To quickly configure interfaces and RSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/13.0 cost 1000
set protocols rstp interface ge-0/0/13.0 mode point-to-point
set protocols rstp interface ge-0/0/9.0 cost 1000
set protocols rstp interface ge-0/0/9.0 mode point-to-point
set protocols rstp interface ge-0/0/11.0 cost 1000
set protocols rstp interface ge-0/0/11.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 1:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch1# set voice-vlan description “Voice VLAN”
user@switch1# set voice-vlan vlan-id 10
user@switch1# set employee-vlan description “Employee VLAN”
user@switch1# set employee-vlan vlan-id 20
user@switch1# set guest-vlan description “Guest VLAN”
user@switch1# set guest-vlan vlan-id 30
user@switch1# set camera-vlan description “Camera VLAN”
user@switch1# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30
40]
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
```

```
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface ge-0/0/13.0 cost 1000
user@switch1# rstp interface ge-0/0/13.0 mode point-to-point
user@switch1# rstp interface ge-0/0/9.0 cost 1000
user@switch1# rstp interface ge-0/0/9.0 mode point-to-point
user@switch1# rstp interface ge-0/0/11.0 cost 1000
user@switch1# rstp interface ge-0/0/11.0 mode point-to-point
```

Results Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
    ge-0/0/13 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/9 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/11 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
}
protocols {
    rstp {
        bridge-priority 16k;
            interface ge-0/0/13.0 {
                cost 1000;
                mode point-to-point;
            }
            interface ge-0/0/9.0 {
```

```
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/11.0 {
            cost 1000;
            mode point-to-point;
          }
        }
      }
    }
    vlans {
      voice-vlan {
        vlan-id 10;
      }
      employee-vlan {
        vlan-id 20;
      }
      guest-vlan {
        vlan-id 30;
      }
      camera-vlan {
        vlan-id 40;
      }
    }
```

Configuring RSTP on Switch 2

To configure RSTP on switch 2, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface ge-0/0/14.0 cost 1000
set protocols rstp interface ge-0/0/14.0 mode point-to-point
set protocols rstp interface ge-0/0/18.0 cost 1000
set protocols rstp interface ge-0/0/18.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 2:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch2# set voice-vlan description “Voice VLAN”
user@switch2# set voice-vlan vlan-id 10
user@switch2# set employee-vlan description “Employee VLAN”
user@switch2# set employee-vlan vlan-id 20
user@switch2# set guest-vlan description “Guest VLAN”
user@switch2# set guest-vlan vlan-id 30
user@switch2# set camera-vlan vlan-description “Camera VLAN”
user@switch2# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface ge-0/0/14.0 cost 1000
user@switch2# rstp interface ge-0/0/14.0 mode point-to-point
user@switch2# rstp interface ge-0/0/18.0 cost 1000
user@switch2# rstp interface ge-0/0/18.0 mode point-to-point
```

Results

Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
    ge-0/0/14 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/18 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
```

```
        }
      }
    }
  }
  protocols {
    rstp {
      bridge-priority 32k;
        interface ge-0/0/14.0 {
          cost 1000;
          mode point-to-point;
        }
        interface ge-0/0/18.0 {
          cost 1000;
          mode point-to-point;
        }
      }
    }
  }
  vlans {
    voice-vlan {
      vlan-id 10;
    }
    employee-vlan {
      vlan-id 20;
    }
    guest-vlan {
      vlan-id 30;
    }
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring RSTP on Switch 3

To configure RSTP on switch 3, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface ge-0/0/26.0 cost 1000
```

```
set protocols rstp interface ge-0/0/26.0 mode point-to-point
set protocols rstp interface ge-0/0/28.0 cost 1000
set protocols rstp interface ge-0/0/28.0 mode point-to-point
set protocols rstp interface ge-0/0/24.0 cost 1000
set protocols rstp interface ge-0/0/24.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 3:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch3# set voice-vlan description “Voice VLAN”
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description “Employee VLAN”
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description “Guest VLAN”
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description “Camera VLAN”
user@switch3# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface ge-0/0/26.0 cost 1000
user@switch3# rstp interface ge-0/0/26.0 mode point-to-point
user@switch3# rstp interface ge-0/0/28.0 cost 1000
user@switch3# rstp interface ge-0/0/28.0 mode point-to-point
user@switch3# rstp interface ge-0/0/24.0 cost 1000
user@switch3# rstp interface ge-0/0/24.0 mode point-to-point
```

Results

Check the results of the configuration:

```
user@switch3> show configuration
  interfaces {
    ge-0/0/26 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
          vlan {
            members [10 20 30 40];
          }
```

```
            }
          }
        }
        ge-0/0/28 {
          unit 0 {
            family ethernet-switching {
              port-mode trunk;
              vlan {
                members [10 20 30 40];
              }
            }
          }
        }
        ge-0/0/24 {
          unit 0 {
            family ethernet-switching {
              port-mode trunk;
              vlan {
                members [10 20 30 40];
              }
            }
          }
        }
      }
    }
    protocols {
      rstp {
        bridge-priority 8k;
          interface ge-0/0/26.0 {
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/28.0 {
            cost 1000;
            mode point-to-point;
          }
          interface ge-0/0/24.0 {
            cost 1000;
            mode point-to-point;
          }
        }
        bridge-priority 8k;
          }
        }
      }
    }
    vlans {
      voice-vlan {
        vlan-id 10;
      }
      employee-vlan {
        vlan-id 20;
      }
      guest-vlan {
        vlan-id 30;
      }
```

```
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring RSTP on Switch 4

To configure RSTP on switch 4, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan–id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/23.0 cost 1000
set protocols rstp interface ge-0/0/23.0 mode point-to-point
set protocols rstp interface ge-0/0/19.0 cost 1000
set protocols rstp interface ge-0/0/19.0 mode point-to-point
```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 4:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

   ```
   [edit vlans]
   user@switch4# set voice-vlan description “Voice VLAN”
   user@switch4# set voice-vlan vlan-id 10
   user@switch4# set employee-vlan description “Employee VLAN”
   user@switch4# set employee-vlan vlan-id 20
   user@switch4# set guest-vlan description “Guest VLAN”
   user@switch4# set guest-vlan vlan-id 30
   user@switch4# set camera-vlan description “Camera VLAN”
   user@switch4# set guest-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   ```

3. Configure the port mode for the interfaces:

   ```
   [edit interfaces]
   user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
   ```

```
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch4# rstp bridge-priority 16k
user@switch4# rstp interface all cost 1000
user@switch4# rstp interface ge-0/0/23.0 cost 1000
user@switch4# rstp interface ge-0/0/23.0 mode point-to-point
user@switch4# rstp interface ge-0/0/19.0 cost 1000
user@switch4# rstp interface ge-0/0/19.0 mode point-to-point
```

Results Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
    ge-0/0/23 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
    ge-0/0/19 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members [10 20 30 40];
                }
            }
        }
    }
}
protocols {
    rstp {
        bridge-priority 16k;
            interface ge-0/0/23.0 {
                cost 1000;
                mode point-to-point;
            }
            interface ge-0/0/19.0 {
                cost 1000;
                mode point-to-point;
            }
        }
    }
}
vlans {
    voice-vlan {
        vlan-id 10;
    }
    employee-vlan {
```

```
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
    vlan-id 40;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying RSTP Configuration on Switch 1 on page 1295
- Verifying RSTP Configuration on Switch 2 on page 1295
- Verifying RSTP Configuration on Switch 3 on page 1296
- Verifying RSTP Configuration on Switch 4 on page 1296

Verifying RSTP Configuration on Switch 1

Purpose Verify the RSTP configuration on Switch 1.

Action Use the operational mode command:

```
user@switch1> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/13.0    128:527      128:525  16384.0019e25040e0      1000  BLK    ALT
ge-0/0/9.0     128:529      128:513  32768.0019e2503d20      1000  BLK    ALT
ge-0/0/11.0    128:531      128:513   8192.0019e25051e0      1000  FWD    ROOT
```

Meaning Refer to the topology in Figure 33 on page 1284. The operational mode command **show spanning-tree interface** shows that **ge-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocking.

Verifying RSTP Configuration on Switch 2

Purpose Verify the RSTP configuration on Switch 2.

Action Use the operational mode command:

```
user@switch2> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/14.0     128:513      128:513  32768.0019e2503d20      1000  BLK    DESG
```

```
ge-0/0/18.0      128:519      128:515    8192.0019e25051e0      1000  FWD    ROOT
```

Meaning Refer to the topology in Figure 33 on page 1284. The operational mode command **show spanning-tree interface** shows that **ge-0/0/18.0** is in a forwarding state and the root port. The other interface on Switch 2 is blocking.

Verifying RSTP Configuration on Switch 3

Purpose Verify the RSTP configuration on Switch 3.

Action Use the operational mode commands:

```
user@switch3>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID         bridge ID          Cost
ge-0/0/26.0     128:513      128:513   8192.0019e25051e0      1000  FWD    DESG
ge-0/0/28.0     128:515      128:515   8192.0019e25051e0      1000  FWD    DESG
ge-0/0/24.0     128:517      128:517   8192.0019e25051e0      1000  FWD    DESG
```

Meaning Refer to the topology in Figure 33 on page 1284. The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

Verifying RSTP Configuration on Switch 4

Purpose Verify the RSTP configuration on Switch 4.

Action Use the operational mode commands:

```
user@switch4>  show spanning-tree interface
Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID         bridge ID          Cost

ge-0/0/23.0    128:523      128:517   8192.0019e25051e0      1000  FWD    ROOT
ge-0/0/19.0    128:525      128:525  16384.0019e25040e0      1000  FWD    DESG
```

Meaning Refer to the topology in Figure 33 on page 1284. The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/23.0** is the root interface and forwarding.

- Understanding RSTP for J-EX Series Switches on page 1276

Example: Configuring Network Regions for VLANs with MSTP on J-EX Series Switches

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates better load sharing across redundant links.

Up to 64 MSTI instances can be created for a J-EX Series switch, and each MSTI can support up to 4094 VLANs.

This example describes how to configure MSTP on four J-EX Series switches:

Requirements

This example uses the following hardware and software components:

- Four J-EX Series switches

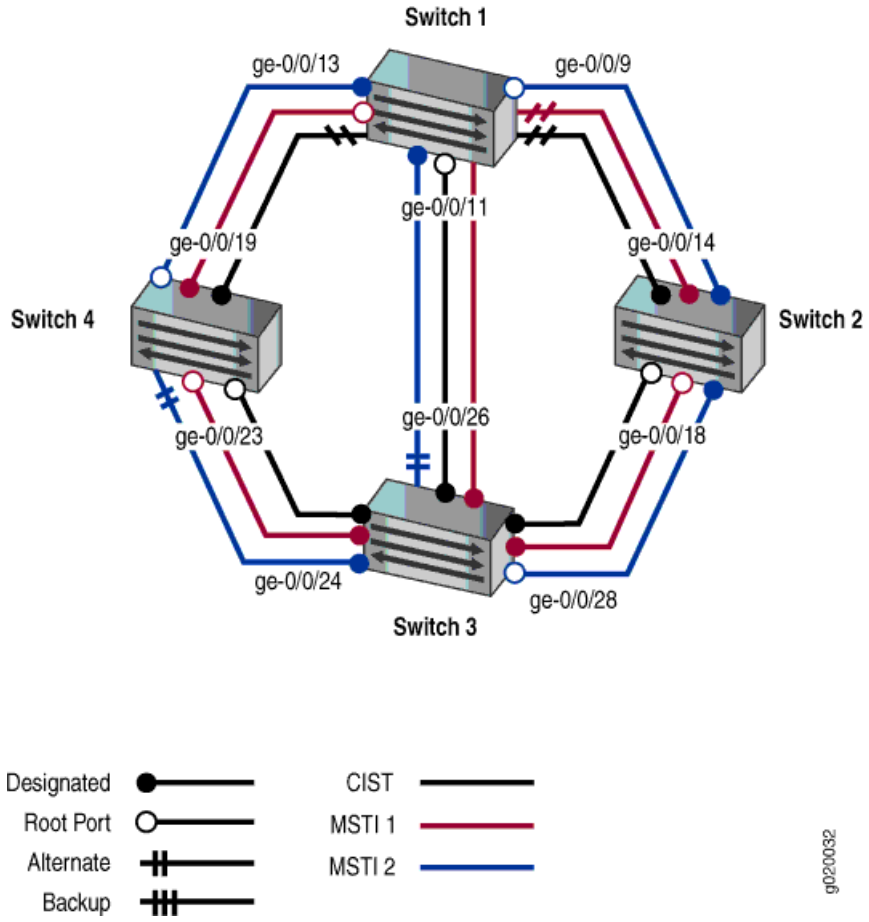
Before you configure the switches for MSTP, be sure you have:

- Installed the four switches. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.
- Performed the initial software configuration on all switches. See Installing and Connecting a J-EX4200 Switch.

Overview and Topology

When the number of VLANs grows in a network, MSTP provides a more efficient way of creating a loop-free topology using MSTIs. Each MSTI in the spanning tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.

Figure 34: Network Topology for MSTP



The interfaces shown in Table 172 on page 1298 will be configured for MSTP.

NOTE: You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

Table 172: Components of the Topology for Configuring MSTP on J-EX Series Switches

Property	Settings
Switch 1	The following ports on Switch 1 are connected in this way: • **ge-0/0/9** is connected to Switch 2 • **ge-0/0/13** is connected to Switch 4 • **ge-0/0/11** is connected to Switch 3
Switch 2	The following ports on Switch 2 are connected in this way: • **ge-0/0/14** is connected to Switch 1 • **ge-0/0/18** is connected to Switch 3

Table 172: Components of the Topology for Configuring MSTP on J-EX Series Switches *(continued)*

Property	Settings
Switch 3	The following ports on Switch 3 are connected in this way: • **ge-0/0/26** is connected to Switch 1 • **ge-0/0/28** is connected to Switch 2 • **ge-0/0/24** is connected to Switch 4
Switch 4	The following ports on Switch 4 are connected in this way: • **ge-0/0/19** is connected to Switch 1 • **ge-0/0/23** is connected to Switch 3
VLAN names and tag IDs	**voice-vlan**, tag **10** **employee-vlan**, tag **20** **guest-vlan**, tag **30** **camera-vlan**, tag **40**
MSTIs	**1** **2**

The topology in Figure 34 on page 1298 shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.
- The backup port is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The **voice-vlan** supports voice traffic and has a VLAN tag identifier of 10.
- **employee-vlan** supports data traffic and has a VLAN tag identifier of 20.
- The **guest-vlan** supports guest VLAN traffic (for supplicants that fail 802-1X authentication) and has a VLAN tag identifier of 30.
- The **camera-vlan** supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, **1** and **2**, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

Configuring MSTP on Switch 1

To configure MSTP on Switch 1, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge–0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge-0/0/13.0 cost 1000
set protocols mstp interface ge-0/0/13.0 mode point-to-point
set protocols mstp interface ge-0/0/9.0 cost 1000
set protocols mstp interface ge-0/0/9.0 mode point-to-point
set protocols mstp interface ge-0/0/11.0 cost 1000
set protocols mstp interface ge-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface ge-0/0/11.0 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

   ```
   [edit vlans]
   user@switch1# set voice-vlan description “Voice VLAN”
   user@switch1# set voice-vlan vlan-id 10
   user@switch1# set employee-vlan description “Employee VLAN”
   user@switch1# set employee-vlan vlan-id 20
   user@switch1# set guest-vlan description “Guest VLAN”
   user@switch1# set guest-vlan vlan-id 30
   user@switch1# set camera-vlan description “Camera VLAN”
   user@switch1# set guest-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch1# set ge–0/0/13 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30
   40]
   user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   ```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch1# set ge–0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface ge-0/0/13.0 cost 1000
user@switch1# mstp interface ge-0/0/13.0 mode point-to-point
user@switch1# mstp interface ge-0/0/9.0 cost 1000
user@switch1# mstp interface ge-0/0/9.0 mode point-to-point
user@switch1# mstp interface ge-0/0/11.0 cost 4000
user@switch1# mstp interface ge-0/0/11.0 mode point-to-point
user@switch1# mstp msti 1 bridge-priority 16k
user@switch1# mstp msti 1 vlan [10 20]
user@switch1# mstp msti 1 interface ge-0/0/11.0 cost 4000
user@switch1# mstp msti 2 bridge-priority 8k
user@switch1# mstp msti 2 vlan [30 40]
```

Results Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
```

```
            port-mode trunk;
            vlan {
              members 10;
              members 20;
              members 30;
              members 40;
            }
          }
        }
      }
    }
    protocols {
      mstp {
        configuration-name region1;
      bridge-priority 16k;
        interface ge-0/0/13.0 {
          cost 1000;
          mode point-to-point;
        }
        interface ge-0/0/9.0 {
          cost 1000;
          mode point-to-point;
        }
        interface ge-0/0/11.0 {
          cost 4000;
          mode point-to-point;
        }
      msti 1 {
        bridge-priority 16k;
        vlan [ 10 20 ];
        interface ge-0/0/11.0 {
          cost 4000;
        }
      }
      msti 2 {
        bridge-priority 8k;
        vlan [ 30 40 ];
      }
    }
    vlans {
      voice-vlan {
        vlan-id 10;
      }
      employee-vlan {
        vlan-id 20;
      }
      guest-vlan {
        vlan-id 30;
      }
      camera-vlan {
        vlan-id 40;
      }
    }
```

Configuring MSTP on Switch 2

To configure on Switch 2, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan—id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan-id 40
set interfaces ge—0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface ge-0/0/14.0 cost 1000
set protocols mstp interface ge-0/0/14.0 mode point-to-point
set protocols mstp interface ge-0/0/18.0 cost 1000
set protocols mstp interface ge-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

   ```
   [edit vlans]
   user@switch2# set voice-vlan description “Voice VLAN”
   user@switch2# set voice-vlan vlan-id 10
   user@switch2# set employee-vlan description “Employee VLAN”
   user@switch2# set employee-vlan vlan-id 20
   user@switch2# set guest-vlan description “Guest VLAN”
   user@switch2# set guest-vlan vlan-id 30
   user@switch2# set camera-vlan vlan-description “Camera VLAN”
   user@switch2# set guest-vlan vlan-id 40
   ```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20
   30 40]
   ```

3. Configure the port mode for the interfaces:

   ```
   [edit interfaces]
   user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
   user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
   ```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
user@switch2# mstp interface ge-0/0/14.0 cost 1000
user@switch2# mstp interface ge-0/0/14.0 mode point-to-point
user@switch2# mstp interface ge-0/0/18.0 cost 1000
user@switch2# mstp interface ge-0/0/18.0 mode point-to-point
user@switch2# mstp interface all cost 1000
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]
```

Results Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  ge-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 32k;
    interface ge-0/0/14.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/18.0 {
      cost 1000;
```

```
        mode point-to-point;
      }
      msti 1 {
        bridge-priority 32k;
        vlan [ 10 20 ];
      }
      msti 2 {
        bridge-priority 4k;
        vlan [ 30 40 ];
      }
    }
  }
  vlans {
    voice-vlan {
      vlan-id 10;
    }
    employee-vlan {
      vlan-id 20;
    }
    guest-vlan {
      vlan-id 30;
    }
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring MSTP on Switch 3

To configure MSTP on Switch 3, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description “Voice VLAN”
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description “Employee VLAN”
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description “Guest VLAN”
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description “Camera VLAN”
set vlans camera-vlan vlan—id 40
set interfaces ge—0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge—0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge—0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface ge-0/0/26.0 cost 1000
set protocols mstp interface ge-0/0/26.0 mode point-to-point
set protocols mstp interface ge-0/0/28.0 cost 1000
set protocols mstp interface ge-0/0/28.0 mode point-to-point
set protocols mstp interface ge-0/0/24.0 cost 1000
set protocols mstp interface ge-0/0/24.0 mode point-to-point
```

```
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch3# set voice-vlan description “Voice VLAN”
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description “Employee VLAN”
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description “Guest VLAN”
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description “Camera VLAN”
user@switch3# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface ge-0/0/26.0 cost 1000
user@switch3# mstp interface ge-0/0/26.0 mode point-to-point
user@switch3# mstp interface ge-0/0/28.0 cost 1000
user@switch3# mstp interface ge-0/0/28.0 mode point-to-point
user@switch3# mstp interface ge-0/0/24.0 cost 1000
user@switch3# mstp interface ge-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

Results

Check the results of the configuration:

```
user@switch3> show configuration
  interfaces {
    ge-0/0/26 {
      unit 0 {
```

```
            family ethernet-switching {
              port-mode trunk;
              vlan {
                members 10;
                members 20;
                members 30;

    guest-vlan {
      vlan-id 30;
    }
    camera-vlan {
      vlan-id 40;
    }
  }
```

Configuring MSTP on Switch 4

To configure MSTP on Switch 4, perform these tasks:

CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice–vlan description “Voice VLAN”
set vlans voice-vlan vlan–id 10
set vlans employee—vlan description “Employee VLAN”
set vlans employee—vlan vlan—id 20
set vlans guest—vlan description “Guest VLAN”
set vlans guest—vlan vlan—id 30
set vlans camera—vlan description “Camera VLAN”
set vlans camera—vlan vlan—id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge—0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge—0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge—0/0/23.0 cost 1000
set protocols mstp interface ge—0/0/23.0 mode point-to-point
set protocols mstp interface ge—0/0/19.0 cost 1000
set protocols mstp interface ge—0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]
```

Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch4# set voice-vlan description “Voice VLAN”
user@switch4# set voice-vlan vlan—id 10
user@switch4# set employee-vlan description “Employee VLAN”
user@switch4# set employee-vlan vlan—id 20
user@switch4# set guest-vlan description “Guest VLAN”
user@switch4# set guest-vlan vlan—id 30
user@switch4# set camera-vlan description “Camera VLAN”
user@switch4# set guest-vlan vlan—id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20
30 40]
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20
30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set ge—0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge—0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface ge—0/0/23.0 cost 1000
user@switch4# mstp interface ge—0/0/23.0 mode point-to-point
user@switch4# mstp interface ge—0/0/19.0 cost 1000
user@switch4# mstp interface ge—0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

Results

Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  ge-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
```

```
        }
    }
    ge-0/0/19 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members 10;
                    members 20;
                    members 30;
                    members 40;
                }
            }
        }
    }
}
protocols {
    mstp {
        configuration-name region1;
        bridge-priority 16k;
        interface ge-0/0/23.0 {
            cost 1000;
            mode point-to-point;
        }
        interface ge-0/0/19.0 {
            cost 1000;
            mode point-to-point;
        }
        msti 1 {
            bridge-priority 16k;
            vlan [ 10 20 ];
        }
        msti 2 {
            bridge-priority 32k;
            vlan [ 30 40 ];
        }
    }
}
vlans {
    voice-vlan {
        vlan-id 10;
    }
    employee-vlan {
        vlan-id 20;
    }
    guest-vlan {
        vlan-id 30;
    }
    camera-vlan {
        vlan-id 40;
    }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying MSTP Configuration on Switch 1 on page 1311
- Verifying MSTP Configuration on Switch 2 on page 1312
- Verifying MSTP Configuration on Switch 3 on page 1314
- Verifying MSTP Configuration on Switch 4 on page 1315

Verifying MSTP Configuration on Switch 1

Purpose Verify the MSTP configuration on Switch 1.

Action Use the operational mode commands:

```
user@switch1> show spanning-tree interface
Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/13.0    128:527      128:525  16384.0019e25040e0      1000  FWD    ROOT
ge-0/0/9.0     128:529      128:513  32768.0019e2503d20      1000  BLK    ALT
ge-0/0/11.0    128:531      128:513   8192.0019e25051e0      4000  BLK    ALT

Spanning tree interface parameters for instance 1

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/13.0    128:527      128:525  16385.0019e25040e0      1000  FWD    ROOT
ge-0/0/9.0     128:529      128:513  32769.0019e2503d20      1000  BLK    ALT

Meaning The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

Related Documentation

- Example: Configuring Faster Convergence and Improving Network Stability with RSTP on J-EX Series Switches on page 1283
- Understanding MSTP for J-EX Series Switches on page 1277

Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Configure BPDU protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

This example describes how to configure BPDU protection on access interfaces on a J-EX Series switch in an RSTP topology:

Requirements

This example uses the following hardware and software components:

- Two J-EX Series switches in an RSTP topology

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Receipt of BPDUs on certain interfaces in an STP, RSTP, or MSTP topology, however, can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on those interfaces that should not receive BPDUs.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If a BPDU is received on a BPDU-protected interface, the interface is disabled and stops forwarding frames.

