces. In general, apply a firewall filter that filters on source and destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP and UDP port numbers—nearest to the source devices. However, typically apply a firewall filter that filters only on a source IP address nearest to the destination devices. When applied too close to the source device, a firewall filter that filters only on a source IP address could potentially prevent that source device from accessing other services that are available on the network.

   

   NOTE: **Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.**

6. In which direction should the firewall filter be applied?

   You can apply firewall filters to ports on the switch to filter packets that are entering a port. You can apply firewall filters to VLANs, and Layer 3 (routed) interfaces to filter packets that are entering or exiting a VLAN or routed interface. Typically, you configure different sets of actions for traffic entering an interface than you configure for traffic exiting an interface.

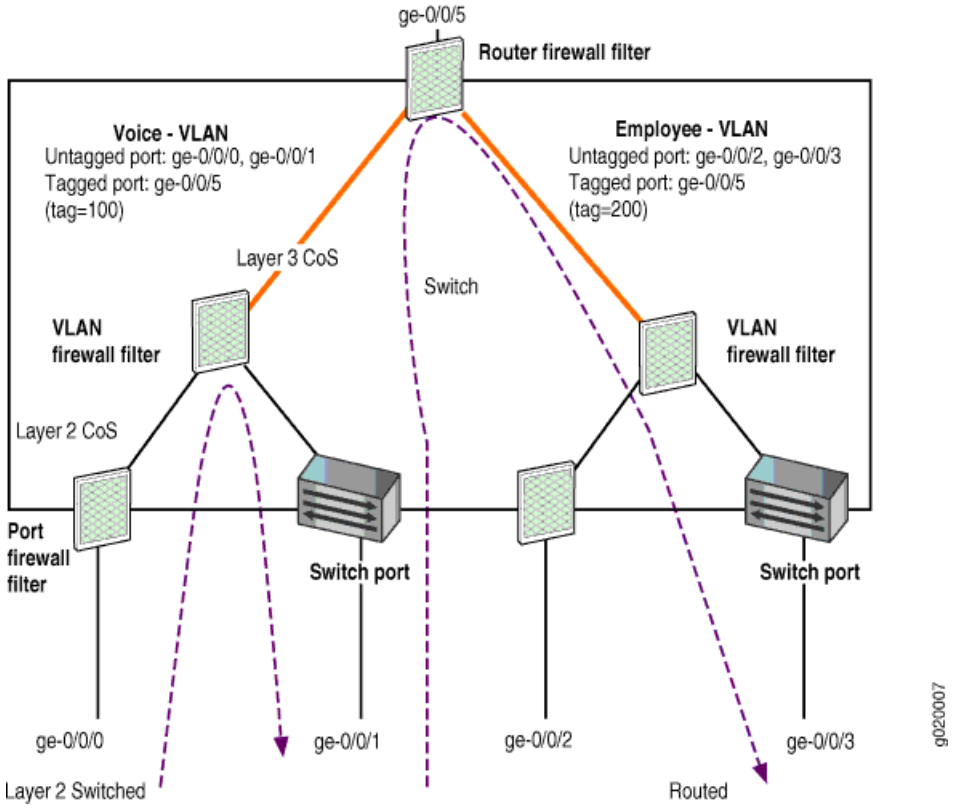
Understanding Firewall Filter Processing Points for Bridged and Routed Packets on J-EX Series Switches

J-EX Series Switches are multilayered switches that provide Layer 2 switching and Layer 3 routing. You apply firewall filters at multiple processing points in the packet forwarding path on J-EX Series switches. At each processing point, the action to be taken on a packet is determined based on the results of the lookup in the switch's forwarding table. A table lookup determines which exit port on the switch to use to forward the packet.

For both bridged unicast packets and routed unicast packets, firewall filters are evaluated and applied hierarchically. First, a packet is checked against the port firewall filter, if present. If the packet is permitted, it is then checked against the VLAN firewall filter, if present. If the packet is permitted, it is then checked against the router firewall filter, if present. The packet must be permitted by the router firewall filter before it is processed.

Figure 54 on page 1713 shows the various firewall filter processing points in the packet forwarding path in a multilayered switching platform.

Figure 54: Firewall Filter Processing Points in the Packet Forwarding Path



For a multicast packet that results in replications, an egress firewall filter is applied to each copy of the packet based on its corresponding egress VLAN.

For Layer 2 (bridged) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter
- Egress port firewall filter
- Egress VLAN firewall filter

For Layer 3 (routed and multilayer-switched) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter (Layer 2 CoS)
- Ingress router firewall filter (Layer 3 CoS)
- Egress router firewall filter
- Egress VLAN firewall filter

Understanding How Firewall Filters Control Packet Flows

J-EX Series Switches support firewall filters that allow you to control flows of data packets and local packets. *Data packets* are chunks of data that transit the switch as they are forwarded from a source to a destination. *Local packets* are chunks of data that are destined for or sent by the switch. Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP).

You create firewall filters to protect your switch from excessive traffic transiting the switch to a network destination or destined for the Routing Engine on the switch. Firewall filters that control local packets can also protect your switch from external incidents such as denial-of-service (DoS) attacks.

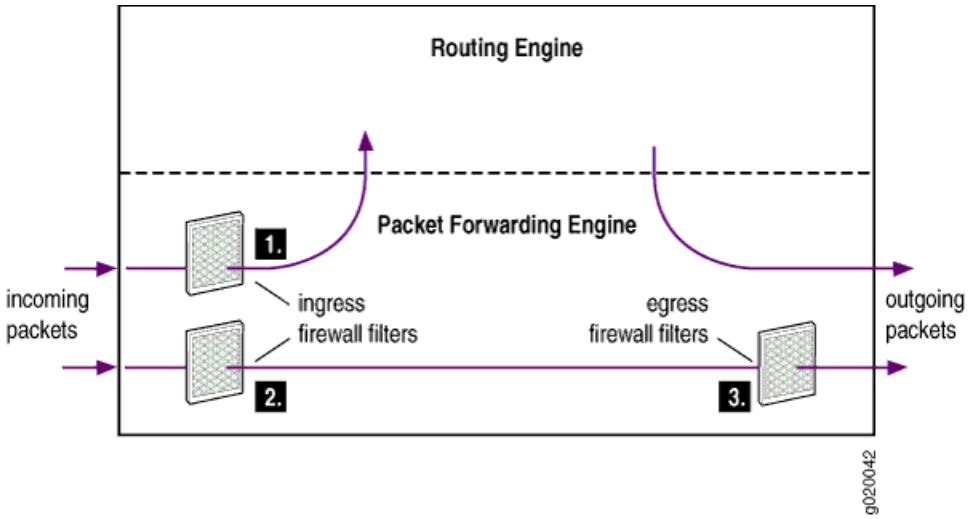
Firewall filters affect packet flows entering in to or exiting from the switch's interfaces:

- Ingress firewall filters affect the flow of data packets that are received by the switch's interfaces. The Packet Forwarding Engine (PFE) handles this flow. When a switch receives a data packet on an interface, the switch determines where to forward the packet by looking in the forwarding table for the best route (Layer 2 switching, Layer 3 routing) to a destination. Data packets are forwarded to their destination through an outgoing interface. Locally destined packets are forwarded to the Routing Engine.

- Egress firewall filters affect the flow of data packets that are transmitted from the switch's interfaces but do not affect the flow of locally generated control packets from the Routing Engine. The Packet Forwarding Engine handles the flow of data packets that are transmitted from the switch, and egress firewall filters are applied here. The Packet Forwarding Engine also handles the flow of control packets from the Routing Engine.

Figure 55 on page 1715 illustrates the application of ingress and egress firewall filters to control the flow of packets through the switch.

Figure 55: Application of Firewall Filters to Control Packet Flow



1. Ingress firewall filter applied to control locally destined packets that are received on the switch's interfaces and are destined for the Routing Engine.
2. Ingress firewall filter applied to control incoming packets on the switch's interfaces.
3. Egress firewall filter applied to control packets that are transiting the switch's interfaces.

Firewall Filter Match Conditions and Actions for J-EX Series Switches

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the values or fields that a packet must contain. You can define multiple, single, or no match conditions. If no match conditions are specified for the term, all packets are matched by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Action modifiers are optional and specify one or more actions that the switch takes if a packet matches the match conditions for the

specific term. Allowed actions are to accept a packet or discard a packet. In addition, you can specify action modifiers to count, mirror, rate limit, and classify packets.

For each firewall filter, you define the terms that specify the filtering criteria (match conditions) to apply to packets and the action for the switch to take if a match occurs. The string that defines a match condition is called a *match statement*. The following tables list various match conditions, their supported platforms, binding points, and actions.

- Table 192 on page 1716 describes the match conditions you can specify when configuring a firewall filter for IPv4 traffic.
- Table 193 on page 1725 describes the match conditions you can specify when configuring a firewall filter for IPv6 traffic.
- Table 194 on page 1732 describes the match conditions you can specify when configuring a firewall filter for non-IP traffic.
- Table 195 on page 1732 shows the actions that you can specify in a term.
- Table 196 on page 1733 shows the action modifiers that you can specify in a term.
- Table 197 on page 1734 shows match conditions, actions, and action modifiers that you can specify when configuring a firewall filter on a loopback interface.

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
destination-address *ip-address*	IP destination address field, which is the address of the final destination node.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
destination-mac-address *mac-address*	Destination media access control (MAC) address of the packet. You can define a destination MAC address with a prefix, such as **from destination-mac-address 00:01:02:03:04:05/24**. If no prefix is specified, the default value 48 is used.	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
destination-port *number*	TCP or User Datagram Protocol (UDP) destination port field. Typically, you specify this match in conjunction with the **protocol** match statement to determine which protocol is used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): **afs (1483)**, **bgp (179)**, **biff (512)**, **bootpc (68)**, **bootps (67)**, **cmd (514)**, **cvspserver (2401)**, **dhcp (67)**, **domain (53)**, **eklogin (2105)**, **ekshell (2106)**, **exec (512)**, **finger (79)**, **ftp (21)**, **ftp-data (20)**, **http (80)**, **https (443)**, **ident (113)**, **imap (143)**, **kerberos-sec (88)**, **klogin (543)**, **kpasswd (761)**, **krb-prop (754)**, **krbupdate (760)**, **kshell (544)**, **ldap (389)**, **login (513)**, **mobileip-agent (434)**, **mobilip-mn (435)**, **msdp (639)**, **netbios-dgm (138)**, **netbios-ns (137)**, **netbios-ssn (139)**, **nfsd (2049)**, **nntp (119)**, **ntalk (518)**, **ntp (123)**, **pop3 (110)**, **pptp (1723)**, **printer (515)**, **radacct (1813)**,**radius (1812)**, **rip (520)**, **rkinit (2108)**, **smtp (25)**, **snmp (161)**, **snmptrap (162)**, **snpp (444)**, **socks (1080)**, **ssh (22)**, **sunrpc (111)**, **syslog (514)**,	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
	tacacs-ds (65), **talk (517)**, **telnet (23)**, **tftp (69)**, **timed (525)**, **who (513)**, **xdmcp (177)**, **zephyr-clt (2103)**, **zephyr-hm (2104)**		

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
destination-prefix-list *prefix-list*	IP destination prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. You make this definition at the **[edit policy-options]** hierarchy level.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
dot1q-tag *number*	The tag field in the Ethernet header. The tag values can be 1–4095.	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—not supported
dot1q-user-priority *number*	User-priority field of the tagged Ethernet packet. User-priority values can be 0–7. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): • **background (1)**—Background • **best-effort (0)**—Best effort • **controlled-load (4)**—Controlled load • **excellent-load (3)**—Excellent load • **network-control (7)**—Network control reserved traffic • **standard (2)**—Standard or Spare • **video (5)**—Video • **voice (6)**—Voice	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
dscp *number*	Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP. You can specify DSCP in hexadecimal, binary, or decimal form. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): • **ef (46)**—as defined in RFC 2598, *An Expedited Forwarding PHB*. • **af11 (10)**, **af12 (12)**, **af13 (14)**; **af21 (18)**, **af22 (20)**, **af23 (22)**; **af31 (26)**, **af32 (28)**, **af33 (30)**; **af41 (34)**, **af42 (36)**, **af43 (38)** These four classes, with three drop precedences in each class, are defined for 12 code points, in RFC 2597, *Assured Forwarding PHB*.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports and VLANs	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports and VLANs
ether-type [aarp | appletalk | arp | ipv4 | ipv6 | mpls—multicast | mpls-unicast | oam | ppp | pppoe-discovery | pppoe-session | sna |*value*]	Ethernet type field of a packet. The *EtherType value* specifies what protocol is being transported in the Ethernet frame. In place of the numeric value, you can specify one of the following text synonyms: • **aarp**—EtherType value AARP (0x80F3) • **appletalk**—EtherType value AppleTalk (0x809B) • **arp**—EtherType value ARP (0x0806) • **ipv4**—EtherType value IPv4 (0x0800) • **ipv6**—EtherType value IPv6 (0x08DD) • **mpls multicast**—EtherType value MPLS multicast (0x8848) • **mpls unicast**—EtherType value MPLS unicast (0x8847) • **oam**—EtherType value OAM (0x88A8) • **ppp**—EtherType value PPP (0x880B) • **pppoe-discovery**—EtherType value PPPoE Discovery Stage (0x8863) • **pppoe-session**—EtherType value PPPoE Session Stage (0x8864) • **sna**—EtherType value SNA (0x80D5)	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—not supported.

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
fragment-flags *fragment-flags*	IP fragmentation flags, specified in symbolic or hexadecimal formats. You can specify one of the following options: dont-fragment (0x4000), more-fragments (0x2000), or reserved (0x8000)	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—not supported	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—not supported
icmp-code *number*	ICMP code field. This value or option provides more specific information than **icmp-type**. Because the value's meaning depends upon the associated **icmp-type**, you must specify **icmp-type** along with **icmp-code**. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The options are grouped by the ICMP type with which they are associated: • **parameter-problem—ip-header-bad (0), required-option-missing (1)** • **redirect—redirect-for-host (1), redirect-for-network (0), redirect-for-tos-and-host (3), redirect-for-tos-and-net (2)** • **time-exceeded—ttl-eq-zero-during-reassembly (1), ttl-eq-zero-during-transit (0)** • **unreachable—communication-prohibited-by-filtering (13), destination-host-prohibited (10), destination-host-unknown (7), destination-network-prohibited (9), destination-network-unknown (6), fragmentation-needed (4), host-precedence-violation (14), host-unreachable (1), host-unreachable-for-TOS (12), network-unreachable (0), network-unreachable-for-TOS (11), port-unreachable (3), precedence-cutoff-in-effect (15), protocol-unreachable (2), source-host-isolated (8), source-route-failed (5)**	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—VLANs and Layer 3 interfaces • J-EX4500—VLANs and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
icmp-type *number*	ICMP packet type field. Typically, you specify this match in conjunction with the **protocol** match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): **echo-reply (0)**, **echo-request (8)**, **info-reply (16)**, **info-request (15)**, **mask-request (17)**, **mask-reply (18)**, **parameter-problem (12)**, **redirect (5)**, **router-advertisement (9)**, **router-solicit (10)**, **source-quench (4)**, **time-exceeded (11)**, **timestamp (13)**, **timestamp-reply (14)**, **unreachable (3)**	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
interface *interface-name*	Interface on which the packet is received. You can specify the wildcard character (*) as part of an interface name. NOTE: The **interface** match condition is not supported on a J-EX8200 Virtual Chassis for egress traffic.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
ip-options	Presence of the options field in the IP header.	• J-EX4200—Layer 3 interfaces • J-EX4500—Layer 3 interfaces • J-EX8200—Layer 3 interfaces	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—not supported

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
ip-version *version* [*match_condition(s)*]	Version of the IP protocol for port and VLAN firewall filters. The value for *version* can be **ipv4** or **ipv6**. In place of *match condition (s)*, you can specify one or more of the following match conditions: • **destination-address** • **destination-port** • **destination-prefix-list** • **dscp** • **fragment-flags** • **icmp-code** • **icmp-type** • **is-fragment** • **precedence** • **protocol** • **source-address** • **source-port** • **source-prefix-list** • **tcp-established** • **tcp-flags** • **tcp-initial**	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs
is-fragment	If the packet is a trailing fragment, this match condition does not match the first fragment of a fragmented packet. Use two terms to match both first and trailing fragments.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—not supported
precedence *precedence*	IP precedence. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): **critical-ecp (5)**, **flash (3)**, **flash-override (4)**, **immediate (2)**, **internet-control (6)**, **net-control (7)**, **priority (1)**, or **routine (0)**.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
protocol *list of protocols*	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms: **egp (8)**, **esp (50)**, **gre (47)**, **icmp (1)**, **igmp (2)**, **ipip (4)**, **ospf (89)**, **pim (103)**, **rsvp (46)**, **tcp (6)**, **udp (17)**	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
source-address *ip-address*	IP source address field, which is the address of the source node sending the packet. For IPV6, the source-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in RFC 2373, *IP Version 6 Addressing Architecture*.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
source-mac-address *mac-address*	Source MAC address. You can define a source MAC address with a prefix, such as **from destination-mac-address 00:01:02:03:04:05/24**. If no prefix is specified, the default value 48 is used.	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs
source-port *number*	TCP or UDP **source-port** field. Typically, you specify this match in conjunction with the **protocol** match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text synonyms listed under **destination-port**.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
source-prefix-list *prefix-list*	IP source prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. You make this definition at the **[edit policy-options]** hierarchy level.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 192: Supported Match Conditions Applicable to IPv4 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
tcp-established	TCP packets of an established TCP connection. This condition matches packets other than the first packet of a connection. **tcp-established** is a synonym for the bit names **"(ack | rst)"**. **tcp-established** does not implicitly check whether the protocol is TCP. To do so, specify the **protocol tcp** match condition.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—ports, VLANs, and Layer 3 interfaces
tcp-flags [*flags* tcp-initial]	One or more TCP flags: • bit-name—**fin**, **syn**, **rst**, **push**, **ack**, **urgent** • logical operators—**&** (logical AND), **|** (logical OR), **!** (negation) • numerical value—0x01 through 0x20 • text synonym—**tcp-initial** To specify multiple flags, use logical operators.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—ports, VLANs, and Layer 3 interfaces
tcp-initial	Match the first TCP packet of a connection. **tcp-initial** is a synonym for the bit names **"(syn & !ack)"**. **tcp-initial** does not implicitly check whether the protocol is TCP. To do so, specify the **protocol tcp** match condition.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX4500—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—ports, VLANs, and Layer 3 interfaces
ttl *value*	TTL type to match. The value can be 1–255.	• J-EX4200—Layer 3 interfaces • J-EX4500—Layer 3 interfaces • J-EX8200—Layer 3 interfaces	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—not supported
vlan [*vlan-name* | *vlan-id*]	The VLAN that is associated with the packet.	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs

Some of the numeric range and bit-field match conditions allow you to specify a text synonym. For a list of all the synonyms for a match condition, do any of the following:

- If you are using the J-Web Filters Configuration page, select the synonym from the appropriate list.
- If you are using the CLI, type a question mark (**?**) after the **from** statement.

To specify the bit-field value to match, you must enclose the values in quotation marks (**" "**). For example, a match occurs if the RST bit in the TCP flags field is set:

```
tcp-flags "rst";
```

For information about logical operators and how to use bit-field logical operations to create expressions that are evaluated for matches, see “Understanding Firewall Filter Match Conditions” on page 1737.

On J-EX Series switches, you can apply a router firewall filter to both IPv4 and IPv6 traffic. You can apply firewall filter match conditions to IPv6 traffic on Layer 3 interfaces, aggregated Ethernet interfaces, and loopback interfaces. Table 193 on page 1725 describes the match conditions you can specify when configuring a firewall filter for IPv6 traffic.

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
destination-address ***ip-address***	Specifies the 128-bit address that is the final destination node address for the packet. The filter description syntax supports the text representations for IPv6 addresses as described in RFC 2373, *IP Version6 Addressing Architecture*.	• J-EX4200— Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
destination-mac-address ***mac-address***	Destination media access control (MAC) address of the packet. You can define a destination MAC address with a prefix, such as **from destination-mac-address 00:01:02:03:04:05/24**. If no prefix is specified, the default value 48 is used.	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
destination-port *number*	Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) destination port field. Typically, you specify this match in conjunction with the **protocol** match statement to determine which protocol is used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): **afs (1483)**, **bgp (179)**, **biff (512)**, **bootpc (68)**, **bootps (67)**, **cmd (514)**, **cvspserver (2401)**, **dhcp (67)**, **domain (53)**, **eklogin (2105)**, **ekshell (2106)**, **exec (512)**, **finger (79)**, **ftp (21)**, **ftp-data (20)**, **http (80)**, **https (443)**, **ident (113)**, **imap (143)**, **kerberos-sec (88)**, **klogin (543)**, **kpasswd (761)**, **krb-prop (754)**, **krbupdate (760)**, **kshell (544)**, **ldap (389)**, **login (513)**, **mobileip-agent (434)**, **mobilip-mn (435)**, **msdp (639)**, **netbios-dgm (138)**, **netbios-ns (137)**, **netbios-ssn (139)**, **nfsd (2049)**, **nntp (119)**, **ntalk (518)**, **ntp (123)**, **pop3 (110)**, **pptp (1723)**, **printer (515)**, **radacct (1813)**,**radius (1812)**, **rip (520)**, **rkinit (2108)**, **smtp (25)**, **snmp (161)**, **snmptrap (162)**, **snpp (444)**, **socks (1080)**, **ssh (22)**, **sunrpc (111)**, **syslog (514)**,	• J-EX4200— VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
	tacacs-ds (65), **talk (517)**, **telnet (23)**, **tftp (69)**, **timed (525)**, **who (513)**, **xdmcp (177)**, **zephyr-clt (2103)**, **zephyr-hm (2104)**		
destination-prefix-list *prefix-list*	IP destination prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. You make this definition at the **[edit policy-options]** hierarchy level.	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
dot1q-tag *number*	The tag field in the Ethernet header. The tag values can be 1–4095.	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX8200—not supported
dot1q-user-priority *number*	User-priority field of the tagged Ethernet packet. User-priority values can be 0–7. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): • **background (1)**—Background • **best-effort (0)**—Best effort • **controlled-load (4)**—Controlled load • **excellent-load (3)**—Excellent load • **network-control (7)**—Network control reserved traffic • **standard (2)**—Standard or Spare • **video (5)**—Video • **voice (6)**—Voice	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs
ether-type (ipv6)*value*	Ethernet type field of a packet. The **ether-type** value specifies what protocol is being transported in the Ethernet frame. In place of the numeric value, you can specify the following text synonym: • **ipv6**—EtherType value IPv6 (0x08DD)	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX8200— ports and VLANs.

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
icmp-code *number*	ICMP code field. This value or option provides more specific information than **icmp-type**. Because the value's meaning depends upon the associated **icmp-type**, you must specify **icmp-type** along with **icmp-code**. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The options are grouped by the ICMP type with which they are associated: • **parameter-problem**—**ip-header-bad (0)**, **unrecognized-next-header (1)**, **unrecognized-option (2)** • **time-exceeded**—**ttl-eq-zero-during-reassembly (1)**, **ttl-eq-zero-during-transit (0)** • **destination-unreachable**—**no-route-to--destination (0)**, **administratively-prohibited (1)**, **address-unreachable (3)**, **port-unreachable (4)**	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
icmp-type *number*	ICMP packet type field. Typically, you specify this match in conjunction with the **protocol** match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): **echo-reply (0)**, **echo-request (8)**, **info-reply (16)**, **info-request (15)**, **mask-request (17)**, **mask-reply (18)**, **parameter-problem (12)**, **redirect (5)**, **router-advertisement (9)**, **router-solicit (10)**, **source-quench (4)**, **time-exceeded (11)**, **timestamp (13)**, **timestamp-reply (14)**, **unreachable (3)**	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
interface *interface-name*	Interface on which the packet is received. NOTE: The **interface** match condition is not supported on a J-EX8200 Virtual Chassis for egress traffic.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
ip-version *version* [*match_condition(s)*]	Version of the IP protocol for port and VLAN firewall filters. The value for *version* can be **ipv4** or **ipv6**. In place of the *match condition (s)*, you can specify one or more of the following match conditions: • **destination-address** • **destination-port** • **destination-prefix-list** • **icmp-code** • **icmp-type** • **next-header** (same as **protocol**) • **source-address** • **source-port** • **source-prefix-list** • **traffic-class** • **tcp-established** • **tcp-initial** • **tcp-flags**	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—ports and VLANs	• J-EX4200—not supported • J-EX4500—not supported • J-EX8200—ports and VLANs
next-header ***bytes***	8-bit protocol field that identifies the type of header immediately following the IPv6 header. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): **ah (51)**, **dstops (60)**, **egp (8)**, **esp (50)**, **fragment (44)**, **gre (47)**, **hop-by-hop (0)**, **icmp (1)**, **icmpv6 (1)**, **igmp (2)**, **ipip (4)**, **ipv6 (41)**, **no-next-header (59)**, **ospf (89)**, **pim (103)**, **routing (43)**, **rsvp (46)**, **sctp (132)**, **tcp (6)**, **udp (17)**, or **vrrp (112)**.	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
packet-length ***bytes***	Length of the received packet, in bytes. The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—Layer 3 interfaces
source-address ***ip-address***	IP source address field, which is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in RFC 2373, *IP Version 6 Addressing Architecture*.	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
source-mac-address *mac-address*	Source MAC address. You can define a source MAC address with a prefix, such as **from destination-mac-address 00:01:02:03:04:05/24**. If no prefix is specified, the default value 48 is used.	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs
source-port *number*	TCP or UDP **source-port** field. Typically, you specify this match in conjunction with the **next-header** match statement to determine which next-header is being used on the port. In place of the numeric field, you can specify one of the text synonyms listed under **destination-port**.	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
source-prefix-list *prefix-list*	IP source prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. You make this definition at the **[edit policy-options]** hierarchy level.	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
tcp-established	TCP packets of an established TCP connection. This condition matches packets other than the first packet of a connection. **tcp-established** is a synonym for the bit names **"(ack | rst)"**. **tcp-established** does not implicitly check whether the protocol is TCP. To do so, specify the **protocol tcp** match condition.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX8200—ports, VLANs, and Layer 3 interfaces
tcp-flags (*flags* **tcp-initial)**	One or more TCP flags: • bit-name—**fin**, **syn**, **rst**, **push**, **ack**, **urgent** • logical operators—**&** (logical AND), **|** (logical OR), **!** (negation) • numerical value—0x01 through 0x20 • text synonym—**tcp-initial** To specify multiple flags, use logical operators.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX8200—ports, VLANs, and Layer 3 interfaces

Table 193: Supported Match Conditions Applicable to IPv6 Traffic for Firewall Filters on J-EX Series Switches *(continued)*

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
tcp-initial	Match the first TCP packet of a connection. **tcp-initial** is a synonym for the bit names **"(syn & !ack)"**. **tcp-initial** does not implicitly check whether the protocol is TCP. To do so, specify the **protocol tcp** match condition.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—not supported • J-EX8200—ports, VLANs, and Layer 3 interfaces
traffic-class *number*	Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP. You can specify DSCP in hexadecimal, binary, or decimal form. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): • **ef (46)**—as defined in RFC 2598, *An Expedited Forwarding PHB*. • **af11 (10)**, **af12 (12)**, **af13 (14)**; **af21 (18)**, **af22 (20)**, **af23 (22)**; **af31 (26)**, **af32 (28)**, **af33 (30)**; **af41 (34)**, **af42 (36)**, **af43 (38)** These four classes, with three drop precedences in each class, are defined for 12 code points, in RFC 2597, *Assured Forwarding PHB*.	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces	• J-EX4200—ports, VLANs, and Layer 3 interfaces • J-EX8200—ports, VLANs, and Layer 3 interfaces
vlan (*vlan-id* **|** *vlan-name***)**	The VLAN that is associated with the packet.	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX8200—ports and VLANs

Table 194 on page 1732 describes the match condition you can specify when configuring a firewall filter for non-IP traffic.

Table 194: Supported Match Condition Applicable to Non-IP Traffic for Firewall Filters on J-EX Series Switches

Match Condition	Description	Supported Platforms and Bind Points	
		Ingress	Egress
l2-encap-type llc-non-snap	Match on logical link control (LLC) layer packets for non-Subnet Access Protocol (SNAP) Ethernet Encapsulation type.	• J-EX4200— ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs	• J-EX4200—ports and VLANs • J-EX4500—ports and VLANs • J-EX8200—ports and VLANs

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria.

Table 195: Actions for Firewall Filters

Action	Description	Supported Platforms and Direction
accept	Accept a packet.	• J-EX4200—ingress and egress • J-EX4500—ingress and egress • J-EX8200—ingress and egress
discard	Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.	• J-EX4200—ingress and egress • J-EX4500—ingress and egress • J-EX8200—ingress and egress
reject ***message-type***	Discard a packet, and send an ICMPv4 message (type 3) “destination unreachable”. You can log the rejected packets if you configure the **syslog** action modifier. You can specify one of the following message codes: **administratively-prohibited (default), bad-host-tos, bad-network-tos, host-prohibited, host-unknown, host-unreachable, network-prohibited, network-unknown, network-unreachable, port-unreachable, precedence-cutoff, precedence-violation, protocol-unreachable, source-host-isolated, source-route-failed,** or **tcp-reset**. If you specify **tcp-reset**, a TCP reset is returned if the packet is a TCP packet. Otherwise nothing is returned. If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered”.	• J-EX4200—ingress only • J-EX4500—ingress only • J-EX8200—ingress only
routing-instance ***routing-instance-name***	Forward matched packets to a virtual routing instance.	• J-EX4200—ingress only • J-EX4500—ingress only • J-EX8200—ingress only

Table 195: Actions for Firewall Filters *(continued)*

Action	Description	Supported Platforms and Direction
vlan *vlan-name*	Forward matched packets to a specific VLAN. Ensure that you specify the VLAN name and not the VLAN range because the **vlan** action does not support the *vlan-range* option. NOTE: **vlan** is not a supported action for IPv6 traffic.	• J-EX4200—ingress and egress • J-EX4500—ingress and egress • J-EX8200—ingress and egress

In addition to the actions, you can specify action modifiers.

Table 196: Action Modifiers for Firewall Filters

Action Modifier	Description	Supported Platforms and Direction
analyzer *analyzer-name*	Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. Mirroring copies all packets seen on one switch port to a network monitoring connection on another switch port. The analyzer name must be configured under **[edit ethernet-switching-options analyzer]**. NOTE: **analyzer** is not a supported action modifier for a management interface.	• J-EX4200—ingress only • J-EX4500—ingress only • J-EX8200—ingress only
count *counter-name*	Count the number of packets that pass this filter, term, or policer.	• J-EX4200—ingress and egress • J-EX4500—ingress only • J-EX8200—ingress only
forwarding-class *class*	Classify the packet in one of the following forwarding classes: • **assured-forwarding** • **best-effort** • **expedited-forwarding** • **network-control**	• J-EX4200—ingress and egress • J-EX8200—ingress and egress
interface *interface-name*	Forward the traffic to the specified interface bypassing the switching lookup.	• J-EX4200—ingress only • J-EX8200—ingress only
log	Log the packet's header information in the Routing Engine. To view this information, issue the **show firewall log** command in the CLI.	• J-EX4200—ingress only • J-EX8200—ingress only
loss-priority (*high* | *low*)	Set the packet loss priority (PLP).	• J-EX4200—ingress and egress • J-EX8200—ingress and egress
policer *policer-name*	Apply rate limits to the traffic. You can specify a policer for ingress port, VLAN, and router firewall filters only.	• J-EX4200—ingress only • J-EX8200—ingress only

Table 196: Action Modifiers for Firewall Filters *(continued)*

Action Modifier	Description	Supported Platforms and Direction
syslog	Log an alert for this packet. You can specify that the log be sent to a server for storage and analysis.	• J-EX4200—ingress only • J-EX8200—ingress only

Firewall filters configured on loopback interfaces on the switches are applied only to packets that are sent to the Routing Engine CPU for further processing. Therefore, you can apply a firewall filter only in the ingress direction on the loopback interface. Table 197 on page 1734 lists match conditions, actions, and action modifiers that you can configure in the ingress direction for a loopback firewall filter.

Table 197: Supported Match Conditions, Actions, and Action Modifiers for Loopback Firewall Filters

Support For	J-EX4200 Switches	J-EX4500 Switch	J-EX8200 Switch
Match conditions	Match conditions supported for IPv4 and IPv6 traffic.		
	destination-address	**destination-address**	**destination-address**
	destination-port	**destination-port**	**destination-port**
	destination-prefix-list	**destination-prefix-list**	**destination-prefix-list**
	dscp	**dscp**	**dscp**
	icmp-code	**icmp-code**	**icmp-code**
	icmp-type	**icmp-type**	**icmp-type**

Understanding How Firewall Filters Are Evaluated

A firewall filter consists of one or more terms, and the order of the terms within a firewall filter is important. Before you configure firewall filters, you should understand how J-EX Series Switches evaluate the terms within a firewall filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the **then** statement is taken.
- If the packet matches all the conditions, and no action is specified in the **then** statement, the default action **accept** is taken.

When a firewall filter consists of more than one term, the firewall filter is evaluated sequentially:

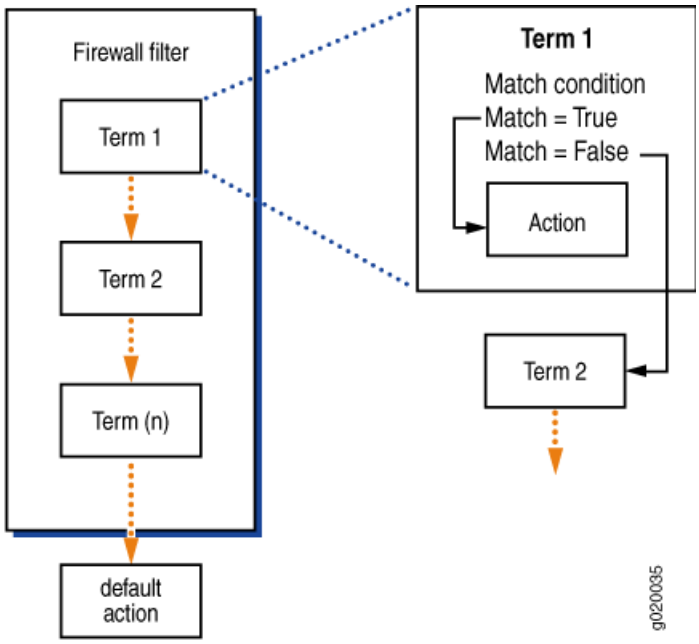
1. The packet is evaluated against the conditions in the **from** statement in the first term.
2. If the packet matches all the conditions in the term, the action in the **then** statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the **from** statement in the second term.

This process continues until either the packet matches the conditions in the **from** statement in one of the subsequent terms or there are no more terms in the filter.

4. If a packet passes through all the terms in the filter without a match, the packet is discarded.

Figure 56 on page 1736 shows how a J-EX Series switch evaluates the terms within a firewall filter.

Figure 56: Evaluation of Terms Within a Firewall Filter



If a term does not contain a **from** statement, the packet is considered to match and the action in the **then** statement of the term is taken.

If a term does not contain a **then** statement, or if an action has not been configured in the **then** statement, and the packet matches the conditions in the **from** statement of the term, the packet is accepted.

Every firewall filter contains an implicit **deny** statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {
then discard;
}
```

Consequently, if a packet passes through all the terms in a filter without matching any conditions, the packet is discarded. If you configure a firewall filter that has no terms, all packets that pass through the filter are discarded.

NOTE: Firewall filtering is supported on packets that are at least 48 bytes long.

Understanding Firewall Filter Match Conditions

Before you define terms for firewall filters, you must understand how the conditions that you specify in a term are handled and how to specify interface filter, numeric filter, address filter, and bit-field filter match conditions to achieve the desired filtering results.

Filter Match Conditions

In the **from** statement of a firewall filter term, you specify the conditions that the packet must match for the action in the **then** statement to be taken. All conditions in the **from** statement must match for the action to be taken. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify no match conditions in a term, that term matches all packets.

An individual condition in a **from** statement cannot contain a list of values. For example, you cannot specify numeric ranges or multiple source or destination addresses.

Individual conditions in a **from** statement cannot be negated. A negated condition is an explicit mismatch.

Numeric Filter Match Conditions

Numeric filter conditions match packet fields that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify a keyword that identifies the condition and a single value that a field in a packet must match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example:

  ```
  source-port 25;
  ```

- Text synonym for a single number— A match occurs if the value of the field matches the number that corresponds to the synonym. For example:

  source-port http;

To specify more than one value in a filter term, you enter each value in its own match statement. For example, a match occurs in the following term if the value of **vlan** field is 10 or 30.

```
[edit firewall family family-name filter filter-name term term-name from]
vlan 10;
vlan 30;
```

The following restrictions apply to numeric filter match conditions:

- You cannot specify a range of values.
- You cannot specify a list of comma-separated values.
- You cannot exclude a specific value in a numeric filter match condition. For example, you cannot specify a condition that would match only if the match condition was not equal to a given value.

Interface Filter Match Conditions

Interface filter match conditions can match interface name values in a packet. For interface filter match conditions, you specify the name of the interface, for example:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set interface ge-0/0/1
```

Port and VLAN interfaces do not use logical unit numbers. However, a firewall filter that is applied to a router interface can specify the logical unit number in the interface filter match condition, for example:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set interface ge-0/1/0.0
```

You can include the * wildcard as part of the interface name, for example:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set interface ge-0/*/1user@host# set interface ge-0/1/*user@host# set interface ge-*
```

IP Address Filter Match Conditions

Address filter match conditions can match prefix values in a packet, such as IP source and destination prefixes. For address filter match conditions, you specify a keyword that identifies the field and one prefix of that type that a packet must match.

You specify the address as a single prefix. A match occurs if the value of the field matches the prefix. For example:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set destination-address 10.2.1.0/28;
```

Each prefix contains an implicit 0/0 except statement, which means that any prefix that does not match the prefix that is specified is explicitly considered not to match.

To specify the address prefix, use the notation prefix/prefix-length. If you omit prefix-length, it defaults to /32. For example:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set destination-address 10[edit firewall family family-name filter filter-name term
term-name from] user@host# showdestination-address {10.0.0.0/32;}
```

To specify more than one IP address in a filter term, you enter each address in its own match statement. For example, a match occurs in the following term if the value of the **source-address** field matches either of the following source-address prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set source-address 10.0.0.0/8user@host# set source-address 10.1.0.0/16
```

MAC Address Filter Match Conditions

MAC address filter match conditions can match source and destination MAC address values in a packet. For MAC address filter match conditions, you specify a keyword that identifies the field and one value of that type that a packet must match.

You can specify the MAC address as six hexadecimal bytes in the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set destination-mac-address 0011.2233.4455
```

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set destination-mac-address 00:11:22:33:44:55
```

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set destination-mac-address 001122334455
```

To specify more than one MAC address in a filter term, you enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the **source-mac-address** field matches either of the following addresses.

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set source-mac-address 00:11:22:33:44:55user@host# set source-mac-address 00:11:22:33:20:15
```

Bit-Field Filter Match Conditions

Bit-field filter conditions match packet fields if particular bits in those fields are or are not set. You can match the IP options, TCP flags, and IP fragmentation fields. For bit-field filter match conditions, you specify a keyword that identifies the field and tests to determine that the option is present in the field.

To specify the bit-field value to match, enclose the value in double quotation marks. For example, a match occurs if the **RST** bit in the TCP flags field is set:

```
[edit firewall family family-name filter filter-name term term-name from]user@host#
set tcp-flags "rst"
```

Typically, you specify the bits to be tested by using keywords. Bit-field match keywords always map to a single bit value. You also can specify bit fields as hexadecimal or decimal numbers.

To match multiple bit-field values, use the logical operators, which are described in Table 198 on page 1740. The operators are listed in order from highest precedence to lowest precedence. Operations are left-associative.

Table 198: Actions for Firewall Filters

Logical Operators	Description
!	Negation.
&	Logical AND.
|	Logical OR.

To negate a match, precede the value with an exclamation point. For example, a match occurs only if the RST bit in the TCP flags field is not set:

```
[edit firewall family family-name filter filter-name term term-name from]user@host# set tcp-flags "!rst"
```

In the following example of a logical AND operation, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]user@host# set tcp-flags "syn&!ack"
```

In the following example of a logical OR operation, a match occurs if the packet is not the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]user@host# set tcp-flags "syn|ack"
```

For a logical OR operation, you can specify a maximum of two match conditions in a single term. If you need to match more than two bit-field values in a logical OR operation, configure the same match condition in consecutive terms with additional bit-field values. In the following example, the two terms configured match the SYN, ACK, FIN, or RST bit in the TCP flags field:

```
[edit firewall family family-name filter filter-name term term-name1 from]user@host# set tcp-flags "syn|ack"
[edit firewall family family-name filter filter-name term term-name2 from]user@host# set tcp-flags "fin|rst"
```

You can use text synonyms to specify some common bit-field matches. You specify these matches as a single keyword. In the following example of a text synonym, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]user@host# set tcp-flags tcp-initial
```

Understanding How Firewall Filters Test a Packet's Protocol

When examining match conditions, the Junos operating system (Junos OS) for J-EX Series Switches tests only the field that is specified. The software does not implicitly test the IP header to determine whether a packet is an IP packet. Therefore, in some cases, you must specify **protocol** field match conditions in conjunction with other match conditions to ensure that the filters are performing the expected matches.

If you specify a protocol match condition or a match of the ICMP type or TCP flags field, there is no implied protocol match. For the following match conditions, you must explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify the match **protocol tcp** or **protocol udp**.
- **source-port**—Specify the match **protocol tcp** or **protocol udp**.

If you do not specify the protocol when using the preceding fields, design your filters carefully to ensure that they perform the expected matches. For example, if you specify a match of **destination-port ssh**, the switch deterministically matches any packets that have a value of **22** in the two-byte field that is two bytes beyond the end of the IP header without ever checking the IP protocol field.

Understanding the Use of Policers in Firewall Filters

Policing, or rate limiting, is an important component of firewall filters that lets you control the amount of traffic that enters an interface.

A single firewall filter configured with a policer permits only traffic at specified data rates to provide protection from denial-of-service (DOS) attacks. Traffic that exceeds the rate limits specified by the policer can be discarded. Discard is the only supported policer action. Typically, traffic that exceeds the rate limits specified by the policer is either discarded or marked as lower priority than traffic that meets the rate limits specified by the policer. When necessary, low-priority traffic can be discarded by the switch to prevent congestion.

A policer applies two types of rate limits on traffic:

- Bandwidth—The number of bits per second permitted, on average.
- Maximum burst size—The maximum size permitted for bursts of data that exceed the given bandwidth limit.

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can define specific classes of traffic on an interface

and apply a set of rate limits to each class. After you name and configure a policer, it is stored as a template. You can then use a policer in a firewall filter configuration.

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. To get filter or term-specific packets counts, you must configure a new policer for each filter or term that requires policing.

Understanding Filter-Based Forwarding for J-EX Series Switches

Administrators of J-EX Series Switches can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature, which is called filter-based forwarding, you specify a filter and match criteria and then specify the virtual routing instance to send packets to.

You might want to use filter-based forwarding to route specific types of traffic through a firewall or security device before the traffic continues on its path. You can also use filter-based forwarding to give certain types of traffic preferential treatment or to improve load balancing of switch traffic.

CHAPTER 45

Examples of Firewall Filters Configuration

Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches

This example shows how to configure and apply firewall filters to control traffic that is entering or exiting a port on the switch, a VLAN on the network, and a Layer 3 interface on the switch. Firewall filters define the rules that determine whether to forward or deny packets at specific processing points in the packet flow.

Requirements

This example uses the following software and hardware components:

- Junos OS Release 10.2 or later for J-EX Series switches.
- Two EX4200-48T switches: one to be used as an access switch, the other to be used as a distribution switch
- One uplink module
- One router

Before you configure and apply the firewall filters in this example, be sure you have:

- An understanding of firewall filter concepts, policers, and CoS
- Installed the uplink module in the distribution switch. For instructions, see the Dell PowerConnect J-Series Ethernet Switch hardware guide for your switch at http://www.support.dell.com/manuals.

Overview

This configuration example show how to configure and apply firewall filters to provide rules to evaluate the contents of packets and determine when to discard, forward, classify, count, and analyze packets that are destined for or originating from the J-EX Series switches that handle all **voice-vlan**, **employee-vlan**, and **guest-vlan** traffic. Table 199 on page 1744 shows the firewall filters that are configured for the J-EX Series switches in this example.

Table 199: Configuration Components: Firewall Filters

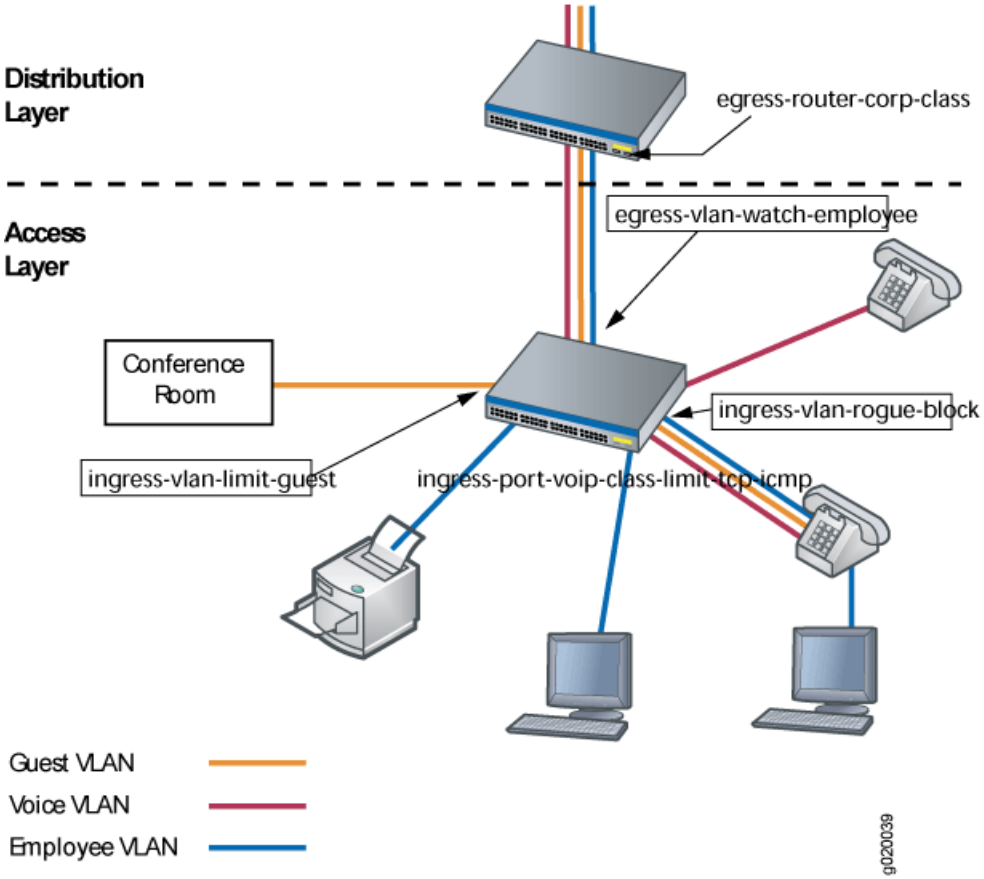
Component	Purpose/Description
Port firewall filter, **ingress-port-voip-class-limit-tcp-icmp**	This firewall filter performs two functions: • Assigns priority queueing to packets with a source MAC address that matches the phone MAC addresses. The forwarding class **expedited-forwarding** provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service for all **voice-vlan** traffic. • Performs rate limiting on packets that enter the ports for **employee-vlan**. The traffic rate for TCP and ICMP packets is limited to 1 Mbps with a burst size up to 30,000 bytes. This firewall filter is applied to port interfaces on the access switch.
VLAN firewall filter, **ingress-vlan-rogue-block**	Prevents rogue devices from using HTTP sessions to mimic the gatekeeper device that manages call registration, admission, and call status for VoIP calls. Only TCP or UDP ports should be used; and only the gatekeeper uses HTTP. That is, all **voice-vlan** traffic on TCP ports should be destined for the gatekeeper device. This firewall filter applies to all phones on **voice-vlan**, including communication between any two phones on the VLAN and all communication between the gatekeeper device and VLAN phones. This firewall filter is applied to VLAN interfaces on the access switch.
VLAN firewall filter, **egress-vlan-watch-employee**	Accepts **employee-vlan** traffic destined for the corporate subnet, but does not monitor this traffic. Employee traffic destined for the Web is counted and analyzed. This firewall filter is applied to vlan interfaces on the access switch.

Table 199: Configuration Components: Firewall Filters *(continued)*

Component	Purpose/Description
VLAN firewall filter, **ingress-vlan-limit-guest**	Prevents guests (non-employees) from talking with employees or employee hosts on **employee-vlan**. Also prevents guests from using peer-to-peer applications on **guest-vlan**, but allows guests to access the Web. This firewall filter is applied to VLAN interfaces on the access switch.
Router firewall filter, **egress-router-corp-class**	Prioritizes **employee-vlan** traffic, giving highest forwarding-class priority to employee traffic destined for the corporate subnet. This firewall filter is applied to a routed port (Layer 3 uplink module) on the distribution switch.

Figure 57 on page 1745 shows the application of port, VLAN, and Layer 3 routed firewall filters on the switch.

Figure 57: Application of Port, VLAN, and Layer 3 Routed Firewall Filters



Network Topology

The topology for this configuration example consists of one EX-4200-48T switch at the access layer, and one EX-4200-48T switch at the distribution layer. The distribution switch's uplink module is configured to support a Layer 3 connection to a router.

The J-EX Series switches are configured to support VLAN membership. Table 200 on page 1746 shows the VLAN configuration components for the VLANs.

Table 200: Configuration Components: VLANs

VLAN Name	VLAN ID	VLAN Subnet and Available IP Addresses	VLAN Description
voice-vlan	10	192.0.2.0/28 192.0.2.1 through 192.0.2.14 192.0.2.15 is subnet's broadcast address	Voice VLAN used for employee VoIP traffic
employee-vlan	20	**192.0.2.16/28 192.0.2.17** through **192.0.2.30 192.0.2.31** is subnet's broadcast address	VLAN standalone PCs, PCs connected to the network through the hub in VoIP telephones, wireless access points, and printers. This VLAN completely includes the voice VLAN. Two VLANs (**voice-vlan** and **employee-vlan**) must be configured on the ports that connect to the telephones.
guest-vlan	30	**192.0.2.32/28 192.0.2.33** through **192.0.2.46 192.0.2.47** is subnet's broadcast address	VLAN for guests' data devices (PCs). The scenario assumes that the corporation has an area open to visitors, either in the lobby or in a conference room, that has a hub to which visitors can plug in their PCs to connect to the Web and to their company's VPN.
camera-vlan	40	**192.0.2.48/28 192.0.2.49** through **192.0.2.62 192.0.2.63** is subnet's broadcast address	VLAN for the corporate security cameras.

Ports on the J-EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. Table 201 on page 1746 shows the switch ports that are assigned to the VLANs and the IP and MAC addresses for devices connected to the switch ports:

Table 201: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

Switch and Port Number	VLAN Membership	IP and MAC Addresses	Port Devices
ge-0/0/0, ge-0/0/1	**voice-vlan**, **employee-vlan**	IP addresses: **192.0.2.1** through **192.0.2.2** MAC addresses: **00.05.85.00.00.01**, **00.05.85.00–00.02**	Two VoIP telephones, each connected to one PC.

Table 201: Configuration Components: Switch Ports on a 48-Port All-PoE Switch *(continued)*

Switch and Port Number	VLAN Membership	IP and MAC Addresses	Port Devices
ge-0/0/2, ge-0/0/3	**employee-vlan**	**192.0.2.17** through **192.0.2.18**	Printer, wireless access points
ge-0/0/4, ge-0/0/5	**guest-vlan**	**192.0.2.34** through **192.0.2.35**	Two hubs into which visitors can plug in their PCs. Hubs are located in an area open to visitors, such as a lobby or conference room
ge-0/0/6, ge-0/0/7	**camera-vlan**	**192.0.2.49** through **192.0.2.50**	Two security cameras
ge-0/0/9	**voice-vlan**	IP address: **192.0.2.14** MAC address:**00.05.85.00.00.0E**	Gatekeeper device. The gatekeeper manages call registration, admission, and call status for VoIP phones.
ge-0/1/0		IP address: **192.0.2.65**	Layer 3 connection to a router; note that this is a port on the switch's uplink module

Configuring an Ingress Port Firewall Filter to Prioritize Voice Traffic and Rate-Limit TCP and ICMP Traffic

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

CLI Quick Configuration

To quickly configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the **employee-vlan** subnet, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall policer tcp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
set firewall policer tcp-connection-policer then discard
set firewall policer icmp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit
1m
set firewall policer icmp-connection-policer then discard
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
from source-mac-address 00.05.85.00.00.01
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
from source-mac-address 00.05.85.00.00.02
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
from protocol udp
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
then forwarding-class expedited-forwarding
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
then loss-priority low
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
network-control from precedence net-control
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
network-control then forwarding-class network-control
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
network-control then loss-priority low
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection from destination-address 192.0.2.16/28
```

```
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection from protocol tcp
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then policer tcp-connection-policer
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then count tcp-counter
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then forwarding-class best-effort
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then loss-priority high

set class-of-service schedulers voice-high buffer-size percent 15
set class-of-service schedulers voice-high priority high
set class-of-service schedulers net-control buffer-size percent 10
set class-of-service schedulers net-control priority high
set class-of-service schedulers best-effort buffer-size percent 75
set class-of-service schedulers best-effort priority low
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class
expedited-forwarding scheduler voice-high
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class network-control
scheduler net-control
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class best-effort
scheduler best-effort
```

Step-by-Step Procedure

To configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the **employee-vlan** subnet:

1. Define the policers **tcp-connection-policer** and **icmp-connection-policer**:

```
[edit]
user@switch# set firewall policer tcp-connection-policer if-exceeding burst-size-limit
30k bandwidth-limit 1m
user@switch# set firewall policer tcp-connection-policer then discard
user@switch# set firewall policer icmp-connection-policer if-exceeding burst-size-limit
30k bandwidth-limit 1m
user@switch# set firewall policer icmp-connection-policer then discard
```

2. Define the firewall filter **ingress-port-voip-class-limit-tcp-icmp**:

```
[edit firewall]
user@switch# set family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp
```

3. Define the term **voip-high**:

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp ]
user@switch# set term voip-high from source-mac-address 00.05.85.00.00.01
user@switch# set term voip-high from source-mac-address 00.05.85.00.00.02
user@switch# set term voip-high from protocol udp
user@switch# set term voip-high then forwarding-class expedited-forwarding
user@switch# set term voip-high then loss-priority low
```

4. Define the term **network-control**:

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp ]
user@switch# set term network-control from precedence net-control
user@switch# set term network-control then forwarding-class network-control
user@switch# set term network-control then loss-priority low
```

5. Define the term **tcp-connection** to configure rate limits for TCP traffic:

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term tcp-connection from destination-address 192.0.2.16/28
user@switch# set term tcp-connection from protocol tcp
user@switch# set term tcp-connection then policer tcp-connection-policer
user@switch# set term tcp-connection then count tcp-counter
user@switch# set term tcp-connection then forwarding-class best-effort
user@switch# set term tcp-connection then loss-priority high
```

6. Define the term **icmp-connection** to configure rate limits for ICMP traffic:

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term icmp-connection from destination-address 192.0.2.16/28
user@switch# set term icmp-connection from protocol icmp
user@switch# set term icmp-connection then policer icmp-policer
user@switch# set term icmp-connection then count icmp-counter
user@switch# set term icmp-connection then forwarding-class best-effort
user@switch# set term icmp-connection then loss-priority high
```

7. Define the term **best-effort** with no match conditions for an implicit match on all packets that did not match any other term in the firewall filter:

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term best-effort then forwarding-class best-effort
user@switch# set term best-effort then loss-priority high
```

8. Apply the firewall filter **ingress-port-voip-class-limit-tcp-icmp** as an input filter to the port interfaces for **employee-vlan** :

```
[edit interfaces]
user@switch# set ge-0/0/0 description "voice priority and tcp and icmp traffic
rate-limiting filter at ingress port"
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input
ingress-port-voip-class-limit-tcp-icmp
user@switch# set ge-0/0/1 description "voice priority and tcp and icmp traffic
rate-limiting filter at ingress port"
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input
ingress-port-voip-class-limit-tcp-icmp
```

9. Configure the parameters that are desired for the different schedulers.

NOTE: When you configure parameters for the schedulers, define the numbers to match your network traffic patterns.

```
[edit class-of-service]
user@switch# set schedulers voice-high buffer-size percent 15
user@switch# set schedulers voice-high priority high
user@switch# set schedulers network—control buffer-size percent 10
user@switch# set schedulers network—control priority high
user@switch# set schedulers best-effort buffer-size percent 75
user@switch# set schedulers best-effort priority low
```

10. Assign the forwarding classes to schedulers with a scheduler map:

```
[edit class-of-service]
user@switch# set scheduler-maps ethernet-diffsrv-cos-map
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class
expedited-forwarding scheduler voice-high
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class
network-control scheduler net-control
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class
best-effort scheduler best-effort
```

11. Associate the scheduler map with the outgoing interface:

```
[edit class-of-service]
user@switch# set interfaces ge—0/1/0 scheduler-map ethernet-diffsrv-cos-map
```

Results Display the results of the configuration:

```
user@switch# show
  firewall {
    policer tcp-connection-policer {
      if-exceeding {
        bandwidth-limit 1m;
        burst-size-limit 30k;
      }
      then {
```

```
        discard;
    }
}
policer icmp-connection-policer {
    if-exceeding {
        bandwidth-limit 1m;
        burst-size-limit 30k;
    }
    then {
        discard;
    }
}
family ethernet-switching {
    filter ingress-port-voip-class-limit-tcp-icmp {
        term voip-high {
            from {
                destination-mac-address 00.05.85.00.00.01;
                    destination-mac-address 00.05.85.00.00.02;
                protocol udp;
            }
            then {
                forwarding-class expedited-forwarding;
                loss-priority low;
            }
        }
        term network-control {
            from {
                precedence net-control ;
            }
            then {
                forwarding-class network-control;
                loss-priority low;
            }
        }
        term tcp-connection {
            from {
                destination-address 192.0.2.16/28;
                protocol tcp;
            }
            then {
                policer tcp-connection-policer;
                    count tcp-counter;
                    forwarding-class best-effort;
                loss-priority high;
            }
        }
        term icmp-connection
            from {
                protocol icmp;
            }
            then {
                policer icmp-connection-policer;
                    count icmp-counter;
                    forwarding-class best-effort;
                loss-priority high;
            }
```

```
        }
        term best-effort {
          then {
            forwarding-class best-effort;
            loss-priority high;
          }
        }
      }
    }
  }
  interfaces {

Configuring a VLAN Ingress Firewall Filter to Prevent Rogue Devices from Disrupting VoIP Traffic

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

CLI Quick Configuration

To quickly configure a VLAN firewall filter on **voice-vlan** to prevent rogue devices from using HTTP sessions to mimic the gatekeeper device that manages VoIP traffic, copy the following commands and paste them into the switch terminal window:

```
[edit]
```

```
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper from
destination-address 192.0.2.14
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper from
destination-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper then
accept
set firewall family ethernet-switching filter ingress-vlan-rogue-block term from-gatekeeper from
source-address 192.0.2.14
set firewall family ethernet-switching filter ingress-vlan-rogue-block term from-gatekeeper from
source-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term from-gatekeeper then
accept
set firewall family ethernet-switching filter ingress-vlan-rogue-block term not-gatekeeper from
destination-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term not-gatekeeper then
count rogue-counter
set firewall family ethernet-switching filter ingress-vlan-rogue-block term not-gatekeeper then
discard
set vlans voice-vlan description "block rogue devices on voice-vlan"
set vlans voice-vlan filter input ingress-vlan-rogue-block
```

Step-by-Step Procedure

To configure and apply a VLAN firewall filter on **voice-vlan** to prevent rogue devices from using HTTP to mimic the gatekeeper device that manages VoIP traffic:

1. Define the firewall filter **ingress-vlan-rogue-block** to specify filter matching on the traffic you want to permit and restrict:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter ingress-vlan-rogue-block
   ```

2. Define the term **to-gatekeeper** to accept packets that match the destination IP address of the gatekeeper:

   ```
   [edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
   user@switch# set term to-gatekeeper from destination-address 192.0.2.14
   user@switch# set term to-gatekeeper from destination-port 80
   user@switch# set term to-gatekeeper then accept
   ```

3. Define the term **from-gatekeeper** to accept packets that match the source IP address of the gatekeeper:

   ```
   [edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
   user@switch# set term from-gatekeeper from source-address 192.0.2.14
   user@switch# set term from-gatekeeper from source-port 80
   user@switch# set term from-gatekeeper then accept
   ```

4. Define the term **not-gatekeeper** to ensure all **voice-vlan** traffic on TCP ports is destined for the gatekeeper device:

   ```
   [edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
   user@switch# set term not-gatekeeper from destination-port 80
   user@switch# set term not-gatekeeper then count rogue-counter
   user@switch# set term not-gatekeeper then discard
   ```

5. Apply the firewall filter **ingress-vlan-rogue-block** as an input filter to the VLAN interface for the VoIP telephones:

   ```
   [edit]
   user@switch# set vlans voice-vlan description "block rogue devices on voice-vlan"
   user@switch# set vlans voice-vlan filter input ingress-vlan-rogue-block
   ```

Results Display the results of the configuration:

```
user@switch# show
  firewall {
    family ethernet-switching {
      filter ingress-vlan-rogue-block {
        term to-gatekeeper {
          from {
            destination-address 192.0.2.14/32
            destination-port 80;
          }
          then {
            accept;
          }
        }
        term from-gatekeeper {
          from {
            source-address 192.0.2.14/32
            source-port 80;
          }
          then {
            accept;
          }
        }
        term not-gatekeeper {
          from {
            destination-port 80;
          }
          then {
            count rogue-counter;
            discard;
          }
        }
    }
  vlans {
    voice-vlan {
      description "block rogue devices on voice-vlan";
      filter {
        input ingress-vlan-rogue-block;
      }
    }
  }
```

Configuring a VLAN Firewall Filter to Count, Monitor, and Analyze Egress Traffic on the Employee VLAN

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

CLI Quick Configuration A firewall filter is configured and applied to VLAN interfaces to filter **employee-vlan** egress traffic. Employee traffic destined for the corporate subnet is accepted but not monitored. Employee traffic destined for the Web is counted and analyzed.

To quickly configure and apply a VLAN firewall filter, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-corp
from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-corp
then accept
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
from destination-port 80
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
then count employee-web-counter
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
then analyzer employee-monitor
set vlans employee-vlan description "filter at egress VLAN to count and analyze employee to
Web traffic"
set vlans employee-vlan filter output egress-vlan-watch-employee
```

Step-by-Step Procedure

To configure and apply an egress port firewall filter to count and analyze **employee-vlan** traffic that is destined for the Web:

1. Define the firewall filter **egress-vlan-watch-employee**:

   ```
   [edit firewall]
   user@switch# set family ethernet-switching filter egress-vlan-watch-employee
   ```

2. Define the term **employee-to-corp** to accept but not monitor all **employee-vlan** traffic destined for the corporate subnet:

   ```
   [edit firewall family ethernet-switching filter egress-vlan-watch-employee]
   user@switch# set term employee-to-corp from destination-address 192.0.2.16/28
   user@switch# set term employee-to-corp then accept
   ```

3. Define the term **employee-to-web** to count and monitor all **employee-vlan** traffic destined for the Web:

   ```
   [edit firewall family ethernet-switching filter egress-vlan-watch-employee]
   user@switch# set term employee-to-web from destination-port 80
   user@switch# set term employee-to-web then count employee-web-counter
   user@switch# set term employee-to-web then analyzer employee-monitor
   ```

   NOTE: See “Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on J-EX Series Switches” on page 2371 for information about configuring the **employee-monitor** analyzer.

4. Apply the firewall filter **egress-vlan-watch-employee** as an output filter to the port interfaces for the VoIP telephones:

   ```
   [edit]
   user@switch# set vlans employee-vlan description "filter at egress VLAN to count and
   analyze employee to Web traffic"
   user@switch# set vlans employee-vlan filter output egress-vlan-watch-employee
   ```

Results

Display the results of the configuration:

```
user@switch# show
  firewall {
    family ethernet-switching {
      filter egress-vlan-watch-employee {
```

```
        term employee-to-corp {
          from {
            destination-address 192.0.2.16/28
          }
          then {
            accept;
          }
        }
        term employee-to-web {
          from {
            destination-port 80;
          }
          then {
            count employee-web-counter:
            analyzer employee-monitor;
          }
        }
      }
    }
  }
  vlans {
    employee-vlan {
      description "filter at egress VLAN to count and analyze employee to Web traffic";
      filter {
        output egress-vlan-watch-employee;
      }
    }
  }
```

Configuring a VLAN Firewall Filter to Restrict Guest-to-Employee Traffic and Peer-to-Peer Applications on the Guest VLAN

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

CLI Quick Configuration

In the following example, the first filter term permits guests to talk with other guests but not employees on **employee-vlan**. The second filter term allows guests Web access but prevents them from using peer-to-peer applications on **guest-vlan**.

To quickly configure a VLAN firewall filter to restrict guest-to-employee traffic, blocking guests from talking with employees or employee hosts on **employee-vlan** or attempting to use peer-to-peer applications on **guest-vlan**, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter ingress-vlan-limit-guest term guest-to-guest from
destination-address 192.0.2.33/28
set firewall family ethernet-switching filter ingress-vlan-limit-guest term guest-to-guest then
accept
set firewall family ethernet-switching filter ingress-vlan-limit-guest term
no-guest-employee-no-peer-to-peer from destination-mac-address 00.05.85.00.00.DF
set firewall family ethernet-switching filter ingress-vlan-limit-guest term
no-guest-employee-no-peer-to-peer then accept
set vlans guest-vlan description "restrict guest-to-employee traffic and peer-to-peer applications
on guest VLAN"
set vlans guest-vlan filter input ingress-vlan-limit-guest
```

Step-by-Step Procedure

To configure and apply a VLAN firewall filter to restrict guest-to-employee traffic and peer-to-peer applications on **guest-vlan**:

1. Define the firewall filter **ingress-vlan-limit-guest**:

```
[edit firewall]
set firewall family ethernet-switching filter ingress-vlan-limit-guest
```

2. Define the term **guest-to-guest** to permit guests on the **guest-vlan** to talk with other guests but not employees on the **employee-vlan**:

```
[edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
user@switch# set term guest-to-guest from destination-address 192.0.2.33/28
user@switch# set term guest-to-guest then accept
```

3. Define the term **no-guest-employee-no-peer-to-peer** to allow guests on **guest-vlan** Web access but prevent them from using peer-to-peer applications on the **guest-vlan**.

NOTE: The destination-mac-address is the default gateway, which for any host in a VLAN is the next-hop router.

```
[edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
user@switch# set term no-guest-employee-no-peer-to-peer from
destination-mac-address 00.05.85.00.00.DF
user@switch# set term no-guest-employee-no-peer-to-peer then accept
```

4. Apply the firewall filter **ingress-vlan-limit-guest** as an input filter to the interface for **guest-vlan** :

```
[edit]
user@switch# set vlans guest-vlan description "restrict guest-to-employee traffic and
peer-to-peer applications on guest VLAN"
user@switch# set vlans guest-vlan filter input ingress-vlan-limit-guest
```

Results

Display the results of the configuration:

```
user@switch# show
  firewall {
    family ethernet-switching {
      filter ingress-vlan-limit-guest {
        term guest-to-guest {
          from {
            destination-address 192.0.2.33/28;
          }
          then {
            accept;
          }
        }
        term no-guest-employee-no-peer-to-peer {
          from {
            destination-mac-address 00.05.85.00.00.DF;
          }
          then {
```

```
            accept;
          }
        }
      }
    }
  }
}
vlans {
  guest-vlan {
    description "restrict guest-to-employee traffic and peer-to-peer applications on
      guest VLAN";
    filter {
      input ingress-vlan-limit-guest;
    }
  }
}
```

Configuring a Router Firewall Filter to Give Priority to Egress Traffic Destined for the Corporate Subnet

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

CLI Quick Configuration

To quickly configure a firewall filter for a routed port (Layer 3 uplink module) to filter **employee-vlan** traffic, giving highest forwarding-class priority to traffic destined for the corporate subnet, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family inet filter egress-router-corp-class term corp-expedite from destination-address
192.0.2.16/28
set firewall family inet filter egress-router-corp-class term corp-expedite then forwarding-class
expedited-forwarding
set firewall family inet filter egress-router-corp-class term corp-expedite then loss-priority low
set firewall family inet filter egress-router-corp-class term not-to-corp then accept
set interfaces ge-0/1/0 description "filter at egress router to expedite destined for corporate
network"
set ge-0/1/0 unit 0 family inet address 103.104.105.1
set interfaces ge-0/1/0 unit 0 family inet filter output egress-router-corp-class
```

Step-by-Step Procedure

To configure and apply a firewall filter to a routed port (Layer 3 uplink module) to give highest priority to **employee-vlan** traffic destined for the corporate subnet:

1. Define the firewall filter **egress-router-corp-class**:

   ```
   [edit]
   user@switch# set firewall family inet filter egress-router-corp-class
   ```

2. Define the term **corp-expedite**:

   ```
   [edit firewall]
   user@switch# set family inet filter egress-router-corp-class term corp-expedite from
   destination-address 192.0.2.16/28
   user@switch# set family inet filter egress-router-corp-class term corp-expedite then
   forwarding-class expedited-forwarding
   user@switch# set family inet filter egress-router-corp-class term corp-expedite then
   loss-priority low
   ```

3. Define the term **not-to-corp**:

```
[edit firewall]
user@switch# set family inet filter egress-router-corp-class term not-to-corp then
accept
```

4. Apply the firewall filter **egress-router-corp-class** as an output filter for the port on the switch's uplink module, which provides a Layer 3 connection to a router:

```
[edit interfaces]
user@switch# set ge-0/1/0 description "filter at egress router to expedite employee
traffic destined for corporate network"
user@switch# set ge-0/1/0 unit 0 family inet address 103.104.105.1
user@switch# set ge-0/1/0 unit 0 family inet filter output egress-router-corp-class
```

Results Display the results of the configuration:

```
user@switch# show
  firewall {
    family inet {
      filter egress-router-corp-class {
        term corp-expedite {
          from {
            destination-address 192.0.2.16/28;
          }
          then {
            forwarding-class expedited-forwarding;
            loss-priority low;
          }
        }
        term not-to-corp {
          then {
            accept;
          }
        }
      }
    }
  }
  interfaces {
    ge-0/1/0 {
      unit 0 {
        description "filter at egress router interface to expedite employee traffic destined
          for corporate network";
        family inet {
          source-address 103.104.105.1
          filter {
            output egress-router-corp-class;
          }
        }
      }
    }
  }
```

Verification

To confirm that the firewall filters are working properly, perform the following tasks:

- Verifying that Firewall Filters and Policers are Operational on page 1760
- Verifying that Schedulers and Scheduler-Maps are Operational on page 1760

Verifying that Firewall Filters and Policers are Operational

Purpose Verify the operational state of the firewall filters and policers that are configured on the switch.

Action Use the operational mode command:

```
user@switch> show firewall
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name                                                Packets
icmp-counter                                              0
tcp-counter                                               0
Policers:
Name                                                Packets
icmp-connection-policer                                   0
tcp-connection-policer                                    0

Filter: ingress-vlan-rogue-block

Filter: egress-vlan-watch-employee
Counters:
Name                                                Packets
employee-web-counter                                      0
```

Meaning The **show firewall** command displays the names of the firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for all configured counters and the packet count for all policers.

Verifying that Schedulers and Scheduler-Maps are Operational

Purpose Verify that schedulers and scheduler-maps are operational on the switch.

Action Use the operational mode command:

```
user@switch> show class-of-service scheduler-map

Scheduler map: default, Index: 2

  Scheduler: default-be, Forwarding class: best-effort, Index: 20
    Transmit rate: 95 percent, Rate Limit: none, Buffer size: 95 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             non-TCP         1    default-drop-profile
      Low             TCP             1    default-drop-profile
      High            non-TCP         1    default-drop-profile
      High            TCP             1    default-drop-profile

  Scheduler: default-nc, Forwarding class: network-control, Index: 22
```

```
    Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             non-TCP         1    default-drop-profile
      Low             TCP             1    default-drop-profile
      High            non-TCP         1    default-drop-profile
      High            TCP             1    default-drop-profileScheduler map:
ethernet-diffsrv-cos-map, Index: 21657

  Scheduler: best-effort, Forwarding class: best-effort, Index: 61257
    Transmit rate: remainder, Rate Limit: none, Buffer size: 75 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             non-TCP         1    <default-drop-profile>
      Low             TCP             1    <default-drop-profile>
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: voice-high, Forwarding class: expedited-forwarding, Index: 3123
    Transmit rate: remainder, Rate Limit: none, Buffer size: 15 percent,
    Priority: high
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             non-TCP         1    <default-drop-profile>
      Low             TCP             1    <default-drop-profile>
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: net-control, Forwarding class: network-control, Index: 2451
    Transmit rate: remainder, Rate Limit: none, Buffer size: 10 percent,
    Priority: high
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             non-TCP         1    <default-drop-profile>
      Low             TCP             1    <default-drop-profile>
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>
```

Meaning Displays statistics about the configured schedulers and schedulers-maps.

Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on J-EX Series Switches

Administrators can configure filter-based forwarding on a J-EX Series switch by using a firewall filter to forward matched traffic to a specific virtual routing instance.

This example describes how to set up filter-based forwarding:

Requirements

This example uses the following software and hardware components:

- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches

Overview and Topology

In this example, traffic from one application server that is destined for a different application server is matched by a firewall filter based on the IP address. Any matching packets are routed to a particular virtual routing instance that first sends all traffic to a security device, then forwards it to the designated destination address.

Configuration

To configure filter-based forwarding:

CLI Quick Configuration

To quickly create and configure filter-based forwarding, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24
set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24
set firewall family inet filter fil term t1 from source-address 1.1.1.1/32
set firewall family inet filter fil term t1 from protocol tcp
set interfaces ge-0/0/0 unit 0 family inet filter input fil
set routing-instances vrf01 instance-type virtual-router
set routing-instances vrf01 interface ge-0/0/1.0
set routing-instances vrf01 interface ge-0/0/3.0
set routing-instances vrf01 routing-options static route 12.34.56.0/24 next-hop 10.1.3.254
set firewall family inet filter fil term t1 then routing-instance vrf01
```

Step-by-Step Procedure

To configure filter-based forwarding:

1. Create interfaces to the application servers:

```
[edit]
user@switch# set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24
user@switch# set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24
```

2. Create a firewall filter that matches the correct source address:

```
[edit]
user@switch# set firewall family inet filter fil term t1 from source-address 1.1.1.1/32
user@switch# set firewall family inet filter fil term t1 from protocol tcp
```

3. Associate the filter with the source application server's interface:

```
[edit]
user@switch# set interfaces ge-0/0/0 unit 0 family inet filter input fil
```

4. Create a virtual router:

```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```

5. Associate the interfaces with the virtual router:

```
[edit]
user@switch# set routing-instances vrf01 interface ge-0/0/1.0
user@switch# set routing-instances vrf01 interface ge-0/0/3.0
```

6. Configure the routing information for the virtual routing instance:

```
[edit]
user@switch# set routing-instances vrf01 routing-options static route 12.34.56.0/24
next-hop 10.1.3.254
```

7. Set the filter to forward packets to the virtual router you created:

```
[edit]
user@switch# set firewall family inet filter fil term t1 then routing-instance vrf01
```

Results

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
    ge-0/0/0 {
        unit 0 {
            family inet {
                filter {
                    input fil;
                }
                address 10.1.0.1/24;
            }
        }
    }
    ge-0/0/3 {
        unit 0 {
            family inet {
                address 10.1.3.1/24;
            }
```

```
    }
  }
}
firewall {
  family inet {
    filter fil {
      term t1 {
        from {
          source-address {
            1.1.1.1/32;
          }
          protocol tcp;
        }
        then {
          routing-instance vrf01;
        }
      }
    }
  }
}
  routing-instances {
    vrf01 {
      instance-type virtual-router;
      interface ge-0/0/1.0;
      interface ge-0/0/3.0;
      routing-options {
        static {
          route 12.34.56.0/24 next-hop 10.1.3.254;
        }
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That Filter-Based Forwarding Was Configured on page 1764

Verifying That Filter-Based Forwarding Was Configured

Purpose Verify that filter-based forwarding was properly enabled on the switch.

Action

1. Use the **show interfaces filters** command:

```
user@switch> show interfaces filters ge-0/0/0.0

Interface        Admin Link Proto Input Filter         Output Filter
ge-0/0/0.0       up    down inet  fil
```

2. Use the **show route forwarding-table** command:

```
user@switch> show route forwarding-table

Routing table: default.inet
Internet:
Destination        Type RtRef Next hop           Type Index NhRef Netif
```

```
default            user     1 0:12:f2:21:cf:0    ucst   331     4 me0.0
default            perm     0                    rjct    36     3
0.0.0.0/32         perm     0                    dscd    34     1
10.1.0.0/24        ifdn     0                    rslv   613     1
ge-0/0/0.0
10.1.0.0/32        iddn     0 10.1.0.0           recv   611     1

10.1.1.0/26        ifdn     0                    rslv   583     1 vlan.0
10.1.1.0/32        iddn     0 10.1.1.0           recv   581     1 vlan.0
10.1.1.1/32        user     0                    rjct    36     3
10.1.1.1/32        intf     0 10.1.1.1           locl   582     2
10.1.1.1/32        iddn     0 10.1.1.1           locl   582     2
10.1.1.63/32       iddn     0 10.1.1.63          bcst   580     1 vlan.0
255.255.255.255/32 perm     0                    bcst    32     1

Routing table: vrf01.inet
Internet:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    rjct   559     2
0.0.0.0/32         perm     0                    dscd   545     1
10.1.3.0/24        ifdn     0                    rslv   617     1
ge-0/0/3.0
10.1.3.0/32        iddn     0 10.1.3.0           recv   615     1
ge-0/0/3.0
10.1.3.1/32        user     0                    rjct   559     2
10.1.3.1/32        intf     0 10.1.3.1           locl   616     2
10.1.3.1/32        iddn     0 10.1.3.1           locl   616     2
10.1.3.255/32      iddn     0 10.1.3.255         bcst   614     1
ge-0/0/3.0
224.0.0.0/4        perm     0                    mdsc   546     1
224.0.0.1/32       perm     0 224.0.0.1          mcst   529     1
255.255.255.255/32 perm     0                    bcst   543     1

Routing table: default.iso
ISO:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    rjct    60     1

Routing table: vrf01.iso
ISO:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    rjct   600     1
```

Meaning The output indicates that the filter was created on the interface and that the virtual routing instance is forwarding matching traffic to the correct IP address.

Related Documentation

- Configuring Firewall Filters (CLI Procedure) on page 1771

Example: Configuring a Firewall Filter on a Management Interface on a J-EX Series Switch

You can configure a firewall filter on a management interface on a J-EX Series switch to filter ingress or egress traffic on the management interface on the switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch.

This example discusses how to configure a firewall filter on a management interface to filter SSH packets egressing from a J-EX Series switch:

Requirements

This example uses the following hardware and software components:

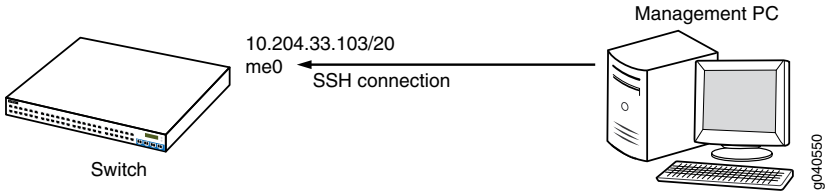
- One J-EX Series switch and one management PC
- Junos OS Release 10.4 or later for J-EX Series switches

Overview and Topology

In this example, a management PC establishes an SSH connection with the management interface on a switch to remotely manage the switch. The IP address configured for the management interface is 10.204.33.103/20. A firewall filter is configured on the management interface to count the number of packets egressing from a source SSH port on the management interface. When the management PC establishes the SSH session with the management interface, the management interface returns SSH packets to the management PC to confirm that the session is established. These SSH packets are filtered based on the match condition specified in the firewall filter before they are forwarded to the management PC. As these packets are generated from the source SSH port on the management interface, they fulfill the match condition specified for the management interface. The number of matched SSH packets provides a count of the number of packets that have traversed the management interface. A system administrator can use this information to monitor the management traffic and take any action if required.

Figure 58 on page 1767 shows the topology for this example in which a management PC establishes an SSH connection with the switch.

Figure 58: SSH Connection From a Management PC to a J-EX Series Switch



Configuration

To configure a firewall filter on a management interface, perform these tasks:

CLI Quick Configuration

To quickly create and configure a firewall filter on the management interface to filter SSH packets egressing from the management interface, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family inet filter mgmt_fil1 term t1 from source-port ssh
set firewall family inet filter mgmt_fil1 term t1 then count c1
set firewall family inet filter mgmt_fil1 term t2 then accept
set interfaces me0 unit 0 family inet filter output mgmt_fil1
```

Step-by-Step Procedure

To configure a firewall filter on the management interface to filter SSH packets:

1. Configure the firewall filter that matches SSH packets from the source port:

   ```
   [edit]
   user@switch# set firewall family inet filter mgmt_fil1 term t1 from source-port ssh

   user@switch# set firewall family inet filter mgmt_fil1 term t1 then count c1

   user@switch# set firewall family inet filter mgmt_fil1 term t2 then accept
   ```

   These statements set a counter **c1** to count the number of SSH packets that egress from the source SSH interface on the management interface.

2. Set the firewall filter for the management interface:

   ```
   [edit]
   user@switch# set interfaces me0 unit 0 family inet filter output mgmt_fil1
   ```

NOTE: You can also set the firewall filter for a VME interface.

Results

Check the results of the configuration:

```
[edit]
user@switch# show
interfaces {
  me0 {
    unit 0 {
      family inet {
        filter {
          output mgmt_fil1;
          }
        address 10.93.54.6/24;
```

```
        }
      }
    }
  }

  firewall {
    family inet {
      filter mgmt_fil1{
        term t1 {
          from {
            source-port ssh;
          then count c1;
          }
        }
        term t2 {
          then accept;
        }
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Firewall Filter Is Configured on a Management Interface on page 1768

Verifying That the Firewall Filter Is Configured on a Management Interface

Purpose Verify that the firewall filter has been enabled on the management interface on the switch.

Action

1. Verify that the firewall filter is applied to the management interface:

```
[edit]

user@switch#show interfaces me0

unit 0 {
    family inet {
        filter {
            output mgmt_fil1;
               }
        address 10.204.33.103/20;
                }
       }
```

2. Check the counter value that is associated with the firewall filter:

```
user@switch> show firewall

Filter: mgmt_fil1
Counters:
Name                                Bytes              Packets
c1                                  0                    0
```

3. From the management PC, establish a secure shell session with the switch:

```
[user@management-pc ~]$ ssh user@10.204.33.103
```

4. Check counter values after SSH packets are generated from the switch in response to the secure shell session request by the management PC:

```
user@switch> show firewall

Filter: mgmt_fil1
Counters:
Name                                Bytes              Packets
c1                                  3533                 23
```

Meaning

The output indicates that the firewall filter has been applied to the management interface and the counter value indicates that 23 SSH packets were generated from the switch.

CHAPTER 46

Configuring Firewall Filters

Configuring Firewall Filters (CLI Procedure)

You configure firewall filters on J-EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

This topic describes:

Configuring a Firewall Filter

Before you can apply a firewall filter to a port, VLAN, or Layer 3 interface, you must configure a firewall filter with the required details, such as type of family for the firewall filter, firewall filter name, and match conditions. A match condition in the firewall filter configuration can contain multiple terms that define the criteria for the match condition. For each term, you must specify an action to be performed if a packet matches the conditions in the term. For information on different match conditions and actions, see “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 1715.

To configure a firewall filter:

1. Configure the family address type for the firewall filter:

   - For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching** to filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets, for example:

     ```
     [edit firewall]
     user@switch# set family ethernet-switching
     ```

   - For a firewall filter that is applied to a Layer 3 (routed) interface:

     - To filter IPv4 packets, specify the family address type **inet**, for example:

       ```
       [edit firewall]
       user@switch# set family inet
       ```

     - To filter IPv6 packets, specify the family address type **inet6**, for example:

       ```
       [edit firewall]
       user@switch# set family inet6
       ```

   

   NOTE: You can configure firewall filters for both IPv4 and IPv6 traffic on the same Layer 3 interface.

2. Specify the filter name:

   ```
   [edit firewall family ethernet-switching]
   user@switch# set filter ingress-port-filter
   ```

   The filter name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters. Each filter name must be unique.

3. If you want to apply a firewall filter to multiple interfaces and name individual firewall counters specific to each interface, configure the **interface-specific** option:

   ```
   [edit firewall family ethernet-switching filter ingress-port-filter]
   user@switch# set interface-specific
   ```

4. Specify a term name:

   ```
   [edit firewall family ethernet-switching filter ingress-port-filter]
   user@switch# set term term-one
   ```

   The term name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters.

   A firewall filter can contain one or more terms. Each term name must be unique within a filter.

NOTE:

The maximum number of terms allowed per firewall filter for J-EX Series switches is:

- 7168 for J-EX4200 switches
- 1536 for J-EX4500 switches
- 32768 for J-EX8200 switches

If you attempt to configure a firewall filter that exceeds these limits, the switch returns an error message when you commit the configuration.

5. In each firewall filter term, specify the match conditions to use to match components of a packet.

   To specify match conditions to match on packets that contain a specific source-address and source-port—for example:

   ```
   [edit firewall family ethernet-switching filter ingress-port-filter term
   term-one]
   user@switch# set from source-address 192.0.2.14
   user@switch# set from source-port 80
   ```

   You can specify one or more match conditions in a single **from** statement. For a match to occur, the packet must match all the conditions in the term.

   The **from** statement is optional, but if included in a term, the **from** statement cannot be empty. If you omit the **from** statement, all packets are considered to match.

6. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term.

   You can specify an action and/or action modifiers:

   - To specify a filter action, for example, to discard packets that match the conditions of the filter term:

     ```
     [edit firewall family ethernet-switching filter ingress-port-filter term
     term-one]
     user@switch# set then discard
     ```

     You can specify no more than one action (**accept**, **discard**, or **routing-instance**) per filter term.

   - To specify action modifiers, for example, to count and classify packets in a forwarding class:

     ```
     [edit firewall family ethernet-switching filter ingress-port-filter term
     term-one]
     user@switch# set then count counter-one
     user@switch# set then forwarding-class expedited-forwarding
     ```

You can specify any of the following action modifiers in a **then** statement:

- **analyzer** ***analyzer-name***—Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. An **analyzer** must be configured under the **ethernet-switching** family address type. See "Configuring Port Mirroring to Analyze Traffic (CLI Procedure)" on page 2383.
- **count** ***counter-name***—Count the number of packets that pass this filter term.

  NOTE: We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

- **forwarding-class** ***class***—Classify packets in a forwarding class.
- **loss-priority** ***priority***—Set the priority of dropping a packet.
- **policer** ***policer-name***—Apply rate-limiting to the traffic.

If you omit the **then** statement or do not specify an action, packets that match all the conditions in the **from** statement are accepted. However, you must always explicitly configure an action and/or action modifier in the **then** statement. You can include no more than one action statement, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the **from** statement must match.

NOTE: Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

On J-EX8200 Ethernet Switches, if an implicit or explicit discard action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the neighbor discovery IPv6 resolve packets to pass through the switch.

Applying a Firewall Filter to a Port on a Switch

You can apply a firewall filter to a port on a switch to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in "Firewall Filter Match Conditions and Actions for J-EX Series Switches" on page 1715. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a port to filter ingress or egress traffic:

NOTE: For applying a firewall filter to a management interface, see "Applying a Firewall Filter to a Management Interface on a Switch" on page 1775

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set ge-0/0/1 description "filter to limit tcp traffic filter at trunk port for employee-vlan and voice-vlan applied on the interface"
```

NOTE: Providing the description is optional.

2. Specify the unit number and family address type for the interface:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching
```

For firewall filters that are applied to ports, the family address type must be **ethernet-switching**.

3. To apply a firewall filter to filter packets that are entering a port:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a port:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter output egress-port-filter
```

NOTE: You can apply no more than one firewall filter per port, per direction.

Applying a Firewall Filter to a Management Interface on a Switch

You can configure and apply a firewall filter to a management interface to control traffic that is entering or exiting the interface on a switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch. Similar to configuring a firewall filter on other types of interfaces, you can configure a firewall filter on a management interface using any match condition, action, and action modifier specified in “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 1715 except for the following action modifiers:

- **loss-priority**
- **forwarding-class**

You can apply a firewall filter to the management Ethernet interface on any J-EX Series switch. You can also apply a firewall filter to the virtual management Ethernet (VME) interface on the J-EX4200 switch. For more information on the management Ethernet interface and the VME interface, see J-EX Series Switches Interfaces Overview.

To apply a firewall filter on the management interface to filter ingress or egress traffic:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set me0 description "filter to limit tcp traffic filter at management interface"
```

NOTE: Providing the description is optional.

2. Specify the unit number and family address type for the management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet
```

NOTE: For firewall filters that are applied to management interfaces, the family address type can be either inet or inet6.

3. To apply a firewall filter to filter packets that are entering a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter output egress-port-filter
```

NOTE: You can apply no more than one firewall filter per management interface, per direction.

Applying a Firewall Filter to a VLAN on a Network

You can apply a firewall filter to a VLAN on a network to filter ingress or egress traffic on the network. To apply a firewall filter to a VLAN, specify the VLAN name and ID, and then apply the firewall filter to the VLAN. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 1715. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a VLAN:

1. Specify the VLAN name and VLAN ID and provide a meaningful description of the firewall filter and the VLAN to which the filter is applied:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 vlan-description "filter to rate limit traffic applied on employee-vlan"
```

NOTE: Providing the description is optional.

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:

   - To apply a firewall filter to filter packets that are entering the VLAN:

     ```
     [edit vlans]
     user@switch# set employee-vlan vlan-id 20 filter input ingress-vlan-filter
     ```

   - To apply a firewall filter to filter packets that are exiting the VLAN:

     ```
     [edit vlans]
     user@switch# set employee-vlan vlan-id 20 filter output egress-vlan-filter
     ```

NOTE: You can apply no more than one firewall filter per VLAN, per direction.

Applying a Firewall Filter to a Layer 3 (Routed) Interface

You can apply a firewall filter to a Layer 3 (routed) interface to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 1715. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a Layer 3 interface on a switch:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

   ```
   [edit interfaces]
   user@switch# set ge-0/1/0 description "filter to count and monitor employee-vlan
   traffic applied on layer 3 interface"
   ```

NOTE: Providing the description is optional.

2. Specify the unit number, family address type, and address for the interface:

   ```
   [edit interfaces]
   user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24
   ```

   For firewall filters applied to Layer 3 interfaces, the family address type must be **inet** (for IPv4 traffic) or **inet6** (for IPv6 traffic).

3. You can apply firewall filters to filter packets that are entering or exiting a Layer 3 (routed) interface:

   - To apply a firewall filter to filter packets that are entering a Layer 3 interface:

     ```
     [edit interfaces]
     ```

```
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter input
ingress-router-filter
```

- To apply a firewall filter to filter packets that are exiting a Layer 3 interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter output
egress-router-filter
```

NOTE: You can apply no more than one firewall filter per Layer 3 interface, per direction.

Configuring Firewall Filters (J-Web Procedure)

You configure firewall filters on J-EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

To configure firewall filter settings using the J-Web interface:

1. Select **Configure** > **Security** > **Filters**.

   The Firewall Filter Configuration page displays a list of all configured port/VLAN or router filters and the ports or VLANs associated with a particular filter.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see “Using the Commit Options to Commit Configuration Changes” in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - Add—Select this option to create a new filter. Enter information as specified in Table 202 on page 1779.
   - Edit—Select this option to edit an existing filter. Enter information as specified in Table 202 on page 1779.
   - Delete—Select this option to delete a filter.
   - Term Up—Select this option to move a term up in the filter term list.
   - Term Down—Select this option to move a term down in the filter term list.

Table 202: Create a New Filter

Field	Function	Your Action
Filter tab		
Filter type	Specifies the filter type: port/VLAN firewall filter or router firewall filter.	Select the filter type.
Filter name	Specifies the name for the filter.	Enter a name.
Select terms to be part of the filter	Specifies the terms to be associated with the filter. Add new terms or edit existing terms.	Click **Add** to add new terms. Enter information as specified in Table 203 on page 1779 and Table 204 on page 1780.
Association tab		
Port Associations	Specifies the ports with which the filter is associated. NOTE: For a port/VLAN filter type, only Ingress direction is supported for port association.	1. Click **Add**. 2. Select the direction: Ingress or Egress. 3. Select the ports. 4. Click **OK**.
VLAN Associations	Specifies the VLANs with which the filter is associated. NOTE: Because router firewall filters can be associated with ports only, this section is not displayed for a router firewall filter.	1. Click **Add**. 2. Select the direction: Ingress or Egress. 3. Select the VLANs. 4. Click **OK**.

Table 203: Create a New Term

Field	Function	Your Action
Term Name	Specifies the name of the term.	Enter a name.
Protocols	Specifies the protocols to be associated with the term.	1. Click **Add**. 2. Select the protocols. 3. Click **OK**.

Table 203: Create a New Term *(continued)*

Field	Function	Your Action
Source	Specifies the source IP address, MAC address, and available ports. NOTE: MAC address is specified only for port/VLAN filters.	To specify the IP address, click **Add** > **IP** and enter the IP address. To specify the MAC address, click **Add** > **MAC** and enter the MAC address. To specify the ports (interfaces), click **Add** > **Ports** and enter the port number. To delete the IP address, MAC address, or port details, select it and click **Remove**.
Destination	Specifies the destination IP address, MAC address, and available ports. NOTE: MAC address is specified only for port/VLAN filters.	To specify the IP address, click **Add** > **IP** and enter the IP address. To specify the MAC address, click **Add** > **MAC** and enter the MAC address. To specify the ports (interfaces), click **Add** > **Ports** and enter the port number. To delete the IP address, MAC address, or port details, select it and click **Remove**.
Action	Specifies the packet action for the term.	Select one: • Accept • Discard
More	Specifies advanced configuration options for the filter.	Select the match conditions as specified in Table 204 on page 1780. Select the packet action for the term as specified in Table 204 on page 1780.

Table 204: Advanced Options for Terms

Table	Function	Your Action
ICMP Type	Specifies the ICMP packet type field. Typically, you specify this match condition in conjunction with the protocol match condition to determine which protocol is being used on the port.	Select the option from the list.
ICMP Code	Specifies more specific information than ICMP type. Because the value's meaning depends upon the associated ICMP type, you must specify **icmp-type** along with **icmp-code.** The keywords are grouped by the ICMP type with which they are associated.	Select a value from the list.
DSCP	Specifies the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.	Select the DSCP number from the list.

Table 204: Advanced Options for Terms *(continued)*

Table	Function	Your Action
Precedence	Specifies IP precedence. NOTE: IP precedence and DSCP number cannot be specified together for the same term.	Select the option from the list.
IP Options	Specifies the presence of the options field in the IP header.	Select the option from the list.
Interface	Specifies the interface on which the packet is received.	Select the interface from the list.
Ether type	Specifies the Ethernet type field of a packet. NOTE: This option is not applicable for a routing filter.	Select a value from the list.
Dot 1q user priority	Specifies the user-priority field of the tagged Ethernet packet. User-priority values can be 0–7. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed) • background (1)—Background • best-effort (0)—Best effort • controlled-load (4)—Controlled load • excellent-load (3)—Excellent load • network-control (7)—Network control reserved traffic • standard (2)—Standard or Spare • video (5)—Video • voice (6)—Voice NOTE: This option is not applicable for a routing filter.	Select a value from the list.
VLAN	Specifies the VLAN to be associated with the packet. NOTE: This option is not applicable for a routing filter.	Select the VLAN from the list.
TCP Flags	Specifies one or more TCP flags. NOTE: TCP flags are supported on ingress ports, VLANs, and router interfaces.	Select the option **TCP Initial** or enter a combination of TCP flags.
Fragmentation Flags	Specifies the IP fragmentation flags. NOTE: Fragmentation flags are supported on ingress ports, VLANs, and router interfaces.	Select either the option **is-fragment** or enter a combination of fragment action flags.
Dot1q tag	Specifies the value for tag field in the Ethernet header. Values can be from 1 through 4095. NOTE: This option is not applicable for a routing filter.	Enter the value.
Action		

Table 204: Advanced Options for Terms *(continued)*

Table	Function	Your Action
Counter name	Specifies the count of the number of packets that pass this filter, term, or policer.	Enter a value.
Forwarding class	Classifies the packet into one of the following forwarding classes: • assured-forwarding • best-effort • expedited-forwarding • network-control • user-defined	Select the option from the list.
Loss priority	Specifies the packet loss priority. NOTE: Forwarding class and loss priority should be specified together for the same term.	Enter the value.
Analyzer	Specifies whether to perform port-mirroring on packets. Port-mirroring copies all packets entering one switch port to a network monitoring connection on another switch port.	Select the analyzer (port mirroring configuration) from the list.

- Firewall Filter Match Conditions and Actions for J-EX Series Switches on page 1715

Configuring Policers to Control Traffic Rates (CLI Procedure)

You can configure policers to rate limit traffic on J-EX Series switches. After you configure a policer, you can include it in an ingress firewall filter configuration.

When you configure a firewall filter, you can specify a policer action for any term or terms within the filter. All traffic that matches a term that contains a policer action goes through the policer that the term references. Each policer that you configure includes an implicit counter. To get term-specific packet counts, you must configure a new policer for each filter term that requires policing.

The following policer limits apply on the switch:

- A maximum of 512 policers can be configured for port firewall filters.
- A maximum of 512 policers can be configured for VLAN and Layer 3 firewall filters.

If the policer configuration exceeds these limits, the switch returns the following message after the commit operation:

```
Cannot assign policers: Max policer limit reached
```

1. Configuring Policers on page 1783
2. Specifying Policers in a Firewall Filter Configuration on page 1784
3. Applying a Firewall Filter That Is Configured with a Policer on page 1784

Configuring Policers

To configure a policer:

1. Specify the name of the policer:

   ```
   [edit firewall]
   user@switch# set policer policer-one
   ```

   The policer name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long.

2. Configure rate limiting for the policer:

   a. Specify the bandwidth limit in bits per second (bps) to control the traffic rate on an interface:

      ```
      [edit firewall policer policer-one]
      user@switch# set if-exceeding bandwidth-limit 300k
      ```

      The range for the bandwidth limit is 1k through 102.3g bps.

   b. Specify the maximum allowed burst size to control the amount of traffic bursting:

      ```
      [edit firewall policer policer-one]
      user@switch# set if-exceeding burst-size-limit 500k
      ```

      To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur:

      burst size = bandwidth * allowable time for burst traffic

      The range for the burst-size limit is 1 through 2,147,450,880 bytes.

3. Specify the policer action **discard** to discard packets that exceed the rate limits:

   ```
   [edit firewall policer]
   user@switch# set policer-one then discard
   ```

   Discard is the only supported policer action.

Specifying Policers in a Firewall Filter Configuration

To reference a policer for a single firewall, configure a filter term that includes the policer action:

```
[edit firewall family ethernet-switching]
user@switch# set filter limit-hosts term term-one from source-address 192.0.2.16/28
userswitch# set filter limit-hosts term term-one then policer policer-one
```

Applying a Firewall Filter That Is Configured with a Policer

A firewall filter that is configured with one or more policer actions, like any other filter, must be applied to a port, VLAN, or Layer 3 interface. For information about applying firewall filters, see the sections on applying firewall filters in “Configuring Firewall Filters (CLI Procedure)” on page 1771.

NOTE: You can include policer actions on ingress firewall filters only.

Assigning Multifield Classifiers in Firewall Filters to Specify Packet-Forwarding Behavior (CLI Procedure)

You can configure firewall filters with multifield classifiers to classify packets transiting a port, VLAN, or Layer 3 interface on a J-EX Series switch.

You specify multifield classifiers in a firewall filter configuration to set the forwarding class and packet loss priority (PLP) for incoming or outgoing packets. By default, the data traffic that is not classified is assigned to the **best-effort** class associated with queue 0.

You can specify any of the following default forwarding classes:

Forwarding class	Queue
best-effort	0
assured-forwarding	1
expedited-forwarding	5
network-control	7

To assign multifield classifiers in firewall filters:

1. Configure the family name and filter name for the filter at the **[edit firewall]** hierarchy level, for example:

```
[edit firewall]
user@switch# set family ethernet-switching
user@switch# set family ethernet-switching filter ingress-filter
```

2. Configure the terms of the filter, including the **forwarding-class** and **loss-priority** action modifiers as appropriate. When you specify a forwarding class you must also specify the packet loss priority. For example, each of the following terms examines different packet header fields and assigns an appropriate classifier and the packet loss priority:

   - The term **voice-traffic** matches packets on the **voice-vlan** and assigns the forwarding class **expedited-forwarding** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term voice-traffic from vlan-id voice-vlan
user@switch# set term voice-traffic then forwarding-class expedited-forwarding
user@switch# set term voice-traffic then loss-priority low
```

   - The term **data-traffic** matches packets on **employee-vlan** and assigns the forwarding class **assured-forwarding** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term data-traffic from vlan-id employee-vlan
user@switch# set term data-traffic then forwarding-class assured-forwarding
user@switch# set term data-traffic then loss-priority low
```

- Because loss of network-generated packets can jeopardize proper network operation, delay is preferable to discard of packets. The following term, **network-traffic**, assigns the forwarding class **network-control** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term network-traffic from precedence net-control
user@switch# set term network-traffic then forwarding-class network
user@switch# set term network-traffic then loss-priority low
```

- The last term **accept-traffic** matches any packets that did not match on any of the preceding terms and assigns the forwarding class **best-effort** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term accept-traffic from precedence net-control
user@switch# set term accept-traffic then forwarding-class best-effort
user@switch# set term accept-traffic then loss-priority low
```

3. Apply the filter **ingress-filter** to a port, VLAN or Layer 3 interface. For information about applying the filter, see "Configuring Firewall Filters (CLI Procedure)" on page 1771.

Configuring Routing Policies (J-Web Procedure)

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes are advertised in the protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table on the routing device.

To configure routing policies for a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Routing** > **Policies**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:

   - **Global Options**—Configures global options for policies. Enter information into the configuration page as described in Table 205 on page 1787.
   - **Add**—Configures a new policy. Select **New** and specify a policy name. To add terms, enter information into the configuration page as described in Table 206 on page 1788. Select **Clone** to create a copy of an existing policy.
   - **Edit**—Edits an existing policy. To modify an existing term, enter information into the configuration page as described in Table 206 on page 1788.
   - **Term Up**—Moves a term up in the list.
   - **Term Down**—Moves a term down in the list.
   - **Delete**—Deletes the selected policy.
   - **Test Policy**—Tests the policy. Use this option to check whether the policy produces the results that you expect.

Table 205: Policies Global Configuration Parameters

Field	Function	Your Action
Prefix List	Specifies a list of IPv4 address prefixes for use in a routing policy statement.	To add a prefix list: 1. Click **Add**. 2. Enter a name for the prefix list. 3. To add an IP address, click **Add**. 4. Enter the IP address and the subnet mask and click **OK**. 5. Click **OK**. To edit a prefix list, click **Edit**. Edit the settings and click **OK**. To delete a prefix list, select it and click **Delete**.

Table 205: Policies Global Configuration Parameters *(continued)*

Field	Function	Your Action
BGP Community	Specifies a BGP community.	To add a BGP community: 1. Click **Add**. 2. Enter a name for the community. 3. To add a community, click **Add**. 4. Enter the community ID and click **OK**. 5. Click **OK**. To edit a BGP community, click **Edit**. Edit the settings and click **OK**. To delete a BGP community, select it and click **Delete**.
AS Path	Specifies an AS path. This is applicable to BGP only.	To add an AS path: 1. Click **Add**. 2. Enter the AS path name. 3. Enter the regular expression and click **OK**. 4. Click **OK**. To edit an AS path, click **Edit**. Edit the settings and click **OK**. To delete an AS path, select it and click **Delete**.

Table 206: Terms Configuration Parameters

Field	Function	Your Action
Term Name	Specifies a term name.	Type or select and edit the name.
Source tab		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list
Preference	Specifies the individual preference value for the route.	Type or select and edit the value.
Metric	Specifies a metric value. You can specify up to four metric values.	Type or select and edit the value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select **Add** > **Interface**. Select the interface from the list. To add an address, select **Add** > **Address**. Select the address from the list. To remove an interface, select it and click **Remove**.

Table 206: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
Prefix List	Specifies a named list of IP addresses. You can specify an exact match with incoming routes.	Click **Add**. Select the prefix list from the list and click **OK**. To remove a prefix list, select it and click **Remove**.
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click **Add** and select the protocol from the list. To remove a protocol, select it and click **Remove**.
Policy	Specifies the name of a policy to evaluate as a subroutine.	Click **Add**. Select the policy from the list. To remove a policy, select it and click **Remove**.
More	Specifies advanced configuration options for policies.	Click **More** for advanced configuration.
OSPF Area ID	Specifies the area identifier.	Type the IP address.
BGP Origin	Specifies the origin of the AS path information.	Select a value from the list.
Local Preference	Specifies the BGP local preference.	Type a value.
Route	Specifies the type of route.	Select **External**. Select the OSPF type from the list.
AS Path	Specifies the name of an AS path regular expression.	Click **Add**. Select the AS path from the list.
Community	Specifies the name of one or more communities.	Click **Add**. Select the community from the list.
Destination tab		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list.
Preference	Specifies the individual preference value for the route.	Type a value.
Metric	Specifies a metric value.	Type a value.

Table 206: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select **Add** > **Interface**. Select the interface from the list. To add an address, select **Add** > **Address**. Select the address from the list. To delete an interface, select it and click **Remove**.
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click **Add** and select the protocol from the list. To delete a protocol, select it and click **Remove**.
Action tab		
Action	Specifies the action to take if the conditions match.	Select a value from the list.
Default Action	Specifies that any action that is intrinsic to the protocol is overridden. This action is also nonterminating, so that various policy terms can be evaluated before the policy is terminated.	Select a value from the list.
Next	Specifies the default control action if a match occurs, and there are no further terms in the current routing policy.	Select a value from the list.
Priority	Specifies a priority for prefixes included in an OSPF import policy. Prefixes learned through OSPF are installed in the routing table based on the priority assigned to the prefixes.	Select a value from the list.
BGP Origin	Specifies the BGP origin attribute.	Select a value from the list.
AS Path Prepend	Affixes an AS number at the beginning of the AS path. The AS numbers are added after the local AS number has been added to the path. This action adds an AS number to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS number is placed within a confederation sequence. Otherwise, the affixed AS number is placed with a nonconfederation sequence.	Enter a value.
AS Path Expand	Extracts the last AS number in the existing AS path and affixes that AS number to the beginning of the AS path *n* times, where *n* is a number from 1 through 32. The AS number is added before the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS numbers are placed within a confederation sequence. Otherwise, the affixed AS numbers are placed within a nonconfederation sequence. This option is typically used in non-IBGP export policies.	Select the type and type a value.

Table 206: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
Load Balance Per Packet	Specifies that all next-hop addresses in the forwarding table must be installed and have the forwarding table perform per-packet load balancing. This policy action allows you to optimize VPLS traffic flows across multiple paths.	Select the check box to enable the option.
Tag	Specifies the tag value. The tag action sets the 32-bit tag field in OSPF external link-state advertisement (LSA) packets.	Select the action and type a value.
Metric	Changes the metric (MED) value by the specified negative or positive offset. This action is useful only in an external BGP (EBGP) export policy.	Select the action and type a value.
Route	Specifies whether the route is external.	Select the **External** check box to enable the option, and select the OSPF type.
Preference	Specifies the preference value.	Select the preference action and type a value.
Local Preference	Specifies the BGP local preference attribute.	Select the action and type a value.
Class of Service	Specifies and applies the class-of-service parameters to routes installed into the routing table. • Source class The value entered here maintains the packet counts for a route passing through your network, based on the source address. • Destination class The value entered here maintains packet counts for a route passing through your network, based on the destination address in the packet. • Forwarding class	Type the source class. Type the destination class. Type the forwarding class.

CHAPTER 47

Verifying Firewall Filter Configuration

Verifying That Firewall Filters Are Operational

Purpose After you configure and apply firewall filters to ports, VLANs, or Layer 3 interfaces, you can perform the following task to verify that the firewall filters configured on J-EX Series switches are working properly.

Action Use the operational mode command to verify that the firewall filters on the switch are working properly:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name                                                Bytes              Packets
counter-employee-web                                    0                    0
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name                                                Bytes              Packets
icmp-counter                                            0                    0
Policers:
Name                                               Packets
icmp-connection-policer                                 0
tcp-connection-policer                                  0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

Meaning The **show firewall** command displays the names of all firewall filters, policers, and counters that are configured on the switch. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits.

Verifying That Policers Are Operational

Purpose After you configure policers and include them in firewall filter configurations, you can perform the following tasks to verify that the policers configured on J-EX Series switches are working properly.

Action Use the operational mode command to verify that the policers on the switch are working properly:

```
user@switch>  show policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
Name                                                Packets
icmp-connection-policer                                   0
tcp-connection-policer                                    0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

Meaning The **show policer** command displays the names of all firewall filters and policers that are configured on the switch. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

Related Documentation

- Configuring Firewall Filters (J-Web Procedure) on page 1778
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 1743
- Monitoring Firewall Filter Traffic on page 1794

Monitoring Firewall Filter Traffic

You can monitor firewall filter traffic on J-EX Series switches.

- Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch on page 1795
- Monitoring Traffic for a Specific Firewall Filter on page 1795
- Monitoring Traffic for a Specific Policer on page 1795

Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch

Purpose Perform the following task to monitor the number of packets and bytes that matched the firewall filters and monitor the number of packets that exceeded policer rate limits:

Action Use the operational mode command:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name                                                Bytes              Packets
counter-employee-web                                 3348                   27
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name                                                Bytes              Packets
icmp-counter                                         4100                   49
Policers:
Name                                              Packets
icmp-connection-policer                                 0
tcp-connection-policer                                  0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

Meaning The **show firewall** command displays the names of all firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for counters and packet count for policers.

Monitoring Traffic for a Specific Firewall Filter

Purpose Perform the following task to monitor the number of packets and bytes that matched a firewall filter and monitor the number of packets that exceeded the policer rate limits.

Action Use the operational mode command:

```
user@switch> show firewall filter ingress-vlan-rogue-block
Filter: ingress-vlan-rogue-block
Counters:
Name                                                Bytes              Packets
rogue-counter                                        2308                   20
```

Meaning The **show firewall filter *filter-name*** command displays the name of the firewall filter, the packet and byte count for all counters configured with the filter, and the packet count for all policers configured with the filter.

Monitoring Traffic for a Specific Policer

Purpose Perform the following task to monitor the number of packets that exceeded policer rate limits:

Action Use the operational mode command:

```
user@switch> show policer tcp-connection-policer
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
```

```
Name                                                  Packets
tcp-connection-policer                                      0
```

Meaning The **show policer** ***policer-name*** command displays the name of the firewall filter that specifies the policer-action and displays the number of packets that exceeded rate limits for the specified filter.

CHAPTER 48

Troubleshooting Firewall Filters

Troubleshooting Firewall Filters

Firewall Filter Configuration Returns a No Space Available in TCAM Message

Problem When a firewall filter configuration exceeds the amount of available TCAM space, the switch returns the following **syslogd** message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

The switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of available TCAM space. However, the commit operation for the firewall filter configuration is completed in the CLI module.

Solution When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the firewall filter and its bind points and apply the new smaller firewall filter to the same bind points:

1. Delete the firewall filter configuration and the bind points to ports, VLANs, or Layer 3 interfaces—for example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter filter-ingress-vlan
user@switch# delete vlans voice-vlan description "filter to block rogue devices on
voice-vlan"
user@switch# delete vlans voice-vlan filter input mini-filter—ingress-vlan
```

2. Commit the operation:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space on the switch—for example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new—filter-ingress-vlan ...
```

4. Apply (bind) the new firewall filter to a port, VLAN , or Layer 3 interface—for example:

```
[edit]
user@switch# set vlans voice-vlan description "filter to block rogue devices on
voice-vlan"
user@switch# set vlans voice-vlan filter input new-filter—ingress-vlan
```

5. Commit the operation:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing bind points:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-filter-ingress-vlan...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the bind points of the original filter—for example:

```
[edit]
user@switch# set vlans voice-vlan description "smaller filter to block rogue devices on
voice-vlan"
user@switch# set vlans voice-vlan filter input new-filter-ingress-vlan
```

3. Commit the operation:

```
[edit]
user@switch# commit
```

Only the original bind points, and not the original firewall filter itself, are deleted.

Firewall Filter Configuration Statements Supported by Junos OS for J-EX Series Switches

You configure firewall filters to filter packets based on their components and to perform an action on packets that match the filter.

Table 207 on page 1800 lists the options that are supported for the firewall statement in Junos OS for J-EX Series switches.

Table 207: Supported Options for Firewall Filter Statements

Statement and Option	Description
family *family-name* { }	The ***family-name*** option specifies the version or type of addressing protocol: • **any**—Filter packets based on protocol-independent match conditions. • **ethernet-switching**—Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets • **inet**—Filter IPv4 packets • **inet6**—Filter IPv6 packets
filter *filter-name* { }	The ***filter-name*** option identifies the filter. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the name in quotation marks (" ").
interface-specific	The **interface-specific** statement configures unique names for individual firewall counters specific to each interface.
term *term-name* { }	The ***term-name*** option identifies the term. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). Each term name must be unique within a filter.

from {
match-conditions;
}
	The **from** statement is optional. If you omit it, all packets are considered to match.

then {
action;
action-modifiers;
}
	For information about the ***action*** and ***action-modifiers*** options, see "Firewall Filter Match Conditions and Actions for J-EX Series Switches" on page 1715.

Table 207: Supported Options for Firewall Filter Statements *(continued)*

Statement and Option	Description
policer *policer-name* { }	The ***policer-name*** option identifies the policer. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the name in quotation marks (" ").
filter-specific	The **filter-specific** statement configures policers and counters for a specific filter name.

if-exceeding {
bandwidth-limit *bps*
burst-size-limit *bytes*
}
	The **bandwidth-limit *bps*** option specifies the traffic rate in bits per second (bps).
	
	You can specify ***bps*** as a decimal value or as a decimal number followed by one of the following abbreviations:
	
	• k (thousand)
	• m (million)
	• g (billion, which is also called a thousand million)
	
	Range: 1000 (1k) through 102,300,000,000 (102.3g) bps
	
	The **burst-size-limit *bytes*** option specifies the maximum allowed burst size to control the amount of traffic bursting. To determine the value for the burst-size limit, you can multiply the bandwidth of the interface on which the filter is applied by the amount of time (in seconds) to allow a burst of traffic at that bandwidth to occur:
	
	burst size = bandwidth * allowable time for burst traffic
	
	You can specify a decimal value or a decimal number followed by k (thousand) or m (million).
	
	Range: 1 through 2,147,450,880 bytes

then {
policer-action
}
	Use the ***policer-action*** option to specify **discard** to discard traffic that exceeds the rate limits.

Junos OS for J-EX Series switches does not support some of the firewall filter statements that are supported by other Junos OS packages. Table 208 on page 1802 shows the firewall filter statements that are not supported by Junos OS for J-EX Series switches.

Table 208: Firewall Filter Statements That Are Not Supported by Junos OS for J-EX Series Switches

Statements Not Supported	Statement Hierarchy Level
• interface-set *interface-set-name* { } • load-balance-group *group-name* { } • three-color-policer *name* { } • logical-interface-policer; • single-rate { } • two-rate { }	[edit firewall]
• prefix-action *name* { } • prefix-policer { } • service-filter *filter-name* { } • simple-filter *simple-filter-name* { }	[edit firewall family *family-name*]
• accounting-profile *name*;	[edit firewall family *family-name* filter *filter-name*]
• logical-bandwidth-policer; • logical-interface-policer;	[edit firewall policer *policer-name*]
bandwidth-percent *number*;	[edit firewall policer *policer-name* if-exceeding]

apply-path

Syntax apply-path *path*;

Hierarchy Level [edit logical-systems *logical-system-name* policy-options **prefix-list** *name*],
[edit policy-options **prefix-list** *name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Expand a prefix list to include all prefixes pointed to by a defined path.

Options *path*—String of elements composed of identifiers or configuration keywords that points to a set of prefixes. You can include wildcards (enclosed in angle brackets) to match more than one identifier. You cannot add a path element, including wildcards, after a leaf statement. Path elements, including wildcards, can only be used after a container statement.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Prefix Lists

as-path

Syntax as-path *name regular-expression*;

Hierarchy Level [edit dynamic policy-options],
[edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define an autonomous system (AS) path regular expression for use in a routing policy match condition.

Options *name*—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 65,536 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

regular-expression—One or more regular expressions used to match the AS path.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring AS Path Regular Expressions to Use as Routing Policy Match Conditions
- Configuring Routing Policies and Policy Objects in the Dynamic Database
- **dynamic-db on page 1811**

as-path-group

Syntax

```
as-path-group group-name {
    as-path name regular-expression;
}
```

Hierarchy Level

[edit dynamic policy-options],
[edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define a group containing multiple AS path regular expressions for use in a routing policy match condition.

Options

group-name—Name that identifies the AS path group. One or more AS path regular expressions must be listed below the **as-path-group** hierarchy.

name—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

regular-expression—One or more regular expressions used to match the AS path.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring AS Path Regular Expressions to Use as Routing Policy Match Conditions
- Configuring Routing Policies and Policy Objects in the Dynamic Database
- **dynamic-db on page 1811**

bandwidth-limit

Syntax bandwidth-limit *bps*;

Hierarchy Level [edit **firewall policer** *policer-name* **if-exceeding**]
[edit logical-systems *logical-system-name* firewall policer *policer-name* if-exceeding]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the traffic rate in bits per second.

Options ***bps*** —Traffic rate to be specified in bits per second. Specify ***bps*** as a decimal value or as a decimal number followed by one of the following abbreviations:

- k (thousand)
- m (million)
- g (billion, which is also called a thousand million)

Range:

- 1000 (1k) through 102,300,000,000 (102.3g) bps (J-EX Series switches)
- 8000 (8k) through 40,000,000,000 (40g) bps (routers)

Required Privilege Level firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

- Configuring a Single-Rate Two-Color Policer

burst-size-limit

Syntax burst-size-limit *bytes*;

Hierarchy Level [edit **firewall policer** *policer-name* **if-exceeding**]
[edit logical-systems *logical-system-name* firewall policer *policer-name* if-exceeding]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum allowed burst size to control the amount of traffic bursting.

Options ***bytes*** —Decimal value or a decimal number followed by k (thousand) or m (million).

Range:

- 1 through 2,147,450,880 bytes (J-EX Series switches)
- 1500 through 1,00,000,000,000 bytes (routers)

Required Privilege Level firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

- Single-Rate Two-Color Policer Overview
- Configuring a Single-Rate Two-Color Policer

community

Syntax

```
community name {
  invert-match;
  members [ community-ids ];
}
```

Hierarchy Level

[edit dynamic policy-options],
[edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define a community or extended community for use in a routing policy match condition.

Options

name—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (“ ”).

invert-match—Invert the results of the community expression matching.

members *community-ids*—One or more community members. If you specify more than one member, you must enclose all members in brackets.

The format for ***community-ids*** is:

as-number:*community-value*

as-number is the AS number and can be a value in the range from 0 through 65,535. ***community-value*** is the community identifier and can be a number in the range from 0 through 65,535.

You also can specify ***community-ids*** for communities as one of the following well-known community names, which are defined in RFC 1997, *BGP Communities Attribute*:

- **no-export**—Routes containing this community name are not advertised outside a BGP confederation boundary.
- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.

You can explicitly exclude BGP community information with a static route using the **none** option. Include **none** when configuring an individual route in the **route** portion of the **static** statement to override a **community** option specified in the **defaults** portion of the statement.

The format for extended ***community-ids*** is the following:

type:*administrator*:*assigned-number*

type is the type of extended community and can be either a **bandwidth**, **target**, **origin**, **domain-id**, **src-as**, or **rt-import** community or a 16-bit number that identifies a specific BGP extended community. The **target** community identifies the destination to which the route is going. The **origin** community identifies where the route originated. The **domain-id** community identifies the OSPF domain from which the route originated. The **src-as** community identifies the autonomous system from which the route originated. The **rt-import** community identifies the route to install in the routing table.

NOTE: For src-as, you can specify only an AS number and not an IP address. For rt-import, you can specify only an IP address and not an AS number.

administrator is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

assigned-number identifies the local provider.

The format for linking a bandwidth with an AS number is:

bandwidth:*as-number*:*bandwidth*

as-number specifies the AS number and ***bandwidth*** specifies the bandwidth in bytes per second.

NOTE: You can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a **target** or **origin** extended community that includes a 4-byte AS number in the plain-number format, append the letter "L" to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as **target:334324L:132**.

You can also use AS-dot notation when defining a 4-byte AS number for the **target** and **origin** extended communities. Specify two integers joined by a period: *16-bit high-order value in decimal*.*16-bit low-order value in decimal*. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Overview of BGP Communities and Extended Communities as Routing Policy Match Conditions
- Defining BGP Communities and Extended Communities for Use in Routing Policy Match Conditions
- Configuring Routing Policies and Policy Objects in the Dynamic Database
- **dynamic-db on page 1811**

condition

Syntax

```
condition condition-name {
    if-route-exists address table table-name;
}
```

Hierarchy Level

[edit dynamic policy-options],
[edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define a policy condition based on the existence of routes in specific tables for use in BGP export policies.

Options

if-route-exists *address*—Specify the address of the route in question.

table *table-name*—Specify a routing table.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

damping

Syntax

```
damping name {
    disable;
    half-life minutes;
    max-suppress minutes;
    reuse number;
    suppress number;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define route flap damping properties to set on BGP routes.

Options

disable—Disable damping on a per-prefix basis. Any damping state that is present in the routing table for a prefix is deleted if damping is disabled.

half-life *minutes*—Decay half-life. ***minutes*** is the interval after which the accumulated figure-of-merit value is reduced by half if the route remains stable.

Range: 1 through 45

Default: 15 minutes

NOTE: For the half-life, configure a value that is less than the max-suppress. If you do not, the configuration is rejected.

max-suppress *minutes*—Maximum hold-down time. ***minutes*** is the maximum time that a route can be suppressed no matter how unstable it has been.

Range: 1 through 720

Default: 60 minutes

NOTE: For the max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.

name—Name that identifies the set of damping parameters. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

reuse *number*—Reuse threshold. ***number*** is the figure-of-merit value below which a suppressed route can be used again.

Range: 1 through 20,000

Default: 750 (unitless)

suppress *number*—Cutoff (suppression) threshold. ***number*** is the figure-of-merit value above which a route is suppressed for use or inclusion in advertisements.

Range: 1 through 20,000

Default: 3000 (unitless)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring BGP Flap Damping Parameters

dynamic-db

Syntax
dynamic-db;

Hierarchy Level

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Define routing policies and policy objects that reference policies configured in the dynamic database at the **[edit dynamic]** hierarchy level.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control-level—To add this statement to the configuration.

Related Documentation
- Configuring Routing Policies Based on Dynamic Database Configuration

family (Firewall Filter)

Syntax

```
family family-name {
  filter filter-name {
    interface-specific;
    term term-name {
      from {
        match-conditions;
      }
      then {
        action;
        action-modifiers;
      }
    }
  }
}
```

Hierarchy Level [edit **firewall**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a firewall filter for IP version 4 or IP version 6.

Options ***family-name***—Version or type of addressing protocol:

- **any**—Filter packets based on protocol-independent match conditions.
- **ethernet-switching**—Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets.
- **inet**—Filter IPv4 packets.
- **inet6**—Filter IPv6 packets.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Firewall Filters (J-Web Procedure) on page 1778
- Firewall Filters for J-EX Series Switches Overview on page 1707

filter

Syntax

```
filter filter-name {
  interface-specific;
  term term-name {
    from {
      match-conditions;
    }
    then {
      action;
      action-modifiers;
    }
  }
}
```

Hierarchy Level [edit **firewall family** *family-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure firewall filters.

Options

filter-name—Name that identifies the filter. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks.

The remaining statements are explained separately.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

- Firewall Filters for J-EX Series Switches Overview on page 1707

filter (VLANs)

Syntax filter (input | output) *filter-name*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a firewall filter to traffic coming into or exiting from the VLAN.

Default All incoming traffic is accepted unmodified to the VLAN, and all outgoing traffic is sent unmodified from the VLAN.

Options ***filter-name*** —Name of a firewall filter defined in a **filter** statement.

- **input**—Apply a firewall filter to VLAN ingress traffic.
- **output**—Apply a firewall filter to VLAN egress traffic.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 1743

- Firewall Filters for J-EX Series Switches Overview on page 1707

filter-specific

Syntax filter-specific;

Hierarchy Level [edit **firewall policer** *policer-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a policer to act as a filter-specific policer.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration

Related Documentation

- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 1743
- Configuring Policers to Control Traffic Rates (CLI Procedure) on page 1782
- Understanding the Use of Policers in Firewall Filters on page 1741

firewall

Syntax

```
firewall {
  family family-name {
    filter filter-name {
      interface-specific;
      term term-name {
        from {
          match-conditions;
        }
        then {
          action;
          action-modifiers;
        }
      }
    }
  }
  policer policer-name {
    filter-specific;
    if-exceeding {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    then {
      policer-action;
    }
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure firewall filters and policers.

The remaining statements are explained separately.

Required Privilege Level firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

from

Syntax

```
from {
  match-conditions;
}
```

Hierarchy Level [edit **firewall family** *family-name* **filter** *filter-name* **term** *term-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Match packet fields to values specified in a match condition. If the **from** statement is not included in a firewall filter configuration, all packets are considered to match and the actions and action modifiers in the **then** statement are taken.

Options

match-conditions —Conditions that define the values or fields that the incoming or outgoing packets must contain for a match. You can specify one or more match conditions. If you specify more than one, they all must match for a match to occur and for the action in the **then** statement to be taken.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

- Understanding Firewall Filter Match Conditions on page 1737

if-exceeding

Syntax

```
if-exceeding {
  bandwidth-limit bps;
  bandwidth-percentpercent
  burst-size-limit bytes;
}
```

Hierarchy Level

[edit **firewall policer** *policer-name*]
[edit logical-systems logical-system-name **firewall policer** policer-name]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure policer rate limits.

The **bandwidth-percent** statement is supported on routers only.

The remaining statements are explained separately.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 1743

interface-specific

Syntax interface-specific;

Hierarchy Level [edit **firewall family** *family-name* **filter** *filter-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure firewall counters that are interface-specific.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

policer

Syntax

```
policer policer-name {
  filter-specific;
  if-exceeding {
    bandwidth-limit bps;
    bandwidth-percent percent
    burst-size-limit bytes;
  }
  then {
    policer-action;
  }
}
```

Hierarchy Level

[edit firewall]
[edit logical-systems *logical-system-name* firewall]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure policer rate limits and actions. To activate a policer, you must include the policer action modifier in the **then** statement in a firewall filter term. Each policer that you configure includes an implicit counter. To ensure term-specific packet counts, you configure a policer for each term in the filter that requires policing.

Options

policer-name—Name that identifies the policer. The name can contain letters, numbers, hyphens (-), and can be up to 64 characters long.

The remaining statements are explained separately.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

policy-statement

Syntax

```
policy-statement policy-name {
  term term-name {
    from {
      family family-name;
      match-conditions;
      policy subroutine-policy-name;
      prefix-list prefix-list-name;
      prefix-list-filter prefix-list-name match-type <actions>;
      route-filter destination-prefix match-type <actions>;
      source-address-filter source-prefix match-type <actions>;
    }
    to {
      match-conditions;
      policy subroutine-policy-name;
    }
    then actions;
  }
}
```

Hierarchy Level [edit dynamic policy-options],
[edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a routing policy, including subroutine policies.

Options ***actions***—(Optional) One or more actions to take if the conditions match. The actions are described in Configuring Flow Control Actions.

family ***family-name***—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**.

NOTE: **When family is not specified, the routing device uses the default IPv4 setting.**

from—(Optional) Match a route based on its source address.

match-conditions—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in Configuring Match Conditions in Routing Policy Terms.

policy ***subroutine-policy-name***—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it

in quotation marks (“ ”). For information about how to configure subroutines, see Configuring Subroutines in Routing Policy Match Conditions.

policy-name—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

prefix-list ***prefix-list-name*** —Name of a list of IPv4 or IPv6 prefixes.

prefix-list-filter ***prefix-list-name***—Name of a prefix list to evaluate using qualifiers; ***match-type*** is the type of match (see Configuring Prefix List Filters), and ***actions*** is the action to take if the prefixes match.

route-filter ***destination-prefix match-type*** **<*actions*>**—(Optional) List of routes on which to perform an immediate match; ***destination-prefix*** is the IPv4 or IPv6 route prefix to match, ***match-type*** is the type of match (see Configuring Route Lists), and ***actions*** is the action to take if the ***destination-prefix*** matches.

source-address-filter ***source-prefix match-type*** **<*actions*>**—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. ***source-prefix*** is the IPv4 or IPv6 route prefix to match, ***match-type*** is the type of match (see Configuring Route Lists), and ***actions*** is the action to take if the ***source-prefix*** matches.

term ***term-name***—Name that identifies the term.

to—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

then—(Optional) Actions to take on matching routes. The actions are described in Configuring Flow Control Actions and Configuring Actions That Manipulate Route Characteristics.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Defining Routing Policies
- Configuring Routing Policies and Policy Objects in the Dynamic Database
- **dynamic-db on page 1811**

prefix-list

Syntax

```
prefix-list name {
  ip-addresses;
  apply-path path;
}
```

Hierarchy Level

[edit dynamic policy-options],
[edit logical-systems *logical-system-name* policy-options],
[edit policy-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Support for the **vpls** protocol family introduced in Junos OS Release 10.2.

Description

Define a list of IPv4 or IPv6 address prefixes for use in a routing policy statement or firewall filter statement.

You can configure up to 85,325 prefixes in each prefix list. To configure more than 85,325 prefixes, configure multiple prefix lists and apply them to multiple firewall filter terms.

Options

name—Name that identifies the list of IPv4or IPv6 address prefixes.

ip-addresses—List of IPv4 or IPv6 address prefixes, one IP address per line in the configuration.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Prefix Lists for Use in Routing Policy Match Conditions
- Configuring Routing Policies and Policy Objects in the Dynamic Database
- **dynamic-db on page 1811**

routing-instance

Syntax routing-instance *routing-instance-name*;

Hierarchy Level [edit **firewall** family inet **filter** *filter-name* **term** *term-name* **then**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a specific virtual routing instance to which the switch sends matched packets.

Options ***routing-instance-name*** —Name of a virtual routing instance.

Required Privilege Level firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Filter-Based Forwarding on J-EX Series Switches on page 1762
- Configuring Virtual Routing Instances (CLI Procedure) on page 119
- Understanding Filter-Based Forwarding for J-EX Series Switches on page 1742

term

Syntax

```
term term-name {
  from {
    match-conditions;
  }
  then {
    action;
    action-modifiers;
  }
}
```

Hierarchy Level [edit **firewall family** *family-name* **filter** *filter-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a firewall filter term.

Options ***term-name***—Name that identifies the term. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks.

The remaining statements are explained separately.

Required Privilege Level firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

- Configuring Firewall Filters (J-Web Procedure) on page 1778
- Firewall Filters for J-EX Series Switches Overview on page 1707

then

Syntax

```
then {
  action;
  action-modifiers;
}
```

Hierarchy Level [edit **firewall family** *family-name* **filter** *filter-name* **term** *term-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a filter action.

Options

action—Actions to accept, discard, or forward packets that match all match conditions specified in a filter term.

action-modifiers—Additional actions to analyze, classify, count, or police packets that match all conditions specified in a filter term.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Related Documentation

then

Syntax

```
then {
  policer-action;
}
```

Hierarchy Level

[edit **firewall policer** *policer-name*]
[edit logical-systems *logical-system-name* firewall policer *policer-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a policer action.

Options

policer-action—Actions to take are:

- **discard**—Discard traffic that exceeds the rate limits defined by the policer.
- **forwarding-class *class-name***—For routers only, classify traffic that exceeds the rate limits defined by the policer.
- **loss-priority**—Set the loss priority for traffic that exceeds the rate limits defined by the policer.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall -control—To add this statement to the configuration.

CHAPTER 50

Operational Commands for Firewall Filters

clear firewall

Syntax clear firewall (all | counter *counter-name* | filter *filter-name* | logical-system *logical-system-name*)

Syntax (J-EX Series Switch) clear firewall (all | counter *counter-name* | filter *filter-name*)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear statistics about configured firewall filters.

NOTE: The clear firewall command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for GRES.

Options

all—Clear the packet and byte counts for all filters.

counter *counter-name*—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.

filter *filter-name*—Clear the packet and byte counts for the specified firewall filter.

logical-system *logical-system-name*—Clear the packet and byte counts for the specified logical system.

Required Privilege Level clear

Related Documentation

- **show firewall on page 1830**

List of Sample Output **clear firewall all on page 1828**

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear firewall all

```
user@host> clear firewall all
```

clear firewall

Syntax

clear firewall
<all>
<counter *counter-name*>
<filter *filter-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear statistics about configured firewall filters.

Options

none—Clear the packet and byte counts for all firewall filter counters and clear the packet counts for all policer counters.

all—(Optional) Clear the packet and byte counts for all firewall filter counters and clear the packet counts for all policer counters.

counter *counter-name* —(Optional) Clear the packet and byte counts for the specified firewall filter counter.

filter *filter-name* —(Optional) Clear the packet and byte counts for the specified firewall filter.

Required Privilege Level

clear

- Verifying That Policers Are Operational on page 1794
- Firewall Filters for J-EX Series Switches Overview on page 1707
- Understanding the Use of Policers in Firewall Filters on page 1741

Sample Output

clear firewall (all)

```
user@host> clear firewall all
```

clear firewall (counter counter-name)

```
user@host> clear firewall counter port-filter-counter
```

clear firewall (filter filter-name)

```
user@host> clear firewall filter ingress-port-filter
```

show firewall

Syntax

show firewall
<filter *filter-name*>
<counter *counter-name*>
<log>
<logical-system (all | *logical-system-name*)>
<terse>

Syntax (J-EX Series Switch)

show firewall
<filter *filter-name*>
<counter *counter-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display statistics about configured firewall filters.

Options

none—(Optional) Display statistics about configured firewall filters.

filter *filter-name*—(Optional) Name of a configured filter.

counter *counter-name*—(Optional) Name of a filter counter.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular system.

log—(Optional) Display log entries for firewall filters.

terse—(Optional) Display firewall filter names only.

Required Privilege Level

view

- **clear firewall on page 1828**

List of Sample Output

show firewall filter on page 1831
show firewall filter (Dynamic Input Filter) on page 1831
show firewall (Logical Systems) on page 1831

Output Fields

Table 209 on page 1831 lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

Table 209: show firewall Output Fields

Field Name	Field Description
Filter	Name of a filter that has been configured with the **filter** statement at the **[edit firewall]** hierarchy level. When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either **-i** for an input filter or **-o** for an output filter. When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either **-in** for an input filter or **-out** for an output filter. When a logical system–specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, **__ls1/filter1**).
Counters	Display filter counter information: • **Name**—Name of a filter counter that has been configured with the **counter** firewall filter action. • **Bytes**—Number of bytes that match the filter term under which the **counter** action is specified. • **Packets**—Number of packets that matched the filter term under which the **counter** action is specified.
Policers	Display policer information: • **Name**—Name of policer. • **Packets**—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

Sample Output

show firewall filter

```
user@host> show firewall filter test
Filter: test
Counters:
Name                                Bytes              Packets
Counter-1                               0                    0
Counter-2                               0                    0
Policers:
Name                                                   Packets
Policer-1                                                    0
```

show firewall filter (Dynamic Input Filter)

```
user@host> show firewall filter dfwd-ge-5/0/0.1-in
Filter: dfwd-ge-5/0/0.1-in
Counters:
Name                                                  Bytes              Packets
c1-ge-5/0/0.1-in                                          0                    0
```

show firewall (Logical Systems)

```
user@host>show firewall

Filter: __lr1/test
Counters:
Name                                                  Bytes              Packets
icmp                                                    420                    5
Filter: __default_bpdu_filter__
Filter: __lr1/inet_filter1
Counters:
Name                                                  Bytes              Packets

show firewall

Syntax

show firewall
<counter *counter-name*>
<filter *filter-name*>
log (detail | interface *interface-name*)
terse

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display statistics about configured firewall filters.

Options

none—Display statistics about all configured firewall filters, counters, and policers.

counter *counter-name*—(Optional) Display statistics about a particular firewall filter counter.

filter *filter-name*—(Optional) Display statistics about a particular firewall filter.

log (detail | interface *interface-name*)—(Optional) Display detailed log entries of firewall activity or log information about a specific interface.

terse—(Optional) Display firewall filter names only.

show firewall (counter counter-name) on page 1834
show firewall log on page 1834

Output Fields

Table 210 on page 1833 lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

Table 210: show firewall Output Fields

Field Name	Field Description	Level of Output
Filter	Name of the filter that is configured with the **filter** statement at the **[edit firewall]** hierarchy level.	All levels

Table 210: show firewall Output Fields *(continued)*

Field Name	Field Description	Level of Output
Counters	Display filter counter information: • Name—Name of a filter counter that has been configured with the counter firewall filter action • Bytes—Number of bytes that match the filter term where the counter action was specified. • Packets—Number of packets that matched the filter term where the counter action was specified.	All levels
Policers	Display policer information: • Name—Name of policer. • Packets—Number of packets that matched the filter term where the policer action was specified. This is the number of packets that exceed the rate limits that the policer specifies.	All levels

Sample Output

show firewall

```
user@host> show firewall
Filter: egress-vlan-filter
Counters:
Name                                                Bytes              Packets
employee-web-counter                                    0                    0
Filter: ingress-port-filter
Counters:
Name                                                Bytes              Packets
ingress-port-counter                                    0                    0
Filter: ingress-port-voip-class-filter
Counters:
Name                                                Bytes              Packets
icmp-counter                                            0                    0
Policers:
Name                                               Packets
icmp-connection-policer                                 0

show firewall log

Syntax

show firewall log
<detail>
<interface *interface-name*>
<logical-system (*logical-system-name* | all)>

Syntax (J-EX Series Switch)

show firewall log
<detail>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display log information about firewall filters.

Options

none—Display log information about firewall filters.

detail—(Optional) Display detailed information.

interface *interface-name*—(Optional) Display log information about a specific interface.

logical-system (*logical-system-name* | all)—(Optional) Perform this operation on all logical systems or on a particular system.

Required Privilege Level

show firewall log on page 1837
show firewall log detail on page 1837

Output Fields

Table 211 on page 1836 lists the output fields for the **show firewall log** command. Output fields are listed in the approximate order in which they appear.

Table 211: show firewall log Output Fields

Field Name	Field Description
Time of Log	Time that the event occurred.
Filter	Name of a filter that has been configured with the **filter** statement at the **[edit firewall]** hierarchy level. • A hyphen (-) indicates that the packet was handled by the Packet Forwarding Engine. • A space (no hyphen) indicates the packet was handled by the Routing Engine. • The notation **pfe** indicates packets logged by the Packet Forwarding Engine hardware filters.

Table 211: show firewall log Output Fields *(continued)*

Field Name	Field Description
Filter Action	Filter action: • **A**—Accept • **D**—Discard • **R**—Reject
Name of Interface	Ingress interface for the packet.
Name of protocol	Packet's protocol name: **egp**, **gre**, **icmp**, **ipip**, **ospf**, **pim**, **rsvp**, **tcp**, or **udp**.
Packet length	Length of the packet.
Source address	Packet's source address.
Destination address	Packet's destination address and port.

Sample Output

show firewall log

```
user@host>show firewall log
Time      Filter    Action Interface     Protocol  Src Addr      Dest Addr

13:10:12  pfe       D      rlsq0.902     ICMP      180.1.177.2   180.1.177.1

13:10:11  pfe       D      rlsq0.902     ICMP      180.1.177.2   180.1.177.1
```

<detail>
<dynamic>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display all the configured conditions as well as the routing tables with which the configuration manager is interacting. If the **detail** keyword is included, the output also displays dependent routes for each condition.

Options

none—Display all configured conditions and associated routing tables.

condition-name—(Optional) Display information about the specified condition only.

detail—(Optional) Display the specified level of output.

dynamic—(Optional) Display information about the conditions in the dynamic database.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

cond2
```

test policy

Syntax test policy *policy-name prefix*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Test a policy configuration to determine which prefixes match routes in the routing table.

Options *policy-name*—Name of a policy.

prefix—Destination prefix to match.

Additional Information All prefixes in the default unicast routing table (**inet.0**) that match prefixes that are the same as or longer than the specific prefix are processed by the **from** clause in the specified policy. All prefixes accepted by the policy are displayed. The **test policy** command evaluates a policy differently from the Border Gateway Protocol (BGP) import process. When testing a policy that contains an **interface** match condition in the **from** clause, the **test policy** command uses the match condition. In contrast, BGP does not use the **interface** match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.

PART 9

Class of Service

CHAPTER 51

Class of Service (CoS)—Overview

Junos OS CoS for J-EX Series Switches Overview

When a network experiences congestion and delay, some packets must be dropped. Junos operating system (Junos OS) class of service (CoS) divides traffic into classes to which you can apply different levels of throughput and packet loss when congestion occurs. This allows packet loss to happen according to rules that you configure.

For interfaces that carry IPv4, IPv6, and MPLS traffic, you can configure Junos OS CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP), IP precedence, 802.1p, or EXP CoS bits of packets egressing out of an interface, thus allowing you to tailor packets for the remote peers' network requirements. See "Understanding Using CoS with MPLS Networks on J-EX Series Switches" on page 1876 for more information about CoS for MPLS networks.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue.

In designing CoS applications, you must give careful consideration to your service needs and thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because J-EX Series Switches implement CoS in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet-forwarding and switching performance.

NOTE: **CoS policies can be enabled or disabled on each interface of a J-EX Series switch. Also, each physical and logical interface on the switch can have custom CoS rules associated with it. When CoS is used in an MPLS network, there are some additional restrictions. See "Understanding Using CoS with MPLS Networks on J-EX Series Switches" on page 1876.**

How Junos OS CoS Works

Junos OS CoS works by examining traffic entering at the edge of your network. The switches classify traffic into defined service groups to provide the special treatment of traffic across the network. For example, voice traffic can be sent across certain links, and data traffic can use other links. In addition, the data traffic streams can be serviced differently along the network path. As the traffic leaves the network at the far edge, you can rewrite the traffic to meet the policies of the targeted peer.

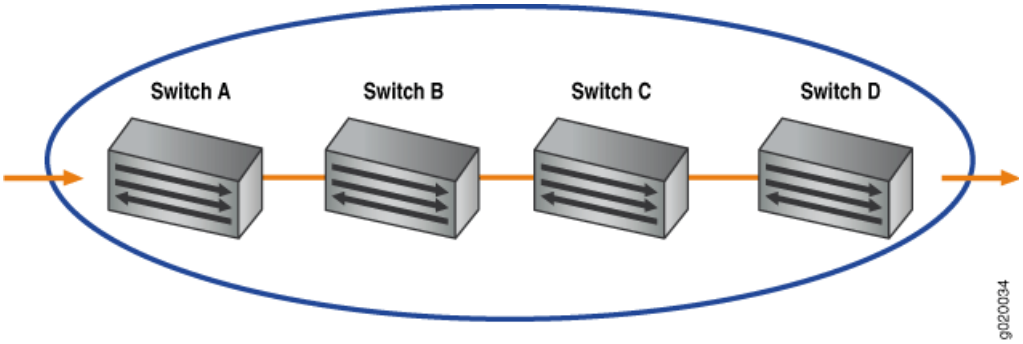
To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings then dictate which packets are transmitted first to the next downstream switch. Switches at

the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.

Figure 59 on page 1855 represents the network scenario of an enterprise. Switch A is receiving traffic from various network nodes such as desktop computers, servers, surveillance cameras, and VoIP telephones. As each packet enters, Switch A examines the packet's CoS settings and classifies the traffic into one of the groupings defined by the enterprise. This definition allows Switch A to prioritize resources for servicing the traffic streams it receives. Switch A might alter the CoS settings of the packets to better match the enterprise's traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packets according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can rewrite the CoS bits of the packets before transmitting them.

Figure 59: Packet Flow Across the Network



Default CoS Behavior on J-EX Series Switches

If you do not configure any CoS settings on the switch, the software performs some CoS functions to ensure that user traffic and protocol packets are forwarded with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

Understanding Junos OS CoS Components for J-EX Series Switches

This topic describes the Junos operating system (Junos OS) class-of-service (CoS) components for J-EX Series Switches:

Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Policers

Policers limit traffic of a certain class to a specified bandwidth and *burst size*. Packets exceeding the policer limits can be discarded. You define policers with filters that can be associated with input interfaces.

For more information about policers, see “Understanding the Use of Policers in Firewall Filters” on page 1741.

NOTE: **You can configure policers to discard packets that exceed the rate limits. If you want to configure CoS parameters such as loss-priority and forwarding-class, you must use firewall filters.**

Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. In the Junos operating system (Junos OS), *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examines the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, and IEEE 802.1p value.
- Multifield traffic classifiers—Examines multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With

multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

Forwarding Classes

Forwarding classes group the packets for transmission. Based on forwarding classes, you assign packets to output queues. Forwarding classes affect the forwarding, scheduling, and marking policies applied to packets as they transit a switch. By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and network control. For J-EX Series switches, 16 forwarding classes are supported, providing granular classification capability.

Tail Drop Profiles

Drop profile is a mechanism that defines parameters that allow packets to be dropped from the network. Drop profiles define the meanings of the loss priorities. When you configure drop profiles you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the queue used to store packets in relation to the total amount that has been allocated for that specific queue.

Loss priorities set the priority of dropping a packet. Loss priority affects the scheduling of a packet without affecting the packet's relative ordering. You can use the loss priority setting to identify packets that have experienced congestion. Typically you mark packets exceeding some service level with a high loss priority.

Schedulers

Each switch interface has multiple queues assigned to store packets. The switch determines which queue to service based on a particular method of scheduling. This process often involves determining which type of packet should be transmitted before another. You can define the priority, bandwidth, delay buffer size, and tail drop profiles to be applied to a particular queue for packet transmission.

A scheduler map associates a specified forwarding class with a scheduler configuration. You can associate up to four user-defined scheduler maps with the interfaces.

Rewrite Rules

A *rewrite rule* sets the appropriate CoS bits in the outgoing packet, thus allowing the next downstream device to classify the packet into the appropriate service group. Rewriting, or marking, outbound packets is useful when the switch is at the border of a network and must alter the CoS values to meet the policies of the targeted peer.

NOTE: Rewrite rules are applied when the packets are routed. Rewrite rules are not applied when the packets are forwarded.

Egress firewall filters can also assign forwarding class and loss priority so that the packets are rewritten based on forwarding class and loss priority.

Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs), IP precedence, and IEEE 802.1 bits to associate incoming packets with a particular CoS servicing level. On a switch, you can assign a meaningful name or alias to the CoS values and use this alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure user-defined classifiers in terms of alias names. If the value of an alias changes, it alters the behavior of any classifier that references it.

You can configure code-point aliases for the following type of CoS markers :

- dscp—Handles incoming IPv4 packets.
- ieee-802.1—Handles Layer 2 CoS.
- inet-precedence—Handles incoming IPv4 packets. IP precedence mapping requires only the upper three bits of the DSCP field.

This topic covers:

- Default Code-Point Aliases on page 1858

Default Code-Point Aliases

Table 217 on page 1859 shows the default mappings between the bit values and standard aliases.

Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. There are two general types of classifiers:

- Behavior aggregate (BA) classifiers
- Multifield (MF) classifiers

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification. If the two classification results conflict, the MF classification result overrides the BA classification result.

NOTE: When a source media access control (MAC) address is learned, the frame that contains the source MAC address is always sent out on queue 0 while egressing from the network interface, irrespective of the classifier applied to the ingress interface.

On J-EX8200 Ethernet Switches, you can specify BA classifiers for bridged multidestination traffic and IP multidestination traffic. The BA classifier for multicast packets is applied to all interfaces on the J-EX8200 switch.

NOTE: J-EX8200 switches implement the on-demand allocation of memory space for ternary content addressable memory (TCAM) so that when additional TCAM space is required for CoS classifiers, it is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers to use memory space that exceeds the available TCAM space that includes both the free and unused space.

This topic describes:

- Behavior Aggregate Classifiers on page 1861
- Multifield Classifiers on page 1863

Behavior Aggregate Classifiers

The behavior aggregate classifier maps a CoS value to a forwarding class and loss priority. The forwarding class determines the output queue. The loss priority is used by a scheduler to control packet discard during periods of congestion.

There are three types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ

- IP precedence bits
- IEEE 802.1p CoS bits

BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore core devices, which handle high traffic volumes, are normally configured to perform BA classification.

Default Behavior Aggregate Classification

The Junos operating system (Junos OS) automatically assigns implicit default classifiers to all logical interfaces based on the type of interface. Table 218 on page 1862 lists different types of interfaces and the corresponding implicit default classifiers.

Table 218: Default BA Classification

Type of Interface	Default BA Classification
Trunk interface	**ieee8021p-default**
Layer 3 interface (IPv4)	**dscp-default**
Layer 3 interface (IPv6)	**dscp-ipv6-default**
Access interface	Untrusted
Routed VLAN interface (RVI)	No default classification

When you explicitly associate a classifier with a logical interface, you are in effect overriding the implicit default classifier with an explicit classifier.

On J-EX4200 Ethernet Switches, you can apply classifier rules for each interface. Table 219 on page 1862 describes the different classifier types you can configure on Layer 2 and Layer 3 interfaces.

Table 219: Allowed BA Classification

Type of Interface	Allowed BA Classification
Layer 2 interface	IEEE 802.1p, IP Precedence, DSCP, DSCP IPv6
Layer 3 interface (IPv4)	IEEE 802.1p, IP Precedence, DSCP
Layer 3 interface (IPv6)	IEEE 802.1p, IP Precedence, DSCP IPv6

You can configure all the allowed classifier types on the same logical interface or on different logical interfaces. If you need to apply all classifier rules on the same logical interface, configure the classifier rules allowed for both IPv4 and IPv6 on the logical interface.

If you have not explicitly associated a classifier with a logical interface, the default classifiers are assigned and classification works as follows:

- If the logical interface is configured with an IPv4 address, DSCP classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP classifier.
- If the logical interface is configured with an IPv6 address, DSCP IPv6 classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP IPv6 classifier.

NOTE: **On J-EX8200 switches, only one classifier of type DSCP and of type IEEE 802.1p can be applied to an interface.**

You can configure routed VLAN interfaces (RVIs) to classify packets. After you do this, the User Priority (UP) bits in the incoming packets are rewritten according to the default IEEE 802.1p rewrite rule, except on J-EX8200 switches. On J-EX8200 switches, you must explicitly assign the default IEEE 802.1p rewrite rule to RVIs.

NOTE: **By default, all BA classifiers classify traffic into either the best-effort forwarding class or the network-control forwarding class.**

Multifield Classifiers

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of DSCP or IP precedence support in end-user applications. On an edge switch, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, any classifier performs matching operations on the selected fields against a configured value.

Understanding CoS Forwarding Classes

Class-of-Service (CoS) forwarding classes can be thought of as output queues. In effect, the result of classifying packets is the identification of an output queue for a particular packet. For a classifier to assign an output queue to a packet, it must associate the packet with one of the following forwarding classes:

- best-effort (be)—Provides no service profile. Loss priority is typically not carried in a CoS value.
- expedited-forwarding (ef)—Provides a low loss, low latency, low jitter, assured bandwidth, end-to-end service.
- assured-forwarding (af)—Provides a group of values you can define and includes four subclasses: AF1, AF2, AF3, and AF4, each with two drop probabilities: low and high.
- network-control (nc)—Supports protocol control and thus is typically high priority.
- multicast best-effort (mcast-be)—Provides no service profile for multicast packets.
- multicast expedited forwarding (mcast-ef)—Supports high-priority multicast packets.
- multicast assured-forwarding (mcast-af)—Provides two drop profiles; high, and low, for multicast packets.

NOTE: The forwarding classes multicast expedited-forwarding, multicast assured-forwarding, and multicast best-effort are applicable only to J-EX8200 Ethernet Switches.

J-EX Series Switches support up to 16 forwarding classes, thus allowing granular packet classification. For example, you can configure multiple classes of expedited forwarding (EF) traffic such as EF, EF1, and EF2.

J-EX Series switches support up to eight output queues. Therefore, if you configure more than eight forwarding classes, you must map multiple forwarding classes to single output queues. On J-EX8200 Virtual Chassis, you can configure only eight forwarding classes and you can assign only one forwarding class to each output queue.

NOTE: On J-EX8200 Virtual Chassis, the queue number seven carries Virtual Chassis port (VCP) traffic and can also carry high-priority user traffic.

This topic describes:

- Default Forwarding Classes on page 1864

Default Forwarding Classes

Table 220 on page 1865 shows the four default forwarding classes defined for unicast traffic, and Table 221 on page 1865 shows the three default forwarding classes defined for multicast traffic.

NOTE: The default forwarding classes for multicast traffic are applicable only to J-EX8200 switches.

You can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. However, because CoS configurations can be quite complicated, we recommend that you avoid altering the default class names or queue number associations.

Table 220: Default Forwarding Classes for Unicast Traffic

Forwarding Class Name	Comments
best-effort (be)	The software does not apply any special CoS handling to packets with 000000 in the DiffServ field. This is a backward compatibility feature. These packets are usually dropped under congested network conditions.
expedited-forwarding (ef)	The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end-to-end for packets in this service class. The software accepts excess traffic in this class, but in contrast to the assured forwarding class, the out-of-profile expedited-forwarding class packets can be forwarded out of sequence or dropped.
assured-forwarding (af)	The software offers a high level of assurance that the packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define. The software accepts excess traffic, but it applies a tail drop profile to determine that excess packets are dropped, and not forwarded. Two drop probabilities (low and high) are defined for this service class.
network-control (nc)	The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.) Typically, these packets represent routing protocol hello or keep alive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard for these packets.

Table 221: Default Forwarding Classes for Multicast Traffic

Forwarding Class Name	Comments
multicast best-effort (mcast-be)	The software does not apply any special CoS handling to multicast packets. These packets are usually dropped under congested network conditions.
multicast expedited-forwarding (mcast-ef)	The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end-to-end for multicast packets in this service class. The software accepts excess traffic in this class, but in contrast to the multicast assured forwarding class, out-of-profile multicast expedited-forwarding class packets can be forwarded out of sequence or dropped.

Table 221: Default Forwarding Classes for Multicast Traffic *(continued)*

Forwarding Class Name	Comments
multicast assured-forwarding (mcast-af)	The software offers a high level of assurance that the multicast packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define. The software accepts excess traffic, but it applies a tail drop profile to determine if the excess packets are dropped and not forwarded. Two drop probabilities (low and high) are defined for this service class.

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. If you commit such a configuration, the commit fails and a message displays that states the number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that is displayed in the default configuration for a queue number is that of the forwarding class currently associated with that queue.

Understanding CoS Tail Drop Profiles

Tail drop profile is a congestion management mechanism that allows switch to drop arriving packets when queue buffers become full or begin to overflow.

Tail drop profiles define the meanings of the loss priorities. When you configure tail drop profiles you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the memory used to store packets in relation to the total amount that has been allocated for that specific queue.

The queue fullness defines the delay-buffer bandwidth, which provides packet buffer space to absorb burst traffic up to the specified duration of delay. Once the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the tail of the buffer.

On J-EX Series Switches, drop probability is implicitly set to **100 percent** and it cannot be modified.

You specify drop probabilities in the drop profile section of the CoS configuration hierarchy and reference them in each scheduler configuration.

By default, if you do not configure any drop profile, tail drop profile is in effect and functions as the primary mechanism for managing congestion. In the default tail drop profile, when the fill level is 0 percent, the drop probability is 0 percent. When the fill level is 100 percent, the drop probability is 100 percent.

NOTE: The default drop profile associated with the packets whose loss priority is low cannot be modified. You can configure custom drop profile only for those packets whose loss priority is high.

- Understanding Junos CoS Components for J-EX Series Switches on page 1856
- Example: Configuring CoS on J-EX Series Switches on page 1883
- Configuring CoS Tail Drop Profiles (CLI Procedure) on page 1926

Understanding CoS Schedulers

You use schedulers to define the properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues, packet schedulers, and tail drop processes that operate according to this mapping.

This topic describes:

Default Schedulers

Each forwarding class has an associated scheduler priority. Only two forwarding classes, best-effort (queue0) and network-control (queue7) are used in the default configuration.

NOTE: On J-EX8200 Ethernet Switches three forwarding classes—best-effort (queue0), multicast best-effort (queue2), and network-control (queue7)—are used in the default configuration.

By default, the best-effort forwarding class (queue 0) receives 95 percent of the bandwidth and the buffer space for the output link, and the network-control forwarding class (queue 7) receives 5 percent. The default drop profile causes the buffer to fill completely and then to discard all incoming packets until it has free space.

NOTE: On J-EX8200 switches, by default, the best-effort forwarding class (queue 0) receives 75 percent of the bandwidth, the multicast best-effort forwarding class (queue 2) receives 20 percent, and the network-control forwarding class (queue 7) receives 5 percent of the bandwidth and buffer space for the output link.

The expedited-forwarding (queue 5) and assured-forwarding (queue 1) classes have no scheduler because no resources are assigned to queue 5 and queue 1, by default. However, you can manually configure resources for the expedited-forwarding and assured-forwarding classes.

Also by default, each queue can exceed the assigned bandwidth if additional bandwidth is available from other queues. When a forwarding class does not fully use the allocated transmission bandwidth, the remaining bandwidth can be used by other forwarding classes if they need to carry traffic load that exceeds their allocated bandwidth.

Transmission Rate

The transmission-rate control determines the actual traffic bandwidth from each forwarding class you configure. The transmission rate is specified in bits per second. Each queue is allocated some portion of the bandwidth of the outgoing interface. This bandwidth can be a fixed value, such as 1 megabit per second (Mbps), a percentage of the total available bandwidth, or the rest of the available bandwidth. In case of congestion, configured amount of transmission rate is guaranteed for the queue. This property allows you to ensure that each queue receives the amount of bandwidth appropriate to its level of service.

Scheduler Buffer Size

To control congestion at the output stage, you can configure the delay-buffer bandwidth using the **buffer-size** command. The delay-buffer bandwidth provides packet buffer space to absorb burst traffic up to the specified duration of delay. Once the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the tail of the buffer.

The default scheduler transmission rate for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent of the total available bandwidth. The default buffer-size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent of the total available buffer.

NOTE: On J-EX8200 switches, the default scheduler transmission rates for queues 0 through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent of the total available bandwidth. The default buffer-size percentages for queues 0 through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent of the total available buffer.

For each scheduler, you can configure the **buffer-size** as one of the following:

- A percentage of the total buffer.
- The remaining buffer available. The remainder is the buffer percentage that is not assigned to other queues. For example, if you assign 40 percent of the delay buffer to queue 0, allow queue 2 to keep the default allotment of 20 percent, allow queue 7 to keep the default allotment of 5 percent, and assign the remainder to queue 3, then queue 3 uses approximately 35 percent of the delay buffer.

Priority Scheduling

Priority scheduling determines the order in which an output interface transmits traffic from the queues, thus ensuring that queues containing important traffic are provided better access to the outgoing interface.

Priority scheduling is accomplished through a procedure in which the scheduler examines the priority of the queue. The Junos operating system (Junos OS) supports two levels of transmission priority:

- Low—The scheduler determines whether the individual queue is within its defined bandwidth profile. This binary decision, which is re-evaluated on a regular time cycle, compares the amount of data transmitted by the queue against the bandwidth allocated to it by the scheduler. When the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out-of-profile when the amount of traffic that it transmits is larger than queue's allocated limit. Out-of-profile queue will be transmitted only if bandwidth is available. Otherwise, it will be buffered.

  A queue from the set is selected based on the shaped deficit weighted round robin (SDWRR) algorithm, which operates within the set.

- Strict-high—Strict-high priority queue receives preferential treatment over low priority queue. Unlimited bandwidth is assigned to strict-high priority queue. Queues are scheduled according to the queue number, starting with the highest queue 7, with decreasing priority down through queue 0. Traffic in higher-numbered queues is always scheduled prior to traffic in lower-numbered queues. In other words, in case of two high priority queues, the queue with higher queue number is processed first.

Packets in low priority queues are transmitted only when strict-high priority queues are empty.

Scheduler Drop-Profile Maps

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type. The inputs for a drop-profile map are the PLP and the protocol type. The output is the drop profile.

Scheduler Maps

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map and then associate the scheduler map with an output interface.

J-EX4200 and J-EX4500 Ethernet Switches allow you to associate up to four user-defined scheduler maps with interfaces. J-EX8200 switches allow up to six user-defined scheduler maps with a port group, which is a set of network ports in a J-EX Series switch. A certain bandwidth is available for each port group and each port in a port group can utilize a portion of that bandwidth. However, the total utilization of bandwidth in a port group cannot exceed the bandwidth available for the port group.

J-EX8200 switches use four types of line cards:

- 8-port SFP+ line card
- 40-port SFP+ line card
- 48-port SFP line card
- 48-port RJ-45 line card

A 40-port SFP+ line card is an oversubscribed 10-Gigabit Ethernet line card for the J-EX8200 switch. The 40 ports in this line card are divided into eight port groups, with 5 ports in each port group. The eight port groups are ports 0-4, ports, 5-9, ports 10-14, ports 15-19, ports 20-24, ports 25-29, ports 30-34, and ports 35-39. Each port group shares 10 gigabits of bandwidth and you can configure a maximum of six scheduler maps for each port group.

In an 8-port 10-Gigabit Ethernet SFP+ line card, the eight ports in the line card are divided into four port groups with two network ports in each port group. The four port groups are ports 0-1, ports 2-3, ports 4-5, and ports 6-7. Each port in this line card supports 10 gigabits of bandwidth. In this line card, six scheduler maps are available for two ports in the port group, and hence, a separate scheduler maps is available for each of the ports.

In a 48-port line card, the 48 ports in the line card are divided into two port groups with 24 ports in each port group. The two ports groups are ports 0-23 and ports 24-47. The 24 ports in each port group share a bandwidth of 1 gigabit. In this case, six scheduler maps are available for the 24 ports in each port group.

If you configure more than the supported number of scheduler maps in a switch, an error is logged in the system log (syslog) and the default scheduler map is bound to all port groups. We recommend that you check the system log for errors (if any) after the commit operation to verify that you have not configured more than the maximum permitted number of scheduler maps.

Understanding CoS Two-Color Marking

Networks police traffic by limiting the input or output transmission rate of a class of traffic on the basis of user-defined criteria. Policing traffic allows you to control the maximum rate of traffic sent or received on an interface and to partition a network into multiple priority levels or classes of service.

Policers require you to apply limits to the traffic flow and set a consequence for packets that exceed these limits—usually a higher loss priority, so that packets exceeding the policer limits are discarded first.

J-EX Series Switches support a single-rate two-color marking type of policer, which is a simplified version of Single-Rate-Three-Color marking, defined in RFC 2697, *A Single Rate Three Color Marker*. This type of policer meters traffic based on the configured committed information rate (CIR) and committed burst size (CBS).

The single-rate two-color marker meters traffic and marks incoming packets depending on whether they are smaller than the committed burst size (CBS)—marked green—or exceed it— marked red.

The single-rate two-color marking policer operates in color-blind mode. In this mode, the policer's actions are not affected by any previous marking or metering of the examined packets. In other words, the policer is “blind? to any previous coloring a packet might have had.

Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. This topic describes how to use rewrite rules to alter the CoS settings. It covers:

This topic covers:

How Rewrite Rules Work

Rewrite rules set the value of the CoS bits within a packet’s header. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header. For rewrites to occur, rewrite rules must be explicitly assigned to an interface. Only tagged Layer 3 interfaces and tagged routed VLAN interfaces (RVIs) automatically rewrite packets by using the default IEEE 802.1p rewrite rule. Multiple rewrite rules of different types can be assigned to a single interface.

NOTE: On J-EX8200 Ethernet Switches, tagged Layer 3 interfaces and tagged RVIs do not automatically rewrite packets using the default IEEE 802.1p rewrite rule. You must explicitly assign the IEEE 802.1p rewrite rule to these interfaces for rewrites to occur.

Also, only one rewrite rule of each type can be assigned to any interface on a J-EX8200 switch.

In effect, the rewrite rule performs the opposite function of the behavior aggregate (BA) classifier, which is used when the packet enters the switch. As the packet leaves the switch, the final CoS action is generally the application of a rewrite rule.

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an edge switch to meet the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

NOTE: When an IP precedence rewrite rule is active, bits 3, 4, and 5 of the type-of-service (ToS) byte are always reset to zero when code points are rewritten.

Default Rewrite Rule

To define a rewrite rule on an interface, you can either create your own rewrite rule and enable it on the interface or enable a default rewrite rule. See “Defining CoS Rewrite Rules (CLI Procedure)” on page 1927.

Table 222 on page 1873 shows the default rewrite-rule mappings. These are based on the default bit definitions of Differentiated Services code point (DSCP), IEEE 802.1p, and IP precedence values and the default forwarding classes. You can configure multiple CoS rewrite rules for DSCP, IP precedence and IEEE 802.1p.

NOTE: By default, rewrite rules are not assigned to an interface. You must explicitly assign a user-defined or system-defined rewrite rule to an interface for the rewrites to occur.

When the CoS values of a packet match the forwarding class and packet-loss-priority (PLP) values, the switch rewrites markings on the packet based on the rewrite table.

Table 222: Default Packet Header Rewrite Mappings

Map from Forwarding Class	PLP Value	Map to DSCP/IEEE 802.1p/IP Precedence Value
expedited-forwarding	low	ef
expedited-forwarding	high	ef
assured-forwarding	low	af11
assured-forwarding	high	af12 (DSCP)
best-effort	low	be
best-effort	high	be
network-control	low	nc1/cs6
network-control	high	nc2/cs7

Understanding Port Shaping and Queue Shaping for CoS on J-EX Series Switches

If the amount of traffic on a switch's network interface is more than the maximum bandwidth allowed on the interface, it leads to congestion. Port shaping and queue shaping can be used to manage the excess traffic and avoid congestion. Port shaping defines the maximum bandwidth allocated to a port, while queue shaping defines a limit on excess-bandwidth usage per queue.

This topic covers:

- Port Shaping on page 1874
- Queue Shaping on page 1874

Port Shaping

Port shaping enables you to shape the aggregate traffic through a port or channel to a rate that is less than the line or port rate.

Queue Shaping

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-priority queue so that the strict-priority queue does not lock out (or starve) low-priority queues. Similarly, for any queue, you can configure queue shaping.

Understanding Junos OS EZQoS for CoS Configurations on J-EX Series Switches

Junos operating system (Junos OS) EZQoS on J-EX Series Switches eliminates the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

Junos OS CoS allows you to divide traffic into classes and offer various levels of throughput and packet loss when congestion occurs. You can use CoS to ensure that different types of traffic (voice, video, and data) get the bandwidth and consideration they need to meet user expectations and business objectives.

Configuring CoS requires careful consideration of your service needs and thorough planning and design to ensure consistency across all switches in a CoS domain. To configure CoS manually, you must define and fine-tune all CoS components such as classifiers, rewrite rules, forwarding classes, schedulers, and scheduler-maps and then apply these components to the interfaces. Therefore, configuring CoS can be a fairly complex and time-consuming task.

EZQoS works by automatically assigning preconfigured values to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name. You can change the preconfigured values of these parameters to suit your particular application needs.

For using EZQoS, you must identify which switch ports are being used for a specific application (such as VoIP, video, and data) and manually apply the corresponding application-specific EZQoS template to these switch ports.

NOTE: Currently, we provide an EZQoS template for configuring CoS for VoIP.

NOTE: We recommend that you do not use the term EZQoS for defining a classifier.

Understanding Using CoS with MPLS Networks on J-EX Series Switches

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. See J-EX Series Switch Software Features Overview for a complete list of the Junos OS MPLS features that are supported on specific J-EX Series switches.

J-EX Series Switches support Differentiated Service Code Point (DSCP) or IP precedence and IEEE 802.1p CoS classifiers on the customer-edge interfaces of the ingress provider edge (PE) switch. DSCP or IP precedence classifiers are used for Layer 3 packets. IEEE 802.1p is used for Layer 2 packets.

When a packet enters a customer-edge interface of the ingress PE switch, the switch associates the packet with a particular CoS servicing level prior to putting the packet onto the label-switched path (LSP). The switches within the LSP utilize the CoS value set at the ingress PE switch. The CoS value that was embedded in the DSCP, IP precedence, or IEEE 802.1 p classifier is translated and encoded in the MPLS header by means of the EXP or experimental bits.

J-EX Series switches enable a default EXP classifier and a default EXP rewrite rule. You can configure a custom EXP classifier and a custom EXP rewrite rule if you prefer. However, the switch supports only one type of EXP classifier (default or custom) and only one EXP rewrite rule (default or custom).

You do not bind the EXP classifier or the EXP rewrite rule to individual interfaces. The switch automatically and implicitly applies the default or the custom EXP classifier and the default or the custom EXP rewrite rule to the appropriate MPLS-enabled interfaces. Because rewrite rules affect only egress interfaces, the switch applies the EXP rewrite rule only to those MPLS interfaces that are transmitting MPLS packets (not to the MPLS interfaces that are receiving the packets).

This topic includes:

Guidelines for Using CoS Classifiers on CCCs

When you are configuring CoS for MPLS over circuit cross-connect (CCC), there are some additional guidelines, as follows:

- You *must* explicitly bind a CoS classifier to the CCC interface on the ingress PE switch.
- You *cannot* use more than one type of DSCP/IP precedence and not more than one type of IEEE 802.1p classifier on the CCC interfaces. Thus, if you configure one CCC interface to use DSCP1, you cannot configure another CCC interface to use DSCP2.

Likewise, if you configure one CCC interface to use IEEE1, you cannot configure another CCC interface on the same switch to use IEEE2. All the CCC interfaces on the switch must use the same DSCP classifier and the same type of IEEE 802.1p classifier.

- You *cannot* configure one CCC interface as DSCP and another CCC interface as IP precedence, because these classifier types overlap.
- You *can* configure one CCC interface as DSCP and another CCC interface as IEEE 802.1p.
- You *can* configure one CCC interface as both DSCP and IEEE 802.1p. If you configure a CCC interface with both these classifiers, the DSCP classifier is used for routing Layer 3 packets and the IEEE 802.1p classifier is used for routing Layer 2 packets.

NOTE: **You can define multiple types of DSCP, IP precedence, and IEEE 802.1p on the switch and use the different classifier types for the non-CCC interfaces on the switch.**

Using CoS Classifiers with IP over MPLS

When you are configuring CoS for IP over MPLS, the customer-edge interface uses the CoS configuration that has been set up for the switch as the default. You do not have to bind a classifier to the customer-edge interface in this case. There are no restrictions regarding using multiple types of DSCP, IP precedence, and IEEE 802.1p on the same switch.

- You can modify the CoS classifier for a particular interface, but it is not required.
- You can configure one interface as DSCP1 and another as DSCP2 and another and IP precedence, and so forth.

Default Classifiers and Default Rewrite Rules

The default classifiers support only two forwarding classes, **best-effort** and **network-control**, and use only two queues, **0** and **7**. However, J-EX Series switches support up to sixteen forwarding classes and eight queues. To use the additional forwarding classes and queues, create a custom classifier. To modify the code point and loss priority for a specific forwarding class, configure a rewrite rule on the switch. The default rewrite rule for EXP is enabled in the default configuration. However, the default rewrite rules for the other classifiers are not enabled in the default configuration. You can display the default classifier mappings and default rewrite mappings by entering the **show class-of-service** command on the switch.

EXP Rewrite Rules

When traffic passes from the customer-edge interface to an MPLS interface, the DSCP, IP precedence, or IEEE 802.1p CoS classifier is translated into the EXP bits within the MPLS header. You cannot disable the default EXP rewrite rule, but you can configure your own custom EXP classifier and a custom EXP rewrite rule. You cannot bind the EXP classifier to individual MPLS interfaces; the switch applies it globally to all the MPLS-enabled interfaces on the switch.

Only one EXP rewrite rule (either default or custom) is supported on a switch. The switch applies it to all the MPLS-enabled egress interfaces.

Policer

Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. During periods of congestion (when the total rate of queuing packets exceeds the rate of transmission), any new packets being sent to an interface can be dropped because there is no place to store them. You should configure a policer on the ingress PE switch:

- If you are using MPLS with CCC, you bind the policer to the LSP. You cannot bind a policer to a CCC interface.
- If you are using IP over MPLS, you bind the policer to the **inet-family** customer-edge interface. You cannot bind a policer to the LSP when you are using IP over MPLS.

Schedulers

The schedulers for using CoS with MPLS are the same as for the other CoS configurations on J-EX Series switches. Default schedulers are provided for **best-effort** and **network-control** forwarding classes. If you are using **assured-forwarding**, **expedited-forwarding**, or other custom forwarding classes, we recommend that you configure a scheduler to support that forwarding class. See “Understanding CoS Schedulers” on page 1868.

Understanding CoS Queues on the 40-port SFP+ Line Card on J-EX8200 Switches

The 40-port SFP+ line card is an oversubscribed 10-Gigabit Ethernet line card for the J-EX8200 Ethernet Switches. The 40 ports on the line card are divided into 8 port groups, with each port group containing 5 ports. The ports in a port group share 10 gigabits of bandwidth. Because the port groups share bandwidth, class-of-service (CoS) ingress and egress queues are handled differently on the 40-port SFP+ line card than on other line cards for J-EX8200 switches.

This topic describes:

Ingress Queues on the 40-port SFP+ Line Card

Ingress packet classification and queuing occurs in two steps:

Preclassification of Packets and Port Ingress Queuing

Packets entering the ports on a port group are sent to one of two ingress queues. These ingress queues are used to schedule the traffic from the port group into the Packet Forwarding Engine.

- Low priority queue—Each interface in a port group has one low priority queue. Traffic on these queues is scheduled using the shaped deficit weighted round-robin (SDWRR) algorithm, with each interface's queue in the port group having an equal weight.
- High priority queue—The interfaces in a port group share a single high priority queue. Traffic on this queue is scheduled by strict-high priority.

For the purpose of port ingress queuing, packets are classified only by behavior aggregate (BA) classification. To control which ingress queue the packets get sent to, you configure a BA classifier on the physical port and specify switch fabric priorities for the forwarding classes. On J-EX8200 switches, fabric priority determines the priority of packets ingressing the switch fabric. For the 40-port SFP+ line card, fabric priority also determines the priority of packets ingressing the port group.

By default, the fabric priority for all forwarding classes is low. To direct packets belonging to a forwarding class to the high priority ingress queue, set the fabric priority to high for that class.

Critical network-control packets are handled differently from other packets. Instead of using the BA classifier to classify them, the switch always sends critical network-control packets to the high priority queue. This handling ensures that these packets are not dropped because of congestion on the oversubscribed ports.

Full Classification of Packets and Fabric Ingress Queueing

When the packets from a port group reach the Packet Forwarding Engine, it performs full packet classification, along with other actions such as multifield (MF) classification, traffic policing, and storm control. It then schedules and queues the packets for ingressing the fabric. The fabric priority associated with the forwarding class determines whether packets are sent to the low priority or high priority fabric ingress queues.

Egress Queues on the 40-port SFP+ Line Card

As with all J-EX Series switch interfaces, each interface on the 40-port SFP+ line card supports eight egress CoS queues. You can map up to 16 forwarding classes to these queues.

All interfaces in a port group also share a single set of eight egress chassis queues at the Packet Forwarding Engine. Egress traffic is fanned out from the Packet Forwarding Engine chassis queues to the corresponding queues for the individual ports. For this reason, the interfaces in a port group must share the same scheduler map configuration. If you configure different scheduler map configurations for the different interfaces in a port group, an error is logged to the system log and the default scheduler map is used for the ports in the port group.

Understanding Priority-Based Flow Control

Priority-based flow control (PFC), IEEE standard 802.1Qbb, is a link-level flow control mechanism. The flow control mechanism is similar to that used by IEEE 802.3x Ethernet PAUSE, but it operates on individual priorities. Instead of pausing all traffic on a link, PFC allows you to selectively pause traffic according to its class.

This topic describes:

- Reliability of Packet Delivery in Standard Ethernet Networks and in Layer 2 Networks on page 1880
- Calculations for Buffer Requirements When Using PFC PAUSE on page 1881
- How PFC and Congestion Notification Profiles Work on page 1881

Reliability of Packet Delivery in Standard Ethernet Networks and in Layer 2 Networks

Standard Ethernet does not guarantee that a packet injected into the network will arrive at its intended destination. Reliability is provided by upper-layer protocols. Generally, a network path consists of multiple hops between the source and destination. A problem

arises when transmitters send packets faster than receivers can accept them. When receivers run out of available buffer space to hold incoming flows, they silently drop additional incoming packets. This problem is generally resolved by upper-layer protocols that detect the drops and request retransmission.

Applications that require reliability in Layer 2 must have flow control that includes feedback from a receiver to a sender regarding buffer availability. Using IEEE 802.3x Ethernet PAUSE control frames, a receiver can generate a MAC control frame and send a PAUSE request to a sender when a specified threshold of receiver buffer has been filled in order to prevent buffer overflow. Upon receiving a PAUSE frame, the sender stops transmissions of any new packets until the receiver has sufficient buffer space to accept them again. The disadvantage of using Ethernet PAUSE is that it operates on the entire link, which might be carrying multiple traffic flows. Some traffic flows do not need flow control in Layer 2, because they are carrying applications that rely on upper-layer protocols for reliability. PFC enables you to configure Layer 2 flow control selectively for the traffic that requires it, such as Fibre Channel over Ethernet (FCoE) traffic, without impacting other traffic on the link. You can also enable PFC for other traffic types, such as iSCSI.

Calculations for Buffer Requirements When Using PFC PAUSE

Receivers must ensure that a PFC PAUSE frame is sent while there is sufficient receive buffer to absorb the data that might continue to be received while the system is responding to the PFC PAUSE.

When you calculate buffer requirements, consider the following factors:

- Processing and queuing delay of the PFC PAUSE—In general, the time to detect the lack of sufficient buffer space and to transmit the PFC PAUSE is negligible. However, delays can occur if the switch detects reduced buffer space occurs just as the transmitter is beginning to transmit a maximum length frame.
- Propagation delay across the media—The delay amount depends on the length and speed of the physical link.
- Response time to the PFC PAUSE frame
- Propagation delay across the media on the return path

NOTE: **We recommend that you configure at least 20 percent of the buffer size for the queue that is using PFC and that you do not specify the exact option.**

How PFC and Congestion Notification Profiles Work

PFC is triggered when the incoming frame has a User Priority (UP) field that matches the three-bit pattern specified for the PFC congestion notification profile, which you have configured. Table 223 on page 1882 shows the one-to-one mapping between the UP field of an IEEE 802.1Q tagged frame, the traffic class, and the egress queue. In addition to setting a PFC congestion notification profile on an ingress port, you must set a forwarding class to match the priority specified in the PFC congestion notification profile and to forward the frame to the appropriate queue.

J-EX Series Switches support up to 6 traffic classes and allow you to associate those classes with 6 different congestion notification profiles. (The switches support up to 16 forwarding classes.)

Table 223: Input for PFC Congestion Notification Profile and Mapping to Traffic Class and Egress Queue

UP Field of IEEE-802.1Q Tagged Frame	Traffic Class	Egress Queue
000	TC 0	queue 0
001	TC 1	queue 1
010	TC 2	queue 2
011	TC 3	queue 3
100	TC4	queue 4
101	TC 5	queue 5

CHAPTER 52

Examples: CoS Configuration

Example: Configuring CoS on J-EX Series Switches

Configure class of service (CoS) on your switch to manage traffic so that when the network experiences congestion and delay, critical applications are protected. Using CoS, you can divide traffic on your switch into classes and provide various levels of throughput and packet loss. This is especially important for traffic that is sensitive to jitter and delay, such as voice traffic.

This example shows how to configure CoS on a single J-EX Series switch in the network.

Requirements

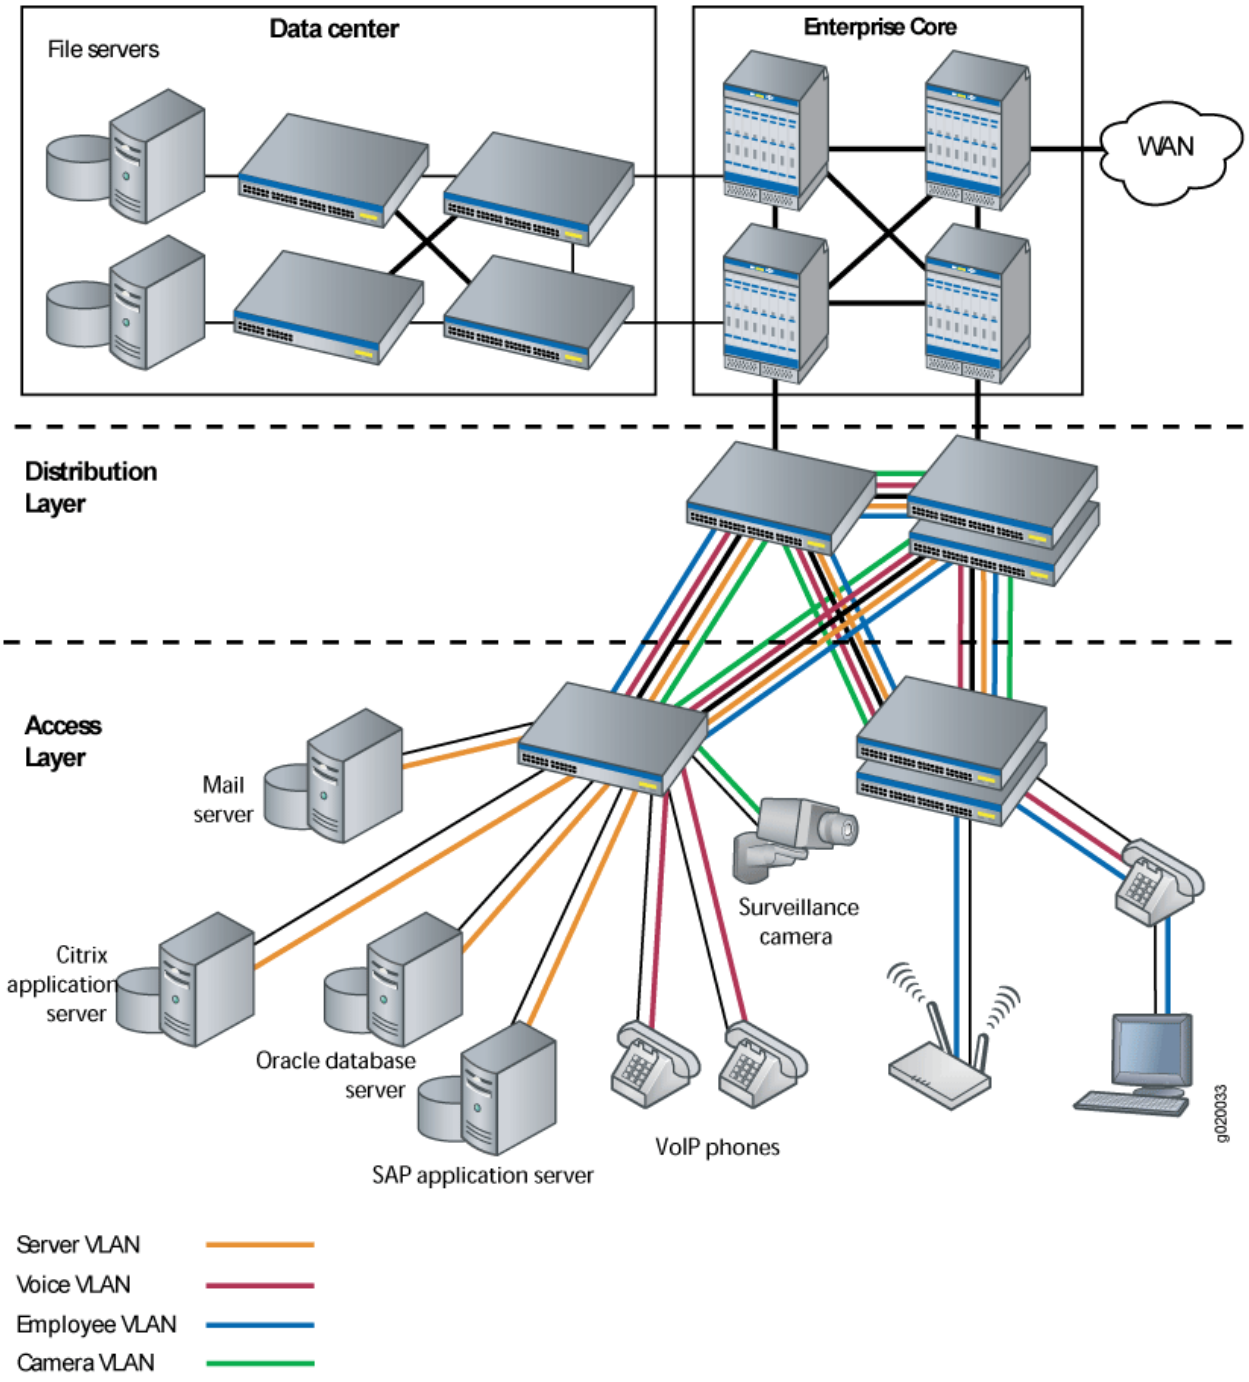
This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX4200 switch

Overview and Topology

This example uses the topology shown in Figure 60 on page 1884.

Figure 60: Topology for Configuring CoS



The topology for this configuration example consists of one J-EX Series switch at the access layer.

The J-EX Series access switch is configured to support VLAN membership. Switch ports **ge-0/0/0**and **ge-0/0/1** are assigned to the **voice-vlan** for two VoIP phones. Switch port **ge-0/0/2** is assigned to the **camera-vlan** for the surveillance camera. Switch ports

ge-0/0/3, **ge-0/0/4**, **ge-0/0/5**, and **ge-0/0/6** are assigned to the **server-vlan** for the servers hosting various applications such as those provided by Citrix, Microsoft, Oracle, and SAP.

Table 224 on page 1885 shows the VLAN configuration components.

Table 224: Configuration Components: VLANs

VLAN Name	VLAN ID	VLAN Subnet and Available IP Addresses	VLAN Description
voice-vlan	10	**192.168.1.0/32** **192.168.1.1** through **192.168.1.11** **192.168.1.12** is the subnet's broadcast address.	Voice VLAN used for employee VoIP communication.
camera-vlan	20	**192.168.1.13/32** **192.168.1.14** through **192.168.1.20** **192.168.1.21** is the subnet's broadcast address.	VLAN for the surveillance cameras.
server-vlan	30	**192.168.1.22/32** **192.168.1.23** through **192.168.1.35** **192.168.1.36** is the subnet's broadcast address.	VLAN for the servers hosting enterprise applications.

Ports on the J-EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. Table 225 on page 1885 shows the switch interfaces that are assigned to the VLANs and the IP addresses for devices connected to the switch ports:

Table 225: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

Interfaces	VLAN Membership	IP Addresses	Port Devices
ge-0/0/0, **ge-0/0/1**	**voice-vlan**	**192.168.1.1** through **192.168.1.2**	Two VoIP telephones.
ge-0/0/2	**camera-vlan**	**192.168.1.14**	Surveillance camera.
ge-0/0/3, **ge-0/0/4**, **ge-0/0/5**, **ge-0/0/6**	**sevrer-vlan**	**192.168.1.23** through **192.168.1.26**	Four servers hosting applications such as those provided by Citrix, Microsoft, Oracle, and SAP.

NOTE: This example shows how to configure CoS on a single J-EX Series switch. This example does not consider across-the-network applications of CoS in which you might implement different configurations on ingress and egress switches to provide differentiated treatment to different classes across a set of nodes in a network.

Configuration

CLI Quick Configuration

To quickly configure CoS, copy the following commands and paste them into the switch terminal window:

```
[edit]
set class-of-service forwarding-classes class app queue-num 5
set class-of-service forwarding-classes class mail queue-num 1
set class-of-service forwarding-classes class db queue-num 2
set class-of-service forwarding-classes class erp queue-num 3
set class-of-service forwarding-classes class video queue-num 4
set class-of-service forwarding-classes class best-effort queue-num 0
set class-of-service forwarding-classes class voice queue-num 6
set class-of-service forwarding-classes class network-control queue-num 7
set firewall family ethernet-switching filter voip_class term voip from source-address 192.168.1.1/32
set firewall family ethernet-switching filter voip_class term voip from source-address 192.168.1.2/32
set firewall family ethernet-switching filter voip_class term voip from protocol udp
set firewall family ethernet-switching filter voip_class term voip from source-port 2698
set firewall family ethernet-switching filter voip_class term voip then forwarding-class voice
loss-priority low
set firewall family ethernet-switching filter voip_class term network_control from precedence
[net-control internet-control]
set firewall family ethernet-switching filter voip_class term network_control then forwarding-class

set class-of-service schedulers mail-sched priority low
set class-of-service schedulers mail-sched transmit-rate percent 5
set class-of-service schedulers db-sched buffer-size percent 10
set class-of-service schedulers db-sched priority low
set class-of-service schedulers db-sched transmit-rate percent 10
set class-of-service schedulers erp-sched buffer-size percent 10
set class-of-service schedulers erp-sched priority low
set class-of-service schedulers erp-sched transmit-rate percent 10
set class-of-service schedulers nc-sched buffer-size percent 5
set class-of-service schedulers nc-sched priority strict-high
set class-of-service schedulers nc-sched transmit-rate percent 5
set class-of-service schedulers be-sched buffer-size percent 35
set class-of-service schedulers be-sched priority low
set class-of-service schedulers be-sched transmit-rate percent 35
set class-of-service scheduler-maps ethernet-cos-map forwarding-class voice scheduler
voice-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class video scheduler
video-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class app scheduler app-sched
```

```
set class-of-service scheduler-maps ethernet-cos-map forwarding-class mail scheduler mail-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class db scheduler db-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class erp scheduler erp-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class network-control
scheduler nc-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class best-effort scheduler
be-sched
set class-of-service interfaces ge-0/0/20 scheduler-map ethernet-cos-map
```

Step-by-Step Procedure

To configure and apply CoS:

1. Configure one-to-one mapping between eight forwarding classes and eight queues:

```
[edit class-of-service]
user@switch# set forwarding-classes class app queue-num 5
user@switch# set forwarding-classes class mail queue-num 1
user@switch# set forwarding-classes class db queue-num 2
user@switch# set forwarding-classes class erp queue-num 3
user@switch# set forwarding-classes class video queue-num 4
user@switch# set forwarding-classes class best-effort queue-num 0
user@switch# set forwarding-classes class voice queue-num 6
user@switch# set forwarding-classes class network-control queue-num 7
```

2. Define the firewall filter **voip_class** to classify the VoIP traffic:

```
[edit firewall]
user@switch# set family ethernet-switching filter voip_class
```

3. Define the term **voip**:

```
[edit firewall]
user@switch# set family ethernet-switching filter voip_class term voip from
source-address 192.168.1.1/32
user@switch# set family ethernet-switching filter voip_class term voip from
source-address 192.168.1.2/32
user@switch# set family ethernet-switching filter voip_class term voip protocol udp
user@switch# set family ethernet-switching filter voip_class term voip source-port
2698
user@switch# set family ethernet-switching filter voip_class term voip then
forwarding-class voice loss-priority low
```

4. Define the term **network_control**:

```
[edit firewall]
user@switch# set family ethernet-switching filter voip_class term network_control from
precedence [net-control internet-control]
user@switch# set family ethernet-switching filter voip_class term network_control then
forwarding-class network-control loss-priority low
```

5. Define the term **best_effort_traffic** with no match conditions:

```
[edit firewall]
user@switch# set family ethernet-switching filter voip_class term best_effort_traffic
then forwarding-class best-effort loss-priority low
```

6. Apply the firewall filter **voip_class** as an input filter to the interfaces for the VoIP phones:

```
[edit interfaces]
user@switch# set ge-0/0/0 description phone1—voip-ingress-port
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input voip_class
user@switch# set ge-0/0/1 description phone2—voip-ingress-port
```

```
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input voip_class
```

7. Define the firewall filter **video_class** to classify the video traffic:

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class
```

8. Define the term **video**:

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term video from
source-address 192.168.1.14/32
user@switch# set family ethernet-switching filter video_class term video protocol udp
user@switch# set family ethernet-switching filter video_class term video source-port
2979
user@switch# set family ethernet-switching filter video_class term video then
forwarding-class video loss-priority low
```

9. Define the term **network_control** (for the **video_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term network_control
from precedence [net-control internet-control]
user@switch# set family ethernet-switching filter video_class term network_control
then forwarding-class network-control loss-priority low
```

10. Define the term **best_effort_traffic** (for the **video_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term best_effort_traffic
then forwarding-class best-effort loss-priority low
```

11. Apply the firewall filter **video_class** as an input filter to the interface for the surveillance camera:

```
[edit interfaces]
user@switch# set ge-0/0/2 description video-ingress-port
user@switch# set ge-0/0/2 unit 0 family ethernet-switching filter input video_class
```

12. Define the firewall filter **app_class** to classify the application server traffic:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class
```

13. Define the term **app**:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term app from
source-address 192.168.1.23/32
user@switch# set family ethernet-switching filter app_class term app protocol tcp
user@switch# set family ethernet-switching filter app_class term app source-port [1494
2512 2513 2598 2897]
user@switch# set family ethernet-switching filter app_class term app then
forwarding-class app loss-priority low
```

14. Define the term **mail**:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term mail from
source-address 192.168.1.24/32
user@switch# set family ethernet-switching filter app_class term mail protocol tcp
user@switch# set family ethernet-switching filter app_class term mail source-port [25
143 389 691 993 3268 3269]
```

```
user@switch# set family ethernet-switching filter app_class term mail then
forwarding-class mail loss-priority low
```

15. Define the term **db**:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term db from source-address
192.168.1.25/32
user@switch# set family ethernet-switching filter app_class term db protocol tcp
user@switch# set family ethernet-switching filter app_class term db source-port [1521
1525 1527 1571 1810 2481]
user@switch# set family ethernet-switching filter app_class term db then
forwarding-class db loss-priority low
```

16. Define the term **erp**:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term erp from
source-address 192.168.1.26/32
user@switch# set family ethernet-switching filter app_class term erp protocol tcp
user@switch# set family ethernet-switching filter app_class term erp source-port [3200
3300 3301 3600]
user@switch# set family ethernet-switching filter app_class term erp then
forwarding-class erp loss-priority low
```

17. Define the term **network_control** (for the **app_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term network_control from
precedence [net-control internet-control]
user@switch# set family ethernet-switching filter app_class term network_control then
forwarding-class network-control loss-priority low
```

18. Define the term **best_effort_traffic** (for the **app_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term best_effort_traffic
then forwarding-class best-effort loss-priority low
```

19. Apply the firewall filter **app_class** as an input filter to the interfaces for the servers hosting applications:

```
[edit interfaces]
user@switch# set ge-0/0/3 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/4 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/5 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input app_class
```

20. Configure schedulers:

```
[edit class-of-service]
user@switch# set schedulers voice-sched buffer-size percent 10
user@switch# set schedulers voice-sched priority strict-high
user@switch# set schedulers voice-sched transmit-rate percent 10
user@switch# set schedulers video-sched buffer-size percent 15
user@switch# set schedulers video-sched priority low
user@switch# set schedulers video-sched transmit-rate percent 15
user@switch# set schedulers app-sched buffer-size percent 10
user@switch# set schedulers app-sched priority low
user@switch# set schedulers app-sched transmit-rate percent 10
user@switch# set schedulers mail-sched buffer-size percent 5
user@switch# set schedulers mail-sched priority low
```

```
user@switch# set schedulers mail-sched transmit-rate percent 5
user@switch# set schedulers db-sched buffer-size percent 10
user@switch# set schedulers db-sched priority low
user@switch# set schedulers db-sched transmit-rate percent 10
user@switch# set schedulers erp-sched buffer-size percent 10
user@switch# set schedulers erp-sched priority low
user@switch# set schedulers erp-sched transmit-rate percent 10
user@switch# set schedulers nc-sched buffer-size percent 5
user@switch# set schedulers nc-sched priority strict-high
user@switch# set schedulers nc-sched transmit-rate percent 5
user@switch# set schedulers be-sched buffer-size percent 35
user@switch# set schedulers be-sched priority low
user@switch# set schedulers be-sched transmit-rate percent 35
```

21. Assign the forwarding classes to schedulers with the scheduler map **ethernet-cos-map**:

```
[edit class-of-service]
user@switch# set scheduler-maps ethernet-cos-map forwarding-class voice scheduler
voice-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class video scheduler
video-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class app scheduler
app-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class mail scheduler
mail-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class db scheduler
db-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class erp scheduler
erp-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class network-control
scheduler nc-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class best-effort
scheduler be-sched
```

22. Associate the scheduler map with the outgoing interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
```

Results Display the results of the configuration:

```
user@switch# show firewall

firewall family ethernet-switching {
  filter voip_class {
    term voip {
      from {
        source-address {

      family ethernet {
        filter {
          input app_class;
        }
      }
    }
  }
  ge-0/0/6 {
    unit 0 {
      family ethernet {
        filter {
          input app_class;
        }
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues on page 1896
- Verifying That the Forwarding Classes Have Been Assigned to Schedulers on page 1897
- Verifying That the Scheduler Map Has Been Applied to the Interface on page 1898

Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues

Purpose Verify that the following forwarding classes **app**, **db**, **erp**, **mail**, **video**, and **voice** have been defined and mapped to queues.

Action

```
user@switch> show class-of-service forwarding-class
Forwarding class                          ID    Queue
  app                                      0        5
  db                                       1        2
  erp                                      2        3
  best-effort                              3        0
  mail                                     4        1
  voice                                    5        6
  video                                    6        4
  network-control                          7        7
```

Meaning This output shows that the forwarding classes have been defined and mapped to appropriate queues.

Verifying That the Forwarding Classes Have Been Assigned to Schedulers

Purpose Verify that the forwarding classes have been assigned to schedulers.

Action

```
user@switch> show class-of-service scheduler-map
Scheduler map: ethernet-cos-map, Index: 2
  Scheduler: voice-sched, Forwarding class: voice, Index: 22
    Transmit rate: 5 percent, Rate Limit: none, Buffer size: 15 percent,
    Priority: Strict-high
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: video-sched, Forwarding class: video, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: app-sched, Forwarding class: app, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: mail-sched, Forwarding class: mail, Index: 22
    Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: db-sched, Forwarding class: db, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: erp-sched, Forwarding class: erp, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
      High            TCP             1    <default-drop-profile>

  Scheduler: be-sched, Forwarding class: best-effort, Index: 20
    Transmit rate: 35 percent, Rate Limit: none, Buffer size: 35 percent,
    Priority: low
    Drop profiles:
      Loss priority   Protocol    Index    Name
      High            non-TCP         1    <default-drop-profile>
```

```
    High            TCP             1     <default-drop-profile>

Scheduler: nc-sched, Forwarding class: network-control, Index: 22
  Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
  Priority: Strict-high
  Drop profiles:
    Loss priority   Protocol    Index    Name
    High            non-TCP         1    <default-drop-profile>
    High            TCP             1    <default-drop-profile>
```

Meaning This output shows that the forwarding classes have been assigned to schedulers.

Verifying That the Scheduler Map Has Been Applied to the Interface

Purpose Verify that the scheduler map has been applied to the interface.

Action

```
user@switch> show class-of-service interface
...
Physical interface: ge-0/0/20, Index: 149
Queues supported: 8, Queues in use: 8
  Scheduler map: ethernet-cos-map, Index: 43366
  Input scheduler map: <default>, Index: 3
...
```

Meaning This output shows that the scheduler map (**ethernet-cos-map**) has been applied to the interface (**ge-0/0/20**).

Example: Combining CoS with MPLS on J-EX Series Switches

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. The CoS value is included within the MPLS label, which is passed through the network, enabling end-to-end CoS across the network.

MPLS services are often used to ensure better performance for low-latency applications such as VoIP and other business-critical functions. These applications place specific demands on a network for successful transmission. CoS gives you the ability to control the mix of bandwidth, delay, jitter, and packet loss while taking advantage of the MPLS labeling mechanism.

This example shows how to configure CoS on an MPLS network that is using a unidirectional circuit cross-connect (CCC) from the ingress provider edge (PE) switch to the egress PE switch. for the customer-edge interface of the ingress provider edge (PE) switch. It describes adding the configuration of CoS components to the ingress PE switch, the egress PE switch, and the core provider switches of the existing MPLS network. Because of the unidirectional configuration, the DSCP classifier needs to be configured only on the ingress PE switch.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Three J-EX Series switches

Before you configure CoS with MPLS, be sure you have:

Configured an MPLS network with two PE switches and one provider switch. See "Example: Configuring MPLS on J-EX Series Switches" on page 2145. This example assumes that an MPLS network has been configured using a cross circuit-connect (CCC).

Overview and Topology

This example describes adding custom classifiers and custom rewrite rules to switches in an MPLS network that is using MPLS over CCC.

It is a unidirectional configuration. Therefore, you need to configure custom classifiers and custom rewrite rules as follows:

- On the ingress PE switch: custom DSCP classifier and custom EXP rewrite rule
- On the egress PE switch: custom EXP classifier
- On the provider switch: customer EXP classifier and custom EXP rewrite rule

NOTE: You can also configure schedulers and shapers as needed. If you are using assured-forwarding, expedited-forwarding, or other custom forwarding classes, we recommend that you configure a scheduler to support that forwarding class. See "Defining CoS Schedulers (CLI Procedure)" on page 1921.

The example creates a custom DSCP classifier (**dscp1**) on the ingress PE switch and binds this classifier to the CCC interface. It includes configuration of a policer on the

ingress PE switch. The policer is applied as a filter on the label-switched path (LSP) **lsp_to_pe2_ge1** (created in "Example: Configuring MPLS on J-EX Series Switches" on page 2145) to ensure that the amount of traffic forwarded through the LSP never exceeds the requested bandwidth allocation.

This example creates a custom EXP rewrite rule (**exp1**) on the ingress PE switch, specifying a loss-priority and code point to be used for the expedited-forwarding class as the packet travels through the LSP. The switch applies this custom rewrite rule on the core interfaces **ge-0/0/5.0** and **ge-0/0/6.0**, which are the egress interfaces for this switch.

Table 226 on page 1900 shows the CoS configuration components added to the ingress PE switch.

Table 226: CoS Configuration Components on the Ingress PE Switch

Property	Settings	Description
Local PE switch hardware	J-EX Series switch	PE-1
Policing filter configured and applied to the LSP.	**policing filter mypolicer** **filter myfilter**	Name of the rate-limiting policer. Name of the filter, which refers to the policer
Custom DSCP classifier	**dscp1**	Specifies the name of the custom DSCP classifier
Custom EXP rewrite rule	**e1**	Name of the custom EXP rewrite rule.
Customer-edge interface	**ge-0/0/1.0**	Interface that receives packets from devices outside the network. The custom DSCP classifier must be specified on this CCC interface.
Core interfaces	**ge-0/0/5.0** and **ge-0/0/6.0**	Interfaces that transmit MPLS packets to other switches within the MPLS network. The EXP rewrite rule is applied implicitly to these interfaces.

Table 227 on page 1900 shows the CoS configuration components added to the egress PE switch in this example.

Table 227: CoS Configuration Components of the Egress PE Switch

Property	Settings	Description
Remote provider edge switch hardware	J-EX Series switch	PE-2
Custom EXP classifier	**exp1**	Name of custom EXP classifier

Table 227: CoS Configuration Components of the Egress PE Switch *(continued)*

Property	Settings	Description
Customer-edge interface	**ge-0/0/1.0**	Interface that transmits packets from this network to devices outside the network. No CoS classifier is specified for this interface. A scheduler can be specified.
Core interfaces	**ge-0/0/7.0** and **ge-0/0/8.0**	Core interfaces on PE-2 that receive MPLS packets from the provider switch. The EXP classifier is enabled by default on the switch and applied implicitly to these interfaces.

Table 228 on page 1901 shows the MPLS configuration components used for the provider switch in this example.

Table 228: CoS Configuration Components of the Provider Switch

Property	Settings	Description
Provider switch hardware	J-EX Series switch	Transit switch within the MPLS network configuration.
Custom EXP classifier	**exp1**	Name of the custom EXP classifier.
Custom EXP rewrite rule	**e1**	Name of the custom EXP rewrite rule.
Core interfaces receiving packets from other MPLS switches.	**ge-0/0/5.0** and **ge-0/0/6.0**	Interfaces that connect the provider switch to the ingress PE switch (PE-1). The EXP classifier is enabled by default on the switch and applied implicitly to these interfaces.
Core interfaces transmitting packets to other switches within the MPLS network.	**ge-0/0/7.0** and **ge-0/0/8.0**	Interfaces that transmit packets to the egress PE (PE-2). The EXP rewrite rule is applied implicitly on these interfaces. Schedulers can also be specified and will be applied to these interfaces.