Two J-EX Series switches are displayed in Figure 35 on page 1318. In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are access ports.

This example shows you how to configure interface **ge-0/0/5** and interface **ge-0/0/6** as edge ports and to configure BPDU protection. When BPDU protection is enabled, the interfaces will transition to a blocking state when BPDUs are received on them.

Figure 35: BPDU Protection Topology

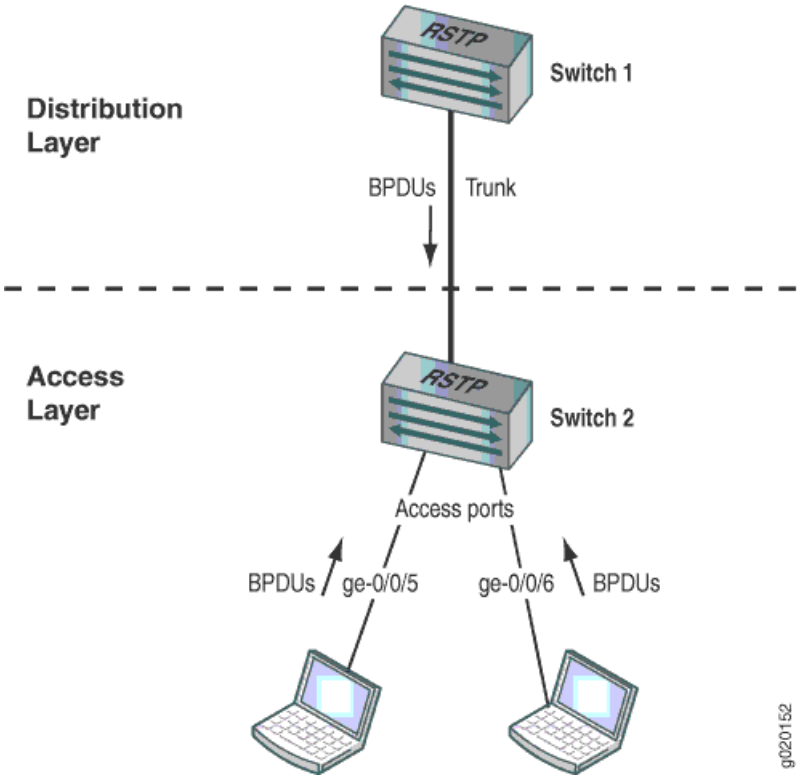

Table 173 on page 1318 shows the components that will be configured for BPDU protection.

Table 173: Components of the Topology for Configuring BPDU Protection on J-EX Series Switches

Property	Settings
Switch 1 (Distribution Layer)	Switch 1 is connected to Switch 2 on a trunk interface.
Switch 2 (Access Layer)	Switch 2 has these access ports that require BPDU protection: • **ge-0/0/5** • **ge-0/0/6**

This configuration example is using an RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the [**edit protocols** (**mstp** | **stp**)] hierarchy level.

Configuration

To configure BPDU protection on two access interfaces:

CLI Quick Configuration

To quickly configure BPDU protection on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/5 edge
set protocols rstp interface ge-0/0/6 edge
set protocols rstp bpdu-block-on-edge
```

Step-by-Step Procedure

To configure BPDU protection:

1. Configure interface **ge-0/0/5** and interface **ge-0/0/6** on Switch 2 as edge ports:

```
[edit protocols rstp]
user@switch# set interface ge-0/0/5 edge
user@switch#set interface ge-0/0/6 edge
```

2. Configure BPDU protection on all edge ports:

```
[edit protocols rstp]
user@switch# set bpdu-block-on-edge
```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/5.0 {
  edge;
}
interface ge-0/0/6.0 {
  edge;
}
bpdu-block-on-edge;
```

Verification

To confirm that the configuration is working properly:

- Displaying the Interface State Before BPDU Protection Is Triggered on page 1319
- Verifying That BPDU Protection is Working Correctly on page 1320

Displaying the Interface State Before BPDU Protection Is Triggered

Purpose

Before BPDUs are being received from the PCs connected to interface **ge-0/0/5** and interface **ge-0/0/6**, confirm the interface state.

Action

Use the operational mode command:

```
user@switch>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518      128:518  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/6.0     128:519      128:519  32768.0019e2503f00     20000  FWD    DESG
[output truncated]
```

Meaning

The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/5.0** and interface **ge-0/0/6.0** are designated ports in a forwarding state.

Verifying That BPDU Protection is Working Correctly

Purpose In this example, the PCs connected to Switch 2 start sending BPDUs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0** . Verify that BPDU protection is configured on the interfaces.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518      128:518  32768.0019e2503f00     20000  BLK    DIS
(Bpdu-Incon)
ge-0/0/6.0     128:519      128:519  32768.0019e2503f00     20000  BLK    DIS
(Bpdu-Incon)
ge-0/0/7.0     128:520        128:1  16384.00aabbcc0348     20000  FWD    ROOT
ge-0/0/8.0     128:521      128:521  32768.0019e2503f00     20000  FWD    DESG
[output truncated]
```

Meaning When BPDUs are sent from the PCs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state makes the interfaces block and prevents them from forwarding traffic.

Disabling the BPDU protection configuration on an interface does not unblock the interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. Otherwise, use the operational mode command **clear ethernet-switching bpdu-error** to unblock the interface.

If the PCs connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state. In such cases, you need to find and repair the misconfiguration on the PCs that is triggering BPDUs being sent to Switch 2.

Example: Configuring BPDU Protection on non-STP Interfaces to Prevent STP Miscalculations on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Configure BPDU protection on non-STP interfaces that are connected to switches with spanning trees to prevent the non-STP interfaces from receiving BPDUs. When non-STP interfaces receive BPDUs, it can result in an STP misconfiguration, which could lead to network outages.

This example describes how to configure BPDU protection on non-STP interfaces on a J-EX Series switch:

- Requirements on page 1321
- Overview and Topology on page 1321
- Configuration on page 1323
- Verification on page 1323

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch in an RSTP topology
- One J-EX Series switch that is not in a spanning-tree topology

Before you configure the interface for BPDU protection, be sure you have:

- RSTP operating on Switch 1.
- Disabled RSTP on Switch 2.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Receipt of BPDUs on certain interfaces can lead to network outages by triggering an STP miscalculation. Enable BPDU protection on those interfaces that should not receive BPDUs to prevent network outages.

BPDU protection for non-STP interfaces can be enabled on interfaces on a non-STP switch connected to an STP switch through a trunk interface. Enable BPDU protection on interfaces on which no BPDUs are expected, such as access ports connected to user devices. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

Two J-EX Series switches are displayed in Figure 36 on page 1322. In this example, Switch 1 and Switch 2 are connected through a trunk interface. Switch 1 is configured for RSTP, but Switch 2 has no spanning tree. Switch 2 has two access ports: interface **ge-0/0/5** and interface **ge-0/0/6**.

This example shows you how to configure BPDU protection on interface **ge-0/0/5** and interface **ge-0/0/6**. When BPDU protection is enabled, the interfaces will transition to a blocking state if BPDUs are received.

Figure 36: BPDU Protection Topology

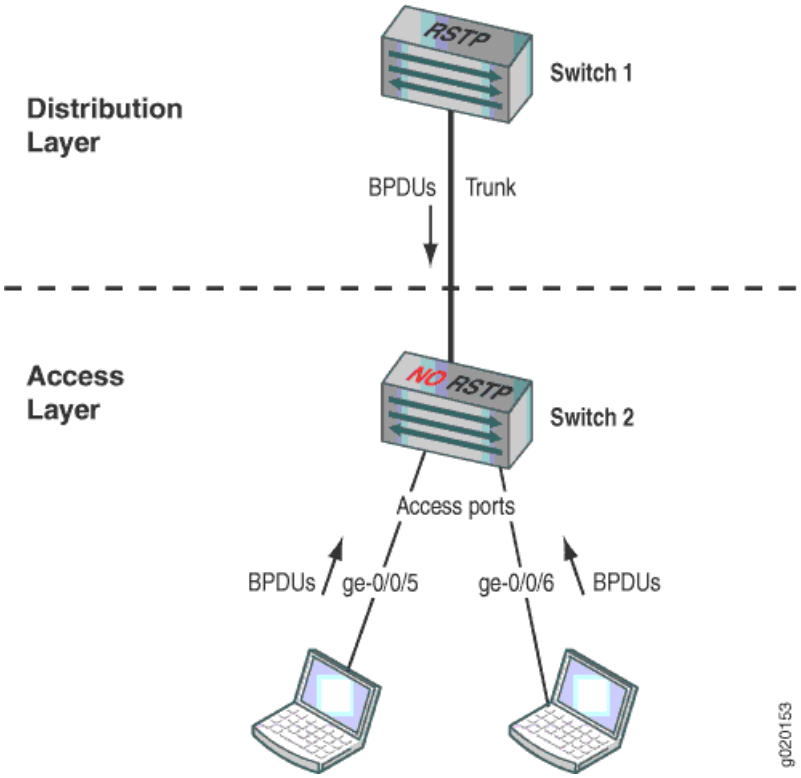

Table 174 on page 1322 shows the components that will be configured for BPDU protection.

Table 174: Components of the Topology for Configuring BPDU Protection on J-EX Series Switches

Property	Settings
Switch 1 (Distribution Layer)	Switch 1 is connected to Switch 2 through a trunk interface. Switch 1 is configured for RSTP.
Switch 2 (Access Layer)	Switch 2 has RSTP disabled and has these access ports that require BPDU protection: • **ge-0/0/5** • **ge-0/0/6**

CAUTION: When configuring BPDU protection on a non-STP configured switch connected to an STP-configured switch, be careful that you do not configure BPDU protection on all interfaces. Doing so could prevent BPDUs being received on interfaces (such as a trunk interface) that should be receiving BPDUs from an STP-configured switch.

Configuration

To configure BPDU protection on the interfaces:

CLI Quick Configuration

To quickly configure BPDU protection on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options bpdu-block interface ge-0/0/5
set ethernet-switching-options bpdu-block interface ge-0/0/6
```

Step-by-Step Procedure

To configure BPDU protection:

1. Configure interface **ge-0/0/5** and interface **ge-0/0/6** on Switch 2:

```
[edit ethernet-switching-options]
user@switch# set bpdu-block interface ge-0/0/5
user@switch# set bpdu-block interface ge-0/0/6
```

Results

Check the results of the configuration:

```
user@switch> show ethernet-switching-options
bpdu-block {
   interface ge-0/0/5.0;
   interface ge-0/0/6.0;
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Displaying the Interface State Before BPDU Protection Is Triggered on page 1323
- Verifying That BPDU Protection Is Working Correctly on page 1324

Displaying the Interface State Before BPDU Protection Is Triggered

Purpose

Before BPDUs are being received from the PCs connected to interface **ge-0/0/5** and interface **ge-0/0/6**, confirm the interface state.

Action

Use the operational mode command:

```
user@switch> show ethernet-switching interfaces

Interface   State    VLAN members          Blocking
ge-0/0/0.0  down     default               unblocked
ge-0/0/1.0  down     default               unblocked
ge-0/0/2.0  down     default               unblocked
ge-0/0/3.0  up       default               unblocked
```

```
ge-0/0/4.0  up       v1                   unblocked
ge-0/0/5.0  up       v1                   unblocked
ge-0/0/6.0  up       default              unblocked
[output truncated]
```

Meaning The output from the operational mode command **show ethernet-switching interfaces** shows that **ge-0/0/5.0** and interface **ge-0/0/6.0** are **up** and unblocked.

Verifying That BPDU Protection Is Working Correctly

Purpose In this example, the PCs connected to Switch 2 start sending BPDUs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0**. Verify that BPDU protection is configured on the interfaces.

Action Use the operational mode command:

```
user@switch> show ethernet-switching interfaces

Interface   State    VLAN members          Blocking
ge-0/0/0.0  up       default               unblocked
ge-0/0/1.0  up       default               unblocked
ge-0/0/2.0  up       default               unblocked
ge-0/0/3.0  up       default               unblocked
ge-0/0/4.0  up       v1                    unblocked
ge-0/0/5.0  down     v1                    blocked - blocked by bpdu-control
ge-0/0/6.0  down     default               blocked - blocked by bpdu-control
[output truncated]
```

Meaning When BPDUs are sent from the PCs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state makes the interfaces shut down and prevents them from forwarding traffic.

Disabling the BPDU protection configuration on an interface does not unblock the interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. Otherwise, use the operational mode command **clear ethernet-switching bpdu-error** to recover from the error condition and restore the interface to service.

If the PCs connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state. In such cases, you need to find and repair the misconfiguration on the PCs that is triggering BPDUs being sent to Switch 2.

Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would result in a loop opening up in the network.

This example describes how to configure loop protection for an interface on a J-EX Series switch in an RSTP topology:

- Requirements on page 1325
- Overview and Topology on page 1325
- Configuration on page 1327
- Verification on page 1327

Requirements

This example uses the following hardware and software components:

- Three J-EX Series switches in an RSTP topology

Before you configure the interface for loop protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop opens up in the spanning tree. Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to

continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted and the ultimate result is a network outage.

CAUTION: An interface can be configured for either loop protection or root protection, but not for both.

Three J-EX Series switches are displayed in Figure 37 on page 1326. In this example, they are configured for RSTP and create a loop-free topology. Interface **ge-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **ge-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **ge-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

Figure 37: Network Topology for Loop Protection

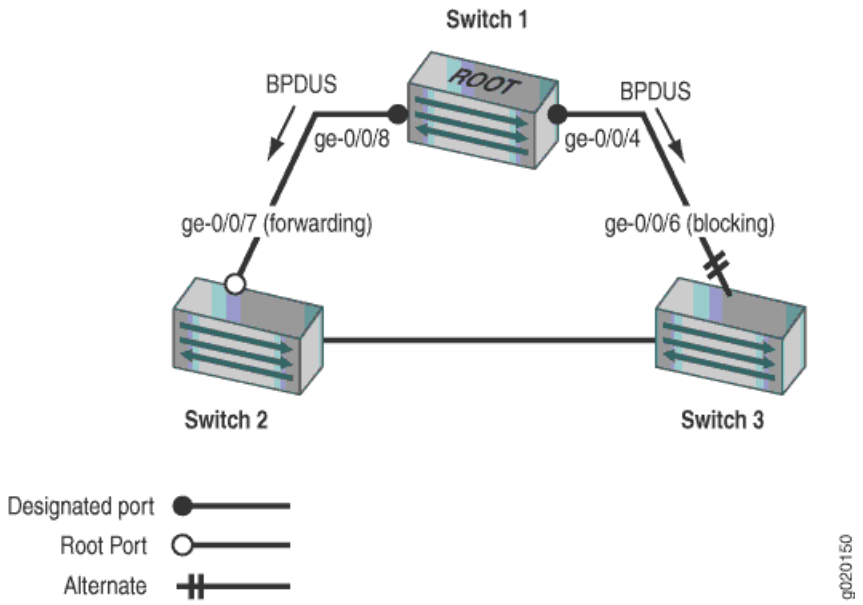

Table 175 on page 1326 shows the components that will be configured for loop protection.

Table 175: Components of the Topology for Configuring Loop Protection on J-EX Series Switches

Property	Settings
Switch 1	Switch 1 is the root bridge.
Switch 2	Switch 2 has the root port **ge-0/0/7**.
Switch 3	Switch 3 is connected to Switch 1 through interface **ge-0/0/6**.

A spanning-tree topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure loop protection for STP or MSTP topologies at the [**edit protocols** (**mstp** | **stp**)] hierarchy level.

Configuration

To configure loop protection on an interface:

CLI Quick Configuration

To quickly configure loop protection on interface **ge-0/0/6**:

```
[edit]
set protocols rstp interface ge-0/0/6 bpdu-timeout-action block
```

Step-by-Step Procedure

To configure loop protection:

1. Configure interface **ge-0/0/6** on Switch 3:

```
[edit protocols rstp]
user@switch# set interface ge-0/0/6 bpdu-timeout-action block
```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/6.0 {
  bpdu-timeout-action {
    block;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Displaying the Interface State Before Loop Protection Is Triggered on page 1327
- Verifying That Loop Protection Is Working on an Interface on page 1328

Displaying the Interface State Before Loop Protection Is Triggered

Purpose

Before loop protection is triggered on interface **ge-0/0/6**, confirm that the interface is blocking.

Action

Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
```

```
                        port ID        bridge ID          Cost
ge-0/0/0.0     128:513     128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514     128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515     128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516     128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517     128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518     128:518  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/6.0     128:519       128:2  16384.00aabbcc0348     20000  BLK    ALT
[output truncated]
```

Meaning The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/6.0** is the alternate port and in a blocking state.

Verifying That Loop Protection Is Working on an Interface

Purpose Verify the loop protection configuration on interface **ge-0/0/6**. RSTP has been disabled on interface **ge-0/0/4** on Switch 1. This will stop BPDUs from being sent to interface **ge-0/0/6** and trigger loop protection on the interface.

Action Use the operational mode command:

```
user@switch> show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513     128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514     128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515     128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516     128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517     128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518     128:518  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/6.0     128:519     128:519  32768.0019e2503f00     20000  BLK    DIS
(Loop-Incon)
[output truncated]
```

Meaning The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

Related Documentation

Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on J-EX Series Switches

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to manually enforce the root bridge placement in the network.

This example describes how to configure root protection on an interface on a J-EX Series switch:

Requirements

This example uses the following hardware and software components:

- Four J-EX Series switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on all J-EX Series switches.

Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election.

To prevent this from happening, enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

CAUTION: An interface can be configured for either root protection or loop protection, but not for both.

Four J-EX Series switches are displayed in Figure 38 on page 1330. In this example, they are configured for RSTP and create a loop-free topology. Interface **ge-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **ge-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **ge-0/0/7** to prevent it from transitioning to become the root port.

Figure 38: Network Topology for Root Protection

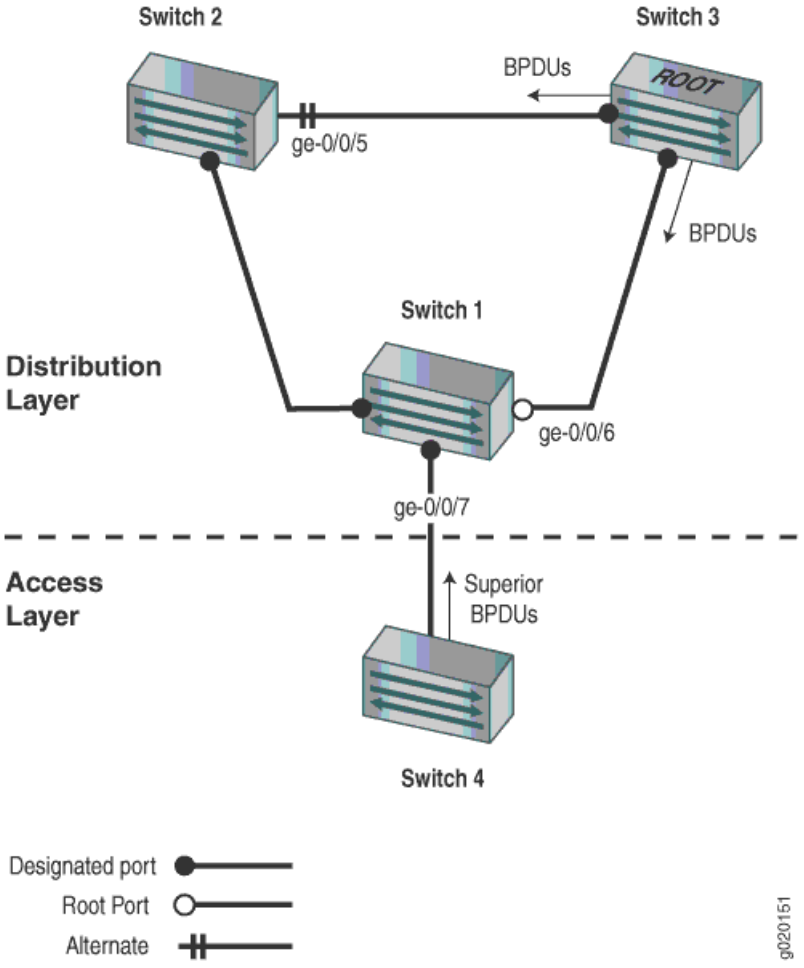

Table 176 on page 1331 shows the components that will be configured for root protection.

Table 176: Components of the Topology for Configuring Root Protection on J-EX Series Switches

Property	Settings
Switch 1	Switch 1 is connected to Switch 4 through interface **ge-0/0/7**.
Switch 2	Switch 2 is connected to Switch 1 and Switch 3. Interface **ge-0/0/4** is the alternate port in the RSTP topology.
Switch 3	Switch 3 is the root bridge and is connected to Switch 1 and Switch 2.
Switch 4	Switch 4 is connected to Switch 1. After loop protection is configured on interface **ge-0/0/7**, Switch 4 will send superior BPDUs that will trigger loop protection on interface **ge-0/0/7**.

A spanning tree topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure root protection for STP or MSTP topologies at the [**edit protocols** (**mstp** | **stp**)] hierarchy level.

Configuration

To configure root protection on an interface:

CLI Quick Configuration

To quickly configure root protection on interface **ge-0/0/7**, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/7 no-root-port
```

Step-by-Step Procedure

To configure root protection:

1. Configure interface **ge-0/0/7**:

```
[edit protocols rstp]

user@switch#
set interface ge-0/0/7 no-root-port
```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/7.0 {
   no-root-port;
}
```

Verification

To confirm that the configuration is working properly:

Displaying the Interface State Before Root Protection Is Triggered

Purpose Before root protection is triggered on interface **ge-0/0/7**, confirm the interface state.

Action Use the operational mode command:

```
user@switch>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518        128:2  16384.00aabbcc0348     20000  BLK    ALT
ge-0/0/6.0     128:519        128:1  16384.00aabbcc0348     20000  FWD    ROOT
ge-0/0/7.0     128:520      128:520  32768.0019e2503f00     20000  FWD    DESG
[output truncated]
```

Meaning The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/7.0** is a designated port in a forwarding state.

Verifying That Root Protection Is Working on the Interface

Purpose A configuration change takes place on Switch 4. A smaller bridge priority on the Switch 4 causes it to send superior BPDUs to interface **ge-0/0/7**. Receipt of superior BPDUs on interface **ge-0/0/7** will trigger root protection. Verify that root protection is operating on interface **ge-0/0/7**.

Action Use the operational mode command:

```
user@switch>  show spanning-tree interface

Spanning tree interface parameters for instance 0

Interface    Port ID    Designated      Designated         Port    State  Role
                         port ID        bridge ID          Cost
ge-0/0/0.0     128:513      128:513  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/1.0     128:514      128:514  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/2.0     128:515      128:515  32768.0019e2503f00     20000  BLK    DIS
ge-0/0/3.0     128:516      128:516  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/4.0     128:517      128:517  32768.0019e2503f00     20000  FWD    DESG
ge-0/0/5.0     128:518        128:2  16384.00aabbcc0348     20000  BLK    ALT
ge-0/0/6.0     128:519        128:1  16384.00aabbcc0348     20000  FWD    ROOT
ge-0/0/7.0     128:520      128:520  32768.0019e2503f00     20000  BLK    DIS
```

```
(Root–Incon)
[output truncated]
```

Meaning The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/7.0** has transitioned to a loop inconsistent state. The loop inconsistent state makes the interface block and prevents the interface from becoming a candidate for the root port. When the root bridge no longer receives superior STP BPDUs from the interface, the interface will recover and transition back to a forwarding state. Recovery is automatic.

CHAPTER 66

Configuring Spanning-Tree Protocols

Unblocking an Interface That Receives BPDUs in Error (CLI Procedure)

J-EX Series switches use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

After the misconfiguration that triggered the BPDUs being sent to an interface is fixed in the topology, the interface can be unblocked and returned to service.

To unblock an interface and return it to service using the CLI:

- Automatically unblock an interface by configuring a timer that expires (here, the interface is **ge-0/0/6**):

```
[edit ethernet-switching-options]
user@switch# set bpdu-block disable-timeout 30 interface ge-0/0/6
```

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpdu-error interface ge-0/0/6
```

- Understanding BPDU Protection for STP, RSTP, and MSTP on J-EX Series Switches on page 1278

Configuring STP (CLI Procedure)

The default spanning-tree protocol for J-EX Series switches is Rapid Spanning Tree Protocol (RSTP). RSTP provides faster convergence times than Spanning Tree Protocol (STP). However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. When you explicitly configure STP, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP.

To configure STP using the CLI:

1. Delete the RSTP configuration on the interface (here, the interface is **ge-0/0/5**):

```
[edit]
user@switch# delete protocols rstp interface ge-0/0/5
```

2. Configure STP on the interface:

```
[edit]
user@switch# set protocols stp interface ge-0/0/5
```

3. Commit the configuration:

```
[edit]
user@switch# commit
```

Configuring Spanning-Tree Protocols (J-Web Procedure)

J-EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). You can configure STP, RSTP, and MSTP using the J-Web interface. You can configure bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

To configure STP, MSTP, or RSTP for a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Switching** > **Spanning Tree**.

   The Spanning Tree Configuration page displays the spanning-tree protocol configuration parameters and a list of interfaces configured for each spanning-tree protocol configuration.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:
   - **Add**—Creates a spanning-tree protocol configuration.
     a. Select a protocol name.
     b. Enter information as described in Table 177 on page 1337.
     c. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
   - **Edit**—Modifies a selected spanning-tree protocol configuration.
     a. Enter information as described in Table 177 on page 1337.
     b. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
   - **Delete**—Deletes a selected spanning-tree protocol configuration.

Table 177: Spanning-Tree Protocol Configuration Parameters

Field	Function	Your Action
General		
Protocol Name	Specifies the spanning-tree protocol type: STP, MSTP, or RSTP.	None.
Disable	Disables spanning-tree protocol on the interface.	To enable this option, select the check box.
BPDU Protect	Specifies BPDU protection on all edge interfaces on the switch.	To enable this option, select the check box.
Bridge Priority	Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.	Select a value from the list.
Forward Delay	Specifies the number of seconds an interface waits before changing from spanning-tree learning and listening states to the forwarding state.	Type a value.
Hello Time	Specifies the time interval in seconds at which the root bridge transmits configuration BPDUs.	Type a value.

Table 177: Spanning-Tree Protocol Configuration Parameters *(continued)*

Field	Function	Your Action
Max Age	Specifies the maximum-aging time in seconds for all MST instances. The maximum aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration.	Type a value.
Max Hops	(MSTP only) Specifies the number of hops in a region before the BPDU is discarded.	Type a value.
Configuration Name	(MSTP only) Specifies the MSTP region name carried in the MSTP BPDUs.	Type a name.
Revision Level	(MSTP only) Specifies the revision number of the MSTP configuration.	Type a value.
Ports		
Interface Name	Specifies an interface for the spanning-tree protocol.	1. Click the **Ports** tab. 2. Choose one: • Click **Add** and select an interface from the list. • Select an interface in the **Port/State** table and click **Edit**. • To delete an interface from the configuration, select it in the **Port/State** table and click **Remove**.
Cost	Specifies the link cost to determine which bridge is the designated bridge and which interface is the designated interface.	Type a value.
Priority	Specifies the interface priority to determine which interface is elected as the root port.	Select a value from the list.
Disable Port	Disables the spanning-tree protocol on the interface.	To enable the option, select the check box.
Edge	Configures the interface as an edge interface. Edge interfaces immediately transition to a forwarding state.	To enable the option, select the check box.
No Root Port	Specifies an interface as a spanning-tree designated port. If the bridge receives superior STP BPDUs on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.	To enable the option, select the check box.

Table 177: Spanning-Tree Protocol Configuration Parameters *(continued)*

Field	Function	Your Action
Interface Mode	Specifies the link mode.	1. To enable the option, select the check box. 2. Select one: • **Point to Point**—For a full-duplex link, the default link mode is point-to-point. • **Shared**—For a half-duplex link, the default link mode is shared.
BPDU Timeout Action	Specifies the BPDU timeout action for the interface.	Select one: • **Alarm** • **Block**
MSTI (MSTP only)		
MSTI Name	Specifies a name (an MSTI ID) for the MST instance.	1. Click the **MSTI** tab. 2. Choose one: • Click **Add**. • Select an MSTI ID and click **Edit**. • To delete an MSTI from the configuration, select the MSTI ID and slick **Remove**.
Bridge Priority	Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.	Select a value from the list.
VLAN ID	Specifies the VLAN for the MST instance.	In the VLAN box, choose one: • Click **Add**, select a VLAN from the list and click **OK**. • To remove a VLAN association, select the VLAN ID, click **Remove**, and click **OK**.

Table 177: Spanning-Tree Protocol Configuration Parameters *(continued)*

Field	Function	Your Action
Interfaces	Specifies an interface for the MST instance.	1. In the Interfaces box, click **Add** and select an interface from the list, or select an interface from the list and click **Edit**. 2. Specify the link cost to determine which bridge is the designated bridge and which interface is the designated interface. 3. Specify the interface priority to determine which interface is elected as the root port. 4. If you want to disable the interface, select the check box. 5. Click OK. To delete an interface configuration, select the interface, click **Remove**, and click **OK**.

Configuring VLAN Spanning Tree Protocol (CLI Procedure)

VLAN Spanning Tree Protocol (VSTP) allows J-EX Series switches to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

To configure VSTP:

1. (Optional) Enable Rapid Spanning Tree Protocol (RSTP):

```
[edit protocols]
user@switch# set rstp
```

   VSTP can run on a maximum of 253 VLANs; RSTP runs on the remaining VLANs if configured. Enabling RSTP ensures that a spanning-tree protocol runs on all VLANs.

2. Enable VSTP.

- To enable VSTP on multiple VLANs using a VLAN group:

```
[edit protocols]
user@switch# set vstp vlan-group group group-name vlan vlan-id-range
```

- To enable VSTP on all VLANs:

```
[edit protocols]
user@switch# set vstp vlan all
```

NOTE: RSTP must be enabled if the set vstp vlan all statement is used to enable VSTP and the switch has more than 253 VLANs. If the set vstp vlan all statement is used to enable VSTP on a switch with more than 253 VLANs, the configuration cannot be committed.

- To enable VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vstp vlan vlan-id
```

- To enable VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vstp vlan vlan-name
```

CHAPTER 67

Verifying Spanning Tree Protocols

Monitoring Spanning-Tree Protocols

Purpose Use the monitoring feature to view status and information about the spanning-tree protocol parameters on your J-EX Series switch.

Action To display spanning-tree protocol parameter details in the J-Web interface, select **Monitor > Switching > STP**.

To display spanning-tree protocol parameter details in the CLI, enter the following commands:

- **show spanning-tree interface**
- **show spanning-tree bridge**

Meaning Table 178 on page 1343 summarizes the spanning-tree protocol parameters.

Table 178: Summary of Spanning-Tree Protocols Output Fields

Field	Values
Bridge Parameters	
Context ID	An internally generated identifier.
Enabled Protocol	Spanning-tree protocol type enabled.
Root ID	Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Bridge ID	Locally configured bridge ID.
Hello Time	The time for which the bridge interface remains in the listening or learning state.
Forward Delay	The time for which the bridge interface remains in the listening or learning state before transitioning to the forwarding state.

Table 178: Summary of Spanning-Tree Protocols Output Fields *(continued)*

Field	Values
Extended System ID	The system ID.
Inter Instance ID	An internally generated instance identifier.
Maximum Age	Maximum age of received bridge protocol data units (BPDUs).
Number of topology changes	Total number of STP topology changes detected since the switch last booted.
Spanning Tree Interface Details	
Interface Name	Interface configured to participate in the STP instance.
Port ID	Logical interface identifier configured to participate in the STP instance.
Designated Port ID	Port ID of the designated port for the LAN segment to which the interface is attached.
Designated Bridge ID	ID of the designated bridge to which the interface is attached.
Port Cost	Configured cost for the interface.
Port State	STP port state: • Forwarding (FWD) • Blocking (BLK) • Listening • Learning • Disabled
Role	MSTP or RSTP port role, Designated (DESG), backup (BKUP), alternate (ALT), or root.
Spanning Tree Statistics of Interface	
Interface	Interface for which statistics is being displayed.
BPDUs Sent	Total number of BPDUs sent.
BPDUs Received	Total number of BPDUs received.
Next BPDU Transmission	Number of seconds until the next BPDU is scheduled to be sent.

bpdu-timeout-action

Syntax

```
bpdu-timeout-action {
  block;
  alarm;
}
```

Hierarchy Level

[edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the BPDU timeout action on a specific interface. You must configure at least one action (**alarm**, **block**, or both).

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

bridge-priority

Syntax bridge-priority *priority*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **mstp msti** *msti-id*],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.

Default 32,768

Options ***priority***—Bridge priority. It can be set only in increments of 4096.

Range: 0 through 61,440

Default: 32,768

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

configuration-name

Syntax configuration-name *configuration-name*;

Hierarchy Level [edit protocols **mstp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the configuration name. The configuration name is the MSTP region name carried in the MSTP BPDUs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 1398**

cost

Syntax cost *cost*;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link cost to control which bridge is the designated bridge and which interface is the designated interface.

Default The link cost is determined by the link speed.

Options ***cost***—Link cost associated with the port.

Range: 1 through 200,000,000

Default: Link cost is determined by the link speed.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

disable

Syntax disable;

Hierarchy Level
[edit protocols **mstp**],
[edit protocols **mstp interface** *interface-name*],
[edit protocols **mstp msti** *msti-id* **vlan** (*vlan-id* | *vlan-name*) **interface** *interface-name*],
[edit protocols **rstp**],
[edit protocols **rstp interface** *interface-name*],
[edit protocols **stp**],
[edit protocols **stp interface** *interface-name*],
[edit protocols **vstp**],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable STP, MSTP, RSTP, or VSTP on the switch or on a specific interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 1398**

- Understanding VSTP for J-EX Series Switches on page 1281

disable-timeout

Syntax disable-timeout *timeout*;

Hierarchy Level [edit **ethernet-switching-options bpdu-block**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled.

Default The disable timeout is not enabled.

Options ***timeout*** —Amount of time, in seconds, the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service.

Range: 10 through 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

edge

Syntax edge;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge interfaces. Edge interfaces immediately transition to a forwarding state.

Default Edge interfaces are not enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 1281

force-version

Syntax force-version stp;

Hierarchy Level [edit protocols vstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Force VLAN Spanning Tree Protocol (VSTP) to use the STP protocol instead of the default protocol, RSTP.

Options **stp**—Spanning Tree Protocol

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 1398**
- **show spanning-tree interface on page 1407**

forward-delay

Syntax forward-delay *seconds*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify how long a bridge interface remains in the listening and learning states before transitioning to the forwarding state.

Default 15 seconds

Options ***seconds***—Number of seconds the bridge interface remains in the listening and learning states.

Range: 4 through 30 seconds

Default: 15 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 1281

hello-time

Syntax hello-time *seconds*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the time interval at which the root bridge transmits configuration BPDUs.

Default 2 seconds

Options ***seconds***—Number of seconds between transmissions of configuration BPDUs.

Range: 1 through 10 seconds

Default: 2 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 1281

interface

Syntax interface (all | [*interface-name*]);

Hierarchy Level [edit **ethernet-switching-options bpdu-block**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply BPDU protection to all interfaces or one or more interfaces.

Options **all**—All interfaces.

interface-name —Name of a Gigabit Ethernet interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding BPDU Protection for STP, RSTP, and MSTP on J-EX Series Switches on page 1278

interface

Syntax

```
interface interface-name {
    disable;
    cost cost;
    edge;
    mode mode;
    no-root-port;
    priority priority;
}
```

Hierarchy Level

[edit protocols **mstp**],
[edit protocols **mstp msti** *msti-id*],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure an interface.

The **edge**, **mode**, and **no-root-port** options are not available at the [**edit protocols mstp msti** ***msti-id***] hierarchy level.

Options

interface-name—Name of a Gigabit Ethernet interface.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

max-age

Syntax max-age *seconds*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the maximum age of received protocol BPDUs.

Default 20 seconds

Options ***seconds***—The maximum age of received protocol BPDUs.

Range: 6 through 40 seconds

Default: 20 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 1398**

- Understanding STP for J-EX Series Switches on page 1275
- Understanding VSTP for J-EX Series Switches on page 1281

max-hops

Syntax max-hops *hops*;

Hierarchy Level [edit protocols mstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple Spanning Tree Protocol (MSTP), configure the maximum number of hops a BPDU can be forwarded in the MSTP region.

Default 20 hops

Options ***hops*** — Number of hops the BPDU can be forwarded.
Range: 1 through 255 hops
Default: 20 hops

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

mode

Syntax mode *mode*;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link mode to identify point-to-point links.

Default For a full-duplex link, the default link mode is **point-to-point**. For a half-duplex link, the default link mode is **shared**.

Options *mode*—Link mode:

- **point-to-point**—Link is point to point.
- **shared**—Link is shared media.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 1281

msti

Syntax

```
msti msti-id {
  vlan (vlan-id | vlan-name);
  interface interface-name {
    disable;
    cost cost;
    priority priority;
  }
}
```

Hierarchy Level [edit protocols mstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Multiple Spanning Tree Instance (MSTI) identifier for Multiple Spanning Tree Protocol (MSTP). MSTI IDs are local to each region, so you can reuse the same MSTI ID in different regions.

Default MSTI is disabled.

Options *msti-id* —MSTI identifier.

Range: 1 through 4094. The Common Instance Spanning Tree (CIST) is always MSTI 0.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

mstp

Syntax

```
mstp {
  disable;
  bpdu-block-on-edge;
  bridge-priority priority;
  configuration-name name;
  forward-delay seconds;
  hello-time seconds;
  interface ( all | interface-name {
    bpdu-timeout-action {
      block;
      alarm;
    }
    disable;
    cost cost;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  max-hops hops;
  msti msti-id {
    vlan (vlan-id | vlan-name);
    interface interface-name {
      disable;
      cost cost;
      priority priority;
    }
  }
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
  revision-level revision-level;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning tree regions.

The statements are explained separately.

Default MSTP is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 1398**
- **show spanning-tree interface on page 1407**

no-root-port

Syntax

no-root-port;

Hierarchy Level

[edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure an interface to be a spanning tree designated port. If the bridge receives superior STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show spanning-tree bridge on page 1398**
- **show spanning-tree interface on page 1407**

priority

Syntax priority *priority*;

Hierarchy Level [edit protocols **mstp interface** (all | *interface-name*)],
[edit protocols **mstp msti** *msti-id* **interface** *interface-name*],
[edit protocols **rstp interface** (all | *interface-name*)],
[edit protocols **stp interface** (all | *interface-name*)],
[edit protocols **vstp vlan** *vlan-id* **interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the interface priority to control which interface is elected as the root port.

Default The default value is 128.

Options ***priority***—Interface priority. The interface priority must be set in increments of 16.
Range: 0 through 240

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 1281

revision-level

Syntax revision-level *revision-level*;

Hierarchy Level [edit protocols mstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple Spanning Tree Protocol (MSTP), set the revision number of the MSTP configuration.

Default The revision level is disabled.

Options ***revision-level*** —Revision number of the MSTP region configuration.

Range: 0 through 65535

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

rstp

Syntax

```
rstp {
  disable;
  bpdu-block-on-edge;
  bridge-priority priority;
  forward-delay seconds;
  hello-time seconds;
  interface (all | interface-name) {
    disable;
    bpdu-timeout-action{
      alarm;
      block;
    }
    cost cost;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | no-world-readable |
      world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, which results in shorter convergence times than those provided by basic Spanning Tree Protocol (STP).

VSTP and RSTP can be configured concurrently. You can selectively configure up to 253 VLANs using VSTP; the remaining VLANs will be configured using RSTP. VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on the switch. See Configuring VSTP (CLI Procedure) for more information on configuring VSTP and RSTP concurrently.

BEST PRACTICE: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than 253 VLANs.

The remaining statements are explained separately.

Default RSTP is enabled on all Ethernet switching interfaces.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

stp

Syntax

```
stp {
  disable;
  bridge-priority priority;
  forward-delay seconds;
  hello-time seconds;
  interface (all | interface-name) {
    disable;
    bpdu-timeout-action {
      block;
      alarm;
    }
    cost  cost;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description When you explicitly configure STP, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).

The remaining statements are explained separately.

Default STP is disabled; by default, RSTP is enabled on all Ethernet switching ports.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions

Syntax

```
traceoptions {
  file name <replace> <size size> <files number> <no-stamp>
    <(world-readable | no-world-readable)>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit protocols **mstp**],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set protocol-level tracing options for STP, RSTP, MSTP, and VSTP.

Default Traceoptions is disabled.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name*** —Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file **/var/log/stp-log**.

files ***number*** —(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*** **.0**, then ***trace-file*** **.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 1 trace file only

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all** —Trace all operations.
- **all-failures**—Trace all failure conditions.
- **bpdu** —Trace BPDU reception and transmission. Note that you must also use port-transmit-state-machine in order to log transmit operations.
- **bridge-detection-state-machine** —Trace the bridge detection state machine.
- **events** —Trace events of the protocol state machine.

- **port-information-state-machine** —Trace the port information state machine.
- **port-migration-state-machine** —Trace the port migration state machine.
- **port-receive-state-machine** —Trace the port receive state machine.
- **port-role-select-state-machine** —Trace the port role selection state machine.
- **port-role-transit-state-machine** —Trace the port role transit state machine.
- **port-state-transit-state-machine** —Trace the port state transit state machine.
- **port-transmit-state-machine** —Trace the port transmit state machine
- **ppmd** —Trace the state and events for the ppmd process
- **state-machine-variables** —Trace when the state machine variables change
- **timers** —Trace protocol timers
- **topology-change-state-machine** —Trace the topology change state machine.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent aney user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size ***size*** —(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*** **.0.** When the ***trace-file*** again reaches its maximum size, ***trace-file*** **.0** is renamed ***trace-file*** **.1** and ***trace-file*** is renamed ***trace-file*** **.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

vlan

Syntax

```
vlan (vlan-id | vlan-name) {
  bridge-priority priority;
  forward-delay seconds;
  hello-time seconds;
  interface interface-name {
    bpdu-timeout-action {
      alarm;
      block;
    }
    cost  cost;
    disable;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols **mstp msti** *msti-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLANs for a Multiple Spanning Tree Instance (MSTI).