Configuring the Local PE Switch

CLI Quick Configuration

To quickly configure a custom DSCP classifier, custom EXP rewrite rule, and a policer on the local PE switch, copy the following commands and paste them into the switch terminal window of PE-1:

```
[edit]
set class-of-service classifiers dscp dscp1 import default
set class-of-service classifiers dscp dscp1 forwarding-class expedited-forwarding loss-priority low code-points 000111
set class-of-service rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low code-point 111
set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
set firewall policer mypolicer if-exceeding bandwidth-limit 500m
```

```
set firewall policer mypolicer if-exceeding burst-size-limit 33553920
set firewall policer mypolicer then discard
set firewall family any filter myfilter term t1 then policer mypolicer
set protocols mpls label-switched-path lsp_to_pe2_ge1 to 127.1.1.3 policing filter myfilter
```

Step-by-Step Procedure

To configure a custom DSCP classifier, custom EXP rewrite rule, and a policer on the ingress PE switch:

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

   ```
   [edit class-of-service]
   user@switch# set classifiers dscp dscp1 import default
   ```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

   ```
   [edit class-of-service]
   user@switch# set classifiers dscp dscp1 forwarding-class expedited-forwarding
   loss-priority low code-points 000111
   ```

3. Specify the values for the custom EXP rewrite rule, **e1**:

   ```
   [edit class-of-service]
   user@switch#  set rewrite-rules exp e1 forwarding-class expedited-forwarding
   loss-priority low code-point 111
   ```

4. Bind the DSCP classifier to the CCC interface:

   ```
   [edit ]
   user@switch#  set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
   ```

5. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the LSP:

   ```
   [edit firewall]
   set policer mypolicer if-exceeding bandwidth-limit 500m
   ```

6. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

   ```
   [edit firewall policer]
   set mypolicer if-exceeding burst-size-limit 33553920
   ```

7. Discard traffic that exceeds the rate limits for this policer:

   ```
   [edit firewall policer]
   set mypolicer then discard
   ```

8. To reference the policer, configure a filter term that includes the policer action:

   ```
   [edit firewall]
   user@switch#  set family any filter myfilter term t1 then policer mypolicer
   ```

9. Apply the filter to the LSP:

   ```
   [edit protocols mpls]
   set label-switched-path lsp_to_pe2_ge1 policing filter myfilter
   ```

Results

Display the results of the configuration:

```
[edit]
```

```
user@switch# show
class-of-service {
  classifiers {
    dscp dscp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 000111;
      }
    }
  }
  interfaces {
    ge-0/0/1 {
      unit 0 {
        classifiers {
          dscp dscp1;
        }
      }
    }
  }
rewrite-rules {
  exp e1 {
    forwarding-class expedited-forwarding {
      loss-priority low code-point 111;
    }
  }
  }
}
firewall {
  family any {
    filter myfilter {
      term t1 {
        then policer mypolicer;
      }
    }
  }
  policer mypolicer {
    if-exceeding {
      bandwidth-limit 500m;
      burst-size-limit 33553920;
    }
    then discard;
  }
}
```

Configuring the Remote PE Switch

CLI Quick Configuration

To quickly configure a custom EXP classifier on the remote PE switch, copy the following commands and paste them into the switch terminal window of PE-2:

```
[edit]
set class-of-service classifiers exp exp1 import default
set class-of-service classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low
code-points 010
```

Step-by-Step Procedure

To configure a custom EXP classifier on the egress PE switch:

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```

Results

Display the results of the configuration:

```
[edit]
 user@switch# show
class-of-service {
  classifiers {
    exp exp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 010;
      }
    }
```

Configuring the Provider Switch

CLI Quick Configuration

To quickly configure a custom EXP classifier and a custom EXP rewrite rule on the provider switch, copy the following commands and paste them into the switch terminal window of the provider switch:

```
[edit]
set class-of-service classifiers exp exp1 import default
set class-of-service classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low
code-points 010
set class-of-service rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low
code-point 111
```

Step-by-Step Procedure

To configure a custom EXP classifier and a custom EXP rewrite rule on the provider switch:

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```

3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

Results Display the results of the configuration:

```
[edit]
 user@switch# show
class-of-service {
  classifiers {
    exp exp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 010;
      }
    }
  }
  rewrite-rules {
    exp e1 {
      forwarding-class expedited-forwarding {
        loss-priority low code-point 111;
      }
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Policer Firewall Filter Is Operational on page 1905
- Verifying That the CoS Classifiers Are Going to the Right Queue on page 1905
- Verifying the CoS Forwarding Table Mapping on page 1908
- Verifying the Rewrite Rules on page 1909

Verifying That the Policer Firewall Filter Is Operational

Purpose Verify the operational state of the policer that is configured on the ingress PE switch.

Action

```
user@switch> show firewall
Filter: myfilter
Policers:
Name                                                Packets
mypolicer-t1                                              0
```

Meaning This output shows that the firewall filter **mypolicer** has been created.

Verifying That the CoS Classifiers Are Going to the Right Queue

Purpose Verify that the CoS classifiers are going to the right queue.

Action

```
user@switch> show class-of-service forwarding-table classifier

Classifier table index: 7, # entries: 64, Table type: DSCP
```

60	111100	3	0
61	111101	3	0
62	111110	3	0
63	111111	3	0

Meaning This output shows that a new DSCP classifier has been created, index **9346**, on the ingress PE switch (PE-1).

Verifying the CoS Forwarding Table Mapping

Purpose For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.

Action

```
user@switch>show class-of-service forwarding-table classifier mapping

                                Table Index/
```

```
Interface       Index      Q num      Table type
ge-0/0/1.0        92        9346      DSCP
```

Meaning The results show that the new DSCP classifier, index number **9346**, is bound to interface **ge-0/0/1.0**.

Verifying the Rewrite Rules

Purpose Display mapping of the queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.

Action

```
user@switch>show class-of-service forwarding-table rewrite-rule

Rewrite table index: 31, # entries: 4, Table type: DSCP
FC#     Low bits  State      High bits  State
0       000000  Enabled       000000  Enabled
1       101110  Enabled       101110  Enabled
2       001010  Enabled       001100  Enabled
3       110000  Enabled       111000  Enabled

Rewrite table index: 34, # entries: 4, Table type: IEEE 802.1
FC#     Low bits  State      High bits  State
0          000  Enabled          001  Enabled
1          010  Enabled          011  Enabled
2          100  Enabled          101  Enabled
3          110  Enabled          111  Enabled

Rewrite table index: 35, # entries: 4, Table type: IPv4 precedence
FC#     Low bits  State      High bits  State
0          000  Enabled          000  Enabled
1          101  Enabled          101  Enabled
2          001  Enabled          001  Enabled
3          110  Enabled          111  Enabled

Rewrite table index: 9281, # entries: 1, Table type: EXP
FC#     Low bits  State      High bits  State
1          111  Enabled          000  Disabled
```

Meaning This output shows that a new EXP classifier with the index number **9281** has been created.

CHAPTER 53

Configuring CoS

Configuring CoS (J-Web Procedure)

The Class of Service Configuration pages allow you to configure the Junos CoS components. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level

for each queue. After defining the CoS components you must assign classifiers to the required physical and logical interfaces.

Using the Class of Service Configuration pages, you can configure various CoS components individually or in combination to define particular CoS services.

To configure CoS components :

1. In the J-Web interface, select **Configure>Class of Service**.
2. On the Class of Service Configuration page, select one of the following options depending on the CoS component that you want to define. Enter information into the pages as described in the respective table:
   - To define or edit CoS value aliases, select **CoS Value Aliases** .
   - To define or edit forwarding classes and assign queues, select **Forwarding Classes**.
   - To define or edit classifiers, select **Classifiers** .
   - To define or edit rewrite rules, select **Rewrite Rules**.
   - To define or edit schedulers, select **Schedulers**.
   - To define or edit virtual channel groups, select **Interface Associations**.
3. Click **Apply** after completing configuration on any Configuration page.

Defining CoS Code-Point Aliases (J-Web Procedure)

You can use the J-Web interface to define CoS code-point aliases on a J-EX Series switch. By defining aliases you can assign meaningful names to a particular set of bit values and refer to them when configuring CoS components.

To define CoS code-point aliases:

1. Select **Configure** > **Class of Service** > **CoS Value Aliases**.

NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds a code-point alias. Enter information into the code point alias page as described in Table 229 on page 1913.
   - **Edit**—Modifies an existing code-point alias. Enter information into the code point alias page as described in Table 229 on page 1913.
   - **Delete**—Deletes an existing code-point alias.

Table 229 on page 1913 describes the related fields.

Table 229: CoS Value Aliases Configuration Fields

Field	Function	Your Action
Code point name	Specifies the name for a code-point—for example, **af11** or **be**.	Enter a name.
Code point type	Specifies a code-point type. The code-point type can be DSCP or IP precedence.	Select a value.
Code point value bits	Specifies the CoS value for which an alias is defined. Changing this value alters the behavior of all classifiers that refer to this alias.	To specify a CoS value, type it in the appropriate format: • For DSCP CoS values, use the format xxxxxx, where x is 1 or 0—for example, **101110**. • For IP precedence CoS values, use the format xxx, where x is 1 or 0—for example, **111**.

Defining CoS Code-Point Aliases (CLI Procedure)

You can use code-point aliases to streamline the process of configuring CoS features on your J-EX Series switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- DSCP—Handles incoming IPv4 packets.
- IEEE 802.1p—Handles Layer 2 CoS.
- Inet precedence—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

To configure a code-point alias for a specified CoS marker type (**dscp**), assign an alias (**my1**) to the code-point (**110001**):

```
[edit class-of-service code-point-aliases]
user@switch# set dscp my1 110001
```

Related Documentation

Defining CoS Classifiers (CLI Procedure)

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate (BA) classifier—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, or IEEE 802.1p value.
- Multifield (MF) classifier—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

NOTE: J-EX8200 Ethernet Switches implement the on-demand ternary content addressable memory (TCAM) allocation of memory so that when additional TCAM space is required for CoS, the space is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers beyond the available TCAM space that includes both the free and unused space.

The following example describes how to configure a BA classifier (**ba-classifier**) as the default DSCP map and apply it to either a specific Gigabit Ethernet interface or to all the Gigabit Ethernet interfaces on the switch. The BA classifier assigns loss priorities, as shown in Table 230 on page 1915, to incoming packets in the four forwarding classes.

You can use the same procedure to set MF classifiers (except that you would use firewall filter rules).

Table 230: BA-classifier Loss Priority Assignments

Forwarding Class	For CoS Traffic Type	ba-classifier Assignment
be	Best-effort traffic	High-priority code point: **000001**
ef	Expedited-forwarding traffic	High-priority code point: **101110**
af	Assured-forwarding traffic	High-priority code point: **001100**
nc	Network-control traffic	High-priority code point: **110001**

To configure a DSCP BA classifier named **ba-classifier** as the default DSCP map:

- Associate code point **000001** with forwarding class **be** and loss priority **high:**

```
[edit class-of-service classifiers]
```

```
user@switch# set dscp ba-classifier import default forwarding-class be loss-priority
high code-points 000001
```

- Associate code point **101110** with forwarding class **ef** and loss priority **high:**

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class ef loss-priority high code-points
101110
```

- Associate code point **001100** with forwarding class **af** and loss priority **high:**

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class af loss-priority high code-points
001100
```

- Associate code point **110001** with forwarding class **nc** and loss priority **high:**

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class nc loss-priority high code-points
110001
```

- Apply the classifier to a specific interface or to all Gigabit Ethernet interfaces on the switch.
  - To apply the classifier to a specific interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/0 unit 0 classifiers dscp ba-classifier
```

  - To apply the classifier to all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set ge-* unit * classifiers dscp ba-classifier
```

Defining CoS Classifiers (J-Web Procedure)

You can use the J-Web interface to define CoS classifiers on a J-EX Series switch. Classifiers examine the CoS value or alias of an incoming packet and assign the packet a level of service by setting its forwarding class and loss priority.

To define CoS classifiers:

1. Select **Configure** > **Class of Service** > **Classifiers**.

NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds a classifier. Enter information into the classifier page as described in Table 231 on page 1917.
   - **Edit**—Modifies an existing classifier. Enter information into the classifier page as described in Table 231 on page 1917.
   - **Delete**—Deletes an existing classifier.

Table 231: Classifiers Configuration Fields

Field	Function	Your Action
Classifier Name	Specifies the name for a classifier.	To name a classifier, type the name—for example, **ba-classifier**.
Classifier Type	Specifies the type of classifier: **dscp**, **ieee-802.1**, or **inet-precedence**.	Select a value from the list.

Table 231: Classifiers Configuration Fields *(continued)*

Field	Function	Your Action
Code Point Mapping	Sets the forwarding classes and the packet loss priorities (PLPs) for specific CoS values and aliases.	To add a code point mapping: 1. Click **Add**. 2. Select the code point. 3. Select a forwarding class from the following list: • **expedited-forwarding**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped. • **best-effort**—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined. • **assured-forwarding**—Provides high assurance for packets within the specified service profile. Excess packets are dropped. • **network-control**—Packets can be delayed but not dropped. 4. Select the loss priority. To assign a loss priority, select one: • **high**—Packet has a high loss priority. • **low**—Packet has a low loss priority.

Defining CoS Forwarding Classes (CLI Procedure)

Forwarding classes allow you to group packets for transmission. Based on forwarding classes, you assign packets to output queues.

By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and network control. J-EX Series switches support up to 16 forwarding classes.

You can configure forwarding classes in one of the following ways:

- Using **class** statement—You can configure up to 16 forwarding classes and you can map multiple forwarding classes to single queue.
- Using **queue** statement—You can configure up to 8 forwarding classes and you can map one forwarding class to one queue.

  This example uses the **class** statement to configure forwarding classes.

To configure CoS forwarding classes, map the forwarding classes to queues:

```
[edit class-of-service forwarding-classes]
user@switch# set class be queue—num 0
user@switch# set class ef queue—num 1
user@switch# set class af queue—num 2
user@switch# set class nc queue—num 3
user@switch# set class ef1 queue—num 4
user@switch# set class ef2 queue—num 5
user@switch# set class af1 queue—num 6
user@switch# set class nc1 queue—num 7
```

Defining CoS Forwarding Classes (J-Web Procedure)

You can define CoS forwarding classes on a J-EX Series switch using the J-Web interface. Assigning a forwarding class to a queue number affects the scheduling and marking of a packet as it transits a switch.

To define forwarding classes:

1. Select **Configure** > **Class of Service** > **Forwarding Classes**.

NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds a forwarding class. Enter information into the forwarding class page as described in Table 232 on page 1920.
   - **Edit**—Modifies an existing forwarding class. Enter information into the forwarding class page as described in Table 232 on page 1920.
   - **Delete**—Deletes an existing forwarding class.

Table 232: Forwarding Classes Configuration Fields

Field	Function	Your Action
Forwarding Class Summary		
Queue #	Specifies the internal queue numbers to which forwarding classes are assigned. By default, if a packet is not classified, it is assigned to the class associated with queue 0. You can have more than one forwarding class to a queue number.	To specify an internal queue number, select an integer from 0 through 7, appropriate for your platform.
Forwarding Class Name	Specifies the forwarding class names assigned to specific internal queue numbers. By default, four forwarding classes are assigned to queue numbers 0 (best-effort), 1 (assured-forwarding), 5 (expedited-forwarding), and 7 (network-connect).	Type the name—for example, **be-class**.

Defining CoS Schedulers (CLI Procedure)

You use schedulers to define the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the tail drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues and packet schedulers that operate according to this mapping.

You can associate up to four user-defined scheduler maps with the interfaces.

This topic describes:

- Configuring CoS Schedulers on page 1921
- Assigning Scheduler Maps to Interfaces on a 40-port SFP+ Line Card on page 1921

Configuring CoS Schedulers

To configure CoS schedulers:

1. Create a scheduler (**be-sched**) and assign it a priority:

   ```
   [edit class-of-service schedulers]
   user@switch# set be-sched priority low
   ```

2. Configure a scheduler map (**be-map**) that associates the scheduler (**be-sched**) with the forwarding class (**best-effort**):

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set be-map forwarding-class best-effort scheduler be-sched
   ```

3. Assign the scheduler map (**be-map**) to one or more Ethernet interfaces:

   - To assign the scheduler map to one interface (**ge-0/0/1**):

     ```
     [edit class-of-service interfaces]
     user@switch# set ge-0/0/1 scheduler-map be-map
     ```

   - To assign the scheduler map to more than one interface by using a wildcard (all Gigabit Ethernet interfaces):

     ```
     [edit class-of-service interfaces]
     user@switch# set ge-* scheduler-map be-map
     ```

Assigning Scheduler Maps to Interfaces on a 40-port SFP+ Line Card

For interfaces on a 40-port SFP+ line card, you use the same procedure to configure CoS schedulers as you do for other interfaces. However, you must assign the same scheduler map to all the interfaces in a port group.

When you assign a scheduler map to one interface in a port group, you do not need to assign the scheduler map to the remaining interfaces. The switch automatically uses that scheduler map for the interfaces in the port group when you bring the interfaces up.

If you assign different scheduler maps to different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, an error is logged to the system log. When you bring an interface in the port group up, the default scheduler map is used. If you assign a scheduler map to an interface that is down that is different from the scheduler map being used by the currently operating interfaces in a port group, the default scheduler map is used by all interfaces in a port group, even the currently operating ones, when you bring the interface up.

To change the scheduler map assigned to a port group:

1. Delete the current scheduler map from the interfaces (**xe-0/0/1** and **xe-0/0/2**) it is currently assigned to:

   ```
   [edit class-of-service interfaces]
   user@switch# delete xe-0/0/1 scheduler-map

   [edit class-of-service interfaces]
   user@switch# delete xe-0/0/2 scheduler-map
   ```

2. Assign the new scheduler map (**ef-map**) to at least one interface in the port group:

   ```
   [edit class-of-service interfaces]
   user@switch# set xe-0/0/1 scheduler-map ef-map
   ```

- Understanding CoS Schedulers on page 1868

Defining CoS Schedulers (J-Web Procedure)

You can use the J-Web interface to define CoS schedulers on a J-EX Series switch. Using schedulers, you can assign attributes to queues and thereby provide congestion control for a particular class of traffic. These attributes include the amount of interface bandwidth, memory buffer size, transmit rate, and schedule priority.

To configure schedulers:

1. Select **Configure** > **Class of Service** > **Schedulers**.

NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds a scheduler. Enter information into the schedulers page as described in Table 233 on page 1923.
   - **Edit**—Modifies an existing scheduler. Enter information into the schedulers page as described in Table 233 on page 1923.
   - **Delete**—Deletes an existing scheduler.

Table 233: Schedulers Configuration Page

Field	Function	Your Action
Scheduler Name	Specifies the name for a scheduler.	To name a scheduler, type the name—for example, **be-scheduler**.
Scheduling Priority	Sets the transmission priority of the scheduler, which determines the order in which an output interface transmits traffic from the queues. You can set scheduling priority at different levels in the order of increasing priority from low to high. A high-priority queue with a high transmission rate might lock out lower-priority traffic.	To set a priority, select one: • **low**—Packets in this queue are transmitted last. • **strict-high**—Packets in this queue are transmitted first. • To specify no scheduling priority, select the blank.
Buffer Size	Defines the size of the delay buffer. By default, queues 0 through 7 are allotted the following percentage of the total available buffer space: • Queue 0—95 percent • Queue 1—0 percent • Queue 2—0 percent • Queue 3—0 percent • Queue 4—0 percent • Queue 5—0 percent • Queue 6—0 percent • Queue 7—5 percent NOTE: A large buffer size value correlates with a greater possibility of packet delays. Such a value might not be practical for sensitive traffic such as voice or video.	To define a delay buffer size for a scheduler, select the appropriate option: • To specify no buffer size, select the blank. • To specify buffer size as a percentage of the total buffer, select **Percent** and type an integer from 1 through 100. • To specify buffer size as the remaining available buffer, select **Remainder**. NOTE: On J-EX8200 switches, you can specify the buffer size as a temporal value. The queuing algorithm will then drop packets once it has queued a computed number of bytes. This number is the product of the logical interface speed and the configured temporal value.
Shaping Rate	Specifies the rate at which queues transmit packets.	• To specify shaping rate as a percentage, select **Percent** and type an integer from 1 through 100. • To specify shaping rate as a number, select **Rate** and enter a value. • To specify no shaping rate, select the blank.

Table 233: Schedulers Configuration Page *(continued)*

Field	Function	Your Action
Transmit Rate	Defines the transmission rate of a scheduler. The transmit rate determines the traffic bandwidth from each forwarding class you configure. By default, queues 0 through 7 are allotted the following percentage of the transmission capacity: • Queue 0—95 percent • Queue 1—0 percent • Queue 2—0 percent • Queue 3—5 percent • Queue 4—0 percent • Queue 6—0 percent • Queue 7—5 percent	To define a transmit rate, select the appropriate option: • To enforce the exact transmission rate, select **Rate** and enter a value. • To specify the remaining transmission capacity, select **Remainder Available**. • To specify a percentage of transmission capacity, select **Percent** and type an integer from 1 through 100. • To specify no transmit rate, select the blank.

Defining CoS Scheduler Maps (J-Web Procedure)

You can use the J-Web interface to configure CoS scheduler maps on a J-EX Series switch.

To configure scheduler maps:

1. Select **Configure** > **Class of Service** > **Scheduler Maps**.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - **Add**—Adds a scheduler map. Enter information into the scheduler map page as described in Table 234 on page 1925.
   - **Edit**—Modifies an existing scheduler map. Enter information into the scheduler map page as described in Table 234 on page 1925.

- **Delete**—Deletes an existing scheduler map.

Table 234: Scheduler Maps Configuration Fields

Field	Function	Your Action
Scheduler Map Name	Specifies the name for a scheduler map.	To name a map, type the name—for example, **be-scheduler-map**.
Scheduler Mapping	Allows you to associate a preconfigured scheduler with a forwarding class. After scheduler maps have been applied to an interface, they affect the hardware queues and packet schedulers.	To associate a scheduler with a forwarding class, locate the forwarding class and select the scheduler in the box next to it. For example, for the **best-effort** forwarding class, select the configured scheduler from the list.

Defining CoS Drop Profiles (J-Web Procedure)

You can use the J-Web interface to define CoS drop profiles on J-EX4500 and J-EX8200 switches.

To configure CoS drop profiles:

1. Select **Configure** > **Class of Service** > **Drop Profile**.

   NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:

   - **Add**—Adds a drop profile. Enter information into the drop profiles page as described in Table 235 on page 1926.
   - **Edit**—Modifies an existing drop file. Enter information into the drop profiles page as described in Table 235 on page 1926.
   - **Delete**—Deletes an existing drop profile.

Table 235: Drop Profiles Configuration parameters

Field	Function	Your Action
Drop Profile Name	Specifies the name for a drop profile.	Type the name.
Drop profile graph	Specifies the drop profile graph type	Select one: **Segmented** or **Interpolated**.
Drop profile values	Specifies values for the following two parameters of the drop profile: the queue fill level and the drop probability. The queue fill level represents a percentage of the memory used to store packets in relation to the total amount that has been allocated for that specific queue. The drop probability is a percentage value that correlates to the likelihood that an individual packet is dropped from the network.	To add new values: 1. Click **Add**. 2. Enter the fill level. 3. Enter the drop probability. 4. Click **OK**. To edit an existing value, click **Edit** and modify the fill level and drop probability. To delete a value, select it and click **Delete**.

Configuring CoS Tail Drop Profiles (CLI Procedure)

Tail drop is a simple and effective traffic congestion avoidance mechanism. When you apply this mechanism to manage congestion, packets are dropped when the output queue is full.

To configure CoS tail-drop profiles, create a drop profile name (**be-dp**) and assign a fill level (**25**):

```
[edit class-of-service drop-profiles]
user@switch# set be-dp fill-level 25
```

- Understanding CoS Tail Drop Profiles on page 1867

Defining CoS Rewrite Rules (CLI Procedure)

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of a J-EX Series switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and a code point, thus creating a rewrite table. After the rewrite rule is created, enable it on an interface. You can also apply an existing rewrite rule on an interface.

NOTE: To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the rewrite rule and then apply the new rule.

NOTE: Custom rewrite-rule bindings are implemented through filters. And custom rewrite rules cannot be bound to routed VLAN interfaces (RVIs).

To create rewrite rules and enable them on interfaces:

- To create an 802.1p rewrite rule named customup-rw in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low
code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high
code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority low
code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority high
code-point 011
user@switch# set ieee-802.1 customup-rw forwarding-class ef loss-priority low
code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef loss-priority high
code-point 101
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority low
code-point 110
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority high
code-point 111
```

- To enable an 802.1p rewrite rule named customup-rw on a Layer 2 interface:

```
[edit]
user@switch# set class-of-service interfaces ge-0/0/0 unit 0 rewrite-rules ieee-802.1
customup-rw
```

- To enable an 802.1p rewrite rule named customup-rw on all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical-interface (unit) number:

```
[edit]
user@switch# set class-of-service interfaces ge-* unit * rewrite-rules customup-rw
```

Defining CoS Rewrite Rules (J-Web Procedure)

You can use the J-Web interface to define CoS rewrite rules. Use the rewrite rules to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule.

To define rewrite rules:

1. Select **Configure** > **Class of Service** > **Rewrite Rules**.

   NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:

   - **Add**—Adds a rewrite rule. Enter information into the rewrite rule page as described in Table 236 on page 1928.
   - **Edit**—Modifies an existing rewrite rule. Enter information into the rewrite rule page as described in Table 236 on page 1928.
   - **Delete**—Deletes an existing rewrite rule.

Table 236: Rewrite Rules Configuration Page Summary

Field	Function	Your Action
Rewrite Rule Name	Specifies the name for the rewrite rule.	To name a rule, type the name—for example, **rewrite-dscps**.
Rewrite rule type	Specifies the type of rewrite rule: **dscp**, **ieee-802.1**, or **inet-precedence**.	Select a value from the list.

Table 236: Rewrite Rules Configuration Page Summary *(continued)*

Field	Function	Your Action
Code Point Mapping	Rewrites outgoing CoS values of a packet based on the forwarding class and loss priority. Allows you to remove a code point mapping entry.	To configure a CoS value assignment, follow these steps: To add a code point mapping: 1. Click **Add**. 2. Select the code point. 3. Select a forwarding class from the following list: • **expedited-forwarding**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped. • **best-effort**—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined. • **assured-forwarding**—Provides high assurance for packets within the specified service profile. Excess packets are dropped. • **network-control**—Packets can be delayed but not dropped. 4. Select the loss priority. To assign a loss priority, select one: • **high**—Packet has a high loss priority. • **low**—Packet has a low loss priority. To edit an existing code point mapping, select it and click **Edit**. To remove a code point mapping entry, select it and click **Remove**.

Assigning CoS Components to Interfaces (CLI Procedure)

After you have defined the following CoS components, you must assign them to logical or physical interfaces.

- Forwarding classes—Assign only to logical interfaces.
- Classifiers—Assign only to logical interfaces.
- Scheduler maps—Assign to either physical or logical interfaces.
- Rewrite rules—Assign to either physical or logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wild cards.

To assign CoS components to interfaces:

- To assign CoS components to a single interface, associate a CoS component (for example a scheduler map named **ethernet-cos-map**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
```

- To assign a CoS component to multiple interfaces, associate a CoS component (for example, a rewrite rule named **customup-rw**) to all Gigabit Ethernet interfaces on the switch, use wild characters for the interface name and logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set ge-* unit * rewrite-rules ieee-802.1 customup-rw
```

Related Documentation

Assigning CoS Components to Interfaces (J-Web Procedure)

After you have defined CoS components on a J-EX Series switch, you must assign them to logical or physical interfaces. You can use the J-Web interface to assign scheduler maps to physical or logical interfaces and to assign forwarding classes or classifiers to logical interfaces.

To assign CoS components to interfaces:

1. Select **Configure** > **Class of Service** > **Assign to Interface**.

   NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. To configure interface association, select an interface from the list and click **Edit**.
3. Select one:
   - **Associate system default scheduler map**—Associates the interface with the default scheduler map.
   - **Select the scheduler map**—Associates the interface with a configured scheduler map. Select the scheduler map from the list.

   NOTE: On the 40-port SFP+ line card for J-EX8200 switches, the J-Web interface does not allow you to commit your changes unless you assign the same scheduler map or the default scheduler map to all interfaces in a port group.

4. Click **OK**.
5. To manage a CoS service assignment on a logical interface, click one:
   - **Add**—Adds a CoS service to a logical interface on a specified physical interface. Enter information as described in Table 237 on page 1931.
   - **Edit**—Modifies a CoS service assignment to a logical interface. Enter information as described in Table 237 on page 1931.
   - **Delete**—Deletes the CoS service assignment to a logical interface.

Table 237: Assigning CoS Components to Logical Interfaces

Field	Function	Your Action
Unit	Specifies the name of a logical interface. Allows you to assign CoS components while configuring a logical interface on a physical interface at the same time.	Type the interface name. To assign CoS services to all logical interfaces configured on this physical interface, type the wildcard character (*).
Forwarding Class	Assigns a predefined forwarding class to incoming packets on a logical interface.	To assign a forwarding class to an interface, select the forwarding class.

Table 237: Assigning CoS Components to Logical Interfaces *(continued)*

Field	Function	Your Action
Classifiers	Allows you to apply classification maps to a logical interface. Classifiers assign a forwarding class and loss priority to an incoming packet based on its CoS value.	To assign a classification map to an interface, select an appropriate classifier for each CoS value type used on the interface.
Rewrite Rules	Allows you to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule.	To assign rewrite rules to the interface, select the appropriate rewrite rule for each CoS value type used on the interface.

Configuring Junos OS EZQoS for CoS (CLI Procedure)

You use Junos OS EZQoS on J-EX Series switches to eliminate the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

When you configure EZQoS on J-EX Series switches, preconfigured values are assigned to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name.

NOTE: Currently, we provide an EZQoS template for configuring CoS for VoIP applications. The EZQoS VoIP template is stored in **/etc/config/ezqos-voip.conf**.

To configure EZQoS using the CLI:

1. Load the EZQoS configuration file (**/etc/config/ezqos-voip.conf**):

   ```
   [edit]
   user@switch# load merge /etc/config/ezqos-voip.conf
   ```

2. Apply the EZQoS group (**ezqos-voip**):

   ```
   [edit]
   user@switch# set apply-groups ezqos-voip
   ```

3. Apply the DSCP classifier (**ezqos-dscp-classifier**) to a Gigabit Ethernet interface (**ge-0/0/0**):

   ```
   [edit class-of-service interfaces]
   ```

```
user@switch# set ge-0/0/0 unit 0 classifiers dscp ezqos-dscp-classifier
```

4. Apply the scheduler map (**ezqos-voip-sched-maps**) to a Gigabit Ethernet interface (**ge-0/0/1**):

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/1 scheduler-map ezqos-voip-sched-maps
```

Configuring CoS on an MPLS Provider Edge Switch Using IP Over MPLS (CLI Procedure)

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. This topic describes configuring CoS components on a provider edge (PE) switch that is using IP Over MPLS.

This task describes now to create a custom DSCP classifier and a custom EXP rewrite rule on the ingress PE switch. It includes configuring a policer firewall filter and applying it to the customer-edge interface of the ingress PE switch. The policer firewall filter ensures that the amount of traffic forwarded through the MPLS tunnel never exceeds the requested bandwidth allocation.

For this procedure, we assume that the switch has already been configured for MPLS. See “Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)” on page 2206.

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

```
[edit class-of-service]
user@switch#set classifiers dscp dscp1 import default
```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch#set classifiers dscp dscp1 forwarding-class expedited-forwarding
loss-priority low code-points 000111
```

3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

4. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the customer-edge-interface:

```
[edit firewall]
set policer mypolicer if-exceeding bandwidth-limit 500m
```

5. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

```
[edit firewall policer]
set mypolicer if-exceeding burst-size-limit 33553920
```

6. Discard traffic that exceeds the rate limits for this policer:

```
[edit firewall policer]
set mypolicer then discard
```

7. To reference the policer, configure a filter term that includes the policer action:

```
[edit firewall]
user@switch# set family inet filter myfilter term t1 then policer mypolicer
```

8. Apply the filter to the customer-edge interface:

```
[edit interfaces]
user@switch# set ge-2/0/3 unit 0 family inet address 121.121.121.1/16 policing filter
myfilter
```

NOTE: You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 1921.

Related Documentation

Configuring CoS on an MPLS Provider Edge Switch Using Circuit Cross-Connect (CLI Procedure)

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. This topic describes configuring CoS components on provider edge (PE) switch that is using MPLS over circuit-cross connect (CCC).

NOTE: If you are using MPLS with CCC, you can use only one type of DSCP/IP precedence and only one type of IEEE 802.1p on the CCC interfaces.

This procedure creates a custom DSCP classifier and a custom EXP rewrite rule on the ingress PE. It also enables a policer on the label-switched path (LSP) of the ingress PE to ensure that the amount of traffic forwarded through the LSP never exceeds the requested bandwidth allocation.

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

   ```
   [edit class-of-service]
   user@switch#set classifiers dscp dscp1 import default
   ```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

   ```
   [edit class-of-service]
   user@switch#set classifiers dscp dscp1 forwarding-class expedited-forwarding
   loss-priority low code-points 000111
   ```

3. Specify the values for the custom EXP rewrite rule, **e1**:

   ```
   [edit class-of-service]
   user@switch#  set rewrite-rules exp e1 forwarding-class expedited-forwarding
   loss-priority low code-point 111
   ```

4. Bind the DSCP classifier to the CCC interface:

   ```
   [edit ]
   user@switch#  set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
   ```

5. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the LSP:

   ```
   [edit firewall]
   set policer mypolicer if-exceeding bandwidth-limit 500m
   ```

6. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

   ```
   [edit firewall policer]
   set mypolicer if-exceeding burst-size-limit 33553920
   ```

7. Discard traffic that exceeds the rate limits for this policer:

   ```
   [edit firewall policer]
   set mypolicer then discard
   ```

8. To reference the policer, configure a filter term that includes the policer action:

```
[edit firewall]
user@switch# set family any filter myfilter term t1 then policer mypolicer
```

9. Apply the filter to the LSP:

```
[edit protocols mpls]
set label-switched-path lsp_to_pe2_ge1 policing filter myfilter
```

NOTE: You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 1921.

Configuring CoS Traffic Classification for Ingress Queuing on 40-port SFP+ Line Cards (CLI Procedure)

Packets arriving on a port in the 40-port SFP+ line card in a J-EX8200 switch are directed to either a high priority or a low priority class-of-service (CoS) ingress queue. These queues are used for scheduling traffic from the port group into the Packet Forwarding Engine. The fabric priority associated with the packet's forwarding class determines which queue the packet is sent to. The forwarding class of the packet in turn is determined by the behavior aggregate (BA) classifier assigned to the port.

By default, the fabric priority of all forwarding classes is low. Thus all packets, with the exception of critical network packets, are sent to the low priority ingress queue by default. This procedure describes how you can direct high priority traffic into the high priority ingress queue and thus avoid congestion at the port group.

To direct traffic to the high priority ingress queue for a port group:

1. Create the BA classifier for the forwarding class:

```
[edit class-of-service]
user@switch# set classifiers classifier-type classifier-name
forwarding-class class-name loss-priority level code-points code-point
```

2. Assign a queue number and fabric priority to the forwarding class:

```
[edit class-of-service]
user@switch# set forwarding-classes class class-name queue-num number
priority level
```

3. Assign the BA classifier to the physical interface:

```
[edit class-of-service]
user@switch# set interfaces interface-name unit 0
classifiers classifier-type classifier-name
```

For example, to direct voice traffic to the high-priority ingress queue for interface **xe-1/0/2**:

```
[edit class-of-service]
user@switch# set classifiers dscp dscp1 forwarding-class cos-voice
loss-priority low code-points ef

[edit class-of-service]
user@switch# set forwarding-classes class cos-voice queue-num 5 priority high

[edit class-of-service]
user@switch# set interfaces xe-1/0/2 unit 0 classifiers dscp dscp1
```

NOTE: You must use a BA classifier to classify traffic for ingress queuing. Multifield (MF) classification and port classification (that is, assigning a forwarding class to the interface) are not supported for classifying traffic for ingress queuing. The BA classifier must be assigned to a physical interface, not a Layer 3 tagged interface or a routed VLAN interface (RVI).

Configuring CoS on Provider Switches of an MPLS Network (CLI Procedure)

You can add class-of-service (CoS) components to your MPLS networks on J-EX Series switches to achieve end-to-end Differentiated Services to match your specific business requirements. The configuration of CoS components on the provider switches is the same regardless of whether the provider edge (PE) switches are using MPLS over CCC or IP over MPLS.

This task shows how to configure a custom EXP classifier and custom EXP rewrite rule on the provider switch.

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

   ```
   [edit class-of-service]
   user@switch# set classifiers exp exp1 import default
   ```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

   ```
   [edit class-of-service]
   user@switch#set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
   low code-points 010
   ```

3. Specify the values for the custom EXP rewrite rule, **e1**:

   ```
   [edit class-of-service]
   user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
   loss-priority low code-point 111
   ```

NOTE: You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 1921.

CHAPTER 54

Verifying CoS Configuration

Monitoring CoS Classifiers

Purpose Use the monitoring functionality to display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

Action To monitor CoS classifiers in the J-Web interface, select **Monitor** > **Class of Service** > **Classifiers**.

To monitor CoS classifiers in the CLI, enter the following CLI command:

show class-of-service classifier

Meaning Table 238 on page 1939 summarizes key output fields for CoS classifiers.

Table 238: Summary of Key CoS Classifier Output Fields

Field	Values	Additional Information
Classifier Name	Name of a classifier.	To display classifier assignments, click the plus sign (+).
CoS Value Type	The classifiers are displayed by type: • **dscp**—All classifiers of the DSCP type. • **ieee-802.1**—All classifiers of the IEEE 802.1 type. • **inet-precedence**—All classifiers of the IP precedence type.	
Index	Internal index of the classifier.	

Table 238: Summary of Key CoS Classifier Output Fields *(continued)*

Field	Values	Additional Information
Incoming CoS Value	CoS value of the incoming packets, in bits. These values are used for classification.	
Assign to Forwarding Class	Forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.	
Assign to Loss Priority	Loss priority value that the classifier assigns to the incoming packet based on its CoS value.

Monitoring CoS Forwarding Classes

Purpose View the current assignment of class-of-service (CoS) forwarding classes to queues on the switch.

Action To monitor CoS forwarding classes in the J-Web interface, select **Monitor** > **Class of Service** > **Forwarding Classes**.

To monitor CoS forwarding classes in the CLI, enter the following CLI command:

show class-of-service forwarding-class

Meaning Table 239 on page 1941 summarizes key output fields for CoS forwarding classes.

Table 239: Summary of Key CoS Forwarding Class Output Fields

Field	Values
Forwarding Class	Names of forwarding classes assigned to queue numbers. The following are the default forwarding classes: • **best-effort**—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value. • **expedited-forwarding**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. • **assured-forwarding**—Provides high assurance for packets within specified service profile. Excess packets are dropped. • **network-control**—Packets can be delayed but not dropped. J-EX8200 switches have the following additional default forwarding classes: • **mcast-be**—Provides no special CoS handling of packets. • **mcast-ef**—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. • **mcast-af**—Provides high assurance for packets within the specified service profile. Excess packets are dropped.
Queue	Queue number corresponding to the forwarding class name. The default forwarding classes are assigned as follows: • **best-effort**—0 • **expedited-forwarding**—5 • **assured-forwarding**—1 • **network-control**—7 • **mcast-be**—2 • **mcast-ef**—4 • **mcast-af**—6
Fabric Priority	(J-EX8200 switches only) Fabric priority for the forwarding class, either **high** or **low**. The fabric priority determines the priority of packets ingressing the switch fabric.

Monitoring Interfaces That Have CoS Components

Purpose Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

Action To monitor interfaces that have CoS components in the J-Web interface, select **Monitor** > **Class of Service** > **Interface Association**.

To monitor interfaces that have CoS components in the CLI, enter the following command:

show class-of-service interface *interface*

Meaning Table 240 on page 1942 summarizes key output fields for CoS interfaces.

Table 240: Summary of Key CoS Interfaces Output Fields

Field	Values	Additional Information
Interface	Name of a physical interface to which CoS components are assigned.	To display names of logical interfaces configured on this physical interface, click the plus sign (+).
Scheduler Map	Name of the scheduler map associated with this interface.	
Queues Supported	Number of queues you can configure on the interface.	
Queues in Use	Number of queues currently configured.	
Logical Interface	Name of a logical interface on the physical interface to which CoS components are assigned.	
Object	Category of an object—for example, **classifier**, **scheduler-map**, or **rewrite**.	
Name	Name that you have given to an object—for example, **ba-classifier**.	
Type	Type of an object—for example, **dscp** for a classifier.	
Index	Index of this interface or the internal index of a specific object.	

Related Documentation

- Assigning CoS Components to Interfaces (CLI Procedure) on page 1930

Monitoring CoS Rewrite Rules

Purpose Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

Action To monitor CoS rewrite rules in the J-Web interface, select **Monitor** > **Class of Service** > **Rewrite Rules**.

To monitor CoS rewrite rules in the CLI, enter the following command:

show class-of-service rewrite-rules

Meaning Table 241 on page 1943 summarizes key output fields for CoS rewrite rules.

Table 241: Summary of Key CoS Rewrite Rules Output Fields

Field	Values	Additional Information
Rewrite Rule Name	Names of rewrite rules.	
CoS Value Type	Rewrite rule type: • **dscp**—For IPv4 DiffServ traffic. • **exp**—For MPLS traffic. • **ieee-802.1**—For Layer 2 traffic. • **inet-precedence**—For IPv4 traffic.	To display forwarding classes, loss priorities, and rewritten CoS values, click the plus sign (+).
Index	Internal index for this particular rewrite rule.	
Forwarding Class	Forwarding class that is used to determine CoS values for rewriting in combination with loss priority.	Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.
Loss Priority	Loss priority that is used to determine CoS values for rewriting in combination with forwarding class.	
Rewrite CoS Value To	Value that the CoS value is rewritten to.

- Example: Configuring CoS on J-EX Series Switches on page 1883

Monitoring CoS Scheduler Maps

Purpose Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

Action To monitor CoS scheduler maps in the J-Web interface, select **Monitor** > **Class of Service** > **Scheduler Maps**.

To monitor CoS scheduler maps in the CLI, enter the following CLI command:

show class-of-service scheduler-map

Meaning Table 242 on page 1944 summarizes key output fields for CoS scheduler maps.

Table 242: Summary of Key CoS Scheduler Maps Output Fields

Field	Values	Additional Information
Scheduler Map	Name of a scheduler map.	For details, click the plus sign (+).
Index	Index of a specific object—scheduler maps, schedulers, or drop profiles.	
Scheduler Name	Name of a scheduler.	
Forwarding Class	Forwarding classes this scheduler is assigned to.	
Transmit Rate	Configured transmit rate of the scheduler in bits per second (bps). The rate value can be either of the following: • A percentage—The scheduler receives the specified percentage of the total interface bandwidth. • **remainder**— The scheduler receives the remaining bandwidth of the interface after bandwidth allocation to other schedulers.	
Buffer Size	Delay buffer size in the queue or the amount of transmit delay (in milliseconds). The buffer size can be either of the following: • A percentage—The buffer is a percentage of the total buffer allocation. • **remainder**—The buffer is sized according to what remains after other scheduler buffer allocations.	
Priority	Scheduling priority of a queue: • **strict-high**—Packets in this queue are transmitted first. • **low**—Packets in this queue are transmitted last.	
Drop Profiles	Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.	
Loss Priority	Packet loss priority corresponding to a drop profile.	
Protocol	Transport protocol corresponding to a drop profile.	
Drop Profile Name	Name of the drop profile.	
Index	Index of a specific object—scheduler maps, schedulers, or drop profiles.	

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883

Monitoring CoS Value Aliases

Purpose Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP, IEEE 802.1p, and IPv4 precedence bits.

Action To monitor CoS value aliases in the J-Web interface, select **Monitor** > **Class of Service** > **CoS Value Aliases**.

To monitor CoS value aliases in the CLI, enter the following command:

show class-of-service code-point-aliases

Meaning Table 243 on page 1945 summarizes key output fields for CoS value aliases.

Table 243: Summary of Key CoS Value Alias Output Fields

Field	Values	Additional Information
CoS Value Type	Type of the CoS value: • **dscp**—Examines Layer 3 packet headers for IP packet classification. • **ieee-802.1**—Examines Layer 2 packet headers for packet classification. • **inet-precedence**—Examines Layer 3 packet headers for IP packet classification.	To display aliases and bit patterns, click the plus sign (+).
CoS Value Alias	Name given to a set of bits—for example, **af11** is a name for **001010** bits.	
CoS Value	Set of bits associated with an alias.	

Related Documentation

- Defining CoS Code-Point Aliases (CLI Procedure) on page 1914

- Example: Configuring CoS on J-EX Series Switches on page 1883

Monitoring CoS Drop Profiles

Purpose Use the monitoring functionality to view data point information for each CoS random early detection (RED) drop profile on the J-EX8200 switch.

Action To monitor CoS RED drop profiles in the J-Web interface, select **Monitor** > **Class of Service** > **RED Drop Profiles**.

To monitor CoS RED drop profiles in the CLI, enter the following CLI command:

```
show class-of-service drop-profile
```

Meaning Table 244 on page 1946 summarizes the key output fields for CoS RED drop profiles.

Table 244: Summary of the Key Output Fields for CoS Red Drop Profiles

Field	Values	Additional Information
RED Drop Profile Name	Name of the RED drop profile. A drop profile consists of pairs of values between 0 and 100, one for queue buffer fill level and the other for drop probability, that determine the relationship between a buffer's fullness and the likelihood it will drop packets.	To display profile values, click the plus sign (+).
Graph RED Profile	Links to a graph of a RED curve that the system uses to determine the drop probability based on queue buffer fullness.	The x axis represents the queue buffer fill level, and the y axis represents the drop probability.
Type	Type of a specific drop profile: • **interpolated**—The two coordinates (x and y) of the graph are interpolated to produce a smooth profile. • **segmented**—The two coordinates (x and y) of the graph are represented by line fragments to produce a segmented profile.	
Index	Internal index of this drop profile.	
Fill Level	Percentage fullness of a buffer queue. This value is the x coordinate of the RED drop profile graph.	
Drop Probability	Drop probability of a packet corresponding to a specific queue buffer fill level. This value is the y coordinate of the RED drop profile graph.

CHAPTER 55

Troubleshooting CoS Configuration

Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in a J-EX8200 Switch

Problem After you configure a scheduler map on an interface on the 40-port SFP+ line card, you notice one or both of the following:

- All packets are being dropped on a class-of-service queue configured on the interface.
- A message in the system log states that the interface is using the default scheduler map, not the scheduler map you configured. For example:

```
Sep 19 21:26:50  hostname cosd[907]: COSD_SCHED_MAP_GROUP_CONFLICT:
Interface xe-5/0/15 cannot be bound to scheduler-map m1. It will be bound
 to
default scheduler-map
```

Cause The ports in a 40-port SFP+ line card are divided into eight groups, each group comprising five ports. The ports in a port group share 10 gigabits of bandwidth. Because the port groups share bandwidth, only one scheduler map can be active at a time in a port group. If you configure different scheduler maps for different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, default scheduler map becomes the active scheduler map for all interfaces in the port group, and messages in the system log report that the default scheduler map is in use for the affected interfaces. If the default scheduler map does not define a queue, all traffic is dropped on that queue.

Solution Check your CoS configuration for the interfaces in the port group. If you have different scheduler maps assigned to different interfaces in the port group:

1. Delete the scheduler map configuration for all interfaces in the port group.
2. Determine the scheduler map that you want all interfaces in the port group to use.
3. Assign that scheduler map to at least one interface in the port group. The remaining interfaces in the port group will adopt this scheduler map.

BEST PRACTICE: To prevent confusion and future configuration conflicts, explicitly assign the scheduler map to each interface in the port group.

4. After you commit the configuration, verify that the scheduler map is the active scheduler map for the interfaces in the port group by using the **show class-of-service forwarding-table scheduler-map** command.

Related Documentation

Troubleshooting a CoS Classifier Configuration for a TCAM Space Error

Problem When a CoS classifier configuration exceeds the amount of available ternary content addressable memory (TCAM) space, the switch returns the following system log message:

```
<number_of_rules_being_added> rules for <filter_name> class <filter_class> will
not be installed, key: <bind_point>. no space in tcam db(<shared_pool_information>)
```

The switch returns this message during the commit operation if the number of classifiers defined in the CoS configuration or the number of bind points (interfaces) to which classifiers are bound causes the CoS configuration to exceed the amount of available TCAM space. However, the commit operation for the CoS configuration is completed in the CLI module.

Solution When a CoS configuration exceeds the amount of available TCAM table space, you must either define fewer classifiers or bind them to fewer interfaces, or both, so that the space requirements for the CoS configuration do not exceed the available space in TCAM.

To delete classifier definitions and bind points in a CoS configuration, and to apply a new CoS classifier definition to fewer bind points:

1. Delete either the CoS classifier definition or the bind points:
   - To delete the CoS classifier definition:
     - For behavioral classifiers:

       ```
       [edit class-of-service]
       user@switch# delete classifier dscp d1
       ```

     - For multifield classifiers:

       ```
       [edit]
       user@switch# delete interfaces ge-3/0/2 unit 0 family ethernet-switching filter input ipacl
       ```

       This command deletes a multifield classifier defined for a port. Similarly, you can delete a multifield classifier defined for a VLAN or router.

       You can also delete terms defined in a single multifield classifier:

       ```
       [edit]
       user@switch# delete firewall family inet filter f1 term t1
       ```

     In both these examples (for behavioral and multifield classifiers), the assumption is that too many classifier definitions resulted in the error message.

   - To delete the bind points:

     ```
     [edit class-of-service]
     user@switch# delete class-of-service interfaces ge-0/0/0
     user@switch# delete class-of-service interfaces ge-0/0/1
     user@switch# delete class-of-service interfaces ge-0/0/2
     user@switch# delete class-of-service interfaces ge-0/0/3
     user@switch# delete class-of-service interfaces ge-0/0/4
     user@switch# delete class-of-service interfaces ge-0/0/5
     user@switch# delete class-of-service interfaces ge-0/0/6
     user@switch# delete class-of-service interfaces ge-0/0/7
     user@switch# delete class-of-service interfaces ge-0/0/8
     ```

     Here the assumption is that too many bind points (nine) in the configuration resulted in the error message.

2. Commit the operation:

   ```
   [edit]
   user@switch# commit
   ```

3. Define fewer classifiers in the CoS configuration or bind classifiers to fewer interfaces, or both, so that the CoS classifier configuration does not exceed the amount of available TCAM space on the switch:
   - To define CoS classifiers:
     - For behavioral classifiers:

       ```
       [edit]
       ```

```
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc1 loss-priority
low code-points 000001
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc2 loss-priority
low code-points 000010
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc3 loss-priority
low code-points 000011
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc4 loss-priority
low code-points 000100
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc5 loss-priority
low code-points 000101
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc6 loss-priority
low code-points 000110
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc7 loss-priority
low code-points 000111
```

- For multifield Classifiers:

```
[edit]
user@switch# set firewall family inet filter f1 term t1 from protocol tcp
user@switch# set firewall family inet filter f1 term t1 then loss-priority high
user@switch# set firewall family inet filter f1 term t1 then forwarding-class best-effort
user@switch# set firewall family inet filter f1 term t2 from protocol udp
user@switch# set firewall family inet filter f1 term t2 then loss-priority high
user@switch# set firewall family inet filter f1 term t2 then forwarding-class
assured-forwarding
user@switch# set firewall family inet filter f1 term t3 from source-port ssh
user@switch# set firewall family inet filter f1 term t3 then loss-priority low
user@switch# set firewall family inet filter f1 term t3 then forwarding-class fc8
user@switch#set class-of-service forwarding-classes best-effort, assured-forwarding,
fc8
```

- To bind classifiers to fewer interfaces:

```
[edit]
user@switch# set class-of-service interfaces ge-0/0/0 unit 0 classifiers dscp d2
user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifiers dscp d2
user@switch# set class-of-service interfaces ge-0/0/2 unit 0 forwarding-class
best-effort
user@switch# set class-of-service interfaces ge-0/0/3 unit 0 forwarding-class
assured-forwarding
user@switch# set class-of-service interfaces ge-0/0/4 unit 0 forwarding-class fc8
```

4. Commit the operation:

```
[edit]
user@switch# commit
```

5. Check system log for an error message. If an error message is not logged, then your classifier configuration has not exceeded the TCAM space limit.

   If an error message is logged, then repeat this procedure by defining fewer classifiers or binding classifiers to fewer bind points.

broadcast

Syntax broadcast *forwarding-class-name*;

Hierarchy Level [edit **class-of-service multi-destination** family **ethernet**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the forwarding class for the broadcast traffic belonging to the Ethernet family.

Options ***forwarding-class-name*** —Name of the forwarding class:

- **mcast-af**—Default forwarding class for assured forwarding of multicast traffic.
- **mcast-be**—Default best-effort forwarding class for multicast traffic.
- **mcast-ef**—Default forwarding class for expedited forwarding of multicast traffic.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Understanding CoS Schedulers on page 1868
- Understanding CoS Forwarding Classes on page 1864
- Understanding CoS Classifiers on page 1861

buffer-size

Syntax buffer-size (exact | percent *percentage* | remainder);

Hierarchy Level [edit **class-of-service schedulers** *scheduler-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify buffer size.

Default If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent.

Options

exact—Enforce the exact buffer size. When this option is configured, sharing is disabled on the queue, restricting the usage to guaranteed buffers only.

percent*percentage*—Buffer size as a percentage of total buffer.

remainder—Remaining buffer available.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

class

Syntax class *class-name* queue-num *queue-number* priority (high | low);

Hierarchy Level [edit **class-of-service forwarding-classes**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure up to 16 forwarding classes with multiple forwarding classes mapped to single queues. If you want to configure up to eight forwarding classes with one-to-one mapping to output queues, use the **queue** statement instead of the **class** statement at the **[edit class-of-service forwarding-classes]** hierarchy level.

On J-EX8200 switches, you can assign a fabric priority to a forwarding class. The fabric priority determines scheduling priority of packets ingressing the switch fabric. In addition, for interfaces on the 40-port SFP+ line card, the fabric priority determines whether packets are sent to the high or low priority queue for ingressing the port group. The primary use of this option is to prevent high priority input traffic from being dropped due to congestion on the port group of a 40-port SFP+ line card.

Options *class-name*—Name of forwarding class.

priority (high | low)—(Optional) (J-EX8200 switches only) Fabric priority.
Values: **high** or **low**
Default: **low**

queue-num ***queue-number***—Output queue number.
Range: 0 through 7

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

class-of-service

Syntax

```
class-of-service {
  classifiers {
    (dscp | ieee-802.1 | inet-precedence) classifier-name {
      import (classifier-name | default);
      forwarding-class class-name {
        loss-priority level {
          code-points [ aliases ] [ 6 bit-patterns ];
        }
      }
    }
  }
  code-point-aliases {
    (dscp | ieee-802.1 | inet-precedence) {
      alias-name  bits;
    }
  }
  forwarding-classes {
    class class-name queue-num queue-number priority ( high | low );
  }
  interfaces {
    interface-name  {
      scheduler-map  map-name;
      unit logical-unit-number {
        forwarding-class class-name;
        classifiers {
          (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
        }
      }
    }
  }
  multi-destination {
    family {
      ethernet {
        broadcast forwarding-class-name;
      }
      inet {
        classifier {
          (dscp | inet-precedence) classifier-name;
        }
      }
    }
    scheduler-map  map-name;
  }
  rewrite-rules {
    (dscp | ieee-802.1 | inet-precedence) rewrite-name {
      import (rewrite-name | default);
      forwarding-class class-name {
        loss-priority priority code-point (alias | bits);
      }
    }
  }
  scheduler-maps {
```

```
    map-name {
      forwarding-class class-name scheduler scheduler-name;
    }
  }
  schedulers {
    scheduler-name  {
      buffer-size (percent percentage | remainder);
      drop-profile-map loss-priority loss-priority protocol protocol drop-profile profile-name;
      priority priority;
      shaping-rate (rate | percent percentage);
      transmit-rate (rate | percent percentage | remainder);
    }
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure class-of-service (CoS) parameters on J-EX Series switches.

The remaining statements are explained separately.

Default If you do not configure any CoS features, the default CoS settings are used.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

classifiers

Syntax

```
classifiers {
  (dscp | ieee-802.1 | inet-precedence | exp) classifier-name {
    import (classifier-name | default);
    forwarding-class class-name {
      loss-priority level {
        code-points [ aliases ] [ 6–bit-patterns ];
      }
    }
  }
}
```

Hierarchy Level

[edit class-of-service],
[edit class-of-service interfaces *interface-name* unit *logical-unit-number*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply a CoS aggregate behavior classifier to a logical interface. You can apply a default classifier or a custom classifier.

The statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

code-point-aliases

Syntax

```
code-point-aliases {
  (dscp | ieee-802.1 | inet-precedence) |{
    alias-name  bits;
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define an alias for a CoS marker.

The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Defining CoS Code-Point Aliases (CLI Procedure) on page 1914 or Defining CoS Code-Point Aliases (J-Web Procedure) on page 1912
- Understanding CoS Code-Point Aliases on page 1858

code-points

Syntax code-points [*aliases*] [*6 bit-patterns*];

Hierarchy Level [edit class-of-service classifiers (dscp | ieee-802.1 | inet-precedence) forwarding-class *class-name* loss-priority *level*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify one or more DSCP code-point aliases or bit sets for association with a forwarding class.

Options ***aliases*** —Name of the DSCP alias.

6 bit-patterns —Value of the code-point bits, in decimal form.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

drop-profile-map

Syntax drop-profile-map **loss-priority** *loss-priority* **protocol** *protocol* drop-profile *profile-name*;

Hierarchy Level [edit **class-of-service schedulers** *scheduler-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the loss priority value for the specified drop profile.

Options **drop-profile** ***profile-name*** —Name of the drop profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

dscp

Syntax

```
dscp classifier-name {
  import (classifier-name | default);
  forwarding-class class-name {
    loss-priority level {
      code-points [ aliases ] [ 6–bit-patterns ];
    }
  }
}
```

Hierarchy Level

[edit class-of-service classifiers],
[edit class-of-service code-point-aliases],
[editclass-of-service interfaces *interface-name* unit *logical-unit-number* classifiers],
[edit class-of-service rewrite-rules]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define the Differentiated Services code point (DSCP) mapping that is applied to the packets.

Options

classifier-name—Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

dscp-ipv6

Syntax

```
dscp-ipv6 classifier-name {
  import (classifier-name | default);
  forwarding-classclass-name {
    loss-priority level {
      code-points [ aliases ] [ 6–bit-patterns ];
    }
  }
}
```

Hierarchy Level

```
[edit class-of-serviceclassifiers],
  [edit class-of-servicecode-point-aliases],
  [editclass-of-serviceinterfacesinterface-nameunitlogical-unit-number classifiers]
  [editclass-of-serviceinterfacesinterface-nameunitlogical-unit-number rewrite-rules]
  [edit class-of-servicerewrite-rules]
```

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Define the Differentiated Services code point (DSCP) mapping that is applied to the IPv6 packets.

Options *classifier-name*—Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883

ethernet

Syntax

```
ethernet {
  broadcast forwarding-class-name;
}
```

Hierarchy Level [edit **class-of-service multi-destination family**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the Ethernet broadcast traffic family.

The remaining statement is explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Understanding CoS Schedulers on page 1868

exp

Syntax

```
exp classifier-name {
  import (classifier-name | default);
  forwarding-class class-name {
    loss-priority level {
      code-points [ aliases ] [ 3–bit-patterns ];
    }
  }
}
```

Hierarchy Level [edit class-of-service classifiers]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the experimental bits (EXP) code point mapping that is applied to the MPLS packets.

J-EX Series switches support only one EXP code mapping on the switch (either default or custom). It is applied globally and implicitly to all the MPLS-enabled interfaces on the switch. You cannot bind it to an individual interface and you cannot disable it.

Options *classifier-name*—Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

family

Syntax

```
family {
  ethernet {
    broadcast forwarding-class-name;
  }
  inet {
    classifiers{
      (dscp | ieee-802.1 | inet-precedence) classifier-name;
    }
  }
}
```

Hierarchy Level [edit class-of-service multi-destination]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the multidestination traffic family.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

ieee-802.1

Syntax

```
ieee-802.1 classifier-name {
  import (classifier-name | default);
  forwarding-class class-name {
    loss-priority level {
      code-points [ aliases ] [ 6 bit-patterns ];
    }
  }
}
```

Hierarchy Level

[edit **class-of-service classifiers**],
[edit **class-of-service code-point-aliases**],
[edit**class-of-service interfaces** *interface-name* **unit** *logical-unit-number* **classifiers**],
[edit **class-of-service rewrite-rules**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply an IEEE-802.1 rewrite rule.

Options

classifier-name —Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

inet-precedence

Syntax

```
inet-precedence classifier-name {
  import (classifier-name | default);
  forwarding-class class-name {
    loss-priority level {
      code-points [ aliases ] [ 6–bit-patterns ];
    }
  }
}
```

Hierarchy Level

[edit **class-of-service classifiers**],
[edit **class-of-service code-point-aliases**],
[edit**class-of-service interfaces** *interface-name* **unit** *logical-unit-number* **classifiers**],
[edit **class-of-service rewrite-rules**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply an IPv4 precedence rewrite rule.

Options

classifier-name—Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interfaces

Syntax

```
interfaces {
  interface-name  {
    congestion-notification-profile profile-name {
      input {
        ieee-802.1 {
          code-point up-bits pfc;
          }
        }
      }
    }
    scheduler-map map-name;
    unit logical-unit-number {
      forwarding-class class-name;
      classifiers {
        (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
      }
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interface-specific class-of-service (CoS) properties for incoming packets.

Options *interface-name*—Name of the interface.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

loss-priority

Syntax

```
loss-priority level {
  code-points [ aliases ] [ 6–bit-patterns | 3–bit-patterns ];
}
```

Hierarchy Level

[edit class-of-service classifiers (dscp | ieee-802.1 | inet-precedence | exp) *classifier-name* forwarding-class *class-name*],
[edit class-of-service rewrite-rules (dscp | ieee-802.1 | inet-precedence | exp) *rewrite-name* forwarding-class *class-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify packet loss priority value for a specific set of code-point aliases and bit patterns.

Options

level —Can be one of the following:

- **high**—Packet has high loss priority.
- **low**—Packet has low loss priority.

The remaining statement is explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multi-destination

Syntax

```
multi-destination {
  family {
    ethernet {
      broadcast forwarding-class-name;
    }
    inet {
      classifiers {
        (dscp | ieee-802.1 | inet-precedence) classifier-name;
      }
    }
  }
  scheduler-map  map-name;
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the CoS configuration for multidestination traffic.

The remaining statements are explained separately.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Understanding CoS Schedulers on page 1868

policing

Syntax policing (filter *filter-name* | no-automatic-policing);

Hierarchy Level [edit protocols mpls label-switched-path *lsp-name*]
[edit interfaces *interface-id* unit *number-of-logical-unit* family inet address *ip-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a rate-limiting policer as the specified policing filter:

- To the LSP for MPLS over CCC.
- To the customer-edge interface for IP over MPLS.

Options **filter *filter-name***—Specify the name of the policing filter.

no-automatic-policing—Disable automatic policing on this LSP.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring CoS on MPLS Provider Edge Switch Using Circuit Cross-Connect (CLI Procedure) on page 1935
- Configuring CoS on MPLS Provider Edge Switch Using IP Over MPLS (CLI Procedure) on page 1933

priority

Syntax priority *priority*;

Hierarchy Level [edit **class-of-service schedulers** *scheduler-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify packet-scheduling priority value.

Options ***priority*** —It can be one of the following:

- **low**—Scheduler has low priority.
- **strict-high**—Scheduler has strictly high priority.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- Defining CoS Schedulers (CLI Procedure) on page 1921 or Defining CoS Schedulers (J-Web Procedure) on page 1922
- Understanding CoS Schedulers on page 1868

protocol

Syntax protocol *protocol* drop-profile *profile-name*;

Hierarchy Level [edit **class-of-service schedulers** *scheduler-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the protocol type for the specified drop profile.

Options **drop-profile** ***profile-name*** —Name of the drop profile.

protocol —Type of protocol. It can be:

- **any**—Accept any protocol type.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Configuring CoS Tail Drop Profiles (CLI Procedure) on page 1926
- Understanding CoS Tail Drop Profiles on page 1867

rewrite-rules

Syntax

```
rewrite-rules {
  (dscp | exp |ieee-802.1 | inet-precedence ) rewrite-name {
    import ( default | rewrite-name);
    forwarding-class class-name {
      loss-priority level code-point (alias | bits);
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a rewrite-rules mapping for the traffic that passes through all queues on the interface.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Combining CoS with MPLS on J-EX Series Switches on page 1883
- Defining CoS Rewrite Rules (CLI Procedure) on page 1927 or Defining CoS Rewrite Rules (J-Web Procedure) on page 1928

- Understanding Using CoS with MPLS Networks on J-EX Series Switches on page 1876

scheduler-map

Syntax scheduler-map *map-name*;

Hierarchy Level [edit **class-of-service interfaces**],
[edit **class-of-service multi-destination**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a scheduler map name with an interface or with a multidestination traffic configuration.

Options ***map-name*** —Name of the scheduler map.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Assigning CoS Components to Interfaces (CLI Procedure) on page 1930 or Assigning CoS Components to Interfaces (J-Web Procedure) on page 1930
- Understanding CoS Schedulers on page 1868
- Understanding CoS Classifiers on page 1861

scheduler-maps

Syntax

```
scheduler-maps {
  map-name {
    forwarding-class class-name scheduler scheduler-name;
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a scheduler map name and associate it with the scheduler configuration and forwarding class.

Options *map-name* —Name of the scheduler map.

The remaining statement is explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883

- Understanding CoS Schedulers on page 1868
- Understanding CoS Forwarding Classes on page 1864

schedulers

Syntax

```
schedulers {
  scheduler-name  {
    buffer-size (percent percentage | remainder);
    drop-profile-map loss-priority loss-priority protocol protocol drop-profile profile-name;
    priority priority;
    shaping-rate (rate | percent percentage);
    transmit-rate (rate | percent percentage | remainder);
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify scheduler name and parameter values.

Options ***scheduler-name*** —Name of the scheduler.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Defining CoS Schedulers (CLI Procedure) on page 1921 or Defining CoS Schedulers (J-Web Procedure) on page 1922
- Understanding CoS Schedulers on page 1868

shaping-rate

Syntax shaping-rate (percent *percentage* | rate);

Hierarchy Level [edit **class-of-service schedulers** *scheduler-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure shaping rate to throttle the rate at which queues transmit packets.

We recommend that you configure the shaping rate as an absolute maximum usage and not as additional usage beyond the configured transmit rate.

Default If you do not include this statement, the default shaping rate is 100 percent, which is the same as no shaping at all.

Options **percent***percentage* —Shaping rate as a percentage of the available interface bandwidth.

Range: 0 through 100 percent

rate—Peak rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Range: 3200 through 32,000,000,000 bps

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Understanding Junos CoS Components for J-EX Series Switches on page 1856

shared-buffer

Syntax shared-buffer percent *percentage*

Hierarchy Level [edit **class-of-service**],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the buffer allocation for the shared buffer pool.

Options **percent *percentage***—Size of the shared buffer as a percentage of the buffer allocated to the shared buffer pool.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Understanding Junos CoS Components for J-EX Series Switches on page 1856

transmit-rate

Syntax transmit-rate (*rate* | percent *percentage* | remainder);

Hierarchy Level [edit **class-of-service schedulers** *scheduler-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the transmit rate or percentage for a scheduler.

Default If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent.

Options

rate —Transmission rate, in bps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Range: 3200 through 160,000,000,000 bps

percent *percentage* —Percentage of transmission capacity. A percentage of zero drops all packets in the queue.

Range: 0 through 100 percent

remainder—Remaining rate available

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Defining CoS Schedulers (CLI Procedure) on page 1921 or Defining CoS Schedulers (J-Web Procedure) on page 1922

unit

Syntax

```
unit logical-unit-number {
  forwarding-class class-name;
  classifiers {
    (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
  }
}
```

Hierarchy Level [edit class-of-service interfaces *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options ***logical-unit-number*** —Number of the logical unit.

Range: 0 through 16,385

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Assigning CoS Components to Interfaces (CLI Procedure) on page 1930 or Assigning CoS Components to Interfaces (J-Web Procedure) on page 1930

CHAPTER 57

Operational Commands for CoS

show class-of-service

Syntax **show class-of-service**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the class-of-service (CoS) information.

Required Privilege Level view

Related Documentation

- Example: Configuring CoS on J-EX Series Switches on page 1883
- Monitoring CoS Value Aliases on page 1945
- Monitoring CoS Classifiers on page 1939

List of Sample Output **show class-of- service on page 1987**
show class-of-service rewrite-rule on page 1990

Output Fields Table 245 on page 1986 lists the output fields for the **show class-of-service** command. Output fields are listed in the approximate order in which they appear.

Table 245: show class-of-service Output Fields

Field Name	Field Description	Level of Output
Forwarding class	The forwarding class configuration: • **Forwarding class**—Name of the forwarding class. • **ID**—Forwarding class ID. • **Queue**—Queue number. • **Fabric Priority**—(J-EX8200 switches only) Fabric priority: either **high** or **low**. The fabric priority determines which CoS ingress queues packets are sent to.	All levels
Code point type	The type of code-point alias: • **dscp**—Aliases for DiffServ code point (DSCP) values. • **ieee–802.1**—Aliases for IEEE 802.1p values. • **inet-precedence**—Aliases for IP precedence values. • **exp**—Aliases for experimental (EXP) values.	All levels
Alias	Names given to CoS values.	All levels
Bit pattern	Set of bits associated with an alias.	All levels
Classifier	Name of the classifier.	All levels

Table 245: show class-of-service Output Fields *(continued)*

Field Name	Field Description	Level of Output
Code point	Code-point values.	All levels
Loss priority	Loss priority assigned to specific CoS values and aliases of the classifier.	All levels
Rewrite rule	Name of the rewrite-rule.	All levels
Drop profile	Name of the drop profile.	All levels
Type	Type of drop profile. J-EX Series switches support only the **discrete** type of drop profile.	All levels
Fill level	Percentage of queue buffer fullness of high packets beyond which high packets are dropped.	All levels
Scheduler	Name of the scheduler.	All levels
Transmit rate	Transmission rate of the scheduler.	All levels
Buffer size	Delay buffer size in the queue.	All levels
Drop profiles	Drop profiles configured for the specified scheduler.	All levels
Protocol	Transport protocol corresponding to the drop profile.	All levels
Name	Name of the drop profile.	All levels
Queues supported	Number of queues that can be configured on the interface.	All levels
Queues in use	Number of queues currently configured.	All levels
Physical interface	Name of the physical interface.	All levels
Scheduler map	Name of the scheduler map.	All levels
Index	Internal index of a specific object.	All levels

Sample Output

show class-of- service

```
user@switch> show class-of-service

show class-of-service classifier

Syntax

show class-of-service classifier
<name *name*>
<type dscp | type dscp-ipv6 | type exp | type ieee-802.1 | type inet-precedence>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For each class-of-service (CoS) classifier, display the mapping of code point value to forwarding class and loss priority.

Options

none—Display all classifiers.

name *name*—(Optional) Display named classifier.

type dscp—(Optional) Display all classifiers of the Differentiated Services code point (DSCP) type.

type dscp-ipv6—(Optional) Display all classifiers of the DSCP for IPv6 type.

type exp—(Optional) Display all classifiers of the MPLS experimental (EXP) type.

type ieee-802.1—(Optional) Display all classifiers of the ieee-802.1 type.

type inet-precedence—(Optional) Display all classifiers of the inet-precedence type.

Required Privilege Level

view

List of Sample Output

show class-of-service classifier type ieee-802.1 on page 1992

Output Fields

Table 246 on page 1991 describes the output fields for the **show class-of-service classifier** command. Output fields are listed in the approximate order in which they appear.

Table 246: show class-of-service classifier Output Fields

Field Name	Field Description
Classifier	Name of the classifier.
Code point type	Type of the classifier: **dscp**, **ieee-802.1**, or **inet-precedence**.
Index	Internal index of the classifier.
Code point	Code point value used for classification
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
Loss priority	Loss priority value used for classification. For most platforms, the value is **high** or **low**. For some platforms, the value is **high**, **medium-high**, **medium-low**, or **low**.

Sample Output

show class-of-service classifier type ieee-802.1

```
user@host>  show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point         Forwarding Class                  Loss priority
  000              best-effort                         low
  001              best-effort                         high
  010              expedited-forwarding                low
  011              expedited-forwarding                high
  100              assured-forwarding                  low
  101              assured-forwarding                  medium-high
  110              network-control                     low
  111              network-control                     high

Classifier: users-ieee802.1, Code point type: ieee-802.1
  Code point         Forwarding class                    Loss priority
  100                expedited-forwarding                low
```

show class-of-service code-point-aliases

Syntax show class-of-service code-point-aliases
<dscp | dscp-ipv6 | exp | ieee-802.1 | inet-precedence>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns.

Options none—Display code point aliases of all code point types.

dscp—(Optional) Display Differentiated Services code point (DSCP) aliases.

dscp-ipv6—(Optional) Display IPv6 DSCP aliases.

exp—(Optional) Display MPLS EXP code point aliases.

ieee-802.1—(Optional) Display IEEE-802.1 code point aliases.

inet-precedence—(Optional) Display IPv4 precedence code point aliases.

Required Privilege Level view

List of Sample Output **show class-of-service code-point-aliases exp on page 1994**

Output Fields Table 247 on page 1993 describes the output fields for the **show class-of-service code-point-aliases** command. Output fields are listed in the approximate order in which they appear.

Table 247: show class-of-service code-point-aliases Output Fields

Field Name	Field Description
Code point type	Type of the code points displayed: **dscp**, **ieee-802.1**, or **inet-precedence**.
Alias	Alias for a bit pattern.
Bit pattern	Bit pattern for which the alias is displayed.

Sample Output

show class-of-service code-point-aliases exp

```
user@host> show class-of-service code-point-aliases exp
Code point type: exp
  Alias               Bit pattern
  af11                100
  af12                101
  be                  000
  be1                 001
  cs6                 110
  cs7                 111
  ef                  010
  ef1                 011
  nc1                 110
  nc2                 111
```

show class-of-service drop-profile

Syntax show class-of-service drop-profile
<profile-name *profile-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display data points for each class-of-service (CoS) random early detection (RED) drop profile.

Options none—Display all drop profiles.

profile-name *profile-name*—(Optional) Display the specified profile only.

Required Privilege Level view

List of Sample Output **show class-of-service drop-profile on page 1996**

Output Fields Table 248 on page 1995 describes the output fields for the **show class-of-service drop-profile** command. Output fields are listed in the approximate order in which they appear.

Table 248: show class-of-service drop-profile Output Fields

Field Name	Field Description
Drop profile	Name of a drop profile.
Type	Type of this drop profile: **discrete** or **interpolated**.
Index	Internal index of this drop profile.
Fill Level	Percentage fullness of a queue.
Drop probability	Drop probability at this fill level.

Sample Output

show class-of-service drop-profile

```
user@host> show class-of-service drop-profile
Drop profile: <default-drop-profile>, Type: discrete, Index: 1
  Fill level    Drop probability
         100                 100
Drop profile: user-drop-profile, Type: interpolated, Index: 2989
  Fill level    Drop probability
           0                   0
           1                   1
           2                   2
           4                   4
           5                   5
           6                   6
           8                   8
          10                  10
          12                  15
          14                  20
          15                  23
        ... 64 entries total
          90                  96
          92                  96
          94                  97
          95                  98
          96                  98
          98                  99
          99                  99
         100                 100
```

show class-of-service forwarding-class

Syntax show class-of-service forwarding-class

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about forwarding classes, including the mapping of forwarding classes to queue numbers.

Required Privilege Level view

List of Sample Output

show class-of-service forwarding-class on page 1997
show class-of-service forwarding-class (J-EX8200 Switch) on page 1998
show class-of-service forwarding-class (QFX Series) on page 1998

Output Fields Table 249 on page 1997 describes the output fields for the **show class-of-service forwarding-class** command. Output fields are listed in the approximate order in which they appear.

Table 249: show class-of-service forwarding-class Output Fields

Field Name	Field Description
Forwarding class	Name of forwarding class.
ID	Forwarding class identifier.
Queue	CoS queue mapped to the forwarding class.
Policing priority	Not supported on J-EX Series switches and can be ignored.
Fabric priority	(J-EX8200 switches only) Fabric priority for the forwarding class, either **high** or **low**. Determines the priority of packets ingressing the switch fabric.

Sample Output

show class-of-service forwarding-class

```
user@switch> show class-of-service forwarding-class
Forwarding class                ID                      Queue  Policing priority
  best-effort                   0                           0           normal
  expedited-forwarding          1                           5           normal
  assured-forwarding            2                           1           normal
  network-control               3                           7           normal
```

Sample Output

show class-of-service forwarding-class (J-EX8200 Switch)

```
user@switch> show class-of-service forwarding-class
Forwarding class                          ID       Queue  Fabric priority
  best-effort                              0       0      low
  expedited-forwarding                     1       5      low
  assured-forwarding                       2       1      low
  network-control                          3       7      low
  mcast-be                                 4       2      low
  mcast-ef                                 5       4      low
  mcast-af                                 6       6      low
```

Sample Output

show class-of-service forwarding-class (QFX Series)

```
user@switch> show class-of-service forwarding-class
Forwarding class                  ID                      Queue  Policing priority

  best-effort                      0                          0          normal
  fcoe                             1                          1          normal
  no-loss                          2                          2          normal
  network-control                  3                          3          normal
  mcast-be                         8                          8          normal
  mcast-ef                         9                          9          normal
  mcast-af                        10                         10          normal
  mcast-nc                        11                         11          normal
```

show class-of-service interface

Syntax show class-of-service interface
<*interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches..

Description Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

Options none—Display class-of-service (CoS) associations for all physical and logical interfaces.

interface-name—(Optional) Display CoS associations for the specified interface.

Required Privilege Level view

List of Sample Output
show class-of-service interface (Physical) on page 2000
show class-of-service interface (Logical) on page 2000
show class-of-service interface (Gigabit Ethernet) on page 2001

Output Fields Table 250 on page 1999 describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

Table 250: show class-of-service interface Output Fields

Field Name	Field Description
Physical interface	Name of a physical interface.
Index	Index of this interface or the internal index of this object.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Shaping rate	Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not both. Therefore, the **Shaping rate** field is displayed for the physical interface or the logical interface, but not both.
Scheduler map	Name of the output scheduler map associated with this interface.
Input shaping rate	For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.
Input scheduler map	For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.
Chassis scheduler map	Name of the scheduler map associated with the packet forwarding component queues.
Rewrite	Name and type of the rewrite rules associated with this interface.
Classifier	Name and type of classifiers associated with this interface.

Table 250: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Forwarding-class-map	Name of the forwarding map associated with this interface.
Logical interface	Name of a logical interface.
Shaping rate	Maximum transmission rate on the logical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not both. Therefore, the **Shaping rate** field is displayed for the physical interface or the logical interface, but not both.
Object	Category of an object: **Classifier**, **Fragmentation-map** (for LSQ interfaces only), **Scheduler-map**, **Rewrite**.
Name	Name of an object.
Type	Type of an object: **dscp**, **dscp-ipv6**, **exp**, **ieee-802.1**, **ip**, or **inet-precedence**.

show pfe statistics traffic

Syntax show pfe statistics traffic

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches..

Description Display the packet forwarding engine traffic statistics.

Options none—Display statistics about all the traffic handled by the packet forwarding engine.

Required Privilege Level admin

List of Sample Output **show pfe statistics traffic on page 2003**

Output Fields Table 251 on page 2002 lists the output fields for the **show pfe statistics traffic** command. Output fields are listed in the approximate order in which they appear.

Table 251: show pfe statistics traffic Output Fields

Field Name	Field Description
Packet Forwarding Engine Traffic statistics	Information about Packet Forwarding Engine traffic: • **Input Packets**—Number and rate of input packets. • **Output Packets**—Number and rate of output packets.
Packet Forwarding Engine Local Traffic statistics	Information about Packet Forwarding Engine local traffic: • **Local packets input**—Number of local input packets. • **Local packets output**—Number of local output packets. • **Software input high drops**—Number of software input high-priority drops. • **Software input medium drops**—Number of software input medium-priority drops. • **Software input low drops**—Number of software input low-priority drops. • **Software output drops**—Number of software output drops. • **Hardware input drops**—Number of hardware input drops.

Table 251: show pfe statistics traffic Output Fields *(continued)*

Field Name	Field Description
Packet Forwarding Engine Local Protocol statistics	Information about the Packet Forwarding Engine Local Protocol: • **HDLC keepalives**—Number of HDLC keepalive packets. • **ATM OAM**—Number of Asynchronous Transfer Mode (ATM) Operation, Administration, and Maintenance (OAM) packets. • **Frame Relay LMI**—Number of Frame Relay Local Management Interface (LMI) packets. • **PPP LCP/NCP**—Number of Point-to-Point Protocol (PPP) Link Control Protocol (LCP) or Network Control Protocol (NCP) packets. • **OSPF hello**—Number of Open Shortest Path First (OSPF) hello packets. • **OSPF3 hello**—Number of Open Shortest Path First version 3 (OSPFv3) hello packets. • **RSVP hello**—Number of Reservation Setup Protocol (RSVP) hello packets. • **LDP hello**—Number of Label Distribution Protocol (LDP) hello packets. • **BFD**—Number of Bidirectional Forwarding Detection Protocol (BFD) hello packets. • **IS-IS IIH**—Number of Intermediate System-to-Intermediate System Hello (IIH) packets. • **LACP**—Number of Link Aggregation Control Protocol (LACP) packets. • **ARP**—Number of Address Resolution Protocol (ARP) packets. • **ETHER OAM**—Number of Ethernet Operations, Administration, and Management (OAM) packets. • **Unknown**—Number of unknown packets not matching any of the packet types listed above.
Packet Forwarding Engine Hardware Discard statistics	Information about Packet Forwarding Engine hardware discards: • **Timeout**—Number of packets discarded because of timeouts. • **Truncated key**—Number of packets discarded because of truncated keys. • **Bits to test**—Number of bits to test. • **Data error**—Number of packets discarded because of data errors. • **Stack underflow**—Number of packets discarded because of stack underflows. • **Stack overflow**—Number of packets discarded because of stack overflows. • **Normal discard**—Number of packets discarded because of discard routes. • **Extended discard**—Number of packets discarded because of illegal next hops. • **Invalid interface**—Number of packets discarded because of invalid incoming interfaces. • **Info cell drops**—Number of information cell drops. • **Fabric drops**—Number of fabric drops.

Sample Output

show pfe statistics traffic

```
user@host> show pfe statistics traffic
Packet Forwarding Engine traffic statistics:
    Input  packets:              102682                    5 pps

show pfe statistics traffic cpu

Syntax show pfe statistics traffic cpu <fpc *fpc-slot*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches..

Description (On J-EX8200 switches only) Display count of multidestination packets ingressing from the physical interface to the CPU.

NOTE: **Multidestination packets include unknown unicast, broadcast, and multicast packets.**

Options none—Displays the count of packets ingressing from all the physical interfaces (line cards) to the CPU.

fpc *fpc-slot*—(Optional) Displays the count of packets ingressing from the physical interface, referred to by the slot number, to the CPU.

On a J-EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are **0** through **7** on the J-EX8208 switch and **0** through **15** on the J-EX8216 switch.

List of Sample Output **show pfe statistics traffic cpu (J-EX8208 Switch) on page 2006**

Output Fields Table 252 on page 2005 lists the output fields for the **show pfe statistics traffic cpu** command. Output fields are listed in the approximate order in which they appear.

Table 252: show pfe statistics traffic cpu Output Fields

Field Name	Field Description
Queue	CoS queue number.
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets queued to this queue.
Queued Bytes	Number of bytes queued to this queue.

Table 252: show pfe statistics traffic cpu Output Fields *(continued)*

Field Name	Field Description
Packets	Number of packets transmitted by this queue.
Bytes	Number of bytes transmitted by this queue.
Tail-dropped packets	Count of packets dropped at the tail end of the queue because of lack of buffer space.
RED-dropped packets	Number of packets dropped because of Random Early Discard (RED): • **Low**—Number of low-loss priority packets dropped because of RED. • **High**—Number of high-loss priority packets dropped because of RED.
RED-dropped bytes	Number of bytes dropped because of Random Early Discard (RED): • **Low**—Number of low-loss priority bytes dropped because of RED. • **High**—Number of high-loss priority bytes dropped because of RED.

Sample Output

show pfe statistics traffic cpu (J-EX8208 Switch)

```
user@switch> show pfe statistics traffic cpu

show pfe statistics traffic egress-queues

Syntax show pfe statistics traffic egress-queues <fpc *fpc-slot*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches..

Description (On J-EX8200 switches only) Display count of multidestination packets dropped on egress ports when the egress queues are oversubscribed due to multidestination traffic.

NOTE: **Multidestination packets include unknown unicast, broadcast, and multicast packets.**

Options none—Displays count of packets dropped on egress ports of all physical interfaces (line cards) when egress queues are oversubscribed due to multidestination traffic.

fpc *fpc-slot*—(Optional) Displays count of packets dropped on egress ports of the physical interface (line card) referred to by the slot number.

NOTE: **On a J-EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are 0 through 7 on the J-EX8208 switch and 0 through 15 on the J-EX8216 switch.**

List of Sample Output **show pfe statistics traffic egress-queues fpc 4 (J-EX8208 Switch) on page 2010**

Output Fields Table 253 on page 2009 lists the output fields for the **show pfe statistics traffic egress-queues** command. Output fields are listed in the approximate order in which they appear.

Table 253: show pfe statistics traffic egress-queues Output Fields

Field Name	Field Description
Tail-dropped packets	Number of arriving packets dropped because the output queue buffers are full.

Sample Output

show pfe statistics traffic egress-queues fpc 4 (J-EX8208 Switch)

```
user@switch> show pfe statistics traffic egress-queues fpc 4
Tail-dropped packets :                          0
```

show pfe statistics traffic multicast

Syntax show pfe statistics traffic multicast <fpc *fpc-slot dev-number*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (On J-EX8200 switches only) Display class-of-service (CoS) queue information for multidestination traffic on a physical interface (line card).

NOTE: Multidestination packets include unknown unicast, broadcast, and multicast packets.

NOTE: To view statistical information for unicast traffic, use the show interfaces queue command.

Options fpc *fpc-slot dev-number*—(Optional) Displays class-of-service (CoS) queue information for multidestination traffic on the physical interface (line card) referred to by the slot number and device number.

NOTE: On a J-EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are 0 through 7 on the J-EX8208 switch and 0 through 15 on the J-EX8216 switch.

List of Sample Output **show pfe statistics traffic multicast fpc 0 (J-EX8208 Switch) on page 2012**

Output Fields Table 254 on page 2011 lists the output fields for the **show pfe statistics traffic multicast** command. Output fields are listed in the approximate order in which they appear.

Table 254: show pfe statistics traffic multicast Output Fields

Field Name	Field Description
Queue	CoS queue number.

Table 254: show pfe statistics traffic multicast Output Fields *(continued)*

Field Name	Field Description
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets queued to this queue.
Queued Bytes	Number of bytes queued to this queue.
Packets	Number of packets transmitted by this queue.
Bytes	Number of bytes transmitted by this queue.
Tail-dropped packets	Count of packets dropped at the tail end of the queue because of lack of buffer space.
RED-dropped packets	Number of packets dropped because of Random Early Discard (RED): • **Low**—Number of low-loss priority packets dropped because of RED. • **High**—Number of high-loss priority packets dropped because of RED.
RED-dropped bytes	Number of bytes dropped because of Random Early Discard (RED): • **Low**—Number of low-loss priority bytes dropped because of RED. • **High**—Number of high-loss priority bytes dropped because of RED.
Multicast Replication Engine-dropped packets	Egress packets dropped by the PFE because none of the ports on the physical interface are needed to forward the packet.

Sample Output

show pfe statistics traffic multicast fpc 0 (J-EX8208 Switch)

```
user@switch> show pfe statistics traffic multicast fpc 0 2

PART 10

Power over Ethernet

CHAPTER 58

Power over Ethernet (PoE)—Overview

PoE and J-EX Series Switches Overview

Power over Ethernet (PoE) permits electric power, along with data, to be passed over a copper Ethernet LAN cable. Powered devices, such as voice over IP (VoIP) telephones, wireless access points, video cameras, and point-of-sale devices, that support PoE can receive power safely from the same access ports that are used to connect personal computers to the network.

This topic describes PoE on J-EX Series Switches.

It covers:

PoE, PoE+, and Enhanced PoE

PoE was first defined in the IEEE 802.3af standard. In this standard, the amount of power that can be supplied to a powered device is limited to 15.4 W. A later standard, IEEE 802.3at, defined PoE+, which increases the amount of power to 30 W. The PoE+ standard provides support for legacy PoE devices—an IEEE 802.3af powered device can operate normally when connected to IEEE 802.3at (PoE+) power sourcing equipment.

J-EX Series switches with PoE ports support either IEEE 802.3af or IEEE 802.3at. The J-EX4200 Ethernet Switches support IEEE 802.3af.

Starting with Junos operating system (Junos OS) Release 11.1, enhanced PoE is supported on J-EX4200 switches. Enhanced PoE is an extension to the IEEE 802.3af standard that allows up to 18.6 W per PoE port.

NOTE: This topic and its related topics use the term PoE as a generic term to refer to PoE, PoE+, and enhanced PoE.

PoE Power Management

Switches that have PoE ports have a PoE controller that keeps track of the PoE power consumption on the switch and allocates power to the PoE ports. The following factors determine how the PoE controller allocates power to the PoE ports:

- PoE Power Budget on page 2018
- Power Management Mode on page 2018
- PoE Interface Power Priority on page 2019

PoE Power Budget

The PoE controller allocates power to the PoE ports from a set PoE power budget. The PoE power budget varies according to switch model and, for switches that support power supplies of different capacities, the capacity of the installed power supply. For example, switch with a 320 W power supply has a PoE power budget of 130 W, while with a 600 W power supply it has a PoE power budget of 410 W.

In switches that support power supplies of different capacities, if you change your existing power supply to a lower-capacity power supply, the PoE power budget might no longer be sufficient to power all the PoE ports on the switch. If your switch supports redundant power supplies and you have installed power supplies of different capacities, the PoE power budget is based on the wattage of the lower-capacity power supply. The number of PoE ports on the switch cannot be increased by installing a larger power supply.

You can display the PoE power budget for your switch by using the **show poe controller** command.

Power Management Mode

J-EX Series switches support two power management modes: class (the default) and static. The mode you configure for your switch determines how the maximum power for a PoE interface is derived and how power is allocated to the PoE interfaces:

- Class mode—In this mode, the maximum power for an interface is determined by the class of connected powered device. Table 255 on page 2018 lists the classes of powered devices and associated power levels.

Table 255: Class of Powered Device and Power Levels

Standard	Class	Maximum Power Delivered by PoE Port	Power Range of Powered Device
IEEE 802.3af (PoE) and IEEE 802.3at (PoE+)	0	15.4 W	0.44 through 12.95 W
	1	4.0 W	0.44 through 3.84 W
	2	7.0 W	3.84 through 6.49 W
	3	15.4 W	6.49 through 12.95 W
IEEE 802.3at (PoE+)	4	30.0 W	12.95 through 25.5 W

The powered device communicates to the PoE controller which class it belongs to when it is connected. The PoE controller then allocates to the interface the maximum power required by the class (see Table 255 on page 2018). It does not allocate power to an interface until a powered device is connected. Class 0 is the default class for powered devices that do not provide class information. Class 4 powered devices are supported only by switches that support IEEE 802.3at (PoE+).

- Static mode—In this mode, you specify the maximum power for each PoE interface. The PoE controller then allocates this amount of power to the interface from its total budget. For example, if you specify a maximum value of 8.0 W for **ge-0/0/3**, the PoE controller allocates 8.0 W out of its total power budget for the interface. This amount is allocated to the interface whether or not a powered device is connected to the interface or whether the connected powered device uses less power than 8.0 W.

  Because of line loss, the power received by the powered device can be less than the power available at the PoE port. Table 256 on page 2019 shows the maximum power available at a PoE port and the resulting power guaranteed to the powered device.

Table 256: Maximum Power Per Port in Static Mode

Switch	Maximum Power Delivered by PoE Port	Guaranteed Power to Powered Devices
J-EX4200 switches running Junos OS Release 10.4 or earlier	15.4 W	12.95 W
J-EX4200 switches running Junos OS Release 11.1 or later	18.6 W NOTE: Switches that are upgraded to Junos OS Release 11.1 from a previous release require an upgrade of the PoE controller software to obtain 18.6 W.	15.64 W

In both class and static mode, if the power consumption of a powered device exceeds the maximum power allocated to the interface, the switch turns off power to the interface.

PoE Interface Power Priority

You can configure a PoE interface to have either a high or low power priority. The power priority determines which interfaces receive power if PoE power demands are greater than the PoE power budget. If the total power allocated for all interfaces exceeds the switch budget, the lower priority interfaces are turned off and the power allocated to those interfaces drops to 0. Thus you should set interfaces that connect to critical powered devices, such as security cameras and emergency phones, to high priority.

Among PoE interfaces that have the same assigned priority, power priority is determined by the port number, with lower-numbered ports having higher priority.

Overview of PoE Configuration and Monitoring

The factory default configuration enables PoE on switches that support PoE. By default, the power management mode is class, and the power priority of all interfaces is low.

If the default configuration meets your needs, you do not need to configure PoE before you connect powered devices to the switch.

To monitor the powered devices and to manage PoE power consumption, you can use the command line interface (CLI) or the J-Web interface to display the current power consumption of the PoE ports. You can also enable the monitoring of power consumption on a port over time and then view the collected records using the CLI or the J-Web interface.

CHAPTER 59

Examples: PoE Configuration

Example: Configuring PoE Interfaces on a J-EX Series Switch

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices and allow you to plug in devices that require both network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and some IP cameras.

You do not need to configure PoE unless you wish to modify the default values or disable PoE on a specific interface.

This example describes a default configuration of PoE interfaces on a J-EX Series switch:

Requirements

This example uses the following software and hardware components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch that supports PoE

Before you configure PoE, be sure you have:

- Performed the initial software configuration on the switch. See connection and configuration instructions in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

The topology used in this example consists of a switch that has 24 ports. Eight of the ports support PoE (IEEE 802.3af), which means they provide both network connectivity

and electric power for powered devices such as VoIP telephones, wireless access points, and IP security cameras that require 12.95 W or less. The remaining 16 ports provide only network connectivity. You use the standard ports to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers. Table 257 on page 2022 details the topology used in this configuration example.

Table 257: Components of the PoE Configuration Topology

Property	Settings
Switch hardware	J-EX Series switch with 24 Gigabit Ethernet ports: 8 PoE interfaces (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE interfaces (**ge-0/0/8** through **ge-0/0/23**)
VLAN name	**default**
Connection to a wireless access point (requires PoE)	**ge-0/0/0**
Connections to Avaya IP telephones with integrated hubs that allow phone and desktop PC to connect to a single port (requires PoE)	**ge-0/0/1** through **ge-0/0/7**
Direct connections to desktop PCs, file servers, integrated printer/fax/copier machines (no PoE required)	**ge-0/0/8** through **ge-0/0/20**
Unused ports (for future expansion)	**ge-0/0/21** through **ge-0/0/23**

Configuration

To enable the default PoE configuration on the switch:

CLI Quick Configuration

To quickly enable the default configuration on the switch:

Simply connect the powered devices to the PoE ports.

Step-by-Step Procedure

To use the PoE interfaces with default values:

1. Make sure the switch is powered on.
2. Connect the wireless access point to interface **ge-0/0/0**.
3. Connect the Avaya phones to interfaces **ge-0/0/1** through **ge-0/0/7**.

Verification

To verify that PoE interfaces have been created and are operational, perform this task:

- Verifying That the PoE Interfaces Have Been Created on page 2022

Verifying That the PoE Interfaces Have Been Created

Purpose Verify that the PoE interfaces have been created on the switch.

Action List all the PoE interfaces configured on the switch:

```
user@switch> show poe interface

Interface Admin status Oper status Max power Priority Power consumption Class
 ge-0/0/0 Enabled      ON          15.4W     Low      7.9W                0
 ge-0/0/1 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/2 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/3 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/4 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/5 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/6 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/7 Enabled      ON          15.4W     Low      3.2W                2
```

Meaning The **show poe interface** command lists PoE interfaces configured on the switch, with their status, priority, power consumption, and class. This output shows that eight interfaces have been created with default values and are consuming power at the expected rates.

Related Documentation

- Configuring PoE (CLI Procedure) on page 2029
- Troubleshooting PoE Interfaces on page 2041

Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices. These ports allow you to plug in devices that need both network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and some IP cameras.

By default, PoE ports on J-EX Series switches are set to low power priority. You can configure a PoE port to have a high power priority setting. If a situation arises where there is not sufficient power for all the PoE ports, the available power is directed to the higher priority ports, while power to the lower priority ports is shut down as needed. Thus you should set ports that connect to security cameras, emergency phones, and other high priority powered devices to high priority.

This example describes how to configure a few high priority PoE interfaces.

Requirements

This example uses the following software and hardware components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch that supports PoE

Before you configure PoE, be sure you have:

- Performed the initial software configuration on the switch. See connection and configuration instructions in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Overview and Topology

The topology used in this example consists of a switch that has 24 ports. Eight of the ports support PoE (IEEE 802.3af), which means they provide both network connectivity and electric power for powered devices such as VoIP telephones, wireless access points, and IP security cameras that require 12.95 W or less. The remaining 16 ports provide only network connectivity. You use the standard ports to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers. Table 258 on page 2024 details the topology used in this configuration example.

Table 258: Components of the PoE Configuration Topology

Property	Settings
Switch hardware	Switch with 24 Gigabit Ethernet ports: 8 PoE interfaces (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE interfaces (**ge-0/0/8** through **ge-0/0/23**)
VLAN name	**default**
Connection to a wireless access point (requires PoE)	**ge-0/0/0**
Security IP Cameras (require PoE)	**ge-0/0/1** and **ge-0/0/2 high**
Emergency VoIP phone (requires PoE)	**ge-0/0/3 high**
VoIP phone in Executive Office (requires PoE)	**ge-0/0/4 high**
Other VoIP phones (require PoE)	**ge-0/0/5** through **ge-0/0/7**
Direct connections to desktop PCs, file servers, integrated printer/fax/copier machines (no PoE required)	**ge-0/0/8** through **ge-0/0/20**
Unused ports (for future expansion)	**ge-0/0/21** through **ge-0/0/23**

Configuration

To configure PoE interfaces:

CLI Quick Configuration

By default, PoE interfaces are created for all PoE ports and PoE is enabled. The default priority for PoE interfaces is **low**.

To quickly set some interfaces to high priority and to include descriptions of the interfaces, copy the following commands and paste them into the switch terminal window:

```
[edit]
set poe interface ge-0/0/1 priority high telemetries
set poe interface ge-0/0/2 priority high telemetries
```

```
set poe interface ge-0/0/3 priority high telemetries
set poe interface ge-0/0/4 priority high telemetries
set interfaces ge-0/0/0 description "wireless access point"
set interfaces ge-0/0/1 description "security camera front door"
set interfaces ge-0/0/2 description "security camera back door"
set interfaces ge-0/0/3 description "emergency phone"
set interfaces ge-0/0/4 description "Executive Office VoIP phone"
set interfaces ge-0/0/5 description "staff VoIP phone"
set interfaces ge-0/0/6 description "staff VoIP phone"
set interfaces ge-0/0/7 description "staff VoIP phone"
```

Step-by-Step Procedure

To configure PoE interfaces with different priorities:

1. Set the interfaces connected to high priority powered devices to high priority. Include the **telemetries** statement for the high priority interfaces, thus enabling the logging of power consumption on those interfaces:

   ```
   [edit poe]
   user@switch# set interface ge-0/0/1 priority high telemetries
   user@switch# set interface ge-0/0/2 priority high telemetries
   user@switch# set interface ge-0/0/3 priority high telemetries
   user@switch# set interface ge-0/0/4 priority high telemetries
   ```

2. Provide descriptions for the PoE interfaces:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0 description "wireless access point"
   user@switch# set ge-0/0/1 description "security camera front door"
   user@switch# set ge-0/0/2 description "security camera back door"
   user@switch# set ge-0/0/3 description "emergency phone"
   user@switch# set ge-0/0/4 description "Executive Office VoIP phone"
   user@switch# set ge-0/0/5 description "staff VoIP phone"
   user@switch# set ge-0/0/6 description "staff VoIP phone"
   user@switch# set ge-0/0/7 description "staff VoIP phone"
   ```

3. Connect the wireless access point to interface **ge-0/0/0.** This interface uses the default PoE settings.

4. Connect the two security cameras to interfaces **ge-0/0/1** and **ge-0/0/2**. These interfaces are set to high priority with telemetries enabled.

5. Connect the emergency VoIP phone to interface **ge-0/0/3**. This interface is set to high priority with telemetries enabled.

6. Connect the Executive Office VoIP phone to interface **ge-0/0/4**. This interface is set to high priority with telemetries enabled.

7. Connect the staff VoIP phones to **ge-0/0/5**, **ge-0/0/6**, and **ge-0/0/7**. These interfaces use the default PoE settings.

Results

Check the results of the configuration:

```
[edit]
user@switch# show
interfaces {
  ge-0/0/0 {
    description "wireless access point";
    unit 0 {
```

```
            family ethernet-switching;
        }
    }
    ge-0/0/1 {
        description "security camera front door";
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/2 {
        description "security camera back door";
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/3 {
        description "emergency phone";
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/4 {
        description "Executive Office VoIP phone";
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/5 {
        description "staff VoIP phone";
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/6 {
        description "staff VoIP phone";
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/7 {
        description "staff VoIP phone";
        unit 0 {
            family ethernet-switching;
        }
    }
}
poe {
    interface all;
    interface ge-0/0/1 {
        priority high;
        telemetries;
    }
    interface ge-0/0/2 {
        priority high;
        telemetries;
    }
```

```
    interface ge-0/0/3 {
      priority high;
      telemetries;
    }
    interface ge-0/0/4 {
      priority high;
      telemetries;
    }
  }
```

Verification

To verify that PoE interfaces have been created and are operational, perform the following tasks:

- Verifying That the PoE Interfaces Have Been Created with the Correct Priorities on page 2027

Verifying That the PoE Interfaces Have Been Created with the Correct Priorities

Purpose Verify that the PoE interfaces on the switch are now set to the correct priority settings.

Action List all the PoE interfaces configured on the switch:

```
user@switch> show poe interface
Interface Admin status Oper status Max power Priority Power consumption Class
 ge-0/0/0 Enabled      ON          15.4W     Low      7.9W                0
 ge-0/0/1 Enabled      ON          15.4W     High     4.8W                0
 ge-0/0/2 Enabled      ON          15.4W     High     4.8W                0
 ge-0/0/3 Enabled      ON          15.4W     High     3.3W                2
 ge-0/0/4 Enabled      ON          15.4W     High     4.7W                2
 ge-0/0/5 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/6 Enabled      ON          15.4W     Low      3.3W                2
 ge-0/0/7 Enabled      ON          15.4W     Low      3.3W                2
```

Meaning The **show poe interface** command lists PoE interfaces configured on the switch, with their status, priority, power consumption, and class. This output shows that eight PoE interfaces are enabled. Interfaces **ge-0/0/1** through **ge-0/0/4** are configured as priority **high**. The remaining PoE interfaces are configured with the default priority value of **low**.

CHAPTER 60

Configuring PoE

Configuring PoE (CLI Procedure)

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices. These ports allow you to plug in devices that require both network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and some IP cameras.

For J-EX Series switches that support PoE ports, the factory default configuration enables PoE on the PoE-capable ports, with default settings in effect. You might not have to do any additional configuration if the default settings work for you. Table 259 on page 2029 shows the configurable PoE options and their default settings for the switch as a whole and for the PoE interfaces.

Table 259: Configurable PoE Options and Default Settings

Option	Default	Description
Switch Options		
guard-band	**0** W	Reserves up to 19 W out of the PoE power budget to be used in the case of a spike in PoE power consumption.
management	**class**	Sets the PoE power management mode for the switch: • **class**—The maximum power delivered by an interface is determined by the class of the connected powered device. No power is allocated to the interface until a powered device is connected. • **static**—The maximum power delivered by an interface is statically configured and independent of the class of the connected powered device. The maximum power is allocated to the interface even if a powered device is not connected.
notification-control	Not included in default configuration	When included in the configuration, enables PoE SNMP traps.
Interface Options		

Table 259: Configurable PoE Options and Default Settings *(continued)*

Option	Default	Description
disable	Not included in default configuration	When included in the configuration, disables PoE on the interface. The interface maintains network connectivity but no longer supplies power to a connected powered device. Power is not allocated to the interface.
maximum-power	**15.4** W for J-EX4200 switches	Sets the maximum power that can be delivered by a PoE interface: • Up to 15.4 W for J-EX4200 switches that have not been upgraded to support enhanced PoE • Up to 18.6 W for J-EX4200 switches that support enhanced PoE This setting is ignored if the power management mode is **class**.
priority	**low**	Sets an interface's power priority to either **low** or **high**. If power is insufficient for all PoE interfaces, the low priority interfaces are shut down before the high priority interfaces. Among interfaces that have the same assigned priority, the power priority is determined by port number, with lower- numbered ports having higher priority.
telemetries	Not included in default configuration	When included in the configuration, enables the logging of power consumption records on an interface. Logging occurs every five minutes for one hour unless you specify a different **interval** or **duration.**

To configure PoE:

1. To change power management mode from the default class mode to static mode:

   ```
   [edit poe]
   user@switch# set management static
   ```

   NOTE: On J-EX4200 switches, you must change the management mode from class mode to static mode to take advantage of the higher per-port power limits of enhanced PoE.

2. To reserve a specified wattage of power in case of a spike in PoE consumption:

   ```
   [edit poe]
   user@switch# set guard-band 15
   ```

3. To configure a number of interfaces with the same settings (for example, to enable telemetry collection on all interfaces):

   ```
   [edit poe]
   user@switch# set interface all telemetries
   ```

4. To configure individual interfaces with different settings:

   ```
   [edit poe]
   user@switch# set interface ge-0/0/0 priority high telemetries duration 24

   [edit poe]
   user@switch# set interface ge-0/0/1
   ```

```
[edit]
user@switch# set  interface ge-0/0/5 maximum-power 18.6

[edit poe]
user@switch# set interface ge-0/0/7 disable
```

When you configure an individual interface, its configuration overrides any settings you configure with the **set poe interface all** command. For example, **ge-0/0/1** in this example retains the default settings, regardless of any settings configured with the **set poe interface all** command.

- Example: Configuring PoE Interfaces on a J-EX Series Switch on page 2021
- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Verifying PoE Configuration and Status (CLI Procedure) on page 2036
- PoE and J-EX Series Switches Overview on page 2017

Configuring PoE (J-Web Procedure)

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices to J-EX Series switches. These ports allow you to plug in devices that require both network connectivity and electric power, such as VoIP phones, wireless access points, and some IP cameras. Using the Power over Ethernet (PoE) Configuration page in the J-Web interface, you can modify the settings of all interfaces that are PoE-enabled.