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Default Not enabled.

Options ***vlan-id***—Numeric VLAN identifier.

vlan-name—Name of the VLAN.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

vlan (VSTP)

Syntax

```
vlan (all | vlan-id | vlan-name) {
  bridge-priority priority;
  forward-delay seconds;
  hello-time seconds;
  interface (all | interface-name) {
    bpdu-timeout-action {
      alarm;
      block;
    }
    cost  cost;
    disable;
    edge;
    mode mode;
    no-root-port;
    priority priority;
  }
  max-age seconds;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols vstp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure VSTP VLAN parameters.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options **all**—All VLANs.

vlan-id—Numeric VLAN identifier.

vlan-name—Name of the VLAN.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

vstp

Syntax

```
vstp {
  bpdu-block-on-edge;
  disable;
  force-version stp;
  vlan (vlan-id | vlan-name) {
    bridge-priority priority;
    forward-delay seconds;
    hello-time seconds;
    interface (all | interface-name) {
      disable;
      bpdu-timeout-action{
        alarm;
        block;
      }
      cost  cost;
      edge;
      mode mode;
      no-root-port;
      priority priority;
    }
    max-age seconds;
    traceoptions {
      file filename <files number > <size size> <no-stamp | no-world-readable |
        world-readable>;
      flag flag;
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

You cannot commit a configuration that uses VSTP on more than 253 VLANs. If there are more than 253 VLANs on your switch, you must use the **vlan** statement to specify which VLANs or VLAN groups should use VSTP, and the total number of VLANs using VSTP cannot exceed 253. You also cannot use the **vlan all** option to configure VSTP when your switch has more than 253 VLANs. Run RSTP with VSTP in networks with large numbers of VLANs to ensure all VLANs are running a spanning-tree protocol.

BEST PRACTICE: Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than 253 VLANs.

The remaining statements are explained separately.

Default VSTP is not enabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

CHAPTER 69

Operational Mode Commands for Spanning-Tree Protocols

clear ethernet-switching bpdu-error

Syntax clear ethernet-switching bpdu-error interface *interface-name*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear bridge protocol data unit (BPDU) errors from an interface and unblock the interface.

Options ***interface-name*** —Clear BPDU errors on the specified interface.

Required Privilege Level clear

Related Documentation

List of Sample Output **clear ethernet-switching bpdu-error interface ge-0/0/1.0 on page 1390**

clear ethernet-switching bpdu-error interface ge-0/0/1.0

```
user@switch> clear ethernet-switching bpdu-error interface ge-0/0/1.0
```

clear spanning-tree statistics

Syntax
clear spanning-tree statistics
<interface *interface-name*>
<logical-system *logical-system-name*>

Syntax (J-EX Series Switch)
clear spanning-tree statistics
<interface *interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Spanning Tree Protocol statistics.

Options
none—Reset STP counters for all interfaces for all routing instances.

interface *interface-name*—(Optional) Clear STP statistics for the specified interface only.

logical-system *logical-system-name*—(Optional) Clear STP statistics on a particular logical system.

Required Privilege Level
clear

Related Documentation
- **show spanning-tree statistics on page 1414**

List of Sample Output
clear stp statistics on page 1391

clear stp statistics
```
user@host> clear stp statistics
```

clear spanning-tree statistics

Syntax
clear spanning-tree statistics
<interface *interface-name* unit *logical-unit-number*>;

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Reset STP statistics for the all interfaces or a specified interface.

Options
none—Reset STP counters for all interfaces.

interface-name —(Optional) The name of the interface for which statistics should be reset.

logical-unit-number —(Optional) The logical unit number of the interface.

Required Privilege Level
clear

Output Fields
This command produces no output.

clear spanning-tree statistics
```
user@switch> clear spanning—tree statistics
```

show spanning-tree bridge

Syntax

show spanning-tree bridge
<brief | detail>
<msti *msti-id*>
<routing-instance *routing-instance-name*>
<vlan-id *vlan-id*>

Syntax (J-EX Series Switch)

show spanning-tree bridge
<brief | detail>
<msti *msti-id*>
<vlan-id *vlan-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the configured or calculated Spanning Tree Protocol (STP) parameters.

Options

none—(Optional) Display brief STP bridge information for all multiple spanning-tree instances (MSTIs).

brief | detail—(Optional) Display the specified level of output.

msti *msti-id*—(Optional) Display STP bridge information for the specified MSTI.

routing-instance *routing-instance-name*—(Optional) Display STP bridge information for the specified routing instance.

vlan-id *vlan-id*—(Optional) Display STP bridge information for the specified VLAN.

Required Privilege Level

Output Fields

Table 179 on page 1393 lists the output fields for the **show spanning-tree bridge** command. Output fields are listed in the approximate order in which they appear.

Table 179: show spanning-tree bridge Output Fields

Field Name	Field Description
Routing instance name	Name of the routing instance under which the bridge is configured.
Enabled protocol	Spanning Tree Protocol type enabled.
Root ID	Bridge ID of the elected spanning tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.

Table 179: show spanning-tree bridge Output Fields *(continued)*

Field Name	Field Description
Root cost	Calculated cost to reach the root bridge from the bridge where the command is entered.
Root port	Interface that is the current elected root port for this bridge.
CIST regional root	Bridge ID of the elected MSTP regional root bridge.
CIST internal root cost	Calculated cost to reach the regional root bridge from the bridge where the command is entered.
Hello time	Configured number of seconds between transmissions of configuration bridge protocol data units (BPDUs).
Maximum age	Configured maximum expected arrival time of hello bridge protocol data units (BPDUs).
Forward delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hop count	Configured maximum number of hops a BPDU can be forwarded in the MSTP region.
Message age	Number of elapsed seconds since the most recent BPDU was received.
Number of topology changes	Total number of STP topology changes detected since the routing device last booted.
Time since last topology change	Number of elapsed seconds since the most recent topology change.
Bridge ID (Local)	Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Extended system ID	System identifier.
MSTI regional root	Bridge ID of the elected MSTP regional root bridge.

```

show spanning-tree bridge

Syntax

show spanning-tree bridge
<brief | detail>
<msti *msti-id*>
<vlan *vlan-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the configured or calculated spanning-tree protocol (can be either STP, RSTP, or MSTP) parameters.

Options

none—(Optional) Display brief STP bridge information for all Multiple Spanning Tree Instances (MSTIs).

brief | detail—(Optional) Display the specified level of output.

msti *msti-id*—(Optional) Display STP bridge information for the specified MSTP instance ID or Common and Internal Spanning Tree (CIST). Specify **0** for CIST. Specify a value from **1** through **4094** for an MSTI.

vlan *vlan-id*—(Optional) Display STP bridge information for the specified VLAN. Specify a VLAN tag identifier from **1** through **4094**.

Output Fields

Table 180 on page 1398 lists the output fields for the **show spanning-tree bridge** command. Output fields are listed in the approximate order in which they appear.

Table 180: show spanning-tree bridge Output Fields

Field Name	Field Description
Context ID	An internally generated identifier.

Table 180: show spanning-tree bridge Output Fields *(continued)*

Field Name	Field Description
Enabled protocol	Spanning-tree protocol type enabled.
Root ID	Bridge ID of the elected spanning tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Root cost	Calculated cost to reach the root bridge from the bridge where the command is entered.
Root port	Interface that is the current elected root port for this bridge.
CIST regional root	Bridge ID of the elected MSTP regional root bridge.
CIST internal root cost	Calculated cost to reach the regional root bridge from the bridge where the command is entered.
Hello time	Configured number of seconds between transmissions of configuration BPDUs.
Maximum age	Maximum age of received protocol BPDUs.
Forward delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hop count	Configured maximum number of hops a BPDU can be forwarded in the MSTP region.
Message age	Number of seconds elapsed since the most recent BPDU was received.
Number of topology changes	Total number of STP topology changes detected since the switch last booted.
Time since last topology change	Number of seconds elapsed since the most recent topology change.
Topology change initiator	Interface name of the interface that received the topology change request.
Topology change last recvd. from	Bridge ID of the bridge that requested the last topology change.
Bridge ID (Local)	Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Extended system ID	Internally generated system identifier.
MSTI regional root	Bridge ID of the elected MSTP regional root bridge.
Internal instance ID	An internally generated identifier.

Table 180: show spanning-tree bridge Output Fields *(continued)*

Field Name	Field Description
Path Cost Method	Bridges supporting 802.1D (legacy) implement only 16-bit values for path cost. Newer versions of this standard support 32-bit values.

show spanning-tree interface

Syntax

show spanning-tree interface
<brief | detail>
<msti *msti-id*>
<routing-instance *routing-instance-name*>
<vlan-id *vlan-id*>

Syntax (J-EX Series Switch)

show spanning-tree interface
<brief | detail>
<msti *msti-id*>
<vlan-id *vlan-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the configured or calculated interface-level STP parameters.

Options

none—Display brief STP interface information.

brief | detail—(Optional) Display the specified level of output.

msti *msti-id*—(Optional) Display STP interface information for the specified MST instance.

routing-instance *routing-instance-name*—(Optional) Display STP interface information for the specified routing instance.

vlan-id *vlan-id*—(Optional) Display STP interface information for the specified VLAN.

Required Privilege Level

view

Output Fields

Table 181 on page 1402 lists the output fields for the **show spanning-tree Interface** command. Output fields are listed in the approximate order in which they appear.

Table 181: show spanning-tree Interface Output Fields

Field Name	Field Description
Interface name	Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance.
Port ID	Logical interface identifier configured to participate in the MSTP or VSTP instance.
Designated port ID	Port ID of the designated port for the LAN segment to which this interface is attached.

Table 181: show spanning-tree Interface Output Fields *(continued)*

Field Name	Field Description
Designated bridge ID	Bridge ID of the designated bridge for the LAN segment to which this interface is attached.
Port Cost	Configured cost for the interface.
Port State	STP port state: forwarding (**FWD**), blocking (**BLK**), listening, learning, or disabled.
Port Role	MSTP, VSTP, or RSTP port role: designated (**DESG**), backup (**BKUP**), alternate (**ALT**), root, or Root Prevented (**Root-Prev**).
Link type	MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge.
Alternate	Identifies the interface as an MSTP, VSTP, or RSTP alternate root port (**Yes**) or nonalternate root port (**No**).
Boundary Port	Identifies the interface as an MSTP regional boundary port (**Yes**) or nonboundary port (**No**).

show spanning-tree interface

Syntax

show spanning-tree interface
<brief | detail>
<interface-name *interface-name*>
<msti *msti-id*>
<vlan-id *vlan-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the configured or calculated interface-level spanning-tree protocol (can be either STP, RSTP, or MSTP) parameters. In **brief** mode, will not display interfaces that are administratively disabled or do not have a physical link.

Options

none—(Optional) Display brief STP interface information.

brief | detail—(Optional) Display the specified level of output.

interface-name *interface-name*—(Optional) Name of an interface.

msti *msti-id*—(Optional) Display STP bridge information for the specified MSTP instance ID or Common and Internal Spanning Tree (CIST). Specify **0** for CIST. Specify a value from **1** through **4094** for an MSTI.

vlan-id *vlan-id*—(Optional) For MSTP interfaces, display interface information for the specified VLAN. Specify a value from **0** through **4094**.

Output Fields

Table 182 on page 1408 lists the output fields for the **show spanning-tree Interface** command. Output fields are listed in the approximate order in which they appear.

Table 182: show spanning-tree interface Output Fields

Field Name	Field Description
Interface name	Interface configured to participate in the STP, RSTP, or MSTP instance.
Port ID	Logical interface identifier configured to participate in the MSTP instance.
Designated port ID	Port ID of the designated port for the LAN segment this interface is attached to.
Designated bridge ID	Bridge ID of the designated bridge for the LAN segment this interface is attached to.
Port Cost	Configured cost for the interface.
Port State	STP port state. Forwarding (FWD), blocking (BLK), listening, learning, or disabled.
Port Role	MSTP or RSTP port role. Designated (DESG), backup (BKUP), alternate (ALT), or root.
Link type	MSTP or RSTP link type. Shared or point-to-point (pt-pt) and edge or non edge.
Alternate	Identifies the interface as an MSTP or RSTP alternate root port (yes) or nonalternate root port (no).
Boundary Port	Identifies the interface as an MSTP regional boundary port (yes) or nonboundary port (no).

PART 15

Layer 3 Protocols

CHAPTER 70

Layer 3 Protocols—Overview

Layer 3 Protocols Supported on J-EX Series Switches

J-EX Series switches support the Junos OS Layer 3 features and configuration statements listed in Table 187 on page 1421:

Table 187: Supported Junos OS Layer 3 Protocol Statements and Features

Protocol	Notes	For More Information
BGP	Fully supported.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
BFD	Fully supported.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
ICMP	Fully supported.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/
IGMPv1, v2 and v3	Fully supported.	See the *Junos OS Multicast Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
IS-IS	Supported, with the exceptions noted in "Layer 3 Protocols Not Supported on J-EX Series Switches" on page 14.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
MPLS	Supported, with the exceptions noted in "Layer 3 Protocols Not Supported on J-EX Series Switches" on page 14.	See the *Junos OS MPLS Applications Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Table 187: Supported Junos OS Layer 3 Protocol Statements and Features *(continued)*

Protocol	Notes	For More Information
OSPFv1, v2 and v3	Supported, with the exceptions noted in "Layer 3 Protocols Not Supported on J-EX Series Switches" on page 14.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
PIM	Supported, with the exception of IPv6.	See the *Junos OS Multicast Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
RIP	Fully supported.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
RIPng	Fully supported.	See the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
SNMP	Fully supported.	See the *Junos OS Network Management Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
VRRP	Fully supported with exception of IPv6 support of VRRP on routed VLAN interfaces (RVIs).	See "Understanding VRRP on J-EX Series Switches" on page 1425. See also the *Junos OS High Availability Guide* at http://www.juniper.net/techpubs/software/junos/.

Understanding Distributed Periodic Packet Management on J-EX Series Switches

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the J-EX Series Switch can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the process that controls Link Aggregation Control Protocol (LACP), and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on J-EX4200 switches) or the line cards (on J-EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

Distributed PPM can be disabled for all protocols that use PPM or for a single protocol that uses PPM. There is no way to disable PPM entirely.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Dell Support advises you to do so (see “Requesting Technical Support” on page lxxi). You should disable distributed PPM only if you have a compelling reason to disable it.

Understanding VRRP on J-EX Series Switches

J-EX Series Switches support the Virtual Router Redundancy Protocol (VRRP) and VRRP for IPv6. This topic covers:

Overview of VRRP on J-EX Series Switches

You can configure the Virtual Router Redundancy Protocol (VRRP) or VRRP for IPv6 on Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and logical interfaces on J-EX Series switches. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup J-EX Series switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts.

VRRP for IPv6 provides a much faster switchover to an alternate default routing platform than IPv6 Neighbor Discovery (ND) procedures. VRRP for IPv6 does not support the **authentication-type** or **authentication-key** statements.

NOTE: Do not confuse the VRRP master and backup routing platforms with the master and backup member switches of a Virtual Chassis configuration. The master and backup members of a Virtual Chassis configuration compose a single host. In a VRRP topology, one host operates as the master routing platform and another operates as the backup routing platform, as shown in Figure 40 on page 1427.

Switches running VRRP dynamically elect master and backup routing platforms. You can also force assignment of master and backup routing platforms using priorities from **1** through **255**, with **255** being the highest priority. In VRRP operation, the default master

routing platform sends advertisements to backup routing platforms at regular intervals. The default interval is 1 second. If the backup routing platforms do not receive an advertisement for a set period, the backup routing platform with the highest priority takes over as master and begins forwarding packets.

NOTE: Priority 255 cannot be set for routed VLAN interfaces (RVIs).

VRRP is defined in RFC 3768, *Virtual Router Redundancy Protocol*.

Examples of VRRP Topologies

Figure 39 on page 1426 illustrates a basic VRRP topology with J-EX Series switches. In this example, Switches A, B, and C are running VRRP and together they make up a virtual routing platform. The IP address of this virtual routing platform is **10.10.0.1** (the same address as the physical interface of Switch A).

Figure 39: Basic VRRP on J-EX Series Switches

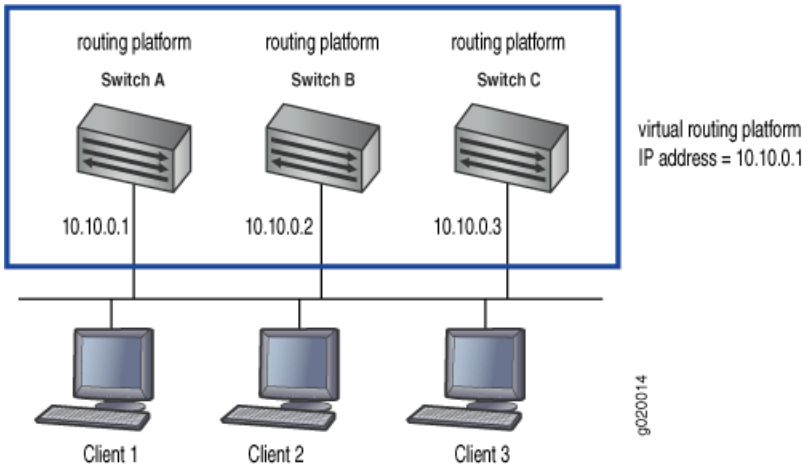

Figure 40 on page 1427 illustrates a basic VRRP topology using Virtual Chassis configurations. Switch A, Switch B, and Switch C are each composed of multiple interconnected J-EX4200 Ethernet Switches. Each Virtual Chassis configuration operates as a single switch, which is running VRRP, and together they make up a virtual routing platform. The IP address of this virtual routing platform is **10.10.0.1** (the same address as the physical interface of Switch A).

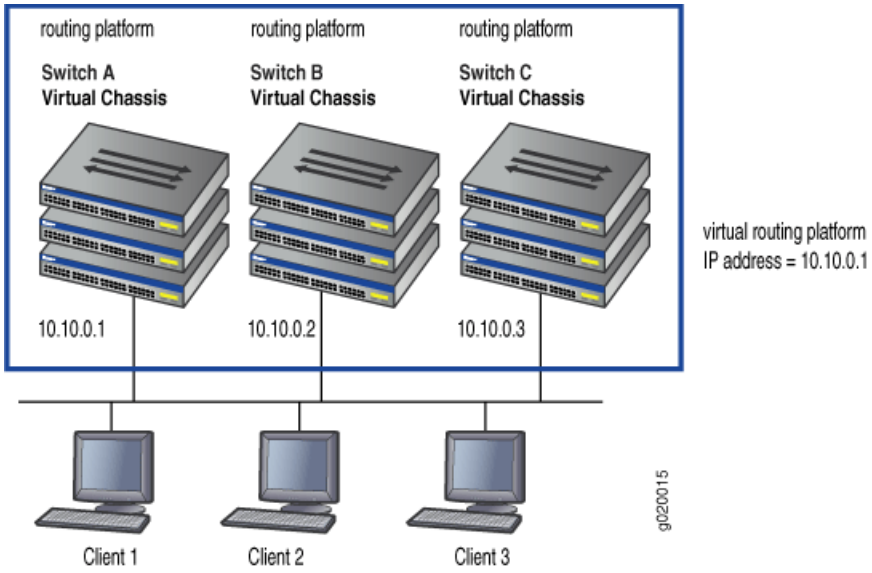
Figure 40: VRRP on Virtual Chassis Switches



Because the virtual routing platform uses the IP address of the physical interface of Switch A, Switch A is the master VRRP routing platform, while Switch B and Switch C function as backup VRRP routing platforms. Clients 1 through 3 are configured with the default gateway IP address of **10.10.0.1** as the master router, Switch A, forwards packets sent to its IP address. If the master routing platform fails, the switch configured with the higher priority becomes the master virtual routing platform and provides uninterrupted service for the LAN hosts. When Switch A recovers, it becomes the master virtual routing platform again.

Understanding IPsec Authentication for OSPF Packets on J-EX Series Switches

IP Security (IPsec) provides a secure way to authenticate senders and encrypt IP version 4 (IPv4) traffic between network devices. IPsec offers network administrators for J-EX Series Ethernet Switches and their users the benefits of data confidentiality, data integrity, sender authentication, and anti-replay services.

IPsec is a framework for ensuring secure private communication over IP networks and is based on standards developed by the International Engineering Task Force (IETF). IPsec provides security services at the network layer of the Open Systems Interconnection (OSI) model by enabling a system to select required security protocols, determine the algorithms to use for the security services, and implement any cryptographic keys required to provide the requested services. You can use IPsec to protect one or more paths between a pair of hosts, between a pair of security gateways (such as switches), or between a security gateway and a host.

OSPF version 3 (OSPFv3), unlike OSPF version 2 (OSPFv2), does not have a built-in authentication method and relies on IPsec to provide this functionality. You can secure specific OSPFv3 interfaces and protect OSPFv3 virtual links.

Authentication Algorithms

Authentication is the process of verifying the identity of the sender. Authentication algorithms use a shared key to verify the authenticity of the IPsec devices. The Junos operating system (Junos OS) uses the following authentication algorithms:

- Message Digest 5 (MD5) uses a one-way hash function to convert a message of arbitrary length to a fixed-length message digest of 128 bits. Because of the conversion process, it is mathematically infeasible to calculate the original message by computing it backwards from the resulting message digest. Likewise, a change to a single character in the message will cause it to generate a very different message digest number.

  To verify that the message has not been tampered with, Junos OS compares the calculated message digest against a message digest that is decrypted with a shared key. Junos OS uses the MD5 hashed message authentication code (HMAC) variant that provides an additional level of hashing. MD5 can be used with an authentication header (AH) and Encapsulating Security Payload (ESP).

- Secure Hash Algorithm 1 (SHA-1) uses a stronger algorithm than MD5. SHA-1 takes a message of less than 264 bits in length and produces a 160-bit message digest. The large message digest ensures that the data has not been changed and that it originates from the correct source. Junos OS uses the SHA-1 HMAC variant that provides an additional level of hashing. SHA-1 can be used with AH, ESP, and Internet Key Exchange (IKE).

- SHA-256, SHA-384, and SHA-512 (sometimes grouped under the name SHA-2) are variants of SHA-1 and use longer message digests. Junos OS supports the SHA-256 version of SHA-2, which can process all versions of Advanced Encryption Standard (AES), Data Encryption Standard (DES), and Triple DES (3DES) encryption.

Encryption Algorithms

Encryption encodes data into a secure format so that it cannot be deciphered by unauthorized users. As with authentication algorithms, a shared key is used with encryption algorithms to verify the authenticity of IPsec devices. Junos OS uses the following encryption algorithms:

- Data Encryption Standard cipher-block chaining (DES-CBC) is a symmetric secret-key block algorithm. DES uses a key size of 64 bits, where 8 bits are used for error detection and the remaining 56 bits provide encryption. DES performs a series of simple logical operations on the shared key, including permutations and substitutions. CBC takes the first block of 64 bits of output from DES, combines this block with the second block, feeds this back into the DES algorithm, and repeats this process for all subsequent blocks.
- Triple DES-CBC (3DES-CBC) is an encryption algorithm that is similar to DES-CBC but provides a much stronger encryption result because it uses three keys for 168-bit (3 x 56-bit) encryption. 3DES works by using the first key to encrypt the blocks, the second key to decrypt the blocks, and the third key to reencrypt the blocks.

IPsec Protocols

IPsec protocols determine the type of authentication and encryption applied to packets that are secured by the switch. Junos OS supports the following IPsec protocols:

- AH—Defined in *RFC 2402*, AH provides connectionless integrity and data origin authentication for IPv4. It also provides protection against replays. AH authenticates as much of the IP header as possible, as well as the upper-level protocol data. However, some IP header fields might change in transit. Because the value of these fields might not be predictable by the sender, they cannot be protected by AH. In an IP header, AH can be identified with a value of 51 in the Protocol field of an IPv4 packet.
- ESP—Defined in *RFC 2406*, ESP can provide encryption and limited traffic flow confidentiality or connectionless integrity, data origin authentication, and an anti-replay service. In an IP header, ESP can be identified with a value of 50 in the Protocol field of an IPv4 packet.

Security Associations

An IPsec consideration is the type of security association (SA) that you wish to implement. An SA is a set of IPsec specifications that are negotiated between devices that are establishing an IPsec relationship. These specifications include preferences for the type of authentication, encryption, and IPsec protocol to be used when establishing the IPsec connection. An SA can be either unidirectional or bidirectional, depending on the choices made by the network administrator. An SA is uniquely identified by a Security Parameter

Index (SPI), an IPv4 or IPv6 destination address, and a security protocol (AH or ESP) identifier.

IPsec Modes

Junos OS supports the following IPsec modes:

- Tunnel mode is supported for both AH and ESP in Junos OS. In tunnel mode, the SA and associated protocols are applied to tunneled IPv4 or IPv6 packets. For a tunnel mode SA, an outer IP header specifies the IPsec processing destination and an inner IP header specifies the ultimate destination for the packet. The security protocol header appears after the outer IP header and before the inner IP header. In addition, there are slight differences for tunnel mode when you implement it with AH and ESP:
  - For AH, portions of the outer IP header are protected, as well as the entire tunneled IP packet.
  - For ESP, only the tunneled packet is protected, not the outer header.

  When one side of an SA is a security gateway (such as a switch), the SA must use tunnel mode. However, when traffic (for example, SNMP commands or BGP sessions) is destined for a switch, the system acts as a host. Transport mode is allowed in this case because the system does not act as a security gateway and does not send or receive transit traffic.

  

  NOTE: Tunnel mode is not supported for OSPF v3 control packet authentication.

- Transport mode provides an SA between two hosts. In transport mode, the protocols provide protection primarily for upper-layer protocols. A transport mode security protocol header appears immediately after the IP header and any options and before any higher-layer protocols (for example, TCP or UDP). There are slight differences for transport mode when you implement it with AH and ESP:
  - For AH, selected portions of the IP header are protected, as well as selected portions of the extension headers and selected options within the IPv4 header.
  - For ESP, only the higher-layer protocols are protected, not the IP header or any extension headers preceding the ESP header.

CHAPTER 71

Configuring Layer 3 Protocols

Configuring BGP Sessions (J-Web Procedure)

You can use the J-Web interface to create BGP peering sessions on a routing device.

NOTE: To configure BGP sessions, you must have a license for BGP installed on the J-EX Series switch.

To configure a BGP peering session:

1. Select **Configure** > **Routing** > **BGP**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:

   - **Add**—Adds a BGP group. Enter information into the configuration page as described in Table 189 on page 1432.
   - **Edit**—Modifies an existing BGP group. Enter information into the configuration page as described in Table 189 on page 1432.
   - **Delete**—Deletes an existing BGP group.
   - **Disable**—Disables BGP configuration.

3. To modify BGP global settings, click **Edit** in the Global Information section. Enter information as described in Table 190 on page 1434.

Table 189: BGP Routing Configuration Summary

Field	Function	Your Action
General tab		
Group Type	Specifies whether the group is an internal BGP (IBGP) group or an external BGP (EBGP) group.	Select the option: **Internal** or **External**.
Group Name	Specifies the name for the group.	Type a new name or select and edit the name.
ASN	Sets the unique numeric identifier of the AS in which the routing device is configured.	Type the routing device's 32-bit AS number, in dotted decimal notation. If you enter an integer, the value is converted to a 32-bit equivalent. For example, if you enter **3**, the value assigned to the AS is **0.0.0.3**.
Preference	Specifies the degree of preference for an external route. The route with the highest local preference value is preferred.	Type or select and edit the value.
Cluster Id	Specifies the cluster identifier to be used by the route reflector cluster in an internal BGP group.	Type or select and edit the IPv6 or IPv4 address to be used as the identifier.
Description	Specifies the text description of the global, group, or neighbor configuration.	Type or select and edit the description.
Damping	Specifies whether route flap damping is enabled or not.	To enable route flap damping, select the check box. To disable route flap damping do not select the check box.
Advertise Inactive Routes	Specifies whether BGP advertises the best route even if the routing table did not select it to be an active route.	To enable advertising inactive routes, select the check box. To disable advertising inactive routes, do not select the check box.

Table 189: BGP Routing Configuration Summary *(continued)*

Field	Function	Your Action
Advertise Peer AS Routes	Specifies whether to disable the default behavior of suppressing AS routes.	To enable advertising peer AS routes, select the check box. To disable advertising peer AS routes, do not select the check box.
Neighbors tab		
Dynamic Neighbors	Configures a neighbor (peer).	Type the IPv4 address of the peer.
Static Neighbors	Configures the system's peers statically.	To configure a static neighbor: 1. Specify the IP address. 2. Specify the address of the local end of a BGP session. 3. Specify the degree of preference for an external route. 4. Enter a description. 5. Specify the hold-time value to use when negotiating a connection with the peer. 6. Specify how long a route must be present in the routing table before it is exported to BGP. Use this time delay to help bundle routing updates. 7. Select **Passive** if you do not want to send active open messages to the peer. 8. Select the option to compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer. 9. Specify an import policy and export policy. 10. Click **OK**.
Policies tab		
Import Policy	Specifies one or more routing policies to routes being imported into the routing table from BGP.	Click **Add** to add an import policy. Select the policy and click **OK**. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Select the policy and click **Remove**.
Export Policy	Specifies one or more policies to routes being exported from the routing table into BGP.	Click **Add** to add an export policy. Select the policy and click **OK**. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Select the policy and click **Remove**.

Table 190: BGP Global Settings

Field	Function	Your Action
General tab		
Router ASN	Specifies the routing device's AS number.	Type or select and edit the value.
Router Identifier	Specify the routing device's IP address.	Type or select and edit the IP address.
BGP Status	Enables or disables BGP.	• To enable BGP, select **Enabled**. • To disable BGP, select **Disabled**.
Description	Describes of the global, group, or neighbor configuration.	Type or select and edit the description.
Confederation Number	Specifies the routing device's confederation AS number.	Type or select and edit the value.
Confederation Members	Specifies the AS numbers for the confederation members.	To add a member AS number, click **Add** and enter the number in the **Member ASN** box. Click **OK**. To modify a confederation member's AS number, select the member click **Edit** and, enter the number and click **OK**. To delete a confederation member, select the member and click **Remove**.
Advance Options	You can configure the following: • **Keep routes**—Specifies whether routes learned from a BGP peer must be retained in the routing table even if they contain an AS number that was exported from the local AS. • **TCP MSS**—Configures the maximum segment size (MSS) for the TCP connection for BGP neighbors. • **MTU Discovery**—Select to configure MTU discovery. • **Remove Private ASN**—Select to have the local system strip private AS numbers from the AS path when advertising AS paths to remote systems. • **Graceful Restart**—Specifies the time period when the restart is expected to be complete. Specify the maximum time that stale routes are kept during restart. • **Multihop**—Configures the maximum time-to-live (TTL) value for the TTL in the IP header of BGP packets. • **Authentication Type**—Select the authentication algorithm: None, MD5, SHA1, AES.	Select **All** or **None** to configure Keep Routes. Enter a value in the **TCP MSS** box. Click to enable **MTU Discovery**. Click to enable **Remove Private ASN**. Enter the time period for a graceful restart and the maximum time that stale routes must be kept. To configure Multihop, select **Nexthop Change** to allow unconnected third-party next hops. Enter a TTL value. Select the authentication algorithm. If you select None, specify an authentication key (password).
Policies tab		

Table 190: BGP Global Settings *(continued)*

Field	Function	Your Action
Import Policy	Specifies one or more routing policies to routes being imported into the routing table from BGP.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Specifies one or more policies to routes being exported from the routing table into BGP.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.
Trace Options tab		
File Name	Specifies the name of the file to receive the output of the tracing operation.	Type or select and edit the name.
Number of Files	Specifies the maximum number of trace files.	Type or select and edit the value.
File Size	Specifies the maximum size for each trace file.	Type or select and edit the value.
World Readable	Specifies whether the trace file can be read by any user or not.	Select **True** to allow any user to read the file. Select **False** to disallow all users being able to read the file.
Flags	Specifies the tracing operation to perform.	Select a value from the list.

Configuring an OSPF Network (J-Web Procedure)

You can use the J-Web interface to create multiarea OSPF networks on a J-EX Series switch.

To configure a multiarea OSPF network:

1. Select **Configure** > **Routing** > **OSPF**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:
   - **Add**—Adds an OSPF area. Enter information into the configuration page as described in Table 191 on page 1436.
   - **Edit**—Modifies an existing OSPF area. Enter information into the configuration page as described in Table 191 on page 1436.
   - **Delete**—Deletes an existing OSPF area.
3. To modify OSPF global settings, click **Edit**. Enter information as described in Table 192 on page 1438.
4. To disable OSPF, click **Disable**.

Table 191: OSPF Routing Configuration Summary

Field	Function	Your Action
General tab		
Area Id	Uniquely identifies the area within its AS.	Type a 32-bit numeric identifier for the area. Type an integer or select and edit the value. If you enter an integer, the value is converted to a 32-bit equivalent. For example, if you enter 3, the value assigned to the area is **0.0.0.3**.
Area Ranges	Specifies a range of IP addresses for an area when sending summary link advertisements (within an area).	To add a range: 1. Click **Add**. 2. Type the area range. 3. Specify the subnet mask. 4. To override the metric for the IP address range, type a specific metric value. 5. If you do not want to display the routes that are contained within a summary, select **Restrict advertisements of this area range**. 6. If you want a summary of a route to be advertised only when an exact match is made with the configured summary range, select **Enforce exact match for advertisement of this area range**. 7. Click **OK**. To modify an existing area range, select the area range, click **Edit**, and edit the value. Click **OK**. To delete an area range, select the area range and click **Delete**.

Table 191: OSPF Routing Configuration Summary *(continued)*

Field	Function	Your Action
Area Type	Designates the type of OSPF area. • **regular**—A regular OSPF area, including the backbone area • **stub**—A stub area • **nssa**—A not-so-stubby area (NSSA)	Select the type of OSPF area you are creating from the list. If you select **stub**: 1. Enter the default metric. 2. To flood summary LSAs into the stub area, select the check box. If you select **nssa**: 1. Specify the metric type. 2. Enter the default metric. 3. To flood summary LSAs into the nssa area, select the check box. 4. To flood Type-7 LSAs into the nssa area, select the check box.
Interfaces tab		
Interfaces	Specifies the interfaces to be associated with the OSPF configuration	To associate an interface with the configuration, select the interface from the list, select **Associate** and click **OK**. To edit an interface's configuration: 1. Select the interface from the list and click **Edit**. 2. Specify the cost of an OSPF interface. 3. Specify the traffic engineering metric. 4. Specify how often the routing device sends hello packets from the interface. 5. Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors. 6. To enable OSPF on the interface, select the check box. 7. To inform other protocols about neighbor down events, select the check box. 8. To treat the interface as a secondary interface, select the check box. 9. To only advertise OSPF, select the check box. 10. Click **OK**.
Policies tab		
Import Policy	Specifies one or more policies to control which routes learned from an area are used to generate summary link-state advertisements (LSAs) into other areas.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.

Table 191: OSPF Routing Configuration Summary *(continued)*

Field	Function	Your Action
Export Policy	Specifies one or more policies to control which summary LSAs are flooded into an area.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.

Table 192: Edit OSPF Global Settings

Field	Function	Your Action
General tab		
Router Id	Specifies the ID for the routing device.	Type or select and edit the value.
RIB Group	Installs the routes learned from OSPF routing instances into routing tables in the OSPF routing table group.	Select a value.
Internal Route Preference	Specifies the route preference for internal groups.	Type or select and edit the value.
External Route Preference	Specifies the route preference for external groups.	Type or select and edit the value.
Graceful Restart	Configures graceful restart for OSPF.	To configure graceful restart: 1. Specify the estimated time to send out purged grace LSAs over all the interfaces. 2. Specified the estimated time to reacquire a full OSPF neighbor from each area. 3. To disable **No Strict LSA Checking**, select the check box. 4. To disable graceful restart helper capability, select the check box. Helper mode is enabled by default. 5. Click **OK**.
SPF Options	Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a hold-down interval after the SPF algorithm runs the maximum number of times.	To configure SPF: 1. Specify the time interval between the detection of a topology change and when the SPF algorithm runs. 2. Specify the time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession. 3. Specify the maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the hold-down interval begins.

Table 192: Edit OSPF Global Settings *(continued)*

Configuring a RIP Network (J-Web Procedure)

You can use the J-Web interface to create RIP networks.

To configure a RIP network:

1. Select **Configure** > **Routing** > **RIP**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:

   - **Add**—Configures a RIP instance. Enter information into the RIP Configuration page as described in Table 193 on page 1440.
   - **Edit**—Modifies an existing RIP instance. Enter information into the configuration page for RIP as described in Table 193 on page 1440.
   - **Delete**—Deletes an existing RIP instance.

4. To modify RIP global settings, click **Edit**. Enter information in the configuration as described in Table 194 on page 1441.

Table 193: RIP Routing Configuration Summary

Field	Function	Your Action
General tab		
Routing instance name	Specifies a name for the routing instance.	Type or select and edit the name.
Preference	Specifies the preference of external routes learned by RIP as compared to those learned from other routing protocols.	Type or select and edit the value.
Metric Out	Specifies the metric value to add to routes transmitted to the neighbor.	Type or select and edit the value.
Update interval	Specifies an update time interval to periodically send out routes learned by RIP to neighbors.	Type or select and edit the value.
Route timeout	Specifies the route timeout interval for RIP.	Type or select and edit the value.
Policies tab		
Import Policy	Applies one or more policies to routes being imported into the local routing device from the neighbors.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.

Table 193: RIP Routing Configuration Summary *(continued)*

Field	Function	Your Action
Export Policy	Applies a policy to routes being exported to the neighbors.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.
Neighbors tab		
RIP-Enabled Interfaces	Selects the interfaces to be associated with the RIP instance.	To enable RIP on an interface, click the check box next to the interface name. Click Edit if you want to modify an interface's settings.

Table 194: Edit RIP Global Settings

Field	Function	Your Action
General tab		
Send	Specifies RIP send options.	Select a value.
Receive	Configure RIP receive options.	Select a value.
Route timeout (sec)	Specifies the route timeout interval for RIP.	Type a value.
Update interval (sec)	Specifies the update time interval to periodically send out routes learned by RIP to neighbors.	Type or select and edit the value.
Hold timeout (sec)	Specifies the time period the expired route is retained in the routing table before being removed.	Type or select and edit the value.
Metric in	Specifies the metric to add to incoming routes when advertising into RIP routes that were learned from other protocols.	Type or select and edit the value.
RIB Group	Specifies a routing table group to install RIP routes into multiple routing tables.	Select and edit the name of the routing table group.
Message size	Specifies the number of route entries to be included in every RIP update message.	Type or select and edit the value.

Table 194: Edit RIP Global Settings *(continued)*

Field	Function	Your Action
Check Zero	Specifies whether the reserved fields in a RIP packet are zero. Options are: • **check-zero**—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications. • **no-check-zero**—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.	Select a value.
Graceful switchover	Configures graceful switchover for OSPF.	To disable graceful restart, select **Disable**. Type or select and edit the estimated time for the restart to finish, in seconds.
Authentication Type	Specifies the type of authentication for RIP route queries received on an interface. Options are: • None • MD5 • Simple	Select the authentication type. Enter the authentication key for MD5.
Policies tab		
Import Policy	Applies one or more policies to routes being imported into the local routing device from the neighbors.	Click **Add** to add an import policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an import policy.
Export Policy	Applies a policy to routes being exported to the neighbors.	Click **Add** to add an export policy. Click **Move up** or **Move down** to move the selected policy up or down the list of policies. Click **Remove** to remove an export policy.
Trace Options tab		
File Name	Specifies the name of the file to receive the output of the tracing operation.	Type or select and edit the name.
Number of Files	Specifies the maximum number of trace files.	Type or select and edit the name.
File Size	Specifies the maximum size for each trace file.	Type or select and edit the name.

Table 194: Edit RIP Global Settings *(continued)*

Field	Function	Your Action
World Readable	Specifies whether the trace file can be read by any user or not.	Select **True** to allow any user to read the file. Select **False** to disallow all users being able to read the file.
Flags	Specifies the tracing operation to perform.	Select a value from the list.

Configuring Static Routing (CLI Procedure)

Static routes are routes that are manually configured and entered into the routing table. Dynamic routes, in contrast, are learned by the J-EX Series switch and added to the routing table using a protocol such as OSPF or RIP.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) *preference* value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, **0** is the lowest and **255** is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:

```
[edit]
user@switch# set routing–options static route 0.0.0.0/0 next-hop 10.0.1.1
```

- To configure a static route and specify the next address to be used when routing traffic to the static route:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
```

- To always keep the static route in the forwarding table:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 retain
```

- To prevent the static route from being readvertised:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
```