To configure PoE:

1. Select **Configure** > **Power over Ethernet**.

   The page displays a list of all interfaces except uplink ports. Specific operational details about an interface are displayed in the Details section of the page. The details include the PoE Operational Status and Port class.

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:

   - **Edit**—Changes PoE settings for the selected port as described in Table 260 on page 2032.

- **System Settings**—Modifies general PoE settings as described in Table 261 on page 2032.

Table 260: PoE Edit Settings

Field	Description	Your Action
Enable PoE	Specifies that PoE is enabled on the interface.	Select this option to enable PoE on the interface.
Priority	Lists the power priority (Low or High) configured on ports enabled for PoE.	Set the priority as **High** or **Low**.
Maximum Power	Specifies the maximum PoE wattage available to provision active PoE ports on the switch.	Select a value in watts. If no value is specified, the default is 15.4.

Table 261: System Settings

Field	Description	Your Action
PoE Management	Specifies the power management mode. The options are: **static** and **class**. NOTE: When the power management mode is set to **class**, the maximum power value is overridden by the maximum power value of the class of power device that is connected to the switch on the PoE port.	By default the power management mode is **static**. Select **class** to change the power management mode.
Guard Band (watts)	Specifies the band to control power availability on the switch.	Enter a value to set the guard band value in watts. The default value is 0.

- PoE and J-EX Series Switches Overview on page 2017

CHAPTER 61

Administering PoE

Monitoring PoE

Purpose Use the monitoring functionality to view real-time data of the power consumed by each PoE interface, and to enable and configure telemetry values. When telemetry is enabled, the software measures the power consumed by each interface and stores the data for future reference.

Action To monitor PoE using the J-Web interface, select **Monitor** > **Power over Ethernet**.

To monitor PoE power consumption with CLI commands in the CLI Terminal in the J-Web interface:

1. Select **Troubleshoot** > **CLI Terminal**.
2. Type a CLI command:
   - **show poe controller**
   - **show poe interface**
   - **show poe telemetries interface**

For detailed information about using these CLI commands to monitor PoE power consumption, see “Monitoring PoE Power Consumption (CLI Procedure)” on page 2034.

Meaning In the J-Web interface the PoE Monitoring screen is divided into two parts. The top half of the screen displays real-time data of the power consumed by each interface and a list of ports that utilize maximum power.

Select a particular interface to view a graph of the power consumed by the selected interface.

The bottom half of the screen displays telemetry information for interfaces. The Telemetry Status field displays whether telemetry has been enabled on the interface. Click the

Show Graph button to view a graph of the telemetries. The graph can be based on power or voltage. To modify telemetry values, click **Edit**. Specify Interval in minutes, Duration in hours, and select **Log Telemetries** to enable telemetry on the selected interface.

Related Documentation

- Configuring PoE (CLI Procedure) on page 2029
- Configuring PoE (J-Web Procedure) on page 2031
- Example: Configuring PoE Interfaces on a J-EX Series Switch on page 2021
- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Monitoring PoE Power Consumption (CLI Procedure) on page 2034
- Verifying PoE Configuration and Status (CLI Procedure) on page 2036

Monitoring PoE Power Consumption (CLI Procedure)

You can monitor Power over Ethernet (PoE) power consumption, both for the switch as a whole and for individual PoE interfaces.

This topic describes how to monitor:

- PoE Power Consumption for the Switch on page 2034
- Current Power Consumption for PoE Interfaces on page 2034
- Power Consumption for PoE Interfaces over Time on page 2035

PoE Power Consumption for the Switch

Purpose Determine the current PoE power consumption for the switch as a whole.

Action Enter the following command:

```
user@switch> show poe controller
Controller  Maximum   Power         Guard    Management  Status
index       power     consumption   band
   0        405 W      130W           0W     Class       AT_MODE
```

Meaning At the time the command was executed, the PoE interfaces on the switch were consuming 130 W out of the switch PoE power budget of 405 W.

Current Power Consumption for PoE Interfaces

Purpose Determine the current power consumption for individual PoE interfaces.

Action To monitor the power consumption of all PoE interfaces on the switch, use the following command:

```
user@switch> show poe interface
Interface Admin status Oper status Max power Priority Power consumption Class
 ge-0/0/0 Enabled       ON         15.4W     Low      7.4W                0
 ge-0/0/1 Enabled       ON         15.4W     High     12.0W               0
 ge-0/0/2 Enabled       ON         15.4W     Low      12.4W               0
```

```
ge-0/0/3 Enabled       ON          7.0W      Low      5.3W              2
ge-0/0/4 Enabled       ON          4.0W      Low      4.0W              1
ge-0/0/5 Disabled      Disabled    0.0W      Low      0.0W              0
ge-0/0/6 Enabled       OFF         15.4W     Low      0.0W              0
ge-0/0/7 Disabled      Disabled    0.0W      Low      0.0W              0
```

To monitor the power consumption of an individual PoE interface (for example, **ge-0/0/3**), use the following command:

```
user@switch> show poe interface ge-0/0/3
PoE interface status:
PoE interface                : ge-0/0/3
Administrative status        : Enabled
Operational status           : ON
Power limit on the interface : 7.0W
Priority                     : Low
Power consumed               : 5.3W
Class of power device        :  2
```

Meaning Using interface **ge-0/0/3** as an example, the powered device connected to the interface was consuming 5.3 W at the time the command was executed.

Power Consumption for PoE Interfaces over Time

Purpose Monitor the power consumption of a PoE interface over a period of time. The records collected remain available for future viewing.

You can specify the intervals at which power consumption data is collected, from once every minute to once every 30 minutes. The default is once every 5 minutes. You can also specify the duration over which the records are collected, from 1 hour (default) to 24 hours.

Action To collect historical records of PoE interface power consumption and display those records:

1. Add the **telemetries** statement to the PoE interface configuration:

   ```
   [edit]
   user@switch# set poe interface ge-0/0/5 telemetries interval 10
   ```

   When you commit the configuration, record collection begins.

2. Display the collected records:

   ```
   user@switch> show poe telemetries interface ge-0/0/5 all
   Sl No    Timestamp                 Power    Voltage
      1     03-19-2010 13:00:07 UTC   3.9W     50.9V
      2     03-19-2010 12:50:07 UTC   3.9W     50.9V
      3     03-19-2010 12:40:07 UTC   3.9W     50.9V
      4     03-19-2010 12:30:07 UTC   3.9W     50.9V
      5     03-19-2010 12:20:07 UTC   3.9W     50.9V
      6     03-19-2010 12:10:07 UTC   3.9W     50.9V
   ```

To start another session of record collection on the interface, you must commit the configuration again.

Meaning Over the hour in which the PoE power consumption data on **ge-0/0/5** was collected, the connected powered device consistently consumed 3.9 W.

Verifying PoE Configuration and Status (CLI Procedure)

You can verify the Power over Ethernet (PoE) configuration and status on a J-EX Series switch.

This topic describes how to verify the:

- Number of PoE Ports on the Switch on page 2036
- PoE Controller Configuration and Status on page 2036
- PoE Interface Configuration and Status on page 2037
- PoE SNMP Trap Generation Status on page 2037

Number of PoE Ports on the Switch

Purpose Verify the number of PoE ports on a switch. The number of PoE ports on a switch varies according to switch model.

Action Enter the following command:

```
user@switch> show chassis hardware
Hardware inventory:
Item             Version  Part number  Serial number     Description
Chassis                                BH0208375304      Dell J-EX4200-24T
Routing Engine 0 REV 11   750-021261   BH0208375304      EX4200-24T, 8 POE
FPC 0            REV 11   750-021261   BH0208375304      EX4200-24T, 8 POE
  CPU                     BUILTIN      BUILTIN           FPC CPU
  PIC 0                   BUILTIN      BUILTIN           24x 10/100/1000 Base-T
Power Supply 0   REV 03   740-020957   AT0508285661      PS 320W AC
Fan Tray                                                 Fan Tray
```

Meaning The switch is a J-EX4200-24T model with eight PoE ports.

PoE Controller Configuration and Status

Purpose Verify the PoE controller configuration and status, such as the PoE power budget, total PoE power consumption, and power management mode.

Action Enter the following command:

```
user@switch> show poe controller
Controller  Maximum   Power             Guard band  Management      Status
```

```
index       power     consumption
   0        130 W       43W               15W        Class            AF_ENHANCE
```

Meaning The switch has an overall PoE power budget of 130 W, of which 43 W were being used by the PoE ports at the time the command was executed. The **Guard band** field shows that 15 W is reserved out of the PoE power budget to protect against spikes in power demand. The power management mode is class. The controller supports enhanced PoE.

PoE Interface Configuration and Status

Purpose Verify that PoE interfaces are enabled and set to the correct maximum power and priority settings. Also verify current operational status and power consumption.

Action To view configuration and status for all PoE interfaces, enter:

```
user@switch>  show poe interface
Interface Admin status Oper status Max power Priority Power consumption Class
 ge-0/0/0 Enabled      ON          15.4W     Low      7.9W                3
 ge-0/0/1 Enabled      ON          15.4W     High     4.8W                0
 ge-0/0/2 Enabled      ON          15.4W     High     4.8W                0
 ge-0/0/3 Enabled      ON          15.4W     High     3.3W                2
 ge-0/0/4 Disabled     Disabled    0.0W      Low      0.0W                0
 ge-0/0/5 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/6 Enabled      ON          15.4W     Low      3.3W                2
 ge-0/0/7 Enabled      OFF         15.4W     Low      0.0W                0
```

To view configuration and status for a single PoE interface, enter:

```
user@switch> show poe interface ge-0/0/3
PoE interface status:
PoE interface                :  ge-0/0/3
Administrative status        : Enabled
Operational status           :  ON
Power limit on the interface : 15.4W
Priority                     : High
Power consumed               : 3.3W
Class of power device        :   2
```

Meaning The command output shows the status and configuration of interfaces. For example, the interface **ge-0/0/3** is administratively enabled. Its operational status is **ON**; that is, the interface is currently delivering power to a connected powered device. The maximum power the interface can deliver is 15.4 W. The interface has a high power priority. At the time the command was executed, the powered device was consuming 3.3 W. The IEEE 802.3af class of the powered device is class 2.

PoE SNMP Trap Generation Status

Purpose Verify the status of the **notification-control** option, which determines whether or not PoE SNMP traps are enabled.

Action Enter the following command:

```
user@switch> show poe notification-control
FPC slot            Notification-control-status
    0                   OFF
```

Meaning PoE SNMP traps are not enabled.

Upgrading the PoE Controller Software for Enhanced PoE Support

Starting with Junos OS Release 11.1, the Power over Ethernet (PoE) controller software on J-EX4200 switches supports enhanced PoE, which allows PoE ports to supply up to 18.6 W per port when PoE power management is in static mode. For a switch running Junos OS Release 10.4 or earlier, you can upgrade the PoE controller software after you have upgraded the switch software to Junos OS Release 11.1 or later. The controller software upgrade process downloads a copy of the upgraded PoE controller software from the Junos OS image to the PoE controller and then reboots the switch.

NOTE: Upgrading the PoE controller requires a reboot of the switch or Virtual Chassis member. In addition, powered devices are not guaranteed to receive power while the new software is being downloaded to the PoE controller, a process that can take up to 45 minutes. If your powered devices do not require more than 15.4 W, you do not need to upgrade the PoE controller software.

We recommend that all member switches of a J-EX4200 Virtual Chassis or a mixed J-EX4200 and J-EX4500 Virtual Chassis run the same version of the PoE controller software.

NOTE: After you upgrade the PoE controller software, the default maximum power per port is not increased—it is still 15.4 W per port. You must explicitly set the maximum power for a port to 18.6 W.

This topic describes how to upgrade the PoE controller software. On a J-EX4200 Virtual Chassis or mixed J-EX4200 and J-EX4500 Virtual Chassis, perform this procedure from the master switch to upgrade the controller software for all member switches that require upgrading.

To upgrade the PoE controller:

1. Verify that the PoE controller software requires upgrading:

```
user@switch> show poe controller
Controller  Maximum   Power         Guard    Management  Status
index       power     consumption   band
   0**      130 W       0W           15W     Static      AF_MODE
  **New PoE software upgrade available.
 Use 'request poe software upgrade'
 Note: reboot of fpc is required after the software upgrade.
```

   The **New PoE software upgrade available** statement indicates that the PoE controller requires upgrading.

2. Upgrade the controller:

```
user@switch> request poe software upgrade
fpc0:
--------------------------------------------------------------------------
```

```
PoE software download time is about 35-45 minutes
Use 'show poe controller' to get the download status
WARNING: reboot is required after the download
```

3. Monitor the progress of the controller software download with the **show poe controller** command:

```
user@switch> show poe controller
Controller  Maximum   Power         Guard    Management  Status
index       power     consumption   band
   0**      130 W       0W           15W                 SW_DOWNLOAD(4%)
  **New PoE software upgrade available.
 Use 'request poe software upgrade'
 Note: reboot of fpc is required after the software upgrade.
```

The **status** field is updated during the download process to show the following stages of the download:

- **POE_SW_ERASE**
- **SW_DOWNLOAD(*n*%)**
- **REBOOT_REQUIRED**

NOTE: During the software download, some PoE operational commands, such as **show poe interface**, might not show correct output.

4. When you see **REBOOT_REQUIRED** in the **status** field, reboot the switch.
5. After the switch has finished rebooting, verify that the PoE controller software has been upgraded:

```
user@switch> show poe controller
Controller  Maximum   Power         Guard    Management  Status
index       power     consumption   band
   0        130 W       0W           15W     Static      AF_ENHANCE
```

The **status** field now shows **AF_ENHANCE**, indicating the PoE controller now supports enhanced PoE.

CHAPTER 62

Troubleshooting PoE Configuration

Troubleshooting PoE Interfaces

Problem A Power over Ethernet (PoE) interface is not supplying power to the powered device.

Solution Check for the items shown in Table 262 on page 2041.

Table 262: Troubleshooting a PoE Interface

Items to Check	Explanation
Is the switch a full PoE model or a partial PoE model?	If you are using a partial PoE model, only interfaces **ge-0/0/0** through **ge-0/0/7** can function as PoE ports.
Has PoE capability been disabled for that interface?	Use the **show poe interface** command to check PoE interface status.
Is the cable properly seated in the port socket?	Check the hardware.
Has the PoE power budget been exceeded for the switch?	Use the **show poe controller** command to check the PoE power budget and consumption for the switch.
Does the powered device require more power than is available on the interface?	Use the **show poe interface** command to check the maximum power provided by the interface.
If the **telemetries** option has been enabled for the interface, check the history of power consumption.	Use the **show poe telemetries interface** command to display the history of power consumption.

CHAPTER 63

Configuration Statements for PoE

[edit poe] Configuration Statement Hierarchy

```
poe {
  guard-band watts;
  interface (all | interface-name) {
    disable;
    maximum-power watts;
    priority (high | low);
    telemetries {
      disable;
      duration hours;
      interval minutes;
    }
  }
  management (class | static);
  notification-control {
    fpc slot-number {
      disable;
    }
  }
}
```

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029
- PoE and J-EX Series Switches Overview on page 2017

disable

Syntax disable;

Hierarchy Level [edit poe **interface** (all | *interface-name*)],
[edit poe **interface** (all | *interface-name*) **telemetries**],
[edit poe **notification-control fpc** *slot-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable a PoE interface, disable the collection of power consumption data for a PoE interface, or disable the generation of the PoE SNMP traps. The action of the **disable** statement depends on which statement it is used with:

- When used with **interface**—Disable the PoE capability of this interface. The interface operates as a standard network access interface, and power is no longer allocated to it from the PoE power budget. Although the PoE capability is disabled, the PoE configuration for the interface is retained. To re-enable the PoE capability of this interface, delete the **disable** statement from the **interface** entry in the configuration.
- When used with **telemetries**—Disable the collection of PoE power consumption records for this interface. Any previously collected records are deleted. However, the **telemetries** configuration is retained, including the values for **interval** and **duration**. To re-enable record collection, delete the **disable** statement from the **telemetries** entry in the configuration.
- When used with **notification-control**—Disable the generation of PoE SNMP traps. To re-enable PoE traps, delete the **disable** statement from the **notification-control** entry in the configuration.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

duration

Syntax duration *hours*;

Hierarchy Level [edit poe **interface** (all | *interface-name*) **telemetries**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Modify the duration over which data is collected when you are monitoring the power consumption of a PoE interface.

Options ***hours*** —Number of hours over which the data is to be collected.

Range: 1 through 24

Default: 1

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

fpc

Syntax

```
fpc slot-number {
    disable;
}
```

Hierarchy Level [edit poe notification-control]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the generation of PoE traps for the specified FPC.

Default PoE traps are disabled by default.

Options ***slot-number***—The FPC slot number, where ***slot-number*** is:

- **0**—On a J-EX4200 switch.
- **0** through **9**—On a J-EX4200 switch in a Virtual Chassis, indicating the member ID.

The remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

guard-band

Syntax guard-band *watts*;

Hierarchy Level [edit poe]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Reserve a specified amount of power out of the PoE power budget in case of a spike in PoE consumption.

Options ***watts*** —Amount of power to be reserved in case of a spike in PoE consumption.

Range: 0 through 19

Default: 0

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

interface

Syntax

```
interface (all | interface-name) {
  disable;
  maximum-power watts;
  priority (high | low);
  telemetries {
    disable;
    duration hours;
    interval minutes;
  }
}
```

Hierarchy Level [edit poe]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a PoE interface to be configured.

Options

all—All PoE interfaces on the switch that have not been individually configured for PoE. If a PoE interface has been individually configured, that configuration overrides any settings specified with **all**.

interface-name—Name of the specific interface being configured.

If you use the **interface** statement without any substatements, PoE is enabled on all interfaces or the specified interface with default values for the remaining statements.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

interval

Syntax interval *minutes*;

Hierarchy Level [edit poe **interface** (all | *interface-name*) **telemetries**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Modify the interval at which data is collected when you are monitoring the power consumption of a PoE interface.

Options ***minutes***—Frequency of data collection.
Range: 1 through 30
Default: 5

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029
- Configuring PoE (J-Web Procedure) on page 2031

management

Syntax management (class | static);

Hierarchy Level [edit poe]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Designate the way that the switch's PoE controller allocates power to the PoE interfaces.

Default class

Options

- **class**—The amount of power allocated to the interface is determined by the class of the connected powered device. If no powered device is connected, no power is allocated to the interface. See “PoE and J-EX Series Switches Overview” on page 2017 for more information about classes of powered devices.
- **static**—The amount of power allocated to the interface is determined by the value of the **maximum-power** statement, not the class of the connected powered device. This amount is allocated even when a powered device is not connected to the interface, ensuring that power is available when needed.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

maximum-power

Syntax maximum-power *watts*;

Hierarchy Level [edit poe **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the maximum amount of power that the switch can supply to the PoE port.

NOTE: Although you can set this value when PoE power management is in class mode, it does not establish the maximum power for the port. Instead, the IEEE 802.3af (PoE) or IEEE 802.3at (PoE+) class of the connected device determines the maximum power for the port.

Options ***watts***—The maximum number of watts that can be supplied to the port.

Range: 0.0 through 18.6 for J-EX4200 switches

NOTE: Support for more than 15.4 W per port on J-EX4200 switches requires Junos OS Release 11.1 or later. In addition to requiring an upgrade of the Junos OS version to Release 11.1 or later, switches that are running a previous Junos OS version require the PoE controller software be upgraded as described in "Upgrading the PoE Controller Software for Enhanced PoE Support" on page 2039. If the controller software is not upgraded and you set **maximum-power** to a value between 15.5 W and 18.6 W, you do not receive an error when you commit the configuration. However, the actual power allocated to the port will be 15.4 W.

Default: 15.4 for J-EX4200 switches

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

notification-control

Syntax

```
notification-control {
    fpc slot-number {
        disable;
    }
}
```

Hierarchy Level [edit poe]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable or disable the generation of PoE SNMP traps. If PoE traps are enabled, an SNMP trap is sent whenever a PoE interface is enabled or disabled.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

priority

Syntax priority (low | high);

Hierarchy Level [edit poe **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the power priority for individual interfaces when there is insufficient power for all PoE interfaces. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, low priority devices are shut down before high priority devices. Among interfaces that have the same assigned priority, priority is determined by port number, with lower-numbered ports having higher priority.

Default **low**

Options *value*—**high** or **low**:

- **high**—Specifies that this interface is to be treated as high priority in terms of power allocation. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, power is not shut down on this interface until it has been shut down on all the low priority interfaces.
- **low**—Specifies that this interface is to be treated as low priority in terms of power allocation. If the switch needs to shut down powered devices because PoE demand exceeds the PoE budget, power is shut down on this interface before it is shut down on high priority interfaces.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

telemetries

Syntax

```
telemetries {
  disable;
  duration hours;
  interval minutes;
}
```

Hierarchy Level [edit poe **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the logging of power consumption of a PoE interface over time.

If you want to log the power consumption of a PoE interface, you must explicitly specify the **telemetries** statement. When you commit the configuration, logging begins, with data being collected at the specified intervals. Logging stops at the end of the specified duration. If you did not specify the **duration** and **interval** statements, data is collected at five minute intervals for one hour.

The remaining statements are explained separately.

Default Logging of power consumption is disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PoE Interfaces with Different Priorities on a J-EX Series Switch on page 2023
- Configuring PoE (CLI Procedure) on page 2029

CHAPTER 64

Operational Commands for PoE

request poe software upgrade

Syntax request poe software upgrade

Release Information Command introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Upgrade the PoE controller software on J-EX4200 switches.

The Junos OS image running on the switch contains a copy of the PoE controller software. This command compares the Junos OS version with the PoE controller version. If the Junos OS version is a more recent version, the command erases the software on the PoE controller and downloads the more recent version to the controller. A reboot of the switch is required to complete the upgrade.

If you execute this command on a Virtual Chassis master switch, all PoE controllers on member switches that require a software upgrade will be upgraded. You can execute this command on the master switch of a mixed J-EX4200 and J-EX4500 Virtual Chassis when the master switch is a J-EX4500 switch. We recommend that all members of a Virtual Chassis run the same version of the PoE controller software.

Download of the software to the controller can take up to 45 minutes. During this period, power to the powered devices is not guaranteed. Use the **show poe controller** command to monitor the progress of the software download.

Required Privilege Level maintenance

Related Documentation

- **show poe controller on page 2058**
- Upgrading the PoE Controller Software for Enhanced PoE Support on page 2039

List of Sample Output **request poe software upgrade (J-EX4200 Virtual Chassis) on page 2057**

Output Fields When you enter this command, you are provided feedback on the status of your request:

- If the PoE controller software needs to be upgraded, the command displays how long the PoE controller software download takes and advises you to use the **show poe controller** command to monitor the download process.
- If the switch does not support the command (for example, the switch does not have a PoE controller), the command displays the message **Download Not supported on this FPC**.
- If the PoE controller software is current with the software in the Junos OS image, the command displays the message **PoE software update NOT required** and provides the version numbers for the software currently running on the controller and for the copy of the controller software contained in the Junos OS image.

Sample Output

request poe software upgrade (J-EX4200 Virtual Chassis)

```
user@switch> request poe software upgrade reboot
fpc0:
--------------------------------------------------------------------------------
Download Not supported on this FPC

fpc1:
--------------------------------------------------------------------------------
PoE software download time is about 35-45 minutes
use 'show poe controller' to get the download status
 WARNING: reboot is required after the download

fpc2:
--------------------------------------------------------------------------------
PoE software download time is about 35-45 minutes
use 'show poe controller' to get the download status
 WARNING: reboot is required after the download

fpc3:
--------------------------------------------------------------------------------
PoE software update NOT required...
software version --> 614
file version --> 614
```

show poe controller

Syntax **show poe controller**

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display configuration and status of the PoE controller.

Required Privilege Level view

Related Documentation

- **show poe interface on page 2060**
- **request poe software upgrade on page 2056**
- Verifying PoE Configuration and Status (CLI Procedure) on page 2036
- Monitoring PoE Power Consumption (CLI Procedure) on page 2034
- Upgrading the PoE Controller Software for Enhanced PoE Support on page 2039

List of Sample Output **show poe controller on page 2059**

Output Fields Table 263 on page 2058 lists the output fields for the **show poe controller** command. Output fields are listed in the approximate order in which they appear.

Table 263: show poe controller Output Fields

Field Name	Field Description
Controller index	Controller number. This number is 0 for a standalone switch. For a J-EX4200 Virtual Chassis or a mixed J-EX4200 and J-EX4500 Virtual Chassis, the **Controller index** is the member ID.
Maximum power	Maximum power the switch can provide to all the PoE ports.
Power consumption	Total amount of power being used by the PoE ports at the time the command is executed.
Guard Band	Amount of power that has been placed in reserve for power demand spikes and that cannot be allocated to a PoE interface.
Management	Power management mode: either **Static** or **Class**.

Table 263: show poe controller Output Fields *(continued)*

Field Name	Field Description
Status	Status of the PoE controller: • **AF_ENHANCE**—Controller supports enhanced PoE. The maximum power per PoE port is 18.6 W. • **DEVICE FAIL**—Software download to the controller has failed. • **AF_MODE**—Controller supports standard IEEE 802.3af. The maximum power per PoE port is 15.4 W. • **AT_MODE**—Controller supports IEEE 802.3at (PoE+). The maximum power per PoE port is 30 W. • **POE_SW_ERASE**—Controller software is being erased in preparation to downloading and installing new software. • **REBOOT_REQUIRED**—Controller software finished downloading. A reboot of the switch is now required to complete the controller software upgrade. • **SW_DOWNLOAD (*n*%)**—Software download to the controller is in progress.

Sample Output

show poe controller

```
user@switch> show poe controller

Controller  Maximum   Power         Guard    Management  Status
index       power     consumption   band

show poe interface

Syntax **show poe interface**
<interface-name>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the status of PoE interfaces.

Options none—Display status of all PoE interfaces on the switch.

interface-name—(Optional) Display the status of a specific PoE interface on the switch.

Required Privilege Level view

Related Documentation

- **show poe controller on page 2058**

List of Sample Output **show poe interface on page 2061**
show poe interface ge-0/0/3 on page 2061

Output Fields Table 264 on page 2060 lists the output fields for the **show poe interface** command. Output fields are listed in the approximate order in which they appear.

Table 264: show poe interface Output Fields

Field Name (All Interfaces Output)	Field Name (Single Interface Output)	Field Description
Interface	**PoE Interface**	Interface name.
Admin status	**Administrative status**	Administrative state of the PoE interface: **Enabled** or **Disabled**. If the PoE interface is disabled, it can provide network connectivity, but it cannot provide power to connected devices.
Oper status	**Operational status**	Operational state of the PoE interface: • **ON**—The interface is currently supplying power to a powered device. • **OFF**—PoE is enabled on the interface, but the interface is not currently supplying power to a powered device. • **Disabled**—PoE is disabled on the interface.
Max power	**Power limit on the interface**	Maximum power that can be provided by the interface.
Priority	**Priority**	Interface power priority: either **High** or **Low**.

Table 264: show poe interface Output Fields *(continued)*

Field Name (All Interfaces Output)	Field Name (Single Interface Output)	Field Description
Power consumption	**Power consumed**	Amount of power being used by the interface at the time the command is executed.
Class	**Class of power device**	IEEE 802.3af (PoE) or IEEE 802.3at (PoE+) class of the powered device. Class 0 is the default class and is used when the class of the powered device is unknown. If no powered device is connected, this field contains **not applicable**.

Sample Output

show poe interface

```
user@switch> show poe interface

Interface Admin status Oper status Max power Priority Power consumption Class
 ge-0/0/0 Enabled      ON          15.4W     Low      7.9W                0
 ge-0/0/1 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/2 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/3 Enabled      ON          15.4W     Low      3.2W                2
 ge-0/0/4 Enabled      ON          15.4W     Low      3.2W                2

Output Fields Table 265 on page 2062 lists the output fields for the **show poe notification-control** command. Output fields are listed in the approximate order in which they appear.

Table 265: show poe notification-control Output Fields

Field Name	Field Description
FPC slot	FPC slot number: • 0 for a standalone switch • Member ID for a Virtual Chassis
Notification-control-status	Status of notification control: • **ON**—PoE traps are enabled. • **OFF**—PoE traps are disabled.

Sample Output

show poe notification-control

```
user@switch> show poe notification-control
FPC slot              Notification-control-status
    0                     OFF
```

show poe telemetries interface

Syntax **show poe telemetries interface** ***interface-name*** **(all | *n*)**

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display a history of power consumption on the specified interface.

Telemetries must be enabled on the interface before you can display a history of power consumption.

Options ***interface-name***—Display power consumption records for the specified PoE interface.

all—Display all power consumption records for the PoE interface.

n—Display the specified number of power consumption records for the PoE interface. The records displayed are the most recent.

Required Privilege Level view

PART 11

Fibre Channel over Ethernet

CHAPTER 65

Fibre Channel over Ethernet (FCoE)—Overview

Understanding FIP Snooping

IP snoopingFibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping is a security mechanism that is designed to prevent unauthorized access and data transmission to a Fibre Channel (FC) network. It works by filtering traffic to permit only servers that have logged in to the FC network to access the network. You enable FIP snooping on FCoE VLANs when the switch is being used as an FCoE transit switch connecting FC initiators (servers) on the Ethernet network to FCoE forwarders (FCFs) at the FC storage area network (SAN) edge.

Through the FIP process, servers that have a converged network adapter (CNA) present an FCoE Node (ENode) that can log in to the FC network. The login process establishes a dedicated virtual link between the ENode and the FCF to emulate a point-to-point connection that passes transparently through the FCoE transit switch.

The FCoE transit switch applies FIP snooping firewall filters at the edge access ports associated with the FCoE VLANs on which you enable FIP snooping. FIP snooping provides security for virtual links by automatically creating firewall filters based on information gathered (snooped) about FC devices during FIP transactions.

This topic describes:

FC Network Security

In traditional pure FC networks, the FCF is a trusted entity and server ENodes connect directly to the FCF. After an ENode gains access to the network through the fabric login (FLOGI) process, the FCF enforces zoning configurations, ensures that the ENode uses valid addresses, monitors the connection, and performs other security functions to prevent unauthorized access.

FIP snooping firewall filters emulate these security functions by preventing unauthorized access to the FCF through the transit switch and by ensuring the security of the virtual link between each ENode and the FCF. FIP snooping also prevents man-in-the-middle attacks.

FIP Snooping Functions

When you enable FIP snooping, the FCoE transit switch monitors FIP logins, solicitations, and advertisements that pass through it and gathers information about the ENode address and the address of the FCF. The transit switch uses the information to construct firewall filters that permit access only to logged-in ENodes. All other traffic on the VLAN is denied.

For example, when an ENode on an FCoE VLAN performs a successful login, the FCoE transit switch snoops the FIP information, constructs a firewall filter that permits access for the ENode, and adds the filter on all transit switch access ports associated with the FCoE VLAN.

The firewall filters allow FCoE frames to pass through the transit switch only between the server ENode FCoE port and the FCF FCoE port to which the server ENode has logged in. This ensures that ENodes can only connect to the FCFs they have successfully logged in to and that only valid FCoE traffic is transmitted. FIP snooping maintains the filters by tracking FCoE sessions.

FIP Snooping Firewall Filters

The FIP snooping firewall filters deny any FCoE traffic on the VLAN except for traffic originating from ENodes that have already logged in to the FCF.

FIP snooping performs these actions and checks to ensure that FCoE traffic is valid:

- Denies ENodes that use the FCF media access control (MAC) address as the source address.
- Denies all traffic from the ENode other than traffic addressed to the FCF that the Enode has logged into.
- Restricts the ENode to sending only FCoE protocol traffic on the virtual link.
- Allows the ENode to transmit only FIP and FCoE frames to the FCF address.
- Ensures that the FCoE source address an ENode uses after fabic login and fabric discovery (FDISC) is the address the FCF assigned to that ENode.
- Ensures that the FCoE source address the FCF assigns or accepts is only used for FCoE traffic.
- Ensures that FCoE frames are only addressed to the accepting FCF.

FIP Snooping Implementation

You enable FIP snooping on a per-VLAN basis. The FCoE transit switch snoops FIP frames at the access ports associated with the FIP snooping-enabled VLANs, then installs the resulting firewall filters on the access ports to ensure that all snooping occurs on the FCoE transit switch network edge.

FCoE VLANs can include both access ports and trunk ports. Access ports face the hosts (FCoE servers and other FCoE initiators), and trunk ports face the FCF. When FIP snooping is enabled, the FCoE transit switch inspects both FIP frames and FCoE frames.

The FIP snooping implementation includes these considerations:

- Server ENode-Facing Interfaces on page 2071
- FCF-Facing Interfaces on page 2071
- FCoE Mapped Address Prefix on page 2071

Server ENode-Facing Interfaces

We recommend that you enable FIP snooping on all FCoE access ports to ensure secure connections to FCFs. After you enable FIP snooping on an FCoE VLAN, the transit switch denies FCoE traffic from any server on that VLAN until the server performs a valid fabric login with an FCF.

FCF-Facing Interfaces

You must configure the interface that you are using to connect to an FCF as FCoE trusted interface, and it must be a 10 Gigabit Ethernet interface.

An FCoE trusted interface receives FCoE traffic only from an FCF. The following conditions apply to FCFs and FCF-facing interfaces:

- By default, FCFs are trusted entities.
- The FCoE transit switch always processes FCF frames because they come from a trusted source.

FCoE Mapped Address Prefix

When you enable FIP snooping on a VLAN, optionally you can specify the FCoE Mapped Address Prefix (FC-MAP) value for that VLAN if the network uses the fabric-provided MAC address (FPMA) addressing scheme. The FC-MAP value is a 24-bit value that identifies the FCF. The FCF combines the FC-MAP value with a unique 24-bit Fibre Channel ID (FCID) value for the server during the fabric login process, creating a unique 48-bit identifier. The FCF assigns the 48-bit value to the server ENode as its MAC address and unique identifier for the session. Each server session the ENode establishes with the FCF receives a unique FCID, so a server can host multiple virtual links to an FCF, each with a unique 48-bit address identifier.

The FIP snooping filter compares the configured FC-MAP value with the FC-MAP value in the header of frames coming from the server. If the values do not match, the FCoE transit switch denies access.

T11 FIP Snooping Specification

For more details about FIP snooping, see the Technical Committee T11 organization document *Increasing FCoE Robustness using FIP Snooping* at http://www.t11.org/ftp/t11/pub/fc/bb-5/08-264v3.pdf.

- Understanding Using an FCoE Transit Switch on page 2072
- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077
- Configuring FIP Snooping on an FCoE Transit Switch (CLI Procedure) on page 2086

Understanding Using an FCoE Transit Switch

You can use a J-EX4500 switch as a Fibre Channel over Ethernet (FCoE) transit switch. An FCoE transit switch is a Layer 2 data center bridging (DCB) switch that can transport FCoE frames and implement FCoE Initialization Protocol (FIP) snooping. The switch can transport both FCoE and Ethernet LAN traffic over the same network infrastructure while preserving the class of service (CoS) that Fibre Channel (FC) traffic requires.

An FCoE transit switch does not encapsulate or decapsulate FC frames in Ethernet. It is an access switch that transports FC frames that have already been encapsulated in Ethernet between FCoE initiators such as servers and an FCoE forwarder (FCF), which is in an FC storage area network (SAN). The transit switch acts as a passthrough switch and is transparent to the FCF, which detects each connection to an FCoE server as a direct point-to-point link.

When the switch acts as a transit switch, the VLANs you configure for FCoE traffic can use any of the switch ingress and egress ports, because the traffic in both directions is Ethernet traffic. FCoE traffic must use a VLAN dedicated only to FCoE traffic that does not carry any other traffic.

When the switch acts as a transit switch, you must enable priority-based flow control (PFC, IEEE standard 802.1Qbb) as a link-level flow control mechanism. See “Understanding Priority-Based Flow Control” on page 1880 for additional information. FIP snooping adds security by filtering access so that only traffic from servers that have successfully logged in to the FC network passes through the transit switch and reaches the FC network.

The transit switch transparently connects FCoE-capable servers in an Ethernet LAN to an FCF, which has both FCoE and FC interfaces and processes both the FCoE and FC protocol stacks. The transit switch acts as a transparent access layer between FCoE servers and the FCF.

Encapsulated FCoE server traffic flows through the transit switch to the FCoE ports on the FCF. The FCF removes the Ethernet encapsulation from the FCoE frames to restore the native FC frames. Native FC traffic travels out FCF FC ports to storage devices in the FC SAN.

Native FC traffic from storage devices flows to the FCF FC ports, and the FCF encapsulates that traffic in Ethernet as FCoE traffic. The FCoE traffic flows through the transit switch to the appropriate server, and the server decapsulates the traffic.

Understanding Priority-Based Flow Control

Priority-based flow control (PFC), IEEE standard 802.1Qbb, is a link-level flow control mechanism. The flow control mechanism is similar to that used by IEEE 802.3x Ethernet PAUSE, but it operates on individual priorities. Instead of pausing all traffic on a link, PFC allows you to selectively pause traffic according to its class.

This topic describes:

- Reliability of Packet Delivery in Standard Ethernet Networks and in Layer 2 Networks on page 2073
- Calculations for Buffer Requirements When Using PFC PAUSE on page 2073
- How PFC and Congestion Notification Profiles Work on page 2074

Reliability of Packet Delivery in Standard Ethernet Networks and in Layer 2 Networks

Standard Ethernet does not guarantee that a packet injected into the network will arrive at its intended destination. Reliability is provided by upper-layer protocols. Generally, a network path consists of multiple hops between the source and destination. A problem arises when transmitters send packets faster than receivers can accept them. When receivers run out of available buffer space to hold incoming flows, they silently drop additional incoming packets. This problem is generally resolved by upper-layer protocols that detect the drops and request retransmission.

Applications that require reliability in Layer 2 must have flow control that includes feedback from a receiver to a sender regarding buffer availability. Using IEEE 802.3x Ethernet PAUSE control frames, a receiver can generate a MAC control frame and send a PAUSE request to a sender when a specified threshold of receiver buffer has been filled in order to prevent buffer overflow. Upon receiving a PAUSE frame, the sender stops transmissions of any new packets until the receiver has sufficient buffer space to accept them again. The disadvantage of using Ethernet PAUSE is that it operates on the entire link, which might be carrying multiple traffic flows. Some traffic flows do not need flow control in Layer 2, because they are carrying applications that rely on upper-layer protocols for reliability. PFC enables you to configure Layer 2 flow control selectively for the traffic that requires it, such as Fibre Channel over Ethernet (FCoE) traffic, without impacting other traffic on the link. You can also enable PFC for other traffic types, such as iSCSI.

Calculations for Buffer Requirements When Using PFC PAUSE

Receivers must ensure that a PFC PAUSE frame is sent while there is sufficient receive buffer to absorb the data that might continue to be received while the system is responding to the PFC PAUSE.

When you calculate buffer requirements, consider the following factors:

- Processing and queuing delay of the PFC PAUSE—In general, the time to detect the lack of sufficient buffer space and to transmit the PFC PAUSE is negligible. However, delays can occur if the switch detects reduced buffer space occurs just as the transmitter is beginning to transmit a maximum length frame.
- Propagation delay across the media—The delay amount depends on the length and speed of the physical link.
- Response time to the PFC PAUSE frame
- Propagation delay across the media on the return path

NOTE: We recommend that you configure at least 20 percent of the buffer size for the queue that is using PFC and that you do not specify the exact option.

How PFC and Congestion Notification Profiles Work

PFC is triggered when the incoming frame has a User Priority (UP) field that matches the three-bit pattern specified for the PFC congestion notification profile, which you have configured. Table 267 on page 2074 shows the one-to-one mapping between the UP field of an IEEE 802.1Q tagged frame, the traffic class, and the egress queue. In addition to setting a PFC congestion notification profile on an ingress port, you must set a forwarding class to match the priority specified in the PFC congestion notification profile and to forward the frame to the appropriate queue.

J-EX Series Switches support up to 6 traffic classes and allow you to associate those classes with 6 different congestion notification profiles. (The switches support up to 16 forwarding classes.)

Table 267: Input for PFC Congestion Notification Profile and Mapping to Traffic Class and Egress Queue

UP Field of IEEE-802.1Q Tagged Frame	Traffic Class	Egress Queue
000	TC 0	queue 0
001	TC 1	queue 1
010	TC 2	queue 2
011	TC 3	queue 3
100	TC4	queue 4
101	TC 5	queue 5

CHAPTER 66

Example: FCoE Configuration

Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping uses information gathered during FIP discovery and login to create firewall filters that provide security against unauthorized access to the FCoE forwarder (FCF) through the FCoE transit switch, which here is the J-EX Series switch. The firewall filters allow only FCoE hosts that succeed at logging in to the fabric to access the FCF through the transit switch. FIP snooping provides security for the point-to-point virtual links that connect host FCoE Nodes (ENodes) and FCFs in the FCoE VLAN by denying access to any device that does not successfully log in to the FCF.

This example shows how to configure FIP snooping and priority-based flow control (PFC):

Requirements

This example uses the following hardware and software components:

- One J-EX4500 switch
- Junos OS Release 10.4 or later for J-EX Series switches
- One FCoE Node (ENode)
- One FCoE forwarder (FCF)

Before you configure FIP snooping and an FCF trusted port, be sure you have:

- Configured the VLAN **fcoe-vlan** on the switch. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 112.

Overview and Topology

FIP snooping is disabled by default. You enable FIP snooping on a per-VLAN basis for VLANs that carry FCoE traffic. Ensure that a VLAN that carries FCoE traffic carries only FCoE traffic, because enabling FIP snooping denies access for all other Ethernet traffic. In addition, you must configure priority-based flow control (PFC) on all interfaces that are carrying FCoE traffic, because flow control must be implemented on the link level for this type of traffic. You configure trunk interfaces that connect to the FCF as trusted interfaces. The switch must use the same FC-MAP value that is being used by the FCF. Therefore, if the FCF is using a nondefault FC-MAP value, you must configure the FC-MAP value on the switch to match that value.

You must also enlarge the maximum transmission unit (MTU) size for all interfaces (both access and trunk) that are handling FCoE traffic to accommodate the maximum FC frame and Ethernet header sizes.

FCoE transmissions are vulnerable to address spoofing and man-in-the-middle attacks, because they are not actually point-to-point links. This example describes how to configure the switch so that it provides security similar to that provided by traditional Fibre Channel (FC) networks. The switch is transparent to the ENode and the FCF, so that the ENode and FCF communicate just as they would for a point-to-point link.

This example shows how to configure FIP snooping on a VLAN of the J-EX4500 switch that is connected with one ENode, that is, a server equipped with converged network adapters (CNAs). The setup for this example includes the VLAN **fcoe-vlan** on the switch. This example also shows how to configure PFC on the interfaces that are being used for FCoE traffic and how to configure an FCoE trusted port to handle traffic between the switch and the FCF gateway to the storage area network (SAN).

The components of the topology for this example are shown in Table 268 on page 2078.

Table 268: Components of the FCoE Security Topology

Properties	Settings
Switch hardware	One J-EX4500 switch
VLAN name and ID	**fcoe-vlan**, tag **20**
Interfaces in **fcoe-vlan**	**xe-0/0/1** **xe-0/0/2** **xe-0/0/3** **xe-0/0/30**
FCoE trusted port to the FCF	**xe-0/0/30**

Table 268: Components of the FCoE Security Topology *(continued)*

Properties	Settings
PFC interfaces	xe-0/0/1 xe-0/0/2 xe-0/0/3 xe-0/0/30
CoS forwarding class interface	xe-0/0/30
CoS scheduler map interface	xe-0/0/30
Interfaces configured with MTU of 2500	xe-0/0/1 xe-0/0/2 xe-0/0/3 xe-0/0/30

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- All access ports are untrusted, which is the default setting.
- The port connecting the switch to the FCF is configured as a trunk port.

Configuration

To configure FIP snooping to protect the switch against man-in-the middle attacks and to enable PFC for the FCoE traffic, perform these tasks:

NOTE: PFC is supported only on 10-Gigabit Ethernet interfaces.

NOTE: We recommend that you also:

- Configure at least 20 percent of the buffer for the queue that is using PFC..
- Do not specify the exact option when configuring the buffer for the queue that is using PFC.
- Configure the loss-priority statement to low for a traffic class that is using PFC.

CLI Quick Configuration

To quickly configure FIP snooping, an FCoE-trusted port, and PFC, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options secure-access-port vlan fcoe-vlan examine-fip fc-map 0x0EFC03
set ethernet-switching-options secure-access-port interface xe-0/0/30 fcoe-trusted
set class-of-service congestion-notification-profile cn-profile input ieee-802.1 code-point 101 pfc
```

```
set class-of-service interfaces xe-0/0/1 congestion-notification-profile cn-profile
set class-of-service interfaces xe-0/0/2 congestion-notification-profile cn-profile
set class-of-service interfaces xe-0/0/3 congestion-notification-profile cn-profile
set class-of-service interfaces xe-0/0/30 congestion-notification-profile cn-profile
set class-of-service classifiers ieee-802.1 pfc-class import default
set class-of-service classifiers ieee-802.1 pfc-class forwarding-class af2 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 pfc-class
set class-of-service interfaces xe-0/0/2 unit 0 classifiers ieee-802.1 pfc-class
set class-of-service interfaces xe-0/0/3 unit 0 classifiers ieee-802.1 pfc-class
set class-of-service interfaces xe-0/0/30 unit 0 classifiers ieee-802.1 pfc-class
set class-of-service forwarding-classes class af2 queue-num 5
set class-of-service schedulers pfc-sched buffer-size percent 20
set class-of-service scheduler-maps pfc-map forwarding-class af2 scheduler pfc-sched
set class-of-service interfaces xe-0/0/30 scheduler-map pfc-map
set interfaces xe-0/0/1 mtu 2500
set interfaces xe-0/0/2 mtu 2500
set interfaces xe-0/0/3 mtu 2500
set interfaces xe-0/0/30 mtu 2500
```

Step-by-Step Procedure

Configure FIP snooping, an FCoE-trusted port, and PFC on the switch:

NOTE: The configuration of PFC includes two different ieee-802.1 configuration statements:

- **ieee-802.1 (Congestion Notification)**—Use to configure the congestion notification profile.
- **ieee-802.1**—Use to configure the CoS classifier.

1. Enable FIP snooping on the VLAN and modify the FC-MAP value to match the FC-MAP value being used by the FCF:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan fcoe-vlan examine-fip fc-map 0x0EFC03
```

2. Set the FCF-facing interface (**xe-0/0/30**) as FCoE-trusted:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/30 fcoe-trusted
```

3. Configure a congestion notification profile, specifying the name of the profile and applying it to the traffic class that is indicated by the User Priority bits in the 802.1Q tagged frame of an incoming packet:

NOTE: The ENode and the switch must use the same traffic class for the FCoE traffic.

```
[edit class-of-service]
user@switch# set congestion-notification-profile cn-profile input ieee-802.1 code-point
101 pfc
```

4. Bind the congestion notification profile to all interfaces of the FCoE VLAN:

```
[edit class-of-service]
```

```
user@switch# set interface xe-0/0/1 congestion-notification-profile cn-profile
user@switch# set interface xe-0/0/2 congestion-notification-profile cn-profile
user@switch# set interface xe-0/0/3 congestion-notification-profile cn-profile
user@switch# set interface xe-0/0/30 congestion-notification-profile cn-profile
```

5. Create a CoS classifier for a traffic class that will use PFC:

```
[edit class-of-service]
user@switch# set classifiers ieee-802.1 pfc-class import default
```

6. Configure this traffic class (**pfc-class**) to use forwarding class **af2** with a low loss priority value:

```
[edit class-of-service]
user@switch# set classifiers ieee-802.1 pfc-class forwarding-class af2 loss-priority low
code-points 101
```

7. Bind the **pfc-class** classifier to all interfaces of the FCoE VLAN:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 pfc-class
user@switch# set interfaces xe-0/0/2 unit 0 classifiers ieee-802.1 pfc-class
user@switch# set interfaces xe-0/0/3 unit 0 classifiers ieee-802.1 pfc-class
user@switch# set interfaces xe-0/0/30 unit 0 classifiers ieee-802.1 pfc-class
```

8. Assign forwarding-class **af2** to an egress queue:

```
[edit class-of-service]
user@switch# set forwarding-classes af2 queue-num 5
```

9. Set a scheduler for this queue, allocating at least 20 percent of the buffer:

```
[edit class-of-service]
user@switch# set schedulers pfc-sched buffer-size percent 20
```

10. Configure a scheduler map (**pfc-map**) that associates the scheduler (**pfc-sched**) with the forwarding class assured-forwarding (**af2**):

```
[edit class-of-service]
user@switch# set scheduler-maps pfc-map forwarding-class af2 scheduler pfc-sched
```

11. Assign the scheduler map (**pfc-map**) to the FCF-facing interface (xe-0/0/30):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/30 scheduler-map pfc-map
```

12. Enlarge the MTU size to 2500 bytes for all the interfaces (both access and trunk) that are handling FCoE traffic:

```
[edit interfaces]
user@switch# set xe-0/0/1 mtu 2500
user@switch# set xe-0/0/2 mtu 2500
user@switch# set xe-0/0/3 mtu 2500
user@switch# set xe-0/0/30 mtu 2500
```

Results Check the results of the configuration:

```
[edit]
  user@switch# show
  interfaces {
    xe-0/0/1 {
```

```
    mtu 2500;
    unit 0 {
      family ethernet-switching {
        vlan {
          members fcoe-vlan;
        }
      }
    }
  }
  xe-0/0/2 {
    mtu 2500;
    unit 0 {
      family ethernet-switching {
        vlan {
          members fcoe-vlan;
        }
      }
    }
  }
  xe-0/0/3 {
    mtu 2500;
    unit 0 {
      family ethernet-switching {
        vlan {
          members fcoe-vlan;
        }
      }
    }
  }
  xe-0/0/30 {
    mtu 2500;
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members fcoe-vlan;
        }
      }
    }
  }
}
class-of-service {
  classifiers {
    ieee-802.1 pfc-class {
    import default;
    forwarding-class af2 {
    loss-priority low code-points 101;
  }
  forwarding-classes {
    class af2 queue-num 5;
  }
  congestion-notification-profile {
    cn-profile {
      input {
        ieee-802.1 {
          code-point 101 {
```

```
            pfc;
          }
        }
      }
    }
  }
  interfaces {
    xe-0/0/1 {
      congestion-notification-profile cn-profile;
      unit 0 {
        classifiers {
          ieee-802.1 pfc-class;
        }
      }
    }
    xe-0/0/2 {
      congestion-notification-profile cn-profile;
      unit 0 {
        classifiers {
          ieee-802.1 pfc-class;
        }
      }
    }
    xe-0/0/3 {
      congestion-notification-profile cn-profile;
      unit 0 {
        classifiers {
          ieee-802.1 pfc-class;
        }
      }
    }
    xe-0/0/30 {
      congestion-notification-profile cn-profile;
      scheduler-map pfc-map;
      unit 0 {
        classifiers {
          ieee-802.1 pfc-class;
        }
      }
    }
  }
  ethernet-switching-options {
    secure-access-port {
      interface xe-0/0/30.0 {
        fcoe-trusted;
      }
      vlan fcoe-vlan {
        examine-fip {
          fc-map 0x0EFC03;
        }
      }
    }
  }
```

Verification

To confirm that the configuration is working properly:

- Verifying That FIP Snooping Is Working Correctly on the Switch on page 2084

Verifying That FIP Snooping Is Working Correctly on the Switch

Purpose Verify that FIP snooping is being implemented on the appropriate VLAN.

Action Send some requests from ENodes to the switch.

Display the FIP snooping information :

```
user@switch> show fip snooping vlan detail fcoe-vlan

VLAN: fcoe-vlan,   FC-MAP: 0e:fc:03
  FCF Information
  FCF-MAC            : 30:10:94:01:00:00
  Active Sessions    : 2
  Configured FKA-ADV : 195
  Running FKA-ADV    : 73
    Enode Information
    Enode-MAC: 10:10:94:01:00:01,       Interface: xe-0/0/1

CHAPTER 67

Configuring FCoE

Configuring FIP Snooping on an FCoE Transit Switch

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping uses information gathered during FIP discovery and login to create firewall filters that provide security against unauthorized access to the FC switch or FCoE forwarder (FCF) through the J-EX4500 when the switch is acting as an FCoE transit switch. The firewall filters allow only FCoE devices that succeed at logging in to the FC fabric to access the FC switch through the transit switch. FIP snooping provides security for the point-to-point virtual links that connect host FCoE Nodes (ENodes) and FC switches in the FCoE VLAN by denying access to any device that does not successfully log in to the FC switch.

FIP snooping is disabled by default. You enable FIP snooping on a per-VLAN basis for VLANs that carry FCoE traffic. Ensure that a VLAN that carries FCoE traffic carries only FCoE traffic, because enabling FIP snooping will deny access for all other Ethernet traffic.

NOTE: All of the transit switch ports are untrusted by default. If an ENode on an FCoE device logs in to an FC switch before you enable FIP snooping on the VLAN and you then enable FIP snooping, the transit switch denies traffic from the ENode because the transit switch has not snooped (learned) the ENode state. The following process automatically logs the ENode back in to the FC switch to reestablish the connection:

1. FIP snooping is enabled on an FCoE VLAN on the switch.
2. The switch denies existing connections between servers and the FC switch on the FCoE VLAN by filtering the FCoE traffic and FIP traffic, so no keepalive messages from the ENodes reach the FC switch.
3. The FC switch port timer for each ENode and for each VN_Port on each ENode expires.
4. The FC switch sends each ENode whose port timer has expired a Clear Virtual LInks (CVL) message.
5. The CVL message causes the ENode to log in again.

Because the FC switch is a trusted source, you configure interfaces that connect to the FC switch as trusted interfaces. FIP snooping continues to run on trusted interfaces so that the switch learns the FC switch state.

Optionally, you can specify an FC-MAP value for each FCoE VLAN. On a given FCoE VLAN, the switch learns only FC switches that have a matching FC-MAP value. The default FC-MAP value is 0EFC00h for all FC devices. (Enter hexadecimal values for FC-MAP preceded by the hexadecimal indicator “0x”—for example, 0x0EFC00.) If you change the FC-MAP value of an FC switch, change the FC-MAP value for the FCoE VLAN it belongs to on the switch and on the servers you want to communicate with the FC switch. An FCoE VLAN can have one and only one FC-MAP value.

To enable FIP snooping:

- To enable FIP snooping on a single VLAN and specify the optional FC-MAP value:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name examine-fip fc-map fc-map-value
```

  For example, to enable FIP snooping on a VLAN named **san1_vlan** and change the FC-MAP value to **0x0EFC03**:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan san1_vlan examine-fip fc-map 0x0EFC03
```

- To enable FIP snooping on all VLANs and use the default FC-MAP value:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all examine-fip
```

- To configure an FC switch-facing interface as a trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name fcoe-trusted
```

  For example, to configure interface **xe-0/0/30** as a trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/30 fcoe-trusted
```

Configuring Priority-Based Flow Control for a J-EX Series Switch (CLI Procedure)

You can configure priority-based flow control (PFC) to apply link-level flow control on a specific traffic class so that different types of traffic can efficiently use the same network interface card (NIC). You must configure PFC for all interfaces carrying FCoE traffic. You can also configure PFC on interfaces carrying other traffic types, such as iSCSI traffic.

NOTE: PFC is supported only on 10-Gigabit Ethernet interfaces.

NOTE: We recommend that you also:

- Configure at least 20 percent of the buffer for the queue that is using PFC.
- Do not specify the exact option when configuring the buffer for the queue that is using PFC.
- Configure the loss-priority statement to low for a traffic class that is using PFC.

J-EX Series switches support up to six congestion notification profiles for PFC.

To configure PFC:

1. Configure a congestion notification profile, specifying the name of the profile and specifying the three-bit pattern of the User Priority bits in an incoming frame that will trigger the priority-based flow control on that traffic class:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile profile-name input ieee-802.1
   code-point up-bits pfc
   ```

2. Bind the congestion notification profile to the interfaces that will be used for the traffic class that you have selected for PFC:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name congestion-notification-profile profile-name
   ```

3. Create a CoS classifier for a traffic class that will use PFC:

   ```
   [edit class-of-service]
   user@switch# set classifiers ieee-802.1 classifier-name import default
   ```

4. Configure this traffic class (***classifier-name***) to use forwarding class **af2** with a low loss priority value:

   ```
   [edit class-of-service]
   user@switch# set classifiers ieee-802.1 classifier-name forwarding-class
   class-nameloss-priority low code-points 6 bit-patterns
   ```

5. Bind the ***classifier-name*** classifier to all interfaces that require PFC:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name unit logical-unit-number classifiers
   ieee-802.1 classifier-name
   ```

6. Assign the specified forwarding-class to an egress queue:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class-name queue-number
   ```

7. Set a scheduler for this queue, allocating at least 20 percent of the buffer:

   ```
   [edit class-of-service]
   user@switch# set schedulers scheduler-name buffer-size percent
   ```

8. Configure a scheduler map that associates the specified scheduler with the specified forwarding class:

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps map-name forwarding-class class-name scheduler
   scheduler-name
   ```

   For example:

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps pfc-map forwarding-class af2 scheduler pfc-sched
   ```

9. Assign the scheduler map to the egress interface:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name scheduler-map pfc-map
   ```

code-point (Congestion Notification)

Syntax code-point *up-bits* pfc;

Hierarchy Level [edit **class-of-service congestion-notification-profile** *profile-name* **input ieee-802.1**],
[edit class-of-service interfaces *interface-name* congestion-notification-profile *profile-name* input ieee-802.1]

Release Information Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Configure the IEEE 802.1p (User Priority) code point bits as input for creating the priority-based flow control (PFC) congestion notification profile, which you will associate with a particular traffic class.

Options
- **pfc**—PFC flow control method
- ***up-bits***—Three-bit pattern of the User Priority field in an IEEE 802.1Q tag

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077

congestion-notification-profile

Syntax

```
congestion-notification-profile profile-name {
  input {
    ieee-802.1 {
      code-point up-bits pfc;
```

Hierarchy Level

[edit class-of-service],
[edit class-of-service interfaces *interface-name*]

Release Information

Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description

Configure a congestion notification profile for priority-based flow control (PFC).

NOTE: You must configure PFC for FCoE traffic. The interface where PFC is enabled must be a 10-Gigabit Ethernet interface.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

examine-fip

Syntax

```
examine-fip {
  fc-map fc-map-value;
}
```

Hierarchy Level [edit ethernet-switching options secure-access-port vlan (all | *vlan-name*)]

Release Information Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Enable FIP snooping on a specified VLAN. Ensure that the VLAN is a dedicated FCoE VLAN that transports only FCoE traffic.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- vlan on page 1688
- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077
- Configuring FIP Snooping on an FCoE Transit Switch on page 2086

fc-map

Syntax fc-map *fc-map-value*;

Hierarchy Level [edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

Release Information Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).

You can configure the FC-MAP value or use the default value. The FC switch provides the FC-MAP value to FCoE Nodes (ENodes) in the FIP discovery advertisement message. If the J-EX Series switch product FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, the device does not discover the FC switch on that VLAN and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN_Port MAC address.

Options ***fc-map-value***—FC-MAP value, hexadecimal value preceded by "0x".

Range: 0x0EFC00–0x0EFCFF

Default: 0xEFC00

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077
- Configuring FIP Snooping on an FCoE Transit Switch on page 2086

fcoe-trusted

Syntax fcoe-trusted;

Hierarchy Level [edit ethernet-switching options secure-access-port interface *interface-name*]

Release Information Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Configure the specified 10-Gigabit Ethernet interface to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is connected to an FCoE forwarder (FCF), you can configure the interface as trusted so that it forwards FCoE traffic from the FCF to FCoE devices.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

input (Congestion Notification)

Syntax

```
input {
  ieee-802.1 {
    code-point up-bits pfc ;
  }
}
```

Hierarchy Level

[edit **class-of-service congestion-notification-profile** *profile-name*],
[edit class-of-service interfaces *interface-name* congestion-notification-profile *profile-name*]

Release Information

Statement introduced in Junos OS Release 10.4 for J-EX Series switches.

Description

Identify the three-bit pattern of the User Priority field that triggers the priority-based congestion notification profile for a specified traffic class.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring FIP Snooping and Priority-Based Flow Control on an FCoE Transit Switch on page 2077

interface

Syntax

```
interface (all | interface-name) {
  allowed-mac {
    mac-address-list;
  }
  (dhcp-trusted | no-dhcp-trusted);
  fcoe-trusted;
  mac-limit limit action action;
  no-allowed-mac-log;
  static-ip ip-address {
    vlan vlan-name;
    mac mac-address;
  }
}
```

Hierarchy Level [edit ethernet-switching-options secure-access-port]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply port security features to all interfaces or to the specified interface.

The statements are explained separately.

Options **all**—Apply port security features to all interfaces.

interface-name —Apply port security features to the specified interface.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

interfaces

Syntax

```
interfaces {
  interface-name  {
    congestion-notification-profile profile-name {
      input {
        ieee-802.1 {
          code-point up-bits pfc;
          }
        }
      }
    }
    scheduler-map map-name;
    unit logical-unit-number {
      forwarding-class class-name;
      classifiers {
        (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
      }
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interface-specific class-of-service (CoS) properties for incoming packets.

Options *interface-name*—Name of the interface.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

secure-access-port

Syntax

```
secure-access-port {
  dhcp-snooping-file {
    location local_pathname | remote_URL;
    timeout seconds;
    write-interval seconds;
  }
  interface (all | interface-name) {
    allowed-mac {
      mac-address-list;
    }
    (dhcp-trusted | no-dhcp-trusted);
    fcoe-trusted;
    mac-limit limit action action;
    no-allowed-mac-log;
    static-ip ip-address {
      vlan  vlan-name;
      mac mac-address;
    }
  }
  vlan (all | vlan-name) {
    (arp-inspection | no-arp-inspection);
    dhcp-option82 {
      circuit-id {
        prefix hostname;
        use-interface-description;
        use-vlan-id;
      }
      remote-id {
        prefix hostname | mac | none;
        use-interface-description;
        use-string string;
      }
      vendor-id <string>;
    }
    (examine-dhcp | no-examine-dhcp);
    examine-fip {
      fc-map fc-map-value;
    }
    (ip-source-guard | no-ip-source-guard);
    mac-move-limit limit action action;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure port security features, including MAC limiting, dynamic ARP inspection, whether interfaces can receive DHCP responses, DHCP snooping, IP source guard, DHCP option 82, MAC move limiting, and FIP snooping.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

vlan

Syntax

```
vlan (all | vlan-name) {
  (arp-inspection | no-arp-inspection);
  dhcp-option82 {
    circuit-id {
      prefix hostname;
      use-interface-description;
      use-vlan-id;
    }
    remote-id {
      prefix hostname | mac | none;
      use-interface-description;
      use-string string;
    }
    vendor-id <string>;
  }
  (examine-dhcp | no-examine-dhcp);
  examine-fip {
    fc-map fc-map-value;
  }
  (ip-source-guard | no-ip-source-guard);
  mac-move-limit limit action action;
}
```

Hierarchy Level [edit ethernet-switching-options secure-access-port]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply any of the following security options to a VLAN:

- DHCP snooping
- DHCP option 82
- Dynamic ARP inspection (DAI)
- FIP snooping
- IP source guard
- MAC move limiting

The remaining statements are explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options **all**—Apply the feature to all VLANs.

vlan-name—Apply the feature to the specified VLAN.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

CHAPTER 69

Operational Commands for FCoE

clear fip snooping enode

Syntax **clear fip snooping enode *enode-mac***
<vlan *vlan-name*>

Release Information Command introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Clear FIP snooping information for the specified FCoE Node (ENode) or (optionally) only on a specified VLAN. This operation deletes the ENode state from the switch database and from the FIP snooping firewall filters, which causes the ENode to lose its connection to the FCoE forwarder (FCF) and to log in to the FCF again.

Options ***enode-mac***—MAC address of the ENode.

vlan *vlan-name*—(Optional) Name of the VLAN.

Required Privilege Level view

Related Documentation
- **show fip snooping enode on page 2117**

List of Sample Output **clear fip snooping enode enode-mac on page 2112**

Sample Output

clear fip snooping enode enode-mac

```
user@switch> clear fip snooping enode 00:10:94:00:00:02
```

clear fip snooping statistics

Syntax **clear fip snooping statistics**
<vlan *vlan-name*>

Release Information Command introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Clear FIP snooping statistics globally or on a specified VLAN.

Required Privilege Level view

Related Documentation
- **show fip snooping statistics on page 2121**

List of Sample Output **clear fip snooping statistics on page 2113**

Sample Output

clear fip snooping statistics

```
user@switch> clear fip snooping statistics
```

clear fip snooping vlan

Syntax **clear fip snooping vlan *vlan-name***

Release Information Command introduced in Junos OS Release 10.4 for J-EX Series switches.

Description Clear FIP snooping information for the specified VLAN. This operation deletes all ENode and FCF information for the VLAN from the switch database and causes the ENodes to lose their connections to the FCFs. After clearing a VLAN, the switch relearns all of the FCFs and ENodes on the VLAN, and the ENodes must log in to the FCF again.

Options ***vlan-name***—Name of the VLAN.

Required Privilege Level view

Related Documentation

- **show fip snooping vlan on page 2123**

List of Sample Output **clear fip snooping vlan vlan-name on page 2114**

Sample Output

clear fip snooping vlan vlan-name

```
user@switch> clear fip snooping vlan fcoevlan1
```

show fip snooping

Syntax
show fip snooping
<brief | detail>

Release Information
Command introduced in Junos OS Release 10.4 for J-EX Series switches.

Description
Display FIP snooping information.

Options
none—Display FIP snooping information.

brief | **detail**—(Optional) Display the specified level of output.

Required Privilege Level
view

Output Fields
Table 269 on page 2115 lists the output fields for the **show fip snooping** command. Output fields are listed in the approximate order in which they appear.

Table 269: show fip snooping Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the VLAN.	All
FCF or **FCF-MAC**	MAC address of the FCF.	All
Session Count or **Active Sessions**	Current number of virtual link sessions with VN_Ports.	All
Configured FKA-ADV	FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258.	**detail**

Table 269: show fip snooping Output Fields *(continued)*

Field Name	Field Description	Level of Output
Running FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the FCF received. This value changes every time the FCF receives an FKA_ADV.	**detail**
ENode-MAC	MAC address of the connected FCoE node (ENode).	All
• **Interface**	Interface connected to the ENode.	**detail**
• **Configured FKA-ADV**	FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258. This value remains constant.	**detail**
• **Running FKA-ADV**	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF. This value changes every time the ENode sends an FKA_ADV to the FCF.	**detail**
• **VN-Port MAC**	MAC address of a VN_Port on the ENode.	All
• **FKA-ADV**	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF on behalf of the VN_Port (VN_Port FKA_ADV). This value changes every time the ENode sends a VN_Port FKA_ADV to the FCF.	**detail**

Sample Output

show fip snooping

```
user@switch> show fip snooping
VLAN : fcoevlan1     FC-MAP : 0e:fc:00
  FCF : 00:10:94:00:00:01   Session Count : 2
    Enode-MAC : 00:10:94:00:00:02
      VN-Port-MAC : 0E:FC:00:00:00:05
      VN-Port-MAC : 0E:FC:00:00:00:01
```

show fip snooping detail

```
user@switch> show fip snooping detail
VLAN : fcoevlan1    FC-MAP : 0e:fc:00
  FCF Information
  FCF-MAC            : 00:10:94:00:00:01
  Active Sessions    : 2

Table 272: show fip snooping statistics Output Fields

Field Name	Field Description
VLAN	Name of the VLAN for which a set of statistics is displayed.
Number of MDS	Number of multicast discovery solicitation messages sent on the VLAN.
Number of UDS	Number of unicast discovery solicitation messages sent on the VLAN.
Number of FLOGI	Number of fabric logins on the VLAN.
Number of FDISC	Number of fabric discovery logins on the VLAN.
Number of LOGO	Number of fabric logouts on the VLAN.
Number of ENode-keep-alive	Number of ENode keepalive messages sent on the VLAN.
Number of VNPort-keep-alive	Number of VN_Port keepalive messages sent on the VLAN.
Number of MDA	Number of multicast discovery advertisement messages sent on the VLAN.

Table 272: show fip snooping statistics Output Fields *(continued)*

Field Name	Field Description
Number of UDA	Number of unicast discovery advertisement messages sent on the VLAN.
Number of FLOGI_ACC	Number of fabric logins accepted on the VLAN.
Number of FLOGI_RJT	Number of fabric logins rejected on the VLAN.
Number of FDISC_ACC	Number of fabric discoveries accepted on the VLAN.
Number of FDISC_RJT	Number of fabric discoveries rejected on the VLAN.
Number of LOGO_ACC	Number of fabric logouts accepted on the VLAN.
Number of LOGO_RJT	Number of fabric logouts rejected on the VLAN.
Number of CVL	Number of clear virtual links (CVL) actions on the VLAN.

Sample Output

show fip snooping statistics

```
user@switch> show fip snooping statistics
VLAN: fcoevlan1

    Number of MDS:               2
    Number of UDS:               2
    Number of FLOGI:             2
    Number of FDISC:             2
    Number of LOGO:              0
    Number of Enode-keep-alive:  200
    Number of VNPort-keep-alive: 200

    Number of MDA:               25
    Number of UDA:               2

PART 12

MPLS

CHAPTER 70

MPLS—Overview

Junos OS MPLS for J-EX Series Switches Overview

You can configure Junos OS MPLS on J-EX Series Switches to increase transport efficiency in the network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as voice over IP (VoIP) and other business-critical functions.

NOTE: MPLS configurations on J-EX Series switches are compatible with configurations on other devices running JUNOS Software that support MPLS and MPLS-based circuit cross-connect (CCC). MPLS features available on the switches depend upon which switch you are using. For a complete list of the Junos OS MPLS features that are supported on specific switches, see the J-EX Series Switch software features overview information in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

NOTE: MPLS configurations on the switches do not support:

- Routed VLAN interfaces (RVIs)
- Q-in-Q tunneling

This topic describes:

Benefits of MPLS

MPLS has the following advantages over conventional packet forwarding:

- Packets arriving on different ports can be assigned different labels.
- A packet arriving at a particular provider edge (PE) switch can be assigned a label that is different from that of the same packet entering the network at a different PE switch. As a result, forwarding decisions that depend on the ingress PE switch can be easily made.
- Sometimes it is desirable to force a packet to follow a particular route that is explicitly chosen at or before the time the packet enters the network, rather than letting it follow the route chosen by the normal dynamic routing algorithm as the packet travels through the network. In MPLS, a label can be used to represent the route so that the packet need not carry the identity of the explicit route.

Additional Benefits of MPLS and Traffic Engineering

MPLS is the packet-forwarding component of the Junos OS traffic engineering architecture. Traffic engineering provides the capabilities to do the following:

- Route primary paths around known bottlenecks or points of congestion in the network.
- Provide precise control over how traffic is rerouted when the primary path is faced with single or multiple failures.
- Provide efficient use of available aggregate bandwidth and long-haul fiber by ensuring that certain subsets of the network are not overutilized while other subsets of the network along potential alternate paths are underutilized.
- Maximize operational efficiency.
- Enhance the traffic-oriented performance characteristics of the network by minimizing packet loss, minimizing prolonged periods of congestion, and maximizing throughput.
- Enhance statistically bound performance characteristics of the network (such as loss ratio, delay variation, and transfer delay) required to support a multiservice Internet.

Understanding Junos OS MPLS Components for J-EX Series Switches

Junos OS MPLS for J-EX Series Switches includes a number of components. Some components are required for all MPLS implementations and other components are required or not depending on the specific implementation or the specific switch. For a complete list of the Junos OS MPLS features that are supported on specific J-EX Series switches, see the J-EX Series software features overview information in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

This topic includes:

Provider Edge Switches

To implement MPLS on the switches, you must configure two provider edge (PE) switches—that is, an ingress (local) PE switch and an egress (remote) PE switch.

The ingress PE switch (the entry point to the MPLS tunnel) receives a packet, analyzes it, and pushes an MPLS label onto it. This label places the packet in a forwarding equivalence class (FEC) and determines its handling and destination through the MPLS

tunnel. The egress PE switch (the exit point from the MPLS tunnel) pops the MPLS label off the outgoing packet.

MPLS traffic is bidirectional. Therefore, each PE switch can be configured to be both an ingress switch and an egress switch, depending on the direction of the traffic.

The following MPLS components are configured on the PE switches but not on the provider switches:

MPLS Protocol and Label-Switched Paths

Each PE switch must be configured to support the MPLS protocol. The configuration of a label-switched path (LSP) depends upon which signaling protocol is used:

- If the RSVP signaling protocol is used, the LSPs must be explicitly configured at the [edit protocols mpls] hierarchy level.
- If the LDP signaling protocol is used, LSP configuration is not required. (LDP signaling is used with Layer 2 circuit configurations.)

Circuit Cross-Connect for Customer Edge Interfaces

You can configure the customer edge interface of the PE switches as a circuit cross-connect (CCC) to create a transparent connection between two circuits. When you configure an interface as a CCC, the interface no longer belongs to a **default** VLAN if it was a member of that VLAN. The interface becomes an MPLS tunnel—used exclusively for MPLS packets. You can create different CCCs for different customers or for segregating different traffic streams over different MPLS tunnels.

Using a CCC configuration, you can connect the following types of circuits:

- Local interface with remote interface or VLAN
- Local VLAN with remote interface or VLAN

NOTE: **To configure a VLAN circuit as a CCC, you must enable VLAN tagging and specify a VLAN ID.**

MPLS on J-EX Series switches does not support the following types of CCC configurations:

- Routed VLAN interfaces (RVIs)
- Q-in-Q tunneling

On J-EX8200 switches only, the following types of CCC configurations are supported:

- Local switching—Connecting interfaces on the same switch
- MPLS tunneling—Using LSPs as the conduit to connect two distant interface circuits
- LSP stitching—Connecting LSPs that fall into two different traffic engineering database areas

IP Over MPLS for Customer Edge Interfaces

You can configure the customer edge interfaces of the PE switches for IP over MPLS using a Layer 3 interface and a static route from the ingress PE switch to the egress PE switch. See "Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)" on page 2206.

BGP for Layer 2 VPN and Layer 3 VPN Configurations (J-EX8200 Switches Only)

If you are implementing a Layer 2 virtual private network (VPN) or a Layer 3 VPN, you must configure the BGP routing protocol on the PE switches.

Routing Instances for Layer 2 VPN and Layer 3 VPN (J-EX8200 Switches Only)

If you are implementing a Layer 2 virtual private network (VPN) or a Layer 3 VPN, you must configure a routing instance. A routing instance is a collection of routing tables, interfaces, and routing protocol parameters. The set of interfaces belongs to the routing tables, and the routing protocol parameters control the information in the routing tables. J-EX Series switches support the following types of routing instances:

- Layer 2 virtual private network (VPN)—To support a Layer 2 VPN.
- VPN routing and forwarding (VRF)—To support a Layer 3 VPN

Each routing instance has a unique name and a corresponding IP unicast table. For example, if you configure a routing instance with the name **my-instance**, its corresponding IP unicast table will be **my-instance.inet.0**. All routes for **my-instance** are installed in **my-instance.inet.0**.

Ethernet Encapsulation for Layer 2 VPN (J-EX8200 Switches Only)

If you are implementing a Layer 2 VPN, you must also configure the physical layer encapsulation type on the customer edge interface and within the routing instance.

LDP for Layer 2 Circuits (J-EX8200 Switches Only)

If you are implementing a Layer 2 circuit configuration, you must configure LDP as the signaling protocol on the PE switches. The configuration of an MPLS-based Layer 2 circuit on the switch is the same as it is for the routers. See the*Junos OS VPNs Configuration Guide*.

Provider Switch

You must configure one or more provider switches as transit switches within the network to support the forwarding of MPLS packets. You can add provider switches without changing the configuration of the PE switches.

A provider switch does not analyze the packets. It refers to an MPLS label forwarding table and swaps one label for another. The new label determines the next hop along the MPLS tunnel. A provider switch cannot perform push or pop operations.

Components Required for All Switches in the MPLS Network

The following MPLS components are configured on both the PE switches and the provider switches:

- Routing Protocol on page 2132
- Traffic Engineering on page 2132
- MPLS Protocol on page 2133
- RSVP on page 2133
- LDP on page 2133
- Family mpls on page 2134

Routing Protocol

MPLS works in coordination with the interior gateway protocol (IGP). Therefore, you must configure OSPF or IS-IS as the routing protocol on the loopback interface and core interfaces of both the PE switches and the provider switches.

The core interfaces can be either Gigabit Ethernet or 10-Gigabit Ethernet interfaces, and they can be configured as either individual interfaces or aggregated Ethernet interfaces.

NOTE: **These core interfaces cannot be configured with VLAN tagging or a VLAN ID. When you configure them to belong to family mpls, they are removed from the default VLAN if they were members of that VLAN. They operate as an exclusive tunnel for MPLS traffic.**

Traffic Engineering

Traffic engineering maps traffic flows onto an existing physical topology and provides the ability to move traffic flow away from the shortest path selected by the IGP and to a potentially less congested physical path across a network.

Traffic engineering enables the selection of specific end-to-end paths to send given types of traffic through your network. The configuration of traffic engineering depends upon which routing protocol is being used:

- With OSPF—Traffic engineering needs to be enabled.
- With IS-IS—Traffic engineering is enabled by default.

MPLS Protocol

You must enable the MPLS protocol on all switches that participate in the MPLS network and apply it to the core interfaces of both the provider edge and provider switches. You do not need to apply it to the loopback interface, because the MPLS protocol uses the framework established by the signaling protocol to create LSPs. On the provider edge switches, the configuration of the MPLS protocol must also include the definition of an LSP.

RSVP

RSVP is a signaling protocol that allocates and distributes labels throughout an MPLS network. RSVP sets up unidirectional paths between the ingress provider edge (PE) switch and the egress PE switch. RSVP makes the LSPs dynamic; it can detect topology changes and outages and establish new LSPs to allow traffic to move around a failure.

You must enable RSVP and apply it to the loopback interface and the core interface of both the PE and provider switches. The path message contains the configured information about the resources required for the LSP to be established.

When the egress switch receives the path message, it sends a reservation message back to the ingress switch. This reservation message is passed along from switch to switch along the same path as the original path message. Once the ingress switch receives this reservation message, an RSVP path is established.

The established LSP stays active as long as the RSVP session remains active. RSVP continues activity through the transmissions and responses to RSVP path and reservation messages. If the messages stop for three minutes, the RSVP session terminates and the LSP is lost.

RSVP runs as a separate software process in the Junos operating system (Junos OS) and is not in the packet-forwarding path.

LDP

LDP is a signaling protocol available on J-EX8200 switches only. LDP is a simple, fast-acting signaling protocol that automatically establishes LSP adjacencies within an MPLS network. Switches then share LSP updates such as hello packets and LSP advertisements across the adjacencies.

Because LDP runs on top of an interior gateway protocol (IGP) such as IS-IS or OSPF, you must configure LDP and the IGP on the same set of interfaces. After both are configured, LDP begins transmitting and receiving LDP messages through all LDP-enabled interfaces. Because of LDP's simplicity, it cannot perform true traffic engineering like RSVP. LDP does not support bandwidth reservation or traffic constraints.

NOTE: **LDP can be used with basic MPLS or with MPLS and a Layer 2 circuit configuration.**

Family mpls

You must configure the core interfaces used for MPLS traffic to belong to **family mpls**.

NOTE: You can enable family mpls on either individual interfaces or on aggregated Ethernet interfaces. You cannot enable it on tagged VLAN interfaces.

Understanding MPLS and Path Protection on J-EX Series Switches

Junos OS MPLS for J-EX Series Switches provides path protection to protect your MPLS network from label switched path (LSP) failures.

By default, an LSP routes itself hop-by-hop from the ingress provider edge switch through the provider switches toward the egress provider edge switch. The LSP generally follows the shortest path as dictated by the local routing table, usually taking the same path as destination-based, best-effort traffic. These paths are “soft” in nature because they automatically reroute themselves whenever a change occurs in a routing table or in the status of a node or link.

Typically, when an LSP fails, the switch immediately upstream from the failure signals the outage to the ingress provider edge switch. The ingress provider edge switch calculates a new path to the egress provider edge switch, establishes the new LSP, and then directs traffic from the failed path to the new path. This rerouting process can be time-consuming and prone to failure. For example, the outage signals to the ingress switch might get lost or the new path might take too long to come up, resulting in significant packet drops.

You can configure path protection by configuring primary and secondary paths on the ingress switch. If the primary path fails, the ingress switch immediately reroutes traffic from the failed path to the standby path, eliminating the need for the ingress switch to calculate a new route and signal a new path. For information about configuring standby LSPs, see “Configuring Path Protection in an MPLS Network (CLI Procedure)” on page 2197.

Understanding Using CoS with MPLS Networks on J-EX Series Switches

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. For a complete list of the Junos OS MPLS features that are supported on specific J-EX Series switches, see the J-EX Series software features overview information in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

J-EX Series Switches support Differentiated Service Code Point (DSCP) or IP precedence and IEEE 802.1p CoS classifiers on the customer-edge interfaces of the ingress provider edge (PE) switch. DSCP or IP precedence classifiers are used for Layer 3 packets. IEEE 802.1p is used for Layer 2 packets.

When a packet enters a customer-edge interface of the ingress PE switch, the switch associates the packet with a particular CoS servicing level prior to putting the packet onto the label-switched path (LSP). The switches within the LSP utilize the CoS value set at the ingress PE switch. The CoS value that was embedded in the DSCP, IP precedence, or IEEE 802.1 p classifier is translated and encoded in the MPLS header by means of the EXP or experimental bits.

J-EX Series switches enable a default EXP classifier and a default EXP rewrite rule. You can configure a custom EXP classifier and a custom EXP rewrite rule if you prefer. However, the switch supports only one type of EXP classifier (default or custom) and only one EXP rewrite rule (default or custom).

You do not bind the EXP classifier or the EXP rewrite rule to individual interfaces. The switch automatically and implicitly applies the default or the custom EXP classifier and the default or the custom EXP rewrite rule to the appropriate MPLS-enabled interfaces. Because rewrite rules affect only egress interfaces, the switch applies the EXP rewrite rule only to those MPLS interfaces that are transmitting MPLS packets (not to the MPLS interfaces that are receiving the packets).

This topic includes:

Guidelines for Using CoS Classifiers on CCCs

When you are configuring CoS for MPLS over circuit cross-connect (CCC), there are some additional guidelines, as follows:

- You *must* explicitly bind a CoS classifier to the CCC interface on the ingress PE switch.
- You *cannot* use more than one type of DSCP/IP precedence and not more than one type of IEEE 802.1p classifier on the CCC interfaces. Thus, if you configure one CCC interface to use DSCP1, you cannot configure another CCC interface to use DSCP2. Likewise, if you configure one CCC interface to use IEEE1, you cannot configure another CCC interface on the same switch to use IEEE2. All the CCC interfaces on the switch must use the same DSCP classifier and the same type of IEEE 802.1p classifier.
- You *cannot* configure one CCC interface as DSCP and another CCC interface as IP precedence, because these classifier types overlap.
- You *can* configure one CCC interface as DSCP and another CCC interface as IEEE 802.1p.
- You *can* configure one CCC interface as both DSCP and IEEE 802.1p. If you configure a CCC interface with both these classifiers, the DSCP classifier is used for routing Layer 3 packets and the IEEE 802.1p classifier is used for routing Layer 2 packets.

NOTE: **You can define multiple types of DSCP, IP precedence, and IEEE 802.1p on the switch and use the different classifier types for the non-CCC interfaces on the switch.**

Using CoS Classifiers with IP over MPLS

When you are configuring CoS for IP over MPLS, the customer-edge interface uses the CoS configuration that has been set up for the switch as the default. You do not have to bind a classifier to the customer-edge interface in this case. There are no restrictions regarding using multiple types of DSCP, IP precedence, and IEEE 802.1p on the same switch.

- You can modify the CoS classifier for a particular interface, but it is not required.
- You can configure one interface as DSCP1 and another as DSCP2 and another and IP precedence, and so forth.

Default Classifiers and Default Rewrite Rules

The default classifiers support only two forwarding classes, **best-effort** and **network-control**, and use only two queues, **0** and **7**. However, J-EX Series switches support up to sixteen forwarding classes and eight queues. To use the additional forwarding classes and queues, create a custom classifier. To modify the code point and loss priority for a specific forwarding class, configure a rewrite rule on the switch. The default rewrite rule for EXP is enabled in the default configuration. However, the default rewrite rules for the other classifiers are not enabled in the default configuration. You can display the

default classifier mappings and default rewrite mappings by entering the **show class-of-service** command on the switch.

EXP Rewrite Rules

When traffic passes from the customer-edge interface to an MPLS interface, the DSCP, IP precedence, or IEEE 802.1p CoS classifier is translated into the EXP bits within the MPLS header. You cannot disable the default EXP rewrite rule, but you can configure your own custom EXP classifier and a custom EXP rewrite rule. You cannot bind the EXP classifier to individual MPLS interfaces; the switch applies it globally to all the MPLS-enabled interfaces on the switch.

Only one EXP rewrite rule (either default or custom) is supported on a switch. The switch applies it to all the MPLS-enabled egress interfaces.

Policer

Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. During periods of congestion (when the total rate of queuing packets exceeds the rate of transmission), any new packets being sent to an interface can be dropped because there is no place to store them. You should configure a policer on the ingress PE switch:

- If you are using MPLS with CCC, you bind the policer to the LSP. You cannot bind a policer to a CCC interface.
- If you are using IP over MPLS, you bind the policer to the **inet-family** customer-edge interface. You cannot bind a policer to the LSP when you are using IP over MPLS.

Schedulers

The schedulers for using CoS with MPLS are the same as for the other CoS configurations on J-EX Series switches. Default schedulers are provided for **best-effort** and **network-control** forwarding classes. If you are using **assured-forwarding**, **expedited-forwarding**, or other custom forwarding classes, we recommend that you configure a scheduler to support that forwarding class. See “Understanding CoS Schedulers” on page 1868.

Understanding MPLS Label Operations on J-EX Series Switches

In the traditional packet-forwarding paradigm, as a packet travels from one switch to the next, an independent forwarding decision is made at each hop. The IP network header is analyzed and the next hop is chosen based on this analysis and on the information in the routing table. In an MPLS environment, the analysis of the packet header is made only once, when a packet enters the MPLS tunnel (that is, the path used for MPLS traffic).

When an IP packet enters a label-switched path (LSP), the ingress provider edge (PE) switch examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. The packet is then forwarded to the next provider switch in the LSP. This switch and all subsequent switches in the LSP do not examine any of the IP routing information in the labeled packet. Rather, they use the label to look up information in their label forwarding table. They then replace the old label with a new label and forward the packet to the next switch in the path. When the packet reaches the egress PE switch, the label is removed, and the packet again becomes a native IP packet and is again forwarded based on its IP routing information.

This topic describes:

- MPLS Label-Switched Paths and MPLS Labels on the Switches on page 2138
- Reserved Labels on page 2139
- MPLS Label Operations on the Switches on page 2139
- Penultimate-Hop Popping and Ultimate-Hop Popping on page 2140

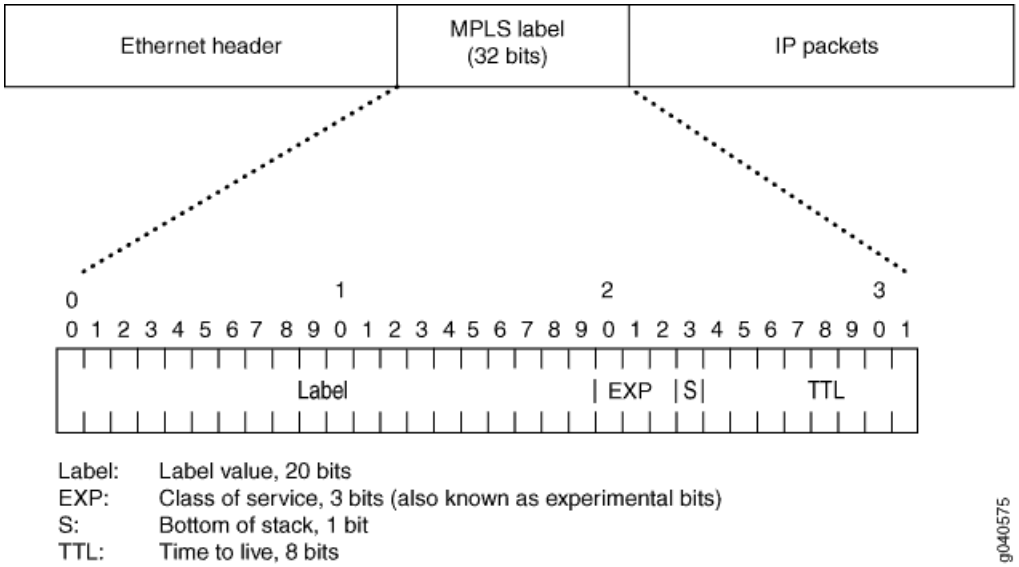
MPLS Label-Switched Paths and MPLS Labels on the Switches

When a packet enters the MPLS network, it is assigned to an LSP. Each LSP is identified by a label, which is a short (20-bit), fixed-length value at the front of the MPLS label (32 bits). Labels are used as lookup indexes for the label forwarding table. For each label, this table stores forwarding information. Because no additional parsing or lookup is done on the encapsulated packet, MPLS supports the transmission of any other protocols within the packet payload.

NOTE: **The implementation of MPLS on J-EX4200 Ethernet Switches supports only single-label packets. However, MPLS on J-EX8200 Ethernet Switches supports packets with as many as three labels.**

Figure 62 on page 2139 shows the encoding of a single label. The encoding appears after data link layer headers, but before any network layer header.

Figure 62: Label Encoding



Reserved Labels

Labels range from 0 through 1,048,575. Labels 0 through 999,999 are for internal use.

Some of the reserved labels (in the range 0 through 15) have well-defined meanings. The following reserved labels are used by the switches:

- 0, IPv4 Explicit Null label—This value is valid only when it is the sole label entry (no label stacking). It indicates that the label must be popped on receipt. Forwarding continues based on the IP version 4 (IPv4) packet.
- 1, Router Alert label—When a packet is received with a top label value of 1, it is delivered to the local software module for processing.
- 2, IPv6 Explicit Null label—This value is legal only when it is the sole label entry (no label stacking). It indicates that the label must be popped on receipt.
- 3, Implicit Null label—This label is used in the signaling protocol (RSVP) only to request label popping by the downstream switch. It never actually appears in the encapsulation. Labels with a value of 3 must not be used in the data packet as real labels. No payload type (IPv4 or IPv6) is implied with this label.

MPLS Label Operations on the Switches

J-EX Series switches support the following label operations:

- Push
- Pop
- Swap

The push operation affixes a new label to the top of the IP packet. For IPv4 packets, the new label is the first label. The time to live (TTL) field value in the packet header is derived

from the IP packet header. The push operation cannot be applied to a packet that already has an MPLS label.

The pop operation removes a label from the beginning of the packet. Once the label is removed, the TTL is copied from the label into the IP packet header, and the underlying IP packet is forwarded as a native IP packet

The swap operation removes an existing MPLS label from an IP packet and replaces it with a new MPLS label, based on the following:

- Incoming interface
- Label
- Label forwarding table

Figure 63 on page 2140 shows an IP packet without a label arriving on the customer edge interface (**ge-0/0/1**) of the ingress PE switch. The ingress PE switch examines the packet and identifies that packet's destination as the egress PE switch. The ingress PE switch applies label 100 to the packet and sends the MPLS packet to its outgoing MPLS core interface (**ge-0/0/5**). The MPLS packet is transmitted on the MPLS tunnel through the provider switch, where it arrives at interface **ge-0/0/5** with label 100. The provider switch swaps label 100 to label 200 and forwards the MPLS packet through its core interface (**ge-0/0/7**) to the next hop on the tunnel, which is the egress PE switch. The egress PE switch receives the MPLS packet through its core interface (**ge-0/0/7**), removes the MPLS label, and sends the IP packet out of its customer edge interface (**ge-0/0/1**) to a destination that is beyond the tunnel.

Figure 63: MPLS Label Swapping

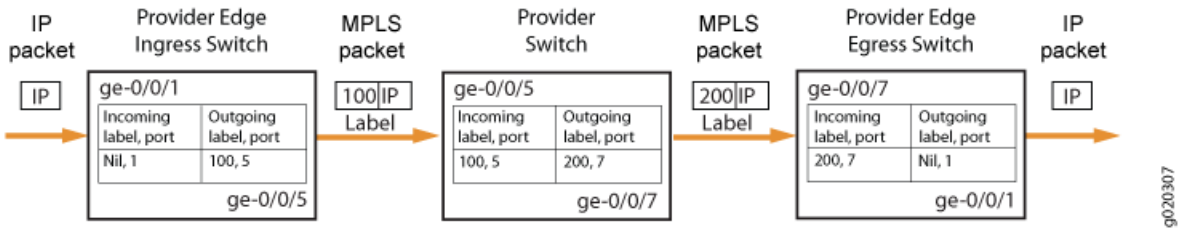


Figure 63 on page 2140 shows the path of a packet as it passes in one direction from the ingress PE switch to the egress PE switch. However, the MPLS configuration also allows traffic to travel in the reverse direction. Thus, each PE switch operates as both an ingress switch and an egress switch.

Penultimate-Hop Popping and Ultimate-Hop Popping

The switches enable penultimate-hop popping (PHP) by default with IP over MPLS configurations. With PHP, the penultimate provider switch is responsible for popping the MPLS label and forwarding the traffic to the egress PE switch. The egress PE switch then performs an IP route lookup and forwards the traffic. This reduces the processing load on the egress PE switch, because it is not responsible for popping the MPLS label.

On J-EX8200 switches, you can choose to use either the default, PHP, or to configure ultimate-hop popping.

- The default advertised label is label 3 (Implicit Null label). If label 3 is advertised, the penultimate-hop switch removes the label and sends the packet to the egress PE switch.
- If ultimate-hop popping is enabled, label 0 (IPv4 Explicit Null label) is advertised and the egress PE switch of the LSP removes the label.

Understanding Using MPLS-Based Layer 2 and Layer 3 VPNs on J-EX Series Switches

On J-EX8200 switches, you can use MPLS-based Layer 2 and Layer 3 virtual private networks (VPNs) or MPLS Layer 2 circuits, allowing you to securely connect geographically diverse sites across an MPLS network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as voice over IP (VoIP) and other business-critical functions.

A VPN uses a public telecommunications infrastructure, such as the Internet, to provide remote offices or individual users with secure access to their organization's network. VPNs are designed to provide the same level of performance and security as privately owned or leased networks but without the attendant costs.

This topic describes:

- MPLS-Based Layer 2 VPNs on page 2141
- Layer 2 Circuits on page 2142
- MPLS-Based Layer 3 VPNs on page 2143
- Comparing an MPLS-Based Layer 3 VPN and an MPLS-Based Layer 2 VPN on page 2143

MPLS-Based Layer 2 VPNs

In an MPLS-based Layer 2 VPN, traffic is forwarded by the customer's customer edge (CE) switch (or router) to the service provider's provider edge (PE) switch in a Layer 2 format. It is carried by MPLS over the service provider's network and then converted back to Layer 2 format at the receiving site.

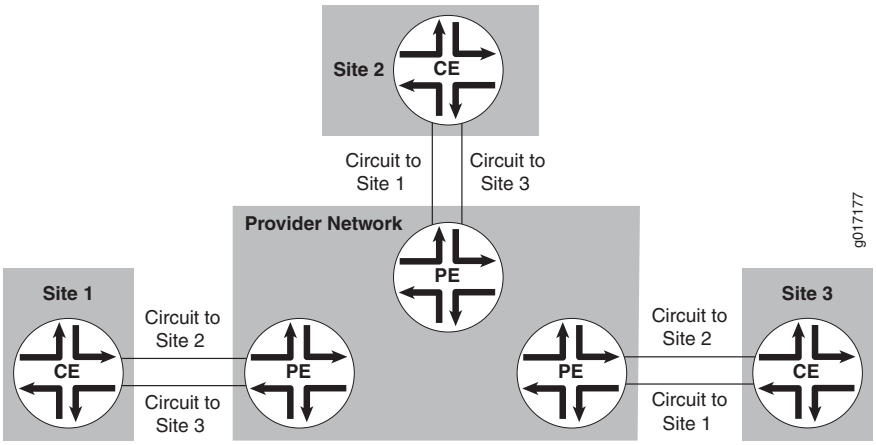
On a Layer 2 VPN, routing occurs on the customer's switches, typically on the CE switch. The CE switch connected to a service provider on a Layer 2 VPN must select the

appropriate circuit on which to send traffic. The PE switch receiving the traffic sends it across the service provider's network to the PE switch connected to the receiving site. The PE switches do not store or process the customer's routes; the switches must be configured to send data to the appropriate tunnel.

For a Layer 2 VPN, customers must configure their own switches to carry all Layer 3 traffic. The service provider must detect only how much traffic the Layer 2 VPN will need to carry. The service provider's switches carry traffic between the customer's sites using Layer 2 VPN interfaces. The VPN topology is determined by policies configured on the PE switches.

Customers must know only which VPN interfaces connect to which of their own sites. Figure 64 on page 2142 illustrates a full-mesh Layer 2 VPN in which each site has a VPN interface linked to each of the other customer sites. In a full-mesh topology between all three sites, each site requires two logical interfaces (one for each of the other CE routers or switches), although only one physical link is needed to connect each PE switch to each CE router or switch.

Figure 64: Layer 2 VPN Connecting CE Switches



Layer 2 Circuits

A Layer 2 circuit is a point-to-point Layer 2 connection that uses MPLS or another tunneling technology on the service provider's network. A Layer 2 circuit is similar to a circuit cross-connect (CCC), except that multiple Layer 2 circuits can be transported over a single label-switched path (LSP) tunnel between two provider edge (PE) switches. In contrast, each CCC requires a dedicated LSP.

The Junos OS implementation of Layer 2 circuits supports only the remote form of a Layer 2 circuit; that is, a connection from a local customer edge (CE) switch to a remote CE switch.

Packets are sent to the remote CE switch by means of an egress virtual private network (VPN) label advertised by the remote PE switch. The VPN label transits over either an RSVP or an LDP LSP (or other type) tunnel to the remote PE switch connected to the remote CE switch. LDP is the signaling protocol used for advertising VPN labels.

Return traffic sent from the remote CE switch to the local CE switch uses an ingress VPN label advertised by the local PE switch.

MPLS-Based Layer 3 VPNs

In Junos OS, Layer 3 VPNs are based on RFC 4364, *BGP/MPLS IP Virtual Private Networks*. RFC 4364 defines a mechanism by which service providers can use their IP backbones to provide VPN services to their customers. A Layer 3 VPN is a set of sites that share common routing information and whose connectivity is controlled by a collection of policies. The sites that make up a Layer 3 VPN are connected over a provider's existing public Internet backbone.

Customer networks, because they are private, can use either public or private addresses, as defined in RFC 1918, *Address Allocation for Private Internets*. When customer networks that use private addresses connect to the public Internet infrastructure, the private addresses might overlap with the same private addresses used by other network users. BGP/MPLS VPNs solve this problem by adding a VPN identifier prefix to each address from a particular VPN site, thereby creating an address that is unique both within the VPN and on the public Internet. In addition, each VPN has its own VPN-specific routing table that contains the routing information for that VPN only. Two different VPNs can use overlapping addresses. Each route within a VPN is assigned an MPLS label (for example, MPLS-ARCH, MPLS-BGP, or MPLS-ENCAPS). When BGP distributes a VPN route, it also distributes an MPLS label for that route. Before a customer data packet travels across the service provider's backbone, it is encapsulated along with the MPLS label that corresponds to the route within the customer's VPN that is the best match based on the packet's destination address. This MPLS packet is further encapsulated with another MPLS label or with an IP, so that it gets tunneled across the backbone to the egress provider edge (PE) switch. Thus, the backbone core switches do not need to know the VPN routes.

Comparing an MPLS-Based Layer 3 VPN and an MPLS-Based Layer 2 VPN

J-EX8200 switches can support the following kinds of MPLS-based VPNs:

- Layer 3 VPNs—The service provider participates in the customer's Layer 3 routing. Layer 3 VPNs allow customers to leverage the service provider's technical expertise to ensure efficient site-to-site routing. The customer's CE switch uses a routing protocol such as BGP or OSPF to communicate with the provider's PE switch to carry IP prefixes across the network. MPLS-based Layer 3 VPNs use IP over MPLS. Other protocol packets are not supported.
- Layer 2 VPNs—The service provider interconnects customer sites using Layer 2 technology. Layer 2 VPNs give customers complete control over their own routing.

NOTE: You can configure an MPLS-based Layer 3 VPN and an MPLS-based Layer 2 VPN on the same switch. However, you cannot configure the MPLS-based Layer 3 VPN and the MPLS-based Layer 2 VPN on the same interface.

CHAPTER 71

Examples of MPLS Configuration

Example: Configuring MPLS on J-EX Series Switches

You can configure MPLS on J-EX Series switches to increase transport efficiency in your network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as voice over IP (VoIP) and other business-critical functions. To implement MPLS on the switches, you must configure two provider edge (PE) switches—an ingress PE switch and an egress PE switch— and at least one provider (transit) switch. You can configure the customer edge (CE) interfaces on the PE switches of the MPLS network as either circuit cross-connect (CCC) or IP (**family inet**) interfaces. This example shows how to configure an MPLS tunnel using a CCC:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Three J-EX Series switches

Before you begin configuring MPLS, ensure that you have configured the routing protocol (OSPF or IS-IS) on the core interface and the loopback interface on all the switches. This example includes the configuration of OSPF on all the switches. For information on

configuring IS-IS as the routing protocol, see the *Junos OS Routing Protocols Configuration Guide*.

Overview and Topology

This example includes an ingress or local PE switch, an egress or remote PE switch, and one provider switch. It includes CCCs that tie the customer edge interface of the local PE switch (PE-1) to the customer edge interface of the remote PE switch (PE-2). It also describes how to configure the core interfaces of the PE switches and the provider switch to support the transmission of the MPLS packets. In this example, the core interfaces that connect the local PE switch and the provider switch are individual interfaces, while the core interfaces that connect the remote PE switch and the provider switch are aggregated Ethernet interfaces.

NOTE:

- Core interfaces cannot be tagged VLAN interfaces.
- Core interfaces can be aggregated Ethernet interfaces. This example includes a LAG between the provider switch and the remote PE switch because this type of configuration is another option you can implement. For information on configuring LAGs, see Configuring Aggregated Ethernet Interfaces (CLI Procedure).

Figure 65 on page 2147 shows the topology used in this example.

Figure 65: Configuring MPLS on J-EX Series Switches

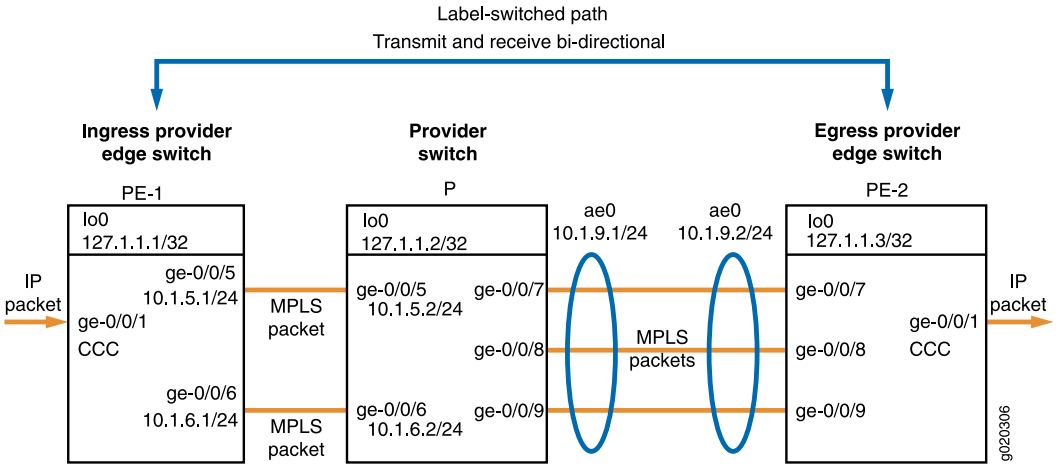

Table 274 on page 2148 shows the MPLS configuration components used for the ingress PE switch in this example.