- To remove inactive routes from the forwarding table:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 active
```

Configuring Static Routing (J-Web Procedure)

You can use the J-Web interface to configure static routes for J-EX Series switches.

To configure static routes:

1. Select **Configure** > **Routing** > **Static Routing**. The Static Routing page displays details of the configured routes.

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:

   - **Add**—To configure a route. Enter information into the routing page as described in Table 195 on page 1445.
   - **Edit**—To modify an existing route. Enter information into the routing page as described in Table 195 on page 1445.
   - **Delete**—To delete an existing route.

Table 195: Static Routing Configuration Summary

Field	Function	Your Action
Default Route		
Default Route	Specifies the default gateway for the switch.	To specify an IPv4 address: 1. Select **IPv4**. 2. Type an IP address—for example, **10.10.10.10**. 3. Enter the subnet mask or address prefix. For example, 24 bits represents **255.255.255.0**. To specify an IPv6 address: 1. Select **IPv6**. 2. Type an IP address—for example, **2001:ab8:85a3::8a2e:370:7334**. 3. Enter the subnet mask or address prefix.
Static Routes		

Table 195: Static Routing Configuration Summary *(continued)*

Field	Function	Your Action
Nexthop	Specifies the next-hop address or addresses to be used when routing traffic to the static route.	To add an address: 1. Click **Add**. 2. In the IP address dialog, enter the IP address. NOTE: If a route has multiple next-hop addresses, traffic is routed across each address in round-robin fashion. 3. Click **OK**. To delete a next-hop address, select it from the list and click **Delete**.

Configuring Routing Policies (J-Web Procedure)

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes are advertised in the protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table on the routing device.

To configure routing policies for a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Routing** > **Policies**.

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:

   - **Global Options**—Configures global options for policies. Enter information into the configuration page as described in Table 196 on page 1447.
   - **Add**—Configures a new policy. Select **New** and specify a policy name. To add terms, enter information into the configuration page as described in Table 197 on page 1448. Select **Clone** to create a copy of an existing policy.

- **Edit**—Edits an existing policy. To modify an existing term, enter information into the configuration page as described in Table 197 on page 1448.
- **Term Up**—Moves a term up in the list.
- **Term Down**—Moves a term down in the list.
- **Delete**—Deletes the selected policy.
- **Test Policy**—Tests the policy. Use this option to check whether the policy produces the results that you expect.

Table 196: Policies Global Configuration Parameters

Field	Function	Your Action
Prefix List	Specifies a list of IPv4 address prefixes for use in a routing policy statement.	To add a prefix list: 1. Click **Add**. 2. Enter a name for the prefix list. 3. To add an IP address, click **Add**. 4. Enter the IP address and the subnet mask and click **OK**. 5. Click **OK**. To edit a prefix list, click **Edit**. Edit the settings and click **OK**. To delete a prefix list, select it and click **Delete**.
BGP Community	Specifies a BGP community.	To add a BGP community: 1. Click **Add**. 2. Enter a name for the community. 3. To add a community, click **Add**. 4. Enter the community ID and click **OK**. 5. Click **OK**. To edit a BGP community, click **Edit**. Edit the settings and click **OK**. To delete a BGP community, select it and click **Delete**.
AS Path	Specifies an AS path. This is applicable to BGP only.	To add an AS path: 1. Click **Add**. 2. Enter the AS path name. 3. Enter the regular expression and click **OK**. 4. Click **OK**. To edit an AS path, click **Edit**. Edit the settings and click **OK**. To delete an AS path, select it and click **Delete**.

Table 197: Terms Configuration Parameters

Field	Function	Your Action
Term Name	Specifies a term name.	Type or select and edit the name.
Source tab		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list
Preference	Specifies the individual preference value for the route.	Type or select and edit the value.
Metric	Specifies a metric value. You can specify up to four metric values.	Type or select and edit the value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select **Add > Interface**. Select the interface from the list. To add an address, select **Add > Address**. Select the address from the list. To remove an interface, select it and click **Remove**.
Prefix List	Specifies a named list of IP addresses. You can specify an exact match with incoming routes.	Click **Add**. Select the prefix list from the list and click **OK**. To remove a prefix list, select it and click **Remove**.
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click **Add** and select the protocol from the list. To remove a protocol, select it and click **Remove**.
Policy	Specifies the name of a policy to evaluate as a subroutine.	Click **Add**. Select the policy from the list. To remove a policy, select it and click **Remove**.
More	Specifies advanced configuration options for policies.	Click **More** for advanced configuration.
OSPF Area ID	Specifies the area identifier.	Type the IP address.
BGP Origin	Specifies the origin of the AS path information.	Select a value from the list.
Local Preference	Specifies the BGP local preference.	Type a value.

Table 197: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
Route	Specifies the type of route.	Select **External**. Select the OSPF type from the list.
AS Path	Specifies the name of an AS path regular expression.	Click **Add**. Select the AS path from the list.
Community	Specifies the name of one or more communities.	Click **Add**. Select the community from the list.
Destination tab		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list.
Preference	Specifies the individual preference value for the route.	Type a value.
Metric	Specifies a metric value.	Type a value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select **Add > Interface**. Select the interface from the list. To add an address, select **Add > Address**. Select the address from the list. To delete an interface, select it and click **Remove**.
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click **Add** and select the protocol from the list. To delete a protocol, select it and click **Remove**.
Action tab		
Action	Specifies the action to take if the conditions match.	Select a value from the list.
Default Action	Specifies that any action that is intrinsic to the protocol is overridden. This action is also nonterminating, so that various policy terms can be evaluated before the policy is terminated.	Select a value from the list.
Next	Specifies the default control action if a match occurs, and there are no further terms in the current routing policy.	Select a value from the list.
Priority	Specifies a priority for prefixes included in an OSPF import policy. Prefixes learned through OSPF are installed in the routing table based on the priority assigned to the prefixes.	Select a value from the list.
BGP Origin	Specifies the BGP origin attribute.	Select a value from the list.

Table 197: Terms Configuration Parameters *(continued)*

Field	Function	Your Action
AS Path Prepend	Affixes an AS number at the beginning of the AS path. The AS numbers are added after the local AS number has been added to the path. This action adds an AS number to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS number is placed within a confederation sequence. Otherwise, the affixed AS number is placed with a nonconfederation sequence.	Enter a value.
AS Path Expand	Extracts the last AS number in the existing AS path and affixes that AS number to the beginning of the AS path *n* times, where *n* is a number from 1 through 32. The AS number is added before the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS numbers are placed within a confederation sequence. Otherwise, the affixed AS numbers are placed within a nonconfederation sequence. This option is typically used in non-IBGP export policies.	Select the type and type a value.
Load Balance Per Packet	Specifies that all next-hop addresses in the forwarding table must be installed and have the forwarding table perform per-packet load balancing. This policy action allows you to optimize VPLS traffic flows across multiple paths.	Select the check box to enable the option.
Tag	Specifies the tag value. The tag action sets the 32-bit tag field in OSPF external link-state advertisement (LSA) packets.	Select the action and type a value.
Metric	Changes the metric (MED) value by the specified negative or positive offset. This action is useful only in an external BGP (EBGP) export policy.	Select the action and type a value.
Route	Specifies whether the route is external.	Select the **External** check box to enable the option, and select the OSPF type.
Preference	Specifies the preference value.	Select the preference action and type a value.
Local Preference	Specifies the BGP local preference attribute.	Select the action and type a value.
Class of Service	Specifies and applies the class-of-service parameters to routes installed into the routing table. • Source class The value entered here maintains the packet counts for a route passing through your network, based on the source address. • Destination class The value entered here maintains packet counts for a route passing through your network, based on the destination address in the packet. • Forwarding class	Type the source class. Type the destination class. Type the forwarding class.

Configuring Distributed Periodic Packet Management on a J-EX Series Switch (CLI Procedure)

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes on the J-EX Series switch can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on J-EX4200 switches) or the line cards (on J-EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

Distributed PPM can be disabled for all protocols that use PPM or for a single protocol that uses PPM.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Dell Support advises you to do so (see “Requesting Technical Support” on page lxxi). You should disable distributed PPM only if you have a compelling reason to disable it.

This topic describes:

- Disabling or Enabling Distributed Periodic Packet Management Globally on page 1451
- Disabling or Enabling Distributed Periodic Packet Management for Link Aggregation Control Protocol (LACP) Packets on page 1452

Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:

```
[edit routing-options]
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:

```
[edit routing-options]
```

```
user@switch# delete ppm no-delegate-processing
```

Disabling or Enabling Distributed Periodic Packet Management for Link Aggregation Control Protocol (LACP) Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:

```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:

```
[edit protocols]
user@switch# delete lacp ppm centralized
```

Configuring VRRP for IPv6 (CLI Procedure)

By configuring the Virtual Router Redundancy Protocol (VRRP) on J-EX Series switches, you can enable hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. You can configure VRRP for IPv6 on Gigabit Ethernet, 10-Gigabit Ethernet, and logical interfaces.

To configure VRRP for IPv6:

1. Configure VRRP group support on interfaces:

   ```
   [edit interfaces interface-name unit logical-unit-number family inet6
   address address]
   user@switch# set vrrp-inet6-group group-id priority number virtual-inet6-address
   address virtual-link-local-address ipv6-address
   ```

   You must explicitly define a virtual link local address for each VRRP for IPv6 group. Otherwise, when you attempt to commit the configuration, the commit request fails. The virtual link local address must be on the same subnet as the physical interface address.

2. If you want to configure the priority order in which this switch functioning as a backup router becomes the master router if the master router becomes nonoperational, configure a priority for this switch:

   ```
   [edit interfaces interface-name unit logical-unit-number family inet6
   address address vrrp-inet6-group group-id]
   user@switch# set priority number
   ```

3. Specify the interval in milliseconds in which the master router sends advertisement packets to the members of the VRRP group:

   ```
   [edit interfaces interface-name unit logical-unit-number family inet6
   address address vrrp-inet6-group group-id]
   ```

```
user@switch# set inet6-advertise-interval milliseconds
```

4. By default, a higher-priority backup router preempts a lower-priority master router.

   - To explicitly enable the master router to be preempted:

     ```
     [edit interfaces interface-name unit logical-unit-number family inet6
     address address vrrp-inet6-group group-id]
     user@switch# set preempt
     ```

   - To prohibit a higher-priority backup router from preempting a lower priority master router:

     ```
     [edit interfaces interface-name unit logical-unit-number family inet6
     address address vrrp-inet6-group group-id]
     user@switch# set no-preempt
     ```

Using IPsec to Secure OSPFv3 Networks (CLI Procedure)

OSPF version 3 (OSPFv3) does not have a built-in authentication method and relies on IP Security (IPsec) to provide this functionality. You can use IPsec to secure OSPFv3 interfaces on J-EX Series switches.

This topic includes:

Configuring Security Associations

When you configure a security association (SA), include your choices for authentication, encryption, direction, mode, protocol, and security parameter index (SPI).

To configure a security association:

1. Specify a name for the security association:

   ```
   [edit security ipsec]
   user@switch# set security-association sa-name
   ```

2. Specify the mode of the security association:

   ```
   [edit security ipsec security-association sa-name]
   user@switch# set mode transport
   ```

3. Specify the type of security association:

   ```
   [edit security ipsec security-association sa-name]
   user@switch# set type manual
   ```

4. Specify the direction of the security association:

   ```
   [edit security ipsec security-association sa-name]
   ```

```
user@switch# set direction bidirectional
```

5. Specify the value of the security parameter index:

```
[edit security ipsec security-association sa-name]
user@switch# set spi spi-value
```

6. Specify the type of authentication to be used:

```
[edit security ipsec security-association sa-name]
user@switch# set authentication algorithm type
```

7. Specify the encryption algorithm and key:

```
[edit security ipsec security-association sa-name]
user@switch# set encryption algorithm algorithm key type
```

Securing OPSFv3 Networks

You can secure the OSPFv3 network by applying the SA to the OSPFv3 configuration.

To secure the OSPFv3 network:

```
[edit protocols ospf3 area area-number interface interface-name]
user@switch# set ipsec-sa sa-name
```

CHAPTER 72

Verifying Layer 3 Protocols Configuration

Monitoring BGP Routing Information

Purpose Use the monitoring functionality to monitor BGP routing information on the routing device.

Action To view BGP routing information in the J-Web interface, select **Monitor>Routing>BGP Information**.

To view BGP routing information in the CLI, enter the following commands:

- **show bgp summary**
- **show bgp neighbor**

Meaning Table 198 on page 1455 summarizes key output fields in the BGP routing display in the J-Web interface.

Table 198: Summary of Key BGP Routing Output Fields

Field	Values	Additional Information
BGP Peer Summary		
Total Groups	Number of BGP groups.	
Total Peers	Number of BGP peers.	
Down Peers	Number of unavailable BGP peers.	
Unconfigured Peers	Address of each BGP peer.	
RIB Summary tab		
RIB Name	Name of the RIB group.	

Table 198: Summary of Key BGP Routing Output Fields *(continued)*

Field	Values	Additional Information
Total Prefixes	Total number of prefixes from the peer, both active and inactive, that are in the routing table.	
Active Prefixes	Number of prefixes received from the EBGP peers that are active in the routing table.	
Suppressed Prefixes	Number of routes received from EBGP peers currently inactive because of damping or other reasons.	
History Prefixes	History of the routes received or suppressed.	
Dumped Prefixes	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	
Pending Prefixes	Number of pending routes.	
State	Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete.	
BGP Neighbors		
Details	Click this button to view the selected BGP neighbor details.	
Peer Address	Address of the BGP neighbor.	
Autonomous System	AS number of the peer.	

Table 198: Summary of Key BGP Routing Output Fields *(continued)*

Field	Values	Additional Information
Peer State	Current state of the BGP session: • **Active**—BGP is initiating a TCP connection in an attempt to connect to a peer. If the connection is successful, BGP sends an open message. • **Connect**—BGP is waiting for the TCP connection to become complete. • **Established**—The BGP session has been established, and the peers are exchanging BGP update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.	Generally, the most common states are **Active**, which indicates a problem establishing the BGP connection, and **Established**, which indicates a successful session setup. The other states are transition states, and BGP sessions normally do not stay in those states for extended periods of time.
Elapsed Time	Elapsed time since the peering session was last reset.	
Description	Description of the BGP session.

Monitoring OSPF Routing Information

Purpose Use the monitoring functionality to monitor OSPF routing information on routing devices.

Action To view OSPF routing information in the J-Web interface, select **Monitor > Routing > OSPF Information**.

To view OSPF routing information in the CLI, enter the following CLI commands:

- **show ospf neighbor**
- **show ospf interface**
- **show ospf statistics**

Meaning Table 199 on page 1458 summarizes key output fields in the OSPF routing display in the J-Web interface.

Table 199: Summary of Key OSPF Routing Output Fields

Field	Values	Additional Information
OSPF Interfaces		
Interface	Name of the interface running OSPF.	
State	State of the interface: **BDR**, **Down**, **DR**, **DRother**, **Loop**, **PtToPt**, or **Waiting**.	The **Down** state, indicating that the interface is not functioning, and **PtToPt** state, indicating that a point-to-point connection has been established, are the most common states.
Area	Number of the area that the interface is in.	
DR ID	Address of the area's designated device.	
BDR ID	Address of the area's backup designated device.	
Neighbors	Number of neighbors on this interface.	
Adjacency Count	Number of devices in the area using the same area identifier.	
Stub Type	The areas into which OSPF does not flood AS external advertisements	
Passive Mode	In this mode the interface is present on the network but does not transmit or receive packets.	
Authentication Type	The authentication scheme for the backbone or area.	
Interface Address	The IP address of the interface.	
Address Mask	The subnet mask or address prefix.	
MTU	The maximum transmission unit size.	
Interface Cost	The path cost used to calculate the root path cost from any given LAN segment is determined by the total cost of each link in the path.	
Hello Interval	How often the routing device sends hello packets out of the interface.	
Dead Interval	The interval during which the routing device receives no hello packets from the neighbor.	
Retransmit Interval	The interval for which the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors.	

Table 199: Summary of Key OSPF Routing Output Fields *(continued)*

Field	Values	Additional Information
OSPF Statistics		
Packets tab		
Sent	Displays the total number of packets sent.	
Received	Displays the total number of packets received.	
Details tab		
Flood Queue Depth	Number of entries in the extended queue.	
Total Retransmits	Number of retransmission entries enqueued.	
Total Database Summaries	Total number of database description packets.	
OSPF Neighbors		
Address	Address of the neighbor.	
Interface	Interface through which the neighbor is reachable.	
State	State of the neighbor: **Attempt**, **Down**, **Exchange**, **ExStart**, **Full**, **Init**, **Loading**, or **2way**.	Generally, only the **Down** state, indicating a failed OSPF adjacency, and the **Full** state, indicating a functional adjacency, are maintained for more than a few seconds. The other states are transitional states that a neighbor is in only briefly while an OSPF adjacency is being established.
ID	ID of the neighbor.	
Priority	Priority of the neighbor to become the designated router.	
Activity Time	The activity time.	
Area	Area that the neighbor is in.	
Options	Option bits received in the hello packets from the neighbor.	
DR Address	Address of the designated router.	
BDR Address	Address of the backup designated router.	
Uptime	Length of time since the neighbor came up.	

Table 199: Summary of Key OSPF Routing Output Fields *(continued)*

Field	Values	Additional Information
Adjacency	Length of time since the adjacency with the neighbor was established.

Monitoring RIP Routing Information

Purpose Use the monitoring functionality to monitor RIP routing on routing devices.

Action To view RIP routing information in the J-Web interface, select **Monitor > Routing > RIP Information**.

To view RIP routing information in the CLI, enter the following CLI commands:

- **show rip statistics**
- **show rip neighbor**

Meaning Table 200 on page 1460 summarizes key output fields in the RIP routing display in the J-Web interface.

Table 200: Summary of Key RIP Routing Output Fields

Field	Values	Additional Information
RIP Statistics		
Protocol Name	The RIP protocol name.	
Port number	The port on which RIP is enabled.	
Hold down time	The interval during which routes are neither advertised nor updated.	
Global routes learned	Number of RIP routes learned on the logical interface.	
Global routes held down	Number of RIP routes that are not advertised or updated during the hold-down interval.	
Global request dropped	Number of requests dropped.	
Global responses dropped	Number of responses dropped.	

Table 200: Summary of Key RIP Routing Output Fields *(continued)*

Field	Values	Additional Information
RIP Neighbors		
Neighbor	Name of the RIP neighbor.	This value is the name of the interface on which RIP is enabled. Click the name to see the details for this neighbor.
State	State of the RIP connection: **Up** or **Dn** (Down).	
Source Address	Local source address.	This value is the configured address of the interface on which RIP is enabled.
Destination Address	Destination address.	This value is the configured address of the immediate RIP adjacency.
Send Mode	The mode of sending RIP messages.	
Receive Mode	The mode in which messages are received.	
In Metric	Value of the incoming metric configured for the RIP neighbor.

Monitoring Routing Information

Purpose Use the monitoring functionality to view the **inet.0** routing table on the routing device.

Action To view the routing tables in the J-Web interface, select **Monitor > Routing > Route Information**. Apply a filter or a combination of filters to view messages. You can use filters to display relevant events.

To view the routing table in the CLI, enter the following commands in the CLI interface:

- **show route terse**
- **show route detail**

Meaning Table 201 on page 1462 describes the different filters, their functions, and the associated actions.

Table 202 on page 1462 summarizes key output fields in the routing information display.

Table 201: Filtering Route Messages

Field	Function	Your Action
Destination Address	Specifies the destination address of the route.	Enter the destination address.
Protocol	Specifies the protocol from which the route was learned.	Enter the protocol name.
Next hop address	Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.	Enter the next hop address.
Receive protocol	Specifies the dynamic routing protocol using which the routing information was received through a particular neighbor.	Enter the routing protocol.
Best route	Specifies only the best route available.	Select the view details of the best route.
Inactive routes	Specifies the inactive routes.	Select the view details of inactive routes.
Exact route	Specifies the exact route.	Select the view details of the exact route.
Hidden routes	Specifies the hidden routes.	Select the view details of hidden routes.
Search	Applies the specified filter and displays the matching messages.	To apply the filter and display messages, click **Search**.

Table 202: Summary of Key Routing Information Output Fields

Field	Values	Additional Information
Static Route Addresses	The list of static route addresses.	
Protocol	Protocol from which the route was learned: **Static**, **Direct**, **Local**, or the name of a particular protocol.	
Preference	The preference is the individual preference value for the route.	The route preference is used as one of the route selection criteria.

Table 202: Summary of Key Routing Information Output Fields *(continued)*

Field	Values	Additional Information
Next-Hop	Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.	If a next hop is listed as **Discard**, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the **discard** attribute has been set. If a next hop is listed as **Reject**, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected. If a next hop is listed as **Local**, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).
Age	How long the route has been active.	
State	Flags for this route.	There are many possible flags.
AS Path	AS path through which the route was learned. The letters of the AS path indicate the path origin: • **I**—IGP. • **E**—EGP. • **?**—Incomplete. Typically, the AS path was aggregated.

CHAPTER 73

Configuration Statements for Layer 3 Protocols

accept-remote-nexthop

Syntax accept-remote-nexthop;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*],
[edit protocols bgp],
[edit protocols bgp group *group-name*],
[edit protocols bgp group *group-name* neighbor *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that a single-hop EBGP peer accept a remote next hop with which it does not share a common subnet. Configure a separate import policy on the EBGP peer to specify the remote next hop. You cannot configure the **multihop** statement at the same time.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **multipath on page 1623**

active

Syntax (active | passive);

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether static, aggregate, or generated routes are removed from the routing and forwarding tables when they become inactive. Routes that have been configured to remain continually installed in the routing and forwarding tables are marked with **reject** next hops when they are inactive.

- **active**—Remove a route from the routing and forwarding tables when it becomes inactive.
- **passive**—Have a route remain continually installed in the routing and forwarding tables even when it becomes inactive.

Default **active**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

advertise-external

Syntax

```
advertise-external {
  conditional;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*],
[edit protocols bgp group *group-name*],
[edit protocols bgp group *group-name* neighbor *address*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *neighbor-address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Have BGP advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.

Options

conditonal—(Optional) Advertise the best external path only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. As a result, an external path with an AS path worse than that of the active path is not advertised.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **advertise-inactive on page 1468**

[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the default behavior of suppressing AS routes.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Applying Policies to BGP Routes

aggregate

Syntax

```
aggregate {
  defaults {
    ... aggregate-options ...
  }
  route destination-prefix {
    policy policy-name;
    ... aggregate-options ...
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],
[edit logical-systems *logical-system-name* routing-options],
[edit logical-systems *logical-system-name* routing-options **rib** *routing-table-name*],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],
[edit routing-options],
[edit routing-options **rib** *routing-table-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure aggregate routes.

Options ***aggregate-options***—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in ***aggregate-options***. Each option is explained separately.

- **(active | passive);**
- **as-path <***as-path***> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator** *as-number in-address***>**;
- **(brief | full)**;
- **community [** *community-ids* **]**;
- **discard**;
- **(metric | metric2 | metric3 | metric4)** *value* **<type** *type***>**;
- **(preference | preference2 | color | color2)** *preference* **<type** *type***>**;
- **tag** *string*;

defaults—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults and apply to all the aggregate routes you configure in the **aggregate** statement. This part of the **aggregate** statement is optional.

route ***destination-prefix***—Configure a nondefault aggregate route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length*—*destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Aggregate Routes

aggregate-label

Syntax

```
aggregate-label {
  community community-name;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp family inet labeled-unicast],
[edit logical-systems *logical-system-name* protocols bgp family inet-vpn labeled-unicast],
[edit protocols bgp family inet labeled-unicast],
[edit protocols bgp family inet-vpn labeled-unicast],
[edit protocols bgp family inet6 labeled-unicast]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Enable aggregate labels for VPN traffic.

Options
community *community-name*—Specify the name of the community to which to apply the aggregate label.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Aggregate Labels for VPNs

allow

Syntax allow (all | [*network/mask-length*]);

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Implicitly configure BGP peers, allowing peer connections from any of the specified networks or hosts. To configure multiple BGP peers, configure one or more networks and hosts within a single **allow** statement or include multiple **allow** statements.