Table 274: Components of the Ingress PE Switch in the Topology for MPLS with Interface-Based CCC

Property	Settings	Description
Local PE switch hardware	J-EX Series switch	PE-1
Loopback address	**lo0 127.1.1.1/32**	Identifies PE-1 for interswitch communications.
Routing protocol	**ospf traffic-engineering**	Indicates that this switch is using OSPF as the routing protocol and that traffic engineering is enabled.
MPLS protocol and definition of label-switched path	**mpls** **label-switched-path lsp_to_pe2_ge1** **to 127.1.13**	Indicates that this PE switch is using the MPLS protocol with the specified LSP to reach the other PE switch (specified by the loopback address). The statement must also specify the core interfaces to be used for MPLS traffic.
RSVP	**rsvp**	Indicates that this switch is using RSVP. The statement must specify the loopback address and the core interfaces that will be used for the RSVP session.
Interface family	**family inet** **family mpls** **family ccc**	The logical units of the core interfaces are configured to belong to both **family inet** and **family mpls**. The logical unit of the customer edge interface is configured to belong to **family ccc**.
Customer edge interface	**ge-0/0/1**	Interface that connects this network to devices outside the network.
Core interfaces	**ge-0/0/5.0** and **ge-0/0/6.0** with IP addresses **10.1.5.1/24** and **10.1.6.1/24**	Interfaces that connect to other switches within the MPLS network.
CCC definition	**connections** **remote-interface-switch ge-1-to-pe2** **interface ge-0/0/1.0** **transmit-lsp lsp_to_pe2_ge1** **receive-lsp lsp_to_pe1_ge1**	Associates the circuit cross-connect (CCC), **ge-0/0/1**, with the LSPs that have been defined on the local and remote PE switches.

Table 275 on page 2149 shows the MPLS configuration components used for the egress PE switch in this example.

Table 275: Components of the Egress PE Switch in the Topology for MPLS with Interface-Based CCC

Property	Settings	Description
Remote PE switch hardware	J-EX Series switch	PE-2
Loopback address	**lo0 127.1.1.3/32**	Identifies PE-2 for interswitch communications.
Routing protocol	**ospf traffic-engineering**	Indicates that this switch is using OSPF as the routing protocol and that traffic engineering is enabled.
MPLS protocol and definition of label-switched path	**mpls** **label-switched-path lsp_to_pe1_ge1** **to 127.1.1.1**	Indicates that this PE switch is using the MPLS protocol with the specified label-switched path (LSP) to reach the other PE switch. The statement must also specify the core interfaces to be used for MPLS traffic.
RSVP	**rsvp**	Indicates that this switch is using RSVP. The statement must specify the loopback address and the core interfaces that will be used for the RSVP session.
Interface family	**family inet** **family mpls** **family ccc**	The logical unit of the core interface is configured to belong to both **family inet** and **family mpls**. The logical unit of the customer edge interface is configured to belong to **family ccc**.
Customer edge interface	**ge-0/0/1**	Interface that connects this network to devices outside the network.
Core interface	**ae0** with IP address **10.1.9.2/24**	Aggregated Ethernet interface on PE-2 that connects to aggregated Ethernet interface **ae0** of the provider switch and belongs to **family mpls**.
CCC definition	**connections remote-interface-switch ge-1-to-pe1** **interface ge-0/0/1.0** **transmit-lsp lsp_to_pe1_ge1;** **receive-lsp lsp_to_pe2_ge1;**	Associates the CCC, **ge-0/0/1**, with the LSPs that have been defined on the local and remote PE switches.

Table 276 on page 2150 shows the MPLS configuration components used for the provider switch in this example.

Table 276: Components of the Provider Switch in the Topology for MPLS with Interface-Based CCC

Property	Settings	Description
Provider switch hardware	J-EX Series switch	Transit switch within the MPLS network configuration.
Loopback address	**lo0 127.1.1.2/32**	Identifies provider switch for interswitch communications.
Routing protocol	**ospf traffic-engineering**	Indicates that this switch is using OSPF as the routing protocol and that traffic engineering is enabled.
MPLS protocol	**mpls**	Indicates that this switch is using the MPLS protocol. The statement must specify the core interfaces that will be used for MPLS traffic.
RSVP	**rsvp**	Indicates that this switch is using RSVP. The statement must specify the loopback and the core interfaces that will be used for the RSVP session.
Interface family	**family inet** **family mpls**	The logical units for the loopback interface and the core interfaces belong to **family inet**. The logical units of the core interfaces are also configured to belong to **family mpls**.
Core interfaces	**ge-0/0/5.0** and **ge-0/0/6.0** with IP addresses **10.1.5.1/24** and **10.1.6.1/24** and **ae0** with IP address **10.1.9.1/24**	Interfaces that connect the provider switch (P) to PE-1. Aggregated Ethernet interface on P that connects to aggregated Ethernet interface **ae0** of PE-2.

Configuring the Local PE Switch

CLI Quick Configuration

To quickly configure the local ingress PE switch, copy the following commands and paste them into the switch terminal window of PE-1:

```
[edit]
set protocols ospf traffic-engineering
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ge-0/0/5.0
set protocols ospf area 0.0.0.0 interface ge-0/0/6.0
set protocols mpls label-switched-path lsp_to_pe2_ge1 to 127.1.1.3
set protocols mpls interface ge-0/0/5.0
```

```
set protocols mpls interface ge-0/0/6.0
set protocols rsvp interface lo0.0
set protocols rsvp interface ge-0/0/5.0
set protocols rsvp interface ge-0/0/6.0
set interfaces lo0 unit 0 family inet address 127.1.1.1/32
set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
set interfaces ge-0/0/5 unit 0 family mpls
set interfaces ge-0/0/6 unit 0 family mpls
set interfaces ge-0/0/1 unit 0 family ccc
set protocols connections remote-interface-switch ge-1-to-pe2 interface ge-0/0/1.0
set protocols connections remote-interface-switch ge-1-to-pe2 transmit-lsp lsp_to_pe2_ge1
set protocols connections remote-interface-switch ge-1-to-pe2 receive-lsp lsp_to_pe1_ge1
```

Step-by-Step Procedure

To configure the local ingress PE switch:

1. Configure OSPF with traffic engineering enabled:

   ```
   [edit protocols]
   user@switchPE-1# set ospf traffic-engineering
   ```

2. Configure OSPF on the loopback address and the core interfaces:

   ```
   [edit protocols]
   user@switchPE-1# set ospf area 0.0.0.0 interface lo0.0
   user@switchPE-1# set ospf area 0.0.0.0 interface ge-0/0/5.0
   user@switchPE-1# set ospf area 0.0.0.0 interface ge-0/0/6.0
   ```

3. Configure MPLS on the local switch with a label-switched path (LSP) to the remote egress PE switch:

   ```
   [edit protocols]
   user@switchPE-1# set mpls label-switched-path lsp_to_pe2_ge1 to 127.1.1.3
   ```

4. Configure MPLS on the core interfaces:

   ```
   [edit protocols]
   user@switchPE-1# set mpls interface ge-0/0/5.0
   user@switchPE-1# set mpls interface ge-0/0/6.0
   ```

5. Configure RSVP on the loopback interface and the core interfaces:

   ```
   [edit protocols]
   user@switchPE-1# set rsvp interface lo0.0
   user@switchPE-1# set rsvp interface ge-0/0/5.0
   user@switchPE-1# set rsvp interface ge-0/0/6.0
   ```

6. Configure IP addresses for the loopback interface and the core interfaces:

   ```
   [edit]
   user@switchPE-1# set interfaces lo0 unit 0 family inet address 127.1.1.1/32
   user@switchPE-1# set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
   user@switchPE-1# set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
   ```

7. Configure **family mpls** on the logical unit of the core interface addresses:

   ```
   [edit]
   user@switchPE-1# set interfaces ge-0/0/5 unit 0 family mpls
   user@switchPE-1# set interfaces ge-0/0/6 unit 0 family mpls
   ```

8. Configure the logical unit of the customer edge interface as a CCC:

   ```
   [edit interfaces ge-0/0/1 unit 0]
   ```

```
-user@PE-1# set family ccc
```

9. Configure the interface-based CCC from PE-1 to PE-2:

NOTE: You can also configure a tagged VLAN interface as a CCC. See Configuring MPLS on Provider Edge Switches (CLI Procedure).

```
[edit protocols]
user@PE-1# set connections remote-interface-switch ge-1-to-pe2 interface ge-0/0/1.0
user@PE-1# set connections remote-interface-switch ge-1-to-pe2 transmit-lsp
lsp_to_pe2_ge1
user@PE-1# set connections remote-interface-switch ge-1-to-pe2 receive-lsp
lsp_to_pe1_ge1
```

Results Display the results of the configuration:

```
user@switchPE-1> show configuration
```

```
interfaces {
    ge-0/0/1 {
        unit 0 {
            family ccc;
        }
    }

        interface ge-0/0/6.0;
      }
    }
    connections {
      remote-interface-switch ge-1-to-pe2 {
        interface ge-0/0/1.0;
        transmit-lsp lsp_to_pe2_ge1;
        receive-lsp lsp_to_pe1_ge1;
      }
    }
```

Configuring the Remote PE Switch

CLI Quick Configuration

To quickly configure the remote PE switch, copy the following commands and paste them into the switch terminal window of PE-2:

```
[edit]
set protocols ospf traffic-engineering
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ae0
set protocols mpls label-switched-path lsp_to_pe1_ge1 to 127.1.1.1
set protocols mpls interface ae0
set protocols rsvp interface lo0.0
set protocols rsvp interface ae0
set interfaces lo0 unit 0 family inet address 127.1.1.3/32
set interfaces ae0 unit 0 family inet address 10.1.9.2/24
set interfaces ae0 unit 0 family mpls
set interfaces ge-0/0/1 unit 0 family ccc
set protocols connections remote-interface-switch ge-1-to-pe1 interface ge-0/0/1.0
set protocols connections remote-interface-switch ge-1-to-pe1 transmit-lsp lsp_to_pe1_ge1
set protocols connections remote-interface-switch ge-1-to-pe1 receive-lsp lsp_to_pe2_ge1
```

Step-by-Step Procedure

To configure the remote PE switch (PE-2):

1. Configure OSPF with traffic engineering enabled:

   ```
   [edit protocols]
   user@switchPE-2# set ospf traffic-engineering
   ```

2. Configure OSPF on the loopback interface and the core interface:

   ```
   [edit protocols]
   user@switchPE-2# set ospf area 0.0.0.0 interface lo0.0
   user@switchPE-2# set ospf area 0.0.0.0 interface ae0
   ```

3. Configure MPLS on the switch with a label-switched path (LSP) to the other PE switch:

   ```
   [edit protocols]
   ```

```
user@switchPE-2# set mpls label-switched-path lsp_to_pe1_ge1 to 127.1.1.1
```

4. Configure MPLS on the core interface:

```
[edit protocols]
user@switchPE-2# set mpls interface ae0
```

5. Configure RSVP on the loopback interface and the core interface:

```
[edit protocols]
ser@switchPE-2# set rsvp interface lo0.0
user@switchPE-2# set rsvp interface ae0
```

6. Configure IP addresses for the loopback interface and the core interface:

```
[edit]
user@switchPE-2# set interfaces lo0 unit 0 family inet address 127.1.1.3/32
user@switchPE-2# set interfaces ae0 unit 0 family inet address 10.1.9.2/24
```

7. Configure **family mpls** on the logical unit of the core interface:

```
[edit]
user@switchPE-2# set interfaces ae0 unit 0 family mpls
```

8. Configure the logical unit of the customer edge interface as a CCC:

```
[edit interfaces ge-0/0/1 unit 0]
user@PE-2# set family ccc
```

9. Configure the interface-based CCC from PE-2 to PE-1:

```
[edit protocols]
user@PE-2# set connections remote-interface-switch ge-1-to-pe1 interface ge-0/0/1.0
user@PE-2# set connections remote-interface-switch ge-1-to-pe1 transmit-lsp
lsp_to_pe1_ge1
user@PE-2# set connections remote-interface-switch ge-1-to-pe1 receive-lsp
lsp_to_pe2_ge1
```

Results Display the results of the configuration:

```
user@switchPE-2> show configuration

interfaces {
    ge-0/0/1 {
        unit 0 {
            family ccc;
        }
    }
    ae0 {
        unit 0 {
            family inet {
                address 10.1.9.2/24;
            }
            family mpls;
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 127.1.1.3/32;
            }
```

```
    }
  }
}
protocols {
  rsvp {
    interface lo0.0;
    interface ae0.0;
  }
  mpls {
    label-switched-path lsp_to_pe1_ge1 {
      to 127.1.1.1;
    }
    interface ae0.0;
  }
  ospf {
    traffic-engineering;
    area 0.0.0.0 {
      interface ae0.0;
    }
  }
  connections {
    remote-interface-switch ge-1-to-pe1 {
      interface ge-0/0/1.0;
      transmit-lsp lsp_to_pe1_ge1;
      receive-lsp lsp_to_pe2_ge1;
    }
  }
}
```

Configuring the Provider Switch

CLI Quick Configuration

To quickly configure the provider switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols ospf traffic-engineering
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ge-0/0/5.0
set protocols ospf area 0.0.0.0 interface ge-0/0/6.0
set protocols ospf area 0.0.0.0 interface ae0
set protocols mpls interface ge-0/0/5.0
set protocols mpls interface ge-0/0/6.0
set protocols mpls interface ae0
set protocols rsvp interface lo0.0
set protocols rsvp interface ge-0/0/5.0
set protocols rsvp interface ge-0/0/6.0
set protocols rsvp interface ae0
set interfaces lo0 unit 0 family inet address 127.1.1.2/32
set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
set interfaces ae0 unit 0 family inet address 10.1.9.1/24
set interfaces ge-0/0/5 unit 0 family mpls
set interfaces ge-0/0/6 unit 0 family mpls
set interfaces ae0 unit 0 family mpls
```

Step-by-Step Procedure

To configure the provider switch:

1. Configure OSPF with traffic engineering enabled:

```
[edit protocols]
user@switchP# set ospf traffic-engineering
```

2. Configure OSPF on the loopback interface and the core interfaces:

```
[edit protocols]
user@switchP# set ospf area 0.0.0.0 interface lo0.0
user@switchP# set ospf area 0.0.0.0 interface ge-0/0/5
user@switchP# set ospf area 0.0.0.0 interface ge-0/0/6
user@switchP# set ospf area 0.0.0.0 interface ae0
```

3. Configure MPLS on the core interfaces on the switch:

```
[edit protocols]
user@switchP# set mpls interface ge-0/0/5
user@switchP# set mpls interface ge-0/0/6
user@switchP# set mpls interface ae0
```

4. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols]
user@switchP# set rsvp interface lo0.0
user@switchP# set rsvp interface ge-0/0/5
user@switchP# set rsvp interface ge-0/0/6
user@switchP# set rsvp interface ae0
```

5. Configure IP addresses for the loopback interface and the core interfaces:

```
[edit]
user@switchP# set interfaces lo0 unit 0 family inet address 127.1.1.2/32
user@switchP# set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
user@switchP# set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
user@switchP# set interfaces ae0 unit 0 family inet address 10.1.9.1/24
```

6. Configure **family mpls** on the logical unit of the core interface addresses:

```
[edit]
user@switchP# set interfaces ge-0/0/5 unit 0 family mpls
user@switchP# set interfaces ge-0/0/6 unit 0 family mpls
user@switchP# set interfaces ae0 unit 0 family mpls
```

Results

Display the results of the configuration:

```
user@switchP> show configuration

interfaces {
  ge-0/0/5 {
    unit 0 {
      family inet {
        address 10.1.5.1/24;
      }
      family mpls;
      }
    }
  ge-0/0/6 {
    unit 0 {
      family inet {
```

```
            address 10.1.6.1/24;
          }
          family mpls;
          }
        }
      }
      ae0 {
        unit 0 {
          family inet {
            address 10.1.9.1/24;
          }
          family mpls;
        }
      }
      lo0 {
        unit 0 {
          family inet {
            address 127.1.1.2/32;
          }
        }
      }
    protocols {
      rsvp {
        interface lo0.0;
        interface ge-0/0/5.0;
        interface ge-0/0/6.0;
        interface ae0.0;
      }
      mpls {
        interface ge-0/0/5.0;
        interface ge-0/0/6.0;
        interface ae0.0;
      }
      ospf {
        traffic-engineering;
        area 0.0.0.0 {
          interface lo0.0;
          interface ge-0/0/5.0;
          interface ge-0/0/6.0;
          interface ae0.0;
        }
      }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the Physical Layer on the Switches on page 2158
- Verifying the Routing Protocol on page 2158
- Verifying the Core Interfaces Being Used for MPLS Traffic on page 2158
- Verifying the Status of the RSVP Sessions on page 2159
- Verifying the Assignment of Interfaces for MPLS Label Operations on page 2159
- Verifying the Status of the CCC on page 2160

Verifying the Physical Layer on the Switches

Purpose Verify that the interfaces are up. Perform this verification task on each of the switches.

Action

```
user@switchPE-1> show interfaces terse

Interface               Admin Link Proto    Local                 Remote
ge-0/0/0                up    up
ge-0/0/0.0              up    up  eth-switch
ge-0/0/1                up    up
ge-0/0/1.0              up    up  ccc
ge-0/0/2                up    up
ge-0/0/2.0              up    up  eth-switch
ge-0/0/3                up    up
ge-0/0/3.0              up    up eth-switch
ge-0/0/4                up    up
ge-0/0/4.0              up    up eth-switch
ge-0/0/5                up    up
ge-0/0/5.0              up    up inet     10.1.5.1/24
                              mpls
ge-0/0/6                up    up
ge-0/0/6.0              up    up inet     10.1.6.1/24
                              mpls
```

Meaning The **show interfaces terse** command displays status information about the Gigabit Ethernet interfaces on the switch. This output verifies that the interfaces are **up**. The output for the protocol family (**Proto** column) shows that interface **ge-0/0/1.0** is configured as a circuit cross-connect. The output for the protocol family of the core interfaces (**ge-0/0/5.0** and **ge-0/0/6.0**) shows that these interfaces are configured as both **inet** and **mpls**. The **Local** column for the core interfaces shows the IP address configured for these interfaces.

Verifying the Routing Protocol

Purpose Verify the state of the configured routing protocol. Perform this verification task on each of the switches. The state must be **Full**.

Action

```
user@switchPE-1> show ospf neighbor

Address          Interface              State     ID               Pri  Dead
127.1.1.2          ge-0/0/5               Full     10.10.10.10      128    39
```

Meaning The **show ospf neighbor** command displays the status of the routing protocol. This output shows that the state is **Full**, meaning that the routing protocol is operating correctly—that is, hello packets are being exchanged between directly connected neighbors.

Verifying the Core Interfaces Being Used for MPLS Traffic

Purpose Verify that the state of the MPLS interface is **Up**. Perform this verification task on each of the switches.

Action

```
user@switchPE-1> show mpls interface

Interface         State       Administrative groups
ge–0/0/5             Up          <none>
ge–0/0/6             Up          <none>
```

Meaning The **show mpls interface** command displays the status of the core interfaces that have been configured to belong to **family mpls**. This output shows that the interface configured to belong to **family mpls** is **Up**.

Verifying the Status of the RSVP Sessions

Purpose Verify the status of the RSVP sessions. Perform this verification task on each of the switches.

Action

```
user@switchPE-1> show rsvp session

Ingress RSVP: 1 sessions
To              From            State   Rt Style Labelin Labelout LSPname
127.1.13        127.1.1.1         Up       0  1 FF       -   300064 lsp_to_pe2_ge1
Total 1 displayed, Up 1, Down 0

Egress RSVP: 1 sessions
To              From            State   Rt Style Labelin Labelout LSPname
127.1.1.1       127.1.1.3         Up       0  1 FF       299968     lsp_to_pe1_ge1
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning This output confirms that the RSVP sessions are **Up**.

Verifying the Assignment of Interfaces for MPLS Label Operations

Purpose Verify which interface is being used as the beginning of the CCC and which interface is being used to push the MPLS packet to the next hop. Perform this task only on the PE switches.

Action

```
user@switchPE-1> show route forwarding-table family mpls
MPLS:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    dscd    50     1
0                  user     0                    recv    49     3
1                  user     0                    recv    49     3
2                  user     0                    recv    49     3
299776             user     0                   Pop     541     2     ge-0/0/1.0
ge-0/0/1.0  (CCC)  user     0 2.0.0.1           Push 299792   540 2   ge-0/0/5.0
```

Meaning This output shows that the CCC has been set up on interface **ge-0/0/1.0**. The switch receives ingress traffic on **ge-0/0/1.0** and pushes label **299792** onto the packet, which goes out through interface **ge-0/0/5.0**. The output also shows when the switch receives an MPLS packet with label 29976, it pops the label and sends the packet out through interface **ge-0/0/1.0**

After you have checked the local PE switch, run the same command on the remote PE switch.

Verifying the Status of the CCC

Purpose Verify the status of the CCC. Perform this task only on the PE switches.

Action

```
user@switchPE-1>  show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)              Legend for connection types
UN -- uninitialized                 if-sw:  interface switching
NP -- not present                   rmt-if: remote interface switching
WE -- wrong encapsulation           lsp-sw: LSP switching
DS -- disabled                      tx-p2mp-sw: transmit P2MP switching
Dn -- down                          rx-p2mp-sw: receive P2MP switching
-> -- only outbound conn is up
 <- -- only inbound  conn is up      Legend for circuit types
Up -- operational                   intf -- interface
RmtDn -- remote CCC down            tlsp -- transmit LSP
Restart -- restarting               rlsp -- receive LSP

Connection/Circuit               Type        St      Time last up     # Up trans
ge1-to-pe2                        rmt-if      Up      Feb 17 05:00:09  1
  ge-0/0/1.0                       intf       Up
  lsp_to_pe1_ge1                     tlsp     Up
  lsp_to_pe2_ge1                     rlsp     Up
```

Meaning The **show connections** command displays the status of the CCC connections. This output verifies that the CCC interface and its associated transmit and receive LSPs are **Up**. After you have checked the local PE switch, run the same command on the remote PE switch.

Example: Combining CoS with MPLS on J-EX Series Switches

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. The CoS value is included within the MPLS label, which is passed through the network, enabling end-to-end CoS across the network.

MPLS services are often used to ensure better performance for low-latency applications such as VoIP and other business-critical functions. These applications place specific demands on a network for successful transmission. CoS gives you the ability to control the mix of bandwidth, delay, jitter, and packet loss while taking advantage of the MPLS labeling mechanism.

This example shows how to configure CoS on an MPLS network that is using a unidirectional circuit cross-connect (CCC) from the ingress provider edge (PE) switch to the egress PE switch. for the customer-edge interface of the ingress provider edge (PE) switch. It describes adding the configuration of CoS components to the ingress PE switch, the egress PE switch, and the core provider switches of the existing MPLS network. Because of the unidirectional configuration, the DSCP classifier needs to be configured only on the ingress PE switch.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Three J-EX Series switches

Before you configure CoS with MPLS, be sure you have:

Configured an MPLS network with two PE switches and one provider switch. See "Example: Configuring MPLS on J-EX Series Switches" on page 2145. This example assumes that an MPLS network has been configured using a cross circuit-connect (CCC).

Overview and Topology

This example describes adding custom classifiers and custom rewrite rules to switches in an MPLS network that is using MPLS over CCC.

It is a unidirectional configuration. Therefore, you need to configure custom classifiers and custom rewrite rules as follows:

- On the ingress PE switch: custom DSCP classifier and custom EXP rewrite rule
- On the egress PE switch: custom EXP classifier
- On the provider switch: customer EXP classifier and custom EXP rewrite rule

NOTE: You can also configure schedulers and shapers as needed. If you are using assured-forwarding, expedited-forwarding, or other custom forwarding classes, we recommend that you configure a scheduler to support that forwarding class. See "Defining CoS Schedulers (CLI Procedure)" on page 1921.

The example creates a custom DSCP classifier (**dscp1**) on the ingress PE switch and binds this classifier to the CCC interface. It includes configuration of a policer on the

ingress PE switch. The policer is applied as a filter on the label-switched path (LSP) **lsp_to_pe2_ge1** (created in "Example: Configuring MPLS on J-EX Series Switches" on page 2145) to ensure that the amount of traffic forwarded through the LSP never exceeds the requested bandwidth allocation.

This example creates a custom EXP rewrite rule (**exp1**) on the ingress PE switch, specifying a loss-priority and code point to be used for the expedited-forwarding class as the packet travels through the LSP. The switch applies this custom rewrite rule on the core interfaces **ge-0/0/5.0** and **ge-0/0/6.0**, which are the egress interfaces for this switch.

Table 277 on page 2162 shows the CoS configuration components added to the ingress PE switch.

Table 277: CoS Configuration Components on the Ingress PE Switch

Property	Settings	Description
Local PE switch hardware	J-EX Series switch	PE-1
Policing filter configured and applied to the LSP.	**policing filter mypolicer** **filter myfilter**	Name of the rate-limiting policer. Name of the filter, which refers to the policer
Custom DSCP classifier	**dscp1**	Specifies the name of the custom DSCP classifier
Custom EXP rewrite rule	**e1**	Name of the custom EXP rewrite rule.
Customer-edge interface	**ge-0/0/1.0**	Interface that receives packets from devices outside the network. The custom DSCP classifier must be specified on this CCC interface.
Core interfaces	**ge-0/0/5.0** and **ge-0/0/6.0**	Interfaces that transmit MPLS packets to other switches within the MPLS network. The EXP rewrite rule is applied implicitly to these interfaces.

Table 278 on page 2162 shows the CoS configuration components added to the egress PE switch in this example.

Table 278: CoS Configuration Components of the Egress PE Switch

Property	Settings	Description
Remote provider edge switch hardware	J-EX Series switch	PE-2
Custom EXP classifier	**exp1**	Name of custom EXP classifier

Table 278: CoS Configuration Components of the Egress PE Switch *(continued)*

Property	Settings	Description
Customer-edge interface	**ge-0/0/1.0**	Interface that transmits packets from this network to devices outside the network. No CoS classifier is specified for this interface. A scheduler can be specified.
Core interfaces	**ge-0/0/7.0** and **ge-0/0/8.0**	Core interfaces on PE-2 that receive MPLS packets from the provider switch. The EXP classifier is enabled by default on the switch and applied implicitly to these interfaces.

Table 279 on page 2163 shows the MPLS configuration components used for the provider switch in this example.

Table 279: CoS Configuration Components of the Provider Switch

Property	Settings	Description
Provider switch hardware	J-EX Series switch	Transit switch within the MPLS network configuration.
Custom EXP classifier	**exp1**	Name of the custom EXP classifier.
Custom EXP rewrite rule	**e1**	Name of the custom EXP rewrite rule.
Core interfaces receiving packets from other MPLS switches.	**ge-0/0/5.0** and **ge-0/0/6.0**	Interfaces that connect the provider switch to the ingress PE switch (PE-1). The EXP classifier is enabled by default on the switch and applied implicitly to these interfaces.
Core interfaces transmitting packets to other switches within the MPLS network.	**ge-0/0/7.0** and **ge-0/0/8.0**	Interfaces that transmit packets to the egress PE (PE-2). The EXP rewrite rule is applied implicitly on these interfaces. Schedulers can also be specified and will be applied to these interfaces.

Configuring the Local PE Switch

CLI Quick Configuration

To quickly configure a custom DSCP classifier, custom EXP rewrite rule, and a policer on the local PE switch, copy the following commands and paste them into the switch terminal window of PE-1:

```
[edit]
set class-of-service classifiers dscp dscp1 import default
set class-of-service classifiers dscp dscp1 forwarding-class expedited-forwarding loss-priority low code-points 000111
set class-of-service rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low code-point 111
set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
set firewall policer mypolicer if-exceeding bandwidth-limit 500m
```

```
set firewall policer mypolicer if-exceeding burst-size-limit 33553920
set firewall policer mypolicer then discard
set firewall family any filter myfilter term t1 then policer mypolicer
set protocols mpls label-switched-path lsp_to_pe2_ge1 to 127.1.1.3 policing filter myfilter
```

Step-by-Step Procedure

To configure a custom DSCP classifier, custom EXP rewrite rule, and a policer on the ingress PE switch:

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

   ```
   [edit class-of-service]
   user@switch# set classifiers dscp dscp1 import default
   ```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

   ```
   [edit class-of-service]
   user@switch# set classifiers dscp dscp1 forwarding-class expedited-forwarding
   loss-priority low code-points 000111
   ```

3. Specify the values for the custom EXP rewrite rule, **e1**:

   ```
   [edit class-of-service]
   user@switch#  set rewrite-rules exp e1 forwarding-class expedited-forwarding
   loss-priority low code-point 111
   ```

4. Bind the DSCP classifier to the CCC interface:

   ```
   [edit ]
   user@switch#  set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
   ```

5. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the LSP:

   ```
   [edit firewall]
   set policer mypolicer if-exceeding bandwidth-limit 500m
   ```

6. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

   ```
   [edit firewall policer]
   set mypolicer if-exceeding burst-size-limit 33553920
   ```

7. Discard traffic that exceeds the rate limits for this policer:

   ```
   [edit firewall policer]
   set mypolicer then discard
   ```

8. To reference the policer, configure a filter term that includes the policer action:

   ```
   [edit firewall]
   user@switch#  set family any filter myfilter term t1 then policer mypolicer
   ```

9. Apply the filter to the LSP:

   ```
   [edit protocols mpls]
   set label-switched-path lsp_to_pe2_ge1 policing filter myfilter
   ```

Results

Display the results of the configuration:

```
[edit]
```

```
user@switch# show
class-of-service {
  classifiers {
    dscp dscp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 000111;
      }
    }
  }
  interfaces {
    ge-0/0/1 {
      unit 0 {
        classifiers {
          dscp dscp1;
        }
      }
    }
  }
rewrite-rules {
  exp e1 {
    forwarding-class expedited-forwarding {
      loss-priority low code-point 111;
    }
  }
  }
}
firewall {
  family any {
    filter myfilter {
      term t1 {
        then policer mypolicer;
      }
    }
  }
  policer mypolicer {
    if-exceeding {
      bandwidth-limit 500m;
      burst-size-limit 33553920;
    }
    then discard;
  }
}
```

Configuring the Remote PE Switch

CLI Quick Configuration

To quickly configure a custom EXP classifier on the remote PE switch, copy the following commands and paste them into the switch terminal window of PE-2:

```
[edit]
set class-of-service classifiers exp exp1 import default
set class-of-service classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low
code-points 010
```

Step-by-Step Procedure

To configure a custom EXP classifier on the egress PE switch:

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```

Results

Display the results of the configuration:

```
[edit]
 user@switch# show
class-of-service {
  classifiers {
    exp exp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 010;
      }
    }
```

Configuring the Provider Switch

CLI Quick Configuration

To quickly configure a custom EXP classifier and a custom EXP rewrite rule on the provider switch, copy the following commands and paste them into the switch terminal window of the provider switch:

```
[edit]
set class-of-service classifiers exp exp1 import default
set class-of-service classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low
code-points 010
set class-of-service rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low
code-point 111
```

Step-by-Step Procedure

To configure a custom EXP classifier and a custom EXP rewrite rule on the provider switch:

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```

3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

Results Display the results of the configuration:

```
[edit]
 user@switch# show
class-of-service {
  classifiers {
    exp exp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 010;
      }
    }
  }
  rewrite-rules {
    exp e1 {
      forwarding-class expedited-forwarding {
        loss-priority low code-point 111;
      }
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Policer Firewall Filter Is Operational on page 2167
- Verifying That the CoS Classifiers Are Going to the Right Queue on page 2167
- Verifying the CoS Forwarding Table Mapping on page 2170
- Verifying the Rewrite Rules on page 2171

Verifying That the Policer Firewall Filter Is Operational

Purpose Verify the operational state of the policer that is configured on the ingress PE switch.

Action

```
user@switch> show firewall
Filter: myfilter
Policers:
Name                                                Packets
mypolicer-t1                                              0
```

Meaning This output shows that the firewall filter **mypolicer** has been created.

Verifying That the CoS Classifiers Are Going to the Right Queue

Purpose Verify that the CoS classifiers are going to the right queue.

Action

```
user@switch> show class-of-service forwarding-table classifier

Classifier table index: 7, # entries: 64, Table type: DSCP
```

61	111101	3	0
62	111110	3	0
63	111111	3	0

Meaning This output shows that a new DSCP classifier has been created, index **9346**, on the ingress PE switch (PE-1).

Verifying the CoS Forwarding Table Mapping

Purpose For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.

Action

```
user@switch>show class-of-service forwarding-table classifier mapping

                                Table Index/
```

```
Interface       Index      Q num      Table type
ge-0/0/1.0        92        9346      DSCP
```

Meaning The results show that the new DSCP classifier, index number **9346**, is bound to interface **ge-0/0/1.0**.

Verifying the Rewrite Rules

Purpose Display mapping of the queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.

Action

```
user@switch>show class-of-service forwarding-table rewrite-rule

Rewrite table index: 31, # entries: 4, Table type: DSCP
FC#     Low bits  State      High bits  State
0       000000  Enabled       000000  Enabled
1       101110  Enabled       101110  Enabled
2       001010  Enabled       001100  Enabled
3       110000  Enabled       111000  Enabled

Rewrite table index: 34, # entries: 4, Table type: IEEE 802.1
FC#     Low bits  State      High bits  State
0          000  Enabled          001  Enabled
1          010  Enabled          011  Enabled
2          100  Enabled          101  Enabled
3          110  Enabled          111  Enabled

Rewrite table index: 35, # entries: 4, Table type: IPv4 precedence
FC#     Low bits  State      High bits  State
0          000  Enabled          000  Enabled
1          101  Enabled          101  Enabled
2          001  Enabled          001  Enabled
3          110  Enabled          111  Enabled

Rewrite table index: 9281, # entries: 1, Table type: EXP
FC#     Low bits  State      High bits  State
1          111  Enabled          000  Disabled
```

Meaning This output shows that a new EXP classifier with the index number **9281** has been created.

Example: Configuring MPLS-Based Layer 2 VPNs on J-EX Series Switches

You can implement an MPLS-based Layer 2 virtual private network (VPN) using J-EX8200 switches to interconnect customer sites with Layer 2 technology. Layer 2 VPNs give customers complete control of their own routing. To support an MPLS-based Layer 2

VPN, you need to add components to the configuration of the two provider edge (PE) switches. You do not need to change the configuration of the provider switches.

This example shows how to configure an MPLS-based Layer 2 VPN using J-EX8200 switches as the PE switches:

NOTE: You can configure both an MPLS-based Layer 2 VPN and an MPLS-based Layer 3 VPN on the same switch. However, you cannot configure the same customer edge interface to support both a Layer 2 VPN and a Layer 3 VPN. The core interfaces and the loopback interfaces are configured in the same way for Layer 2 VPNs and Layer 3 VPNs.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for J-EX Series switches
- Two J-EX8200 switches as the PE switches
- One or more J-EX Series switches as provider switches

Before you configure the Layer 2 VPN components, configure the basic components for an MPLS network:

- Configure two PE switches. See “Configuring MPLS on Provider Edge Switches Using Circuit Cross-Connect (CLI Procedure)” on page 2210.
- Configure one or more provider switches. See “Configuring MPLS on Provider Switches (CLI Procedure)” on page 2201.

NOTE: A Layer 2 VPN requires that the PE switches be configured using circuit cross-connect (CCC). The provider switch or switches are configured in the same way for MPLS using CCC and for IP over MPLS.

Overview and Topology

A Layer 2 VPN provides complete separation between the provider’s network and the customer’s network—that is, the PE switches and the CE switches do not exchange routing information. Some benefits of a Layer 2 VPN are that it is private, secure, and flexible.

This example shows how to configure Layer 2 VPN components on the local and remote PE switches. This example does not include configuring a provider switch, because there are no specific Layer 2 VPN components on the provider switches.

In the basic MPLS configuration of the PE switches using a circuit cross-connect (CCC), the PE switches were configured to use IS-IS as the routing protocol between the MPLS switches and RSVP as the signaling protocol. Traffic engineering was enabled. A label-switched path (LSP) was configured within the **[edit protocols]** hierarchy. However, unlike the basic MPLS configuration using a CCC, you did not need to associate the LSP with the customer edge interface. When you are configuring a Layer 2 VPN, you must use BGP signaling. The BGP signaling automates the connections, so manual configuration of the association between the LSP and the customer edge interface is not required.

The following components must be added to the PE switches for an MPLS-based Layer 2 VPN:

- BGP group with **family l2vpn signaling**
- Routing instance using instance type **l2vpn**
- The physical layer encapsulation type (**ethernet**) must be specified on the customer edge interface and the encapsulation type must also be specified in the configuration of the routing instance.

Figure 66 on page 2174 illustrates the topology of this MPLS-based Layer 2 VPN.

Figure 66: MPLS-Based Layer 2 VPN

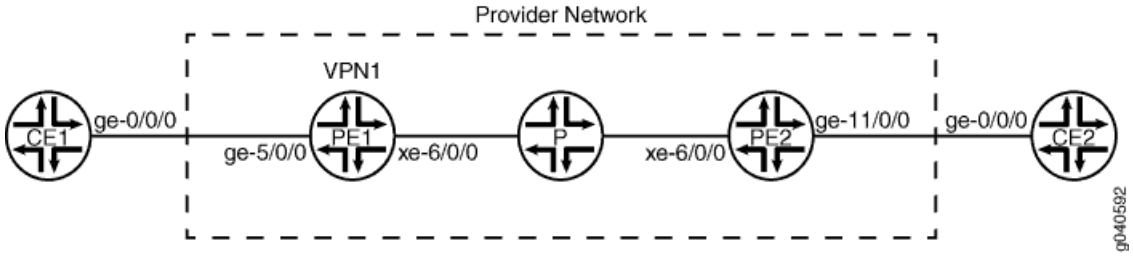

Table 280 on page 2174 shows the settings of the customer edge interface on the local CE switch.

Table 280: Local CE Switch in the MPLS-Based Layer 2 VPN Topology

Property	Settings	Description
Local CE switch hardware	J-EX8200 switch	CE1
Customer edge interface	**ge-0/0/0 unit 0** **family inet** **address 11.0.0.2/16**	Interface that connects CE1 to PE1.

Table 281 on page 2174 shows the settings of the customer edge interface on the remote CE switch.

Table 281: Remote CE Switch in the MPLS-Based Layer 2 VPN Topology

Property	Settings	Description
Remote CE switch hardware	J-EX8200 switch	CE2
Customer edge interface	**ge-0/0/0 unit 0** **family inet** **address 11.0.0.1/16**	Interface that connects CE2 to PE2.

Table 282 on page 2175 shows the Layer 2 VPN components of the local PE switch.

Table 282: Layer 2 VPN Components of the Local PE Switch

Property	Settings	Description
Local PE switch hardware	J-EX8200 switch	PE1
Customer edge interface	**ge-5/0/0** **encapsulation ethernet-ccc** **unit 0** **family ccc**	Connects PE1 to CE1. For the Layer 2 VPN, add **ethernet-ccc** as the physical layer encapsulation type. NOTE: The **family ccc** should already have been completed as part of the basic MPLS configuration of a PE switch for circuit cross-connect. It is included here to show what was specified for that portion of the configuration.
Core interface	**xe-6/0/0 unit 0** **family inet address 60.0.0.60/16** **family iso** **family mpls**	Connects PE1 to P. NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
Loopback interface	**lo0 unit 0** **family inet address 21.21.21.21/32** **family iso address** **49.0001.2102.2021.0210.00**	NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
BGP	**bgp**	Added for the Layer 2 VPN configuration.
Routing instance	**vpn1**	Added for the Layer 2 VPN configuration.

Table 283 on page 2176 shows the Layer 2 VPN components of the remote PE switch.

Table 283: Layer 2 VPN Components of the Remote PE Switch

Property	Settings	Description
PE switch hardware	J-EX8200 switch	PE2
Customer edge interface	**ge-11/0/0** **encapsulation ethernet-ccc unit 0** **family ccc**	Connects PE2 to CE2. For the Layer 2 VPN, add **ethernet-ccc** as the physical layer encapsulation type. NOTE: The **family ccc** should already have been completed as part of the basic MPLS configuration of a PE switch for circuit cross-connect. It is included here to show what was specified for that portion of the configuration.
Core interface	**xe-6/0/0** **unit 0** **family inet** **address 60.2.0.61/16 family iso** **family mpls**	Connects PE2 to P. NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
Loopback interface	**lo0 unit 0** **family inet address 22.22.22.22/32** **family iso address** **49.0001.2202.2022.0220.00**	NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
BGP	**bgp**	Added for the Layer 2 VPN configuration.
Routing instance	**vpn1**	Added for the Layer 2 VPN configuration.

Configuring the Local PE Switch

CLI Quick Configuration

To quickly configure the Layer 2 VPN components on the local PE switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-5/0/0 encapsulation ethernet-ccc
set protocols bgp local-address 21.21.21.21 family l2vpn signaling
set protocols bgp group ibgp type internal
set protocols bgp neighbor 22.22.22.22
set routing-instances vpn1 instance-type l2vpn
set routing-instances vpn1 interface ge-5/0/0
set routing-instances vpn1 route-distinguisher 21.21.21.21:21
set routing-instances vpn1 vrf-target target:21:21
set routing-instances vpn1 protocols l2vpn encapsulation-type ethernet
set routing-instances vpn1 protocols l2vpn interface ge-5/0/0.0 description "BETWEEN PE1 AND PE2"
set routing-instances vpn1 protocols l2vpn site JE-V21 site-identifier 21 remote-site-id 26
```

Step-by-Step Procedure

To configure the Layer 2 VPN components on the local PE switch:

1. Configure the customer edge interface to use the physical encapsulation type **ethernet-ccc**:

```
[edit]
user@switchPE1# set interfaces ge-5/0/0 encapsulation ethernet-ccc
```

2. Configure BGP, specifying the loopback address as the local address and enabling **family l2vpn signaling**:

```
[edit protocols bgp]
user@switchPE1# set local-address 21.21.21.21 family l2vpn signaling
```

3. Configure the BGP group, specifying the group name and type:

```
[edit protocols bgp]
user@switchPE1# set group ibgp type internal
```

4. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:

```
[edit protocols bgp]
user@switchPE1# set neighbor 22.22.22.22
```

5. Configure the routing instance, specifying the routing-instance name and using **l2vpn** as the instance type:

```
[edit routing-instances]
user@switchPE1# set vpn1 instance-type l2vpn
```

6. Configure the routing instance to apply to the customer edge interface:

```
[edit routing-instances]
user@switchPE1# set vpn1 interface ge-5/0/0
```

7. Configure the routing instance to use a route distinguisher:

```
[edit routing-instances]
user@switchPE1# set vpn1 route-distinguisher 21.21.21.21:21
```

8. Configure the VPN routing and forwarding (VRF) target of the routing instance:

```
[edit routing-instances]
user@switchPE1# set vpn1 vrf-target target:21:21
```

NOTE: You can create more complex policies by explicitly configuring VRF import and export policies using the import and export options. See the *Junos OS VPNs Configuration Guide*.

9. Configure the protocols and encapsulation type used by the routing instance:

```
[edit routing-instances]
user@switchPE1# set vpn1 protocols l2vpn encapsulation-type ethernet
```

10. Apply the routing instance to a customer edge interface and specify a description for it:

```
[edit routing-instances]
```

```
user@switchPE1# set vpn1 protocols interface ge-5/0/0.0 description "BETWEEN PE1
AND PE2"
```

11. Configure the routing-instance protocols site:

```
[edit routing-instances]
user@switchPE1# set vpn1 protocols l2vpn site JE-V21 site-identifier 21remote-site-id
26
```

NOTE: The remote site ID (configured with the remote-site-id statement) corresponds to the site ID (configured with the site-identifier statement) configured on the other PE switch.

Results Display the results of the configuration:

```
user@switchPE1# show
```

```
interfaces {
    ge-5/0/0 {
        encapsulation ethernet-ccc;
        unit 0 {
            family ccc;
        }
    }
    xe-6/0/0 {
        unit 0 {
            family inet {
                address 60.0.0.60/16;
            }
            family mpls;
        }
    }
    lo0 {
        unit 0 {

          signaling;
        }
        group ibgp {
          type internal;
          neighbor 22.22.22.22;
        }
      }
    routing-instances {
      vpn1 {
        instance-type l2vpn;
        interface ge-5/0/0.0;
        route-distinguisher 21.21.21.21:21;
        vrf-target target:21:21;
        protocols {
          l2vpn {
            encapsulation-type ethernet;
            interface ge-5/0/0.0 {
              description "BETWEEN PE1 AND PE2";
            }
            site JE-V21 {
            site-identifier 21;
              interface ge-5/0/0.0 {
                remote-site-id 26;
              }
          }
        }
      }
    }
```

Configuring the Remote PE Switch

CLI Quick Configuration

To quickly configure the Layer 2 VPN components on the remote PE switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-11/0/0 encapsulation ethernet-ccc
set protocols bgp local-address 22.22.22.22 family l2vpn signaling
set protocols bgp group ibgp type internal
set protocols bgp neighbor 21.21.21.21
set routing-instances vpn1 instance-type l2vpn
set routing-instances vpn1 interface ge-11/0/0
set routing-instances vpn1 route-distinguisher 21.21.21.21:21
set routing-instances vpn1 vrf-target target:21:21
set routing-instances vpn1 protocols l2vpn encapsulation-type ethernet
set routing-instances vpn1 protocols l2vpn interface ge-11/0/0.0 description "BETWEEN PE1 AND
PE2"
set routing-instances vpn1 protocols l2vpn site T26-VPN1 site-identifier 26 remote-site-id 21
```

Step-by-Step Procedure

To configure the Layer 2 VPN components on the remote PE switch:

1. Configure the customer edge interface to use the physical encapsulation type **ethernet-ccc**:

```
[edit]
user@switchPE1# set interfaces ge-11/0/0 encapsulation ethernet-ccc
```

2. Configure BGP, specifying the loopback address as the **local-address** and specifying **family l2vpn signaling**:

```
[edit protocols bgp]
user@switchPE2# set local-address 22.22.22.22 family l2vpn signaling
```

3. Configure the BGP group, specifying the group name and type:

```
[edit protocols bgp]
user@switchPE2# set group ibgp type internal
```

4. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:

```
[edit protocols bgp]
user@switchPE2# set neighbor 21.21.21.21
```

5. Configure the routing instance, specifying the routing-instance name and using **l2vpn** as the **instance-type**:

```
[edit routing-instances]
user@switchPE2# set vpn1 instance-type l2vpn
```

6. Configure the routing instance to apply to the customer edge interface:

```
[edit routing-instances]
user@switchPE2# set vpn1 interface ge-11/0/0.0
```

7. Configure the routing instance to use a route distinguisher, using the format *ip-address:number*:

```
[edit routing-instances]
user@switchPE2# set vpn1 route-distinguisher 21.21.21.21:21
```

8. Configure the VPN routing and forwarding (VRF) target of the routing instance:

```
[edit routing-instances]
user@switchPE2# set vpn1 vrf-target target:21:21
```

9. Configure the protocols and encapsulation type used by the routing instance:

```
[edit routing-instances]
user@switchPE2# set vpn1 protocols l2vpn encapsulation-type ethernet
```

10. Apply the routing instance to a customer edge interface and specify a description for it:

```
[edit routing-instances]
user@switchPE1# set vpn1 protocols interface ge-11/0/0.0 description "BETWEEN PE1
AND PE2"
```

11. Configure the routing-instance protocols site:

```
[edit routing-instances]
```

```
user@switchPE2# set vpn1 protocols l2vpn site T26-VPN1 site-identifier 26 remote-site-id
21
```

NOTE: The remote site ID (configured with the remote-site-id statement) corresponds to the site ID (configured with the site-identifier statement) configured on the other PE switch.

Results Display the results of the configuration:

```
user@switchPE2# show
  interfaces {
    ge-11/0/0 {
      encapsulation ethernet-ccc;
      unit 0 {
        family ccc;
      }
    }
    xe-6/0/0 {
      unit 0 {
        family inet {
          address 60.2.0.61/16;
        }
        family mpls;
      }
    }
    lo0 {
      unit 0 {
        family inet {
          address 22.22.22.22/32;
        }
        family iso {
          address 49.0001.2202.2022.0220.00;
        }
      }
    }
  protocols {
    rsvp {
      interface lo0.0;
      interface xe-0/0/6.0;
    mpls {
      label-switched-path lsp_to_pe1 {
        to 21.21.21.21;
      }
    interface xe-0/0/6.0;
    bgp {
      local-address 22.22.22.22;
      family l2vpn {
        signaling;
      }
      group ibgp {
        type internal;
        neighbor 21.21.21.21;
```

```
    }
  }
routing-instances {
  vpn1 {
    instance-type l2vpn;

          }
        }
    }
  }
}
```

Verification

To confirm that the MPLS-based Layer 2 VPN is working properly, perform these tasks:

- Verifying the Layer 2 VPN Connection on page 2182
- Verifying the Status of MPLS Label-Switched Paths on page 2183
- Verifying BGP Status on page 2183
- Verifying the Status of the RSVP Sessions on page 2184
- Verifying the Routes in the Routing Table on page 2184

Verifying the Layer 2 VPN Connection

Purpose Verify that the Layer 2 VPN connection is up.

Action

```
user@switchPE1> show l2vpn connections

Layer-2 VPN connections:

Legend for connection status (St)
EI -- encapsulation invalid      NC -- interface encapsulation not CCC/TCC/VPLS
EM -- encapsulation mismatch     WE -- interface and instance encaps not same
VC-Dn -- Virtual circuit down    NP -- interface hardware not present
CM -- control-word mismatch      -> -- only outbound connection is up
CN -- circuit not provisioned    <- -- only inbound connection is up
OR -- out of range               Up -- operational
OL -- no outgoing label          Dn -- down
LD -- local site signaled down   CF -- call admission control failure
RD -- remote site signaled down  SC -- local and remote site ID collision
LN -- local site not designated  LM -- local site ID not minimum designated
RN -- remote site not designated RM -- remote site ID not minimum designated
XX -- unknown connection status  IL -- no incoming label
```

```
MM -- MTU mismatch                MI -- Mesh-Group ID not availble
BK -- Backup connection           ST -- Standby connection
PF -- Profile parse failure       PB -- Profile busy
RS -- remote site standby         SN -- Static Neighbor

Legend for interface status
Up -- operational
Dn -- down

Instance: vpn1
  Local site: JE-V21 (21)
    connection-site           Type  St     Time last up          # Up trans
    26                        rmt   Up     Apr 16 05:53:21 2010           1
      Remote PE: 22.22.22.22, Negotiated control-word: Yes (Null)
      Incoming label: 800000, Outgoing label: 800001
      Local interface: ge-5/0/0.0, Status: Up, Encapsulation: ETHERNET
```

Meaning The **St** field in the output shows that the Layer 2 VPN connection to **Remote PE** (**22.22.22.22**) is up.

Verifying the Status of MPLS Label-Switched Paths

Purpose Verify that the MPLS label-switched paths (ingress and egress) are up.

Action

```
user@switchPE1> show mpls lsp
Ingress LSP: 1 sessions

To              From            State Rt P     ActivePath       LSPname
22.22.22.22     21.21.21.21     Up     0 *                      lsp_to_pe2

Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions

To              From            State   Rt Style Labelin Labelout LSPname

21.21.21.21     22.22.22.22     Up       0  1 FF       3        - lsp_to_pe1

Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The **State** field in the output shows that the Ingress LSP to **Remote PE** (**22.22.22.22**) is up, and the Egress LSP from the remote PE switch to this PE switch (**21.21.21.21**) is also up.

Verifying BGP Status

Purpose Verify that BGP is up.

Action

```
user@switchPE1> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table          Tot Paths  Act Paths Suppressed    History Damp State    Pending
bgp.l2vpn.0            1          1          0          0          0          0
Peer                     AS      InPkt     OutPkt    OutQ   Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
22.22.22.22              10         33         34       0       1       13:24
Establ
  bgp.l2vpn.0: 1/1/1/0
  vpn2.l2vpn.0: 1/1/1/0
```

Meaning The output shows that the remote PE switch (**22.22.22.22**) is listed as the BGP peer and that a protocol session has been established. It also shows the number of packets received from the remote PE switch (**33**) and the number of packets sent (**34**) to the remote PE switch.

Verifying the Status of the RSVP Sessions

Purpose Verify that the RSVP sessions (ingress and egress) are up.

Action

```
user@switchPE1> show rsvp session
Ingress RSVP: 1 sessions
To              From            State   Rt Style Labelin Labelout LSPname
22.22.22.22     21.21.21.21     Up       0  1 FF       -   462880 lsp_to_pe2
Total 1 displayed, Up 1, Down 0

Egress RSVP: 1 sessions
To              From            State   Rt Style Labelin Labelout LSPname
21.21.21.21     22.22.22.22     Up       0  1 FF       3        - lsp_to_pe1
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The output shows that both the ingress RSVP session and the egress RSVP session are up.

Verifying the Routes in the Routing Table

Purpose On switch PE 1, use the **show route table** command to verify that the routing table is populated with the Layer 2 VPN routes used to forward the traffic.

Action

```
user@switchPE1> show route table bgp.l2vpn.0

bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

2:2:27:27/96
                   *[BGP/170] 00:13:55, localpref 100, from 22.22.22.22
                      AS path: I
                    > to 60.2.0.24 via ge-6/0/46.0, label-switched-path lsp_to_pe2

user@switchPE1> show route table vpn1.l2vpn.0
```

```
vpn1.l2vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

2:2:27:27/96

                    *[BGP/170] 00:14:00, localpref 100, from 22.22.22.22
                       AS path: I

                    > to 60.2.0.24 via ge-6/0/46.0, label-switched-path lsp_to_pe2
2:2:28:27/96

                    *[L2VPN/170/-101] 00:15:55, metric2 1
                       Indirect
```

Meaning The command **show route table bgp.l2vpn.0** displays all Layer 2 VPN routes that have been created on this switch. The command **show route table vpn1.l2vpn.0** shows the Layer 2 VPN routes that have been created for the routing instance **vpn1**.

Related Documentation

- Example: Configuring MPLS on J-EX Series Switches on page 2145
- Example: Configuring MPLS-Based Layer 3 VPNs on J-EX Series Switches on page 2185
- Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 2213

Example: Configuring MPLS-Based Layer 3 VPNs on J-EX Series Switches

You can implement an MPLS-based Layer 3 virtual private network (VPN) on J-EX8200 switches to interconnect sites for customers who want the service provider to handle all the Layer 3 routing functions. To support an MPLS-based Layer 3 VPN, you need to add components to the configuration of the two provider edge (PE) switches. You do not need to change the configuration of the provider switches.

NOTE: You can configure both an MPLS-based Layer 2 VPN and an MPLS-based Layer 3 VPN on the same switch. However, you cannot configure the same customer edge interface to support both Layer 2 VPN and Layer 3 VPN. The core interfaces and the loopback interfaces are configured in the same way for Layer 2 VPNs and Layer 3 VPNs.

This example shows how to configure an MPLS-based Layer 3 VPN spanning two corporate sites:

- Requirements on page 2186
- Overview and Topology on page 2186
- Configuring the Local PE Switch on page 2189
- Configuring the Remote PE Switch on page 2192
- Verification on page 2195

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for J-EX Series switches
- Three J-EX8200 switches

Before you configure the Layer 3 VPN components, you must configure the basic components for an MPLS network:

- Configure two PE switches. See “Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)” on page 2206.
- Configure one or more provider switches. See “Configuring MPLS on Provider Switches (CLI Procedure)” on page 2201.

NOTE: **A Layer 3 VPN requires that the PE switches be configured using IP over MPLS.**

- Junos OS Release 11.1 or later for J-EX Series switches
- Three J-EX8200 switches

Overview and Topology

Layer 3 VPNs allow customers to leverage the service provider’s technical expertise to ensure efficient site-to-site routing. The customer’s customer edge (CE) switch uses a routing protocol such as BGP or OSPF to communicate with the service provider’s provider edge (PE) switch to carry IP prefixes across the network. MPLS-based Layer 3 VPNs use only IP over MPLS; other protocol packets are not supported. This example includes two PE switches, PE1 and PE2.

In the basic MPLS configuration of the PE switches using IP over MPLS, the PE switches were configured to use OSPF as the routing protocol between the MPLS switches and RSVP as the signaling protocol. Traffic engineering was enabled. A label-switched path (LSP) was configured in the **[edit protocols]** hierarchy.

NOTE: **A static path was not configured. Static LSPs are not supported on J-EX8200 switches.**

The following components must be added to the PE switches for an MPLS-based Layer 3 VPN:

- BGP group with **family inet-vpn unicast**
- Routing instance with instance type **vrf**

Figure 67 on page 2187 illustrates the topology of this MPLS-based Layer 3 VPN.

Figure 67: MPLS-Based Layer 3 VPN

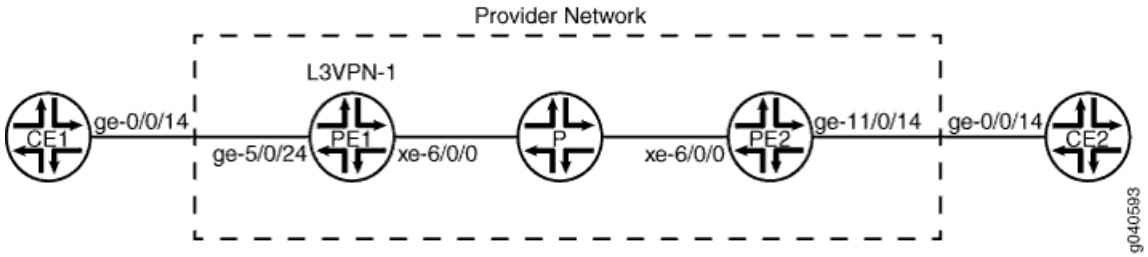

Table 284 on page 2187 shows the settings of the customer edge interface on the local CE switch.

Table 284: Local CE Switch in the MPLS-Based Layer 3 VPN Topology

Property	Settings	Description
Local CE switch hardware	J-EX8200 switch	CE1
Customer edge interface	**ge-0/0/14 unit 0** **family inet** **address 51.51.0.14/16**	Interface that connects CE1 to PE1.

Table 285 on page 2187 shows the settings of the customer edge interface on the remote CE switch.

Table 285: Remote CE Switch in the MPLS-Based Layer 3 VPN Topology

Property	Settings	Description
Remote CE switch hardware	J-EX8200 switch	CE2
Customer edge interface	**ge-0/0/14 unit 0** **family inet** **address 11.22.26.1/16**	Interface that connects CE2 to PE2.

Table 286 on page 2187 shows the Layer 3 VPN components of the local PE switch.

Table 286: Layer 3 VPN Components of the Local PE Switch

Property	Settings	Description
Local PE switch hardware	J-EX8200 switch	PE1
Customer edge interface	**ge-5/0/24 unit 0** **family inet** **address 51.51.0.1/16**	Connects PE1 to CE1. NOTE: The **family inet** configuration should already have been completed as part of the basic MPLS configuration of the PE switch for IP over MPLS. It is included here to show what was specified for that portion of the configuration.

Table 286: Layer 3 VPN Components of the Local PE Switch *(continued)*

Property	Settings	Description
Core interface	**xe-6/0/0 unit 0** **family inet address 60.0.0.60/16** **family iso;** **family mpls**	Connects PE1 to P. NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
Loopback interface	**lo0 unit 0** **family inet address 21.21.21.21/32** **family iso address** **49.0001.2102.1021.0210.00**	NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
BGP	**bgp**	Added for the Layer 3 VPN configuration.
Routing instance	**L3VPN-1**	Added for the Layer 3 VPN configuration.

Table 287 on page 2189 shows the Layer 3 VPN components of the remote PE switch.

Table 287: Layer 3 VPN Components of the Remote PE Switch

Property	Settings	Description
Remote PE switch hardware	J-EX8200 switch	PE2
Customer edge interface	**ge-11/0/14 unit 0** **family inet** **address 11.22.26.14/16** **family mpls**	Connects PE2 to CE2. For the Layer 3 VPN configuration, added **family mpls**. NOTE: The **family inet** configuration should already have been completed as part of the basic MPLS configuration of the PE switch for IP over MPLS. It is included here to show what was specified for that portion of the configuration.
Core interface	**xe-6/0/0/0 unit 0** **family inet address 60.2.0.60/16** **family iso** **family mpls**	Connects PE1 to P. NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
Loopback interface	**lo0 unit 0** **family inet address 22.22.22.22/32** **family iso address** **49.0001.2202.1022.0220.00**	NOTE: This portion of the configuration should already have been completed as part of the basic MPLS configuration. It is included here to show what was specified for that portion of the configuration.
BGP	**bgp**	Added for the Layer 3 VPN configuration.
Routing instances	**L3VPN-1**	Added for the Layer 3 VPN configuration.

Configuring the Local PE Switch

CLI Quick Configuration

To quickly configure the Layer 3 VPN components on the local PE switch, copy the following commands and paste them into the switch terminal window of PE1:

```
[edit]
set protocols bgp local-address 21.21.21.21 family inet-vpn unicast
set protocols bgp group ibgp type internal
set protocols bgp neighbor 22.22.22.22
set routing-instances L3VPN-1 instance-type vrf
set routing-instances L3VPN-1 description "BETWEEN PE1 AND PE2"
set routing-instances L3VPN-1 interface ge-5/0/24.0
set routing-instances L3VPN-1 route-distinguisher 21:21
set routing-instances L3VPN-1 vrf-target target:21:21
set routing-instances L3VPN-1 vrf-table-label;
set routing-options router-id 21.21.21.21
set routing-options autonomous-system 10;
```

Step-by-Step Procedure

To configure the Layer 3 VPN components on the local PE switch:

1. Configure BGP, specifying the loopback address as the local address and specifying **family inet-vpn unicast**:

```
[edit protocols bgp]
user@switchPE1# set local-address 21.21.21.21 family inet-vpn unicast
```

2. Configure the BGP group, specifying the group name and type:

```
[edit protocols bgp]
user@switchPE1# set group ibgp type internal
```

3. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:

```
[edit protocols bgp]
user@switchPE1# set neighbor 22.22.22.22
```

4. Configure the routing instance, specifying the routing-instance name and using **vrf** as the instance type:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 instance-type vrf
```

5. Configure a description for this routing instance:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 description "BETWEEN PE1 AND PE2"
```

6. Configure the routing instance to use a route distinguisher:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 route-distinguisher 21:21
```

NOTE: Each routing instance that you configure on a PE switch must have a unique route distinguisher associated with it. VPN routing instances require a route distinguisher to allow BGP to distinguish between potentially identical network layer reachability information (NLRI) messages received from different VPNs. If you configure different VPN routing instances with the same route distinguisher, the commit fails.

7. Configure the VPN routing and forwarding (VRF) target of the routing instance:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 vrf-target target:21:21
```

NOTE: You can create more complex policies by explicitly configuring VRF import and export policies using the import and export options. See the *Junos OS VPNs Configuration Guide*.

8. Configure this routing instance with **vrf-table-label**, which maps the inner label of a packet to a specific VPN routing and forwarding (VRF) table and allows the examination of the encapsulated IP header:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 vrf-table-label
```

9. Configure the router ID and autonomous system (AS):

NOTE: We recommend that you explicitly configure the router identifier under the **[edit routing-options]** hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

```
[edit routing-options]
user@switchPE1# set router-id 21.21.21.21 autonomous-system 10
```

Results Display the results of the configuration:

```
user@switchPE1>  show configuration

  interfaces {
    ge-5/0/24 {
      unit 0 {
        family inet {
          address 51.51.0.1/16;
        }
      }
    }
    lo0 {
      unit 0 {
        family inet {
          address 21.21.21.21/32;
        }
      }
    }
    xe-6/0/0 {
      unit 0 {
        family inet {
          address 60.0.0.60/16;
        }
        family iso;
        family mpls;
      }
    }
    protocols {
      mpls {
        label-switched-path 21-22 {
          from 21.21.21.21;
          to 22.22.22.22;
          no-cspf;
        }
        interface xe-6/0/0.0;
        interface lo0.0;
      bgp {
```

```
    local-address 21.21.21.21;
    family inet-vpn {
      unicast;
    }
    group ibgp {
      type internal;
      neighbor 22.22.22.22;
    }
  }
  ospf {
    traffic-engineering;
    area 0.0.0.0 {
      interface ge-5/0/24.0;
      interface lo0.0;
      interface xe-6/0/0.0;
    }
  }
}
routing-instances {
  L3VPN-1 {
    instance-type vrf;
    description "BETWEEN PE1 AND PE2";
    route-distinguisher 21:21;
    vrf-target target:21:21;
    vrf-table-label;
  }
routing-options {
  router-id 21.21.21.21;
  autonomous-system 10;
```

Configuring the Remote PE Switch

CLI Quick Configuration

To quickly configure the Layer 3 VPN components on the remote PE switch, copy the following commands and paste them into the switch terminal window of PE2:

```
[edit]
set protocols bgp local-address 22.22.22.22 family inet-vpn unicast
set protocols bgp group ibgp type internal
set protocols bgp neighbor 21.21.21.21
set routing-instances L3VPN-1 instance-type vrf
set routing-instances L3VPN-1 description "BETWEEN PE1 AND PE2"
set routing-instances L3VPN-1 interface ge-11/0/14.0
set routing-instances L3VPN-1 route-distinguisher 21:21
set routing-instances L3VPN-1 vrf-target target:21:21
set routing-instances L3VPN-1 vrf-table-label;
set routing-options router-id 22.22.22.22;
set routing-options autonomous-system 10;
```

Step-by-Step Procedure

To configure Layer 3 VPN components on the remote PE switch:

1. Configure BGP, specifying the loopback address as the local address and specifying **family inet-vpn unicast**:

   ```
   [edit protocols bgp]
   user@switchPE2# set local-address 22.22.22.22 family inet-vpn unicast
   ```

2. Configure the BGP group, specifying the group name and type:

```
[edit protocols bgp]
user@switchPE2# set group ibgp type internal
```

3. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:

```
[edit protocols bgp]
user@switchPE2# set neighbor 21.21.21.21
```

4. Configure the routing instance, specifying the routing-instance name and using **vrf** as the instance type:

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 instance-type vrf
```

5. Configure a description for this routing instance:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 description "BETWEEN PE1 AND PE2"
```

6. Configure the routing instance to apply to the customer edge interface:

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 interface ge-11/0/14.0
```

7. Configure the routing instance to use a route distinguisher, using the format *ip-address:number*:

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 route-distinguisher 21:21
```

8. Configure the VPN routing and forwarding (VRF) target of the routing instance:

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 vrf-target target:21:21
```

9. Configure this routing instance with **vrf-table-label**, which maps the inner label of a packet to a specific VPN routing and forwarding (VRF) table and allows the examination of the encapsulated IP header.

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 vrf-tabel-label
```

10. Configure the router ID and autonomous system (AS):

```
[edit routing-options]
user@switchPE2# set router-id 22.22.22.22 autonomous-system 10
```

Results Display the results of the configuration:

```
user@switchPE2> show configuration

interfaces {
    ge-11/0/14 {
        unit 0 {
            family inet {
                address 11.22.26.14/16;
            }
        }
    }
    lo0 {
```

```
    unit 0 {
      family inet {
        address 22.22.22.22/32;
      }
    }
}
xe-6/0/0 {
    unit 0 {
      family inet {
        address 60.2.0.60/16;
      }
      family iso;
      family mpls;
    }
}
protocols {
    mpls {
      label-switched-path 22-21 {
        from 22.22.22.22;
        to 21.21.21.21;
        no-cspf;
      }
      interface xe-6/0/0.0;
      interface lo0.0;
    bgp {
      local-address 22.22.22.22;
      family inet-vpn {
        unicast;
      }
      group ibgp {
        type internal;
        neighbor 21.21.21.21;
      }
    }
    ospf {
      traffic-engineering;
      area 0.0.0.0 {
        interface ge-11/0/14.0;
        interface lo0.0;
        interface xe-6/0/0.0;
      }
    }
}
routing-instances {
    L3VPN-1 {
      instance-type vrf;
      description"BETWEEN PE1 AND PE2";
      route-distinguisher 21:21;
      vrf-target target:21:21;
      vrf-table-label;
    }
routing-options {
    router-id 22.22.22.22;
    autonomous-system 10;
```

Verification

To confirm that the MPLS-based Layer 3 VPN is working properly, perform these tasks:

- Verifying Peering and Adjacency on page 2195
- Verifying That the Local CE Switch Can Ping the Local PE Switch on page 2195
- Verifying That the Local PE Switch Can Ping the Local CE Switch on page 2195

Verifying Peering and Adjacency

Purpose Verify that the peering and adjacency along the route from CE1 (the local CE switch or router) to CE2 (the remote CE switch or router), starting with the checking the routing protocol adjacency on the local PE switch:

NOTE: Be sure to specify the name of the routing instance.

Action

```
user@switchPE1> show ospf neighbor instance L3VPN-1

Address    Interface   State ID         Pri Dead
51.51.0.14 ge-5/0/24.0 Full 21.21.21.21 128 38
```

Meaning The **Address** field shows the IP address of the customer edge interface that connects CE1 to PE1. The **Interface** field shows the interface name of the customer edge interface that connects PE1 to CE1. For our purposes, the **State** field is the most important. It shows a status of **Full**, indicating that neighboring routing devices are fully adjacent. These adjacencies appear in router-link and network-link advertisements. (The field **Pri** indicates the priority of the neighbor to become the designated router. The field **Dead** indicates the number of seconds until the neighbor becomes unreachable.)

Verifying That the Local CE Switch Can Ping the Local PE Switch

Purpose Verify that the local CE switch can ping the local PE switch:

Action

```
user@CE1> ping 51.51.0.1
PING 51.51.0.1 (51.51.0.1): 56 data bytes
64 bytes from 51.51.0.1: icmp_seq=0 ttl=64 time=3.461 ms
64 bytes from 51.51.0.1: icmp_seq=1 ttl=64 time=3.543 ms
```

Meaning This command specified the IP address of the customer edge interface on PE1. The results indicate that CE1 is receiving packets from PE1.

Verifying That the Local PE Switch Can Ping the Local CE Switch

Purpose Verify that the local PE switch can ping the local CE switch:

Action

```
user@PE1> ping 51.51.0.14 routing-instance L3VPN-1
PING 51.51.0.14 (51.51.0.14): 56 data bytes
64 bytes from 51.51.0.14: icmp_seq=0 ttl=64 time=3.842 ms
64 bytes from 51.51.0.14: icmp_seq=1 ttl=64 time=3.736 ms
```

Meaning The results indicate a successful connection.

CHAPTER 72

Configuring MPLS

Configuring Path Protection in an MPLS Network (CLI Procedure)

The Junos OS implementation of MPLS on J-EX Series switches provides path protection as a mechanism for protecting against label switched path (LSP) failures. Path protection reduces the time required to recalculate a route in case of a failure within the MPLS tunnel. You configure path protection on the ingress provider edge switch in your MPLS network. You do not configure the egress provider edge switch or the provider switches for path protection. You can explicitly specify which provider switches are used for the primary and secondary paths, or you can let the software calculate the paths automatically.

Before you configure path protection, be sure you have:

- Configured an ingress provider edge switch and an egress provider edge switch. See Configuring MPLS on Provider Edge Switches (CLI Procedure).
- Configured at least one provider (transit) switch. See “Configuring MPLS on Provider Switches (CLI Procedure)” on page 2201.
- Verified the configuration of your MPLS network. See “Verifying That MPLS Is Working Correctly” on page 2219.

To configure path protection, complete the following tasks on the ingress provider edge switch:

1. Configuring the Primary Path on page 2199
2. Configuring the Secondary Path on page 2199
3. Configuring the Revert Timer on page 2200

Configuring the Primary Path

The **primary** statement creates the primary path, which is the LSP's preferred path. The **secondary** statement creates an alternative path if the primary path can no longer reach the egress provider edge switch.

In the tasks described in this topic, the ***lsp-name*** has already been configured on the ingress provider edge switch as **lsp_to_240** and the loopback interface address on the remote provider edge switch has already been configured as **127.0.0.8**.

When the software switches from the primary to the secondary path, it continuously attempts to revert to the primary path, switching back to it when it is again reachable but no sooner than the retry time specified in the **revert-timer** statement.

You can configure zero primary paths or one primary path. If you do not configure a primary path, the first secondary path (if a secondary path has been configured) is selected as the path. If you do not specify any named paths, or if the path that you specify is empty, the software makes all routing decisions necessary for the packets to reach the egress provider edge switch.

To configure a primary path:

1. Create the primary path for the LSP:

```
[edit protocols mpls label-switched-path lsp_to_240 to 127.0.0.8]
user@switch# set primary primary_path_lsp_to_240
```

2. Configure an explicit route for the primary path by specifying the IP address of the loopback interface or the switch IP address or hostname of each switch used in the MPLS tunnel. You can specify the link types as either **strict** or **loose** in each **path** statement. If the link type is **strict**, the LSP must go to the next address specified in the **path** statement without traversing other switches. If the link type is **loose**, the LSP can traverse through other switches before reaching this switch. This configuration uses the default **strict** designation for the paths.

NOTE: You can enable path protection without specifying which provider switches are used. If you do not list the specific provider switches to be used for the MPLS tunnel, the switch calculates the route.

TIP: Do not include the ingress provider edge switch in these statements. List the IP address of the loopback interface or switch address or hostname of all other switch hops in sequence, ending with the egress provider edge switch.

```
[edit protocols mpls label-switched-path lsp_to_240 to 127.0.0.8]
user@switch# set path primary_path_lsp_to_240 127.0.0.2
user@switch# set path primary_path_lsp_to_240 127.0.0.3
user@switch# set path primary_path_lsp_to_240 127.0.0.8
```

Configuring the Secondary Path

You can configure zero or more secondary paths. All secondary paths are equal, and the software tries them in the order that they are listed in the configuration. The software does not attempt to switch among secondary paths. If the first secondary path in the configuration is not available, the next one is tried, as so on. To create a set of equal paths, specify secondary paths without specifying a primary path. If you do not specify any named paths, or if the path that you specify is empty, the software makes all routing decisions necessary to reach the egress provider edge switch.

To configure the secondary path:

1. Create a secondary path for the LSP:

```
[edit protocols mpls label-switched-path lsp_to_240 to 127.0.0.8]
user@switch# set secondary secondary_path_lsp_to_240 standby
```

2. Configure an explicit route for the secondary path by specifying the IP address of the loopback interface or the switch IP address or hostname of each switch used in the MPLS tunnel. You can specify the link types as either **strict** or **loose** in each **path** statement. This configuration uses the default **strict** designation for the paths.

TIP: Do not include the ingress provider edge switch in these statements. List the IP address of the loopback interface or switch address or hostname of all other switch hops in sequence, ending with the egress provider edge switch.

```
[edit protocols mpls label-switched-path lsp_to_240 to 127.0.0.8]
user@switch# set path secondary_path_lsp_to_240 127.0.0.4
user@switch# set path primary_path_lsp_to_240 127.0.0.8
```

Configuring the Revert Timer

For LSPs configured with both primary and secondary paths, you can optionally configure a revert timer. If the primary path goes down and traffic is switched to the secondary path, the revert timer specifies the amount of time (in seconds) that the LSP must wait before it can revert traffic back to the primary path. If the primary path experiences any connectivity problems or stability problems during this time, the timer is restarted.

TIP: If you do not explicitly configure the revert timer, it is set by default to 60 seconds.

To configure the revert timer for LSPs configured with primary and secondary paths:

- For all LSPs on the switch:

```
[edit protocols mpls]
user@switch# set revert-timer 120
```

- For a specific LSP on the switch:

```
[edit protocols mpls label-switched-path]
user@switch#  set lsp_to_240 revert-timer 120
```

Configuring MPLS on Provider Switches (CLI Procedure)

You can configure MPLS on J-EX Series switches to increase transport efficiency in your network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as VoIP and other business-critical functions.

To implement MPLS on J-EX Series switches, you must configure at least one provider switch as a transit switch for the MPLS packets. The configuration of all the provider switches remains the same regardless of whether the provider edge (PE) switches are using circuit cross-connect (CCC) or using MPLS over IP for the customer edge interfaces. Likewise, you do not need to change the configuration of the provider switches if you implement an MPLS-based Layer 2 VPN, Layer 3 VPN, or a Layer 2 circuit configuration.

MPLS requires the configuration of a routing protocol (OSPF or IS-IS) on the core interfaces and the loopback interface of all the switches. This procedure includes the configuration of OSPF on the provider switch. For information on configuring IS-IS as the routing protocol, see the *Junos OS Routing Protocols Configuration Guide*.

To configure the provider switch, complete the following tasks:

1. Enable the routing protocol (OSPF or IS-IS) on the loopback interface and on the core interfaces:

   NOTE: You can use the switch address as an alternative to the loopback interface.

   ```
   [edit protocols]
   user@switch# set ospf area 0.0.0.0 interface lo0.0
   user@switch# set ospf area 0.0.0.0 interface ge-0/0/5.0
   user@switch# set ospf area 0.0.0.0 interface ge-0/0/6.0
   user@switch# set ospf area 0.0.0.0 interface ae0
   ```

2. Enable traffic engineering for the routing protocol (traffic engineering must be explicitly enabled for OSPF):

   ```
   [edit protocols]
   user@switch# set ospf traffic-engineering
   ```

3. Enable MPLS within the **protocols** stanza and apply it to the core interfaces:

   ```
   [edit protocols]
   user@switch# set mpls interface ge-0/0/5.0
   user@switch# set mpls interface ge-0/0/6.0
   user@switch# set mpls interface ae0
   ```

4. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols]
user@switch# set rsvp interface lo0.0
user@switch# set rsvp interface ge-0/0/5.0
user@switch# set rsvp interface ge-0/0/6.0
user@switch# set rsvp interface ae0
```

5. Configure an IP address for the loopback interface and for the core interfaces:

```
[edit]
user@switch# set interfaces lo0 unit 0 family inet address 127.1.1.1/32
user@switch# set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
user@switch# set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
user@switch# set interfaces ae0 unit 0 family inet address 10.1.9.2/24
```

6. Configure **family mpls** on the logical units of the core interfaces:

```
[edit]
user@switch# set interfaces ge-0/0/5 unit 0 family mpls
user@switch# set interfaces ge-0/0/6 unit 0 family mpls
user@switch# set interfaces ae0 unit 0 family mpls
```

NOTE: You can enable family mpls on either individual interfaces or aggregated Ethernet interfaces. You cannot enable it on tagged VLAN interfaces.

Configuring CoS on an MPLS Provider Edge Switch Using IP Over MPLS (CLI Procedure)

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. This topic describes configuring CoS components on a provider edge (PE) switch that is using IP Over MPLS.

This task describes now to create a custom DSCP classifier and a custom EXP rewrite rule on the ingress PE switch. It includes configuring a policer firewall filter and applying it to the customer-edge interface of the ingress PE switch. The policer firewall filter ensures that the amount of traffic forwarded through the MPLS tunnel never exceeds the requested bandwidth allocation.

For this procedure, we assume that the switch has already been configured for MPLS. See "Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)" on page 2206.

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

   ```
   [edit class-of-service]
   user@switch#set classifiers dscp dscp1 import default
   ```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

   ```
   [edit class-of-service]
   user@switch#set classifiers dscp dscp1 forwarding-class expedited-forwarding
   loss-priority low code-points 000111
   ```

3. Specify the values for the custom EXP rewrite rule, **e1**:

   ```
   [edit class-of-service]
   user@switch#  set rewrite-rules exp e1 forwarding-class expedited-forwarding
   loss-priority low code-point 111
   ```

4. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the customer-edge-interface:

   ```
   [edit firewall]
   set policer mypolicer if-exceeding bandwidth-limit 500m
   ```

5. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

   ```
   [edit firewall policer]
   set mypolicer if-exceeding burst-size-limit 33553920
   ```

6. Discard traffic that exceeds the rate limits for this policer:

   ```
   [edit firewall policer]
   set mypolicer then discard
   ```

7. To reference the policer, configure a filter term that includes the policer action:

   ```
   [edit firewall]
   user@switch#  set family inet filter myfilter term t1 then policer mypolicer
   ```

8. Apply the filter to the customer-edge interface:

```
[edit interfaces]
user@switch# set ge-2/0/3 unit 0 family inet address 121.121.121.1/16 policing filter
myfilter
```

NOTE: You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 1921.

Related Documentation

- Understanding the Use of Policers in Firewall Filters on page 1741

Configuring CoS on an MPLS Provider Edge Switch Using Circuit Cross-Connect (CLI Procedure)

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. This topic describes configuring CoS components on provider edge (PE) switch that is using MPLS over circuit-cross connect (CCC).

NOTE: If you are using MPLS with CCC, you can use only one type of DSCP/IP precedence and only one type of IEEE 802.1p on the CCC interfaces.

This procedure creates a custom DSCP classifier and a custom EXP rewrite rule on the ingress PE. It also enables a policer on the label-switched path (LSP) of the ingress PE to ensure that the amount of traffic forwarded through the LSP never exceeds the requested bandwidth allocation.

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

   ```
   [edit class-of-service]
   user@switch#set classifiers dscp dscp1 import default
   ```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

   ```
   [edit class-of-service]
   user@switch#set classifiers dscp dscp1 forwarding-class expedited-forwarding
   loss-priority low code-points 000111
   ```

3. Specify the values for the custom EXP rewrite rule, **e1**:

   ```
   [edit class-of-service]
   user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
   loss-priority low code-point 111
   ```

4. Bind the DSCP classifier to the CCC interface:

```
[edit ]
user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
```

5. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the LSP:

```
[edit firewall]
set policer mypolicer if-exceeding bandwidth-limit 500m
```

6. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

```
[edit firewall policer]
set mypolicer if-exceeding burst-size-limit 33553920
```

7. Discard traffic that exceeds the rate limits for this policer:

```
[edit firewall policer]
set mypolicer then discard
```

8. To reference the policer, configure a filter term that includes the policer action:

```
[edit firewall]
user@switch# set family any filter myfilter term t1 then policer mypolicer
```

9. Apply the filter to the LSP:

```
[edit protocols mpls]
set label-switched-path lsp_to_pe2_ge1 policing filter myfilter
```

NOTE: You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 1921.

Configuring CoS on Provider Switches of an MPLS Network (CLI Procedure)

You can add class-of-service (CoS) components to your MPLS networks on J-EX Series switches to achieve end-to-end Differentiated Services to match your specific business requirements. The configuration of CoS components on the provider switches is the same regardless of whether the provider edge (PE) switches are using MPLS over CCC or IP over MPLS.

This task shows how to configure a custom EXP classifier and custom EXP rewrite rule on the provider switch.

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch#set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low code-points 010
```

3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low code-point 111
```

NOTE: You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 1921.

- Example: Combining CoS with MPLS on J-EX Series Switches on page 1883

Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)

You can configure MPLS on J-EX Series switches to increase transport efficiency in your network. MPLS services can be used to connect various sites to a backbone network or to ensure better performance for low-latency applications such as VoIP and other business-critical functions.

To implement MPLS on the switches, you must configure two provider edge (PE) switches—an ingress PE switch and an egress PE switch—and at least one provider switch. You can configure the customer edge (CE) interfaces on the PE switches of the MPLS network as either circuit cross-connect (CCC) or using IP over MPLS.

The main differences between configuring IP over MPLS and configuring MPLS over CCC are that for IP over MLPS you configure the customer edge interfaces to belong to **family inet** rather than **family ccc** and you configure a static route for the label-switched path (LSP). The configuration of the provider switch is the same regardless of whether the PE switches are configured for MPLS over CCC or IP over MPLS. See “Configuring MPLS on Provider Switches (CLI Procedure)” on page 2201.

This topic describes how to configure an ingress PE switch and an egress PE switch for IP over MPLS:

1. Configuring the Ingress PE Switch on page 2207
2. Configuring the Egress PE Switch on page 2208

Configuring the Ingress PE Switch

To configure the ingress PE switch:

1. Configure OSPF on the loopback (or switch address) and core interfaces:

```
[edit protocols]
user@switch# set ospf area 0.0.0.0 interface lo0.0
user@switch# set ospf area 0.0.0.0 interface ge-0/0/5.0
user@switch# set ospf area 0.0.0.0 interface ge-0/0/6.0
```

2. Enable traffic engineering for the routing protocol:

```
[edit protocols]
user@switch# set ospf traffic-engineering
```

3. Configure an IP address for the loopback interface and for the core interfaces:

```
[edit]
user@switch# set interfaces lo0 unit 0 family inet address 100.100.100.100/32
user@switch# set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
user@switch# set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
```

4. Configure MPLS on the core interfaces:

```
[edit protocols]
user@switch# set mpls interface ge-0/0/5.0
user@switch# set mpls interface ge-0/0/6.0
```

5. Configure **family mpls** on the logical units of the core interfaces, thereby identifying the interfaces that will be used for forwarding MPLS packets:

```
[edit]
user@switch# set interfaces ge-0/0/5 unit 0 family mpls
user@switch# set interfaces ge-0/0/6 unit 0 family mpls
```

6. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols]
user@switch# set rsvp interface lo0.0
user@switch# set rsvp interface ge-0/0/5.0
user@switch# set rsvp interface ge-0/0/6.0
```

7. Configure a customer edge interface as a Layer 3 routed interface, specifying an IP address:

```
[edit]
user@switch# set interfaces ge-2/0/3 unit 0 family inet 121.121.121.1/16
```

8. Configure this Layer 3 customer edge interface for the routing protocol:

```
[edit]
user@switch# set protocols ospf area 0.0.0.0 interface ge-2/0/3.0
```

9. Configure an LSP on the ingress PE switch (**100.100.100.100**) to send IP packets over MPLS to the egress PE switch (**208.208.208.208**):

```
[edit protocols mpls]
user@switch# set label-switched-path ip_lspjavae_29 from 100.100.100.100
user@switch# set label-switched-path ip_lspjavae_29 to 208.208.208.208
```

10. Disable constrained-path LSP computation for this LSP:

```
[edit protocols mpls]
user@switch# set label-switched-path ip_lspjavae_29 no-cspf
```

11. Configure a static route from the ingress PE switch to the egress PE switch, thereby indicating to the routing protocol that the packets will be forwarded over the MPLS LSP that has been set up to that destination:

NOTE: Do not configure a static route if you are using this procedure to configure an MPLS-based Layer 3 VPN.

```
[edit]
user@switch# set routing-options static route 2.2.2.0/24 next-hop 100.100.100.100
user@switch# set routing-options static route 2.2.2.0/24 resolve
```

Configuring the Egress PE Switch

To configure the egress PE switch:

1. Configure OSPF on the loopback interface (or switch address) and core interfaces:

```
[edit protocols]
user@switch# set ospf area 0.0.0.0 interface lo0.0
user@switch# set ospf area 0.0.0.0 interface ge-0/0/5.0
user@switch# set ospf area 0.0.0.0 interface ge-0/0/6.0
```

2. Enable traffic engineering for the routing protocol:

```
[edit protocols]
user@switch# set ospf traffic-engineering
```

3. Configure an IP address for the loopback interface and for the core interfaces:

```
[edit]
user@switch# set interfaces lo0 unit 0 family inet address 208.208.208.208/32
user@switch# set interfaces ge-0/0/5 unit 0 family inet address 10.1.20.1/24
user@switch# set interfaces ge-0/0/6 unit 0 family inet address 10.1.21.1/24
```

4. Configure MPLS on the core interfaces:

```
[edit protocols]
user@switch# set mpls interface ge-0/0/5.0
user@switch# set mpls interface ge-0/0/6.0
```

5. Configure **family mpls** on the logical units of the core interfaces, thereby identifying the interfaces that will be used for forwarding MPLS packets:

```
[edit]
user@switch# set interfaces ge-0/0/5 unit 0 family mpls
user@switch# set interfaces ge-0/0/6 unit 0 family mpls
```

6. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols]
user@switch# set rsvp interface lo0.0
user@switch# set rsvp interface ge-0/0/5.0
user@switch# set rsvp interface ge-0/0/6.0
```

7. Configure a customer edge interface as a Layer 3 routed interface, specifying an IP address:

```
[edit]
user@switch# set interfaces ge-2/0/3 unit 0 family inet address 2.2.2.1/16
```

8. Configure this Layer 3 customer edge interface for the routing protocol:

```
[edit]
user@switch# set protocols ospf area 0.0.0 interface ge-2/0/3
```

9. Configure an LSP on the egress PE switch (**208.208.208.208**) to send IP packets over MPLS to the ingress PE switch (**100.100.100.100**):

```
[edit protocols mpls]
user@switch# set label-switched-path ip_lsp29_javae from 208.208.208.208
user@switch# set label-switched-path ip_lspjavae_29 to 100.100.100.100
```

10. Disable constrained-path LSP computation for this LSP:

```
[edit protocols mpls]
user@switch# set label-switched-path ip_lsp29_javae no-cspf
```

11. Configure a static route from the ingress PE switch to the egress PE switch, thereby indicating to the routing protocol that the packets will be forwarded over the MPLS LSP that has been set up to that destination:

NOTE: Do not configure a static route if you are using this procedure to configure an MPLS-based Layer 3 VPN.

```
[edit]
user@switch# set routing-options static route 121.121.121.0/24 next-hop 208.208.208.208
user@switch# set routing-options static route 121.121.121.0/24 resolve
```

Configuring MPLS on Provider Edge Switches Using Circuit Cross-Connect (CLI Procedure)

Junos OS MPLS for J-EX Series switches supports Layer 2 protocols and Layer 2 virtual private networks (VPNs). You can configure MPLS on J-EX Series switches to increase transport efficiency in your network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as VoIP and other business-critical functions.

This topic describes configuring provider edge (PE) switches in an MPLS network using a circuit cross-connect (CCC). The customer edge interface can be either a simple interface or a tagged VLAN interface.

NOTE: If you are going through this procedure in preparation for configuring an MPLS-based Layer 2 VPN, you do not need to configure the association of the label-switched path (LSP) with the customer edge interface. The BGP signaling automates the connections, so manual configuration of the connections is not required.

The following guidelines apply to CCC configurations:

- When an interface is configured to belong to **family ccc**, it cannot belong to any other family.
- You can send any kind of traffic over a CCC, including nonstandard bridge protocol data units (BPDUs) generated by other vendors' equipment.
- If you are configuring a CCC on a tagged VLAN interface, you must explicitly enable VLAN tagging and specify a VLAN ID. The VLAN ID cannot be configured on logical interface unit **0**. The logical unit number must be **1** or higher.

NOTE: CCC on a tagged VLAN interface is not supported on J-EX8200 switches.

This procedure shows how to set up two CCCs:

- If you are configuring a CCC on a simple interface (**ge-0/0/1**), you do not need to enable VLAN tagging or specify a VLAN ID, so you skip those steps.
- If you are configuring a CCC on a tagged VLAN interface (**ge-0/0/2**), include all the steps in this procedure.

To configure a PE switch with a CCC:

1. Configure OSPF (or IS-IS) on the loopback (or switch address) and core interfaces:

```
[edit protocols]
user@switch# set ospf area 0.0.0.0 interface lo0.0
user@switch# set ospf area 0.0.0.0 interface ge-0/0/5.0
user@switch# set ospf area 0.0.0.0 interface ge-0/0/6.0
user@switch# set ospf area 0.0.0.0 interface ae0
```

2. Enable traffic engineering for the routing protocol:

```
[edit protocols]
user@switch# set ospf traffic-engineering
```

3. Configure an IP address for the loopback interface and for the core interfaces:

```
[edit]
user@switch# set interfaces lo0 unit 0 family inet address 127.1.1.1/32
user@switch# set interfaces ge-0/0/5 unit 0 family inet address 10.1.5.1/24
user@switch# set interfaces ge-0/0/6 unit 0 family inet address 10.1.6.1/24
user@switch# set interfaces ae0 unit 0 family inet address 10.1.9.1/24
```

4. Enable MPLS and define the LSP:

```
[edit protocols]
user@switch# set mpls label-switched-path lsp_to_pe2_ge1 to 127.1.1.3
```

TIP: **lsp_to_pe2_ge1** is the LSP name. You will need to use the specified name again when configuring the CCC.

5. Configure MPLS on the core interfaces:

```
[edit protocols]
user@switch# set mpls interface ge-0/0/5.0
user@switch# set mpls interface ge-0/0/6.0
user@switch# set mpls interface ae0
```

6. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols]
user@switch# set rsvp interface lo0.0
user@switch# set rsvp interface ge-0/0/5.0
user@switch# set rsvp interface ge-0/0/6.0
user@switch# set rsvp interface ae0
```

7. Configure **family mpls** on the logical units of the core interfaces:

```
[edit]
user@switch# set interfaces ge-0/0/5 unit 0 family mpls
user@switch# set interfaces ge-0/0/6 unit 0 family mpls
user@switch# set interfaces ae0 unit 0 family mpls
```

NOTE: You can enable **family mpls** on either individual interfaces or aggregated Ethernet interfaces. You cannot enable it on tagged VLAN interfaces.

8. If you are configuring a CCC on a tagged VLAN interface, enable VLAN tagging on the customer edge interface **ge-0/0/2** of the local PE switch:

```
[edit interfaces ge-0/0/2]
user@switch# set vlan-tagging
```

   If you are configuring a CCC on a simple interface (**ge-0/0/1**), omit this step.

9. If you are configuring a CCC on a tagged VLAN interface, configure the logical unit of the customer edge interface with a VLAN ID:

```
[edit interfaces ge-0/0/2 unit 1]
user@switch# set vlan-id 100
```

   If you are configuring a CCC on a simple interface (**ge-0/0/1**), omit this step.

10. Configure the logical unit of the customer edge interface to belong to **family ccc**:

    - On a simple interface:

```
[edit interfaces ge-0/0/1 unit 0]
user@switch# set family ccc
```

    - On a tagged VLAN interface:

```
[edit interfaces ge-0/0/2 unit 1]
user@switch# set family ccc
```

11. Associate the CCC interface with two LSPs, one for transmitting MPLS packets and the other for receiving MPLS packets:

NOTE: If you are configuring a Layer 2 VPN, omit this step. The BGP signaling automates the connections, so manual configuration of the connections is not required.

    - On a simple interface:

```
[edit protocols]
user@switch# set connections remote-interface-switch ge-1-to-pe2 interface ge-0/0/1.0
user@switch# set connections remote-interface-switch ge-1-to-pe2 transmit-lsp
lsp_to_pe2_ge1
user@switch# set connections remote-interface-switch ge-1-to-pe2 receive-lsp
lsp_to_pe1_ge1
```

    - On a tagged VLAN interface:

```
[edit protocols]
user@switch# set connections remote-interface-switch ge-1-to-pe2 interface ge-0/0/2.1
user@switch# set connections remote-interface-switch ge-1-to-pe2 transmit-lsp
lsp_to_pe2_ge1
user@switch# set connections remote-interface-switch ge-1-to-pe2 receive-lsp
lsp_to_pe1_ge1
```

TIP: The transmit-lsp option specifies the LSP name that was configured on PE-1 (the local PE switch) by the label-switched-path statement within the [edit protocols mpls] hierarchy.
The receive-lsp option specifies the LSP name that was configured on PE-2 (the remote PE switch) by the label-switched-path statement within the [edit protocols mpls] hierarchy.

When you have completed configuring one PE switch, follow the same procedures to configure the other PE switch.

Configuring an MPLS-Based Layer 2 VPN (CLI Procedure)

You can configure MPLS-based Layer 2 virtual private networks (VPNs) on J-EX8200 switches. Some benefits of a Layer 2 VPN are that it is private, secure and flexible. To configure Layer 2 VPN functionality in your MPLS network, you must configure Layer 2 VPN components on the local and remote provider edge (PE) switches.

Before you configure the Layer 2 VPN components, you must configure the basic components for an MPLS network:

- Configure two PE switches. See “Configuring MPLS on Provider Edge Switches Using Circuit Cross-Connect (CLI Procedure)” on page 2210.
- Configure one or more provider switches. See “Configuring MPLS on Provider Switches (CLI Procedure)” on page 2201.

NOTE: A Layer 2 VPN requires that the PE switches be configured using a circuit cross-connect (CCC).

Configure the Layer 2 VPN components on both PE switches. This procedure describes how to configure one PE switch. Repeat the procedure to configure the remote PE switch.

To configure Layer 2 VPN components on the PE switch:

1. Configure the customer edge interface to use the physical encapsulation type **ethernet-ccc**:

   ```
   [edit]
   user@switch# set interfaces interface-name encapsulation ethernet-ccc
   ```

2. Configure BGP, specifying the loopback address of this PE switch as the local address and specifying **family l2vpn signaling**:

   ```
   [edit protocols bgp]
   user@switch# set local-address address family l2vpn signaling
   ```

3. Configure the BGP group, specifying the group name and **type internal**:

   ```
   [edit protocols bgp]
   user@switch# set group group-name type internal
   ```

4. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:

   ```
   [edit protocols bgp]
   user@switch# set neighbor address
   ```

5. Configure the routing instance, specifying the routing-instance name and using **l2vpn** as the instance type:

   ```
   [edit routing-instances]
   user@switch# set routing-instance-name instance-type l2vpn
   ```

6. Configure the routing instance to apply to the customer edge interface:

   ```
   user@switch#  set routing-instances routing-instance-name interface interface-name
   ```

7. Configure the routing instance to use a route distinguisher:

   

   NOTE: Each routing instance that you configure on a PE switch must have a unique route distinguisher associated with it. VPN routing instances musthave a route distinguisher to allow BGP to distinguish between potentially identical network layer reachability information (NLRI) messages received from different VPNs. If you configure different VPN routing instances with the same route distinguisher, the commit fails.

   ```
   user@switch#  set routing-instances routing-instance-name route-distinguisher
   ip-address:number
   ```

8. Configure the VPN routing and forwarding (VRF) target of the routing instance:

   ```
   [edit routing-instances]
   user@switch# set routing-instance-name vrf-target community
   ```

NOTE: If you configure the *community* option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. You can create more complex policies by explicitly configuring VRF import and export policies using the import and export options. See the *Junos OS VPNs Configuration Guide*.

9. Configure the protocols and encapsulation type used by the routing instance:

```
[edit routing-instances]
user@switch# set routing-instance-name protocols l2vpn encapsulation-type ethernet
```

10. Apply the routing instance to a customer edge interface and specify a description for it:

```
[edit routing-instances]
user@switch# set routing-instance-name protocols interface interface-name description
text
```

11. Configure the routing instance protocols site:

```
[edit routing-instances]
user@switch# set routing-instance-name protocols l2vpn site site-name site-identifier
identifierremote-site-id identifier
```

NOTE: The remote site ID (configured with the remote-site-id statement) corresponds to the site ID (configured with the site-identifier statement) configured on the other PE switch.

Related Documentation

- Example: Configuring MPLS-Based Layer 2 VPNs on J-EX Series Switches on page 2171
- Configuring an MPLS-Based Layer 3 VPN (CLI Procedure) on page 2216
- Understanding Using MPLS-Based Layer 2 and Layer 3 VPNs on J-EX Series Switches on page 2141

Configuring an MPLS-Based Layer 3 VPN (CLI Procedure)

You can configure MPLS-based Layer 3 virtual private networks (VPNs) on J-EX8200 switches. Layer 3 VPNs leverage the service provider's technical expertise for site-to-site routing.

To configure Layer 3 VPN functionality in your MPLS network, you must enable Layer 3 VPN support on the local and remote provider edge (PE) switches as described in this task.

Before you configure the Layer 3 VPN components, you must configure the basic components for an MPLS network:

- Configure two PE switches. See "Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)" on page 2206.
- Configure one or more provider switches. See "Configuring MPLS on Provider Switches (CLI Procedure)" on page 2201.

NOTE: A Layer 3 VPN requires that the PE switches be configured using IP over MPLS.

Configure the Layer 3 VPN components on both PE switches. This procedure describes how to configure one PE switch. Repeat the procedure to configure the remote PE switch.

NOTE: When you configure the remote PE switch, the information specified for the routing instance must be configured the same as the information specified for the routing instance on the local PE switch. You must also specify the same BGP group name. The following statements will have different values on the remote PE switch from those on the local PE switch:

- **local-address**
- **neighbor**

To configure an MPLS-based Layer 3 VPN on the PE switch:

1. Configure BGP, specifying the loopback address as the local address and specifying **family inet-vpn unicast**:

   ```
   [edit protocols bgp]
   user@switch# set local-address address family inet-vpn unicast
   ```

2. Configure the BGP group, specifying the group name and **type internal**:

   ```
   [edit protocols bgp]
   user@switch# set group group-name type internal
   ```

3. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:

```
[edit protocols bgp]
user@switch# set neighbor address
```

4. Configure the routing instance, specifying the routing-instance name and using **vrf** as the instance type:

```
[edit]
user@switch# set routing-instances routing-instance-name instance-type vrf
```

5. Configure a description for this routing instance:

```
[edit]
user@switch# set routing-instances routing-instance-name description text
```

6. Configure the routing instance to use a route distinguisher:

NOTE: Each routing instance that you configure on a PE switch must have a unique route distinguisher associated with it. VPN routing instances must have a route distinguisher to allow BGP to distinguish between potentially identical network layer reachability information (NLRI) messages received from different VPNs. If you configure different VPN routing instances with the same route distinguisher, the commit fails.

```
user@switch#  set routing-instances routing-instance-name route-distinguisher
ip-address:number
```

7. Configure the VPN routing and forwarding (VRF) target of the routing instance:

```
[edit routing-instances]
user@switch# set routing-instance-name vrf-target community
```

NOTE: If you configure the *community* option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. You can create more complex policies by explicitly configuring VRF import and export policies using the import and export options. See the *Junos OS VPNs Configuration Guide*.

8. Configure this routing instance with **vrf-table-label**, which maps the inner label of a packet to a specific VPN routing and forwarding (VRF) table and allows the examination of the encapsulated IP header.

```
[edit routing-instances]
user@switch# set routing-instance-name vrf-table-label
```

9. (Optional) Configure the routing options:

NOTE: We recommend that you configure the router identifier under the **[edit routing-options]** hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

```
[edit routing-options]
```

```
user@switch# set router-id ip-address autonomous-system as-number
```

CHAPTER 73

Verifying MPLS

Verifying That MPLS Is Working Correctly

To verify that MPLS is working correctly on J-EX Series switches, perform the following tasks:

Verifying the Physical Layer on the Switches

Purpose Verify that the interfaces are up. Perform this verification task on each of the switches.

Action

```
user@switch> show interfaces ge- terse

Interface               Admin Link Proto    Local                 Remote
ge-0/0/0                up    up
ge-0/0/0.0              up    up
ge-0/0/1.0              up    up   ccc
ge-0/0/2.0              up    up   ccc
ge-0/0/3.0              up    up   eth-switch
ge-0/0/4.0              up    up   eth-switch
ge-0/0/5.0              up    up   inet      10.1.5.1/24
            mpls
ge-0/0/6.0              up    up   inet      10.1.6.1/24
            mpls
```

Meaning The **show interfaces terse** command displays status information about the Gigabit Ethernet interfaces on the switch. This output verifies that the interfaces are **up**. The output for the protocol family (**Proto** column) shows that interfaces **ge-0/0/1.0** and **ge-0/0/2.0** are configured as circuit cross-connect. The Local and Remote columns do not display

IP addresses, because the **inet family** is not configured for CCC interfaces. The output for the protocol family of the core interfaces (**ge-0/0/0.5** and **ge-0/0/0.6**), shows that these interfaces are configured as both **inet** and **mpls**. The **Local** column for the core interfaces shows the IP address configured for these interfaces.

Verifying the Routing Protocol

Purpose Verify the state of the configured routing protocol. You should perform this verification task on each of the switches. The state should be **Full**. If you have configured OSPF as the routing protocol, use the **show ospf neighbor** command to verify that the routing protocol is communicating with the switch neighbors. If you have configured IS-IS as the routing protocol, use the **show isis adjacency** command to verify that the routing protocol is communicating with the switch neighbors.

Action

```
user@switch> show ospf neighbor

Address          Interface              State     ID               Pri  Dead
127.1.1.2          ge–0/0/5               Full      10.10.10.10      128    39
```

Meaning The **show ospf neighbor** command displays the status of the routing protocol that has been configured on this switch. The output shows that the state is **full**, meaning that the routing protocol is operating correctly—that is, hello packets are being exchanged between directly connected neighbors. For additional information on checking and monitoring routing protocols, see the *Junos OS Routing Protocols and Policies Command Reference* .

Verifying the Core Interfaces Being Used for the MPLS Traffic

Purpose Verify that the state of the MPLS interface is **Up**. You should perform this verification task on each of the switches.

Action

```
user@switch> show mpls interface

Interface        State       Administrative groups
ge–0/05            Up          <none>
```

Meaning The **show mpls interface** command displays the status of the core interfaces that have been configured to belong to **family mpls**. This output shows that the interface configured to belong to **family mpls** is **up**.

Verifying RSVP

Purpose Verify the state of the RSVP session. You should perform this verification task on each of the switches.

Action

```
user@switch> show rsvp session

Ingress RSVP: 1 sessions
To              From            State   Rt Style Labelin Labelout LSPname
127.1.1.3         127.1.1.1         Up       0  1 FF       -   300064
lsp_to_pe2_ge1
Total 1 displayed, Up 1, Down 0
```

```
Egress RSVP: 1 sessions
To              From            State   Rt Style Labelin Labelout LSPname
127.1.1.1         127.1.1.3         Up       0  1 FF  299968        -
lsp_to_pe1_ge1
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning This output confirms that the RSVP sessions are **Up**.

Verifying the Assignment of Interfaces for MPLS Label Operations

Purpose Verify which interface is being used as the beginning of the CCC and which interface is being used to push the MPLS packet to the next hop. You should perform this task only on the provider edge switches.

Action

```
user@switch> show route forwarding-table family mpls
MPLS:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    dscd    50     1
0                  user     0                    recv    49     3
1                  user     0                    recv    49     3
2                  user     0                    recv    49     3
299776             user     0                    Pop    541     2 ge-0/0/1.0
ge-0/0/1.0  (CCC)  user     0 127.1.2.1         Push 299792   540 2   ge-0/0/5.0
```

Meaning This output shows that CCC has been set up on interface **ge-0/0/1.0**. The switch receives ingress traffic on **ge-0/0/1.0** with label **299776**. It pops that label and swaps it to label **299792**, which it pushes out on interface **ge-0/0/5.0**.

Verifying the Status of the CCC

Purpose Verify the status of the CCC. You should perform this task only on the provider edge switches.

Action

```
user@switch> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)              Legend for connection types
UN -- uninitialized                 if-sw:  interface switching
NP -- not present                   rmt-if: remote interface switching
WE -- wrong encapsulation           lsp-sw: LSP switching
DS -- disabled                      tx-p2mp-sw: transmit P2MP switching
Dn -- down                          rx-p2mp-sw: receive P2MP switching
-> -- only outbound conn is up
 <- -- only inbound  conn is up      Legend for circuit types
Up -- operational                   intf -- interface
RmtDn -- remote CCC down            tlsp -- transmit LSP
Restart -- restarting               rlsp -- receive LSP

Connection/Circuit               Type        St      Time last up     # Up trans
ge1-to-pe2                        rmt-if      Up      Feb 17 05:00:09  1
  ge-0/0/1.0                       intf       Up
  lsp_to_pe1_ge1                     tlsp     Up
  lsp_to_pe2_ge1                     rlsp     Up
```

Meaning The **show connections** command displays the status of the CCC connections. This output verifies that the CCC interface and its associated transmit and receive LSPs are **Up**.

    7 Mar 11 23:58:01.684 Deselected as active: due to 'primary'
    6 Mar 11 23:46:17.298 Selected as active path
```

```
    5 Mar 11 23:46:17.295 Record Route:  5.5.5.2
    4 Mar 11 23:46:17.287 Up
    3 Mar 11 23:46:16.760 Originate Call
    2 Mar 11 23:46:16.760 CSPF: computation result accepted  10.3.5.2
    1 Mar 11 23:45:48.095 CSPF failed: no route toward 10.5.5.5[2 times]
  Created: Wed Mar 11 23:44:37 2009
 [Output truncated]
```

Meaning As indicated by the **ActivePath** in the output, the LSP **primary_path_lsp_to_240** is active.

Verifying the RSVP-Enabled Interfaces

Purpose Verify the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics.

Action

```
user@switch> show rsvp interfaces

RSVP interface: 1 active
                  Active Subscr- Static      Available   Reserved    Highwater
Interface   State resv   iption  BW          BW          BW          mark
ge-0/0/20.0 Up         2   100%  1000Mbps    1000Mbps    0bps        0bps
```

Meaning This output verifies that RSVP is enabled and operational on interface **ge-0/0/20.0**.

Verifying a Secondary Path

Purpose Verify that a secondary path is established.

Action Deactivate a switch that is critical to the primary path and then issue the following command:

```
user@switch> show mpls lsp extensive

Ingress LSP: 1 sessions

127.0.0.8
  From: 127.0.0.1, State: Up, ActiveRoute: 0, LSPname: lsp_to_240

connections

Syntax

```
connections {
  remote-interface-switch connection-name {
    interface interface-name.unit-number;
    transmit-lsp label-switched-path;
    receive-lsp label-switched-path;
  }
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the connection between two circuits in a CCC connection.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols l2vpn site *site-name* interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Describe the VPN or virtual private LAN service (VPLS) routing instance.

Options ***text***—Provide a text description. If the text includes one or more spaces, enclose it in quotation marks (" "). Any descriptive text you include is displayed in the output of the **show route instance detail** command and has no effect on operation.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

encapsulation (Physical Interface)

Syntax encapsulation (atm-ccc-cell-relay | atm-pvc | cisco-hdlc | cisco-hdlc-ccc | cisco-hdlc-tcc | ethernet-ccc | ethernet-over-atm | ethernet-tcc | ethernet-vpls | ethernet-vpls-fr | ethernet-vpls-ppp | extended-frame-relay-ccc | extended-frame-relay-tcc | extended-vlan-ccc | extended-vlan-tcc | extended-vlan-vpls | flexible-ethernet-services | flexible-frame-relay | frame-relay | frame-relay-ccc | frame-relay-port-ccc | frame-relay-tcc | multilink-frame-relay-uni-nni | ppp | ppp-ccc | ppp-tcc | vlan-ccc | vlan-vpls);

Hierarchy Level [edit interfaces *interface-name*],
[edit logical-systems *logical-system-name* interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify the physical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.

Default PPP encapsulation.

Options **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.

atm-pvc—Use ATM permanent virtual connection (PVC) encapsulation.

cisco-hdlc—Use Cisco-compatible HDLC framing.

cisco-hdlc-ccc—Use Cisco-compatible HDLC framing on CCC circuits.

cisco-hdlc-tcc—Use Cisco-compatible HDLC framing on TCC circuits for connecting unlike media.

ethernet-ccc—Use Ethernet CCC encapsulation on Ethernet interfaces that must accept packets carrying standard Tag Protocol ID (TPID) values. For example, Ethernet CCC encapsulation can be used to transparently transport any VLANs or other Ethernet frames entering a port across a Layer 2 circuit.

ethernet-over-atm—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 1483 *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridged-mode protocol data units (BPDUs). The Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or Address Resolution Protocol (ARP) in the payload and drops the rest. For packets destined for the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and media access control (MAC) header and forwarded to the ATM interface.

ethernet-tcc—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. Ethernet TCC is not currently supported on Fast Ethernet 48-port PICs.

ethernet-vpls—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values.

ethernet-vpls-fr—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

ethernet-vpls-ppp—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

extended-frame-relay-ccc—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate data link connection identifiers (DLCIs) 1 through 1022 to CCC.

extended-frame-relay-tcc—Use Frame Relay encapsulation on TCC circuits to connect unlike media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

extended-vlan-ccc—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values.

extended-vlan-tcc—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. Extended Ethernet TCC is not currently supported on Fast Ethernet 48-port PICs.

extended-vlan-vpls—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901.

flexible-ethernet-services—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) only, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. This encapsulation type allows you to configure any combination of route, TCC, CCC, and VPLS encapsulations on a single physical port. Aggregated Ethernet bundles cannot use this encapsulation type. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

flexible-frame-relay—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

frame-relay—Use Frame Relay encapsulation.

frame-relay-ccc—Use Frame Relay encapsulation or Frame Relay encapsulation on CCC circuits.

frame-relay-port-ccc—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two CE routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. When you use this encapsulation type, you can configure the family **ccc** only.

frame-relay-tcc—Use Frame Relay encapsulation on TCC circuits to connect unlike media.

multilink-frame-relay-uni-nni—Use MLFR user-to-network interface (UNI) network-to-network interface (NNI) encapsulation. This encapsulation is used only on link services and voice services interfaces functioning as FRF.16 bundles and their constituent T1 or E1 interfaces.

ppp—Use serial PPP encapsulation.

ppp-ccc—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the family **ccc** only.

ppp-tcc—Use serial PPP encapsulation on TCC circuits for connecting unlike media. When you use this encapsulation type, you can configure the family **tcc** only.

vlan-ccc—Use Ethernet VLAN encapsulation on CCC circuits.

vlan-vpls—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

encapsulation-type

Syntax encapsulation-type (atm-aal5 | atm-cell | atm-cell-port-mode | atm-cell-vc-mode | atm-cell-vp-mode | cesop | cisco-hdlc | ethernet | ethernet-vlan | frame-relay | frame-relay-port-mode | interworking | ppp | satop-e1 | satop-e3 | satop-t1 | satop-t3);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn],
[edit routing-instances *routing-instance-name* protocols l2vpn]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify the type of Layer 2 traffic originating from the CE router for the Layer 2 VPN. Not all encapsulation types are supported on the switches. See the switch CLI.

Options

atm-aal5—ATM Adaptation Layer (AAL/5)

atm-cell—ATM cell relay

atm-cell-port-mode—ATM cell relay port promiscuous mode

atm-cell-vc-mode—ATM VC cell relay nonpromiscuous mode

atm-cell-vp-mode—ATM virtual path (VP) cell relay promiscuous mode

cesop—CESOP-based Layer 2 VPN

cisco-hdlc—Cisco Systems–compatible HDLC

ethernet—Ethernet

ethernet-vlan—Ethernet VLAN

frame-relay—Frame Relay

frame-relay-port-mode—Frame Relay port mode

interworking—Layer 2.5 interworking VPN

ppp—PPP

satsop-e1—SATSOP-E1–based Layer 2 VPN

satsop-e3—SATSOP-E3–based Layer 2 VPN

satsop-t1—SATSOP-T1–based Layer 2 VPN

satsop-t3—SATSOP-T3–based Layer 2 VPN

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

exp

Syntax

```
exp classifier-name {
  import (classifier-name | default);
  forwarding-class class-name {
    loss-priority level {
      code-points [ aliases ] [ 3–bit-patterns ];
    }
  }
}
```

Hierarchy Level [edit class-of-service classifiers]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the experimental bits (EXP) code point mapping that is applied to the MPLS packets.

J-EX Series switches support only one EXP code mapping on the switch (either default or custom). It is applied globally and implicitly to all the MPLS-enabled interfaces on the switch. You cannot bind it to an individual interface and you cannot disable it.

Options *classifier-name*—Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

instance-type

Syntax instance-type (forwarding | l2vpn | layer2-control | no-forwarding | virtual-router | virtual-switch | vpls | vrf);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*], [edit routing-instances *routing-instance-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the type of routing instance.

Default **no-forwarding**

Options

forwarding—Provide support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance. Other instances are used for populating RPD learned routes. See Configuring Filter-Based Forwarding.

l2vpn—Provide support for Layer 2 VPNs.

layer2-control—(MX Series routers only) Provide support for RSTP or MSTP in customer edge interfaces of a VPLS routing instance.

no-forwarding—This is the default routing instance. Do not create a corresponding forwarding instance.

virtual-router—Similar to a VPN routing and forwarding instance type, but used for non-VPN-related applications. There are no VRF import, VRF export, VRF target, or route distinguisher requirements for this instance type.

virtual-switch—(MX Series routers only) Provide support for Layer 2 bridging. Use this routing instances type to isolate a LAN segment with its Spanning Tree Protocol (STP) instance and separates its VLAN identifier space.

vpls—Virtual private local-area network (LAN) service. Use this routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN.

vrf—VPN routing and forwarding instance. Provides support for Layer 3 VPNs, where interface routes for each instance go into the corresponding forwarding table only.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface

Syntax interface (all | *interface-name*);

Hierarchy Level [edit protocols mpls]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable MPLS on all interfaces on the switch or on the specified interface.

Default MPLS is disabled.

Options **all**—All interfaces on the switch.

interface-name—Name of an interface:

- Aggregated Ethernet—**ae*x***
- Gigabit Ethernet—**ge-*fpc/pic/port***

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

label-switched-path

Syntax label-switched-path *lsp-name* to *remote-provider-edge-switch*;

Hierarchy Level [edit protocols mpls]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a label-switched path (LSP) to the remote provider edge switch to use for MPLS traffic. You must specify this statement on the provider edge switch.

Options

lsp-name —Name that identifies the LSP. The name can be up to 32 characters and can contain letters, digits, periods, and hyphens. To include other characters, enclose the name in quotation marks. The name must be unique on the ingress switch.

remote-provider-edge-switch —Either the loopback address or the switch address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

neighbor

Syntax

```
neighbor address {
  interface interface-name {
    bandwidth (bandwidth | ctnumber bandwidth);
    community community-name;
    (control-word | no-control-word);
    description text;
    ignore-encapsulation-mismatch;
    ignore-mtu-mismatch;
    mtu mtu-number;
    protect-interface interface-name;
    pseudowire-status-tlv;
    psn-tunnel-endpoint address;
    static {
      incoming-label label;
      outgoing-label label;
    }
    virtual-circuit-id identifier;
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols l2circuit],
[edit protocols l2circuit]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Each Layer 2 circuit is represented by the logical interface connecting the local provider edge (PE) router or switch to the local customer edge (CE) router or switch. All the Layer 2 circuits using a particular remote PE router or switch designated for remote CE routers or switches are listed under the **neighbor** statement (neighbor designates the PE router or switch). Each neighbor is identified by its IP address and is usually the end-point destination for the LSP tunnel (transporting the Layer 2 circuit).

Options ***address***—IP address of a neighboring router or switch.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Interfaces for Layer 2 Circuits

path

Syntax

```
path destination {
  <address | hostname> <strict | loose>
}
```

Hierarchy Level [edit protocols mpls]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure path protection on your MPLS network.

Options

destination —Name of a label switched path (LSP). In addition to specifying the name of the configured LSP, you can include some other designation such as **primary-path**.

address —(Optional) IP address of each transit switch (or the IP address of the loopback interface on the switch) in the LSP. If you want to control exactly which switches are selected for the LSP, specify the address or hostname of each transit switch. Specify the addresses in order, starting with the first provider (transit) switch, and continuing sequentially along the path until reaching the egress provider edge switch.

Default: If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.

hostname —(Optional) See ***address*** .

Default: If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.

loose—(Optional) Indicates that the next address in the **path** statement is a loose link. This means that the LSP can traverse through other switches before reaching this switch.

Default: **strict**

strict—(Optional) Indicates that the LSP must go to the next address specified in the **path** statement without traversing other switches. This is the default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Path Protection in an MPLS Network (CLI Procedure) on page 2197

policing

Syntax policing (filter *filter-name* | no-automatic-policing);

Hierarchy Level [edit protocols mpls label-switched-path *lsp-name*]
[edit interfaces *interface-id* unit *number-of-logical-unit* family inet address *ip-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a rate-limiting policer as the specified policing filter:

- To the LSP for MPLS over CCC.
- To the customer-edge interface for IP over MPLS.

Options **filter *filter-name***—Specify the name of the policing filter.

no-automatic-policing—Disable automatic policing on this LSP.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- **policer on page 1819**

- Configuring CoS on MPLS Provider Edge Switch Using IP Over MPLS (CLI Procedure) on page 1933

primary

Syntax primary *path-name*;

Hierarchy Level [edit protocols **mpls label-switched-path** *lsp-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the primary path to use for a label switched path (LSP). You can configure only one primary path.

Options ***path-name*** —Name of the primary path that you created with the **path** statement.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Path Protection in an MPLS Network (CLI Procedure) on page 2197

remote-interface-switch

Syntax

```
remote-interface-switch connection-name {
    interface interface-name.unit-number;
    receive-lsp label-switched-path;
    transmit-lsp label-switched-path;
}
```

Hierarchy Level [edit protocols **connections**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MPLS LSP tunnel cross-connects. This makes an association between a CCC interface and two LSPs, one for transmitting MPLS packets from the local provider edge switch to the remote provider edge switch and the other for receiving MPLS packets on the local provider edge switch from the remote provider edge switch.

Options

connection-name —Connection name.

interface *interface-name.unit-number* —Interface name. Include the logical portion of the name, which corresponds to the logical unit number of the CCC interface.

receive-lsp *label-switched-path* —Name of the LSP from the connection's source. This LSP name was specified by the **label-switched-path** statement on the remote provider edge switch in the **protocols mpls** stanza.

transmit-lsp *label-switched-path* —Name of the LSP to the connection's destination. This LSP name was specified by the **label-switched-path** statement on the local provider edge switch in the **protocols mpls** stanza.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring MPLS on J-EX Series Switches on page 2145
- Configuring MPLS on Provider Edge Switches (CLI Procedure)
- *Junos OS MPLS Applications Configuration Guide*

remote-site-id

Syntax remote-site-id *remote-site-ID*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn site *site-name* interface *interface-name*],
[edit routing-instances *routing-instance-name* protocols l2vpn site *site-name* interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Control the remote interface to which the interface should connect. If you do not explicitly configure the remote site ID, the order of the interfaces configured for the site determines the default value. This statement is optional.

Options ***remote-site-ID***—Identifier specifying the interface on the remote PE router the Layer 2 VPN routing instance connects to.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring the Local Site on PE Routers in Layer 2 VPNs
- Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 2213

revert-timer

Syntax revert-timer *seconds*;

Hierarchy Level [edit protocols **mpls**],
[edit protocols mpls **label-switched-path** *lsp-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the amount of time that a label switched path (LSP) must wait before traffic reverts to a primary path. If during this time the primary path experiences any connectivity problem or stability problem, the timer is restarted.

If you have configured a value of 0 seconds for the **revert-timer** statement and traffic is switched to the secondary path, the traffic remains on that path indefinitely. It is never switched back to the primary path unless you intervene.

Default 60 seconds

Options ***seconds*** —Value in seconds.

Range: 0 through 65,535 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Path Protection in an MPLS Network (CLI Procedure) on page 2197

route-distinguisher

Syntax route-distinguisher (*as-number:number* | *ip-address:number*);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*], [edit routing-instances *routing-instance-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify an identifier attached to a route, enabling you to distinguish to which VPN the route belongs. Each routing instance must have a unique route distinguisher associated with it. The route distinguisher is used to place bounds around a VPN so that the same IP address prefixes can be used in different VPNs without having them overlap. If the instance type is **vrf**, the **route-distinguisher** statement is required.

Options ***as-number:number*—*as-number*** is an assigned AS number and ***number*** is any 2-byte for 4-byte value. The AS number can be from 1 through 4,294,967,295. If the AS number is a 2-byte value, the administrative number is a 4-byte value. If the AS number is 4-byte value, the administrative number is a 2-byte value. A route distinguisher consisting of a 4-byte AS number and a 2-byte administrative number is defined as a type 2 route distinguisher in RFC 4364 *BGP/MPLS IP Virtual Private Networks*.

NOTE: The numeric range for AS numbers is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. All releases of the Junos OS support 2-byte AS numbers. To configure a route distinguisher that includes a 4-byte AS number, append the letter "L" to the end of the number. For example, a route distinguisher with the 4-byte AS number 7,765,000 and an administrative number of 1,000 is represented as 7765000L:1000.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <*16-bit high-order value in decimal*>.<*16-bit low-order value in decimal*>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

ip-address:number*—*ip-address is an IP address in your assigned prefix range (a 4-byte value) and ***number*** is any 2-byte value.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

rsvp

Syntax rsvp;

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable Resource Reservation Protocol (RSVP) signaling. The primary purpose of RSVP in Junos OS for J-EX Series switches is to support dynamic signaling within label switched paths (LSPs).

Default RSVP is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

secondary

Syntax

```
secondary path-name {
    standby;
{
```

Hierarchy Level [edit protocols **mpls label-switched-path** *lsp-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify one or more secondary paths to use for the label switched path (LSP). You can configure more than one secondary path. All secondary paths are equal, and the first one that is available is chosen.

Options ***path-name*** —Name of a secondary path that you created with the **path** statement.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* family inet-mvpn]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Enable signaling in BGP. For multicast distribution tree (MDT) subaddress family identifier (SAFI) NLRI signaling, configure signaling under the **inet-mdt** family. For multiprotocol BGP (MBGP) intra-AS NLRI signaling, configure signaling under the **inet-mvpn** family.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Source-Specific Multicast for Draft-Rosen Multicast VPNs
- Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 2213

site

Syntax

```
site site-name {
  site-identifier identifier;
  site-preference preference-value {
    backup;
    primary;
  }
  interface interface-name {
    description text;
    remote-site-id remote-site-ID;
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn],
[edit routing-instances *routing-instance-name* protocols l2vpn]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify the site name, site identifier, and interfaces connecting to the site. Allows you to configure a remote site ID for remote sites.

Options

site-identifier *identifier*—Numerical identifier for the site used as a default reference for the remote site ID.

site-name—Name of the site.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring the Local Site on PE Routers in Layer 2 VPNs
- Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 2213

site-identifier

Syntax site-identifier *identifier*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn site *site-name*],
[edit routing-instances *routing-instance-name* protocols l2vpn site *site-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify the numerical identifier for the local Layer 2 VPN site.

Options ***identifier***—The numerical identifier for the Layer 2 VPN site, which can be any number from 1 through 65,534.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Local Site on PE Routers in Layer 2 VPNs
- Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 2213

standby

Syntax standby;

Hierarchy Level [edit protocols **mpls label-switched-path** *lsp-name* **secondary** *path-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the path to remain up at all times to provide instant switchover if connectivity problems occur.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Path Protection in an MPLS Network (CLI Procedure) on page 2197

traffic-engineering

Syntax traffic-engineering;

Hierarchy Level [edit protocols ospf | isis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the traffic engineering features of the specified routing protocol.

Default Traffic engineering is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring MPLS on J-EX Series Switches on page 2145
- Configuring MPLS on Provider Edge Switches (CLI Procedure)
- Configuring MPLS on Provider Switches (CLI Procedure) on page 2201

- *Junos OS MPLS Applications Configuration Guide*

vrf-table-label

Syntax vrf-table-label;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],
[edit routing-instances *routing-instance-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Map the inner label of a packet to a specific VPN routing and forwarding (VRF) table. This allows the examination of the encapsulated IP header. This statement is not supported on 4 port E3 IQ PICs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Filtering Packets in Layer 3 VPNs Based on IP Headers
- Configuring EXP-Based Traffic Classification for VPLS
- Load Balancing and IP Header Filtering for Layer 3 VPNs

vrf-target

Syntax

```
vrf-target {
  community;
  import community-name;
  export community-name;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*], [edit routing-instances *routing-instance-name*]

Release Information Statement introduced in Junos OS Release 11.1 for J-EX Series switches.

Description Specify a VRF target community. If you configure the ***community*** option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. The purpose of the **vrf-target** statement is to simplify the configuration by allowing you to configure most statements at the **[edit routing-instances]** hierarchy level.

You can still create more complex policies by explicitly configuring VRF import and export policies using the **import** and **export** options.

Options ***community***—Community name.

import *community-name*—Communities accepted from neighbors.

export *community-name*—Communities sent to neighbors.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

CHAPTER 75

Operational Commands for MPLS

clear mpls lsp

Syntax

clear mpls lsp
<autobandwidth>
<logical-system (all | *logical-system-name*)>
<name *name*>
<optimize | optimize-aggressive>
<path *regular-expression*>
<statistics>

Syntax (J-EX Series Switch)

clear mpls lsp
<autobandwidth>
<name *name*>
<optimize | optimize-aggressive>
<path *regular-expression*>
<statistics>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

CAUTION: This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.

Options

none—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.

autobandwidth—(Optional) Clear LSP autobandwidth counters.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name *name*—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos OS Network Interfaces Configuration Guide*.

optimize | optimize-aggressive—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.

path *regular-expression*—(Optional) Clear the specific LSP path matching the specified regular expression.

statistics—(Optional) Clear LSP statistics.

Required Privilege Level

clear

Related Documentation
- show mpls lsp on page 2312
- show rsvp session on page 2344

List of Sample Output clear mpls lsp on page 2261

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear mpls lsp

```
user@host> clear mpls lsp
```

clear rsvp session

Syntax

clear rsvp session
<connection-source *address*>
<connection-destination *address*>
<gracefully>
<logical-system (all | *logical-system-name*)>
<lsp-id *identifier*>
<name *name*>
<optimize-fast-reroute>
<tunnel-id *identifier*>

Syntax (J-EX Series Switch)

clear rsvp session
<connection-source *address*>
<connection-destination *address*>
<gracefully>
<lsp-id *identifier*>
<name *name*>
<optimize-fast-reroute>
<tunnel-id *identifier*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reset and restart Resource Reservation Protocol (RSVP) sessions.

Options

none—Reset and restart all RSVP sessions for which this routing device is the ingress, transit, or egress routing device.

connection-source *address*—(Optional) Source address for GMPLS and MPLS LSPs from the RSVP sender template.

connection-destination *address*—(Optional) Destination address for GMPLS and MPLS LSPs from the RSVP sender template.

gracefully—(Optional) Gracefully reset an RSVP session for a nonpacket LSP in two passes. In the first pass, the Admin-Status object is signaled along the path to the other endpoint of the RSVP session. In the second pass, the path used by the RSVP session is torn down. This option can only be used on the ingress or egress routing device of the RSVP session and is only valid for nonpacket LSPs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-id *identifier*—(Optional) LSP identifier (source port) for the RSVP sender template.

name *name*—(Optional) Reset and restart the specified RSVP session.

optimize-fast-reroute—(Optional) Begin fast reroute optimization.

tunnel-id *identifier*—(Optional) Tunnel identifier (destination port) for the RSVP session.

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear rsvp session

```
user@host> clear rsvp session
```

clear rsvp statistics

Syntax clear rsvp statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) clear rsvp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear Resource Reservation Protocol (RSVP) packet and error statistics.

Options none—Clear RSVP packet and error statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level clear

```
user@host> clear rsvp statistics
```

ping mpls l2circuit

Syntax

ping mpls l2circuit (interface *interface-name* | virtual-circuit *virtual-circuit-id* neighbor *address*)
<count *count*>
<destination *address*>
<detail>
<exp *forwarding-class*>
<logical-system (all | *logical-system-name*)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size *bytes*>
<source *source-address*>
<sweep>
<v1>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

Description

Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a **ping mpls l2circuit** command.

Options

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through **1,000,000**. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

interface *interface-name*—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel—Reply using an application level control channel.

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

NOTE: The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size *bytes*—(Optional) Size of the label-switched path (LSP) ping request packet (**96** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

v1—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

virtual-circuit *virtual-circuit-id* neighbor *address*—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Additional Information

You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level

network

List of Sample Output

ping mpls l2circuit interface on page 2266
ping mpls l2circuit virtual-circuit detail on page 2266
ping mpls l2circuit interface <interface-name> reply-mode on page 2267

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

ping mpls l2circuit virtual-circuit detail

```

Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

ping mpls l2vpn

Syntax

ping mpls l2vpn (instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number* | interface *interface-name*)
<bottom-label-ttl>
<count *count*>
<destination *address*>
<detail>
<exp *forwarding-class*>
<logical-system (all | *logical-system-name*)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size *bytes*>
<source *source-address*>
<sweep>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

Description

Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a **ping mpls l2vpn** command.

Options

bottom-label-ttl—(Optional) Display the time-to-live value for the bottom label in the label stack.

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through 1,000,000. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number*—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.

interface *interface-name*—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel—Reply using an application level control channel.

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel, ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size *bytes*—(Optional) Size of the label-switched path (LSP) ping request packet (**96** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

ping mpls l3vpn

Syntax

ping mpls l3vpn prefix *prefix-name*
<*l3vpn-name*>
<bottom-label-ttl>
<count *count*>
<destination *address*>
<detail>
<exp *forwarding-class*>
<logical-system (all | *logical-system-name*)>
<size *bytes*>
<source *source-address*>
<sweep>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a **ping mpls l3vpn** command.

Options

bottom-label-ttl—(Optional) Display the time-to-live value for the bottom label in the label stack.

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through **1,000,000**. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

l3vpn-name—(Optional) Layer 3 VPN name.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

prefix *prefix-name*—Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.

size *bytes*—(Optional) Size of the label-switched path (LSP) ping request packet (**96** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

5 packets transmitted, 5 packets received, 0% packet loss
```

ping mpls ldp

Syntax

ping mpls ldp *fec*
<count *count*>
<destination *address*>
<detail>
<exp *forwarding-class*>
<instance *routing-instance-name*>
<logical-system (all | *logical-system-name*)>
<size *bytes*>
<source *source-address*>
<sweep>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a **ping mpls** command.

Options

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through **1,000,000**. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

fec—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

instance *routing-instance-name*—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

size *bytes*—(Optional) Size of the label-switched path (LSP) ping request packet (**88** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *Junos OS MPLS Applications Configuration Guide*.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level network

List of Sample Output **ping mpls ldp fec count on page 2274**

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

ping mpls lsp-end-point

Syntax

ping mpls lsp-end-point *prefix-name*
<count *count*>
<destination *address*>
<detail>
<exp *forwarding-class*>
<instance *routing-instance-name*>
<logical-system (all | *logical-system-name*)>
<size *bytes*>
<source *source-address*>
<sweep>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a **ping mpls** command.

Options

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through **1,000,000**. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

instance *routing-instance-name*—(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

prefix-name—LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.

size *bytes*—(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is **88** bytes. If the endpoint is RSVP-based, the minimum size of the packet is **100** bytes. The maximum size in either case is **65468** bytes.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols**

mpls] hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

```

ping mpls rsvp

Syntax

ping mpls rsvp
<*lsp-name*>
<count *count*>
<destination *address*>
<detail>
<dynamic-bypass>
<egress *egress-address*>
<exp *forwarding-class*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<manual-bypass>
<multipoint>
<size *bytes*>
<source *source-address*>
<standby *standby-path-name*>
<sweep>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.

Description

Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a **ping mpls** command.

Options

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is **1** through **1,000,000**. The default value is **5**.

destination *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

NOTE: When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent routers running Junos OS with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

dynamic-bypass—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

egress *egress-address*—(Optional) Only the specified egress router or switch responds to the ping request.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

interface—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

lsp-name—Ping an RSVP-signaled LSP using an LSP name.

manual-bypass—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

multipoint—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

size *bytes*—(Optional) Size of the LSP ping request packet (**100** through **65468** bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

standby *standby-path-name*—(Optional) Name of the standby path.

sweep —(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information

If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

request mpls lsp adjust-autobandwidth

Syntax
request mpls lsp adjust-autobandwidth
<logical-system (all | *logical-system-name*)>
<name *lsp-name*>

Syntax (J-EX Series Switch)
request mpls lsp adjust-autobandwidth
<name *lsp-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).

Options
none—Manually trigger a bandwidth allocation adjustment for all active LSP paths.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name *lsp-name*—(Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only.

Additional Information
For this command to work properly, the following conditions must exist:

- Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the **request mpls lsp adjust-autobandwidth** command.
- The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.

Required Privilege Level
maintenance

List of Sample Output
request mpls lsp adjust-auto-bandwidth on page 2282

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

request mpls lsp adjust-auto-bandwidth

```
user@host> request mpls lsp adjust-auto-bandwidth
```

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the configured circuit cross-connect (CCC) connections.

Options

none—Display the standard level of output for all configured CCC connections.

all—(Optional) Display all connections.

brief | extensive—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.

interface-switch—(Optional) Display interface switch connections only.

lsp-switch—(Optional) Display LSP switch connections only.

p2mp-receive-switch—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

p2mp-transmit-switch—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

remote-interface-switch—(Optional) Display remote interface switch connections only.

down | up | up-down—(Optional) Display nonoperational, operational, or both kinds of connections.

history—(Optional) Display information about connection history.

labels—(Optional) Display labels used for transmit and receive.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name—(Optional) Display information about the specified connection only.

status—(Optional) Display information about the connection and interface status.

Required Privilege Level view

Output Fields Table 288 on page 2284 describes the output fields for the **show connections** command. Output fields are listed in the approximate order in which they appear.

Table 288: show connections Output Fields

Field Name	Field Description
CCC and TCC connections [Link Monitoring On | Off]	Whether link monitoring is enabled: **On** or **Off**.
Legend for Status (St)	Connection or circuit status. See the output's legend for an explanation of the status field values.
Legend for connection types	Type of connection: • **if-sw**—Layer 2 switching cross-connect. • **rmt-if**—Remote interface switch. While graceful restart is in progress, **rmt-if** will display a state **(St)** of **Restart**. • **lsp-sw**—LSP stitching cross-connect. While graceful restart is in progress, **lsp-sw** will display a state **(St)** of **Restart**.
Legend for circuit types	Type of circuits: • **intf**—Interface circuit. • **tlsp**—Transmit LSP circuit. • **rlsp**—Receive LSP circuit.
Connection/Circuit	Name of the configured CCC connection.
Type	Type of connection.
St	State of the connection.
Time last up	Time that the connection or circuit last transitioned to the **Up** (operational) state.
# Up trans	Number of times that the connection or circuit has transitioned to the **Up** (operational) state.

Sample Output

show connections

```
user@switch> show connections
CCC and TCC connections [Link Monitoring On]
  Legend for status (St)              Legend for connection types
  UN -- uninitialized                 if-sw:  interface switching
  NP -- not present                   rmt-if: remote interface switching
  WE -- wrong encapsulation           lsp-sw: LSP switching
  DS -- disabled
  Dn -- down                          Legend for circuit types
  -> -- only outbound conn is up      intf -- interface
  <- -- only inbound  conn is up      tlsp -- transmit LSP
  Up -- operational                   rlsp -- receive LSP
  RmtDn -- remote CCC down
  Restart -- restarting

show connections status on page 2289

Output Fields Table 289 on page 2287 describes the output fields for the **show connections** command. Output fields are listed in the approximate order in which they appear.

Table 289: show connections Output Fields

Field Name	Field Description
CCC and TCC connections [Link Monitoring On I Off]	Whether link monitoring is enabled: **On** or **Off**.
Legend for Status (St)	Connection or circuit status. See the output's legend for an explanation of the status field values.
Legend for connection types	Type of connection: • **if-sw**—Layer 2 switching cross-connect. • **rmt-if**—Remote interface switch. While graceful restart is in progress, **rmt-if** will display a state **(St)** of **Restart**.
Legend for circuit types	Type of circuit: • **intf**—Interface circuit. • **tlsp**—Transmit LSP circuit. • **rlsp**—Receive LSP circuit.
Connection/Circuit	Name of the configured CCC connection.
Type	Type of connection.
St	State of the connection.
Time last up	Time that the connection or circuit last transitioned to the **Up** (operational) state.
# Up trans	Number of times that the connection or circuit has transitioned to the **Up** (operational) state.

Sample Output

show connections

```
user@switch> show connections

Connection/Circuit               Type        St      Time last up     # Up trans
ge1-to-pe2                        rmt-if      Up      Jun 26 18:37:25

List of Sample Output **show link-management on page 2293**

Output Fields Table 290 on page 2290 describes the output fields for the **show link-management** command. Output fields are listed in the approximate order in which they appear.

Table 290: show link-management Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is **0** through **64,000**.
State	State of the peer: **Up** or **Down**.
Control address	Address to which a control channel is established.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is **1** through **4,294,967,296**.
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is **1** through **4,294,967,296**.
State	State of the control channel: **Up** or **Down**.
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is **1** through **4,294,967,295**.
RcvSeqNum	Sequence number of the last hello message received from the peer. The range of values is **0** through **4,294,967,295.**

Table 290: show link-management Output Fields *(continued)*

Field Name	Field Description
Flags	Code that provides information about the control channel. Currently supports only code value **R**, which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
TE links	Traffic-engineered links that are managed by their peer.
TE link name	Name of the traffic-engineered link.
State	State of the traffic-engineered link: **Up**, **Down**, or **Init**.
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET, Ethernet**, **Packet**, and **PDH**.
Switching	Type of switching that can be performed on the traffic-engineered link. Supported values are **PSC-1** and **Packet**.
Minimum bandwidth	Smallest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link (in bps).
Maximum bandwidth	Largest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
Total bandwidth	Sum of the bandwidth, in bits per second (bps) and megabits per second (Mbps), of all interfaces that are members of the link.
Available bandwidth	Sum of the bandwidths of all interfaces that are members of the link and that are not yet allocated (in bps).
Name	Name of the interface.
State	State of the interface: **Up** or **Down**.
Local ID	Identifier of the local side of the interface.
Remote ID	Identifier of the remote side of the interface.
Bandwidth	Bandwidth, in bps or Mbps, of the member interface.
Used	Whether the resource is allocated to an LSP: **Yes** or **No**.

Table 290: show link-management Output Fields *(continued)*

Field Name	Field Description
LSP-name	LSP name.

Sample Output

show link-management

```
user@host> show link-management
Peer name: PEER-A, System identifier: 11973

Output Fields Table 291 on page 2294 describes the output fields for the **show link-management peer** command. Output fields are listed in the approximate order in which they appear.

Table 291: show link-management peer Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is **0** through **64,000**.
State	State of the peer: **Up** or **Down**.
Control address	Address to which a control channel is established.
Hello interval	How often the routing device sends Link Management Protocol (LMP) hello packets.
Hello dead interval	How long LMP waits before declaring the control channel to be dead. This is an interval during which the routing device receives no LMP hello packets from the neighbor on a control that is active or up.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is **1** through **4,294,967,296**.
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is **1** through **4,294,967,296**.

Table 291: show link-management peer Output Fields *(continued)*

Field Name	Field Description
State	State of the control channel: **Up** or **Down**.
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is **1** through **4,294,967,295**.
RcvSeqNum	Sequence number of the last hello message received from the peer. The range of values is **0** through **4,294,967,295.**
Flags	Code that provides information about the control channel. Currently supports only code value **R**, which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
TE links	Traffic-engineered links that are managed by their peer.

Sample Output

           3265            0 ConfSnd            1          0 R
   TE links:
    to-sonet
```

show link-management routing

Syntax
show link-management routing
<peer <name *name*> | te-link <name *name*>>
<resource <name *name*>>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Multiprotocol Label Switching (MPLS) peer or traffic engineering link information from the routing process.

Options
none—Display all peer and traffic-engineered link information.

peer <name *name*>—(Optional) Display information for all peers or for the specified peer only.

resource <name *name*>—(Optional) Display information for all resources or for the specified resource only.

te-link <name *name*>—(Optional) Display information for all traffic-engineered forwarding paths or for the specified path only.

Output Fields
Table 292 on page 2296 describes the output fields for the **show link-management routing** command. Output fields are listed in the approximate order in which they appear.

Table 292: show link-management routing Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is **0** through **64,000**.
State	State of the peer: **Up** or **Down**.
Control address	Address to which a control channel is established.
Control channel	Interface over which control packets are sent.

Table 292: show link-management routing Output Fields *(continued)*

Field Name	Field Description
State	State of the control channel.
TE link name	Traffic-engineered link name.
State	State of the traffic-engineered link: **Up** or **Down**.
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET**, **Ethernet**, and **Packet**.
Minimum bandwidth	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
Maximum bandwidth	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
Total bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link.
Available bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
Resource	Forwarding adjacency LSP information.
Type	Type of resource. The type is always a forwarding adjacency LSP.
State	State of the LSP: **Up** or **Down**.
System Identifier	Internal identifier for the peer. The range of values is **0** through **64,000**.
Total bandwidth	Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process.
Traffic parameters	• **Encoding**—Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET**, **Ethernet**, and **Packet**. • **Switching**—Type of switching that can be performed on the traffic-engineered link: **PSC-1** and **Packet**. • **Granularity**—Layer 2 data for switching Layer 2 LSPs for this resource. Not supported. This value is always **unknown**.

List of Sample Output **show link-management statistics on page 2300**

Output Fields Table 293 on page 2299 describes the output fields for the **show link-management statistics** command. Output fields are listed in the approximate order in which they appear.

Table 293: show link-management statistics Output Fields

Field Name	Field Description
Received packets	Number of received packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Received bad packets	Number of received bad packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Small packets	Number of packets that are too small.
Wrong protocol version	Number of packets specifying the wrong LMP version.
Messages for unknown peer	Number of packets destined for an unknown peer.
Messages for bad state	Number of packets indicating a state that does not match the recipient.
Stale acknowledgments	Number of **configAck** and **LinkSummaryAck** packets received that have a stale message ID.
Stale negative acknowledgments	Number of **configNack** and **LinkSummaryNack** packets received that have a stale message ID.

Table 293: show link-management statistics Output Fields *(continued)*

Field Name	Field Description
Sent packets	Number of sent packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Retransmitted packets	Number of retransmitted packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Dropped packets	Number of packets sent, by message type, that have been dropped by the receiver after the LMP retransmission interval has been exceeded. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.

Sample Output

show link-management statistics

```
user@host> show link-management statistics peer pro4-a
Statistics for peer pro4-a
    Received packets
        Config: 1

    Stale acknowledgments: 0
    Stale negative acknowledgments: 0
    Sent packets
        Config: 2
        ConfigAck: 1
        Hello: 2572
    Retransmitted packets
        Config: 1
```

show link-management te-link

Syntax
show link-management te-link
<brief | detail>
<name *name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the resources used to set up Multiprotocol Label Switching (MPLS) traffic-engineered forwarding paths.

Options
none—Display information for all traffic-engineered links.

brief | detail—(Optional) Display the specified level of output.

name *name*—(Optional) Display information for the specified traffic-engineered link only.

Required Privilege Level
view

Output Fields
Table 294 on page 2301 describes the output fields for the **show link-management te-link** command. Output fields are listed in the approximate order in which they appear.

Table 294: show link-management te-link Output Fields

Field Name	Field Description
TE link name	Traffic-engineered link name.
State	State of the traffic-engineered link: **Up** or **Down.**
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET**, **Ethernet**, **Packet**, and **PDH**.

Table 294: show link-management te-link Output Fields *(continued)*

Field Name	Field Description
Switching	Type of switching that can be performed on the traffic-engineered link. Supported values are **PSC-1** and **Packet**.
Minimum bandwidth	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
Maximum bandwidth	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link.
Total bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link (in bps).
Available Bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
Name	Name of the interface.
State	State of the interface: **Up** or **Down**.
Local ID	Identifier of the local side of the interface.
Remote ID	Identifier of the remote side of the interface.
Bandwidth	Bandwidth, in bps or Mbps, of the member interface.
Used	Whether the resource is allocated to an LSP: **Yes** or **No**.
LSP-name	LSP name.

Sample Output

show link-management te-link

```
user@host> show link-management te-link
TE link name: FA-bd, State: Up
  Local identifier: 4144, Remote identifier: 0, Local address: 2.2.2.1,
  Remote address: 2.2.2.2, Encoding: Ethernet, Switching: Packet,
  Minimum bandwidth: 0bps, Maximum bandwidth: 0bps, Total bandwidth: 0bps,
Available bandwidth: 0bps
    Name        State Local ID  Remote ID      Bandwidth Used  LSP-name
    falsp-bd    Dn       43077          0           0bps No

 TE link name: FA-be, State: Up
  Local identifier: 4145, Remote identifier: 0, Local address: 1.1.1.1,
   Remote address: 1.1.1.2, Encoding: Ethernet, Switching: Packet,
  Minimum bandwidth: 0bps, Maximum bandwidth: 10Mbps, Total bandwidth: 10Mbps,
 Available bandwidth: 8Mbps
    Name        State Local ID  Remote ID      Bandwidth Used  LSP-name
    falsp-be    Up       43076          0         10Mbps  Yes  e2elsp-bf
```

show mpls admin-groups

Syntax
show mpls admin-groups
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show mpls admin-groups

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about configured Multiprotocol Label Switching (MPLS) administrative groups.

Options
none—Display information about the configured MPLS administrative groups.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show mpls admin-groups on page 2303

Output Fields
Table 295 on page 2303 describes the output fields for the **show mpls admin-groups** command. Output fields are listed in the approximate order in which they appear.

Table 295: show mpls admin-groups Output Fields

Field Name	Field Description
Group	Name of the administrative group.
Bit index	Value assigned to the administrative group.

Sample Output

show mpls admin-groups

```
user@host> show mpls admin-groups
Group        Bit index
black         3
blue          2
gold          1
green         0
```

show mpls call-admission-control

Syntax show mpls call-admission-control
<logical-system (all | *logical-system-name*)>
<*lsp-name*>

Syntax (J-EX Series Switch) show mpls call-admission-control
<*lsp-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.

Options none—Display CAC information for all LSPs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-name—(Optional) Display CAC information for the specified LSP only.

Additional Information The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.

Required Privilege Level view

List of Sample Output **show mpls call-admission-control on page 2305**

Output Fields Table 296 on page 2304 describes the output fields for the **show mpls call-admission-control** command. Output fields are listed in the approximate order in which they appear.

Table 296: show mpls call-admission-control Output Fields

Field Name	Field Description
Available bandwidth	Current available bandwidth on each LSP path. Depending on whether the LSP is an E-LSP or a regular LSP, either per-class bandwidth or a single bandwidth value (corresponding to best-effort bandwidth at **ct0**) is displayed. The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by some Layer 2 connections at that class type.
Layer2 connections	Different Layer 2 connections that had some bandwidth requirement and were admitted into an LSP path.
LSP name	LSP pathname.
Neighbor address	Neighbor address from which CAC and bandwidth booking are configured for Layer 2 circuits.
Circuit	Interface name and circuit information.

Table 296: show mpls call-admission-control Output Fields *(continued)*

Field Name	Field Description
Primary	LSP's primary standby path.
Standby	LSP's secondary standby path.
VC bandwidth	Bandwidth constraints associated with a Layer 2 circuit route.

Sample Output

show mpls call-admission-control

```
user@host# show mpls call-admission-control

LSP name: pro1-be
 *Primary
  Available bandwidth: 0bps

LSP name: pro1-be-1
 *Primary
  Available bandwidth: 60kbps

LSP name: pro1-be-gold
 *Primary
  Available bandwidth: <ct0 50kbps> <ct1 20kbps> <ct2 30kbps> <ct3 0bps>
    Layer2 connections:
    Neighbor address: 10.255.245.215, Circuit: so-0/3/0.0(vc 5)
    VC bandwidth: <ct0 50kbps> <ct1 40kbps> <ct2 40kbps>

LSP name: pro1-be-gold-2
 *Primary
  Available bandwidth: <ct0 0bps> <ct1 40kbps> <ct2 40kbps> <ct3 0bps>

LSP name: pro1-be-silver
 *Primary   prim1
  Available bandwidth: <ct0 10kbps> <ct1 20kbps> <ct2 0bps> <ct3 40kbps>
    Layer2 connections:
    Neighbor address: 10.255.245.215, Circuit: so-0/3/0.1(vc 3)
    VC bandwidth: <ct0 20kbps> <ct1 20kbps>
  Standby   sec1
  Available bandwidth: <ct0 10kbps> <ct1 10kbps> <ct2 20kbps> <ct3 0bps>
    Layer2 connections:
    Neighbor address: 10.255.245.215, Circuit: so-0/3/0.1(vc 3)
    VC bandwidth: <ct0 20kbps> <ct1 20kbps>
```

show mpls cspf

Syntax
show mpls cspf
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show mpls cspf

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Multiprotocol Label Switching (MPLS) Constrained Shortest Path First (CSPF) statistics.

Options
none—Display MPLS CSFP statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show mpls cspf on page 2307

Output Fields
Table 297 on page 2306 describes the output fields for the **show mpls cspf** command. Output fields are listed in the approximate order in which they appear.

Table 297: show mpls cspf Output Fields

Field Name	Field Description
Queue length	Number of LSPs queued for automatic path computation.
current	Current queue length.
maximum	Maximum queue length (high-water mark).
dequeued	Number of aborted computation attempts.
Paths	Counters for label-switched path computations.
total	Sum of the next four fields.
successful	Number of path computations that were successfully completed.
no route	Number of path computations that failed because the destination is unreachable.
Sys Error	Number of path computations that failed because of lack of memory.
CSPFs	Total number of CSPF computations. A single path might require multiple CSPF computations.

Table 297: show mpls cspf Output Fields *(continued)*

Field Name	Field Description
Time	Time, in seconds, required to perform the label-switched path computation.
Total	Total amount of time consumed by the CSPF path computation algorithm.
CSPFs	Total number of CSPF computations.
Avg per CSPF	Average amount of time required for each CSPF computation.
% of rpd	Percentage of routing process CPU used in the CSPF computation.

Sample Output

show mpls cspf

```
user@host> show mpls cspf
CSPF statistics
Queue length   current       maximum      dequeued
                     0             0             0
Paths            total    successful     no route     sys error         CSPFs
                     0             0             0             0             0
Time (secs)      total         CSPFs  avg per CSPF      % of rpd
              0.000000      0.000000      0.000000        0.0000
```

show mpls diffserv-te

Syntax show mpls diffserve-te
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show mpls diffserve-te

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) Differentiated Services (DiffServ) class and preemption priority information.

Options none—Display DiffServ classes and priorities used by MPLS LSPs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show mpls diffserv-te on page 2308**

Output Fields Table 298 on page 2308 describes the output fields for the **show mpls diffserv-te** command. Output fields are listed in the approximate order in which they appear.

Table 298: show mpls diffserv-te Output Fields

Field Name	Field Description
Bandwidth model	Bandwidth constraint model supported. The maximum allocation model (MAM) for EXP-inferred LSPs (E-LSPs) is currently supported.
TE class	DiffServ traffic engineering class.
Traffic class	MPLS class type that corresponds to the DiffServ traffic engineering class: • **ct0**—Best effort • **ct1**—Assured forwarding • **ct2**—Expedited forwarding • **ct3**—Network control
Priority	MPLS preemption priority for this class type, a value from **0** through **7**. Interior gateway protocols (IGPs) distribute information about the available bandwidth for each traffic engineering class.

Sample Output

show mpls diffserv-te

```
user@host> show mpls diffserv-te
Bandwidth model: Maximum Allocation Model with support for E-LSPs.
TE class     Traffic class       Priority
```

```
te0             ct0                 3
te1             ct1                 2
```

show mpls interface

Syntax show mpls interface
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show mpls interface

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Multiprotocol Label Switching (MPLS)-enabled interfaces.

Options none—Display information about MPLS-enabled interfaces.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information MPLS is enabled on an interface when the interface is configured with both the **set protocol mpls interface** ***interface-name*** and **set interface** ***interface-name*** **unit 0 family mpls** statements.

Required Privilege Level view

List of Sample Output **show mpls interface on page 2310**

Output Fields Table 299 on page 2310 describes the output fields for the **show mpls interface** command. Output fields are listed in the approximate order in which they appear.

Table 299: show mpls interface Output Fields

Field Name	Field Description
Interface	Name of the interface.
State	State of the interface: **Up** or **Dn** (down).
Administrative groups	Administratively assigned colors of the link.

Sample Output

show mpls interface

```
user@host> show mpls interface
Interface   State       Administrative groups
so-1/0/0.0  Up          Blue Yellow Red
```

show mpls interface

Syntax show mpls interface

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about MPLS-enabled interfaces. MPLS is enabled on an interface when the interface is configured with both the **set protocols mpls interface** ***interface-name*** and **set interfaces** ***interface-name*** **unit 0 family mpls** commands.

Required Privilege Level view

<name *name*>
<p2mp>
<statistics>
<transit>

Syntax (J-EX Series Switch)

show mpls lsp
<brief | detail | extensive | terse>
<bidirectional | unidirectional>
<bypass>
<descriptions>
<down | up>
<*lsp-type*>
<name *name*>
<p2mp>
<statistics>
<transit>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options

none—Display standard information about all configured and active dynamic MPLS LSPs.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

bidirectional | unidirectional—(Optional) Display bidirectional or unidirectional LSP information, respectively.

bypass—(Optional) Display LSPs used for protecting other LSPs.

defaults—(Optional) Display the MPLS LSP default settings.

descriptions—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls lsp]** hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

name *name*—(Optional) Display information about the specified LSP or group of LSPs.

p2mp—(Optional) Display information about point-to-multipoint LSPs.

statistics—(Optional) (Egress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

transit—(Optional) Display LSPs transiting this routing device.

Required Privilege Level view

Output Fields Table 301 on page 2313 describes the output fields for the **show mpls lsp** command. Output fields are listed in the approximate order in which they appear.

Table 301: show mpls lsp Output Fields

Field Name	Field Description	Level of Output
Ingress LSP	Information about LSPs on the ingress routing device. Each session has one line of output.	All levels
Egress LSP	Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.	All levels

Table 301: show mpls lsp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Transit LSP	Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
P2MP name	Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format ***identifier*:vpls:*router-id*:*routing-instance-name***. The ***identifier*** is automatically generated by Junos OS.	All levels
P2MP branch count	Number of destination LSPs the point-to-multipoint LSP is transmitting to.	All levels
P	An asterisk (*) under this heading indicates that the LSP is a primary path.	All levels
address	(**detail** and **extensive**) Destination (egress routing device) of the LSP.	**detail extensive**
To	Destination (egress routing device) of the session.	**brief**
From	Source (ingress routing device) of the session.	**brief detail**
State	State of the LSP handled by this RSVP session: **Up**, **Dn** (down), or **Restart**.	**brief detail**
Active Route	Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (**mpls.0**).	**detail extensive**
P	Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.	**brief**
LSPname	Name of the LSP.	**brief detail**
DiffServeInfo	Type of LSP: multiclass LSP **(multiclass diffServ-TE LSP)** or Differentiated-Services-aware traffic engineering LSP **(diffServ-TE LSP)**.	**detail**
Bypass	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels
LSPpath	Indicates whether the RSVP session is for the primary or secondary LSP path. **LSPpath** can be either **primary** or **secondary** and can be displayed on the ingress, egress, and transit routing devices.	**detail**
Bidir	(GMPLS) The LSP allows data to travel in both directions between GMPLS devices.	All levels
Bidirectional	(GMPLS) The LSP allows data to travel both ways between GMPLS devices.	All levels
Rt	Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0).	**brief**
ActivePath	(Ingress LSP) Name of the active path: **Primary** or **Secondary**.	**detail extensive**

Table 301: show mpls lsp Output Fields *(continued)*

Field Name	Field Description	Level of Output
FastReroute desired	Fast reroute has been requested by the ingress routing device.	**detail**
Link protection desired	Link protection has been requested by the ingress routing device.	**detail**
LoadBalance	(Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: **Most-fill**, **Least-fill**, or **Random**.	**detail extensive**
Signal type	Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: **DS0**, **DS3**, **STS-1**, **STM-1**, or **STM-4**.	All levels
Encoding type	LSP encoding type: **Packet**, **Ethernet**, **PDH**, **SDH/SONET**, **Lambda**, or **Fiber**.	All levels
Switching type	Type of switching on the links needed for the LSP: **Fiber**, **Lamda**, **Packet**, **TDM**, or **PSC-1**.	All levels
GPID	Generalized Payload Identifier (identifier of the payload carried by an LSP): **HDLC**, **Ethernet**, **IPv4**, **PPP**, or **Unknown**.	All levels
Protection	Configured protection capability desired for the LSP: **Extra**, **Enhanced**, **none**, **One plus one**, **One to one**, or **Shared**.	All levels
Upstream label in	(Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP.	All levels
Upstream label out	(Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP.	All levels
Suggested label received	(Bidirectional LSPs) Label the upstream node suggests to use in the Resv message that is sent.	All levels
Suggested label sent	(Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned.	All levels
Autobandwidth	(Ingress LSP) The LSP is performing autobandwidth allocation.	**detail extensive**
MinBW	(Ingress LSP) Configured minimum value of the LSP, in bps.	**detail extensive**
MaxBW	(Ingress LSP) Configured maximum value of the LSP, in bps.	**detail extensive**
AdjustTimer	(Ingress LSP) Configured value of the bandwidth adjustment timer, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	**detail extensive**
MaxAvgBW util	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.	**detail extensive**
Overflow limit	(Ingress LSP) Configured value of the threshold overflow limit.	**detail extensive**

Table 301: show mpls lsp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Overflow sample count	(Ingress LSP) Current value for the overflow sample count.	**detail extensive**
Bandwidth Adjustment in *nnn* second(s)	(Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds.	**detail extensive**
Active path indicator	(Ingress LSP) A value of * indicates that the path is active. The absence of * indicates that the path is not active. In the following example, "long" is the active path. ***Primary long** **Standby short**	**detail extensive**
Primary	(Ingress LSP) Name of the primary path.	**detail extensive**
Secondary	(Ingress LSP) Name of the secondary path.	**detail extensive**
Standby	(Ingress LSP) Name of the path in standby mode.	**detail extensive**
State	(Ingress LSP) State of the path: **Up** or **Dn** (down).	**detail extensive**
COS	(Ingress LSP) Class-of-service value.	**detail extensive**
Bandwidth per class	(Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps.	**detail extensive**
Priorities	(Ingress LSP) Configured value of the setup priority and the reservation priority, where 0 is the highest priority and 7 is the lowest priority.	**extensive**
OptimizeTimer	(Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	**detail extensive**
SmartOptimizeTimer	(Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	**detail extensive**
Reoptimization in xxx seconds	(Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds.	**detail extensive**
Computed ERO (S [L] denotes strict [loose] hops)	(Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (**S**) or loose (**L**).	**detail extensive**
CSPF metric	(Ingress LSP) Constrained Shortest Path First metric for this path.	**detail extensive**

Table 301: show mpls lsp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Received RRO	(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If **Received RRO** is different from **Computed ERO**, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node: • **0x01**—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the **SESSION_ATTRIBUTE** object of the corresponding Path message. • **0x02**—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously). • **0x03**—Combination of **0x01** and **0x02**. • **0x04**—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section. • **0x08**—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the **Local protection available** bit is set but the **Node protection** bit is cleared. • **0x09**—Detour is established. Combination of **0x01** and **0x08**. • **0x10**—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted. • **0xb**—Detour is in use. Combination of **0x01**, **0x02**, and **0x08**.	**detail extensive**
Index number	(Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed.	**extensive**
Date	(Ingress LSP) Date of the LSP event.	**extensive**
Time	**(**Ingress LSP) Time of the LSP event.	**extensive**
Event	(Ingress LSP) Description of the LSP event.	**extensive**
Created	(Ingress LSP) Date and time the LSP was created.	**extensive**
Resv style	(Bypass) RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be **FF** (fixed filter), **SE** (shared explicit), or **WF** (wildcard filter).	**brief detail extensive**
Labelin	Incoming label for this LSP.	**brief detail**
Labelout	Outgoing label for this LSP.	**brief detail**
LSPname	Name of the LSP.	**brief detail**

Table 301: show mpls lsp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Time left	Number of seconds remaining in the lifetime of the reservation.	**detail**
Since	Date and time when the RSVP session was initiated.	**detail**
Tspec	Sender's traffic specification, which describes the sender's traffic parameters.	**detail**
Port number	Protocol ID and sender or receiver port used in this RSVP session.	**detail**
PATH rcvfrom	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor.	**detail**
PATH sentto	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device.	**detail**
RESV rcvfrom	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the **PATH rcvfrom** field, indicates that the RSVP negotiation is complete.	**detail**
Record route	Recorded route for the session, taken from the record route object.	**detail**
Soft preempt	Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used).	**detail**
Soft preemption pending	Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path.	**detail**
MPLS-TE LSP Defaults	Default settings for MPLS traffic engineered LSPs: • **LSP Holding Priority**—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully. • **LSP Setup Priority**—Determines whether a new LSP that preempts an existing LSP can be established. • **Hop Limit**—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress). • **Bandwidth**—Specifies the bandwidth in bits per second for the LSP. • **LSP Retry Timer**—Length of time in seconds that the ingress router waits between attempts to establish the primary path.	**defaults**

Sample Output

show mpls path

Syntax
show mpls path
<logical-system (all | *logical-system-name*)>
<*path-name*>

Syntax (J-EX Series Switch)
show mpls path
<*path-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options
none—Display standard information about all MPLS LSPs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

path-name—(Optional) Display information about the specified LSP only.

Required Privilege Level
view

List of Sample Output
show mpls path on page 2322

Output Fields
Table 302 on page 2322 describes the output fields for the **show mpls path** command. Output fields are listed in the approximate order in which they appear.

Table 302: show mpls path Output Fields

Field Name	Field Description
Path name	Information about ingress LSPs. Each path has one line of output.
Address	Addresses of the routing devices that form the LSP.
Strict/loose address	Whether the address is a configured as a strict or loose address.

Sample Output

show mpls path

```
user@host> show mpls path
Path name        Address          Strict/loose address
p1               123.456.55.6     Strict
                 123.456.1.6      Loose
p2               191.456.1.4      Strict
```

show route forwarding-table

Syntax

show route forwarding-table
<detail | extensive | summary>
<ccc *ccc-interface-name*>
<*destination*>
<family *family-name*>
<label *label*>
<matching *ip_prefix*>
<multicast>
<vpn *vpn*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

Options

none—Display the routes in the forwarding table.

detail | extensive | summary—(Optional) Display the specified level of output.

ccc—(Optional) Display the specified circuit cross-connect interface name for entries to match.

destination —(Optional) Display the destination prefix.

family *family-name* —(Optional) Display routing table entries for the specified family: **ethernet-switching**, **inet**, **inet6**, **iso**, **mpls**, **vlan classification**.

label *label* —(Optional) Display route entries for the specified label name.

matching *ip_prefix* —(Optional) Display route entries for the specified IP prefix.

multicast—(Optional) Display route entries for multicast routes.

vpn *vpn* —(Optional) Display route entries for the specified VPN.

Output Fields Table 303 on page 2324 lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used instead of the **extensive** keyword.

Table 303: show route forwarding-table Output Fields

Field Name	Field Description	Level of Output
Routing table	Name of the routing table (for example, **inet**, **inet6**, **mpls**).	All levels
Address family	Address family (for example, **IP**, **IPv6**, **ISO**, **MPLS**).	All levels
Destination	Destination of the route.	**detail, extensive**
Route Type (Type)	How the route was placed into the forwarding table. When the **detail** keyword is used, the route type might be abbreviated (as shown in parentheses): • **cloned** (**clon**)—(TCP or multicast only) Cloned route. • **destination** (**dest**)—Remote addresses directly reachable through an interface. • **destination down** (**iddn**)—Destination route for which the interface is unreachable. • **interface cloned** (**ifcl**)—Cloned route for which the interface is unreachable. • **route down** (**ifdn**)—Interface route for which the interface is unreachable. • **ignore** (**ignr**)—Ignore this route. • **interface** (**intf**)—Installed as a result of configuring an interface. • **permanent** (**perm**)—Routes installed by the kernel when the routing table is initialized. • **user**—Routes installed by the routing protocol process or as a result of the configuration.	All levels
Route reference (RtRef)	Number of routes to reference.	**detail, extensive**
Flags	Route type flags: • **none**—No flags are enabled. • **accounting**—Route has accounting enabled. • **cached**—Cache route. • **incoming-iface** ***interface-number*** —Check against incoming interface. • **prefix load balance**—Load balancing is enabled for this prefix. • **sent to PFE**—Route has been sent to the Packet Forwarding Engine. • **static**—Static route.	**extensive**
Nexthop	IP address of the next hop to the destination.	**detail, extensive**

Table 303: show route forwarding-table Output Fields *(continued)*

Field Name	Field Description	Level of Output
Next hop type (Type)	Next-hop type. When the **detail** keyword is used, the next-hop type might be abbreviated (as indicated in parentheses): • **broadcast (bcst)**—Broadcast. • **deny**—Deny. • **hold**—Next hop is waiting to be resolved into a unicast or multicast type. • **indexed (idxd)**—Indexed next hop. • **indirect (indr)**—Indirect next hop. • **local (locl)**—Local address on an interface. • **routed multicast (mcrt)**—Regular multicast next hop • **multicast (mcst)**—Wire multicast next hop (limited to the LAN). • **multicast discard (mdsc)**—Multicast discard. • **multicast group (mgrp)** —Multicast group member. • **receive (recv)**—Receive. • **reject (rjct)** Discard. An ICMP unreachable message was sent. • **resolve (rslv)**—Resolving the next hop. • **unicast (ucst)**—Unicast. • **unilist (ulst)**—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.	**detail, extensive**
Index	Software index of the next hop that is used to route the traffic for a given prefix.	**detail, extensive** none
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	**extensive**
Reference (NhRef)	Number of routes that refer to this next hop.	none **detail, extensive**
Next-hop interface (Netif)	Interface used to reach the next hop.	none **detail, extensive**
Alternate forward nh index	Index number of the alternate next hop interface. Seen with **multicast** option only.	**extensive**
Next-hop L3 Interface	The next hop layer 3 interface. This option can be expressed as a VLAN name and is only seen with the **multicast** option.	**extensive**
Next-hop L2 Interfaces	The next hop layer 2 interfaces. Seen with **multicast** option only.	**extensive**

show rsvp interface

Syntax
show rsvp interface
<brief | detail | extensive>
<link-management>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show rsvp interface
<brief | detail | extensive>
<link-management>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics.

Options
none—Display standard information about the status of RSVP-enabled interfaces and packet statistics.

brief | detail | extensive | link-management—(Optional) Display the specified level of output.

link-management—(Optional) Use the link-management option to display the control peers and corresponding TE-link information created by the Link Management Protocol (LMP).

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show rsvp interface brief on page 2333
show rsvp interface detail on page 2333
show rsvp interface extensive on page 2333
show rsvp interface link-management on page 2334

Output Fields
Table 304 on page 2330 lists the output fields for the **show rsvp interface** command. Output fields are listed in the approximate order in which they appear.

Table 304: show rsvp interface Output Fields

Field Name	Field Description	Level of Output
RSVP interface	Number of interfaces on which RSVP is active. Each interface has one line of output.	All levels
Interface	Name of the interface.	All levels
Index	Index of the interface.	**detail**

Table 304: show rsvp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	State of the interface. • **Disabled**—No traffic engineering information is displayed. • **Down**—Interface is not operational. • **Enabled**—Displays traffic engineering information. • **Up**—Interface is operational.	All levels
NoAuthentication	Interface does not support RSVP authentication.	**detail**
NoAggregate	Interface does not support refresh reduction.	**detail**
NoReliable	Interface does not support refresh reduction message ID extension.	**detail**
NoLinkProtection	Interface does not support link protection.	**detail**
HelloInterval	Frequency at which RSVP hellos are sent on this interface (in seconds).	**detail**
Address	IP address of the local interface.	**detail**
Active control channel	Next-hop link address to transmit messages.	None specified
TElink	Traffic-engineered links that are managed by the peer they are associated with.	None specified
Active resv	Number of reservations that are actively reserving bandwidth on the interface.	All levels
PreemptionCnt	Number of times an RSVP session was preempted on this interface.	**detail**
Update threshold	Percentage change in reserved bandwidth to trigger an IGP update.	**detail**
Subscription	User-configured subscription factor.	All levels
bc *number*	Bandwidth allocated for the specified bandwidth constraint.	**extensive**
ct *number*	Bandwidth allocated for the specified class type.	**extensive**
Static BW	Total interface bandwidth, in bps.	All levels
Available BW	Amount of bandwidth that RSVP is allowed to reserve, in bps. It is equal to (static bandwidth * subscription factor).	al levels
Reserved BW	Currently reserved bandwidth, in bps.	All levels
SoftPreemptionCnt	Number of times a soft preemption occurred on this interface. This number is not included in the **PreemptionCnt** value.	**detail**
Overbooked BW	Currently overbooked bandwidth, in bps, by class type (**ct0** through **ct3**).	**detail**

Table 304: show rsvp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Highwater mark	Highest bandwidth that has ever been reserved on this interface, in bps.	**brief**
PacketType	Type of RSVP packet.	**detail**
Total Sent	Total number of packets sent.	**detail**
Total Received	Total number of packets received since RSVP was enabled.	**detail**
Last 5 seconds Sent	Number of packets sent in the last 5 seconds.	**detail**
Last 5 seconds Received	Number of packets received in the last 5 seconds.	**detail**
Path	Statistics about Path messages, which are sent from the RSVP sender along the data paths and store path state information in each node along the path.	**detail**
PathErr	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.	**detail**
PathTear	Statistics about PathTear messages, which remove path states and dependent reservation states in any routers along a path.	**detail**
Resv	Statistics about Resv messages, which are sent from the RSVP receiver along the data paths and store reservation state information in each node along the path.	**detail**
ResvErr	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.	**detail**
ResvTear	Statistics about ResvTear messages, which remove reservation states along a path.	**detail**
Hello	Number of RSVP hello packets that have been sent to and received from the neighbor.	**detail**
Ack	Acknowledge message for refresh reductions.	**detail**
Srefresh	Summary refresh messages.	**detail**
EndtoEnd RSVP	Statistics for the number of end-to-end RSVP messages sent.	**detail**
Queue	CoS transmit queue number and its associated forwarding class designation.	**extensive**
TxRate	Configured bandwidth in Mbps and configured bandwidth as a percentage of the specified queue.	**extensive**
Priority	Weight of the queue relative to other configured queues, in percentage.	**extensive**

Table 304: show rsvp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
queue-priority-value	**Low**, **High**, **None**, or **Exact**. **None** indicates no rate limiting. **Exact** indicates the queue transmits at the configured rate only.	**extensive**

show rsvp neighbor

Syntax
show rsvp neighbor
<brief | detail>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show rsvp neighbor
<brief | detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Resource Reservation Protocol (RSVP) neighbors that were discovered dynamically during the exchange of RSVP packets.

Options
none—Display standard information about RSVP neighbors.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show rsvp neighbor on page 2338
show rsvp neighbor detail on page 2338

Output Fields
Table 305 on page 2335 lists the output fields for the **show rsvp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 305: show rsvp neighbor Output Fields

Field Name	Field Description	Level of Output
RSVP neighbor	Number of neighbors that the routing device has learned of. Each neighbor has one line of output.	All levels
via	Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected.	**detail**
Address	Address of a learned neighbor.	All levels
Idle	Length of time the neighbor has been idle, in seconds.	All levels
Up/Dn	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets are not reported as up or down.	All levels

Table 305: show rsvp neighbor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Up cnt and Down cnt	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets are not reported as up or down.	**detail**

status	State of the RSVP neighbor:
	• **Up**—Routing device can detect RSVP Hello messages from the neighbor.
	• **Down**—Routing device has received one of the following indications:
	  ◦ Communication failure from the neighbor.
	  ◦ Communication from IGP that the neighbor is unavailable.
	  ◦ Change in the sequence numbers in the RSVP Hello messages sent by the neighbor.
	• **Restarting**—RSVP neighbor is unavailable and might be restarting. The neighbor remains in this state until it has restarted or is declared dead. This state is possible only when graceful restart is enabled.
	• **Restarted**—RSVP neighbor has restarted and is undergoing state recovery (graceful restart) procedures.
	• **Dead**—Routing device has lost all communication with the RSVP neighbor. Any RSVP sessions with that neighbor are torn down.
		detail

LastChange	Time elapsed since the neighbor state changed either from up to down or from down to up. The format is ***hh*:*mm*:*ss***.	All levels
Last changed time	Time elapsed since the neighbor state changed either from up to down or from down to up.	**detail**
HelloInt	Frequency at which RSVP hellos are sent on this interface (in seconds).	All levels
HelloTx/Rx	Number of hello packets sent to and received from the neighbor.	All levels
Hello	Number of RSVP hello packets that have been sent to and received from the neighbor.	**detail**
Message received	Number of Path and Resv messages that this routing device has received from the neighbor.	**detail**
Remote Instance	Identification provided by the remote routing device during Hello message exchange.	**detail**
Local Instance	Identification sent to the remote routing device during Hello message exchange.	**detail**

Table 305: show rsvp neighbor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Refresh reduction	Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. **Refresh reduction** can have the following values: • **operational**—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961. • **incomplete**—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices. • **no operational**—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions.	**detail**
Remote end	Neighboring routing device's status with regard to refresh reduction: • **enabled**—Remote routing device has requested refresh reduction during RSVP message exchanges. • **disabled**—Remote routing device does not require refresh reduction.	**detail**
Ack-extension	An RSVP refresh reduction extension: • **enabled**—Both local and remote routing devices support the ack-extension (RFC 2961). • **disabled**—Remote routing device does not support the ack-extension.	**detail**
Link protection	Status of the MPLS fast reroute mechanism that protects traffic from link failure: • **enabled**—Link protection feature has been turned on, protecting the neighbor with a bypass LSP. • **disabled**—No link protection feature has been enabled for this neighbor.	**detail**
LSP name	Name of the bypass LSP.	**detail**
Bypass LSP	Status of the bypass LSP. It can have the following values: • **does not exist**—Bypass LSP is not available. • **connecting**—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment. • **operational**—Bypass LSP is up and running. • **down**—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path.	**detail**
Backup routes	Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure).	**detail**
Backup LSPs	Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence).	**detail**
Bypass explicit route	Explicit route object's (ERO) path that is taken by the bypass LSP.	**detail**

Table 305: show rsvp neighbor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Restart time	Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds).	**detail**
Recovery time	Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.	**detail**

Sample Output

show rsvp neighbor

```
user@host> show rsvp neighbor

```

show rsvp session

Syntax

show rsvp session
<brief | detail | extensive | terse>
<bidirectional | unidirectional>
<down | up>
<interface *interface-name*>
<*lsp-type*>
<name *session-name*>
<*session-type*>
<statistics>
<te-link *te-link*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Resource Reservation Protocol (RSVP) sessions.

Options

none—Display standard information about all RSVP sessions.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

bidirectional | unidirectional—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

interface *interface-name*—(Optional) Display RSVP sessions for the specified interface only.

lsp-type —(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

name *session-name*—(Optional) Display information about the named session.

session-type—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this switch.
- **ingress**—Sessions that originate from this switch.
- **transit**—Sessions that transit through this switch.

statistics—(Optional) Display packet statistics.

te-link *te-link*—(Optional) Display sessions with reservations on the specified traffic-engineered link name.

show rsvp session detail on page 2342
show rsvp session extensive on page 2342

Output Fields

Table 306 on page 2340 describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

Table 306: show rsvp session Output Fields

Field Name	Field Description	Level of Output
Ingress RSVP	Information about ingress RSVP sessions.	**detail**
Ingress RSVP	Information about ingress RSVP sessions. Each session has one line of output.	All levels
Egress RSVP	Information about egress RSVP sessions.	All levels
Transit RSVP	Information about the transit RSVP sessions.	All levels
To	Destination (egress switch) of the session.	All levels
From	Source (ingress switch) of the session.	All levels
State	State of the path: **Up**, **Down**, or **AdminDn**. **AdminDn** indicates that the LSP is being taken down gracefully.	All levels
Address	Destination (egress switch) of the LSP.	**detail**
LSPstate	State of the LSP that is being handled by this RSVP session. It can be either **Up**, **Dn** (down), or **AdminDn**. **AdminDn** indicates that the LSP is being taken down gracefully.	**brief, detail**
Rt	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the routing table is the primary MPLS table **mpls.0**).	**brief**
ActiveRoute	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (**mpls.0**).	**detail**
LSPname	Name of the LSP.	**brief, detail**

Table 306: show rsvp session Output Fields *(continued)*

Field Name	Field Description	Level of Output
LSPpath	Indicates whether the RSVP session is for the primary or secondary LSP path. **LSPpath** can be either **primary** or **secondary** and can be displayed on the ingress, egress, and transit switches. **LSPpath** can also indicate when a graceful LSP deletion has been triggered.	**detail**
Recovery label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	**detail**
Recovery label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	**detail**
Suggested label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	**detail**
Suggested label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	**detail**
Resv style or **Style**	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be **FF** (fixed filter), **SE** (shared explicit), or **WF** (wildcard filter).	**brief detail**
Label in	Incoming label for this LSP.	**brief, detail**
Label out	Outgoing label for this LSP.	**brief, detail**
Time left	Number of seconds remaining in the lifetime of the reservation.	**brief, detail**
Since	Date and time when the RSVP session was initiated.	**detail**
Tspec	Sender's traffic specification, which describes the sender's traffic parameters.	**detail**
Port number	Protocol ID and sender/receiver port used in this RSVP session.	**detail**
Creating backup LSP, link down	A **link down** event occurred, and traffic is being switched over to the bypass LSP.	**extensive**
Deleting backup LSP, protected LSP restored	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	**extensive**
PATH rcvfrom	Address of the previous-hop (upstream) switch or client, interface the neighbor used to reach this switch, and number of packets received from the upstream neighbor.	**detail**

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Resource Reservation Protocol (RSVP) sessions.

Options

none—Display standard information about all RSVP sessions.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

bidirectional | unidirectional—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

bypass—(Optional) Display RSVP sessions for bypass LSPs.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

interface *interface-name*—(Optional) Display RSVP sessions for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.

- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

name *session-name*—(Optional) Display information about the named session.

p2mp—(Optional) Display point-to-multipoint information.

session-type—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that transit through this routing device.

statistics—(Optional) Display packet statistics.

te-link *te-link*—(Optional) Display sessions with reservations on the specified TE link.

Output Fields Table 307 on page 2345 describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

Table 307: show rsvp session Output Fields

Field Name	Field Description	Level of Output
Ingress RSVP	Information about ingress RSVP sessions.	**detail**
Ingress RSVP	Information about ingress RSVP sessions. Each session has one line of output.	All levels
Egress RSVP	Information about egress RSVP sessions.	All levels
Transit RSVP	Information about the transit RSVP sessions.	All levels
P2MP name	(Appears only when the **p2mp** option is specified). Name of the point-to-multipoint LSP path.	All levels

Table 307: show rsvp session Output Fields *(continued)*

Field Name	Field Description	Level of Output
P2MP branch count	(Appears only when the **p2mp** option is specified). Number of LSPs receiving packets from the point-to-multipoint LSP.	All levels
To	Destination (egress routing device) of the session.	All levels
From	Source (ingress routing device) of the session.	All levels
State	State of the path: **Up**, **Down**, or **AdminDn**. **AdminDn** indicates that the LSP is being taken down gracefully.	All levels
Address	Destination (egress routing device) of the LSP.	**detail**
From	Source (ingress routing device) of the session.	**detail**
LSPstate	State of the LSP that is being handled by this RSVP session. It can be either **Up**, **Dn** (down), or **AdminDn**. **AdminDn** indicates that the LSP is being taken down gracefully.	**brief detail**
Rt	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the routing table is the primary MPLS table **mpls.0**).	**brief**
Active Route	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (**mpls.0**).	**detail**
LSPname	Name of the LSP.	**brief detail**
LSPpath	Indicates whether the RSVP session is for the primary or secondary LSP path. **LSPpath** can be either **primary** or **secondary** and can be displayed on the ingress, egress, and transit routing devices. **LSPpath** can also indicate when a graceful LSP deletion has been triggered.	**detail**
Bypass	(Egress routing device) Destination address for the bypass LSP.	**detail**
Bidir	(When LSP is bidirectional) LSP will allow data to travel in both directions between GMPLS devices.	**detail**
Bidirectional	(When LSP is bidirectional) LSP will allow data to travel both ways between GMPLS devices.	**detail**
Upstream label in	(When LSP is bidirectional) Incoming label for reverse direction traffic for this LSP.	**detail**
Upstream label out	(When LSP is bidirectional) Outgoing label for reverse direction traffic for this LSP.	**detail**

Table 307: show rsvp session Output Fields *(continued)*

Field Name	Field Description	Level of Output
Recovery label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	**detail**
Recovery label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	**detail**
Suggested label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	**detail**
Suggested label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	**detail**
Resv style or **Style**	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be **FF** (fixed filter), **SE** (shared explicit), or **WF** (wildcard filter).	**brief detail**
Label in	Incoming label for this LSP.	**brief detail**
Label out	Outgoing label for this LSP.	**brief detail**
Time left	Number of seconds remaining in the lifetime of the reservation.	**brief detail**
Since	Date and time when the RSVP session was initiated.	**detail**
Tspec	Sender's traffic specification, which describes the sender's traffic parameters.	**detail**
DiffServ info	Indicates whether the LSP is a multiclass LSP (**multiclass diffServ-TE LSP**) or a Differentiated-Services-aware traffic engineering LSP (**diffServ-TE LSP**).	**detail**
bandwidth	Bandwidth for each class type (**ct0**, **ct1**, **ct2**, or **ct3**).	**detail**
Port number	Protocol ID and sender/receiver port used in this RSVP session.	**detail**
FastReroute desired	Fast reroute has been requested by the ingress routing device.	**detail**
Soft preemption desired	Soft preemption has been requested by the ingress routing device.	**detail**
FastReroute desired	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Fast reroute (one-to-one backup) has been requested by the ingress routing device.	**detail extensive**
Link protection desired	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Link protection (many-to-one backup) has been requested by the ingress routing device.	**detail extensive**

Table 307: show rsvp session Output Fields *(continued)*

Field Name	Field Description	Level of Output
Node/Link protection desired	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Node and link protection (many-to-one backup) has been requested by the ingress routing device.	**detail extensive**
Type	LSP type: • **Link protected LSP**—LSP has been protected by link protection at the outgoing interface. The name of the bypass used is also listed here (**extensive**). • **Node/Link protected LSP**—LSP has been protected by node and link protection at the outgoing interface. The name of the bypass used is also listed here (**extensive**). • **Protection down**—LSP is not currently protected. • **Bypass LSP**—LSP that is used to protected one or more user LSPs in case of link failure. • **Backup LSP at Point-of-Local-Repair (PLR)**—LSP that has been temporarily established to protected a user LSP at the ingress of a failed link. • **Backup LSP at Merge Point (MP)**—LSP that has been temporarily established to protected a user LSP at the egress of a failed link.	**detail extensive**
New bypass	New bypass (the bypass name is also displayed) has been activated to protect the LSP.	**extensive**
Link protection up, using *bypass-name*	Link protection (the bypass name is also displayed) has been activated for the LSP.	**extensive**
Creating backup LSP, link down	A **link down** event occurred, and traffic is being switched over to the bypass LSP.	**extensive**
Deleting backup LSP, protected LSP restored	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	**extensive**
Path mtu	Displays the value of the path MTU received from the network (through signaling) and the value used for forwarding. This value is only displayed on ingress routing devices with the **allow-fragmentation** statement configured at the **[edit protocols mpls path-mtu]** hierarchy level. If there is a detour LSP, the path MTU for the detour is also displayed.	**detail**
PATH rcvfrom	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor.	**detail**
Adspec	MTU signaled from the ingress routing device to the egress routing device by means of the adspec object.	**detail**
PATH sentto	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor (or peer-name in the GMPLS LSP case), and number of packets sent to the downstream routing device.	**detail**

Table 307: show rsvp session Output Fields *(continued)*

Field Name	Field Description	Level of Output
Explct route	Explicit route for the session. Normally this value will be the same as that of record route. Differences indicate that path rerouting has occurred, typically during fast reroute.	**detail**
Record route	Recorded route for the session, taken from the record route object. Normally this value will be the same as that of explct route. Differences indicate that path rerouting has occurred, typically during fast reroute.	**detail**

show rsvp statistics

Syntax show rsvp statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show rsvp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Resource Reservation Protocol (RSVP) packet and error statistics.

Options none—Display RSVP packet and error statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show rsvp statistics on page 2354**

Output Fields Table 308 on page 2352 describes the output fields for the **show rsvp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 308: show rsvp statistics Output Fields

Field Name	Field Description
Packet Type	Statistics about different RSVP messages.
Total Sent	Total number of packets sent since RSVP was enabled.
Total Received	Total number of packets received since RSVP was enabled.
Last 5 seconds Sent	Total number of packets sent in the last 5 seconds.
Last 5 seconds Received	Number of packets received in the last 5 seconds.
Path	Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path.
PathErr	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.
PathTear	Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path.

Table 308: show rsvp statistics Output Fields *(continued)*

Field Name	Field Description
Resv FF	Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders.
Resv WF	Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders.
Res SE	Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders.
ResvErr	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.
ResvTear	Statistics about ResvTear messages, which remove reservation states along a path.
ResvConf	Statistics about ResvConfirm messages, which are responses to confirm a reservation request.
Ack	Acknowledge message for refresh reductions.
SRefresh	Summary refresh messages.
Hello	Number of RSVP hello packets that have been sent to and received from the neighbor.
EndtoEnd RSVP	Statistics for the number of End-to-end RSVP messages.
Errors	Statistics about errored RSVP packets.
Rcv pkt bad length	The packet was not processed because its length is inappropriate.
Rcv pkt unknown type	The packet is not one of the well-known RSVP types, as defined in RFC 2205, *Resource ReSerVation Protocol (RSVP)*.
Rcv pkt bad version	The packet is not an RSVP version 1 packet.
Rcv pkt auth fail	The packet failed authentication checks.
Rcv pkt bad checksum	The RSVP checksum check failed.
Rcv pkt bad format	General packet processing failed because the packet was badly formed.
Memory allocation fail	An internal resource failure occurred.
No path information	A reservation was received, but no sender is active.
Resv style conflict	The same session contains inconsistent reservation styles.
Port conflict	There were inconsistent port numbers for the same session.
Resv no interface	An interface for the receive reservation packets cannot be located.

Table 308: show rsvp statistics Output Fields *(continued)*

Field Name	Field Description
PathErr to client	Number of PathErr packets delivered to the local client.
ResvErr to client	Number of ResvErr packets delivered to the local client.
Path timeout	Number of times the sender timed out because the path was removed.
Resv timeout	Number of times the receiver timed out because the reservation was removed.
Message out-of-order	Records the number of RSVP incoming messages that are considered out of order. This is detected from the message ID object's sequence number.
Unknown ack msg	A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1.
Recv nack	If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Resv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again.
Recv duplicated msg-id	Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts.
No TE-link to recv Hop	Counter of packets discarded because a TE link was not found.
Rcv pkt disabled interface	Number of RSVP packets received on an interface that is not enabled for RSVP.
Transmit buffer full	Number of times the buffer for assembling an outgoing RSVP message was not large enough.
Transmit failure	Number of times the RSVP task failed to send out a packet.
Receive failure	Number of times the RSVP task failed to read an incoming packet.
P2MP RESV discarded by appl	Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application.
Rate limit	Number of RSVP packets dropped due to rate limiting.
Err msg loop detected	Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object.

```

show rsvp version

Syntax
show rsvp version
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show rsvp version

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about the Resource Reservation Protocol (RSVP) protocol settings, such as the version of the RSVP software, the refresh timer and keep multiplier, and local RSVP graceful restart capabilities on a routing device.

Options
none—Display RSVP protocol settings.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show rsvp version (Router in Steady State) on page 2357
show rsvp version (Router Restarting) on page 2357

Output Fields
Table 309 on page 2356 describes the output fields for the **show rsvp version** command. Output fields are listed in the approximate order in which they appear.

Table 309: show rsvp version Output Fields

Field Name	Field Description
Resource ReSerVation Protocol, version	RSVP software version.
RSVP protocol	Status of RSVP: **Enabled** or **Disabled**.
R(refresh timer)	Configured time interval used to generate periodic RSVP messages.
K(keep multiplier)	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Preemption	Currently configured preemption capability: **Aggressive**, **Disabled**, or **Normal**. The default is **Normal**.
Graceful deleting timeout	Currently configured value for the **graceful-deletion-timeout** statement. The router that initiates the graceful deletion procedure for an RSVP session waits for the graceful deletion timeout interval to ensure that all routers along the path (especially the ingress and egress routers) have prepared for the LSP to be taken down.
Graceful restart	Status of the graceful restart feature for RSVP on the restarting routing device: **Enabled** or **Disabled**.
Restart helper mode	Status of the helper mode feature: **Enabled** or **Disabled**. When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures.

Table 309: show rsvp version Output Fields *(continued)*

Field Name	Field Description
Maximum helper restart time	Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down.
Maximum helper recovery time	Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully.
Restart time	Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states.
Recovery time	Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.
Soft-preemption cleanup	Time, in seconds, that an LSP is kept after it has been soft preempted. This is a global property of the RSVP protocol.

Sample Output

show rsvp version (Router in Steady State)

```
user@host> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
   RSVP protocol             Enabled
   R(refresh timer)          30 seconds
   K(keep multiplier)        3
   Preemption                Normal
   Soft-preemption cleanup   60 seconds
   Graceful restart          Enabled
   Restart helper mode       Enabled
   Restart time              60000 msec
```

show rsvp version (Router Restarting)

```
user@host> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
   RSVP protocol:                Enabled
   R(refresh timer):             30 seconds
   K(keep multiplier):           3
   Preemption:                   Normal
   Soft-preemption cleanup:      30 seconds
   Graceful deletion timeout:    30 seconds
   Graceful restart:             Disabled
   Restart helper mode:          Enabled
   Maximum helper restart time:  20000 msec
   Maximum helper recovery time: 180000 msec
   Restart time:                 0 msec
```

show ted database

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the entries in the Multiprotocol Label Switching (MPLS) traffic engineering database.

Options
none—Display standard information about all entries in the traffic engineering database.

brief | detail | extensive—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

system-name—(Optional) Display traffic engineering database information for a particular system.

Required Privilege Level
view

List of Sample Output
show ted database brief on page 2360
show ted database detail system-name on page 2361
show ted database extensive on page 2361

Output Fields
Table 310 on page 2358 describes the output fields for the **show ted database** command. Output fields are listed in the approximate order in which they appear.

Table 310: show ted database Output Fields

Field Name	Field Description	Level of Output
TED database	Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing.	All levels
ID	Hostname and address of the node that the link is coming from. An address of **.00** indicates that the node is the routing device itself. An address in the range **0.01** through **0.FF** indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses.	**brief**
NodeID	Hostname and address of the node that the link is coming from. An address of **.00** indicates that the node is the routing device itself. An address in the range **0.01** through **0.FF** indicates that the node is a pseudonode.	**extensive**
Type	Type of node. It can be either **Rtr** (router) or **Net** (pseudonode).	All levels

Table 310: show ted database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Age(s)	How long since the node was last refreshed, in seconds.	All levels
LnkIn	Number of nodes pointing toward this node.	All levels
LnkOut	Number of nodes to which this node points.	All levels
Protocol	Protocol that reported the node information: • **IS-IS(1)**—IS-IS Level 1. • **IS-IS(2)**—IS-IS Level 2. • **OSPF (area-number)**—OSPF from the specified area.	All levels
To	Address on the far end of a link.	**detail extensive**
Local	Address of the local interface being used to reach the remote node.	**detail extensive**
Remote	Address of the interface on the remote node.	**detail extensive**
Metric	Configured traffic engineering metric.	**extensive**
Static BW	Total interface bandwidth in bps.	**extensive**
Reservable bandwidth	Subscription factor for the interface, which is the percentage of the link bandwidth that can be used for the RSVP reservation process. You configure this by including the **subscription** statement when configuring RSVP.	**extensive**
Available BW [priority]	(Must include **diffserv-te** statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each priority level. The bandwidth shown is for the entire interface, not for each individual LSP.	**extensive**
Diffserv-TE BW Model	Bandwidth constraint model used by the LSPs.	**extensive**
Available BW [TE-class]	(Must include the **diffserv-te** statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each traffic engineering class.	**extensive**
Static BW [CT-class]	Total interface bandwidth used by an MPLS traffic class, in bps.	**extensive**

Table 310: show ted database Output Fields *(continued)*

Field Name	Field Description	Level of Output

Interface Switching Capability Descriptor (*n*)	Information about the interface switching capability descriptor, which is a subtype length value (TLV) of the link TLV. ***n*** is the index number.
	• **Switching type**—Type of switching to be performed on a particular link:
	  • **PSC-1**—Packet switch-capable 1
	  • **PSC-2**—Packet switch-capable 2
	  • **PSC-3**—Packet switch-capable 3
	  • **PSC-4**—Packet switch-capable 4
	  • **L2SC**—Layer-2-switch-capable
	  • **TDM**—Time-division-multiplexing-capable
	  • **LSC**—Lambda switch-capable
	  • **FSC**—Fiber switch-capable
	• **Encoding type**—Encoding of the LSP being requested:
	  • **Packet**
	  • **Ethernet**
	  • **ANSI/ETSI PDH**
	  • **Reserved**
	  • **SDH /SONET**
	  • **Digital Wrapper**
	  • **Lambda (photonic)**
	  • **Fiber**
	  • **FiberSDH/SONET**
	• **Maximum LSP BW [priority] bps**—Maximum LSP bandwidth information. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface.
	  • **[*n*]**—Priority level. The range is from **0** (high) through **7** (low).
	  • ***n* Mbps**—Amount of the maximum bandwidth.
	• **Minimum LSP BW**—Minimum LSP bandwidth in Mbps. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. **Minimum LSP BW** is displayed only when **switching type** is **PSC-1** or **TDM**.
	• **Interface MTU**—Displayed only when **switching type** is **TDM**.
	• **Interface supports standard SONET/SDH**—Displayed only when **switching type** is **TDM**.
		extensive

```

PART 13

Network Management and Monitoring

CHAPTER 76

Port Mirroring

Port Mirroring—Overview

Understanding Port Mirroring on J-EX Series Switches

Use port mirroring to facilitate analyzing traffic on your J-EX Series Switch on a packet level. Use port mirroring as part of monitoring switch traffic for such purposes as enforcing policies concerning network usage and file sharing, and identifying sources of problems on your network by locating abnormal or heavy bandwidth usage from particular stations or applications.

Port mirroring copies packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use port mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on J-EX4200 or J-EX4500 Ethernet Switches
- Packets exiting a VLAN on J-EX8200 Ethernet Switches

This topic describes:

Port Mirroring Overview

Port mirroring is needed for traffic analysis on a switch because a switch, unlike a hub, does not broadcast packets to every port on the device. The switch sends packets only to the port to which the destination device is connected. You configure port mirroring on the switch to send copies of unicast traffic to either a local analyzer port or an analyzer

VLAN. Then you can analyze the mirrored traffic using a protocol analyzer application. The protocol analyzer application can run either on a computer connected to the analyzer output interface or on a remote monitoring station.

We recommend that you disable port mirroring when you are not using it and that you select specific interfaces as input to the port mirror analyzer in preference to using the **all** keyword option. You can also limit the amount of mirrored traffic by using statistical sampling, setting a ratio to select a statistical sample, or using a firewall filter. Mirroring only the necessary packets reduces any potential performance impact.

With local port mirroring, traffic from multiple ports is replicated to the analyzer output interface. If the output interface for an analyzer reaches capacity, packets are dropped. You should consider whether the traffic being mirrored exceeds the capacity of the analyzer output interface.

You can use port mirroring on a switch to mirror any of the following:

- **Packets entering or exiting a port**—You can mirror the packets in any combination (on up to 256 ports). For example, you can send copies of the packets entering some ports and the packets exiting other ports to the same local analyzer port or analyzer VLAN.
- **Packets entering a VLAN on a J-EX4200 or J-EX4500 switch**—You can mirror the packets entering a VLAN on these switches to either a local analyzer port or to an analyzer VLAN. (On J-EX4200 and J-EX4500 switches, you can configure multiple VLANs [up to 256 VLANs], including a VLAN range and PVLANs, as ingress input to an analyzer.)
- **Packets exiting a VLAN on a J-EX8200 switch**—You can mirror the packets exiting a VLAN on a J-EX8200 switch to either a local analyzer port or to an analyzer VLAN. You can configure multiple VLANs (up to 256 VLANs), including a VLAN range and PVLANs, as egress input to an analyzer.
- **Statistical sample**—You can mirror a statistical sample of packets that are
  - Entering or exiting a port
  - Entering a VLAN on a J-EX4200 or J-EX4500 switch
  - Exiting a VLAN on a J-EX8200 switch

  You specify the sample number of packets by setting the ratio. You can send the sample to either a local analyzer port or to an analyzer VLAN.
- **Policy-based sample**—You can mirror a policy-based sample of packets that are entering a port or a VLAN. You configure a firewall filter to establish a policy to select certain packets. You can send the sample to a local analyzer port or to an analyzer VLAN.

NOTE: The Junos operating system (Junos OS) for J-EX Series switches implements port mirroring differently from other Junos OS packages. Junos OS for J-EX Series switches does not include the **port-mirroring** statement found in the **edit forwarding-options** level of the hierarchy of other Junos OS packages, nor the **port-mirror** action in firewall filter terms.

Limitations of Port Mirroring

Port mirroring on J-EX Series switches has the following limitations:

- On a J-EX4200 or J-EX4500 switch, you can enable only one analyzer (port mirroring configuration).
- On J-EX8200 switches, you can configure seven analyzers (port mirroring configurations). Of these, one can be configured for input and output, the others only for output configured using firewall filters—the action of the firewall filters provides the input to the analyzers.

  An analyzer configured using a firewall filter does not support mirroring of packets that are egressing ports.
- Packets with physical layer errors are filtered out and thus are not sent to the analyzer port or analyzer VLAN.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis ports (VCPs)
  - Management port (**me0** or **vme0**)
  - Routed VLAN interfaces (RVIs) and VLAN-tagged L3 interfaces
- On J-EX4200 and J-EX4500 switches, mirrored packets exiting a tagged interface might contain an incorrect VLAN ID and Ethertype.
- On J-EX8200 switches, if you configure port mirroring to mirror packets egressing from 10-Gigabit Ethernet ports, packets might be dropped in the network traffic and in the mirrored traffic.
- On J-EX8200 switches, you can set a ratio only for ingress packets.
- On J-EX8200 switches, when an egress VLAN that belongs to a routed VLAN interface (RVI) is configured as the input for a port mirroring analyzer, the analyzer appends an incorrect dot1q (802.1Q) header to the mirrored packets on the routed traffic or does not mirror any packets on the routed traffic. As a workaround, configure a port mirroring analyzer with each port of the VLAN as egress input.
- Mirrored packets exiting an interface do not reflect the rewritten DSCP or 802.1p bits.

Table 313 on page 2370 lists some port mirroring terms and their descriptions.

Port Mirroring Terminology

Table 313: Port Mirroring Terminology

Term	Description
Analyzer	A port-mirroring configuration on a J-EX Series switch. The analyzer includes: • The name of the analyzer • Source (input) ports or VLAN (optional) • A destination for mirrored packets (either a monitor port or a monitor VLAN) • Ratio field for specifying statistical sampling of packets (optional) • Loss-priority setting
Analyzer output interface Also known as monitor port	Interface to which mirrored traffic is sent and to which a protocol analyzer application is connected. NOTE: Interfaces used as output for a port mirror analyzer must be configured as family **ethernet-switching**. Analyzer output interfaces have the following limitations: • Cannot also be a source port. • Cannot be used for switching. • Do not participate in Layer 2 protocols, such as Spanning Tree Protocol (STP), when part of a port mirroring configuration. • When configured as an analyzer output interface, they lose any existing VLAN associations. If the bandwidth of the analyzer output interface is not sufficient to handle the traffic from the source ports, overflow packets are dropped.
Analyzer VLAN Also known as monitor VLAN	VLAN to which mirrored traffic is sent. The mirrored traffic can be used by a protocol analyzer application. The monitor VLAN is spread across the switches in your network.
Firewall-based analyzer	An analyzer session that has only an “output” stanza. A firewall-based analyzer must be used along with a firewall filter to achieve the functionality of an analyzer.
Input interface Also known as mirrored ports or monitored interfaces	An interface on the switch that is being mirrored, either on traffic entering or exiting the interface. An input interface cannot also be an output interface for an analyzer.
Mirror ratio	See statistical sampling.
Monitoring station	A computer running a protocol analyzer application.
Native analyzer session	An analyzer session that has both “input” and “output” stanzas.
Policy-based mirroring	Mirroring of packets that match the match items in the defined firewall filter term. The action item **analyzer *analyzer-name*** is used in the firewall filter to send the packets to the port mirror analyzer.
Protocol analyzer application	An application used to examine packets transmitted across a network segment. Also commonly called network analyzer, packet sniffer, or probe.

Table 313: Port Mirroring Terminology *(continued)*

Term	Description
Remote port mirroring	Functions the same as local port mirroring, except that the mirrored traffic is not copied to a local analyzer port but is flooded into an analyzer VLAN that you create specifically for the purpose of receiving mirrored traffic. In the intermediate switch, you can avoid flooding of the mirrored traffic to the member ports of the VLAN by setting the "ingress only" attribute to the incoming ports of the VLAN and the "egress only" attribute to the outgoing port of the VLAN.
Statistical sampling	You can configure the system to mirror a sampling of the packets, by setting a ratio of 1:*x*, where *x* is a value from 1 through 2047. For example, when the ratio is set to 1, all packets are copied to the analyzer. When the ratio is set to 200, 1 of every 200 packets is copied.

Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on J-EX Series Switches

J-EX Series switches allow you to configure port mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use port mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on J-EX4200 or J-EX4500 switches
- Packets exiting a VLAN on J-EX8200 switches

You can analyze the mirrored traffic using a protocol analyzer application installed on a system connected to the local destination interface (or a running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN).

This example describes how to configure a J-EX Series switch to mirror traffic entering interfaces connected to employee computers to an analyzer output interface on the same switch.

This example describes how to configure local port mirroring:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX Series switch

Before you configure port mirroring, be sure you have an understanding of port mirroring concepts.

Overview and Topology

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to a destination interface on the same switch. The first example shows how to mirror all traffic entering the ports connected to employee computers. The second example shows the same scenario, but includes a filter to mirror only the employee traffic going to the Web.

Network Topology

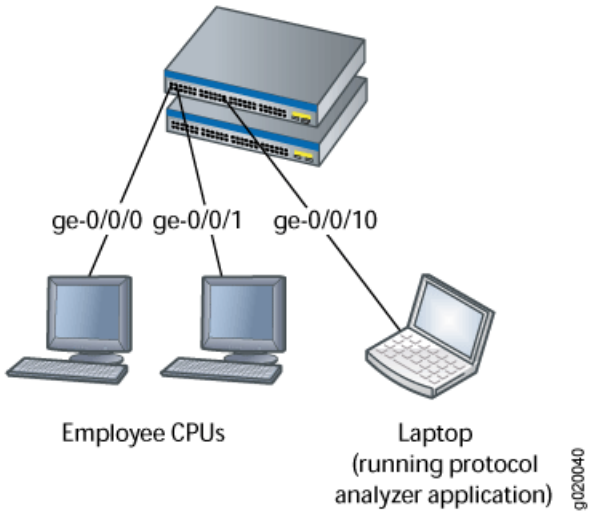
In this example, **ge-0/0/0** and **ge-0/0/1** serve as connections for employee computers.

In this example, one interface, **ge-0/0/10**, is reserved for analysis of mirrored traffic. Connect a PC running a protocol analyzer application to the analyzer output interface to analyze the mirrored traffic.

NOTE: **Multiple ports mirrored to one interface can cause buffer overflow and dropped packets.**

Figure 68 on page 2373 shows the network topology for this example.

Figure 68: Network Topology for Local Port Mirroring Example



Mirroring All Employee Traffic for Local Analysis

To configure port mirroring for all employee traffic for local analysis, perform these tasks:

CLI Quick Configuration

To quickly configure local port mirroring for ingress traffic to the two ports connected to employee computers, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 family ethernet-switching
set interfaces ge-0/0/1 unit 0 family inet 192.1.1.1/24
set interfaces ge-0/0/10 unit 0 family ethernet-switching
set ethernet-switching options analyzer employee–monitor input ingress interface ge-0/0/0.0
set ethernet-switching options analyzer employee–monitor input ingress interface ge-0/0/1.0
set ethernet-switching options analyzer employee–monitor output interface ge-0/0/10.0
```

Step-by-Step Procedure

To configure an analyzer called **employee-monitor** and specify the input (source) interfaces and the analyzer output interface:

1. Configure each interface connected to employee computers as an input interface for the port-mirror analyzer that we are calling **employee-monitor**:

   ```
   [edit ethernet-switching-options]
   user@switch# set analyzer employee-monitor input ingress interface ge–0/0/0.0
   user@switch# set analyzer employee-monitor input ingress interface ge–0/0/1.0
   ```

2. Configure the output analyzer interface for the **employee-monitor** analyzer. This will be the destination interface for the mirrored packets:

   ```
   [edit ethernet-switching-options]
   user@switch# set analyzer employee-monitor output interface ge-0/0/10.0
   ```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
ethernet-switching-options {
   analyzer employee-monitor {
```

```
    input {
      ingress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;
      }
    }
    output {
      interface {
        ge-0/0/10.0;
      }
    }
  }
}
```

Mirroring Employee-to-Web Traffic for Local Analysis

To configure port mirroring for employee to web traffic, perform these tasks:

CLI Quick Configuration

To quickly configure local port mirroring of traffic from the two ports connected to employee computers, filtering so that only traffic to the external Web is mirrored, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options analyzer employee–web–monitor output interface ge-0/0/10.0
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then analyzer
employee-web-monitor
set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

Step-by-Step Procedure

To configure local port mirroring of employee-to-web traffic from the two ports connected to employee computers:

1. Configure the local analyzer interface:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/10 unit 0 family ethernet-switching
   ```

2. Configure the **employee-web-monitor** analyzer output (the input to the analyzer comes from the action of the filter):

   ```
   [edit ethernet-switching-options]
   user@switch# set analyzer employee-web-monitor output interface ge-0/0/10.0
   ```

3. Configure a firewall filter called **watch-employee** to send mirrored copies of employee requests to the Web to the **employee-web-monitor** analyzer. Accept all traffic to and from the corporate subnet (destination or source address of **192.0.2.16/28**). Send mirrored copies of all packets destined for the Internet (**destination port 80**) to the **employee-web-monitor** analyzer.

   ```
   [edit firewall family ethernet-switching]
   user@switch# set filter watch-employee term employee-to-corp from
   destination-address 192.0.2.16/28
   ```

```
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port
80
user@switch# set filter watch-employee term employee-to-web then analyzer
employee-web-monitor
```

4. Apply the **watch-employee** filter to the appropriate ports:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

Results Check the results of the configuration:

```
[edit]
user@switch# show
ethernet-switching-options {
    analyzer employee-web-monitor {
        output {
            interface ge-0/0/10.0;
            }
        }
}
...
firewall family ethernet-switching {
    filter watch-employee {
        term employee-to-corp {
            from {
                destination-address 192.0.2.16/28;
                source-address 192.0.2.16/28;
            }
            then accept {
        }
        term employee-to-web {
            from {
                destination-port 80;
            }
            then analyzer employee-web-monitor;
        }
    }
}
...
interfaces {
    ge-0/0/0 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan members [employee-vlan, voice-vlan];
                filter {
                    input watch-employee;
                }
            }
        }
    }
```

```
    ge-0/0/1 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
```

Verification

To confirm that the configuration is correct, perform these tasks:

- Verifying That the Analyzer Has Been Correctly Created on page 2376

Verifying That the Analyzer Has Been Correctly Created

Purpose Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces, and appropriate output interface.

Action You can verify the port mirror analyzer is configured as expected using the **show analyzer** command.