Options **all**—Allow all addresses, which is equivalent to **0.0.0.0/0** (or **::/0**).

network/mask-length—IPv6 or IPv4 network number of a single address or a range of allowable addresses for BGP peers, followed by the number of significant bits in the subnet mask.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **neighbor on page 1624**
- Minimum BGP Configuration
- Configuring BGP Groups and Peers

any-sender

Syntax any-sender;

Hierarchy Level [edit logical-systems *logical-system-name* protocols rip group *group-name* neighbor *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip group *group-name* neighbor *neighbor-name*],
[edit protocols rip group *group-name* neighbor *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* neighbor *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable strict sender address checks.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling Strict Address Checking for RIP Messages

area

Syntax area *area-id*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.

Specify multiple **area** statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas; use the **area-range** statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the **virtual-link** statement.

To specify that the routing device is directly connected to the OSPF and OSPFv3 backbone, include the **area 0.0.0.0** statement.

All routing devices on the backbone must be contiguous. If they are not, use the **virtual-link** statement to create the appearance of connectivity to the backbone.

Options *area-id*—Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number **0.0.0.0** is reserved for the OSPF and OSPFv3 backbone area.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring OSPF Areas
- Configuring Multiple Address Families for OSPFv3

area-range

Syntax area-range *network/mask-length* <exact> <override-metric *metric*> <restrict>;

Hierarchy Level [edit logical-systems *logical-system-name* protocols (ospf | ospf3) **area** *area-id*],
[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* **nssa**],
[edit logical-systems *logical-system-name* **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **nssa**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*],
[edit protocols (ospf | ospf3) **area** *area-id*],
[edit protocols (ospf | ospf3) area *area-id* **nssa**],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id*],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **nssa**],
[edit routing-instances *routing-instance-name* **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple **area-range** statements.

For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple **area-range** statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.

Default By default, area border routers do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.

Options

exact—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.

mask-length—Number of significant bits in the network mask.

network—IP address. You can specify one or more IP addresses.

override-metric *metric*—(Optional) Override the metric for the IP address range and configure a specific metric value.

restrict—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

Range: 1 through 16,777,215

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Summarizing Ranges of Routes in OSPF Link-State Advertisements

as-override

Syntax
as-override;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* neighbor *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.

NOTE: The **as-override** statement is specific to a particular BGP group. This statement does not affect peers from the same remote AS configured in different groups.

Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The **as-override** statement overrides this default behavior.

Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network. For more information, see the *Junos OS MPLS Applications Configuration Guide*.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options (**aggregate | generate | static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate | generate | static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.

The numeric range for the AS number provides BGP support for 2-byte AS numbers and 4-byte AS numbers. .

Options

aggregator—(Optional) Attach the BGP **aggregator** path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for ***as-number***, followed by the IP address of the BGP system that formed the aggregate route for ***in-address***.

as-path—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ([ ]). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for ***as-path***; you must use a full, valid AS path.

atomic-aggregate—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

origin egp—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

origin igp—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

origin incomplete—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

[edit protocols isis **level** *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **level** *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Authentication key (password). Neighboring routing devices use the password to verify the authenticity of packets sent from this interface. For the key to work, you also must include the **authentication-type** statement.

All routing devices must use the same password. If you are using the Junos OS IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces adjacent to the Dell PowerConnect J-Series routing device.

Default If you do not include this statement and the **authentication-type** statement, IS-IS authentication is disabled.

Options *key*—Authentication password. The password can be up to 1024 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).

CAUTION: A simple password for authentication is truncated if it exceeds 254 characters.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

authentication-key-chains

Syntax

```
authentication-key-chains {
  key-chain key-chain-name {
    description text-string;
    key key {
      secret secret-data;
      start-time yyyy-mm-dd.hh:mm:ss;
    }
    tolerance seconds;
  }
}
```

Hierarchy Level [edit security]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure authentication key updates for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, and the Bidirectional Forwarding Detection (BFD) protocol. When the **authentication-key-chains** statement is configured at the **[edit security]** hierarchy level, and is associated with the BGP and LDP protocols at the **[edit protocols]** hierarchy level or with the BFD protocol using the **bfd-liveness-detection** statement, authentication key updates can occur without interrupting routing and signaling protocols such as Open Shortest Path First (OSPF), and Resource Reservation Setup Protocol (RSVP).

Options

key-chain *key-chain-name*—Keychain name. This name is configured at the **[edit protocols bgp]** or the **[edit protocols ldp]** hierarchy level to associate unique **authentication key-chain** attributes with each protocol as specified using the following options:

- **description *text-string***—A text string of the **authentication-key-chain**. Put the text string in quotes (“text description”).
- **key *key***—Each key within a keychain is identified by a unique integer value.

  Range: 0 through **63**

  - **secret *secret-data***—Each key must specify a secret in encrypted text or plain text format. The secret always appears in encrypted format.
  - **start-time *yyyy–mm-dd.hh:mm:ss***—Start times are specified in UTC (Coordinated Universal Time), and must be unique within the keychain.
- **tolerance *seconds***—Specify the clock skew tolerance, in seconds.

  Range: 0 through **999999999**

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **level** *level-number*],
[edit protocols isis **level** *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **level** *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable authentication and specify the authentication scheme for IS-IS. If you enable authentication, you must specify a password by including the **authentication-key** statement.

Default If you do not include this statement and the **authentication-key** statement, IS-IS authentication is disabled.

Options ***authentication***—Authentication scheme:

- **md5**—Use HMAC authentication in combination with MD5. HMAC-MD5 authentication is defined in RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*.
- **simple**—Use a simple password for authentication. The password is included in the transmitted packet, making this method of authentication relatively insecure. We recommend that you *not* use this authentication method.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the type of authentication for RIP route queries received on an interface.

Default If you do not include this statement and the **authentication-key** statement, RIP authentication is disabled.

Options *type*—Authentication type:

- **md5**—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.
- **none**—Disable authentication. If **none** is configured, the configured authentication key is ignored.
- **simple**—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

autonomous-system

Syntax

```
autonomous-system autonomous-system <asdot-notation> <loops number> {
  independent-domain;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify the routing device's AS number. The numeric range provides BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options

autonomous-system—AS number. Use a number assigned to you by the Network Information Center (NIC).

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format

Range: 0.0 through 65535.65535 in AS-dot notation format

asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

Default: Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

number—(Optional) Maximum number of times this AS number can appear in an AS path.

Range: 1 through 10

Default: 1 (AS number can appear once)

NOTE: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the independent-domain option if the loops statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, the Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.

Options

bandwidth *value*—Specify the bandwidth threshold in bits per second.

Range: 9600 through 1,000,000,000,000,000

metric *number*—Specify a metric value to associate with a specific bandwidth value.

Range: 1 through 65,535

NOTE: You must also configure a static metric value for the OSPF interface or topology with the metric statement. The Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

For IBGP and multihop EBGP support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

authentication key-chain ***key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

holddown-interval ***milliseconds***—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.

Range: 0 through 255,000

Default: 0

NOTE: You can configure the holddown-interval option only for EBGP peers.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-interval ***milliseconds***— Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval ***milliseconds***—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Configure the BFD version to detect.

Range: **1** or **automatic** (autodetect the BFD version)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold *milliseconds*—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

minimum-interval *milliseconds*—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-interval ***milliseconds***—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval ***milliseconds***—Configure only the minimum interval at which the routing device sends hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Specify the BFD version to detect.

Range: **1** (BFD version 1), or **automatic** (autodetection)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

full-neighbors-only—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

minimum-receive-interval ***milliseconds***—Configure only the minimum interval at which the routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval ***milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Specify the BFD version to detect.

Range: **1** (BFD version 1) or **automatic** (autodetect version)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure bidirectional failure detection timers and authentication.

Options

authentication algorithm ***algorithm-name*** —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain ***key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

minimum-receive-interval ***milliseconds***—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000 milliseconds

multiplier ***number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

no-adaptation—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

transmit-interval minimum-interval ***milliseconds***—Configure only a minimum interval at which the local routing device transmits hello packets to a neighbor.

Range: 1 through 255,000

version—Specify the BFD version to detect.

Range: (BFD version 1), or **automatic** (autodetect the version)

Default: **automatic**

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

[edit routing-options static route *destination-prefix* qualified-next-hop (*interface-name* | *address*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure bidirectional failure detection timers and authentication criteria for static routes.

Options

authentication algorithm ***algorithm-name*** —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain ***key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold ***milliseconds***—Configure a threshold. When the Bidirectional Forwarding Detection (BFD) protocol session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

holddown-interval ***milliseconds***—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.

Range: 0 through 255,000

Default: 0

local-address ***ip-address***—Enable a multihop BFD session and configure the source address for the BFD session.

minimum-interval ***milliseconds***—Configure the minimum intervals at which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-interval ***milliseconds***—Configure the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Range: 1 through 255,000

minimum-receive-ttl ***number***—Configure the time-to-live (TTL) for the multihop BFD session.

Range: 1 through 255

Default: 255

multiplier ***number***—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

Range: 1 through 255

Default: 3

neighbor ***address***—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

no-adaptation—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold *milliseconds*—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295

transmit-interval minimum-interval *milliseconds*—Configure the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

Range: 1 through 255,000

version—Configure the BFD protocol version to detect.

Range: 1 or **automatic**

Default: **automatic** (autodetect the BFD protocol version)

The remaining statements are explained separately.

bmp

Syntax

```
bmp {
  memory limit bytes;
  station-address (ip-address | name);
  station-port port-number;
  statistics-timeout seconds;
}
```

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP **Adjacency-RIB-In** routing tables and periodically send that data to a monitoring station.

Options

memory-limit *bytes*—(Optional) Specify a threshold at which to stop collecting BMP data if the limit is exceeded.

Default: 10 MB

Range: 1,048,576 through 52,428,800

station-address (*ip-address* | *name*)—Specify the IP address or a valid URL for the monitoring where BMP data should be sent.

station-port *port-number*—Specify the port number of the monitoring station to use when sending BMP data.

statistics-timeout *seconds*—(Optional) Specify how often to send BMP data to the monitoring station.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure all AS numbers from all contributing paths to be included in the aggregate or generated route's path.

- **brief**—Include only the longest common leading sequences from the contributing AS paths. If this results in AS numbers being omitted from the aggregate route, the BGP **ATOMIC_ATTRIBUTE** path attribute is included with the aggregate route.
- **full**—Include all AS numbers from all contributing paths in the aggregate or generated route's path.

Default **full**

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

centralized

Syntax centralized;

Hierarchy Level [edit protocols lacp **ppm**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.

This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the **no-delegate-processing** statement in the **[edit routing-options ppm]** hierarchy.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Dell Support advises you to do so (see “Requesting Technical Support” on page lxxi). You should disable distributed PPM only if you have a compelling reason to disable it.

Default Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Check whether the reserved fields in a RIP packet are zero:

- **check-zero**—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.
- **no-check-zero**—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.

Default **check-zero**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Accepting RIP Packets with Nonzero Values in Reserved Fields

checksum

Syntax checksum;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable checksum for packets on this interface. The checksum cannot be enabled with MD5 hello authentication on the same interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling Packet Checksum on IS-IS Interfaces

cluster

Syntax cluster *cluster-identifier*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],

[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate BGP community information with a static, aggregate, or generated route.

Options ***community-ids***—One or more community identifiers. The ***community-ids*** format varies according to the type of attribute that you use.

The BGP community attribute format is ***as-number:community-value***:

- ***as-number***—AS number of the community member. It can be a value from 1 through 65,535.
- ***community-value***—Identifier of the community member. It can be a number from 0 through 65,535.

For more information about BGP community attributes, see the "Configuring the Extended Communities Attribute" section in the *Junos OS Policy Framework Configuration Guide*.

For specifying the BGP community attribute only, you also can specify ***community-ids*** as one of the following well-known community names defined in RFC 1997:

- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export**—Routes containing this community name are not advertised outside a BGP confederation boundary.
- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.
- **none**—Explicitly exclude BGP community information with a static route. Include this option when configuring an individual route in the **route** portion to override a **community** option specified in the **defaults** portion.

NOTE: Extended community attributes are not supported at the [edit routing-options] hierarchy level. You must configure extended communities at the [edit policy-options] hierarchy level. For information about configuring extended communities, see the *Junos OS Policy Framework Configuration Guide*.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

confederation

Syntax
confederation *confederation-autonomous-system* members [*autonomous-systems*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify the routing device's confederation AS number.

Options
autonomous-system—AS numbers of the confederation members.
Range: 1 through 65,535

confederation-autonomous-system—Confederation AS number. Use one of the numbers assigned to you by the NIC.
Range: 1 through 65,535

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring AS Confederation Members

csnp-interval

Syntax csnp-interval (*seconds* | disable);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interval between complete sequence number (CSN) packets on a LAN interface.

Options **disable**—Do not send CSN packets on this interface.

seconds—Number of seconds between the sending of CSN packets.

Range: 1 through 65,535 seconds

Default: 10 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable route flap damping.

Default Flap damping is disabled on the routing device.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **virtual-link**],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long OSPF waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor.

Options ***seconds***—Interval to wait.

Range: 1 through 65,535 seconds

Default: 40 seconds (four times the hello interval)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

On area border routers only, for an NSSA, inject a default LSA with a specified metric value into the area. The default route matches any destination that is not explicitly reachable from within the area.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit protocols isis traffic-engineering],
[edit routing-instances *routing-instance-name* protocols **isis**],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis traffic-engineering]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IS-IS on the routing device, on an interface, or on a level. At the **[edit protocols isis traffic-engineering]** hierarchy level, disable IS-IS support for traffic engineering.

Enabling IS-IS on an interface (by including the **interface** statement at the **[edit protocols isis]** or the **[edit routing-instances *routing-instance-name* protocols isis]** hierarchy level), disabling it (by including the **disable** statement), and not actually having IS-IS run on an interface (by including the **passive** statement) are mutually exclusive states.

Default IS-IS is enabled for Level 1 and Level 2 routers on all interfaces on which an International Organization for Standardization (ISO) protocol family is enabled.

IS-IS support for traffic engineering is enabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable OSPF, an OSPF interface, or an OSPF virtual link.

Default The configured object is enabled (operational) unless explicitly disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum OSPF Configuration

disable

Syntax disable;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* **routing-options** graceful-restart],
[edit logical-systems *logical-system-name* **routing-options** graceful-restart],
[edit routing-instances *routing-instance-name* **routing-options** graceful-restart],
[edit **routing-options** graceful-restart]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable graceful restart.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Graceful Restart

discard

Syntax discard;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],

[edit routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

Default When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

domain-id

Syntax domain-id *domain-id*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a domain ID for a route. The domain ID identifies the OSPF domain from which the route originated.

Options ***domain-id***—You can specify either an IP address or an IP address and a local identifier using the following format: ***ip-address*:*local-identifier***. If you do not specify a local identifier with the IP address, the identifier is assumed to have a value of 0.

Default: If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring OSPF Domain IDs for VPNs

domain-vpn-tag

Syntax domain-vpn-tag *number*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set a virtual private network (VPN) tag for OSPFv2 external routes generated by the provider edge (PE) router.

Options ***number***—VPN tag.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring OSPF Domain IDs for VPNs

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply one or more policies to routes being exported from the routing table into OSPF.

Options

policy-names—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Applying Policies to OSPF Routes
- *Junos OS Policy Framework Configuration Guide*

export

Syntax export [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols rip **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip **group** *group-name*],
[edit protocols rip **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a policy to routes being exported to the neighbors.

Options ***policy-names***—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **import on page 1569**

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.

Options

any—Configure the family type to be both unicast and multicast.

inet—Configure NLRI parameters for IPv4.

inet6—Configure NLRI parameters for IPv6.

inet-mdt—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.

inet-mvpn—Configure NLRI parameters for IPv4 for multicast VPNs.

inet6-mvpn—Configure NLRI parameters for IPv6 for multicast VPNs.

inet-vpn—Configure NLRI parameters for IPv4 for Layer 3 VPNs.

inet6-vpn—Configure NLRI parameters for IPv6 for Layer 3 VPNs.

iso-vpn—Configure NLRI parameters for IS-IS for Layer 3 VPNs.

l2-vpn—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.

labeled-unicast—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.

loops ***number***—(Optional) Specify the maximum number of times that the AS number can appear in the AS path received from a BGP peer for the specified address family. For ***number***, include a value from 1 through 10.

NOTE: When you configure the **loops** statement for a specific BGP address family, that value is used to evaluate the AS path for routes received by a BGP peer for the specified address family rather than the loops value configured for the global AS number.

multicast—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.

unicast—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes.

Default: unicast

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

fate-sharing

Syntax

```
fate-sharing {
  group group-name {
    cost value;
    from address <to address>;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-instances *routing-instance-name* routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify groups of objects that share characteristics resulting in backup paths to be used if primary paths fail. All objects are treated as **/32** host addresses. You specify one or more objects within a group. The objects can be LAN interfaces, router IDs, or point-to-point links. The sequence is insignificant.

Options

cost *value*—Cost assigned to the group.

Range: 1 through 65,535

Default: 1

from *address*—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate **from** addresses in the group.

group *group-name*—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.

to *address*—(Optional) Address of egress router. For point-to-point link objects, you must specify both a **from** and a **to** address.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

flow

Syntax

```
flow {
  route name {
    match {
      match-conditions;
    }
    term-order (legacy | standard);
    then {
      actions;
    }
  }
  validation {
    traceoptions {
      file filename <files number> <size size> <world-readable | no-world-readable>;
      flag flag <flag-modifier> <disable>;
    }
  }
}
```

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a flow route.

Default legacy

Options

actions—An action to take if conditions match.

match-conditions—Match packets to these conditions.

route *name*—Name of the flow route.

standard—Specify to use version 7 or later of the flow-specification algorithm.

term-order (legacy | standard)—Specify the version of the flow-specification algorithm.

- **legacy**—Use version 6 of the flow-specification algorithm.
- **standard**—Use version 7 of the flow-specification algorithm.

then—Actions to take on matching packets.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

forwarding-cache (Flow Maps)

Syntax

```
forwarding-cache {
  timeout (minutes | never );
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multicast forwarding cache properties for the flow map.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

forwarding-cache (Multicast)

Syntax

```
forwarding-cache {
    threshold suppress value <reuse value>;
    timeout minutes;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits and timeout values.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring General Multicast Forwarding Cache Properties

forwarding-table

Syntax

```
forwarding-table {
    export [ policy--names ];
    (indirect-next-hop | no-indirect-next-hop);
    unicast-reverse-path (active-paths | feasible-paths);
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure information about the routing device's forwarding table.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Per-Packet Load Balancing

generate

Syntax

```
generate {
  defaults {
    generate-options;
  }
  route destination-prefix {
    policy policy-name;
    generate-options;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],
[edit routing-options],
[edit routing-options **rib** *routing-table-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure generated routes, which are used as routes of last resort.

Options

generate-options—Additional information about generated routes, which is included with the route when it is installed in the routing table. Specify zero or more of the following options in ***generate-options***. Each option is explained separately.

- **(active | passive);**
- **as-path <***as-path***> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator** *as-number in-address***>;**
- **community [** *community-ids* **];**
- **discard;**
- **(brief | full);**
- **(metric | metric2 | metric3 | metric4)** *value* **<type** *type***>;**
- **(preference | preference2 | color | color2)** *preference* **<type** *type***>;**
- **tag** *string***;**

defaults—Specify global generated route options. These options only set default attributes inherited by all newly created generated routes. These are treated as global defaults and apply to all the generated routes you configure in the **generate** statement. This part of the **generate** statement is optional.

route ***destination-prefix***—Configure a non-default generated route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.

- ***destination-prefix/prefix-length***—/***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure graceful restart for BGP.