```
user@switch> show analyzer
  Analyzer name                 : employee-monitor
  Output interface              : ge-0/0/10.0
  Mirror ratio                  : 1
  Loss priority                 : Low
  Ingress monitored interfaces : ge-0/0/0.0
  Ingress monitored interfaces : ge-0/0/1.0
  Egress monitored interfaces  : None
```

Meaning This output shows that the **employee-monitor** analyzer has a ratio of 1 (mirroring every packet, the default setting), a loss priority of low (set this option to high only when the analyzer output is to a VLAN), is mirroring the traffic entering the **ge-0/0/0** and **ge-0/0/1** interfaces, and sending the mirrored traffic to the **ge-0/0/10** interface.

Related Documentation

- Example: Configuring Port Mirroring for Remote Monitoring of Employee Resource Use on J-EX Series Switches on page 2376
- Configuring Port Mirroring to Analyze Traffic (CLI Procedure) on page 2383
- Configuring Port Mirroring to Analyze Traffic (J-Web Procedure) on page 2386
- Understanding Port Mirroring on J-EX Series Switches on page 2367

Example: Configuring Port Mirroring for Remote Monitoring of Employee Resource Use on J-EX Series Switches

J-EX Series switches allow you to configure port mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use port mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on J-EX4200 or J-EX4500 switches
- Packets exiting a VLAN on J-EX8200 switches

You can analyze the mirrored traffic using a protocol analyzer application running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN.

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to the **remote-analyzer** VLAN so that you can perform analysis from a remote monitoring station. The first example shows how to mirror all traffic entering the ports connected to employee computers. The second example shows the same scenario, but includes a filter to mirror only the employee traffic going to the Web.

This example describes how to configure remote port mirroring:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- One J-EX4200 switch connected to another J-EX4200 switch

Before you configure port mirroring, be sure you have an understanding of port mirroring concepts.

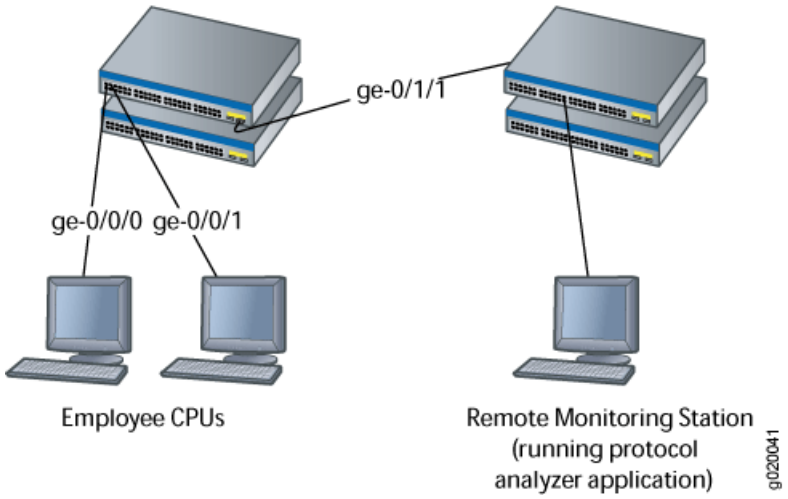
Input interfaces that are referred by the analyzer must be configured.

Overview and Topology

This topic includes two related examples that describe how to configure port mirroring to the **remote-analyzer** VLAN so that analysis can be performed from a remote monitoring station. The first example shows how to configure a J-EX Series switch to mirror all traffic from employee computers. The second example shows the same scenario, but the setup includes a filter to mirror only the employee traffic going to the Web.

Figure 69 on page 2378 shows the network topology for this example.

Figure 69: Remote Port Mirroring Example Network Topology



In this example:

- Interface **ge-0/0/0** is a Layer 2 interface and interface **ge-0/0/1** is a Layer 3 interface that serve as connections for employee computers.
- Interface **ge-0/0/10** is a Layer 2 interface that connects to another switch.
- VLAN **remote-analyzer** is configured on all switches in the topology to carry the mirrored traffic.

NOTE: The interface connected to the remote monitoring station must be a member of VLAN **remote-analyzer**, and this VLAN must be configured on all switches between the monitored switch and the monitoring station.

Mirroring All Employee Traffic for Remote Analysis

To configure port mirroring for remote traffic analysis for all incoming and outgoing employee traffic, perform these tasks:

CLI Quick Configuration

To quickly configure port mirroring for remote traffic analysis for incoming and outgoing employee traffic, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set ethernet-switching-options analyzer employee-monitor input ingress interface ge-0/0/0.0
set ethernet-switching-options analyzer employee-monitor input ingress interface ge-0/0/1.0
set ethernet-switching-options analyzer employee-monitor input egress interface ge-0/0/0.0
set ethernet-switching-options analyzer employee-monitor input egress interface ge-0/0/1.0
set ethernet-switching-options analyzer employee-monitor loss-priority high output vlan
remote-analyzer
```

Step-by-Step Procedure

To configure basic remote port mirroring:

1. Configure the VLAN tag ID for the **remote-analyzer** VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

2. Configure the interface on the network port connected to another switch for trunk mode and associate it with the **remote-analyzer** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

3. Configure the **employee-monitor** analyzer:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee–monitor loss-priority high
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
user@switch# set analyzer employee–monitor input ingress interface ge-0/0/1.0
user@switch# set analyzer employee–monitor output vlan remote-analyzer
set analyzer employee-monitor input egress interface ge-0/0/0.0
set analyzer employee-monitor input egress interface ge-0/0/1.0
```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
ethernet-switching-options {
    analyzer employee-monitor {
        loss-priority high;
        input {
            ingress {
                interface ge-0/0/0.0;
                interface ge-0/0/1.0;
            }
            egress {
                interface ge-0/0/0.0;
                interface ge-0/0/1.0;
            }
        }
        output {
            vlan {
                remote-analyzer;
            }
        }
    }
}
```

Mirroring Employee-to-Web Traffic for Remote Analysis

To configure port mirroring for remote traffic analysis of employee to web traffic, perform these tasks:

CLI Quick Configuration

To quickly configure port mirroring to mirror employee traffic to the external Web, copy the following commands and paste them into the terminal window:

```
[edit]
```

```
set ethernet-switching-options analyzer employee-web-monitor loss-priority high output vlan
999
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then analyzer
employee–web-monitor
set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

Step-by-Step Procedure

To configure port mirroring of all traffic from the two ports connected to employee computers to the **remote-analyzer** VLAN for use from a remote monitoring station:

1. Configure the **employee-web-monitor** analyzer:

```
[edit ethernet-switching-options]
user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode
trunk
user@switch# set analyzer employee-web-monitor loss-priority high output vlan 999
```

2. Configure the VLAN tag ID for the **remote-analyzer** VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

3. Configure the interface to associate it with the **remote-analyzer** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

4. Configure the firewall filter called **watch-employee**:

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port
80
user@switch# set filter watch-employee term employee-to-web then analyzer
employee-web-monitor
```

5. Apply the firewall filter to the employee interfaces:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
interfaces {
```

```
    ...
    ge-0/0/10 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members remote-analyzer;
          }
        }
      }
    }
    ge-0/0/0 {
      unit 0 {
        family ethernet-switching {
          filter {
            input watch-employee;
          }
        }
      }
    }
    ge-0/0/1 {
      unit 0 {
        family ethernet-switching {
          filter {
            input watch-employee;
          }
        }
      }
    }
}
...
firewall {
    family ethernet-switching {
      ...
      filter watch-employee {
        term employee-to-corp {
          from {
            source-address {
              192.0.2.16/28;
            }
            destination-address {
              192.0.2.16/28;
            }
          }
          then accept;
        }
        term employee-to-web {
          from {
            destination-port 80;
          }
          then analyzer employee-web-monitor;
        }
      }
    }
}
ethernet-switching-options {
```

```
    analyzer employee-web-monitor {
      loss-priority high;
      output {
        vlan {
          999;
        }
      }
    }
  vlans {
    remote-analyzer {
      vlan-id 999;
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Analyzer Has Been Correctly Created on page 2382

Verifying That the Analyzer Has Been Correctly Created

Purpose Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces, and appropriate output interface.

Action You can verify the port mirror analyzer is configured as expected using the **show analyzer** command. To view previously created analyzers that are disabled, go to the J-Web interface.

```
user@switch> show analyzer
 Analyzer name                : employee-monitor
 Output VLAN                  : remote-analyzer
 Mirror ratio                 : 1
 Loss priority                : High
 Ingress monitored interfaces : ge-0/0/0.0
 Ingress monitored interfaces : ge-0/0/1.0
```

Meaning This output shows that the **employee-monitor** analyzer has a ratio of 1 (mirroring every packet, the default), a loss priority of high (set this option to high whenever the analyzer output is to a VLAN), is mirroring the traffic entering **ge-0/0/0** and **ge-0/0/1**, and sending the mirrored traffic to the analyzer called **remote-analyzer**.

Configuring Port Mirroring

Configuring Port Mirroring to Analyze Traffic (CLI Procedure)

J-EX Series switches allow you to configure port mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use port mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on J-EX4200 or J-EX4500 switches
- Packets exiting a VLAN on J-EX8200 switches

We recommend that you disable port mirroring when you are not using it and select specific input interfaces in preference to using the **all** keyword. You can also limit the amount of mirrored traffic by using a firewall filter or the **ratio** keyword to mirror only a selection of packets.

NOTE: If you want to create additional analyzers without deleting the existing analyzer, first disable the existing analyzer using the **disable analyzer** ***analyzer-name*** command or the J-Web configuration page for port mirroring.

NOTE: Interfaces used as output for a port mirror analyzer must be configured as family **ethernet-switching**.

Configuring Port Mirroring for Local Traffic Analysis

To mirror interface traffic or VLAN traffic on the switch to an interface on the switch:

1. Choose a name for the port mirroring configuration—in this case, **employee-monitor**—and specify the input—in this case, packets entering **ge-0/0/0** and **ge-0/0/1**:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee-monitor input ingress interface ge–0/0/0.0

[edit ethernet-switching-options]
user@switch# set analyzer employee-monitor input ingress interface ge–0/0/1.0
```

2. Optionally, you can specify a statistical sampling of the packets by setting a ratio:

```
[edit ethernet-switching-options]
```

```
user@switch# set analyzer employee-monitor ratio 200
```

When the ratio is set to 200, 1 of every 200 packets is mirrored to the analyzer. You can use statistical sampling to reduce the volume of mirrored traffic, as a high volume of mirrored traffic can be performance intensive for the switch. On J-EX8200 switches, you can set a ratio only for ingress packets.

3. Configure the destination interface for the mirrored packets:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee-monitor output interface ge-0/0/10.0
```

Configuring Port Mirroring for Remote Traffic Analysis

To mirror traffic that is traversing interfaces or a VLAN on the switch to a VLAN for analysis from a remote location:

1. Configure a VLAN to carry the mirrored traffic. This VLAN is called **remote-analyzer** and given the ID of 999 by convention in this documentation:

```
[edit]
user@switch# set vlans remote-analyzer vlan-id 999
```

2. Set the uplink module interface that is connected to the distribution switch to trunk mode and associate it with the **remote-analyzer** VLAN:

```
[edit]
user@switch# set interfaces ge-0/1/1 unit 0 family ethernet-switching port-mode trunk
vlan members 999
```

3. Configure the analyzer:

   a. Choose a name and set the loss priority to high. Loss priority should always be set to high when configuring for remote port mirroring:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee—monitor loss-priority high
```

   b. Specify the traffic to be mirrored—in this example the packets entering ports **ge-0/0/0** and **ge-0/0/1**:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee—monitor input ingress interface ge-0/0/0.0
```

```
[edit ethernet-switching-options]
user@switch# set analyzer employee—monitor input ingress interface ge-0/0/1.0
```

   c. Specify the **remote-analyzer** VLAN as the output for the analyzer:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee-monitor output vlan 999
```

4. Optionally, you can specify a statistical sampling of the packets by setting a ratio:

```
[edit ethernet-switching-options]
user@switch# set analyzer employee-monitor ratio 200
```

When the ratio is set to 200, 1 out of every 200 packets is mirrored to the analyzer. You can use this to reduce the volume of mirrored traffic as a very high volume of mirrored traffic can be performance intensive for the switch.

Filtering the Traffic Entering an Analyzer

To filter which packets are mirrored to an analyzer, create the analyzer and then use it as the action in the firewall filter. You can use firewall filters in both local and remote port mirroring configurations.

If the same analyzer is used in multiple filters or terms, the packets are copied to the analyzer output port or analyzer VLAN only once.

To filter mirrored traffic, create an analyzer and then create a firewall filter. The filter can use any of the available match conditions and must have an action of **analyzer *analyzer-name***. The action of the firewall filter provides the input to the analyzer.

To configure port mirroring with filters:

1. Configure the analyzer name (here, **employee-monitor**) and the output:

   a. For local analysis, set the output to the local interface to which you will connect the computer running the protocol analyzer application:

      ```
      [edit ethernet-switching-options]
      user@switch# set analyzer employee-monitor output interface ge-0/0/10.0
      ```

   b. For remote analysis, set the loss priority to high and set the output to the **remote-analyzer** VLAN:

      ```
      [edit ethernet-switching-options]
      user@switch# set analyzer employee—monitor loss-priority high output vlan 999
      ```

2. Create a firewall filter using any of the available match conditions and specify the action as **analyzer employee-monitor**:

   This step shows a firewall filter called **example-filter**, with two terms:

   a. Create the first term to define the traffic that should not pass through to the analyzer:

      ```
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term no-analyzer from source-address ip–address
      ```

      ```
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term no-analyzer from destination-address
      ip-address
      ```

      ```
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term no-analyzer then accept
      ```

   b. Create the second term to define the traffic that should pass through to the analyzer:

      ```
      [edit firewall family ethernet-switching]
      user@switch# set filter example-filter term to-analyzer from destination-port 80

      [edit firewall family ethernet-switching]
      ```

```
user@switch# set filter example-filter term to-analyzer then analyzer employee–monitor
```

3. Apply the firewall filter to the interfaces or VLAN that are input to the analyzer:

```
[edit]
user@switch# set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input
example-filter

[edit]
user@switch# set vlan rspan filter input example-filter
```

Configuring Port Mirroring to Analyze Traffic (J-Web Procedure)

J-EX Series switches allow you to configure port mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use port mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on J-EX4200 or J-EX4500 switches
- Packets exiting a VLAN on J-EX8200 switches

To configure port mirroring on a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Security** > **Port Mirroring**.

   The first part of the screen displays analyzer details such as the name, status, analyzer port, ratio, and loss priority.

   The second part of the screen lists ingress and egress ports of the selected analyzer.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see “Using the Commit Options to Commit Configuration Changes” in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

2. Click one:
   - Add—Add an analyzer. Enter information as specified in Table 314 on page 2387.
   - Edit—Modify details of the selected analyzer. Enter information as specified in Table 314 on page 2387.
   - Delete—Delete the selected analyzer.
   - Enable/Disable—Enable or disable the selected analyzer (toggle).

NOTE: On J-EX4200 and J-EX4500 switches, only one analyzer can be enabled at a time. On J-EX8200 switches, a maximum of seven analyzers can be enabled.

NOTE: When an analyzer is deleted or disabled, any filter association is removed.

Table 314: Port Mirroring Configuration Settings

Field	Function	Your Action
Analyzer Name	Specifies the name of the analyzer.	Type a name for the analyzer.
Ratio	Specifies the ratio of packets to be mirrored. For example: • A ratio of 1 sends copies of all packets. • A ratio of 2047 sends copies of 1 out of every 2047 packets.	Enter a number from 0 through 2047.
Loss Priority	Specifies the loss priority of the mirrored packets. By default, the switch applies a lower priority to mirrored data than to regular port-to-port data—mirrored traffic is dropped in preference to regular traffic when capacity is exceeded. For port mirroring configurations with output to an analyzer VLAN, set the loss priority to high.	Keep the default of low, unless the output is to a VLAN.
Analyzer Port	Specifies a local interface or VLAN to which mirrored packets are sent. NOTE: A VLAN must have only one associated interface to be specified as an analyzer interface.	Click **Select**. In the Select Analyzer Port/VLAN window, select either port or VLAN as the **Analyzer Type**. Next, select the required port or VLAN.
Ingress	Specifies interfaces or VLANs for which entering traffic is mirrored.	Click **Add** and select Port or VLAN. Next, select the interfaces or VLANs. Click **Remove** to delete an ingress interface or VLAN.

Table 314: Port Mirroring Configuration Settings *(continued)*

Field	Function	Your Action
Egress	Specifies interfaces for which exiting traffic is mirrored.	Click **Add** to add egress interfaces. Click **Remove** to remove egress interfaces.

Verifying Port Mirroring Configuration

- Verifying Input and Output for Port Mirroring Analyzers on J-EX Series Switches on page 2388

Verifying Input and Output for Port Mirroring Analyzers on J-EX Series Switches

Purpose Verify that an analyzer has been created on the switch and has the appropriate output interfaces, and appropriate output interface.

Action You can verify the port mirror analyzer is configured as expected using the **show analyzer** command.

```
[edit]
user@switch>  show analyzer
Analyzer name                   : employee-monitor
  Output VLAN                   : remote-analyzer
  Mirror ratio                  : 1
  Loss priority                 : High
  Ingress monitored interfaces : ge-0/0/0.0
  Ingress monitored interfaces : ge-0/0/1.0
```

You can view all of the port mirror analyzers configured on the switch, including any that are disabled, using the **show ethernet-switching-options** command in configuration mode.

```
user@switch# show ethernet-switching-options
inactive: analyzer employee-web-monitor {
    loss-priority high;
    output {

analyzer employee-monitor {
    loss-priority high;
    input {
        ingress {
            interface ge-0/0/0.0;
            interface ge-0/0/1.0;
        }
    }
```

```
    output {
        vlan {
            remote-analyzer;
        }
    }
}
```

Meaning This output shows that the employee-monitor analyzer has a ratio of 1 (mirroring every packet, the default), a loss priority of high (set this option to high whenever the analyzer output is to a VLAN), is mirroring the traffic entering **ge-0/0/0** and **ge-0/0/1**, and sending the mirrored traffic to the analyzer called remote-analyzer.

analyzer

Syntax

```
analyzer {
  name {
    ratio number;
    loss-priority priority;
    input {
      ingress {
        interface (all | interface-name);
        vlan (vlan-id | vlan-name);
      }
      egress {
        interface (all | interface-name);
      }
    output {
      interface interface-name;
      vlan (vlan-id | vlan-name);
    }
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure port mirroring. One analyzer (port mirroring configuration) can be configured on a J-EX4200 or J-EX4500 switch and seven analyzers (port mirroring configurations) can be configured on a J-EX8208 or J-EX8216 switch at a time. Other analyzers can be present and disabled.

Default Port mirroring is disabled and Junos OS creates no default analyzers.

Options *name*—Name that identifies the analyzer. The name can be up to 125 characters long, must begin with a letter, and can include uppercase letters, lowercase letters, numbers, dashes, and underscores. No other special characters are allowed.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

ingress

Syntax

```
ingress {
  interface (all | interface-name);
  vlan (vlan-id | vlan-name);
}
```

Hierarchy Level [edit ethernet-switching-options analyzer *name* input]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure ports or VLANs for which the entering traffic is mirrored as part of an port mirroring configuration.

The statements are explained separately.

Default No default.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

input

Syntax

```
input {
  ingress {
    interface (all | interface-name);
    vlan (vlan-id | vlan-name);
  }
  egress {
    interface (all | interface-name);
  }
}
```

Hierarchy Level [edit **ethernet-switching-options analyzer** *name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the traffic to be mirrored in a port mirroring configuration—the definition can be a combination of:

- Packets entering or exiting a port
- Packets entering a VLAN on a J-EX4200 or J-EX4500 switch
- Packets exiting a VLAN on a J-EX8200 switch

The remaining statements are explained separately.

Default No default.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

interface

Syntax interface (all | *interface-name*);

Hierarchy Level [edit **ethernet-switching-options analyzer** *name* **input egress**],
[edit **ethernet-switching-options analyzer** *name* **input ingress**],
[edit **ethernet-switching-options analyzer** *name* **output**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interfaces for which traffic is mirrored.

Options all—Apply port mirroring to all interfaces on the switch. Mirroring a high volume of traffic can be performance intensive for the switch. Therefore, you should generally select specific input interfaces in preference to using the all keyword, or use the all keyword in combination with setting a ratio for statistical sampling.

interface-name—Apply port mirroring to the specified interface only.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

loss-priority

Syntax loss-priority *priority*;

Hierarchy Level [edit **ethernet-switching-options analyzer** *name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a loss priority for mirrored packets. By default, the switch applies a lower priority to mirrored data than to regular port-to-port data—mirrored traffic is dropped in preference for regular traffic when capacity is exceeded. For port mirroring configurations with output to an analyzer VLAN, set the loss priority to high.

Default Low

Options *priority*—The value for priority can be low or high.
Default: low

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

output

Syntax

```
output {
  interface interface-name;
  vlan (vlan-id | vlan-name);
}
```

Hierarchy Level [edit ethernet-switching-options analyzer *name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the destination for mirrored traffic, either an interface on the switch, for local monitoring, or a VLAN, for remote monitoring.

The statements are explained separately.

Default No default.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

ratio

Syntax ratio *number*;

Hierarchy Level [edit **ethernet-switching-options analyzer** *name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure port mirroring to copy a sampling of packets, by setting a ratio of 1:x, A ratio of 1 mirrors all packets, and 2047 mirrors 1 out of every 2047 packets.

On J-EX8200 switches, you can set a ratio only for ingress packets.

Default 1

Options ***number***—The number of packets in the sample, out of which 1 packet is mirrored.
Range: 1 through 2047
Default: 1

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Understanding Port Mirroring on J-EX Series Switches on page 2367

vlan

Syntax vlan (*vlan-id* | *vlan-name*);

Hierarchy Level [edit **ethernet-switching-options analyzer** *name* **input ingress**],
[edit **ethernet-switching-options analyzer** *name* **output**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure mirrored traffic to be sent to a VLAN for remote monitoring.

Options *vlan-id*—Numeric VLAN identifer.

vlan-name—Name of the VLAN.

Required Privilege Level system—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Operational Commands for Port Mirroring

show analyzer

Syntax **show analyzer *analyzer-name***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about analyzers configured for port mirroring.

Options *analyzer-name*—(Optional) Displays the status of a specific analyzer on the switch.

Required Privilege Level view

List of Sample Output **show analyzer on page 2403**

Output Fields Table 315 on page 2403 lists the output fields for the **command-name** command. Output fields are listed in the approximate order in which they appear.

Table 315: show analyzer Output Fields

Field Name	Field Description
Analyzer name	Displays the name of the analyzer.
Output interface	Specifies a local interface to which mirrored packets are sent. An analyzer can have output to either an interface or a VLAN, not both.
Output VLAN	Specifies a VLAN to which mirrored packets are sent. An analyzer can have output to either an interface or a VLAN, not both.
Mirror ratio	Displays the ratio of packets to be mirrored, between 1 and 2047 where 1 sends copies of all packets and 2047 sends copies of 1 out of every 2047 packets.
Loss priority	Displays the loss priority of mirrored packets. By default, loss priority is set to **low**, with mirrored traffic dropped in preference for regular traffic when capacity is exceeded. For analyzers with output to a VLAN, set the loss priority to **high**.
Egress monitored interfaces	Displays interfaces for which traffic exiting the interfaces is mirrored.
Ingress monitored interfaces	Displays interfaces for which traffic entering the interfaces is mirrored.
Ingress monitored VLANs	Displays VLANs for which traffic entering the VLAN is mirrored.

Sample Output

show analyzer

```
user@host> show analyzer
Analyzer name                  : employee-monitor
  Output interface             : ge-0/0/10.0
  Output VLAN                  : remote-analyzer
  Mirror ratio                 : 1
  Loss priority                : High
  Egress monitored interfaces  : ge-0/0/3.0
  Ingress monitored interfaces : ge-0/0/0.0
```

```
    Ingress monitored interfaces : ge-0/0/1.0
```

CHAPTER 77

sFlow Monitoring Technology

sFlow Technology—Overview

Understanding How to Use sFlow Technology for Network Monitoring on a J-EX Series Switch

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology randomly samples network packets and sends the samples to a monitoring station. You can configure sFlow technology on a J-EX Series Switch to continuously monitor traffic at wire speed on all interfaces simultaneously.

This topic describes:

Sampling Mechanism and Architecture of sFlow Technology on J-EX Series Switches

sFlow technology uses the following two sampling mechanisms:

- Packet-based sampling: Samples one packet out of a specified number of packets from an interface enabled for sFlow technology.
- Time-based sampling: Samples interface statistics at a specified interval from an interface enabled for sFlow technology.

The sampling information is used to create a network traffic visibility picture. The Junos operating system (Junos OS) fully supports the sFlow standard described in RFC 3176,

InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks (see http://faqs.org/rfcs/rfc3176.html).

NOTE: sFlow technology on the switches samples only raw packet headers. A raw Ethernet packet is the complete Layer 2 network frame.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent's two main activities are random sampling and statistics gathering. It combines interface counters and flow samples and sends them across the network to the sFlow collector in UDP datagrams, directing those datagrams to the IP address and UDP destination port of the collector. Each datagram contains the following information:

- The IP address of the sFlow agent
- The number of samples
- The interface through which the packets entered the agent
- The interface through which the packets exited the agent
- The source and destination interface for the packets
- The source and destination VLAN for the packets

J-EX Series switches adopt the distributed sFlow architecture. The sFlow agent has two separate sampling entities that are associated with each Packet Forwarding Engine. These sampling entities are known as subagents. Each subagent has a unique ID that is used by the collector to identify the data source. A subagent has its own independent state and forwards its own sample messages to the sFlow agent. The sFlow agent is responsible for packaging the samples into datagrams and sending them to the sFlow collector. Because sampling is distributed across subagents, the protocol overhead associated with sFlow technology is significantly reduced at the collector.

NOTE: If the mastership assignment changes in a Virtual Chassis setup, sFlow technology continues to function.

Adaptive Sampling

The switches use adaptive sampling to ensure both sampling accuracy and efficiency. Adaptive sampling is a process of monitoring the overall incoming traffic rate on the network device and providing intelligent feedback to interfaces to dynamically adapt their sampling rate to the traffic conditions. Interfaces on which incoming traffic exceeds the system threshold are checked so that all violations can be regulated without affecting the traffic on other interfaces. Every 5 seconds the agent checks interfaces to get the number of samples, and interfaces are grouped based on the slot that they belong to. The top five interfaces that produce the highest number of samples are selected. Using the binary backoff algorithm, the sampling load on these interfaces is reduced by half and allotted to interfaces that have a lower sampling rate. Therefore when the processor limit is reached, the sampling rate is adapted such that it does not load the processor

any further. If the switch is rebooted, the adaptive sampling rate is reset to the user-configured sampling rate. Also, if you modify the sampling rate, the adaptive sampling rate changes.

The advantage of adaptive sampling is that the switch continues to operate at its optimum level even when there is a change in the traffic patterns in the interfaces. You do not need to make any changes. Because the sampling rate adapts dynamically to changing network conditions, the resources are utilized optimally resulting in a high performance network.

Infrequent sampling flows are not reported in the sFlow information, but over time the majority of flows are reported. Based on a defined sampling rate, 1 out of *N* packets is captured and sent to the collector. This type of sampling does not provide a 100 percent accurate result in the analysis, but it does provide a result with quantifiable accuracy. A user-configured polling interval defines how often the sFlow data for a specific interface are sent to the collector, but an sFlow agent can also schedule polling.

NOTE: **sFlow technology on J-EX Series switches does not support graceful restart. When a graceful restart occurs, the adaptive sampling rate is set to the user-configured sampling rate.**

sFlow Agent Address Assignment

The sFlow collector uses the sFlow agent's IP address to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID for the sFlow agent remains constant. If you do not specify the IP address to be assigned to the agent, an IP address is automatically assigned to the agent based on the following order of priority of interfaces configured on the switch:

1. Virtual management Ethernet (VME) interface

2. Management Ethernet interface

If neither of the preceding interfaces has been configured, the IP address of any Layer 3 interface or the routed VLAN interface (RVI) is assigned to the agent. At least one interface must be configured on the switch for an IP address to be automatically assigned to the agent. When the agent's IP address is assigned automatically, the IP address is dynamic and changes when the switch reboots.

sFlow data can be used to provide network traffic visibility information. You can explicitly configure the IP address to be assigned to source data (sFlow datagrams). If you do not explicitly configure that address, the IP address of the configured Gigabit Ethernet interface, 10-Gigabit Ethernet interface, or the routed VLAN interface (RVI) is used as the source IP address.

Example: sFlow Technology Configuration

Example: Configuring sFlow Technology to Monitor Network Traffic on J-EX Series Switches

You can configure sFlow technology, designed for monitoring high-speed switched or routed networks, to continuously monitor traffic at wire speed on all interfaces simultaneously. You can specify sample rates for ingress and egress packets. sFlow data can be used to provide network traffic visibility information.

This example describes how to configure and use sFlow technology to monitor network traffic. Junos OS fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks* (see http://faqs.org/rfcs/rfc3176.html).

Requirements

This example uses the following hardware and software components:

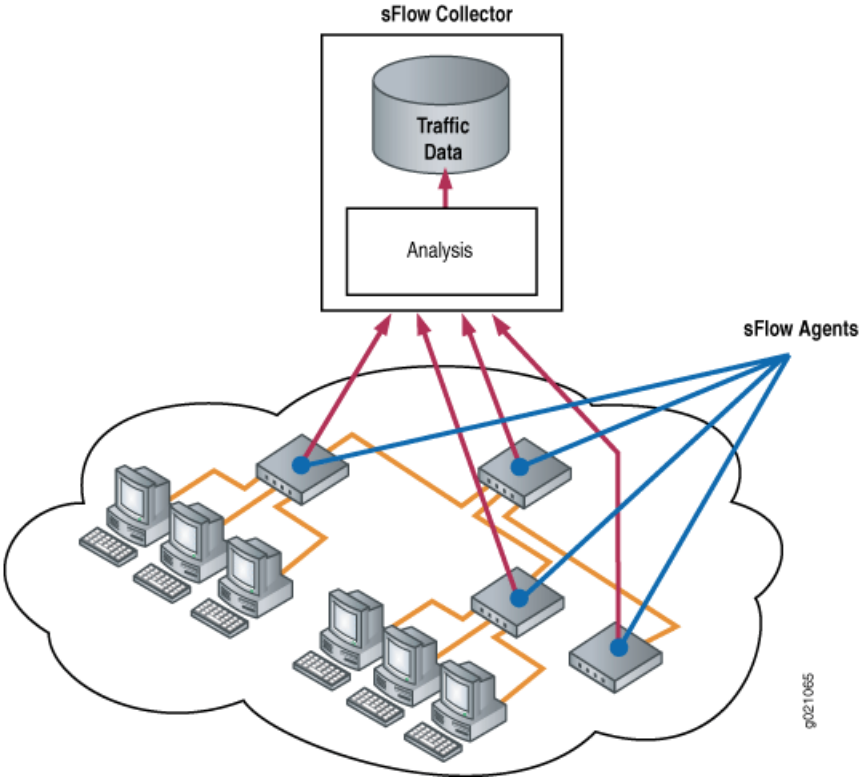
- One J-EX Series switch
- Junos OS Release 10.2 or later for J-EX Series switches

Overview and Topology

sFlow technology is a statistical-sampling–based network monitoring technology for high-speed switched or routed networks. sFlow technology samples network packets and sends the samples to a monitoring station. You can specify sample rates for ingress and egress packets. The information gathered is used to create a network traffic visibility picture.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent runs on the switch. It combines interface counters and flow samples and sends them across the network to the sFlow collector. Figure 70 on page 2409 depicts the basic elements of the sFlow system.

Figure 70: sFlow Technology Monitoring System



Configuration

To configure sFlow technology, perform the following tasks:

CLI Quick Configuration

To quickly configure sFlow technology, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set sflow collector 10.204.32.46 udp-port 5600
set sflow interfaces ge-0/0/0
set sflow polling-interval 20
set sflow sample-rate egress 1000
```

Step-by-Step Procedure

To configure sFlow technology:

1. Configure the IP address and UDP port of the collector:

   ```
   [edit protocols]
   user@switch# set sflow collector 10.204.32.46 udp-port 5600
   ```

   NOTE: You can configure a maximum of 4 collectors.

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@switch# set interfaces ge-0/0/0
   ```

NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a link aggregation group (LAG) interface—that is, an aggregated Ethernet interface with a name such as ae0. You can enable sFlow technology on the member interfaces that make up the LAG.

3. Specify how often the sFlow agent polls the interface:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

NOTE: The polling interval can be specified as a global parameter also. Specify 0 if you do not want to poll the interface.

4. Specify the rate at which egress packets must be sampled:

NOTE: The sample-rate *number* (the global sample-rate) statement has been deprecated and might be removed from future product releases. We strongly recommend that you phase out its use.

```
[edit protocols sflow]
user@switch# set sample-rate egress 1000
```

NOTE: If you set only the egress sample rate, the ingress sample rate will be disabled.

Results Check the results of the configuration:

```
[edit protocols sflow]
  user@switch# show
  polling-interval 20;
  sample-rate egress 1000;
  collector 10.204.32.46 {
  udp-port 5600;
  }
  interfaces ge-0/0/0.0;
```

Verification

To confirm that the configuration is correct, perform these tasks:

- Verifying That sFlow Technology Has Been Configured Properly on page 2411
- Verifying That sFlow Technology Is Enabled on the Intended Interface on page 2411
- Verifying the sFlow Collector Configuration on page 2412

Verifying That sFlow Technology Has Been Configured Properly

Purpose Verify that sFlow technology has been configured properly.

Action Use the **show sflow** command:

```
user@switch> show sflow
sFlow: Enabled
Sample limit: 300 packets/second
Polling interval: 20 seconds
Sample rate egress: 1:1000: Enabled
Sample rate ingress: 1:2048: Disabled
Agent ID: 10.204.96.222
```

NOTE: The sample limit cannot be configured and is set to 300 packets/second.

Meaning The output shows that sFlow technology is enabled and specifies the values for the sample limit, polling interval, and sample rate.

Verifying That sFlow Technology Is Enabled on the Intended Interface

Purpose Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

Action Use the **show sflow interface** command:

```
user@switch> show sflow interface
Interface       Status      Sample rate    Adapted sample rate   Polling-interval

            Egress Ingress   Egress Ingress   Egress Ingress
ge-0/0/0.0  Enabled  Disabled  1000    2048    1000     2048            20
```

NOTE: The sample limit cannot be configured and is set to 300 packets/second.

Meaning The output indicates that sFlow technology is enabled on the **ge-0/0/0.0** interface with an egress sample rate of 1000, a disabled ingress sample rate, a sampling limit of 300 packets per second and a polling interval of 20 seconds.

Verifying the sFlow Collector Configuration

Purpose Verify the sFlow collector's configuration.

Action Use the **show sflow collector** command:

```
user@switch> show sflow collector

Collector          Udp-port    No. of samples
 address
10.204.32.46       5600        1000
10.204.32.76       3400        1000
```

Meaning The output displays the IP address of the collectors and the UDP ports. It also displays the number of samples.

Configuring sFlow Technology

Configuring sFlow Technology for Network Monitoring (CLI Procedure)

You can configure sFlow technology, designed for monitoring high-speed switched or routed networks, to continuously monitor traffic at wire speed on all interfaces simultaneously. Junos OS fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks* (see http://faqs.org/rfcs/rfc3176.html).`

To configure sFlow features:

1. Configure the IP address and the UDP port of the collector:

   ```
   [edit protocols]
   user@switch# set sflow collector ip-address udp-port port-number
   ```

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@switch# set interfaces interface-name
   ```

   NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

   You cannot enable sFlow technology on a link aggregation group (LAG), but you can enable it on the member interfaces of a LAG.

3. Specify how often the sFlow agent polls the interface:

```
[edit protocols sflow]
user@switch# set polling-interval seconds
```

NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled. You can specify either an egress or an ingress qualifier.

NOTE: The sample-rate *number* (the global sample rate) statement has been deprecated and might be removed from future product releases. We strongly recommend that you phase out its use.

To specify an egress sample rate:

```
[edit protocols sflow]
user@switch# set sample-rate egress number
```

To specify an ingress sample rate:

```
[edit protocols sflow]
user@switch# set sample-rate ingress number
```

5. To configure the polling interval and the egress and ingress sample rates at the interface level:

```
[edit protocols sflow interfaces interface-name]
user@switch# set polling-interval seconds

[edit protocols sflow interfaces]
user@switch# set sample-rate egress number

[edit protocols sflow interfaces]
user@switch# set sample-rate ingress number
```

NOTE: The interface-level configuration overrides the global configuration.

6. To specify an IP address to be used as the agent ID for the sFlow agent:

```
[edit protocols sflow]
user@switch# set agent-id ip-address
```

7. To specify the source IP address to be used for sFlow datagrams:

```
[edit protocols sflow]
user@switch# set source-ip ip-address
```

collector

Syntax

```
collector {
  ip-address;
  udp-port port-number;
}
```

Hierarchy Level [edit protocols **sflow**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a remote collector for sFlow network traffic monitoring. The switch sends sFlow UDP datagrams to this collector for analysis. You can configure up to four collectors on the switch. You configure a collector by specifying its IP address and a UDP port.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Monitoring Network Traffic Using sFlow Technology on J-EX Series Switches on page 2408
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 2412

disable

Syntax

```
disable;
```

Hierarchy Level [edit protocols **sflow**],
[edit protocols **sflow interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the sFlow monitoring protocol on all interfaces on the switch or on the specified interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Monitoring Network Traffic Using sFlow Technology on J-EX Series Switches on page 2408
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 2412

interfaces

Syntax

```
interfaces interface-name {
    disable;
    polling-interval seconds;
    sample-rate {
        egress number;
        ingress number;
    }
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure sFlow network traffic monitoring on the specified interface on the switch. You can configure sFlow parameters such as polling interval and sample rate with different values on different interfaces, and you can also disable sFlow monitoring on individual interfaces.

The remaining statements are explained separately.

Options ***interface-name***—Name of the interface on which to configure sFlow parameters.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Monitoring Network Traffic Using sFlow Technology on J-EX Series Switches on page 2408
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 2412

polling-interval

Syntax polling-interval *seconds*;

Hierarchy Level [edit protocols **sflow**],
[edit protocols **sflow interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interval (in seconds) that the switch waits between port statistics update messages. "Polling" refers to the switch's gathering various statistics for the network interfaces configured for sFlow monitoring and exporting the statistics to the configured sFlow collector.

Default If no polling interval is configured for a particular interface, the switch waits the number of seconds that is configured for the global sFlow configuration. If no global interval is configured, the switch waits 20 seconds between messages.

Options ***seconds***—Number of seconds between port statistics update messages. A **0** (zero) value specifies that polling is disabled.

Range: 0–3600 seconds

Default: 20 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

sample-rate

Syntax

```
sample-rate {
    egress number;
    ingress number;
}
```

Hierarchy Level

[edit protocols **sflow**],
[edit protocols **sflow interfaces** *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Option *number* (directly following sample-rate) deprecated and options **egress *number*** and **ingress *number*** added in Junos OS Release 10.4 for J-EX Series switches.

Description

Set the ratios of the number of packets to be sampled in sFlow network traffic monitoring. For example, if you specify a rate of 1000, every thousandth packet (1 packet out of 1000) is sampled.

Default

By default, both ingress and egress sample rates are disabled if no global sample rate is configured.

NOTE: The **sample-rate *number*** (the global sample-rate) statement has been deprecated and might be removed from future product releases. We strongly recommend that you phase out its use.

Options

egress *number*—Egress qualifier for the sample rate.

Range: 100–1073741823

Default: 2048

ingress *number*—Ingress qualifier for the sample rate.

Range: 100–1073741823

Default: 2048

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

sflow

Syntax

```
sflow {
  agent-id ip-address;
  collector {
    ip-address;
    udp-port port-number;
  }
  disable;
  interfaces interface-name {
    disable;
    polling-interval seconds;
    sample-rate number;
  }
  polling-interval seconds;
  sample-rate number;
  source-ip ip-address;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Options **agent-id** and **source-ip** added in Junos OS Release 10.2 for J-EX Series switches.

Description Configure sFlow technology, designed for monitoring high-speed switched or routed networks, to continuously monitor traffic at wire speed on specified interfaces simultaneously. sFlow data can be used to provide network traffic visibility information.

The remaining statements are explained separately.

Default The sFlow protocol is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 156
- Example: Monitoring Network Traffic Using sFlow Technology on J-EX Series Switches on page 2408
- Configuring sFlow Technology for Network Monitoring (CLI Procedure) on page 2412

udp-port

Syntax udp-port *port-number*;

Hierarchy Level [edit protocols **sflow collector**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the UDP port for a remote collector for sFlow network traffic monitoring. The switch sends sFlow UDP datagrams to the collector for analysis.

Options ***port-number***—UDP port number for this collector.

Default: 6343

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

Operational Commands for sFlow Technology

show sflow

Syntax
show sflow
<collector>
<interface>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display default sFlow technology configuration information.

Options
none—Display default sFlow technology configuration information.

collector—(Optional) Display standard status information about the specified sFlow collector.

interface—(Optional) Display standard status information about the specified sFlow interface.

Required Privilege Level
view

List of Sample Output
show sflow on page 2428

Output Fields
Table 316 on page 2427 lists the output fields for the **show sflow** command. Output fields are listed in the approximate order in which they appear.

Table 316: show sflow Output Fields

Field Name	Field Description	Level of Output
sFlow	Status of the feature: **enabled** or **disabled**.	All levels
Sample rate egress	Rate at which egress packets are sampled.	All levels
Sample rate ingress	Rate at which ingress packets are sampled.	All levels
Sample limit	Number of packets sampled per second. The sample limit cannot be configured and is set to 300 packets/second.	All levels
Polling interval	Interval at which the sFlow agent polls the interface.	All levels
Agent ID	The IP address assigned to the sFlow agent.	All levels

Sample Output

show sflow

```
sFlow         : Enabled
Sample rate egress     : 1:1000
Sample rate ingress  : 1: 2048: Disabled
Sample limit     : 300 packets/second
Polling interval : 20 seconds
Agent ID    : 10.93.54.7
Source IP address : 10.93.54.7
```

show sflow collector

Syntax show sflow collector

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Displays a list of configured sFlow collectors and their properties.

Required Privilege Level view

Related Documentation

- **show sflow on page 2427**
- **show sflow interfaces on page 2430**

Output Fields Table 317 on page 2429 lists the output fields for the **show sflow collector** command. Output fields are listed in the approximate order in which they appear.

Table 317: show sflow collector Output Fields

Field Name	Field Description	Level of Output
IP address	IP address of the collector.	All levels
UDP port	UDP port number.	All levels
No of samples	Packet sampling rate.	All levels

show sflow collector

```
IP-address     UDP-Port  No of samples
10.204.32.46    5600    1000
100.204.32.76    3400    1000
```

show sflow interface

Syntax show sflow interface

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the interfaces on which sFlow technology is enabled and the sampling parameters.

Required Privilege Level view

Related Documentation

List of Sample Output **show sflow interface on page 2430**

Output Fields Table 318 on page 2430 lists the output fields for the **show sflow interface** command. Output fields are listed in the approximate order in which they appear.

Table 318: show sflow interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interfaces on which sFlow technology is enabled.	All levels
Status Egress	Indicates whether egress sample rate is enabled.	All levels
Status Ingress	Indicates whether ingress sample rate is enabled.	All levels
Sample rate Egress	Rate at which egress packets are sampled.	All levels
Sample rate Ingress	Rate at which ingress packets are sampled.	All levels
Adapted sample rate Egress	Adapted rate at which egress packets are sampled.	All levels
Adapted sample rate Ingress	Adapted rate at which ingress packets are sampled.	All levels
Polling-interval	The interval at which the sFlow agent polls the interface.	All levels

Sample Output

show sflow interface

```
Interface       Status      Sample rate    Adapted sample rate   Polling-interval

                Egress Ingress   Egress Ingress   Egress Ingress
ge-0/0/0.0  Enabled  Disabled  1000    2048    1000     2048           20
```

CHAPTER 78

SNMP

Configuring SNMP

Configuring SNMP (J-Web Procedure)

You can use the J-Web interface to define system identification information, create SNMP communities, create SNMP trap groups, and configure health monitor options for J-EX Series switches.

To configure SNMP features:

1. Select **Configure** > **Services** > **SNMP**.
2. Enter information into the configuration page for SNMP as described in Table 319 on page 2433.
3. To apply the configuration click **Apply**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. For details about all commit options, see "Using the Commit Options to Commit Configuration Changes" in the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS: Volume 1* at http://www.support.dell.com/manuals.

Table 319: SNMP Configuration Page

Field	Function	Your Action
Identification		

Table 319: SNMP Configuration Page *(continued)*

Field	Function	Your Action
Contact Information	Free-form text string that specifies an administrative contact for the system.	Type contact information for the administrator of the system (such as name and phone number).
System Description	Free-form text string that specifies a description for the system.	Type information that describes the system
Local Engine ID	Provides an administratively unique identifier of an SNMPv3 engine for system identification. The local engine ID contains a prefix and a suffix. The prefix is formatted according to specifications defined in RFC 3411. The suffix is defined by the local engine ID. Generally, the local engine ID suffix is the MAC address of Ethernet management port 0.	Type the MAC address of Ethernet management port 0.
System Location	Free-form text string that specifies the location of the system.	Type location information for the system (lab name or rack name, for example).
System Override Name	Free-form text string that overrides the system hostname.	Type the hostname of the system.
Communities To add a community, click **Add**		
Community Name	Specifies the name of the SNMP community.	Type the name of the community being added.
Authorization	Specifies the type of authorization (either read-only or read-write) for the SNMP community being configured.	Select the authorization (either read-only or read-write) from the list.
Traps To add a trap group, click **Add**.		
Trap Group Name	Specifies the name of the SNMP trap group being configured.	Type the name of the group being added.

Table 319: SNMP Configuration Page *(continued)*

Field	Function	Your Action
Categories	Specifies which trap categories are added to the trap group being configured.	• To generate traps for authentication failures, select **Authentication**. • To generate traps for chassis and environment notifications, select **Chassis**. • To generate traps for configuration changes, select **Configuration**. • To generate traps for link-related notifications (up-down transitions), select **Link**. • To generate traps for remote operation notifications, select **Remote operations**. • To generate traps for remote network monitoring (RMON), select **RMON alarm**. • To generate traps for routing protocol notifications, select **Routing**. • To generate traps on system warm and cold starts, select **Startup**. • To generate traps on Virtual Router Redundancy Protocol (VRRP) events (such as new-master or authentication failures), select **VRRP events**.
Targets	Specifies one or more hostnames or IP addresses for the systems to receive SNMP traps generated by the trap group being configured.	1. Enter the hostname or IP address, in dotted decimal notation, of the target system to receive the SNMP traps. 2. Click **Add**.
Health Monitoring		
Enable Health Monitoring	Enables the SNMP health monitor on the switch. The health monitor periodically (over the time you specify in the interval field) checks the following key indicators of switch health: • Percentage of file storage used • Percentage of Routing Engine CPU used • Percentage of Routing Engine memory used • Percentage of memory used for each system process • Percentage of CPU used by the forwarding process • Percentage of memory used for temporary storage by the forwarding process	Select the check box to enable the health monitor and configure options. Clear the check box to disable the health monitor. NOTE: If you select the **Enable Health Monitoring** check box and do not specify options, then SNMP health monitoring is enabled with default values.
Interval	Specifies the sampling frequency, in seconds, over which the key health indicators are sampled and compared with the rising and falling thresholds. For example, if you configure the interval as 100 seconds, the values are checked every 100 seconds.	Enter an interval time, in seconds, from **1** through **2147483647**. The default value is 300 seconds (5 minutes).

Table 319: SNMP Configuration Page *(continued)*

Field	Function	Your Action
Rising Threshold	Specifies the value at which SNMP generates an event (trap and system log message) when the value of a sampled indicator is increasing. For example, if the rising threshold is 90 (the default), SNMP generates an event when the value of any key indicator reaches or exceeds 90 percent.	Enter a value from **0** through **100**. The default value is **90**.
Falling Threshold	Specifies the value at which SNMP generates an event (trap and system log message) when the value of a sampled indicator is decreasing. For example, if the falling threshold is 80 (the default), SNMP generates an event when the value of any key indicator falls back to 80 percent or less.	Enter a value from **0** through **100**. The default value is **80**. NOTE: The falling threshold value must be less than the rising threshold value.

- *Junos OS Network Management Configuration Guide*

address

Syntax address *address*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the SNMP target address.

Options ***address***—IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Address

address-mask

Syntax address-mask *address-mask*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Verify the source addresses for a group of target addresses.

Options ***address-mask*** combined with the address defines a range of addresses.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Address Mask

agent-address

Syntax agent-address outgoing-interface;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is **outgoing-interface**, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Options

outgoing-interface—Value of the agent address of all SNMPv1 traps generated by this router or switch. The **outgoing-interface** option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Default: disabled (the agent address is not specified in SNMPv1 traps).

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Agent Address for SNMP Traps

alarm

Syntax

```
alarm index {
  description description;
  falling-event-index index;
  falling-threshold integer;
  falling-threshold-interval seconds;
  interval seconds;
  request-type (get-next-request | get-request | walk-request);
  rising-event-index index;
  rising-threshold integer;
  sample-type (absolute-value | delta-value);
  startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
  syslog-subtag syslog-subtag;
  variable oid-variable;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RMON alarm entries.

Options *index*—Identifies this alarm entry as an integer.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring an Alarm Entry and Its Attributes
- **event on page 2450**

authorization

Syntax authorization *authorization*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the access authorization for SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests.

Options ***authorization***—Access authorization level:

- **read-only**—Enable **Get**, **GetNext**, and **GetBulk** requests.
- **read-write**—Enable all requests, including **Set** requests. You must configure a view to enable **Set** requests.

Default: read-only

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String
- Configuring the SNMP Community String

bucket-size

Syntax bucket-size *number*;

Hierarchy Level [edit snmp rmon history]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the sampling of Ethernet statistics for network fault diagnosis, planning, and performance tuning.

Default 50

Options ***number***—Number of discrete samples of Ethernet statistics requested.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP (J-Web Procedure) on page 2433
- *Junos OS Network Management Configuration Guide*

categories

Syntax

```
categories {
  category;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the types of traps that are sent to the targets of the named trap group.

Default If you omit the **categories** statement, all trap types are included in trap notifications.

Options ***category***—Name of a trap type: **authentication**, **chassis**, **configuration**, **link**, **remote-operations**, **rmon-alarm**, **routing**, **sonet-alarms**, **startup**, or **vrrp-events**.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP Trap Groups

client-list

Syntax

```
client-list client-list-name {
  ip-addresses;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a list of SNMP clients.

Options ***client-list-name***—Name of the client list.

ip-addresses—IP addresses of the SNMP clients to be added to the client list,

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Adding a Group of Clients to an SNMP Community

client-list-name

Syntax client-list-name *client-list-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Add a client list or prefix list to an SNMP community.

Options ***client-list-name***—Name of the client list or prefix list.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Adding a Group of Clients to an SNMP Community

clients

Syntax
```
clients {
  address <restrict>;
}
```

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.

Default If you omit the **clients** statement, all SNMP clients using this community string are authorized to access the router.

Options ***address***—Address of an SNMP client that is authorized to access this router. You must specify an address, not a hostname. To specify more than one client, include multiple ***address*** options.

restrict—(Optional) Do not allow the specified SNMP client to access the router.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the SNMP Community String

commit-delay

Syntax commit-delay *seconds*;

Hierarchy Level [edit snmp nonvolatile]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the timer for the SNMP **Set** reply and start of the commit.

Options ***seconds***—Delay between an affirmative SNMP **Set** reply and start of the commit.
Default: 5 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Commit Delay Timer

community (SNMP)

Syntax

```
community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
        address restrict;
    }
    view view-name;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

Default If you omit the **community** statement, all SNMP requests are denied.

Options ***community-name***—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String

community (RMON)

Syntax community *community-name*;

Hierarchy Level [edit snmp rmon event *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The trap group that is used when generating a trap (if **eventType** is configured to send traps). If that trap group has the **rmon-alarm** trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of **eventCommunity**). If nothing is configured, traps are sent to each group with the **rmon-alarm** category set.

Options ***community-name***—Identifies the trap group that is used when generating a trap if the event is configured to send traps.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring an Event Entry and Its Attributes

community-name

Syntax community-name *community-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The community name defines an SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2 clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (notify, read, or write) allowed on those objects.

Options *community-name*—Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose it in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community *community-index*]** hierarchy levels.

The community name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level is encrypted and not displayed in the command-line interface (CLI).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMPv3 Community

contact

Syntax contact *contact*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the value of the MIB II **sysContact** object, which is the contact person for the managed system.

Options ***contact***—Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the System Contact on a Device Running Junos OS

description (SNMP)

Syntax description *description*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the value of the MIB II **sysDescription** object, which is the description of the system being managed.

Options ***description***—System description. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the System Description on a Device Running Junos OS

description (RMON)

Syntax description *description*;

Hierarchy Level [edit snmp rmon alarm *index*],
[edit snmp rmon event *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Text description of alarm or event.

Options ***description***—Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Description
- Configuring an Event Entry and Its Attributes

destination-port

Syntax destination-port *port-number*;

Hierarchy Level [edit snmp trap-group]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Assign a trap port number other than the default.

Default If you omit this statement, the default port is 162.

Options ***port-number***—SNMP trap port number.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP Trap Groups

engine-id

Syntax

```
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.

For the engine ID, we recommend using the MAC address of fxp0.

Options

local *engine-id-suffix*—Explicit setting for the engine ID suffix.

use-default-ip-address—The engine ID suffix is generated from the default IP address.

use-mac-address—The SNMP engine identifier is generated from the MAC address of the management interface on the router.

Default: use-default-ip-address

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Local Engine ID

event

Syntax

```
event index {
  community community-name;
  description description;
  type type;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RMON event entries.

Options *index*—Identifier for a specific event entry.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Entry and Its Attributes
- **alarm on page 2439**

falling-event-index

Syntax falling-event-index *index*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The index of the event entry that is used when a falling threshold is crossed. If this value is zero, no event is triggered.

Options *index*—Index of the event entry that is used when a falling threshold is crossed.

Range: 0 through 65,535

Default: 0

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Falling Event Index or Rising Event Index
- **rising-event-index on page 2468**

falling-threshold

Syntax falling-threshold *percentage*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The lower threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the **rising-threshold**.

Options *percentage*—The lower threshold for the alarm entry.

Range: 1 through 100

Default: 70 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Falling Threshold or Rising Threshold
- **rising-threshold on page 2468**

falling-threshold (RMON)

Syntax falling-threshold *integer*;

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The lower threshold for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup-alarm value is equal to falling-alarm value or rising-or-falling-alarm value. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the **rising-threshold**.

Options *integer*—The lower threshold for the alarm entry.
Range: -2,147,483,648 through 2,147,483,647
Default: 20 percent less than **rising-threshold**

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Falling Threshold or Rising Threshold
- **rising-threshold on page 2469**

falling-threshold-interval

Syntax falling-threshold-interval *seconds*;

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.

Options *seconds*—Time between samples, in seconds.
Range: 1 through 2,147,483,647 seconds
Default: 60 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Falling Threshold Interval
- **interval on page 2459**

filter-duplicates

Syntax filter-duplicates;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Filter duplicate **Get**, **GetNext**, or **GetBulk** SNMP requests.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Filtering Duplicate SNMP Requests

filter-interfaces

Syntax
```
filter-interfaces {
  interfaces {
    all-internal-interfaces;
    interface 1;
    interface 2;
  }
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Filter out information related to specific interfaces from the output of SNMP **Get** and **GetNext** requests performed on interface-related MIBs.

Options

all-internal-interfaces—Filters out information from SNMP **Get** and **GetNext** requests for the specified interfaces.

interfaces—Specifies the interfaces to filter out from the output of SNMP **Get** and **GetNext** requests.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Filtering Interface Information Out of SNMP Get and GetNext Output

group (Configuring Group Name)

Syntax

```
group group-name {
  (default-context-prefix | context-prefix context-prefiix){
    security-model (any | usm | v1 | v2c) {
      security-level (authentication | none | privacy) {
        notify-view view-name;
        read-view view-name;
        write-view view-name;
      }
    }
  }
}
```

Hierarchy Level [edit snmp v3 vacm access]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix *context-prefix*** statement enables you to specify a context and to add that particular context to the group. When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group.

The remaining statements under this hierarchy are documented in separate topics.

Options ***group-name***—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Group

group (Defining Access Privileges for an SNMPv3 Group)

Syntax group *group-name*;

Hierarchy Level [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)
security-name *security-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define access privileges granted to a group.

Options ***group-name***—Identifies a collection of SNMP security names that belong to the same access policy SNMP.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Group

health-monitor

Syntax
```
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure health monitoring.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring Health Monitoring on Devices Running Junos OS

history

Syntax

```
history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent in the switch to monitor all the traffic flowing among switches on all connected LAN segments. It collects statistics in accordance with user-configurable parameters.

The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. The **interface *interface-name*** statement is mandatory. Other statements in the history group are optional.

Default Not configured.

Options ***history-index***—Identifies this history entry as an integer.

Range: 1 through 655535

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP (J-Web Procedure) on page 2433
- *Junos OS Network Management Configuration Guide*

interface (SNMP)

Syntax interface [*interface-names*];

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interfaces on which SNMP requests can be accepted.

Default If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.

Options ***interface-names***—Names of one or more logical interfaces.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Interfaces on Which SNMP Requests Can Be Accepted

interface (RMON)

Syntax interface *interface-name*;

Hierarchy Level [edit **snmp rmon history** *history-index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the interface to be monitored in the specified RMON history entry.

Only one interface can be specified for a particular RMON history index. There is a one-to-one relationship between the interface and the history index. The interface must be specified in order for the RMON history to be created.

Options ***interface-name***—Specify the interface to be monitored within the specified entry of the RMON history of Ethernet statistics.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP (J-Web Procedure) on page 2433
- *Junos OS Network Management Configuration Guide*

interval (RMON History)

Syntax interval *seconds*;

Hierarchy Level [edit **snmp rmon history**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interval over which data is to be sampled for the specified interface.

Default **1800 sec**

Options ***seconds***—Interval at which data is to be sampled for the specified interface.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

interval (Health Monitor)

Syntax interval *seconds*;

Hierarchy Level [edit **snmp health-monitor**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Interval between samples.

Options ***seconds***—Time between samples, in seconds.
Range: **1** through **2147483647** seconds
Default: **300** seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Interval

interval (RMON)

Syntax interval *seconds*;

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Interval between samples.

Options ***seconds***—Time between samples, in seconds.
Range: 1 through 2,147,483,647 seconds
Default: 60 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Interval

location

Syntax location *location*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the value of the MIB II **sysLocation** object, which is the physical location of the managed system.

Options ***location***—Location of the local system. You must enclose the name within quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the System Location for a Device Running Junos OS

logical-system

Syntax

```
logical-system logical-system-name {
    routing-instance routing-instance-name;
}
```

Hierarchy Level

[edit snmp **community** *community-name*],
[edit snmp **trap-group**],
[edit snmp **trap-options**]
[edit snmp **v3target-address** *target-address-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify a logical system name for SNMP v1 and v2c clients.

Include at the **[edit snmp trap-options]** hierarchy level to specify a logical-system address as the source address of an SNMP trap.

Include at the **[edit snmp v3 target-address]** hierarchy level to specify a logical-system name as the destination address for an SNMPv3 trap or inform.

Options

logical-system-name—Name of the logical system.

routing-instance ***routing-instance-name***—Statement to specify a routing instance associated with the logical system.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community
- Configuring the Trap Target Address

message-processing-model

Syntax message-processing-model (v1 | v2c | v3);

Hierarchy Level [edit snmp v3 target-parameters *target-parameter-name* parameters]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the message processing model to be used when generating SNMP notifications.

Options **v1**—SNMPv1 message process model.

v2c—SNMPv2c message process model.

v3—SNMPv3 message process model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Message Processing Model

name

Syntax name *name*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the system name from the command-line interface.

Options *name*—System name override.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the System Name

nonvolatile

Syntax

```
nonvolatile {
  commit-delay seconds;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure options for SNMP **Set** requests.

The statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Commit Delay Timer
- **commit-delay on page 2443**

notify

Syntax

```
notify name {
  tag tag-name;
  type (trap | inform);
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Select management targets for notifications as well as the type of notifications. Notifications can be either traps or informs.

Options ***name***—Name assigned to the notification.

tag-name—Notifications are sent to all targets configured with this tag.

type—Notification type is **trap** or **inform**. Traps are unconfirmed notifications. Informs are confirmed notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Inform Notification Type and Target Address
- Configuring the SNMPv3 Trap Notification

notify-filter (Configuring the Profile Name)

Syntax

```
notify-filter profile-name {
  oid oid (include | exclude);
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a group of MIB objects on which to define access. The notify filter limits the type of traps or informs sent to the NMS.

Options ***profile-name***—Name assigned to the notify filter.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Trap Notification Filter
- **oid on page 2465**

notify-filter (Applying to the Management Target)

Syntax notify-filter *profile-name*;

Hierarchy Level [edit snmp v3 **target-parameters** *target-parameters-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the notify filter to be used by a specific set of target parameters.

Options ***profile-name***—Name of the notify filter to apply to notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Applying the Trap Notification Filter

notify-view

Syntax notify-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) **security-level** (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate the view with a community or a group name (SNMPv3).

Options ***view-name***—Name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

oid (SNMP View)

Syntax oid *object-identifier* (exclude | include);

Hierarchy Level [edit snmp view *view-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects.

Options **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

object-identifier—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring MIB Views

oid (SNMPv3)

Syntax oid *oid* (include | exclude);

Hierarchy Level [edit snmp v3 **notify-filter** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects.

Options

exclude—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

oid—Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Trap Notification Filter

owner

Syntax owner *owner-name*;

Hierarchy Level [edit **snmp rmon history**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the user or group responsible for this configuration.

Options

owner-name—The user or group responsible for this configuration.

Range: 0 through 32 alphanumeric characters

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP (J-Web Procedure) on page 2433
- *Junos OS Network Management Configuration Guide*

parameters

Syntax

```
parameters {
  message-processing-model (v1 | v2c | v3);
  security-level (none | authentication | privacy);
  security-model (usm | v1 | v2c);
  security-name security-name;
}
```

Hierarchy Level [edit snmp v3 **target-parameters** *target-parameters-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a set of target parameters.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Defining and Configuring the Trap Target Parameters

port

Syntax port *port-number*;

Hierarchy Level [edit snmp v3 **target-address** *target-address-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a UDP port number for an SNMP target.

Default If you omit this statement, the default port is 162.

Options ***port-number***—Port number for the SNMP target.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Port

read-view

Syntax read-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) **security-level** (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate the view with a community or a group name (SNMPv3).

Options ***view-name***—The name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Read View
- Configuring MIB Views

request-type

Syntax request-type (get-next-request | get-request | walk-request);

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Extend monitoring to a specific SNMP object instance (**get-request**), or extend monitoring to all object instances belonging to a MIB branch (**walk-request**), or extend monitoring to the next object instance after the instance specified in the configuration (**get-next-request**).

Options **get-next-request**—Performs an SNMP get next request.

get-request—Performs an SNMP get request.

walk-request—Performs an SNMP walk request.

Default: walk-request

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Request Type
- **variable on page 2493**

rising-event-index

Syntax rising-event-index *index*;

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Index of the event entry that is used when a rising threshold is crossed. If this value is zero, no event is triggered.

Options ***index***—Index of the event entry that is used when a rising threshold is crossed.
Range: 0 through 65,535
Default: 0

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Falling Event Index or Rising Event Index
- **falling-event-index on page 2450**

rising-threshold (Health Monitor)

Syntax rising-threshold *percentage*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The upper threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the **falling-threshold**.

Options ***percentage***—The lower threshold for the alarm entry.
Range: 1 through 100
Default: 80 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- **falling-threshold on page 2451**
- Configuring the Falling Threshold or Rising Threshold

rising-threshold (RMON)

Syntax rising-threshold *integer*;

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Upper threshold for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated startup alarm value is equal to the falling alarm or rising or falling alarm value. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold.

Options ***integer***—The lower threshold for the alarm entry.
Range: –2,147,483,648 through 2,147,483,647

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Falling Threshold or Rising Threshold
- **falling-threshold on page 2452**

rmon

Syntax rmon { ... }

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Remote Monitoring.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring an Alarm Entry and Its Attributes

rmon

Syntax

```
rmon {
  history history-index {
    interface interface-name;
    bucket-size number;
    interval seconds;
    owner owner-name;
  }
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description RMON is an existing feature of Junos OS.

The RMON specification provides network administrators with comprehensive network fault diagnosis, planning, and performance tuning information. It delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports RMON Statistics, History, Alarm, and Event groups. The J-EX Series documentation describes only the **rmon history** statement, which was added with this release.

The statements are explained separately.

Default Disabled.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP (J-Web Procedure) on page 2433
- *Junos OS Network Management Configuration Guide*

routing-instance

Syntax routing-instance *routing-instance-name*;

Hierarchy Level [edit snmp **community** *community-name*],
[edit snmp **community** *community-name* logical-system *logical-system-name*],
[edit snmp **trap-group** *group*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a routing instance for SNMPv1 and SNMPv2 trap targets. All targets configured in the trap group use this routing instance.

If the routing instance is defined within a logical system, include the **logical-system** ***logical-system-name*** statement at the **[edit snmp community** ***community-name*****]** hierarchy level and specify the **routing-instance** statement under the **[edit snmp community** ***community-name*** **logical-system** ***logical system-name*****]** hierarchy level.

Options ***routing-instance-name***—Name of the routing instance.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups
- Configuring the Source Address for SNMP Traps
- Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community

routing-instance

Syntax routing-instance *routing-instance-name*;

Hierarchy Level [edit snmp v3 **target-address** *target-address-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a routing instance for an SNMPv3 trap target.

Options ***routing-instance-name***—Name of the routing instance.

To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash (**/**) to separate the two names (for example, **test-ls/test-ri**). To configure the default routing instance on a logical system, specify the logical system name followed by **default** (for example, **test-ls/default**).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Trap Target Address

sample-type

Syntax sample-type (absolute-value | delta-value);

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Method of sampling the selected variable.

Options **absolute-value**—Actual value of the selected variable is used when comparing against the thresholds.

delta-value—Difference between samples of the selected variable is used when comparing against the thresholds.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Sample Type

security-level (Generating SNMP Notifications)

Syntax security-level (authentication | none | privacy);

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* **parameters**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the security level to use when generating SNMP notifications.

Options **authentication**—Provides authentication but no encryption.

none—No authentication and no encryption.

privacy—Provides authentication and encryption.

Default: none

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Security Level

security-level (Defining Access Privileges)

Syntax
```
security-level (authentication | none | privacy) {
  notify-view view-name;
  read-view view-name;
  write-view view-name;
}
```

Hierarchy Level [edit snmp v3 vacm access **group** *group-name* (default-context-prefix | context-prefix *context-prefix*)**security-model** (any | usm | v1 | v2c)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the security level used for access privileges.

Options **authentication**—Provides authentication but no encryption.

none—No authentication and no encryption.

privacy—Provides authentication and encryption.

Default: none

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Security Level

security-model (Access Privileges)

Syntax security-model (usm | v1 | v2c);

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a group's security model used for access privileges.

Options **usm**—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Security Model

security-model (Group)

Syntax
```
security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}
```

Hierarchy Level [edit snmp v3 vacm **security-to-group**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a security model for a group.

Options **usm**—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Security Model

security-model (SNMP Notifications)

Syntax security-model (usm | v1 | v2c);

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a group's security model used with sending notifications.

Options **usm**—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Security Model

security-name (Security Group)

Syntax
```
security-name security-name {
  group group-name;
}
```

Hierarchy Level [edit snmp v3 vacm security-to-group **security-model** (usm | v1 | v2c)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a group or a community string with a configured security group.

Options ***security-name***—Username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 and SNMPv2c, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Assigning Security Names to Groups

security-name (Community String)

Syntax security-name *security-name*;

Hierarchy Level [edit snmp v3 **snmp-community** *community-index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level to a security name.

Options ***security-name***—Name used when performing access control.

NOTE: The security name must match the configured security name at the **[edit snmp v3 target-parameters *target-parameters-name* parameters]** hierarchy level when you configure traps or informs.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Security Names

security-name (SNMP Notifications)

Syntax security-name *security-name*;

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the security name used when generating SNMP notifications.

Options ***security-name***—Identifies the user that is used when generating the notification if the USM security model is used. Identifies the SNMP community used when generating the notification if the v1 or v2c security models are used.

NOTE: The access privileges for the group associated with this security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the **[edit snmp v3 vacm security-to-group]** hierarchy level must match the security name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Security Name

security-to-group

Syntax
```
security-to-group {
  security-model (usm | v1 | v2c) {
    group group-name;
    security-name security-name;
  }
}
```

Hierarchy Level [edit snmp v3 vacm]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the group to which a specific security name belongs.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Assigning Security Model and Security Name to a Group

snmp

Syntax snmp { ... }

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure SNMP.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP on a Device Running Junos OS

snmp

Syntax

```
snmp {
  rmon {
    history index {
      interface interface-name;
      bucket-size number;
      interval seconds;
      owner owner-name;
    }
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure SNMP.

The statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP (J-Web Procedure) on page 2433

snmp-community

Syntax

```
snmp-community community-index {
    community-name community-name;
    security-name security-name;
    tag tag-name;
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the SNMP community.

Options ***community-index***—(Optional) String that identifies an SNMP community.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMPv3 Community

source-address

Syntax source-address *address*;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.

Options ***address***—Source address of SNMP traps. You can configure the source address of trap packets two ways: **lo0** or a valid IPv4 address configured on one of the router interfaces. The value **lo0** indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface **lo0**.

Default: Disabled. (The source address is the address of the outgoing interface.)

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Source Address for SNMP Traps

startup-alarm

Syntax startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The alarm that can be sent upon entry startup.

Options

falling-alarm—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.

rising-alarm—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.

rising-or-falling-alarm—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

Default: rising-or-falling-alarm

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Sample Type

syslog-subtag

Syntax syslog-subtag *syslog-subtag*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Add a tag to the system log message.

Options

syslog-subtag *syslog-subtag*—Tag of not more than 80 uppercase characters to be added to syslog messages.

Default: None

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the System Log Tag

tag

Syntax tag *tag-name*;

Hierarchy Level [edit snmp v3 **notify** *name*],
[edit snmp v3 **snmp-community** *community-index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a set of targets to receive traps or informs (for IPv4 packets only).

Options ***tag-name***—Identifies the address of managers that are allowed to use a community string.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Tag
- Configuring the SNMPv3 Trap Notification

tag-list

Syntax tag-list *tag-list*;

Hierarchy Level [edit snmp v3 **target-address** *target-address-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an SNMP tag list used to select target addresses.

Options ***tag-list***—Defines sets of target addresses. To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Trap Target Address

target-address

Syntax

```
target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system logical-system;
    port port-number;
    retry-count number;
    routing-instance instance;
    tag-list tag-list;
    target-parameters target-parameters-name;
    timeout seconds;
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a management application's address and parameters to be used in sending notifications.

Options *target-address-name*—String that identifies the target address.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Trap Target Address

target-parameters

Syntax

```
target-parameters target-parameters-name {
  profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

```
target-parameters target-parameters-name; # syntax for the statement at the [edit snmp
  v3 target-address target-address-name] hierarchy level.
```

Hierarchy Level

[edit snmp **v3**]

[edit snmp **v3 target-address** *target-address-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the message processing and security parameters to be used in sending notifications to a particular management target when included at the **[edit snmp v3]** hierarchy level. The remaining statements at this level are explained separately.

Apply the target parameters configured at the **[edit snmp v3 target-parameters *target-parameters-name*]** hierarchy level to the target-address configuration at the **[edit snmp v3]** hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Defining and Configuring the Trap Target Parameters
- Applying Target Parameters

targets

Syntax

```
targets {
  address;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure one or more systems to receive SNMP traps.

Options ***address***—IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options

file *filename*—By default, the name of the log file that records trace output is the name of the process being traced (for example, **mib2d** or **snmpd**). Use this option to specify another name.

files *number*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, **snmpd**) reaches its maximum size, it is archived by being renamed to **snmpd.0**. The previous **snmpd.1** is renamed to **snmpd.2**, and so on. The oldest archived file is deleted.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.
- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.

- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

size *size*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

Range: 10 KB through 1 GB

Default: 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Tracing SNMP Activity on a Device Running Junos OS

trap-group

Syntax

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

Options ***group-name***—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

trap-options

Syntax

```
trap-options {
    agent-address outgoing-interface;
    source-address address;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

The remaining statements are explained separately.

Default Disabled

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Options

type

Syntax type (inform | trap);

Hierarchy Level [edit snmp v3 notify *name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the type of notification.

Options **inform**—Defines the type of notification as an inform. SNMP informs are confirmed notifications.

trap—Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Informs
- Configuring the SNMPv3 Trap Notification

type (RMON)

Syntax type *type*;

Hierarchy Level [edit snmp rmon **event** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Type of notification generated when a threshold is crossed.

Options *type*—Type of notification:

- **log**—Add an entry to **logTable**.
- **log-and-trap**—Send an SNMP trap and make a log entry.
- **none**—No notifications are sent.
- **snmptrap**—Send an SNMP trap.

Default: log-and-trap

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

vacm

Syntax

```
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
  security-to-group {
    security-model (usm | v1 | v2c);
    security-name security-name {
      group group-name;
    }
  }
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure view-based access control model (VACM) information.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Defining Access Privileges for an SNMP Group

variable

Syntax variable *oid-variable*;

Hierarchy Level [edit snmp rmon **alarm** *index*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Object identifier (OID) of MIB variable to be monitored.

Options ***oid-variable***—OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, **1.3.6.1.2.1.2.1.2.2.1.10.1**). Alternatively, use the MIB object name (for example, **ifInOctets.1**).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the Variable

version

Syntax version (all | v1 | v2);

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the version number of SNMP traps.

Default **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

Options **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

v1—Send SNMPv1 traps only.

v2—Send SNMPv2 traps only.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP Trap Groups

view (Configuring a MIB View)

Syntax

```
view view-name {
  oid object-identifier (include | exclude);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The **view** statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the **view** statement at the **[edit snmp community *community-name*]** hierarchy level.

NOTE: To remove an OID completely, use the **delete view all oid oid-number** command but omit the **include** parameter.

Options ***view-name***—Name of the view.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Associating MIB Views with an SNMP User Group
- **community on page 2444**

view (Associating a MIB View with a Community)

Syntax view *view-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a view with a community. A view represents a group of MIB objects.

Options ***view-name***—Name of the view. You must use a view name already configured in the **view** statement at the **[edit snmp]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring the SNMP Community String

write-view

Syntax write-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) **security-level** (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate the view with a community or a group name (SNMPv3).

Options ***view-name***—The name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

Operational Commands for SNMP

clear snmp rmon history

Syntax **clear snmp rmon history <*interface-name* | all>**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Delete the samples of Ethernet statistics collected, but do not delete the RMON history configuration.

The **clear snmp rmon history** command deletes all the samples collected for the interface configured for the history group, but not the configuration of that group. If you want to delete the RMON history group configuration, you must use the **delete snmp rmon history** configuration-mode command.

Options *interface-name*—Delete the samples of Ethernet statistics collected for this interface.

all—Delete the samples of Ethernet statistics collected for all interfaces that have been configured for RMON monitoring.

Required Privilege Level clear

Related Documentation

- **show snmp rmon history on page 2518**

clear snmp statistics

Syntax clear snmp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear Simple Network Management Protocol (SNMP) statistics.

Options This command has no options.

Required Privilege Level clear

Related Documentation
- **show snmp statistics on page 2521**

List of Sample Output **clear snmp statistics on page 2497**

Output Fields See **show snmp statistics** for an explanation of output fields.

Sample Output

clear snmp statistics In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 0, Total set varbinds: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
```

```
Output:
  Packets: 0, Too bigs: 0, No such names: 0,
  Bad values: 0, General errors: 0,
  Get requests: 0, Get nexts: 0, Set requests: 0,
  Get responses: 0, Traps: 0
```

request snmp spoof-trap

Syntax **request snmp spoof-trap**
<*trap*> variable-bindings <*object*> <*instance*> <*value*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.

Options <*trap*>—Name of the trap to spoof.

variable-bindings <*object*> <*instance*> <*value*>—(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, **ifIndex[14] = 14**). Enclose the list of variable bindings in quotation marks (“ “) and use a comma to separate each object name, instance, and value definition (for example, **variable-bindings “ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2”**). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.

<*dummy name*>—A dummy trap name to display the list of available traps.

Question mark (**?**)—Question mark**?** to display possible completions.

Required Privilege Level request

List of Sample Output
request snmp spoof-trap (with Variable Bindings) on page 2499
request snmp spoof-trap (Illegal Trap Name) on page 2499
request snmp spoof-trap (Question Mark ?) on page 2503

Sample Output

request snmp spoof-trap (with Variable Bindings)

```
user@host> request snmp spoof-trap linkUp variable-bindings “ifIndex[14] = 14, ifAdminStatus[14]
= 1, ifOperStatus[14] = 2”
Spoof trap request result: trap sent successfully
```

request snmp spoof-trap (Illegal Trap Name)

```
user@host> request snmp spoof-trap xx
Spoof trap request result: trap not found

show snmp health-monitor

Syntax show snmp health-monitor
<alarms <detail>> | <logs>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.

Options none—Display information about all health monitor alarms and logs.

alarms <detail>—(Optional) Display detailed information about health monitor alarms.

logs—(Optional) Display information about health monitor logs.

Required Privilege Level view

List of Sample Output **show snmp health-monitor on page 2507**
show snmp health-monitor alarms detail on page 2509

Output Fields Table 320 on page 2505 describes the output fields for the **show snmp health-monitor** command. Output fields are listed in the approximate order in which they appear.

Table 320: show snmp health-monitor Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 320: show snmp health-monitor Output Fields *(continued)*

Field Name	Field Description	Level of Output

State	State of the alarm or event entry:
	• Alarms:
	  • **active**—Entry is fully configured and activated.
	  • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit.
	  • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit.
	  • **under creation**—Entry is being configured and is not yet activated.
	  • **startup**—Alarm is waiting for the first sample of the monitored variable.
	  • **object not available**—Monitored variable of that type is not available to the health monitor agent.
	  • **instance not available**—Monitored variable's instance is not available to the health monitor agent.
	  • **object type invalid**—Monitored variable is not a numeric value.
	  • **object processing errored**—An error occurred when the monitored variable was processed.
	  • **unknown**—State is not one of the above.
		All levels

Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of **absolute value** or **delta value**.	**detail**

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  • Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  • Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  • Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	**detail**
Creator	Mechanism by which the entry was configured (**Health Monitor**).	**detail**
Sample interval	Time period between samples (in seconds).	**detail**
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.	**detail**

Table 320: show snmp health-monitor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.	**detail**
Rising event index	Event triggered when the rising threshold is crossed.	**detail**
Falling event index	Event triggered when the falling threshold is crossed.	**detail**

Sample Output

show snmp health-monitor

```
user@host> show snmp health-monitor

Alarm

show snmp inform-statistics

Syntax show snmp inform-statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Simple Network Management Protocol (SNMP) inform requests.

Options This command has no options.

Required Privilege Level view

List of Sample Output **show snmp inform-statistics on page 2512**

Output Fields Table 321 on page 2512 describes the output fields for the **show snmp inform-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 321: show snmp inform-statistics Output Fields

Field Name	Field Description
Target Name	Name of the device configured to receive and respond to SNMP informs.
Address	IP address of the target device.
Sent	Number of informs sent to the target device and acknowledged by the target device.
Pending	Number of informs held in memory pending a response from the target device.
Discarded	Number of informs discarded after the specified number of retransmissions to the target device were attempted.
Timeouts	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
Probe Failures	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

Sample Output

show snmp inform-statistics

```
user@host> show snmp inform-statistics
Inform Request Statistics:
 Target Name: TA1_v3_md5_none Address: 172.17.20.184
  Sent: 176, Pending: 0
  Discarded: 0, Timeouts: 0, Probe Failures: 0
 Target Name: TA2_v3_sha_none Address: 192.168.110.59
  Sent: 0, Pending: 4
  Discarded: 84, Timeouts: 0, Probe Failures: 258
 Target Name: TA5_v2_none Address: 172.17.20.184
  Sent: 0, Pending: 0
  Discarded: 2, Timeouts: 10, Probe Failures: 0
```

show snmp rmon

Syntax show snmp rmon
<alarms <brief | detail> | events <brief | detail> | logs>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Simple Network Management Protocol (SNMP) Remote Monitoring (RMON) alarms and events.

Options none—Display information about all RMON alarms and events.

alarms—(Optional) Display information about RMON alarms.

brief | detail—(Optional) Display brief or detailed information about RMON alarms or events.

events—(Optional) Display information about RMON events.

logs—(Optional) Display information about RMON monitoring logs.

Required Privilege Level view

List of Sample Output **show snmp rmon on page 2516**
show snmp rmon alarms detail on page 2516
show snmp rmon events detail on page 2517

Output Fields Table 322 on page 2514 describes the output fields for the **show snmp rmon** command. Output fields are listed in the approximate order in which they appear.

Table 322: show snmp rmon Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels

Table 322: show snmp rmon Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	State of the alarm or event entry: Alarms: • **active**—Entry is fully configured and activated. • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit. • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit. • **under creation**—Entry is being configured and is not yet activated. • **startup**—Alarm is waiting for the first sample of the monitored variable. • **object not available**—Monitored variable of that type is not available to the SNMP agent. • **instance not available**—Monitored variable's instance is not available to the SNMP agent. • **object type invalid**—Monitored variable is not a numeric value. • **object processing errored**—An error occurred when the monitored variable was processed. • **unknown**—State is not one of the above. Events: • **active**—Entry has been fully configured and activated. • **under creation**—Entry is being configured and is not yet activated. • **unknown**—State is not one of the above.	All levels
Variable name	Name of the SNMP object instance being monitored.	All levels
Event Index	Event identifier.	All levels
Type	Type of notification made when an event is triggered. It can be one of the following: • **log**—A system log message is generated and an entry is made to the log table. • **snmptrap**—An SNMP trap is sent to the configured destination. • **log and trap**—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination. • **none**—Neither log nor trap will be sent.	**detail**
Last Event	Date and time of the last event. It has the format *yyyy-mm-dd hh:mm:ss timezone*.	**brief**
Community	Identifies the trap group used for sending the SNMP trap.	**detail**
Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of **absolute value** or **delta value**.	**detail**

Table 322: show snmp rmon Output Fields *(continued)*

Field Name	Field Description	Level of Output

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  ◦ Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  ◦ Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  ◦ Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  ◦ Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  ◦ Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	**detail**
Creator	Mechanism by which the entry was configured (**CLI** or **SNMP**).	**detail**
Sample interval	Time period between samples (in seconds).	**detail**
Rising threshold	Upper limit threshold value configured by the user.	**detail**
Falling threshold	Lower limit threshold value configured by the user.	**detail**
Rising event index	Event triggered when the rising threshold is crossed.	**detail**
Falling event index	Event triggered when the falling threshold is crossed.	**detail**
Current value	Current value of the monitored variable in the most recent sample interval.	**detail**

Output Fields Table 323 on page 2518 lists the output fields for the **show smp rmon history** command. Output fields are listed in the approximate order in which they appear.

Table 323: show smp rmon history Output Fields

Field Name	Field Description
History Index	Identifies this RMON history entry within the RMON history group.
Owner	The entity that configured this entry. Range is 0 to 32 alphanumeric characters.
Status	The status of the RMON history entry.
Interface or **Data Source**	The ifndex object that identifies the interface that is being monitored.
Interval	The interval (in seconds) configured for this RMON history entry.
Buckets Requested	The requested number of buckets (**intervals**) configured for this RMON history entry.
Buckets Granted	The number of buckets granted for this RMON history entry.

Table 323: show smp rmon history Output Fields *(continued)*

Field Name	Field Description
Sample Index	The sample statistics taken at the specified interval. • **Drop Events**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Octets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • **Packets**—Total number of packets. • **Broadcast Packets**—Number of broadcast packets. • **Multicast Packets**—Number of multicast packets. • **CRC errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error). • **Undersize Pkts**—Number of packets received during this sampling interval that were less than 64 octets long (excluding framing bits but including FCS octets) and were otherwise well formed. • **Oversize Pkts**—Number of packets received during the sampling interval that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed. • **Fragments**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **Jabbers**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Utilization(%)**—The best estimate of the mean physical layer network utilization on this interface during this sampling interval, in hundredths of a percent.

Sample Output

show snmp rmon history 1

```
user@host> show snmp rmon history 1

List of Sample Output **show snmp statistics on page 2524**

Output Fields Table 324 on page 2521 describes the output fields for the **show snmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 324: show snmp statistics Output Fields

Field Name	Field Description
Input	Information about received packets: • **Packets(snmpInPkts)**—Total number of messages delivered to the SNMP entity from the transport service. • **Bad versions—(snmpInBadVersions**) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • **Bad community names—(snmpInBadCommunityNames)** Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • **Bad community uses—(snmpInBadCommunityUses)** Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • **ASN parse errors—(snmpInASNParseErrs)** Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • **Too bigs—(snmpInTooBigs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpInNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpInBadValues)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **badValue**. • **Read onlys—(snmpInReadOnlys)** Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of **readOnly**. Only incorrect implementations of SNMP generate this error.

Table 324: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
Input (continued)	• **General errors—(snmpInGenErrs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of**genErr**. • **Total requests varbinds—(snmpInTotalReqVars)** Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP **GetRequest** and **GetNext** PDUs. • **Total set varbinds—(snmpInSetVars)** Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP **SetRequest** PDUs. • **Get requests—(snmpInGetRequests)** Total number of SNMP **GetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get nexts—(snmpInGetNexts)** Total number of SNMP **GetNext** PDUs that have been accepted and processed by the SNMP entity. • **Set requests—(snmpInSetRequests)** Total number of SNMP **SetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get responses—(snmpInGetResponses)** Total number of SNMP **GetResponse** PDUs that have been accepted and processed by the SNMP entity. • **Traps—(snmpInTraps)** Total number of SNMP traps generated by the SNMP entity. • **Silent drops—(snmpSilentDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • **Proxy drops—(snmpProxyDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned. • **Commit pending drops**—Number of SNMP packets for **Set** requests dropped because of a previous pending SNMP **Set** request on the committed configuration. • **Throttle drops**—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 324: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
V3 Input	Information about SNMP version 3 packets: • **Unknown security models—(snmpUnknownSecurityModels)** Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • **Invalid messages—(snmpInvalidMsgs)** Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • **Unknown pdu handlers—(snmpUnknownPDUHandlers)** Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • **Unavailable contexts—(snmpUnavailableContexts)** Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • **Unknown contexts—(snmpUnknownContexts)** Total number of requests received for a context that is unknown to the SNMP engine. • **Unsupported security levels—(usmStatsUnsupportedSecLevels)** Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • **Not in time windows—(usmStatsNotInTimeWindows)** Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • **Unknown user names—(usmStatsUnknownUserNames)** Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • **Unknown engine ids—(usmStatsUnknownEngineIDs)** Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine. • **Wrong digests—(usmStatsWrongDigests)** Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • **Decryption errors—(usmStatsDecryptionErrors)** Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.

Table 324: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
Output	Information about transmitted packets: • **Packets—(snmpOutPkts)** Total number of messages passed from the SNMP entity to the transport service. • **Too bigs—(snmpOutTooBigs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpOutNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpOutBadValues)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **badValue**. • **General errors—(snmpOutGenErrs)** Total number of SNMP PDUs generated the SNMP entity with an error status field of **genErr**. • **Get requests—(snmpOutGetRequests)** Total number of SNMP **GetRequest** PDUs generated by the SNMP entity. • **Get nexts—(snmpOutGetNexts)** Total number of SNMP **GetNext** PDUs generated by the SNMP entity. • **Set requests—(snmpOutSetRequests)** Total number of SNMP **SetRequest** PDUs generated by the SNMP entity. • **Get responses—(snmpOutGetResponses)** Total number of SNMP **GetResponse** PDUs generated by the SNMP entity. • **Traps—(snmpOutTraps)** Total number of SNMP traps generated by the SNMP entity.

Sample Output

show snmp statistics

```
user@host> show snmp statistics

```

show snmp v3

Syntax
show snmp v3
<access <brief | detail> | community | general | groups | notify <filter> | target <address | parameters> | users>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.

Options
none—Display all of the SNMPv3 operating configuration.

access—(Optional) Display SNMPv3 access information.

brief | detail—(Optional) Display brief or detailed information about SNMPv3 access information.

community—(Optional) Display SNMPv3 community information.

general—(Optional) Display SNMPv3 general information.

groups—(Optional) Display SNMPv3 security-to-group information.

notify <filter>—(Optional) Display SNMPv3 notify and, optionally, notify filter information.

target <address | parameters>—(Optional) Display SNMPv3 target and, optionally, either target address or target parameter information.

users—(Optional) Display SNMPv3 user information.

Additional Information
To edit the default display of the **show snmp v3** command, specify options in the **show** statement at the **[edit snmp v3]** hierarchy level.

Required Privilege Level
view

List of Sample Output
show snmp v3 on page 2527

Output Fields
Table 325 on page 2526 describes the output fields for the **show snmp v3** command. Output fields are listed in the approximate order in which they appear.

Table 325: show snmp v3 Output Fields

Field Name	Field Description
Access control	Information about access control: • **Group**—Group name for which the configured access privileges apply. The group, together with the context prefix and the security model and security level, forms the index for this table. • **Context prefix**—SNMPv3 context for which the configured access privileges apply. • **Security model/level**—Security model and security level for which the configuration access privileges apply. • **Read view**—Identifies the MIB view applied to SNMPv3 read operations. • **Write view**—Identifies the MIB view applied to SNMPv3 write operations. • **Notify view**—Identifies the MIB view applied to outbound SNMP notifications.
Engine	Information about local engine configuration: • **Local engine ID**—Identifier that uniquely and unambiguously identifies the local SNMPv3 engine. • **Engine boots**—Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed. • **Engine time**—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • **Max msg size**—Maximum message size the sender can accommodate.
Engine ID	Information about engine ID: • **Local engine ID**—Identifier that uniquely and unambiguously identifies the local SNMPv3 engine. • **Engine boots**—Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed. • **Engine time**—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • **Max msg size**—Maximum message size the sender can accommodate. • **Engine ID**—SNMPv3 engine ID associated with each user. • **User**—SNMPv3 user. • **Auth/Priv**—Authentication and encryption algorithm available for use by each user. • **Storage**—Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status. • **Status**—Status of the conceptual row. Only rows with an active status are used by the SNMPv3 engine.
Group name	Name of the group to which this entry belongs.
Security model	Identifies the security model context for the security name.
Security name	Used with the security model; identifies a specific security name instance. Each security model/security name combination can be assigned to a specific group.
Storage type	Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status.
Status	Status of the conceptual row. Only rows with active status are used by the SNMPv3 engine.

Sample Output

show snmp v3

```
user@host> show snmp v3
Local engine ID: 80 00 0a 4c e04 31 32 33 34

CHAPTER 79

Real-Time Performance Monitoring (RPM)

RPM—Overview

Understanding Real-Time Performance Monitoring on J-EX Series Switches

Real-time performance monitoring (RPM) enables you to configure active probes to track and monitor traffic across the network and to investigate network problems. You can use RPM with J-EX Series Switches.

The ways in which you can use RPM include:

- Monitor time delays between devices.
- Monitor time delays at the protocol level.
- Set thresholds to trigger SNMP traps when values are exceeded.

  You can configure thresholds for round-trip time, ingress or egress delay, standard deviation, jitter, successive lost probes, and total lost probes per test. (SNMP trap results are stored in **pingResultsTable**, **jnxPingResultsTable**, **jnxPingProbeHistoryTable**, and **pingProbeHistoryTable**.)
- Determine automatically whether a path exists between a host router or switch and its configured BGP neighbors. You can view the results of the discovery using an SNMP client.
- Use the history of the most recent 50 probes to analyze trends in your network and predict future needs.

RPM provides MIB support with extensions for RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

This topic includes:

RPM Packet Collection

Probes collect packets per destination and per application, including ping Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets.

Tests and Probe Types

A test can contain multiple probes. The probe type specifies the packet and protocol contents of the probe.

J-EX Series switches support the following tests and probe types:

- Ping tests:
  - ICMP echo probe

    - ICMP timestamp probe
- HTTP tests:
    - HTTP get probe (not available for BGP RPM services)
    - HTTP get metadata probe
- UDP and TCP tests with user-configured ports:
    - UDP echo probe
    - TCP connection probe
    - UDP timestamp probe

Hardware Timestamps

To account for latency or jitter in the communication of probe messages, you can enable timestamping of the probe packets (hardware timestamps). If hardware timestamps are not configured, then timers are generated at the software level and are less accurate than they would have been with hardware timestamps.

NOTE: J-EX Series switches support hardware timestamps for UDP and ICMP probes. J-EX Series switches do not support hardware timestamps for HTTP or TCP probes.

You can timestamp the following RPM probes to improve the measurement of latency or jitter:

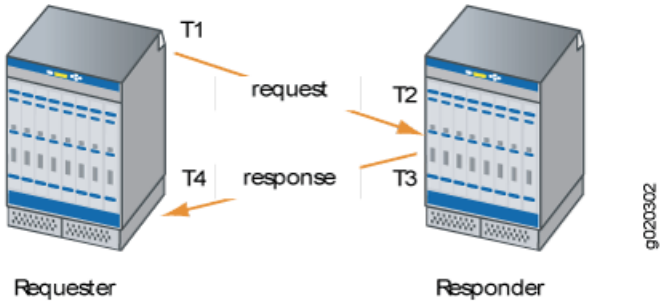
- ICMP ping
- ICMP ping timestamp
- UDP ping
- UDP ping timestamp

You should configure the requester (the RPM client) with hardware timestamps (see Figure 71 on page 2532) to get more meaningful results than you would get without the timestamps.The responder (the RPM server) does not need to be configured to support hardware timestamps. If the responder supports hardware timestamps, it timestamps the RPM probes. If the responder does not support hardware timestamps, RPM can only report round-trip measurements that include the processing time on the responder.

NOTE: Hardware timestamps are supported on all J-EX Series switches.

Figure 71 on page 2532 shows the timestamps:

Figure 71: RPM Timestamps



- T1 is the time the packet leaves the requester port.
- T2 is the time the responder receives the packet.
- T3 is the time the responder sends the response.
- T4 is the time the requester receives the response.

The round-trip time is (T2 – T1) + (T4 – T3). If the responder does not support hardware timestamps, then the round-trip time is (T4 – T1) / 2, and thus includes the processing time of the responder.

You can use RPM probes to find the following time measurements:

- Minimum round-trip time
- Maximum round-trip time
- Average round-trip time
- Standard deviation of the round-trip time
- Jitter of the round-trip time—Difference between the minimum and maximum round-trip time

NOTE: See "Configuring the Interface for RPM Timestamping for Client/Server on a J-EX Series Switch (CLI Procedure)" on page 2540 for information on how to configure hardware timestamps on the requester.

The RPM feature provides a configuration option to set one-way hardware timestamps. Use one-way timestamps when you want information about one-way time, rather than round-trip times, for packets to traverse the network between the requester and the responder. As shown in Figure 71 on page 2532, one-way timestamps represent the time T2 – T1 and the time from T4 – T3. Use one-way timestamps when you want to gather information about delay in each direction and to find egress and ingress jitter values.

NOTE: For correct one-way measurement, the clocks of the requester and responder must be synchronized. If the clocks are not synchronized, one-way jitter measurements and calculations can include significant variations, in some cases orders of magnitude greater than the round-trip times.

When you enable one-way timestamps in a probe, the following one-way measurements are reported:

- Minimum, maximum, standard deviation, and jitter measurements for egress and ingress times
- Number of probes sent
- Number of probe responses received
- Percentage of lost probes

Limitations of RPM on J-EX Series Switches

- Two-Way Active Measurement Protocol (TWAMP) is not supported on J-EX Series switches.
- J-EX Series switches do not support user-configured class-of-service (CoS) classifiers or prioritization of RPM packets over regular data packets received on an input interface.
- Timestamps:
  - If the responder does not support hardware timestamps, RPM can only report the round-trip measurements and cannot calculate round-trip jitter.
  - J-EX Series switches do not support hardware timestamps for HTTP and TCP probes.
  - Timestamps apply only to IPv4 traffic.

Configuring Real-Time Performance Monitoring (RPM)

- Configuring Real-Time Performance Monitoring (J-Web Procedure) on page 2533
- Configuring the Interface for RPM Timestamping for Client/Server on a J-EX Series Switch (CLI Procedure) on page 2540

Configuring Real-Time Performance Monitoring (J-Web Procedure)

Real-time performance monitoring (RPM) in J-EX Series switches enables you to configure and send probes to a specified target and monitor the analyzed results to determine packet loss, round-trip time, and jitter. Jitter is the difference in relative transit time between two consecutive probes. You can set up probe owners and configure one or more performance probe tests under each probe owner.

The ways in which you can use RPM include:

- Monitor time delays between devices.
- Monitor time delays at the protocol level.
- Set thresholds to trigger SNMP traps when threshold values are exceeded. You can configure thresholds for round-trip time, ingress or egress delay, standard deviation, jitter, successive lost probes, and total lost probes per test.
- Determine automatically whether a path exists between a host switch and its configured Border Gateway Protocol (BGP) neighbors. You can view the results of the discovery using an SNMP client.
- Use the history of the most recent 50 probes to analyze trends in your network and predict future needs.

Probes collect packets per destination and per application, including PING Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets.

J-EX Series switches support the following tests and probe types:

- Ping tests:
  - ICMP echo
  - ICMP timestamp
- HTTP tests:
  - HTTP get (not available for BGP RPM services)
- UDP and TCP tests with user-configured ports:
  - UDP echo
  - TCP connection
  - UDP timestamp

To account for latency in the communication of probe messages, you can enable timestamping of the probe packets. You should configure both the requester and the responder to timestamp the RPM packets. The RPM features provides an additional configuration option to set one-way hardware timestamps. Use one-way timestamps when you want information about one-way, rather than round-trip, times for packets to traverse the network between the requester and the responder.

NOTE:

- J-EX Series switches support hardware timestamps for UDP and ICMP probes. J-EX Series switches do not support hardware timestamps for HTTP or TCP probes.
- If the responder does not support hardware timestamps, RPM can only report the round-trip measurements, it cannot calculate round-trip jitter.
- In J-EX Series switches timestamps apply only to IPv4 traffic.

To configure RPM using the J-Web interface:

1. Select **Troubleshoot** > **RPM** > **Configure RPM** .
2. In the **Configure RPM** page, enter information as specified in Table 326 on page 2535.
   a. Click **Add** to set up the **Owner Name** and **Performance Probe Tests**.
   b. Select a probe owner from **Probe Owners** list and click **Delete** to remove the selected probe owner
   c. Double-click one of the probe owners in **Probe Owners** list to display the list of performance probe tests.
   d. Double-click one of the performance probe tests to edit the test parameters.
3. Enter the **Maximum Number of Concurrent Probes** and specify the **Probe Servers**.
4. Click **Apply** to apply the RPM probe settings.

Table 326: RPM Probe Owner, Concurrent Probes, and Probe Servers Configuration Fields

Field	Function	Your Action
Probe Owners	Identifies a owner for whom one or more RPM tests are configured. In most implementations, the owner name identifies a network on which a set of tests is being run.	1. Click **Add** and type an owner name. 2. In **Performance Probe Tests**, click **Add** to define the RPM test parameters. See Table 327 on page 2536 for information on configuring RPM test parameters. 3. Click **OK** to save the settings or **Cancel** to exit from the window without saving the changes.
Maximum Number of Concurrent Probes	Specifies the maximum number of concurrent probes allowed.	Type a number from 1 through 500.

Table 326: RPM Probe Owner, Concurrent Probes, and Probe Servers Configuration Fields *(continued)*

Field	Function	Your Action
Probe Servers	Specifies the servers that act as receivers and transmitters for the probes.	Set up the following servers: • TCP Probe Server—Specifies the port on which the device is to receive and transmit TCP probes. Type the number 7 (a standard TCP port number) or a port number from 49160 through 65535. • UDP Probe Server—Specifies the port on which the device is to receive and transmit UDP probes. Type the number 7 (a standard TCP port number) or a port number from 49160 through 65535.

Table 327: Performance Probe Tests Configuration Fields

Field	Function	Your Action
Identification		
Test Name	Identifies the RPM test.	Type a test name.
Target (Address or URL)	Specifies the IP address or the URL of the probe target.	Type the IP address in dotted decimal notation or the URL of the probe target. If the target is a URL, type a fully formed URL that includes **http://**.
Source Address	Specifies the IP address to be used as the probe source address.	Type the source address to be used for the probe. If you do not supply this value, the packet uses the outgoing interface's address as the probe source address.
Routing Instance	Specifies the routing instance over which the probe is sent.	Type the routing instance name. The routing instance applies only to **icmp-ping** and **icmp-ping-timestamp** probe types. The default routing instance is **inet.0**.
History Size	Specifies the number of probe results to be saved in the probe history.	Type a number from 0 through 255. The default history size is 50.
Request Information		

Table 327: Performance Probe Tests Configuration Fields *(continued)*

Field	Function	Your Action
Probe Type	Specifies the type of probe to send as part of the test.	Select a probe type from the list: • **http-get** • **http-get-metadata** • **icmp-ping** • **icmp-ping-timestamp** • **tcp-ping** • **udp-ping** • **udp-ping-timestamp**
Interval	Sets the wait time (in seconds) between probe transmissions.	Type a number from 1 through 255 .
Test Interval	Sets the wait time (in seconds) between tests.	Type a number from 0 through 86400 .
Probe Count	Sets the total number of probes to be sent for each test.	Type a number from 1 through 15.
Moving Average Size	Specifies the number of samples to be used in the statistical calculation operations to be performed across a number of the most recent samples.	Type a number from 0 through 255.
Destination Port	Specifies the TCP or UDP port to which probes are sent. To use TCP or UDP probes, you must configure the remote server as a probe receiver. Both the probe server and the remote server must be Juniper Networks network devices configured to receive and transmit RPM probes on the same TCP or UDP port.	Type the number 7 (a standard TCP or UDP port number) or a port number from 49160 through 65535.
DSCP Bits	Specifies the Differentiated Services code point (DSCP) bits. This value must be a valid 6-bit pattern.	Type a valid 6-bit pattern.
Data Size	Specifies the size (in bytes) of the data portion of the ICMP probes.	Type a number from 0 through 65507.
Data Fill	Specifies the hexadecimal value of the data portion of the ICMP probes.	Type a hexadecimal value from 1h through 800h .
Hardware Timestamp		
One Way Hardware Timestamp	Enables one-way hardware timestamp.	To enable timestamping, select the check box.

Table 327: Performance Probe Tests Configuration Fields *(continued)*

Field	Function	Your Action
Destination Interface	Enables hardware timestamp on the specified interface.	Select an interface from the list.
Maximum Probe Thresholds		
Successive Lost Probes	Sets the number of probes that can be lost successively, if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 15.
Lost Probes	Sets the number of probes that can be lost , if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 15.
Round Trip Time	Sets the round-trip time (in microseconds), from the switch to the remote server, if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Jitter	Sets the jitter (in microseconds), if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Standard Deviation	Sets the maximum allowable standard deviation (in microseconds), if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Egress Time	Sets the one-way time (in microseconds), from the switch to the remote server, if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Ingress Time	Sets the one-way time (in microseconds), from the remote server to the switch, if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000 (microseconds).
Jitter Egress Time	Sets the outbound-time jitter (in microseconds), if exceeded triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Jitter Ingress Time	Sets the inbound-time jitter (in microseconds), if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 and 60000000.

Table 327: Performance Probe Tests Configuration Fields *(continued)*

Field	Function	Your Action
Egress Standard Deviation	Sets the maximum allowable standard deviation of outbound times (in microseconds), if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Ingress Standard Deviation	Sets the maximum allowable standard deviation of inbound times (in microseconds), if exceeded, triggers a probe failure and generates a system log message.	Type a number from 0 through 60000000.
Traps		
Egress Jitter Exceeded	Generates SNMP traps when the threshold for jitter in outbound time is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Egress Standard Deviation Exceeded	Generates SNMP traps when the threshold for standard deviation in outbound times is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Egress Time Exceeded	Generates SNMP traps when the threshold for maximum outbound time is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Ingress Jitter Exceeded	Generates SNMP traps when the threshold for jitter in inbound time is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Ingress Standard Deviation Exceeded	Generates SNMP traps when the threshold for standard deviation in inbound times is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Ingress Time Exceeded	Generates SNMP traps when the threshold for maximum inbound time is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Jitter Exceeded	Generates SNMP traps when the threshold for jitter in round-trip time is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.

Table 327: Performance Probe Tests Configuration Fields *(continued)*

Field	Function	Your Action
Probe Failure	Generates SNMP traps when the threshold for the number of successive lost probes is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
RTT Exceeded	Generates SNMP traps when the threshold for maximum round-trip time is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Standard Deviation Exceeded	Generates SNMP traps when the threshold for standard deviation in round-trip times is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Test Completion	Generates SNMP traps when a test is completed.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.
Test Failure	Generates SNMP traps when the threshold for the total number of lost probes is exceeded.	• To enable SNMP traps for this condition, select the check box. • To disable SNMP traps, clear the check box.

Configuring the Interface for RPM Timestamping for Client/Server on a J-EX Series Switch (CLI Procedure)

Use real-time performance monitoring (RPM) to configure active probes to track and monitor traffic across the network and to investigate network problems. To configure basic RPM probes on the J-EX Series switch, you must configure the probe owner, the test, and the specific parameters of the RPM probe.

You can also set a timestamp to improve the measurement of latency or jitter. The probe is timestamped by the device originating the probe (the RPM client). If you do not enable hardware timestamps, the timer values are set. You should configure both the RPM client (the requester) and the RPM server (the responder) to timestamp the RPM packets. However, if the RPM server does not support hardware timestamps, RPM can only report the round-trip measurements.

Timestamps apply only to IPv4 traffic.

You can enable hardware timestamps for the following RPM probe types:

- icmp-ping
- icmp-ping-timestamp
- udp-ping
- udp-ping-timestamp

To configure RPM probes and enable hardware timestamping:

1. Specify the probe owner:

   ```
   [edit services rpm]
   user@switch# set probe owner
   ```

2. Specify a test name. A test represents the range of probes over which the standard deviation, average, and jitter are calculated.

   ```
   [edit services rpm probe owner]
   user@switch# set test test-name
   ```

3. Specify the packet and protocol contents of the probe:

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set probe-type type
   ```

4. Specify the destination IPv4 address to be used for the probes:

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set target address
   ```

5. Specify the number of probes within a test:

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set probe-count count
   ```

6. Specify the time, in seconds, to wait between sending packets:

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set probe-interval interval
   ```

7. Specify the time, in seconds, to wait between tests:

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set test-interval interval
   ```

8. Specify the source IP address to be used for probes. If the source IP address is not one of the switch's assigned addresses, the packet uses the outgoing interface's address as its source.

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set source-address address
   ```

9. Specify the value of the Differentiated Services (DiffServ) field within the IP header. The DiffServ code point (DSCP) bits value must be set to a valid 6-bit pattern.

   ```
   [edit services rpm probe owner test test-name]
   user@switch# set dscp-code-point dscp-bits
   ```

10. If you are using ICMP probes, specify the size of the data portion of ICMP probes:

    ```
    [edit services rpm probe owner test test-name]
    ```

```
user@switch# set data-size size
```

11. Enable hardware timestamping of RPM probe messages:

```
[edit services rpm probe owner test test-name]
user@switch# set hardware-timestamp
```

Viewing Real-Time Performance Monitoring Information

Real-time performance monitoring (RPM) on J-EX Series switches enables you to configure and send probes to a specified target and monitor the analyzed results to determine packet loss, round-trip time, and jitter. The J-Web interface provides a graphical view of RPM information for J-EX Series switches.

To view the RPM information using the J-Web interface:

1. Select **Troubleshoot** >**RPM** >**View RPM**.
2. Select the **Round Trip Time** check box to display the graph with round-trip time included. Clear the check-box to view the graph without the round-trip time.
3. From the **Refresh Time** list, select a refresh time interval for the graph.

Configuration Statements for Real-Time Performance Monitoring

data-fill

Syntax data-fill *data*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the contents of the data portion of Internet Control Message Protocol (ICMP) probes.

Options ***data***—A hexadecimal value; for example, **0-9**, **A-F**.

Usage Guidelines The **data-fill** statement is not valid with the **http-get** or **http-metadata-get** probe types. See Configuring BGP Neighbor Discovery Through RPM or Configuring Real-Time Performance Monitoring.

Required Privilege Level system—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

data-size

Syntax data-size *size*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the size of the data portion of ICMP probes.

Options ***data***—The size can be from 0 through 65507
Default: 0

NOTE: If you configure the hardware timestamp feature (see Configuring Real-Time Performance Monitoring), the data-size default value is 32 bytes and 32 is the minimum value for explicit configuration. The UDP timestamp probe type is an exception; it requires a minimum data size of 52 bytes.

Usage Guidelines The **data-size** statement is not valid with the **http-get** or **http-metadata-get** probe type. See Configuring BGP Neighbor Discovery Through RPM or Configuring Real-Time Performance Monitoring.

Required Privilege Level system—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

destination-port

Syntax destination-port *port*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the User Datagram Protocol (UDP) or Transmission Control Protocol (TCP) port to which a probe is sent. This statement is used only for TCP or UDP probe types.

Options ***port***—The port number can be **7** or from **49,160** to **65,535**.

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM or Configuring Real-Time Performance Monitoring.

Required Privilege Level system—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

dscp-code-point

Syntax dscp-code-point *dscp-bits*;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the value of the Differentiated Services (DiffServ) field within the IP header. The DiffServ code point (DSCP) bits value must be set to a valid 6-bit pattern.

Options ***dscp-bits***—A valid 6-bit pattern; for example, **001111**, or one of the following configured DSCP aliases:

- **af11**—Default: 001010
- **af12**—Default: 001100
- **af13**—Default: 001110
- **af21**—Default: 010010
- **af22**—Default: 010100
- **af23** —Default: 010110
- **af31** —Default: 011010
- **af32** —Default: 011100
- **af33** —Default: 011110
- **af41** —Default: 100010
- **af42** —Default:100100
- **af43** —Default:100110
- **be**—Default: 000000
- **cs1**—Default: 001000
- **cs2**—Default: 010000
- **cs3**—Default: 011000
- **cs4**—Default: 100000
- **cs5**—Default: 101000
- **cs6**—Default: 110000
- **cs7**—Default: 111000
- **ef**—Default: 101110
- **nc1**—Default: 110000
- **nc2**—Default: 111000

Usage Guidelines See Configuring Real-Time Performance Monitoring.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

hardware-timestamp

Syntax hardware-timestamp;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced in Junos OS Release 10.3 for J-EX Series switches.

Description On J-EX Series switches, enable timestamping of RPM probe messages in the Packet Forwarding Engine host processor. This feature is supported only with **icmp-ping**, **icmp-ping-timestamp**, **udp-ping**, and **udp-ping-timestamp** probe types.

Usage Guidelines See Configuring RPM Timestamping.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

history-size

Syntax history-size *size*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of stored history entries.

Options ***size***—A value from 0 to 255.
Default: 50

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM or Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

moving-average-size

Syntax moving-average-size *number*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable statistical calculation operations to be performed across a configurable number of the most recent samples.

Options ***number***—Number of samples to be used in calculations.
Range: 0 through 255

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

one-way-hardware-timestamp

Syntax one-way-hardware-timestamp;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable timestamping of RPM probe messages for one-way delay and jitter measurements. You must configure this statement along with the **destination-interface** statement to invoke timestamping. This feature is supported only with **icmp-ping**, **icmp-ping-timestamp**, **udp-ping**, and **udp-ping-timestamp** probe types.

Usage Guidelines See Configuring RPM Timestamping.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- destination-interface, **hardware-timestamp on page 2546**

port (RPM)

Syntax port *number*;

Hierarchy Level [edit services rpm **probe-server** (**tcp** | **udp**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the port number for the probe server.

Options ***number***—Port number for the probe server. The value can be **7** or **49,160** through **65,535**.

Usage Guidelines See Configuring RPM Receiver Servers.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

probe

Syntax

```
probe owner {
  test test-name {
    data-fill data;
    data-size size;
    destination-interface interface-name;
    destination-port port;
    dscp-code-point dscp-bits;
    hardware-timestamp;
    history-size size;
    moving-average-size number;
    one-way-hardware-timestamp;
    probe-count count;
    probe-interval seconds;
    probe-type type;
    routing-instance instance-name;
    source-address address;
    target (url | address);
    test-interval interval;
    thresholds thresholds;
    traps traps;
  }
}
```

Hierarchy Level [edit services rpm]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an owner name. The owner name combined with the test name represent a single RPM configuration instance.

Options ***owner***—Specify an owner name up to 32 characters in length.

The remaining statements are explained separately.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level system—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

probe-count

Syntax probe-count *count*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of probes within a test.

Options ***count***—A value from 1 through 15.

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM or Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

probe-interval

Syntax probe-interval *interval*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the time to wait between sending packets, in seconds.

Options ***interval***—Number of seconds, from 1 through 255.

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM or Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

probe-limit

Syntax probe-limit *limit;*

Hierarchy Level [edit services rpm]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of concurrent probes allowed.

Options ***limit***—A value from 1 through 500.
Default: 100.

Usage Guidelines See Limiting the Number of Concurrent RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

probe-server

Syntax

```
probe-server {
  tcp {
    destination-interface interface-name;
    port number;
  }
  udp {
    destination-interface interface-name;
    port number;
  }
}
```

Hierarchy Level [edit services rpm]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the server to act as a receiver for the probes.

The remaining statements are explained separately.

Usage Guidelines See Configuring RPM Receiver Servers.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

probe-type

Syntax probe-type *type*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the packet and protocol contents of a probe.

Options ***type***—Specify one of the following probe type values:

- **http-get**—(Not available at the [edit services rpm bgp] hierarchy level.) Sends a Hypertext Transfer Protocol (HTTP) get request to a target URL.
- **http-metadata-get**—(Not available at the [edit services rpm bgp] hierarchy level.) Sends an HTTP get request for metadata to a target URL.
- **icmp-ping**—Sends ICMP echo requests to a target address.
- **icmp-ping-timestamp**—Sends ICMP timestamp requests to a target address.
- **tcp-ping**—Sends TCP packets to a target.
- **udp-ping**—Sends UDP packets to a target.
- **udp-ping-timestamp**—Sends UDP timestamp requests to a target address.

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM or Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

routing-instance

Syntax routing-instance *instance-name*;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the routing instance used by the probes.

Options ***instance-name***—A routing instance configured at the **[edit routing-instance]** hierarchy level.
Default: Internet routing table **inet.0**.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

routing-instances

Syntax routing-instances *instance-name*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm bgp logical-system *logical-system-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the routing instance used by the probes.

Options *instance-name*—A routing instance configured at the **[edit routing-instances]** hierarchy level.

Default: Internet routing table **inet.0**.

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

rpm

Syntax rpm (client | server);

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate an RPM client (router or switch that originates RPM probes) or RPM server with a specified interface.

Options ***client***—Identifier for RPM client router or switch.

server—Identifier for RPM server.

Usage Guidelines See Configuring RPM Timestamping.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

source-address

Syntax source-address *address*;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the source IP address used for probes. If the source IP address is not one of the router's or switch's assigned addresses, the packet will use the outgoing interface's address as its source.

Options ***address***—Valid IP address.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

target

Syntax target (url *url* | address *address*);

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the destination address used for the probes.

Options **url** ***url***—For HTTP probe types, specify a fully formed URL that includes **http://** in the URL address.

address ***address***—For all other probe types, specify an IPv4 address for the target host.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

tcp

Syntax

```
tcp {
  destination-interface interface-name;
  port port;
}
```

Hierarchy Level [edit services rpm **probe-server**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the port information for the TCP server.

The remaining statements are explained separately.

Usage Guidelines See Configuring RPM Receiver Servers.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

test

Syntax

```
test test-name {
    data-fill data;
    data-size size;
    destination-interface interface-name;
    destination-port port;
    dscp-code-point dscp-bits;
    hardware-timestamp;
    history-size size;
    moving-average-size number;
    one-way-hardware-timestamp;
    probe-count count;
    probe-interval seconds;
    probe-type type;
    routing-instance instance-name;
    source-address address;
    target (url url | address address);
    test-interval interval;
    thresholds thresholds;
    traps traps;
}
```

Hierarchy Level [edit services rpm probe *owner*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the range of probes over which the standard deviation, average, and jitter are calculated. The test name combined with the owner name represent a single RPM configuration instance.

Options ***test-name***—Specify a test name. The name can be up to 32 characters in length.

The remaining statements are explained separately.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

test-interval

Syntax test-interval *frequency*;

Hierarchy Level [edit services rpm bgp],
[edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the time to wait between tests, in seconds.

Options ***frequency***—Number of seconds, from 0 through 86400.

Usage Guidelines See Configuring BGP Neighbor Discovery Through RPM or Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

thresholds

Syntax thresholds *thresholds*;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.

Options ***thresholds***—Specify one or more threshold measurements. The following options are supported:

- **egress-time**—Measures maximum source-to-destination time per probe.
- **ingress-time**—Measures maximum destination-to-source time per probe.
- **jitter-egress**—Measures maximum source-to-destination jitter per test.
- **jitter-ingress**—Measures maximum destination-to- source jitter per test.
- **jitter-rtt**—Measures maximum jitter per test, from 0 through 60,000,000 microseconds.
- **rtt**—Measures maximum round-trip time per probe, in microseconds.
- **std-dev-egress**—Measures maximum source-to-destination standard deviation per test.
- **std-dev-ingress**—Measures maximum destination-to-source standard deviation per test.
- **std-dev-rtt**—Measures maximum standard deviation per test, in microseconds.
- **successive-loss**—Measures successive probe loss count, indicating probe failure.
- **total-loss**—Measures total probe loss count indicating test failure, from 0 through 15.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traps

Syntax traps *traps*;

Hierarchy Level [edit services rpm **probe** *owner* **test** *test-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the trap bit to generate traps for probes. Traps are sent if the configured threshold is met or exceeded.

Options ***traps***—Specify one or more traps. The following options are supported:

- **egress-jitter-exceeded**—Generates traps when the jitter in egress time threshold is met or exceeded.
- **egress-std-dev-exceeded**—Generates traps when the egress time standard deviation threshold is met or exceeded.
- **egress-time-exceeded**—Generates traps when the maximum egress time threshold is met or exceeded.
- **ingress-jitter-exceeded**—Generates traps when the jitter in ingress time threshold is met or exceeded.
- **ingress-std-dev-exceeded**—Generates traps when the ingress time standard deviation threshold is met or exceeded.
- **ingress-time-exceeded**—Generates traps when the maximum ingress time threshold is met or exceeded.
- **jitter-exceeded**—Generates traps when the jitter in round-trip time threshold is met or exceeded.
- **probe-failure**—Generates traps for successive probe loss thresholds crossed.
- **rtt-exceeded**—Generates traps when the maximum round-trip time threshold is met or exceeded.
- **std-dev-exceeded**—Generates traps when the round-trip time standard deviation threshold is met or exceeded.
- **test-completion**—Generates traps when a test is completed.
- **test-failure**—Generates traps when the total probe loss threshold is met or exceeded.

Usage Guidelines See Configuring RPM Probes.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

udp

Syntax

```
udp {
    destination-interface interface-name;
    port port;
}
```

Hierarchy Level [edit services rpm **probe-server**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the port information for the UDP server.

The remaining statements are explained separately.

Usage Guidelines See Configuring RPM Receiver Servers.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Operational Commands for Real-Time Performance Monitoring

show services rpm active-servers

Syntax show services rpm active-servers

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the protocols and corresponding ports for which a router or switch is configured as a real-time performance monitoring (RPM) server.

Options This command has no options.

Required Privilege Level view

List of Sample Output **show services rpm active-servers on page 2561**

Output Fields Table 328 on page 2561 lists the output fields for the **show services rpm active-servers** command. Output fields are listed in the approximate order in which they appear.

Table 328: show services rpm active-servers Output Fields

Field Name	Field Description
Protocol	Protocol configured on the receiving probe server. The protocol can be the User Datagram Protocol (UDP) or the Transmission Control Protocol (TCP).
Port	Port configured on the receiving probe server.
Destination interface name	Output interface name for the probes.

Sample Output

show services rpm active-servers

```
user@host> show services rpm active-servers
    Protocol: TCP, Port: 50000, Destination interface name: lt-0/0/0.0
    Protocol: UDP, Port: 50001, Destination interface name: lt-0/0/0.0
```

show services rpm history-results

Syntax show services rpm history-results
<brief | detail>
<owner *owner*>
<since *time*>
<test *name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display standard information about the results of the last 50 probes for each real-time performance monitoring (RPM) instance.

Options none—Display the results of the last 50 probes for all RPM instances.

brief | detail—(Optional) Display the specified level of output.

owner *owner*—(Optional) Display information for the specified probe owner.

since *time*—(Optional) Display information from the specified time. Specify time as ***yyyy-mm-dd.hh:mm:ss***.

test *name*—(Optional) Display information for the specified test.

Required Privilege Level view

List of Sample Output **show services rpm history-results on page 2563**
show services rpm history-results detail on page 2563

Output Fields Table 329 on page 2562 lists the output fields for the **show services rpm history-results** command. Output fields are listed in the approximate order in which they appear.

Table 329: show services rpm history-results Output Fields

Field Name	Field Description	Level of Output
Owner	Probe owner.	All levels
Test	Name of a test for a probe instance.	All levels
Probe received	Timestamp when the probe result was determined.	All levels
Round trip time	Average ping round-trip time (RTT), in microseconds.	All levels
Probe results	Result of a particular probe performed by a remote host. The following information is contained in the results: • **Response received**—Timestamp when the probe result was determined. • **Rtt**—Average ping round-trip time (RTT), in microseconds.	**detail**

Table 329: show services rpm history-results Output Fields *(continued)*

Field Name	Field Description	Level of Output
Results over current test	Displays the results for the current test by probe at the time each probe was completed, as well as the status of the current test at the time the probe was completed.	**detail**
Probes sent	Number of probes sent with the current test.	**detail**
Probes received	Number of probe responses received within the current test.	**detail**
Loss percentage	Percentage of lost probes for the current test.	**detail**
Measurement	Increment of measurement. Possible values are round-trip time delay and, for the probe type icmp-pin-timestamp, the egress and ingress delay: • **Minimum**—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • **Maximum**—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • **Average**—Average RTT, ingress delay, or egress delay measured over the course of the current test. • **Jitter**—Difference, in microseconds, between the maximum and minimum RTT measured over the course of the current test. • **Stddev**—Standard deviation of the round-trip time, in microseconds, measured over the course of the current test.	**detail**

Sample Output

show services rpm history-results

```
user@host> show services rpm history-results
     Owner, Test                 Probe received              Round trip time

show services rpm probe-results

Syntax show services rpm probe-results
<owner *owner*>
<test *name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the results of the most recent real-time performance monitoring (RPM) probes.

Options none—Display all results of the most recent RPM probes.

owner *owner*—(Optional) Display information for the specified probe owner.

test *name*—(Optional) Display information for the specified test.

Required Privilege Level view

List of Sample Output **show services rpm probe-results on page 2568**
show services rpm probe-results (BGP Neighbor Discovery) on page 2569

Output Fields Table 330 on page 2565 lists the output fields for the **show services rpm probe-results** command. Output fields are listed in the approximate order in which they appear.

Table 330: show services rpm probe-results Output Fields

Field Name	Field Description
Owner	Owner name. When you configure the probe owner statement at the **[edit services rpm]** hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is **Rpm-Bgp-Owner.**
Test	Name of a test representing a collection of probes. When you configure the test test-name statement at the **[edit services rpm probe owner]** hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is **Rpm-BGP-Test-***n*, where *n* is a cumulative number.
Target address	Destination address used for the probes.
Source address	Source address used for the probes.
Probe type	Protocol configured on the receiving probe server: **http-get, http-metadata-get, icmp-ping, icmp-ping-timestamp, tcp-ping, udp-ping,** or **udp-ping-timestamp**.
Test size	Number of probes within a test.

Table 330: show services rpm probe-results Output Fields *(continued)*

Field Name	Field Description
Routing Instance Name	(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured: • When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash **(/)** is used to separate the two entities. For example, if the routing instance called **R1** is configured within the logical system called **LS**, the name in the output field is **LS/R1**. • When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance. • When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by **default**. A slash (**/**) is used to separate the two entities. For example, **LS/default**.
Probe results	Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement: • **Response received**—Timestamp when the probe result was determined. • **Client and server hardware timestamps**—If timestamps are configured, an entry appears at this point. • **Rtt**—Average ping round-trip time (RTT), in microseconds. • **Egress jitter**—Egress jitter, in microseconds. • **Ingress jitter**—Ingress jitter, in microseconds. • **Round trip jitter**—Round-trip jitter, in microseconds. • **Egress interarrival jitter**—Egress interarrival jitter, in microseconds. • **Ingress interarrival jitter**—Ingress interarrival jitter, in microseconds. • **Round trip interarrival jitter**—Round-trip interarrival jitter, in microseconds.
Results over current test	Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes. • **Probes sent**—Number of probes sent within the current test. • **Probes received**—Number of probe responses received within the current test. • **Loss percentage**—Percentage of lost probes for the current test. • **Measurement**—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type **icmp-ping-timestamp**, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: ◦ **Samples**—Number of probes. ◦ **Minimum**—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. ◦ **Maximum**—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. ◦ **Average**—Average RTT, ingress delay, or egress delay measured over the course of the current test. ◦ **Peak to peak**—Peak-to-peak difference, in microseconds. ◦ **Stddev**—Standard deviation, in microseconds. ◦ **Sum**—Statistical sum.

Table 330: show services rpm probe-results Output Fields *(continued)*

Field Name	Field Description
Results over last test	Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed • **Probes sent**—Number of probes sent for the most recently completed test. • **Probes received**—Number of probe responses received for the most recently completed test. • **Loss percentage**—Percentage of lost probes for the most recently completed test. • **Test completed**—Time the most recent test was completed. • **Measurement**—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type **icmp-ping-timestamp**, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: ◦ **Samples**—Number of probes. ◦ **Minimum**—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test. ◦ **Maximum**—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test. ◦ **Average**—Average RTT, ingress delay, or egress delay measured for the most recently completed test. ◦ **Peak to peak**—Peak-to-peak difference, in microseconds. ◦ **Stddev**—Standard deviation, in microseconds. ◦ **Sum**—Statistical sum.
Results over all tests	Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test. • **Probes sent**—Number of probes sent in all tests. • **Probes received**—Number of probe responses received in all tests. • **Loss percentage**—Percentage of lost probes in all tests. • **Measurement**—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types **icmp-ping-timestamp** and **udp-ping-timestamp**, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: ◦ **Samples**—Number of probes. ◦ **Minimum**—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. ◦ **Maximum**—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. ◦ **Average**—Average RTT, ingress delay, or egress delay measured over the course of the current test. ◦ **Peak to peak**—Peak-to-peak difference, in microseconds. ◦ **Stddev**—Standard deviation, in microseconds. ◦ **Sum**—Statistical sum.

CHAPTER 80

Ethernet OAM Link Fault Management

Ethernet OAM Link Fault Management—Overview

Understanding Ethernet OAM Link Fault Management for a J-EX Series Switch

The Junos operating system (Junos OS) for J-EX Series Switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities even as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward-compatible with existing Ethernet technology.

Ethernet OAM provides the tools that network management software and network managers can use to determine how a network of Ethernet links is functioning. Ethernet OAM should:

- Rely only on the media access control (MAC) address or virtual LAN identifier for troubleshooting.
- Work independently of the actual Ethernet transport and function over physical Ethernet ports or a virtual service such as pseudowire.
- Isolate faults over a flat (or single operator) network architecture or nested or hierarchical (or multiprovider) networks.

The following OAM LFM features are supported on J-EX Series switches:

- Discovery and Link Monitoring

  The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. You can specify the discovery mode used for IEEE 802.3ah OAM support. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery. The switch performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.

  You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

- Remote Fault Detection

  Remote fault detection uses flags and events. Flags are used to convey the following: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition such as a power failure, and Critical Event means an unspecified vendor-specific critical event. You can specify the periodic OAM PDU sending interval for fault detection.The J-EX Series switch uses the Event Notification OAM PDU to notify the remote OAM device when a problem is detected. You can specify the action to be taken by the system when the configured link-fault event occurs.

- Remote Loopback Mode

  Remote loopback mode ensures link quality between the switch and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

  Junos OS can place a remote DTE into loopback mode (if remote loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent and processed.

Example: Configuring Ethernet OAM Link Fault Management on J-EX Series Switches

Junos OS for J-EX Series switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example describes how to enable and configure OAM LFM on a Gigabit Ethernet interface:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Two J-EX4200 switches connected directly

Overview and Topology

Junos OS for J-EX Series switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example uses two J-EX4200 switches connected directly. Before you begin configuring Ethernet OAM LFM on two switches, connect the two switches directly through a trunk interface.

Configuring Ethernet OAM Link Fault Management on Switch 1

CLI Quick Configuration

To quickly configure Ethernet OAM LFM, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet link-fault-management]
set interface ge-0/0/0
set interface ge-0/0/0 link-discovery active
set interface ge-0/0/0 pdu-interval 800
set interface ge-0/0/0 remote-loopback
```

Step-by-Step Procedure

To configure Ethernet OAM LFM on switch 1:

1. Enable IEEE 802.3ah OAM support on an interface:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface ge-0/0/0
```

2. Specify that the interface initiates the discovery process by configuring the link discovery mode to **active**:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface ge-0/0/0 link-discovery active
```

3. Set the periodic OAM PDU-sending interval (in milliseconds) to 800 on switch 1:

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface pdu-interval 800
```

4. Set a remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes made to the frames. Ensure that the remote DTE supports remote loopback mode. To set the remote DTE in loopback mode

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface ge-0/0/0.0 remote-loopback
```

Results Check the results of the configuration:

```
[edit]
user@switch1# show
```

```
protocols {
    oam {
        ethernet {
            link-fault-management {
                interface ge-0/0/0 {
                    pdu-interval 800;
                    link-discovery active;
                    remote-loopback;
                }
            }
        }
    }
```

Configuring Ethernet OAM Link Fault Management on Switch 2

CLI Quick Configuration To quickly configure Ethernet OAM LFM on switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet link-fault-management ]
set interface ge-0/0/1
set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

Step-by-Step Procedure To configure Ethernet OAM LFM on switch 2:

1. Enable OAM on the peer interface on switch 2:

```
[edit protocols oam ethernet link-fault-management]
user@switch2# set interface ge-0/0/1
```

2. Enable remote loopback support for the local interface:

```
[edit protocols oam ethernet link-fault-management]
user@switch2# set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

Results Check the results of the configuration:

```
[edit]
user@switch2# show

  protocols {
    oam {
      ethernet {
        link-fault-management {
          interface ge-0/0/1 {
            negotiation-options {
              allow-remote-loopback;
            }
          }
        }
      }
    }
```

Verification

Verifying That OAM LFM Has Been Configured Properly

Purpose Verify that OAM LFM has been configured properly.

Action Use the **show oam ethernet link-fault-management** command:

```
user@switch1#show oam ethernet link-fault-management
```

Sample Output

```
Interface: ge-0/0/0.0
Status: Running, Discovery state: Send Any
Peer address: 00:19:e2:50:3b:e1
Flags:Remote-Stable Remote-State-Valid Local-Stable 0x50
Remote entity information:
Remote MUX action: forwarding, Remote parser action: forwarding
Discovery mode: active, Unidirectional mode: unsupported
Remote loopback mode: supported, Link events: supported
Variable requests: unsupported
```

Meaning When the output displays the MAC address and the discover state is **Send Any**, it means that OAM LFM has been configured properly.

Configuring Ethernet OAM Link Fault Management

- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

Configuring Ethernet OAM Link Fault Management (CLI Procedure)

Ethernet OAM link fault management (LFM) can be used for physical link-level fault detection and management. The IEEE 802.3ah LFM works across point-to-point Ethernet links either directly or through repeaters.

To configure Ethernet OAM LFM using the CLI:

1. Enable IEEE 802.3ah OAM support on an interface:

   ```
   [edit protocols oam ethernet link-fault-management]
   user@switch# set interface interface-name
   ```

   

   NOTE: The remaining steps are optional. You can choose which of these features to configure for Ethernet OAM LFM on your switch.

2. Specify whether the interface or the peer initiates the discovery process by configuring the link discovery mode to **active** or **passive** (**active** = interface initiates; **passive** = peer initiates):

   ```
   [edit protocols oam ethernet link-fault-management]
   user@switch# set interface interface-name link-discovery active
   ```

3. Configure a periodic OAM PDU-sending interval (in milliseconds) for fault detection:

   ```
   [edit protocols oam ethernet link-fault-management]
   user@switch# set interface pdu-interval interval
   ```

4. Specify the number of OAM PDUs that an interface can miss before the link between peers is considered down:

   ```
   [edit protocols oam ethernet link-fault-management]
   user@switch# set interface interface-name pdu-threshold threshold-value
   ```

5. Configure event threshold values on an interface for the local errors that trigger the sending of link event TLVs:

   - Set the threshold value (in seconds) for sending frame-error events or taking the action specified in the action profile:

     ```
     [edit protocols oam ethernet link-fault-management]
     user@switch# set interface interface-name event-thresholds frame-error count
     ```

   - Set the threshold value (in seconds) for sending frame-period events or taking the action specified in the action profile:

     ```
     [edit protocols oam ethernet link-fault-management]
     user@switch#  set interface interface-name event-thresholds frame-period count
     ```

   - Set the threshold value (in seconds) for sending frame-period-summary events or taking the action specified in the action profile:

     ```
     [edit protocols oam ethernet link-fault-management]
     user@switch#  set interface interface-name event-thresholds frame-period-summary
     count
     ```

- Set the threshold value (in seconds) for sending symbol-period events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds symbol-period count
```

NOTE: You can disable the sending of link event TLVs.

To disable the sending of link event TLVs:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name negotiation-options no-allow-link-events
```

6. Create an action profile to define event fault flags and thresholds to be taken when the link fault event occurs. Then apply the action profile to one or more interfaces. (You can also apply multiple action profiles to a single interface.)

   a. Name the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name
```

   b. Specify actions to be taken by the system when the link fault event occurs:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name action syslog

user@switch# set action-profile profile-name action link-down
```

   c. Specify events for the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name event link-adjacency-loss
```

NOTE: For each action profile, you must specify at least one link event and one action. The actions are taken only when all of the events in the action profile are true. If more than one action is specified, all actions are executed. You can set a low threshold for a specific action such as logging the error and set a high threshold for another action such as system logging.

7. Set a remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes made to the frames. Set the remote DTE in loopback mode (the remote DTE must support remote-loopback mode) and then enable remote loopback support for the local interface.

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name remote-loopback

user@switch# set interface interface-name negotiation-options allow-remote-loopback
```

action

Syntax

```
action {
  syslog;
  link-down;
}
```

Hierarchy Level [edit protocols **oam ethernet link-fault-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define the action or actions to be taken when the OAM link fault management (LFM) fault event occurs.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

action-profile

Syntax

```
action-profile profile-name;
  action {
    syslog;
    link-down;
  }
  event {
    link-adjacency-loss;
    link-event-rate;
    frame-error count;
    frame-period count;
    frame-period-summary count;
    symbol-period count;
  }
}
```

Hierarchy Level [edit protocols **oam ethernet link-fault-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an Ethernet OAM link fault management (LFM) action profile by specifying a profile name.

The remaining statements are explained separately.

Options *profile-name*—Name of the action profile.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

allow-remote-loopback

Syntax allow-remote-loopback;

Hierarchy Level [edit protocols **oam ethernet link-fault-management interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Advertise that the interface is capable of getting into loopback mode. Enable remote loopback in Ethernet OAM link fault management (LFM) on all Ethernet interfaces or the specified interface on the J-EX Series switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

}
```

Hierarchy Level [edit protocols oam]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches. **connectivity-fault-management** introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support for Ethernet interfaces on J-EX Series switches or configure connectivity fault management (CFM) for IEEE 802.1ag Operation, Administration, and Management (OAM) support on the switches.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

event

Syntax

```
event {
  link-adjacency-loss;
  link-event-rate {
  frame-error count;
  frame-period count;
  frame-period-summary count;
  symbol-period count;
  }
}
```

Hierarchy Level [edit protocols **oam ethernet link-fault-management action-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure link events in an action profile for Ethernet OAM link fault management (LFM).

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

event-thresholds

Syntax

```
event-thresholds {
  frame-error count;
  frame-period count;
  frame-period-summary count;
  symbol-period count;
}
```

Hierarchy Level [edit protocols **oam ethernet link-fault-management interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure threshold limit values for link events in periodic OAM PDUs.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

frame-error

Syntax frame-error *count*;

Hierarchy Level [edit protocols **oam ethernet link-fault-management event link-event-rate**],
[edit protocols **oam ethernet link-fault-management interface** *interface-name* **event-thresholds**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the threshold value for sending frame error events or taking the action specified in the action profile.

Frame errors occur on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value.

Options *count*—Threshold count in seconds for frame error events.

Range: 1 through 100 seconds

Default: 1 second

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

frame-period

Syntax frame-period *count*;

Hierarchy Level [edit protocols **oam ethernet link-fault-management event link-event-rate**],
[edit protocols **oam ethernet link-fault-management interface** *interface-name* **event-thresholds**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of frame errors within the last N frames that has exceeded a threshold.

Frame errors occur on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value.

Options *count*—Threshold count in seconds for frame error events.

Range: 1 through 100 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

frame-period-summary

Syntax frame-period-summary *count*;

Hierarchy Level [edit protocols **oam ethernet link-fault-management event link-event-rate**],
[edit protocols **oam ethernet link-fault-management interface** *interface-name* **event-thresholds**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the threshold value for sending frame period summary error events or taking the action specified in the action profile.

An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period.

Options *count*—Threshold count in seconds for frame period summary error events.

Range: 1 through 100 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

interface

Syntax

```
interface interface-name {
  link-discovery (active | passive);
  pdu-interval interval;
  event-thresholds threshold-value;
  remote-loopback;
  event-thresholds {
    frame-error count;
    frame-period count;
    frame-period-summary count;
    symbol-period count;
  }
  negotiation-options {
    allow-remote-loopback;
    no-allow-link-events;
  }
}
```

Hierarchy Level [edit protocols **oam ethernet link-fault-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces.

The remaining statements are explained separately.

Options *interface-name*—Name of the interface to be enabled for IEEE 802.3ah OAM link fault management (LFM) support.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Ethernet OAM Link Fault Management on J-EX Series Switches on page 2573
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

link-adjacency-loss

Syntax link-adjacency-loss;

Hierarchy Level [edit protocols **oam ethernet link-fault-management action-profile event**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure **loss of adjacency** event with the IEEE 802.3ah link fault management (LFM) peer. When included, the loss of adjacency event triggers the action specified under the **action** statement.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Ethernet OAM Link Fault Management on J-EX Series Switches on page 2573
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

link-discovery

Syntax link-discovery (active | passive);

Hierarchy Level [edit protocols **oam ethernet link-fault-management interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on an interface. Link monitoring is done when the interface sends periodic OAM PDUs.

Options *active*—In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality.

passive—In passive mode, the peer initiates the discovery process.

Once the discovery process is initiated, both sides participate in discovery.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

link-down

Syntax link-down;

Hierarchy Level [edit protocols **oam ethernet link-fault-management action-profile action**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Mark the interface as down for transit traffic.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

link-event-rate

Syntax
```
link-event-rate {
  frame-error count;
  frame-period count;
  frame-period-summary count;
  symbol-period count;
}
```

Hierarchy Level [edit protocols **oam ethernet link-fault-management action-profile event**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of link fault management (LFM) events per second.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

symbol-period

Syntax symbol-period *count*;

Hierarchy Level [edit protocols **oam ethernet link-fault-management action-profile** *profile-name*; **event link-event-rate**] ,
[edit protocols **oam ethernet link-fault-management interface** *interface-name* **event-thresholds**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the threshold for sending symbol period events or taking the action specified in the action profile.

Symbol code errors occur on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period. You cannot configure the default value to a different value.

Options *count*—Threshold count in seconds for symbol period events.

Range: 1 through 100 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2576

syslog

Syntax syslog;

Hierarchy Level [edit protocols **oam ethernet link-fault-management action-profile** *profile-name*; **action**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Generate a system log message for the Ethernet Operation, Administration, and Maintenance (OAM) link fault management (LFM) event.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

List of Sample Output
show oam ethernet link-fault-management brief on page 2607
show oam ethernet link-fault-management detail on page 2607

Output Fields Table 331 on page 2603 lists the output fields for the **show oam ethernet link-fault-management** command. Output fields are listed in the approximate order in which they appear.

Table 331: show oam ethernet link-fault-management Output Fields

Field Name	Field Description	Level of Output
Status	Indicates the status of the established link. • **Fail**—A link fault condition exists. • **Running**—A link fault condition does not exist.	All levels
Discovery state	State of the discovery mechanism: • **Passive Wait** • **Send Any** • **Send Local Remote** • **Send Local Remote Ok**	All levels
Peer address	Address of the OAM peer.	All levels

Table 331: show oam ethernet link-fault-management Output Fields *(continued)*

Field Name	Field Description	Level of Output
Flags	Information about the interface. • **Remote-Stable**—Indicates remote OAM client acknowledgment of, and satisfaction with local OAM state information. **False** indicates that remote DTE has either not seen or is unsatisfied with local state information. **True** indicates that remote DTE has seen and is satisfied with local state information. • **Local-Stable**—Indicates local OAM client acknowledgment of, and satisfaction with remote OAM state information. **False** indicates that local DTE either has not seen or is unsatisfied with remote state information. **True** indicates that local DTE has seen and is satisfied with remote state information. • **Remote-State-Valid**—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. **False** indicates that OAM client has not seen remote state information. **True** indicates that the OAM client has seen remote state information.	All levels
Remote loopback status	Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels
Remote entity information	Remote entity information. • **Remote MUX action**—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs. • **Remote parser action**—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs. • **Discovery mode**—Indicates whether discovery mode is active or inactive. • **Unidirectional mode**—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes. • **Remote loopback mode**—Indicates whether remote loopback is supported or not supported. • **Link events**—Indicates whether interpreting link events is supported or not supported on the remote peer. • **Variable requests**—Indicates whether variable requests are supported or not supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer.	All levels
OAM Receive Statistics		
Information	The number of information PDUs received.	**detail**
Event	The number of loopback control PDUs received.	**detail**
Variable request	The number of variable request PDUs received.	**detail**
Variable response	The number of variable response PDUs received.	**detail**
Loopback control	The number of loopback control PDUs received.	**detail**

Table 331: show oam ethernet link-fault-management Output Fields *(continued)*

Field Name	Field Description	Level of Output
Organization specific	The number of vendor organization specific PDUs received.	**detail**
OAM Transmit Statistics		
Information	The number of information PDUs transmitted.	**detail**
Event	The number of event notification PDUs transmitted.	**detail**
Variable request	The number of variable request PDUs transmitted.	**detail**
Variable response	The number of variable response PDUs transmitted.	**detail**
Loopback control	The number of loopback control PDUs transmitted.	**detail**
Organization specific	The number of vendor organization specific PDUs transmitted.	**detail**
OAM Received Symbol Error Event information		
Events	The number of symbol error event TLVs that have been received after the OAM sublayer was reset.	**detail**
Window	The symbol error event window in the received PDU. The protocol default value is the number of symbols that can be received in one second on the underlying physical layer.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**
Errors in period	The number of symbol errors in the period reported in the received event PDU.	**detail**
Total errors	The number of errored symbols that have been reported in received event TLVs after the OAM sublayer was reset. Symbol errors are coding symbol errors.	**detail**
OAM Received Frame Error Event Information		
Events	The number of errored frame event TLVs that have been received after the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**

Table 331: show oam ethernet link-fault-management Output Fields *(continued)*

Field Name	Field Description	Level of Output
Total errors	The number of errored frames that have been reported in received event TLVs after the OAM sublayer was reset. A frame error is any frame error on the underlying physical layer.	**detail**
OAM Received Frame Period Error Event Information		
Events	The number of frame seconds errors event TLVs that have been received after the OAM sublayer was reset.	**detail**
Window	The duration of the frame seconds window.	**detail**
Threshold	The number of frame seconds errors in the period.	**detail**
Errors in period	The number of frame seconds errors in the period.	**detail**
Total errors	The number of frame seconds errors that have been reported in received event TLVs after the OAM sublayer was reset.	**detail**
OAM Transmitted Symbol Error Event Information		
Events	The number of symbol error event TLVs that have been transmitted after the OAM sublayer was reset.	**detail**
Window	The symbol error event window in the transmitted PDU.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**
Errors in period	The number of symbol errors in the period reported in the transmitted event PDU.	**detail**
Total errors	The number of errored symbols reported in event TLVs that have been transmitted after the OAM sublayer was reset.	**detail**
OAM Transmitted Frame Error Event Information		
Events	The number of errored frame event TLVs that have been transmitted after the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**
Total errors	The number of errored frames that have been detected after the OAM sublayer was reset.	**detail**

CHAPTER 81

Ethernet OAM Connectivity Fault Management

Ethernet OAM Connectivity Fault Management—Overview

Understanding Ethernet OAM Connectivity Fault Management for a J-EX Series Switch

Ethernet interfaces on J-EX Series Switches and the Junos operating system (Junos OS) for J-EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM). CFM monitors Ethernet networks that might comprise one or more service instances for network-compromising connectivity faults.

The major features of CFM are:

- Fault monitoring using the continuity check protocol. This is a neighbor discovery and health check protocol that discovers and maintains adjacencies at the VLAN or link level.
- Path discovery and fault verification using the linktrace protocol.
- Fault isolation using the loopback protocol.

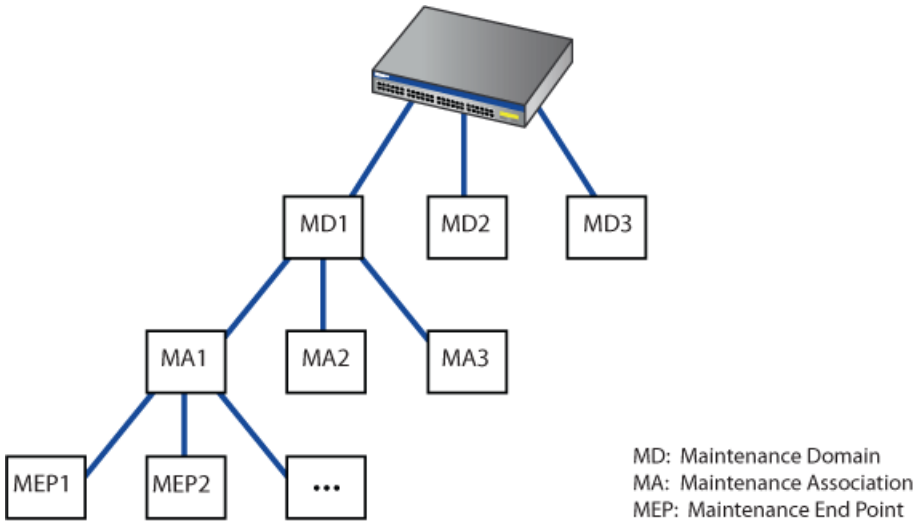
CFM partitions the service network into various administrative domains. For example, operators, providers, and customers might be part of different administrative domains. Each administrative domain is mapped into one maintenance domain providing enough information to perform its own management, thus avoiding security breaches and making end-to-end monitoring possible.

In a CFM maintenance domain, each service instance is called a maintenance association. A maintenance association can be thought of as a full mesh of maintenance association endpoints (MEPs) having similar characteristics. MEPs are active CFM entities generating and responding to CFM protocol messages. There is also a maintenance intermediate point (MIP), which is a CFM entity similar to the MEP, but more passive (MIPs only respond to CFM messages).

Each maintenance domain is associated with a maintenance domain level from 0 through 7. Level allocation is based on the network hierarchy, where outer domains are assigned a higher level than the inner domains. Configure customer end points to have the highest maintenance domain level. The maintenance domain level is a mandatory parameter that indicates the nesting relationships between various maintenance domains. The level is embedded in each CFM frame. CFM messages within a given level are processed by MEPs at that same level.

To enable CFM on an Ethernet interface, you must configure maintenance domains, maintenance associations, and maintenance association end points (MEPs). Figure 72 on page 2610 shows the relationships among maintenance domains, maintenance association end points (MEPs), and maintenance intermediate points (MIPs) configured on a switch.

Figure 72: Relationship Among MEPs, MIPs, and Maintenance Domain Levels



Related Documentation

- *Junos OS Network Interfaces Configuration Guide*

Example of Ethernet OAM Connectivity Fault Management Configuration

- Example: Configuring Ethernet OAM Connectivity Fault Management on J-EX Series Switches on page 2611

Example: Configuring Ethernet OAM Connectivity Fault Management on J-EX Series Switches

Ethernet interfaces on J-EX Series Switches and Junos OS for J-EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM).

This example describes how to enable and configure OAM CFM on a Gigabit Ethernet interface:

Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.2 or later for J-EX Series switches
- Two J-EX Series switches connected by a point-to-point Gigabit Ethernet link

Overview and Topology

CFM can be used to monitor the physical link between two switches. In the following example, two switches are connected by a point-to-point Gigabit Ethernet link. The link between these two switches is monitored using CFM.

Configuring Ethernet OAM Connectivity Fault Management on Switch 1

CLI Quick Configuration

To quickly configure Ethernet OAM CFM, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain]set
name-format character-string set maintenance-domain private level 0set
maintenance-association private-maset continuity-check hold-interval 1s
```

Step-by-Step Procedure

To enable and configure OAM CFM on switch 1:

1. Specify the maintenance domain name format:

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain]user@switch1# set name-format character-string
   ```

2. Specify the maintenance domain name and the maintenance domain level:

   ```
   [edit protocols oam ethernet connectivity-fault-management]user@switch1#
   set maintenance-domain private level 0
   ```

3. Create a maintenance association:

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain private]user@switch1# set maintenance-association private-ma
   ```

4. Enable the continuity check protocol and specify the continuity check hold interval:

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain private maintenance-association private-ma]user@switch1#
set continuity-check hold-interval 1s
```

5. Configure the maintenance association end point (MEP):

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain private maintenance-association private-ma]
user@switch1# set mep 100 interface ge-1/0/1 auto-discovery direction down
```

Results Check the results of the configuration.

```
[edit]
user@switch1# show
```

```
protocols {
    oam {
        ethernet {
            connectivity-fault-management {
                maintenance-domain private {
                    level 0;
                    maintenance-association private-ma {
                        continuity-check {
                            interval 1s;
                        }
                        mep 100 {
                            interface ge-1/0/1;
                            auto-discovery;
                            direction down;
                        }
                    }
                }
            }
        }
    }
```

Configuring Ethernet OAM Connectivity Fault Management on Switch 2

CLI Quick Configuration To quickly configure Ethernet OAM CFM, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain]set
name-format character-string set maintenance-domain private level 0set
maintenance-association private-maset continuity-check hold-interval 1s
```

Step-by-Step Procedure The configuration on switch 2 mirrors that on switch 2.

1. Specify the maintenance domain name format:

```
[edit protocols oam ethernet connectivity-fault-management]user@switch2#
set name-format character-string
```

2. Specify the maintenance domain name and the maintenance domain level:

```
[edit protocols oam ethernet connectivity-fault-management]user@switch2#
set maintenance-domain private level 0
```

3. Create a maintenance association:

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain private]user@switch2# set maintenance-association private-ma
```

4. Enable the continuity check protocol and specify the continuity check hold interval:

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain private maintenance-association private-ma]user@switch2#
set continuity-check hold-interval 1s
```

5. Configure the maintenance association end point (MEP)

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain private maintenance-association private-ma]
user@switch2# set mep 100 interface ge-0/2/5 auto-discovery direction down
```

Results Check the results of the configuration.

```
[edit]
user@switch2# show

  protocols {
    oam {
      ethernet {
        connectivity-fault-management {
          maintenance-domain private {
            level 0;
            maintenance-association private-ma {
              continuity-check {
                interval 1s;
              }
              mep 100 {
                interface ge-0/2/5;
                auto-discovery;
                direction down;
              }
            }
          }
        }
      }
    }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That OAM CFM Has Been Configured Properly on page 2613

Verifying That OAM CFM Has Been Configured Properly

Purpose Verify that OAM CFM has been configured properly.

Action Use the show oam ethernet connectivity-fault-management interfaces detail command:

```
user@switch1# show oam ethernet connectivity-fault-management interfaces detail
```

Sample Output

```
Interface name: ge-1/0/1.0, Interface status: Active, Link status: Up
  Maintenance domain name: private, Format: string, Level: 0
    Maintenance association name: private-ma, Format: string
    Continuity-check status: enabled, Interval: 1ms, Loss-threshold: 3 frames
    MEP identifier: 100, Direction: down, MAC address: 00:90:69:0b:4b:94
    MEP status: running
    Defects:
```

```
  Remote MEP not receiving CCM                 : no
  Erroneous CCM received                       : yes
  Cross-connect CCM received                   : no
  RDI sent by some MEP                         : yes
Statistics:
  CCMs sent                                    : 76
  CCMs received out of sequence                : 0
  LBMs sent                                    : 0
  Valid in-order LBRs received                 : 0
  Valid out-of-order LBRs received             : 0
  LBRs received with corrupted data            : 0
  LBRs sent                                    : 0
  LTMs sent                                    : 0
  LTMs received                                : 0
  LTRs sent                                    : 0
  LTRs received                                : 0
  Sequence number of next LTM request          : 0
Remote MEP count: 2
  Identifier    MAC address        State    Interface
   2001     00:90:69:0b:7f:71       ok    ge-0/2/5.0
```

Meaning When the output displays continuity-check status is **enabled** and displays details of the remote MEP, it means that connectivity fault management (CFM) has been configured properly.

Configuring Ethernet OAM Connectivity Fault Management

Configuring Ethernet OAM Connectivity Fault Management (CLI Procedure)

Ethernet interfaces on J-EX Series Switches and Junos OS for J-EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM).

This topic describes these tasks:

Creating the Maintenance Domain

A maintenance domain comprises network entities such as operators, providers, and customers. To enable connectivity fault management (CFM) on an Ethernet interface, you must create a maintenance domains, maintenance associations, and MEPs.

To create a maintenance domain:

1. Specify a name for the maintenance domain:

   ```
   [edit protocols oam ethernet connectivity-fault-management]
   user@switch# set maintenance-domain domain-name
   ```

2. Specify a format for the maintenance domain name. If you specify **none**, no name is configured:

   - A plain ASCII character string
   - A domain name service (DNS) format
   - A media access control (MAC) address plus a two-octet identifier in the range 0 through 65,535
   - **none**

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name]
   user@switch# set name-format format
   ```

   For example, to specify the name format as MAC address plus a two-octet identifier:

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name]
   user@switch# set name-format mac+2oct
   ```

3. Configure the maintenance domain level, which is used to indicate the nesting relationship between this domain and other domains. Use a value from 0 through 7:

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name]
   user@switch# set level level
   ```

Configuring the Maintenance Domain MIP Half Function

MIP Half Function (MHF) divides the maintenance association intermediate point (MIP) functionality into two unidirectional segments, improves visibility with minimal configuration, and improves network coverage by increasing the number of points that can be monitored. MHF extends monitoring capability by responding to loop-back and link-trace messages to help isolate faults. Whenever a MIP is configured, the MIP half function value for all maintenance domains and maintenance associations must be the same.

To configure the MIP half function:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
user@switch# set mip-half-function (none | default | explicit)
```

Creating a Maintenance Association

In a CFM maintenance domain, each service instance is called a maintenance association.

To create a maintenance association:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
user@switch# set maintenance-association ma-name
```

Configuring the Continuity Check Protocol

The continuity check protocol is used for fault detection by a maintenance association end point (MEP) within a maintenance association. The MEP periodically sends continuity check multicast messages. The receiving MEPs use the continuity check messages (CCMs) to build a MEP database of all MEPs in the maintenance association.

To configure the continuity check protocol:

1. Enable the continuity check protocol:

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name maintenance-association ma-name]
   user@switch# set continuity-check
   ```

2. Specify the continuity check hold interval. The hold interval is the number of minutes to wait before flushing the MEP database if no updates occur. The default value is 10 minutes.

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name maintenance-association ma-name
   continuity-check]
   user@switch# set hold-interval number
   ```

3. Specify the CCM interval. The interval is the time between the transmission of CCMs. You can specify 10 minutes (10m), 1 minute (1m), 10 seconds (10s), 1 second (1s), 100 milliseconds (100ms), or 10 milliseconds (10ms).

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name maintenance-association ma-name
   continuity-check]
   user@switch# set interval number
   ```

4. Specify the number of CCMs (that is, protocol data units) that can be lost before the MEP is marked as down. The default number of protocol data units (PDUs) is 3.

   ```
   [edit protocols oam ethernet connectivity-fault-management
   maintenance-domain domain-name maintenance-association ma-name
   continuity-check]
   user@switch# set loss-threshold number
   ```

Configuring a Maintenance Association End Point

To configure a maintenance association end point:

1. Specify an ID for the MEP. The value can be from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain domain-name maintenance-association ma-name]
user@switch# set mep mep-id]
```

2. Enable maintenance endpoint automatic discovery if you want to have the MEP accept continuity check messages (CCMs) from all remote MEPs of the same maintenance association:

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain domain-name maintenance-association ma-name mep mep-id
user@switch# set auto-discovery
```

3. You can specify that CFM packets (CCMs) be transmitted only in one direction for the MEP, that is, the direction be set as **down** so that CCMs are transmitted only out of (not into) the interface configured on this MEP.

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain domain-name maintenance-association ma-name mep mep-id]
user@switch# set direction down
```

4. Specify the logical interface to which the MEP is attached. It can be either an access interface or a trunk interface. If you specify a trunk interface, the VLAN associated with that interface must have a VLAN ID.

NOTE: You cannot associate an access interface that belongs to multiple VLANs with the MEP.

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain domain-name maintenance-association ma-name mep mep-id]
user@switch# set interface interface-name
```

5. You can configure a remote MEP from which CCMs are expected. If autodiscovery is not enabled, the remote MEP must be configured under the **mep** statement. If the remote MEP is not configured under the **mep** statement, the CCMs from the remote MEP are treated as errors.

```
[edit protocols oam ethernet connectivity-fault-management
maintenance-domain domain-name maintenance-association ma-name mep mep-id]
user@switch# set remote-mep mep-id
```

Configuring a Connectivity Fault Management Action Profile

You can configure an action profile and specify the action to be taken when any of the configured events occur. Alternatively, you can configure an action profile and specify default actions when connectivity to a remote MEP fails.

To configure an action profile:

1. Specify a name for an action profile:

```
[edit protocols oam ethernet connectivity-fault-management]
user@switch# set action-profile profile-name
```

2. Configure the action of the action profile:

```
[edit protocols oam ethernet connectivity-fault-management action-profile
profile-name]
user@switch# set action interface-down
```

3. Configure one or more events under the action profile, the occurrence of which will trigger the corresponding action to be taken:

```
[edit protocols oam ethernet connectivity-fault-management action-profile
profile-name]
user@switch# set event event
```

See *Junos OS Network Interfaces Configuration Guide*

Configuring the Linktrace Protocol

The linktrace protocol is used for path discovery between a pair of maintenance points. Linktrace messages are triggered by an administrator using the **traceroute** command to verify the path between a pair of MEPs under the same maintenance association. Linktrace messages can also be used to verify the path between a MEP and a MIP under the same maintenance domain.

To configure the linktrace protocol:

1. Configure the linktrace path age timer. If no response to a linktrace request is received, the request and response entries are deleted after the age timer expires:

```
[edit protocols oam ethernet connectivity-fault-management]
user@switch# set linktrace age time
```

2. Configure the number of linktrace reply entries to be stored per linktrace request:

```
[edit protocols oam ethernet connectivity-fault-management]
user@switch# set linktrace path-database-size path-database-size
```

action-profile (Applying to OAM CFM, for J-EX Series Switch Only)

Syntax

```
action-profile profile-name {
  default-actions {
    interface-down;
  }
}
```

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure a name and default action for an action profile.

Options

profile-name—Name of the action profile.

default-actions—Defines the action to be taken when connectivity to the remote MEP is lost.

interface-down—Brings the interface down when a remote MEP connectivity failure is detected.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

connectivity-fault-management (J-EX Series Switch Only)

Syntax

```
connectivity-fault-management {
  action-profile profile-name {
    default-actions {
      interface-down;
    }
  }
  linktrace {
    age (30m | 10m | 1m | 30s | 10s);
    path-database-size path-database-size;
  }
  maintenance-domain domain-name {
    level number;
    mip-half-function (none | default |explicit);
    name-format (character-string | none | dns | mac+2oct);
    maintenance-association ma-name {
      continuity-check {
        hold-interval minutes;
        interval (10m | 10s | 1m | 1s| 100ms);
        loss-threshold number;
      }
      mep mep-id {
        auto-discovery;
        direction down;
        interface interface-name;
        remote-mep mep-id {
          action-profile profile-name;
        }
      }
    }
  }
}
```

Hierarchy Level [edit protocols oam ethernet]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure connectivity fault management for IEEE 802.1ag Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

continuity-check (J-EX Series Switch Only)

Syntax

```
continuity-check {
  hold-interval minutes;
  interval (10m | 10s | 1m | 1s| 100ms);
  loss-threshold number;
}
```

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name* **maintenance-association** *ma-name*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Specify continuity check protocol options.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

direction (J-EX Series Switch Only)

Syntax direction down;

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name* **maintenance-association** *ma-name* **mep** *mep-id*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Specify that connectivity fault management (CFM) packets (CCMs) be transmitted only in one direction for the MEP, that is, the direction be set as **down** so that CCMs are transmitted only out of (not into) the interface configured on this MEP.

Options **down**—Down MEP CCMs are transmitted only out (not into) of the interface configured on this MEP.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface (OAM CFM, for J-EX Series Switch Only)

Syntax interface (*interface-name* | ((ge- | xe-) (*fpc/pic/port* | *fpc/pic/port.unit-number* | *fpc/pic/port.unit-number* vlan *vlan-id*)));

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name* **maintenance-association** *ma-name* **mep** *mep-id*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure IEEE 802.1ag Operation, Administration, and Management (OAM) Connectivity Fault Management (CFM) support for the specified interface.

Options ***interface-name***—Interface to which the MEP is attached. It can be a physical Ethernet interface or a logical interface. If the interface is a trunk interface, the VLAN associated with the interface must have a VLAN ID.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interval (J-EX Series Switch Only)

Syntax interval (10m | 10s | 1m | 1s | 100ms | 10ms);

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name* **maintenance-association** *ma-name* **continuity-check**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure the time between continuity check messages.

Options

10m—10 minutes.

10s—10 seconds.

1m—1 minute.

1s—1 second.

100ms—100 milliseconds.

10ms—10 milliseconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

level (J-EX Series Switch Only)

Syntax level *number*;

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure a number to be used in CFM messages to identify the maintenance association.

Options

number—Number used to identify the maintenance domain to which the CFM message belongs.

Range: 0 through 7

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

maintenance-association (J-EX Series Switch Only)

Syntax

```
maintenance-association ma-name {
  continuity-check {
    hold-interval minutes;
    interval (10m | 10s | 1m | 1s| 100ms);
    loss-threshold number;
  }
  mep mep-id {
    auto-discovery;
    direction down;
    interface interface-name;
    remote-mep mep-id {
      action-profile profile-name;
    }
  }
}
```

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure the name of the maintenance association in IEEE-compliant format.

Options ***ma-name***—The name of the maintenance association within the maintenance domain.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

maintenance-domain (J-EX Series Switch Only)

Syntax

```
maintenance-domain domain-name {
  level number;
  mip-half-function (none | default |explicit);
  name-format (character-string | none | dns | mac+2oct);
  maintenance-association ma-name {
    continuity-check {
      hold-interval minutes;
      interval (10m | 10s | 1m | 1s| 100ms);
      loss-threshold number;
    }
    mep mep-id {
      auto-discovery;
      direction down;
      interface interface-name;
      remote-mep mep-id {
        action-profile profile-name;
      }
    }
  }
}
```

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure the name of the maintenance domain in IEEE-compliant format.

Options ***domain-name***—The name for the maintenance domain.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

mep (J-EX Series Switch Only)

Syntax

```
mep mep-id {
  auto-discovery;
  direction down;
  interface interface-name;
  remote-mep mep-id {
    action-profile profile-name;
  }
}
```

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name* **maintenance-association** *ma-name*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure the numeric identifier of the maintenance association end point (MEP) within the maintenance association.

Options ***mep-id***—Numeric identifier of the MEP.

Range: 1 through 8191

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

mip-half-function (J-EX Series Switch Only)

Syntax mip-half-function (none | default | explicit);

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Specify the OAM Ethernet CFM maintenance domain MIP half functions.

NOTE: Whenever a MIP is configured, the MIP half function value for all maintenance domains and maintenance associations must be the same.

Options **none**—Specify to not use the mip-half-function.

default—Specify to use the default mip-half-function.

explicit—Specify an explicit mip-half-function.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

name-format (J-EX Series Switch Only)

Syntax name-format (character-string | none | dns | mac+2oct);

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Specify the format of the maintenance domain name.

Options

character-string—The name is an ASCII character string.

none—Name format **none** means that maintenance domain name is not used.

dns—Name is in domain name service (DNS) format. For example: www.support.dell.com.

mac+2oct—Name is the MAC address plus a two-octet maintenance association identifier. For example: 08:00:22:33:44:55.100.

Default: character-string

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

path-database-size (J-EX Series Switch Only)

Syntax path-database-size *path-database-size*;

Hierarchy Level [edit protocols **oam ethernet connectivity-fault-management linktrace**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of linktrace reply entries to be stored per linktrace request.

Options

path-database-size—Database size (number of entries stored per request).

Range: 1 through 500

Default: 100

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

remote-mep (J-EX Series Switch Only)

Syntax

```
remote-mep mep-id {
    action-profile profile-name;
}
```

Hierarchy Level

[edit protocols **oam ethernet connectivity-fault-management maintenance-domain** *domain-name* **maintenance-association** *ma-name* **mep** *mep-id*]

Release Information

Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description

Specify the numeric identifier of the remote maintenance association end point (MEP) within the maintenance association.

Options

mep-id—Specify the numeric identifier of the MEP.

Range: 1 through 8191

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Operational Commands for Ethernet OAM Connectivity Fault Management

clear oam ethernet connectivity-fault-management statistics

Syntax **clear oam ethernet connectivity-fault-management statistics**
<interface *ethernet-interface-name*>
<level *md-level*>

Release Information Command introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Clear all statistics maintained by CFM.

Options **interface *ethernet-interface-name***—(Optional) Clear CFM statistics only for MEPs attached to the specified Ethernet physical interface.

level *level*—(Optional) Clear CFM statistics only for MEPs within CFM maintenance domains (MDs) of the specified level.

Required Privilege Level clear

- **show oam ethernet connectivity-fault-management mip on page 2658**

List of Sample Output **clear oam ethernet connectivity-fault-management statistics on page 2639**

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear oam ethernet connectivity-fault-management statistics

```
user@host> clear oam ethernet connectivity-fault-management statistics
Cleared statistics of all CFM sessions
```

show oam ethernet connectivity-fault-management forwarding-state

Syntax **show oam ethernet connectivity-fault-management forwarding-state <brief | detail | extensive>**

Release Information Command introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

Options interface *interface-name*—Display forwarding state information for the specified Ethernet interface only.

brief | detail | extensive—(Optional) Display the specified level of output.

Required Privilege Level view

show oam ethernet connectivity-fault-management interfaces

Syntax **show oam ethernet connectivity-fault-management interfaces**
<*ethernet-interface-name*>
<level *md-level*>
<brief | detail | extensive>

Release Information Command introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

Options brief | detail | extensive—(Optional) Display the specified level of output.

ethernet-interface-name—(Optional) Display CFM information only for CFM entities attached to the specified Ethernet interface.

level *md-level*—(Optional) Display CFM information for CFM identities enclosed within a maintenance domain of the specified level.

Required Privilege Level view

Format (Maintenance association)	Maintenance association name format configured.	**detail extensive**
Continuity-check status	Continuity-check status.	**detail extensive**
Interval	Continuity-check message interval.	**detail extensive**
Loss-threshold	Lost continuity-check message threshold.	**detail extensive**
MEP identifier	Maintenance association end point (MEP) identifier.	All levels
Neighbours	Number of MEP neighbors.	All levels
Direction	MEP direction configured.	**detail extensive**
MAC address	MAC address configured for the MEP.	**detail extensive**
MEP status	Indicates the status of the Connectivity Fault Management (CFM) protocol running on the MEP: **Running**, **inactive**, **disabled**, or **unsupported**.	**detail extensive**
Remote MEP not receiving CCM	Whether the remote MEP is not receiving connectivity check messages (CCMs).	**detail extensive**
Erroneous CCM received	Whether erroneous CCMs have been received.	**detail extensive**
Cross-connect CCM received	Whether cross-connect CCMs have been received.	**detail extensive**
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.	**detail extensive**
CCMs sent	Number of CCMs transmitted.	**detail extensive**

Table 333: show oam ethernet connectivity-fault-management interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
CCMs received out of sequence	Number of CCMs received out of sequence.	**detail extensive**
LBMs sent	Number of loopback request messages (LBMs) sent.	**detail extensive**
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.	**detail extensive**
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.	**detail extensive**
LBRs received with corrupted data	Number of LBRs received that were corrupted.	**detail extensive**
LBRs sent	Number of LBRs transmitted.	**detail extensive**
LTMs sent	Linktrace messages (LTMs) transmitted.	**detail extensive**
LTMs received	Linktrace messages received.	**detail extensive**
LTRs sent	Linktrace responses (LTRs) transmitted.	**detail extensive**
LTRs received	Linktrace responses received.	**detail extensive**
Sequence number of next LTM request	Sequence number of next LTM request to be transmitted.	**detail extensive**
1DMs sent	If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**
Valid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
Invalid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
DMMs sent	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**

Table 333: show oam ethernet connectivity-fault-management interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
DMRs sent	If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays **0**.	**detail extensive**
Valid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
Invalid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
Remote MEP count	Number of remote MEPs.	**extensive**
Identifier (remote MEP)	MEP identifier of the remote MEP.	**extensive**
MAC address (remote MEP)	MAC address of the remote MEP.	**extensive**
State (remote MEP)	State of the remote MEP.	**extensive**
Interface (remote MEP)	Interface of the remote MEP.	**extensive**

show oam ethernet connectivity-fault-management linktrace path-database

Syntax **show oam ethernet connectivity-fault-management path-database** *host* **maintenance-association** *ma-name* **maintenance-domain** *md-name mac-address*

Release Information Command introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

Options mac-address—Display connectivity fault management path database information for the specified MAC address of the remote host.

maintenance-association *ma-name*—Display connectivity fault management path database information for the specified maintenance association.

maintenance-domain *md-name*—Display connectivity fault management path database information for the specified maintenance domain.

show oam ethernet connectivity-fault-management linktrace path-database (Two traceroute Commands) on page 2651

Output Fields Table 334 on page 2650 lists the output fields for the **show oam ethernet connectivity-fault-management path-database** command. Output fields are listed in the approximate order in which they appear.

Table 334: show oam ethernet connectivity-fault-management linktrace path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the 802.1ag node to which the linktrace message is targeted.
Interface	Interface used by the local MEP to send the linktrace message (LTM).
Maintenance Domain	Maintenance domain identifier specified in the traceroute command.
Maintenance Association	Maintenance association identifier specified in the traceroute command.
Level	Maintenance domain level configured for the maintenance domain.

Table 334: show oam ethernet connectivity-fault-management linktrace path-database Output Fields *(continued)*

Field Name	Field Description
Local Mep	MEP identifier of the local MEP originating the linktrace.
Hop	Sequential hop count of the linktrace path.
TTL	Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.
Source MAC address	MAC address of the 802.1ag maintenance intermediate point (MIP) that is forwarding the LTM.
Next hop MAC address	MAC address of the 802.1ag node that is the next hop in the LTM path.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM.

show oam ethernet connectivity-fault-management mep-database

Syntax **show oam ethernet connectivity-fault-management mep-database**
maintenance-domain *domain-name*
maintenance-association *ma-name*
<local-mep *local-mep-id*>
<remote-mep *remote-mep-id*>

Release Information Command introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

Options
maintenance-association *ma-name*—Display connectivity fault management information for the specified maintenance association.

maintenance-domain *domain-name*—Display connectivity fault management information for the specified maintenance domain.

local-mep *local-mep-id*—(Optional) Display connectivity fault management information for the specified local MEP only.

remote-mep *remote-mep-id*—(Optional) Display connectivity fault management information for the specified remote MEP only.

Table 335: show oam ethernet connectivity-fault-management mep-database Output Fields

Field Name	Field Description
Maintenance domain name	Maintenance domain name.

Table 335: show oam ethernet connectivity-fault-management mep-database Output Fields *(continued)*

Field Name	Field Description
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Format (Maintenance association)	Maintenance association name format configured.
Continuity-check status	Continuity-check status.
Interval	Continuity-check message interval.
MEP identifier	Maintenance association end point (MEP) identifier.
Direction	MEP direction configured.
MAC address	MAC address configured for the MEP.
Auto-discovery	Whether automatic discovery is enabled or disabled.
Priority	Priority used for CCMs and linktrace messages transmitted by the MEP.
Interface name	Interface identifier.
Interface status	Local interface status.
Link status	Local link status.
Remote MEP not receiving CCM	Whether the remote MEP is not receiving CCMs.
Erroneous CCM received	Whether erroneous CCMs have been received.
Cross-connect CCM received	Whether cross-connect CCMs have been received.
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.
CCMs sent	Number of CCMs transmitted.
CCMs received out of sequence	Number of CCMs received out of sequence.

Table 335: show oam ethernet connectivity-fault-management mep-database Output Fields *(continued)*

Field Name	Field Description
LBMs sent	Number of loopback messages (LBMs) sent.
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.
LBRs received with corrupted data	Number of LBRs received that were corrupted.
LBRs sent	Number of LBRs transmitted.
LTMs sent	Linktrace messages (LTMs) transmitted.
LTMs received	Linktrace messages received.
LTRs sent	Linktrace responses (LTRs) transmitted.
LTRs received	Linktrace responses received.
Sequence number of next LTM request	Sequence number of the next linktrace message request to be transmitted.
1DMs sent	If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.
Valid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.
Invalid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.
DMMs sent	If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.
DMRs sent	If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays **0**.

Table 335: show oam ethernet connectivity-fault-management mep-database Output Fields *(continued)*

Field Name	Field Description
Valid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.
Invalid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.
Remote MEP identifier	MEP identifier of the remote MEP.
State (remote MEP)	State of the remote MEP: **idle**, **start**, **ok**, or **failed**.
MAC address	MAC address of the remote MEP.
Type	Whether the remote MEP MAC address was learned using automatic discovery or configured.
Interface	Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.
Last flapped	Date, time, and how long ago the remote MEP interface went from down to up. The format is **Last flapped: *year-month-day hours:minutes:seconds timezone* (*hours:minutes:seconds* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.
Remote defect indication	Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.
Port status TLV	• In the Maintenance domain section, displays the last transmitted port status TLV value. • In the Remote MEP section, displays the last value of port status TLV received from the remote MEP. In the Action profile section, displays, the last occurred event **port-status-tlv blocked** event. This event occurred due to the reception of **blocked** value in the port status TLV from remote MEP.
Interface status TLV	• In the Maintenance domain section, displays the last transmitted interface status TLV value. • In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP. In the Action profile section, if displays, the last occurred event interface-status-tlv event (either **lower-layer-down** or **down**). This event occurred due to the reception of either lower or **down** value in the interface status TLV from remote MEP.
Action profile	Name of the action profile occurrence associated with a remote MEP.
Last event	When an action profile occurs, displays the last event that triggered it.
Last event cleared	When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.
Action	Action taken and the corresponding time of the action occurrence.

CHAPTER 82

Uplink Failure Detection

Uplink Failure Detection—Overview

Understanding Uplink Failure Detection

Uplink failure detection allows a J-EX Series switch to detect link failure on uplink interfaces and to propagate the failure to the downlink interfaces so that servers connected to those downlinks can switch over to secondary interfaces.

Uplink failure detection supports network adapter teaming and provides network redundancy. In network adapter teaming, all the network interface cards (NICs) on a server are configured in a primary or secondary relationship and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link. With uplink failure detection, the switch monitors uplink interfaces for link failures. When it detects a failure, it disables the downlink interfaces. When the server detects disabled downlink interfaces, it switches over to the secondary link to help ensure balanced traffic flow on switches.

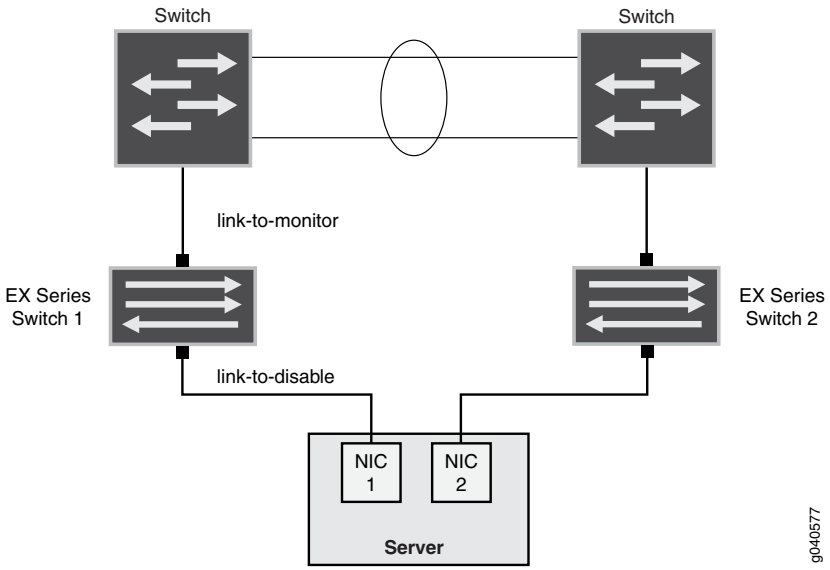
This topic describes:

Uplink Failure Detection Overview

Uplink failure detection allows switches to monitor uplink interfaces to spot link failures. When a switch detects a link failure, it automatically disables the downlink interfaces bound to the uplink interface. A server that is connected to the disabled downlink interface triggers a network-adapter failover to a secondary link to avoid any information drop.

Figure 73 on page 2660 illustrates a typical setup for uplink failure detection.

Figure 73: Uplink Failure Detection Configuration on Switches



For uplink failure detection, you specify a group of uplink interfaces to be monitored and downlink interfaces to be brought down when an uplink fails. The downlink interfaces are bound to the uplink interfaces within the group. If all uplink interfaces in a group go down, then the switch brings down all downlink interfaces within that group. If any uplink interface returns to service, then the switch brings all downlink interfaces in that group back to service.

The switch can monitor both physical-interface links and logical-interface links for uplink failures, but you must put the two types of interfaces into separate groups.

NOTE: For logical interfaces, the server must run some high level protocol such as keepalives between switch and server to detect failure of logical links.

Failure Detection Pair

Uplink failure detection requires that you create pairs of uplink and downlink interfaces in a group. Each pair includes one of each of the following:

- A link-to-monitor interface—The link-to-monitor interfaces specify the uplinks the switch monitors. You can configure a maximum of eight uplink interfaces as link-to-monitor for a group.
- A link-to-disable interface—The link-to-disable interfaces specify the downlinks the switch disables when the switch detects an uplink failure. You can configure a maximum of eight downlink interfaces as link-to-disable for a group.

The link-to-disable interfaces are bound to the link-to-monitor interfaces within the group. When a link-to-monitor interface returns to service, the switch automatically enables all link-to-disable interfaces in the group.

Configuring Uplink Failure Detection

- Configuring Interfaces for Uplink Failure Detection (CLI Procedure) on page 2661

Configuring Interfaces for Uplink Failure Detection (CLI Procedure)

You can configure uplink failure detection on J-EX Series switches to help ensure balanced traffic flow. Using this feature, switches can monitor and detect link failure on uplink interfaces and can propagate the failure to downlink interfaces so that servers connected to those downlinks can switch over to secondary interfaces.

Follow these configuration guidelines:

- Configure an interface in only one group.
- Configure a maximum of eight uplinks and eight downlinks in each group.
- Configure physical links and logical links in separate groups.

To configure uplink-failure-detection on a switch:

1. Specify a name for an uplink-failure-detection group:

   ```
   [edit protocols]
   user@switch# set uplink-failure-detection group group-name
   ```

2. Add an uplink interface to the group:

   ```
   [edit protocols]
   user@switch# set uplink-failure-detection group group-name link-to-monitor
   interface-name
   ```

3. Repeat Step 2 for each uplink interface you add to the group.
4. Add a downlink interface to the group:

   ```
   [edit protocols]
   user@switch# set uplink-failure-detection group group-name link-to-disable
   interface-name
   ```

5. Repeat Step 3 for each downlink interface you add to the group.

NOTE: After you have configured an uplink-failure-detection group, use the **show uplink-failure-detection group *group-name*** command to verify that all interfaces in the group are up. If the interfaces are down, uplink failure detection does not work.

Related Documentation

- Understanding Uplink Failure Detection on page 2659

Verifying Uplink Failure Detection

Verifying That Uplink Failure Detection Is Working Correctly

Purpose Verify that the switch disables the downlink interface when it detects an uplink failure.

Action

1. View the current uplink-failure-detection status:

```
user@switch> show uplink-failure-detection

Group                       : group1
Uplink                      :  ge-0/0/0*
Downlink                    :  ge-0/0/1*
Failure Action              :  Inactive
```

NOTE: The asterisk (*) indicates that the link is up.

2. Disable the uplink interface:

```
[edit]
user@switch# set interface ge-0/0/0 disable
```

3. Save the configuration on the switch.
4. View the current uplink-failure-detection status:

```
user@switch> show uplink-failure-detection

Group                       : group1
Uplink                      :  ge-0/0/0
Downlink                    :  ge-0/0/1
Failure Action              :  Active
```

Meaning The output in Step 1 shows that the uplink interface is up, and hence that the downlink interface is also up, and that the status of **Failure Action** is **Inactive**.

The output in Step 4 shows that both the uplink and downlink interfaces are down and that the status of **Failure Action** is changed to **Active**. This output shows that uplink failure detection is working.

List of Sample Output **show uplink-failure-detection on page 2665**

Output Fields Table 337 on page 2665 lists the output fields for the **show uplink-failure-detection** command. Output fields are listed in the approximate order in which they appear.

Table 337: show uplink-failure-detection Output Fields

Field Name	Field Description
Group	Name of the group.
Uplink	The uplink interface or interfaces configured as link-to-monitor. NOTE: The asterisk (*) indicates that the link is up.
Downlink	The downlink interface or interfaces configured as link-to-disable. NOTE: The asterisk (*) indicates that the link is up.
Failure Action	Status of uplink failure detection: • Active—The switch has detected an uplink failure and has brought the downlink down. • Inactive—The uplink or uplinks are up.

Sample Output

show uplink-failure-detection

```
user@switch> show uplink-failure-detection
Group              : group1
Uplink             :  ge-0/0/0*
Downlink           :  ge-0/0/1*
Failure Action     :  Inactive

Group              : group2
Uplink             :  ge-0/0/3.0
```

```
Downlink          :  ge-0/0/4.0
Failure Action    :  Active
```

CHAPTER 83

Monitoring General Network Traffic and Hosts

Monitoring Hosts Using the J-Web Ping Host Tool

Purpose Use the J-Web ping host tool to verify that the host can be reached over the network. The output is useful for diagnosing host and network connectivity problems. The switch sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

Action To use the J-Web ping host tool:

1. Select **Troubleshoot>Ping Host**.
2. Next to Advanced options, click the expand icon.
3. Enter information into the Ping Host page, as described in Table 338 on page 2667.

   The Remote Host field is the only required field.
4. Click **Start**.

   The results of the ping operation are displayed in the main pane . If no options are specified, each ping response is in the following format:

   ```
   bytes bytes from ip-address: icmp_seq=number ttl=number time=time
   ```
5. To stop the ping operation before it is complete, click **OK**.

Meaning Table 338 on page 2667 lists the fields.

Table 338: J-Web Ping Host Field Summary

Field	Function	Your Action
Remote Host	Identifies the host to ping.	Type the hostname or IP address of the host to ping.
Advanced Options		

Table 338: J-Web Ping Host Field Summary *(continued)*

Field	Function	Your Action
Don't Resolve Addresses	Determines whether to display hostnames of the hops along the path.	• To suppress the display of the hop hostnames, select the check box. • To display the hop hostnames, clear the check box.
Interface	Specifies the interface on which the ping requests are sent.	Select the interface on which ping requests are sent from the list. If you select **any**, the ping requests are sent on all interfaces.
Count	Specifies the number of ping requests to send.	Select the number of ping requests to send from the list.
Don't Fragment	Specifies the Don't Fragment (DF) bit in the IP header of the ping request packet.	• To set the DF bit, select the check box. • To clear the DF bit, clear the check box.
Record Route	Sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed in the main pane.	• To record and display the path of the packet, select the check box. • To suppress the recording and display of the path of the packet, clear the check box.
Type-of-Service	Specifies the type-of-service (TOS) value in the IP header of the ping request packet.	Select the decimal value of the TOS field from the list.
Routing Instance	Name of the routing instance for the ping attempt.	Select the routing instance name from the list.
Interval	Specifies the interval, in seconds, between transmissions of individual ping requests.	Select the interval from the list.
Packet Size	Specifies the size of the ping request packet.	Type the size, in bytes, of the packet. The size can be from 0 through 65468. The switch adds 8 bytes of ICMP header to the size.
Source Address	Specifies the source address of the ping request packet.	Type the source IP address.
Time-to-Live	Specifies the time-to-live (TTL) hop count for the ping request packet.	Select the TTL value from the list.
Bypass Routing	Determines whether ping requests are routed by means of the routing table. If the routing table is not used, ping requests are sent only to hosts on the interface specified in the Interface box. If the host is not on that interface, ping responses are not sent.	• To bypass the routing table and send the ping requests to hosts on the specified interface only, select the check box. • To route the ping requests using the routing table, clear the check box.

Related Documentation

- Monitoring Interface Status and Traffic

Monitoring Network Traffic Using Traceroute

Purpose Use the Traceroute page in the J-Web interface to trace a route between the switch and a remote host. You can use a traceroute task to display a list of waypoints between the switch and a specified destination host. The output is useful for diagnosing a point of failure in the path from the switch platform to the destination host and addressing network traffic latency and throughput problems.

Action To use the traceroute tool:

1. Select **Troubleshoot** > **Traceroute**.
2. Next to **Advanced options**, click the expand icon.
3. Enter information into the Traceroute page.

   The **Remote Host** field is the only required field.
4. Click **Start**.
5. To stop the traceroute operation before it is complete, click **OK** while the results of the traceroute operation are being displayed.

Meaning The switch generates the list of waypoints by sending a series of ICMP traceroute packets in which the time-to-live (TTL) value in the messages sent to each successive waypoint is incremented by 1. (The TTL value of the first traceroute packet is set to 1.) In this manner, each waypoint along the path to the destination host replies with a Time Exceeded packet from which the source IP address can be obtained.

The results of the traceroute operation are displayed in the main pane. If no options are specified, each line of the traceroute display is in the following format:

hop-number host (ip-address) [as-number] time1 time2 time3

The switch sends a total of three traceroute packets to each waypoint along the path and displays the round-trip time for each traceroute operation. If the switch times out before receiving a **Time Exceeded** message, an asterisk (*) is displayed for that round-trip time.

Table 339: Traceroute field summary

Field	Function	Your Action
Remote Host	Identifies the destination host of the traceroute.	Type the hostname or IP address of the destination host.
Advanced Options		
Don't Resolve Addresses	Determines whether hostnames of the hops along the path are displayed, in addition to IP addresses.	To suppress the display of the hop hostnames, select the check box.
Gateway	Specifies the IP address of the gateway to route through.	Type the gateway IP address.

Table 339: Traceroute field summary *(continued)*

Field	Function	Your Action
Source Address	Specifies the source address of the outgoing traceroute packets.	Type the source IP address.
Bypass Routing	Determines whether traceroute packets are routed by means of the routing table. If the routing table is not used, traceroute packets are sent only to hosts on the interface specified in the Interface box. If the host is not on that interface, traceroute responses are not sent.	To bypass the routing table and send the traceroute packets to hosts on the specified interface only, select the check box.
Interface	Specifies the interface on which the traceroute packets are sent.	From the list, select the interface on which traceroute packets are sent. If you select any, the traceroute requests are sent on all interfaces.
Time-to-live	Specifies the maximum time-to-live (TTL) hop count for the traceroute request packet.	From the list, select the TTL.
Type-of-Service	Specifies the type-of-service (TOS) value to include in the IP header of the traceroute request packet.	From the list, select the decimal value of the TOS field.
Resolve AS Numbers	Determines whether the autonomous system (AS) number of each intermediate hop between the router and the destination host is displayed.	To display the AS numbers, select the check box.

CHAPTER 84

Configuration Statements for General Network Management and Monitoring

archive-sites

Syntax

```
archive-sites {
    site-name;
}
```

Hierarchy Level [edit accounting-options file *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format ***router-name_log-filename_timestamp***.

Options ***site-name***—Any valid FTP URL to a destination. For information about specifying valid FTP URLs, see the *Junos OS System Basics Configuration Guide*.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

    }
}
```

Hierarchy Level [edit accounting-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a class usage profile, which is used to log class usage statistics to a file in the **/var/log** directory. The class usage profile logs class usage statistics for the configured source classes on every interface that has **destination-class-usage** configured.

For information about configuring source classes, see the *Junos OS Routing Protocols Configuration Guide*. For information about configuring source class usage, see the *Junos OS Network Interfaces Configuration Guide*.

Options ***profile-name***—Name of the destination class profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Class Usage Profiles

counters

Syntax

```
counters {
  counter-name;
}
```

Hierarchy Level [edit accounting-options **filter-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Names of counters for which filter profile statistics are collected. The packet and byte counts for the counters are logged to a file in the **/var/log** directory.

Options ***counter-name***—Name of the counter.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the Counters

destination-classes

Syntax

```
destination-classes {
  destination-class-name;
}
```

Hierarchy Level [edit accounting-options **class-usage-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the destination classes for which statistics are collected.

Options ***destination-class-name***—Name of the destination class to include in the source class usage profile.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring a Class Usage Profile

fields (for Interface Profiles)

Syntax

```
fields {
  field-name;
}
```

Hierarchy Level [edit accounting-options **interface-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Statistics to collect in an accounting-data log file for an interface.

Options ***field-name***—Name of the field:

- **input-bytes**—Input bytes
- **input-errors**—Generic input error packets
- **input-multicast**—Input packets arriving by multicast
- **input-packets**—Input packets
- **input-unicast**—Input unicast packets
- **output-bytes**—Output bytes
- **output-errors**—Generic output error packets
- **output-multicast**—Output packets sent by multicast
- **output-packets**—Output packets
- **output-unicast**—Output unicast packets

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the Interface Profile

file (Associating with a Profile)

Syntax file *filename*;

Hierarchy Level [edit accounting-options **class-usage-profile** *profile-name*],
[edit accounting-options **filter-profile** *profile-name*],
[edit accounting-options **interface-profile** *profile-name*],
[edit accounting-options **mib-profile** *profile-name*],
[edit accounting-options **routing-engine-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description Specify the accounting log file associated with the profile.

Options ***filename***—Name of the log file. You must specify a filename already configured in the **file** statement at the **[edit accounting-options]** hierarchy level.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

file (Configuring a Log File)

Syntax

```
file filename {
  archive-sites {
    site-name;
  }
  files number;
  nonpersistent;
  size bytes;
  source-classes time;
  transfer-interval minutes;
}
```

Hierarchy Level [edit accounting-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a log file to be used for accounting data.

Options ***filename***—Name of the file in which to write accounting data.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Accounting-Data Log Files

files

Syntax files *number*;

Hierarchy Level [edit accounting-options file *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of log files to be used for accounting data.

Options ***number***—The maximum number of files. When a log file (for example, **profilelog**) reaches its maximum size, it is renamed **profilelog.0**, then **profilelog.1**, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for ***number*** is 3 and the default value is 10.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Accounting-Data Log Files

filter-profile

Syntax

```
filter-profile profile-name {
  counters {
    counter-name;
  }
  file filename;
  interval minutes;
}
```

Hierarchy Level [edit accounting-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a profile to filter and collect packet and byte count statistics and write them to a file in the **/var/log** directory. To apply the profile to a firewall filter, you include the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** hierarchy level. For more information about firewall filters, see the *Junos OS Network Interfaces Configuration Guide*.

Options ***profile-name***—Name of the filter profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the Filter Profile

interface-profile

Syntax

```
interface-profile profile-name {
  fields {
    field-name;
  }
  file filename;
  interval minutes;
}
```

Hierarchy Level [edit accounting-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a profile to filter and collect error and packet statistics and write them to a file in the **/var/log** directory. You can specify an interface profile for either a physical or a logical interface.

Options ***profile-name***—Name of the interface profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the Interface Profile

interval

Syntax interval *minutes*;

Hierarchy Level [edit accounting-options **class-usage-profile** *profile-name*],
[edit accounting-options **filter-profile** *profile-name*],
[edit accounting-options **interface-profile** *profile-name*],
[edit accounting-options **mib-profile** *profile-name*],
[edit accounting-options **routing-engine-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often statistics are collected for the accounting profile.

Options ***minutes***—Length of time between each collection of statistics.

Range: 1 through 2880 minutes

Default: 30 minutes

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the Interface Profile
- Configuring the Filter Profile
- Configuring the MIB Profile
- Configuring the Routing Engine Profile

mib-profile

Syntax

```
mib-profile profile-name {
  file filename;
  interval minutes;
  object-names {
    mib-object-name;
  }
  operation operation-name;
}
```

Hierarchy Level [edit accounting-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description Create a MIB profile to collect selected MIB statistics and write them to a file in the **/var/log** directory.

Options ***profile-name***—Name of the MIB statistics profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the MIB Profile

object-names

Syntax

```
object-names {
  mib-object-name;
}
```

Hierarchy Level [edit accounting-options **mib-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description Specify the name of each MIB object for which MIB statistics are collected for an accounting-data log file.

Options ***mib-object-name***—Name of a MIB object. You can specify more than one MIB object name.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the MIB Profile

operation

Syntax operation *operation-name*;

Hierarchy Level [edit accounting-options **mib-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description Specify the name of the operation used to collect MIB statistics for an accounting-data log file.

Options ***operation-name***—Name of the operation to use. You can specify a **get**, **get-next**, or **walk** operation.
Default: walk

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the MIB Profile

routing-engine-profile

Syntax
```
routing-engine-profile profile-name {
  fields {
    field-name;
  }
  file filename;
  interval minutes;
}
```

Hierarchy Level [edit accounting-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the **/var/log** directory.

Options ***profile-name***—Name of the Routing Engine statistics profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the Routing Engine Profile

size

Syntax size *bytes*;

Hierarchy Level [edit accounting-options **file** *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify attributes of an accounting-data log file.

Options ***bytes***—Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, **profilelog**) reaches its maximum size, it is renamed **profilelog.0**, then **profilelog.1**, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.

Syntax: ***x*** to specify bytes, ***x***k to specify KB, ***x***m to specify MB, ***x***g to specify GB

Range: 256 KB through 1 GB

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the Maximum Size of the File

source-classes

Syntax
```
source-classes {
  source-class-name;
}
```

Hierarchy Level [edit accounting-options **class-usage-profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the source classes for which statistics are collected.

Options ***source-class-name***—Name of the source class to include in the class usage profile.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring a Class Usage Profile

start-time

Syntax start-time *time*;

Hierarchy Level [edit accounting-options file *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description Specify the start time for transfer of an accounting-data log file.

Options *time*—Start time for file transfer.
Syntax: *YYYY-MM-DD.hh:mm*

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the Start Time for File Transfer

transfer-interval

Syntax transfer-interval *minutes*;

Hierarchy Level [edit accounting-options file *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the length of time the file remains open and receives new statistics before it is closed and transferred to an archive site.

Options *minutes*—Time the file remains open and receives new statistics before it is closed and transferred to an archive site.
Range: 5 through 2880 minutes
Default: 30 minutes

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the Transfer Interval of the File

CHAPTER 85

Operational Commands for General Network Management and Monitoring

monitor traffic

Syntax

monitor traffic
<brief | detail | extensive>
<absolute-sequence>
<count *count*>
<interface *interface-name*>
<layer2-headers>
<matching *matching*>
<no-domain-names>
<no-promiscuous>
<no-resolve>
<no-timestamp>
<print-ascii>
<print-hex>
<resolve-timeout>
<size *size*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description

Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

Options

none—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

brief | detail | extensive—(Optional) Display the specified level of output.

absolute-sequence—(Optional) Display absolute TCP sequence numbers.

count *count*—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.

interface *interface-name*—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

layer2-headers—(Optional) Display the link-level header on each line.

matching *matching*—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

no-domain-names—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

no-promiscuous—(Optional) Do not put the interface into promiscuous mode.

no-resolve—(Optional) Suppress reverse lookup of the IP addresses.

no-timestamp—(Optional) Suppress timestamps on displayed packets.

print-ascii—(Optional) Display each packet in ASCII format.

print-hex—(Optional) Display each packet, except the link-level header, in hexadecimal format.

resolve-timeout *timeout*—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

size *size*—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

Additional Information

In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace ***expression*** with one or more of the match conditions listed in Table 340 on page 2688.

Table 340: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	**host** [*address* | *hostname*]	Matches packets that contain the specified address or hostname. The protocol match conditions **arp**, **ip**, or **rarp**, or any of the directional match conditions, can be prepended to the **host** match condition.
	net *address*	Matches packets with source or destination addresses containing the specified network address.
	net *address* **mask** *mask*	Matches packets containing the specified network address and subnet mask.
	port [*port-number* | *port-name*]	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as **bgp** (179), **dhcp** (67), or **domain** (53) (the port numbers are also listed).
Directional	**dst**	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	src	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	src and **dst**	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	src or **dst**	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	**less** *value*	Matches packets shorter than or equal to the specified value, in bytes.
	greater *value*	Matches packets longer than or equal to the specified value, in bytes.

Table 340: Match Conditions for the monitor traffic Command *(continued)*

Match Type	Condition	Description
Protocol	**amt**	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	arp	Matches all ARP packets.
	ether	Matches all Ethernet packets.
	ether [broadcast | multicast]	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with**src** and **dst**.
	ether *protocol* **[***address* **| (arp | ip | rarp)]**	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The **ether protocol** arguments **arp**, **ip**, and **rarp** are also independent match conditions, so they must be preceded by a backslash (\) when used in the **ether protocol** match condition.
	icmp	Matches all ICMP packets.
	ip	Matches all IP packets.
	ip [broadcast | multicast]	Matches broadcast or multicast IP packets.
	ip protocol [*address* **| (icmp | igrp | tcp | udp)]**	Matches packets with the specified address or protocol type. The **ip protocol** arguments **icmp**, **tcp**, and **udp** are also independent match conditions, so they must be preceded by a backslash (\) when used in the **ip protocol** match condition.
	isis	Matches all IS-IS routing messages.
	rarp	Matches all RARP packets.
	tcp	Matches all TCP datagrams.
	udp	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in Table 341 on page 2689.

Table 341: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.

Table 341: Logical Operators for the monitor traffic Command *(continued)*

Logical Operator (Highest to Lowest Precedence)	Description
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
||	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
( )	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0""arithmetic_expression relational_operator
  arithmetic_expression"
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are **1, 2,** or **4** bytes.The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in Table 342 on page 2691.

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the **match** pipe option (**| match**) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see Table 340 on page 2688.
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[*x*]** command for aggregated Ethernet interfaces (such as **ae0**) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 342: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
|	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

ping

Syntax

ping *host*
<bypass-routing>
<count *requests*>
<detail>
<do-not-fragment>
<inet | inet6>
<interface *source-interface*>
<interval *seconds*>
<logical-system (all | *logical-system-name*)>
<loose-source *value*>
<no-resolve>
<pattern *string*>
<rapid>
<record-route>
<routing-instance *routing-instance-name*>
<size *bytes*>
<source *source-address*>
<strict >
<strict-source *value*.>
<tos *type-of-service*>
<ttl *value*>
<verbose>
<wait *seconds*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description

Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Type Ctrl+c to interrupt a ping command.

Options

host—IP address or hostname of the remote system to ping.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

count *requests*—(Optional) Number of ping requests to send. The range of values is **1** through **2,000,000,000**. The default value is an unlimited number of requests.

detail—(Optional) Include in the output the interface on which the ping reply was received.

do-not-fragment—(Optional) Set the do-not-fragment (DF) bit in the IP header of the ping packets.

inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.

interface *source-interface*—(Optional) Interface to use to send the ping requests.

interval *seconds*—(Optional) How often to send ping requests. The range of values, in seconds, is **1** through infinity. The default value is **1**.

loose-source *value*—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address *mac-address*—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern *string*—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the count option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the ping attempt.

size *bytes*—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

strict—(Optional) Use the strict source route option (IPv4).

strict-source *value*—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos *type-of-service*—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

ttl *value*—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

verbose—(Optional) Display detailed output.

vpls *instance-name*—(Optional) Ping the instance to which this VPLS belongs.

wait *seconds*—(Optional) Delay, in seconds, after sending the last packet. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

Required Privilege Level network

List of Sample Output

ping hostname on page 2696
ping hostname size count on page 2696
ping hostname rapid on page 2696

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

Sample Output

ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes
64 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.028 ms
64 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=1.053 ms
64 bytes from 192.168.169.254: icmp_seq=2 ttl=253 time=1.025 ms
64 bytes from 192.168.169.254: icmp_seq=3 ttl=253 time=1.098 ms
64 bytes from 192.168.169.254: icmp_seq=4 ttl=253 time=1.032 ms
64 bytes from 192.168.169.254: icmp_seq=5 ttl=253 time=1.044 ms
^C [abort]
```

ping hostname size count

```
user@host> ping skye size 200 count 5
PING skye.net (192.168.169.254): 200 data bytes
208 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.759 ms
208 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=2.075 ms
208 bytes from 192.168.169.254: icmp_seq=2 ttl=253 time=1.843 ms
208 bytes from 192.168.169.254: icmp_seq=3 ttl=253 time=1.803 ms
208 bytes from 192.168.169.254: icmp_seq=4 ttl=253 time=17.898 ms

--- skye.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.759/5.075/17.898 ms
```

ping hostname rapid

```
user@host> ping skye rapid
PING skye.net (192.168.169.254): 56 data bytes
!!!!!
--- skye.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.956/0.974/1.025/0.026 ms
```

show snmp mib

Syntax show snmp mib (get | get-next | walk) (ascii | decimal) *object-id* .

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.

Options **get**—Retrieve and display one or more SNMP object values.

get-next—Retrieve and display the next SNMP object values.

walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.

ascii—Display the SNMP object's string indices as an ascii-key representation.

decimal—Display the SNMP object values in the decimal (default) format. The **decimal** option is the default option for this command. Therefore, issuing the **show snmp mib (get | get-next | walk) decimal object-id** and the **show snmp mib (get | get-next | walk) object-id** commands display the same output.

object-id—The object can be represented by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). When entering multiple objects, enclose the objects in quotation marks.

Required Privilege Level snmp—To view this statement in the configuration.

traceroute

Syntax

traceroute *host*
<as-number-lookup>
<bypass-routing>
<clns>
<gateway *address*>
<inet | inet6>
<interface *interface-name*>
<logical system (all | *logical-system-name*)>
<mpls (ldp *FEC address* | rsvp *label-switched-path-name*)>
<no-resolve>
<routing-instance *routing-instance-name*>
<source *source-address*>
<tos *value*>
<ttl *value*>
<wait *seconds*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series Switches.

Description

Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

Options

host—IP address or name of remote host.

as-number-lookup—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

bypass-routing—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

clns—(Optional) Trace the route belonging to Connectionless Network Service (CLNS).

gateway *address*—(Optional) Address of a router or switch through which the route transits.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interface *interface-name*—(Optional) Name of the interface over which to send packets.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

monitor *host*—(Optional) Display real-time monitoring information for the specified host.

mpls (ldp *FEC address* | rsvp *label-switched-path name*)—(Optional) Analyze the status of LDP-signaled or RSVP-signaled MPLS label-switched paths (LSPs). You can optionally specify the forward equivalence class (FEC) address for the LDP LSP or the LSP name for RSVP. You can also analyze a specific LSP by issuing the **traceroute**

mpls rsvp *lsp-name* command. You can only analyze IPv4 point-to-point LSPs. IPv6 is not supported.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the traceroute attempt.

source *source-address*—(Optional) Source address of the outgoing traceroute packets.

tos *value*—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is **0** through **255**.

ttl *value*—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is **0** through **128**.

wait *seconds*—(Optional) Maximum time to wait for a response to the traceroute request.

Required Privilege Level

traceroute as-number-lookup host on page 2701
traceroute no-resolve on page 2701
traceroute (Between CE Routers, Layer 3 VPN) on page 2701
traceroute (Through an MPLS LSP) on page 2701

Output Fields

Table 344 on page 2700 describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

Table 344: traceroute Output Fields

Field Name	Field Description
traceroute to	IP address of the receiver.
hops max	Maximum number of hops allowed.
byte packets	Size of packets being sent.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
Round trip time	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```
user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1  blue23 (10.168.1.254)    2.370 ms  2.853 ms  0.367 ms
 2  red14  (10.168.255.250)  0.778 ms  2.937 ms  0.446 ms
 3  yellow (10.156.169.254)  7.737 ms  89.905 ms  0.834 ms
```

traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1  10.39.1.1 (10.39.1.1)  0.779 ms  0.728 ms  0.562 ms
 2  10.39.1.6 (10.39.1.6) [AS  32]  0.657 ms  0.611 ms  0.617 ms
 3  10.100.1.1 (10.100.1.1) [AS  10, 40, 50]  0.880 ms  0.808 ms  0.774 ms
```

traceroute no-resolve

```
user@host> traceroute santacruz no-resolve
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1  10.168.1.254  0.458 ms  0.370 ms  0.365 ms
 2  10.168.255.250  0.474 ms  0.450 ms  0.444 ms
 3  10.156.169.254  0.931 ms  0.876 ms  0.862 ms
```

traceroute (Between CE Routers, Layer 3 VPN)

```
user@host> traceroute vpn09
traceroute to vpn09.skybank.net (10.255.14.179), 30 hops max, 40
      byte packets
       1  10.39.10.21 (10.39.10.21)  0.598 ms  0.500 ms  0.461 ms
       2  10.39.1.13 (10.39.1.13)  0.796 ms  0.775 ms  0.806 ms
           MPLS Label=100006 CoS=0 TTL=1 S=1
       3  vpn09.skybank.net (10.255.14.179)  0.783 ms  0.716 ms  0.686
```

traceroute (Through an MPLS LSP)

```
user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1  mpls1-sr0.company.net (10.168.200.101)  0.555 ms  0.393 ms  0.367 ms
     MPLS Label=1024 CoS=0 TTL=1
 2  mpls5-lo0.company.net (10.168.1.224)  0.420 ms  0.394 ms  0.401 ms