Options
disable—Disable graceful restart for BGP.

restart-time *seconds*—Time period when the restart is expected to be complete.
Range: 1 through 600 seconds

stale-routes-time *seconds*—Maximum time that stale routes are kept during restart.
Range: 1 through 600 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

graceful-restart

Syntax

```
graceful-restart {
  disable;
  helper-disable;
  notify-duration seconds;
  restart-duration seconds;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure graceful restart for OSPF.

Options

disable—Disable graceful restart for OSPF.

helper-disable—Disable graceful restart helper capability. Helper mode is enabled by default.

notify-duration *seconds*—Estimated time to send out purged grace LSAs over all the interfaces.

Range: 1 through 3600 seconds

Default: 30 seconds

restart-duration *seconds*—Estimated time to reacquire a full OSPF neighbor from each area.

Range: 1 through 3600 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define a BGP peer group. BGP peer groups share a common type, peer autonomous system (AS) number, and cluster ID, if present. To configure multiple BGP groups, include multiple **group** statements.

By default, the group's options are identical to the global BGP options. To override the global options, include group-specific options within the **group** statement.

The **group** statement is one of the statements you must include in the configuration to run BGP on the routing device. See Minimum BGP Configuration.

Options

group-name—Name of the BGP group.

The remaining statements are explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a set of RIP neighbors that share an export policy and metric. The export policy and metric govern what routes to advertise to neighbors in a given group.

Options

group-name—Name of a group, up to 16 characters long.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

hello-authentication-key

Syntax hello-authentication-key *password*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name*level *number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*],
[edit protocols isis interface *interface-name* level *number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an authentication key (password) for hello packets. Neighboring routing devices use the password to verify the authenticity of packets sent from an interface. For the key to work, you also must include the **hello-authentication-type** statement.

Default By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.

Options ***password***—Authentication password. The password can be up to 255 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

hello-authentication-type

Syntax hello-authentication-type (md5 | simple);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*],
[edit protocols isis interface *interface-name* level *number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable authentication on an interface for hello packets. If you enable authentication on hello packets, you must specify a password by including the **hello-authentication-key** statement.

Default By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.

Options **md5**—Specifies Message Digest 5 as the packet verification type.

simple—Specifies simple authentication as the packet verification type.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

hello-interval

Syntax hello-interval *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Frequency with which the routing device sends hello packets out of an interface, in seconds.

Options ***seconds***—Frequency of transmission for hello packets.

Range: 1 through 20,000 seconds

Default: 3 seconds (for designated intersystem [DIS] routers), 9 seconds (for non-DIS routers)

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.

Options ***seconds***—Time between hello packets, in seconds.

Range: 1 through 255 seconds

Default: 10 seconds; 120 seconds (nonbroadcast networks)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hello-padding

Syntax hello-padding (adaptive | loose | strict);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.

Options **adaptive**—Configure padding until state of neighbor adjacency is up.

loose—Configure padding until state of adjacency is initialized.

strict—Configure padding for all adjacency states.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.

The hold time is three times the interval at which keepalive messages are sent.

Options ***seconds***—Hold time.

Range: 20 through 65,535 seconds

Default: 90 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Delay Before BGP Peers Mark the Routing Device as Down

hold-time (IS-IS)

Syntax hold-time *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name*level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the length of time a neighbor considers this router to be operative (up) after receiving a hello packet. If the neighbor does not receiver another hello packet within the specified time, it marks this routing device as inoperative (down). The hold time itself is advertised in the hello packets.

Options ***seconds***—Hold-time value, in seconds.

Range: 3 through 65,535 seconds, or 1 to send out hello packets every 333 milliseconds

Default: 9 seconds (for DIS routers), 27 seconds (for non-DIS routers; three times the default hello interval)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

idle-after-switch-over

Syntax idle-after-switch-over (forever | *seconds*);

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp group *group-name*],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address*],
[edit protocols bgp],
[edit protocols bgp group *group-name*],
[edit protocols bgp group *group-name* neighbor *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device not to automatically reestablish BGP peering sessions after a nonstop active routing (NSR) switchover. This feature is particularly useful if you are using dynamic routing policies because the dynamic database is not synchronized with the backup Routing Engine when NSR is enabled.

Options

forever—Do not reestablish a BGP peering session after an NSR switchover until the **clear bgp neighbor** command is issued.

seconds—Do not reestablish a BGP peering session after an NSR switchover until after the specified period.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ignore-attached-bit

Syntax ignore-attached-bit;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement allows the routing device to ignore the attached bit on incoming Level 1 LSPs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.

Default The **ignore-attached-bit** statement is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

import

Syntax import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options resolution **rib**],
[edit logical-systems *logical-system-name* routing-options resolution **rib**],
[edit routing-instances *routing-instance-name* routing-options resolution **rib**],
[edit routing-options resolution **rib**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify one or more import policies to use for route resolution.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Route Resolution

import-policy

Syntax import-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib-group** *group-name*],
[edit logical-systems *logical-system-name* routing-options passive *group-name*],
[edit routing-instances *routing-instance-name* routing-options **rib-group** *group-name*],
[edit routing-options **rib-groups** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to routes imported into the routing table group. The **import-policy** statement complements the **import-rib** statement and cannot be used unless you first specify the routing tables to which routes are being imported.

Options ***policy-names***—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

import-rib

Syntax import-rib [*routing-table--names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib-group** *group-name*],
[edit logical-systems *logical-system-name* routing-options **rib-group** *group-name*],
[edit routing-instances *routing-instance-name* routing-options **rib-group** *group-name*],
[edit routing-options **rib-group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Name of the routing table into which Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be **inet.0** or **routing-instance-name.inet.0**. For IPv6 import routing tables, the primary routing table must be **inet6.0**.

You can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4.

Options ***routing-table-names***—Name of one or more routing tables.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

include-mp-next-hop

Syntax include-mp-next-hop;

Hierarchy Level [edit logical-systems *logical-system-name* protocols bgp],
[edit protocols bgp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable multiprotocol updates to contain next-hop reachability information.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Including Next-Hop Reachability Information in Multiprotocol Updates

indirect-next-hop

Syntax (indirect-next-hop | no-indirect-next-hop);

Hierarchy Level [edit logical-systems *logical-system-name* routing-options **forwarding-table**],
[edit routing-options **forwarding-table**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable indirectly connected next hops for route convergence.

NOTE: When virtual private LAN service (VPLS) is configured on the routing device, the indirect-next-hop statement is not supported.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling Indirect Next Hops

inet6-advertise-interval

Syntax inet6-advertise-interval *milliseconds*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* vrrp-inet6-group *group-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interval between Virtual Router Redundancy Protocol (VRRP) IPv6 advertisement packets.

Options ***milliseconds***—Interval, in milliseconds, between advertisement packets.

Range: 100 to 40,000 ms

Default: 1 second

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

install

Syntax (install | no-install);

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit routing-options rib *routing-table-name* **static** (defaults | route)]
[edit routing-options **static** (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether the Junos OS installs all static routes into the forwarding table. Even if you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols.

Options
install—Explicitly install all static routes into the forwarding table.

no-install—Do not install the route into the forwarding table, even if it is the route with the lowest preference.

Default: **install**

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis],
[edit protocols isis],
[edit routing-instances *routing-instance-name* protocols isis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interface-specific IS-IS properties. To configure more than one interface, include the **interface** statement multiple times.

Enabling IS-IS on an interface (by including the **interface** statement at the **[edit protocols isis]** or the **[edit routing-instances *routing-instance-name* protocols isis]** hierarchy level), disabling it (by including the **disable** statement), and not actually having IS-IS run on an interface (by including the **passive** statement) are mutually exclusive states.

Options **all**—Have the Junos OS create IS-IS interfaces automatically.

interface-name—Name of an interface. Specify the full interface name, including the physical and logical address components. For details about specifying interfaces, see the *Junos OS Network Interfaces Configuration Guide* and the *Junos OS Services Interfaces Configuration Guide*.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) **area** *area-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable OSPF routing on a routing device interface.

You must include at least one **interface** statement in the configuration to enable OSPF on the routing device.

Options ***interface-name***—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify **all**. Specifying a particular interface and **all** produces an invalid configuration. For details about specifying interfaces, see interface naming in the *Junos OS Network Interfaces Configuration Guide*.

NOTE: For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as *interface-name*.

The remaining statements are explained separately.

NOTE: You cannot run both OSPF and ethernet-tcc encapsulation between two routing devices.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Define the maximum bandwidth for an interface on which you want to apply bandwidth management.

Options

interface-name—Names of the physical or logical interface. For details about specifying interfaces, see the *Junos OS Network Interfaces Configuration Guide*.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface (Multicast via Static Routes)

Syntax

```
interface interface-names {
  maximum-bandwidth bps;
  no-qos-adjust;
  reverse-oif-mapping {
    no-qos-adjust;
  }
  subscriber-leave-timer seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **multicast**],
[edit logical-systems *logical-system-name* routing-options **multicast**],
[edit routing-instances *routing-instance-name* routing-options **multicast**],
[edit routing-options **multicast**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable multicast traffic on an interface.

NOTE: You cannot enable multicast traffic on an interface using the enable statement and configure PIM on the same interface simultaneously.

Options

interface-name—Name of the interface on which to enable multicast traffic. Specify the ***interface-name*** to enable multicast traffic on the interface.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling Multicast Forwarding Without PIM

interface-routes

Syntax

```
interface-routes {
  family (inet | inet6) {
    export {
      lan;
      point-to-point;
    }
  }
  rib-group group-name;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Associate a routing table group with the routing device's interfaces and specify routing table groups into which interface routes are imported.

Options

inet—Specify the IPv4 address family.

inet6—Specify the IPv6 address family.

lan—Export LAN routes.

point-to-point—Export point-to-point routes.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-multicast | ipv4-unicast | ipv6-multicast) area *area-id* interface *interface-name*],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the type of interface.

By default, the software chooses the correct interface type based on the type of physical interface. Therefore, you should never have to set the interface type. The exception to this is for NBMA interfaces, which default to an interface type of point-to-multipoint. To have these interfaces explicitly run in NBMA mode, configure the **nbma** interface type, using the IP address of the local ATM interface.

A point-to-point interface can be an Ethernet interface without a subnet. For more information about configuring interfaces, see the *Junos OS Network Interfaces Configuration Guide*.

Default The software chooses the correct interface type based on the type of physical interface.

Options **nbma** (OSPFv2 only)—Nonbroadcast multiaccess (NBMA) interface.

p2mp (OSPFv2 only)—Point-to-multipoint interface.

p2p—Point-to-point interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify whether routes learned from a BGP peer are retained in the routing table even if they contain an AS number that was exported from the local AS.

Default If you do not include this statement, most routes are retained in the routing table.

Options **all**—Retain all routes.

none—Retain none of the routes. When **keep none** is configured for the BGP session and the inbound policy changes, the Junos OS forces readvertisement of the full set of routes advertised by the peer.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (inet | inet6)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the family type to be labeled-unicast.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling Multiprotocol BGP

level (Global IS-IS)

Syntax

```
level level-number {
    authentication-key key;
    authentication-type type;
    external-preference preference;
    no-csnp-authentication;
    no-hello-authentication;
    no-psnp-authentication;
    preference preference;
    wide-metrics-only;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the global-level properties.

Options

level-number—IS-IS level number.

Values: 1 or 2

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Preference Values for IS-IS Routes

link-protection

Syntax link-protection;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name*],
[edit protocols isis interface *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable link protection on the specified IS-IS interface. The Junos OS creates a backup loop-free alternate path to the primary next hop for all destination routes that traverse the protected interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.

Default If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address. For more information, see the *Junos OS Network Interfaces Configuration Guide*.

Options ***address***—IPv6 or IPv4 address of the local end of the connection.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **router-id on page 1697**

[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the local AS number.

The autonomous system (AS) numeric range in plain-number format provides BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

autonomous-system—AS number.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format

Range: 0.0 through 65535.65535 in AS-dot notation format

loops *number*—(Optional) Specify the maximum number of times that the local AS number can appear in an AS path received from a BGP peer. For ***number***, include a value from 1 through 10.

no-prepend-global-as—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

private—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

NOTE: The private and alias options are mutually exclusive. You cannot configure both options with the same local-as statement.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

local-interface

Syntax
local-interface *interface-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *ipv6-link-local-address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *ipv6-link-local-address*],
[edit protocols bgp group *group-name* **neighbor** *ipv6-link-local-address*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *ipv6-link-local-address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify the interface name of the peer for IPv6 peering using link-local addresses. This peer is link-local in scope.

Options
interface-name—Interface name of the EBGP IPv6 peer.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring EBGP Peering Using IPv6 Link-Local Addresses

local-preference

Syntax local-preference *local-preference*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],
[edit protocols bgp],
[edit protocols bgp **group** *group-name*],
[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Modify the value of the **LOCAL_PREF** path attribute, which is a metric used by IBGP sessions to indicate the degree of preference for an external route. The route with the highest local preference value is preferred.

The **LOCAL_PREF** path attribute always is advertised to internal BGP peers and to neighboring confederations. It is never advertised to external BGP peers.

Default If you omit this statement, the **LOCAL_PREF** path attribute, if present, is not modified.

Options *local-preference*—Preference to assign to routes learned from BGP or from the group or peer.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: If the **LOCAL_PREF** path attribute is present, do not modify its value. If a BGP route is received without a **LOCAL_PREF** attribute, the route is handled locally (it is stored in the routing table and advertised by BGP) as if it were received with a **LOCAL_PREF** value of 100. By default, non-BGP routes that are advertised by BGP are advertised with a **LOCAL_PREF** value of 100.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **preference on page 1660**

loose-authentication-check

Syntax loose-authentication-check;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allow the use of MD5 authentication without requiring network-wide deployment.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling Authentication for IS-IS Without Network-Wide Deployment

lsp-interval

Syntax lsp-interval *milliseconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the link-state PDU interval time.

Options ***milliseconds***—Number of milliseconds between the sending of link-state PDUs. Specifying a value of 0 blocks all link-state PDU transmission.

Range: 0 through 1000 milliseconds

Default: 100 milliseconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces

lsp-lifetime

Syntax lsp-lifetime *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.

Options ***seconds***—link-state PDU lifetime, in seconds.

Range: 350 through 65,535 seconds

Default: 1200 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Link-State PDU Lifetime for IS-IS

lsp-metric-into-summary

Syntax lsp-metric-into-summary;

Hierarchy Level [edit logical-systems *logical-system-name* protocols (ospf | ospf3) **traffic-engineering shortcuts**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **traffic-engineering shortcuts**],
[edit protocols (ospf | ospf3) **traffic-engineering shortcuts**],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **traffic-engineering shortcuts**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Advertise the LSP metric in summary LSAs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling OSPF Traffic Engineering Support

martians

Syntax

```
martians {
  destination-prefix match-type <allow>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **rib** *routing-table-name*],

[edit routing-options],
[edit routing-options **rib** *routing-table-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure martian addresses.

Options

allow—(Optional) Explicitly allow a subset of a range of addresses that has been disallowed.

destination-prefix—Destination route you are configuring:

- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.
- **default**—Default route to use when routing packets do not match a network or host in the routing table. This is equivalent to specifying the IP address **0.0.0.0/0**.

match-type—Criteria that the destination must match:

- **exact**—Exactly match the route's mask length.
- **longer**—The route's mask length is greater than the specified mask length.
- **orlonger**—The route's mask length is equal to or greater than the specified mask length.
- **through *destination-prefix***—The route matches the first prefix, the route matches the second prefix for the number of bits in the route, and the number of bits in the route is less than or equal to the number of bits in the second prefix.
- **upto *prefix-length***—The route's mask length falls between the two destination prefix lengths, inclusive.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Martian Addresses

max-areas

Syntax max-areas *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**]
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Modify the maximum number of IS-IS areas advertised.

Options ***number***—Maximum number of areas to include in the IS-IS hello (IIH) PDUs and link-state PDUs.

Range: 3 through 36

Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Limiting the Number of Advertised IS-IS Areas

maximum-bandwidth

Syntax maximum-bandwidth *bps*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-options multicast **interface** *interface-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit routing-options multicast **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the multicast bandwidth for the interface.

Options ***bps***—Bandwidth rate, in bits per second, for the multicast interface.

Range: 0 through any amount of bandwidth

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Defining Interface Bandwidth Maximums

maximum-paths

Syntax maximum-paths *path-limit* <log-interval *seconds*> <log-only | threshold *value*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit for the number of routes installed in a routing table based upon the route path.

Options

log-interval *seconds*—(Optional) Minimum time interval (in seconds) between log messages.

Range: 5 through 86,400

log-only—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.

path-limit—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

Default: No default

threshold *value*—(Optional) Percentage of the maximum number of routes that starts triggering warning. You can configure a percentage of the ***path-limit*** value that starts triggering the warnings.

Range: 1 through 100

NOTE: When the number or routes reaches the **threshold** value, routes are still installed into the routing table while warning messages are sent. When the number or routes reaches the ***path-limit*** value, then additional routes are rejected.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Route Limits for Routing Tables

maximum-prefixes

Syntax maximum-prefixes *prefix-limit* <log-interval *seconds*> <log-only | threshold *value*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit for the number of routes installed in a routing table based upon the route prefix.

Options

log-interval *seconds*—(Optional) Minimum time interval (in seconds) between log messages.

Range: 5 through 86,400

log-only—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.

prefix-limit—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.

Range: 1 through 4,294,967,295

Default: No default

threshold *value*—(Optional) Percentage of the maximum number of prefixes that starts triggering warning. You can configure a percentage of the ***prefix-limit*** value that starts triggering the warnings.

Range: 1 through 100

NOTE: When the number or routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number or routes reaches the *prefix-limit* value, then additional routes are rejected.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Route Limits for Routing Tables

med-igp-update-interval

Syntax med-igp-update-interval *minutes*;

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a timer for how long to delay updates for the multiple-exit discriminator (MED) path attribute for BGP groups and peers configured with the **metric-out igp *offset* delay-med-update** statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

Options ***minutes***—Interval to delay MED updates.

Default: 10 minutes

Range: 10 through 600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **metric-out on page 1615**
- Delaying Updates of the MED Path Attribute for BGP

mesh-group

Syntax mesh-group (blocked | *value*);

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an interface to be part of a mesh group, which is a set of fully connected nodes.

Options **blocked**—Configure the interface so that it does not flood link-state PDU packets.

value—Number that identifies the mesh group.

Range: 1 through 4,294,967,295 (2^{32} – 1; 32 bits are allocated to identify a mesh group)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Mesh Groups of IS-IS Interfaces

message-size

Syntax message-size *number*;

Hierarchy Level

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of route entries to be included in every RIP update message. To ensure interoperability with other vendors' equipment, use the standard of 25 route entries per message.

Options ***number***—Number of route entries per update message.

Range: 25 through 255 entries

Default: 25 entries

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the cost of an OSPF interface. The cost is a routing metric that is used in the link-state calculation.

To set the cost of routes exported into OSPF, configure the appropriate routing policy.

Options *metric*—Cost of the route.

Range: 1 through 65,535

Default: By default, the cost of an OSPF route is calculated by dividing the reference-bandwidth value by the bandwidth of the physical interface. Any specific value you configure for the **metric** overrides the default behavior of using the reference-bandwidth value to calculate the cost of route for that interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

metric (Aggregate, Generated, or Static Route)

Syntax (metric | metric2 | metric3 | metric4) *metric* <type *type*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Metric value for an aggregate, generated, or static route. You can specify up to four metric values, starting with **metric** (for the first metric value) and continuing with **metric2**, **metric3**, and **metric4**.

Options *metric*—Metric value.
Range: 0 through 4,294,967,295 ($2^{32} - 1$)

type *type*—(Optional) Type of route.
Range: 1 through 16

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Metric for all routes sent using the multiple exit discriminator (MED, or **MULTI_EXIT_DISC**) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.

You can specify a constant metric value by including the ***metric*** option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the **multihop** command—you can specify a variable metric by including the **minimum-igp** or **igp** option.

You can increase or decrease the variable metric calculated from the IGP metric (either from the **igp** or **igp-minimum** statement) by specifying a value for ***offset***. The metric is increased by specifying a positive value for ***offset***, and decreased by specifying a negative value for ***offset***.

You can specify for a BGP group or peer not to advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the **med-igp-update-interval** ***minutes*** at the **[edit routing-options]** hierarchy level.

Options

delay-med-update—Specify for a BGP group or peer configured with the **metric-out igp** statement not to advertise MED updates when the value worsens, that is, unless the value is lower.

NOTE: You cannot configure delay-med–update statement at the global BGP level.

igp—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop.

metric—Primary metric on all routes sent to peers.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: No metric is sent.

minimum-igp—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value.

offset—(Optional) Increases or decreases the metric by this value.

Range: -2^{31} through $2^{31} - 1$

Default: None

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure an EBGP multihop session.

External confederation peering is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case; multihop behavior is implied.

If you have confederation external BGP peer-to-loopback addresses, you still need the multihop configuration.

Default

If you omit this statement, all EBGP peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or "regular," BGP session), and the default time-to-live (TTL) value is 1.

Options

no-nexthop-change—Specify not to change the BGP next-hop value; for route advertisements, specify the **no-nexthop-self** option.

ttl-value—Configure the maximum TTL value for the TTL in the IP header of BGP packets.

Range: 1 through 255

Default: 64 (for multihop EBGP sessions, confederations, and IBGP sessions)

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring EBGP Multihop Sessions

multipath

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Allow load sharing among multiple EBGP paths and multiple IBGP paths.

Options

multiple-as—Disable the default check requiring that paths accepted by BGP multipath must have the same neighboring AS.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple **neighbor** statements.

By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the **neighbor** statement.

The **neighbor** statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an **allow all** statement in place of a **neighbor** statement.)

Options ***address***—IPv6 or IPv4 address of a single peer.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

neighbor

Syntax

```
neighbor neighbor-name {
  authentication-key password;
  authentication-type type;
  bfd-liveness-detection {
    authentication {
      algorithm algorithm-name;
      key-chain key-chain-name;
      loose-check;
    }
    detection-time {
      threshold milliseconds;
    }
    minimum-interval milliseconds;
    minimum-receive-interval milliseconds;
    transmit-interval {
      threshold milliseconds;
      minimum-interval milliseconds;
    }
    multiplier number;
    version (0 | 1 | automatic);
  }
  (check-zero | no-check-zero);
  import policy-name;
  message-size number;
  metric-in metric;
  metric-out metric;
  receive receive-options;
  route-timeout seconds;
  send send-options;
  update-interval seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols rip **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip **group** *group-name*],
[edit protocols rip **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure neighbor-specific RIP parameters, thereby overriding the defaults set for the routing device.

Options

neighbor-name—Name of an interface over which a routing device communicates to its neighbors.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the router ID in the BGP aggregator path attribute to zero. (This is one of the path attributes included in BGP update messages.) Doing this prevents different routing devices within an AS from creating aggregate routes that contain different AS paths.

Default If you omit this statement, the router ID is included in the BGP aggregator path attribute.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-ipv4-multicast

Syntax no-ipv4-multicast;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv4 multicast topologies.

Default Multicast topologies are disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Multicast Topologies

no-ipv4-routing

Syntax no-ipv4-routing;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IP version 4 (IPv4) routing.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling IPv4 Routing for IS-IS

no-ipv6-multicast

Syntax no-ipv6-multicast;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv6 multicast topologies.

Default Multicast topologies are disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Multicast Topologies

no-ipv6-routing

Syntax no-ipv6-routing;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IP version 6 (IPv6) routing.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling IPv6 Routing for IS-IS

no-ipv6-unicast

Syntax no-ipv6-unicast;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv6 unicast topologies.

Default IPv6 unicast topologies are disabled.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS IPv6 Unicast Topologies

no-nssa-abr

Syntax no-nssa-abr;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable exporting Type 7 link-state advertisements into not-stubby-areas (NSSAs) for an autonomous system boundary router (ASBR) or an area border router (ABR).

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling Export of LSAs into NSSAs Attached to ASBR ABRs

no-psnp-authentication

Syntax no-psnp-authentication;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis **level** *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **level** *level-number*],
[edit protocols isis **level** *level-number*],
[edit routing-instances *routing-instance-name* protocols isis **level** *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Suppress authentication check on partial sequence number PDU (PSNP) packets.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Authentication

no-qos-adjust

Syntax no-qos-adjust;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name* **reverse-oif-mapping**],
[edit logical-systems *logical-system-name* routing-options multicast **interface** *interface-name*],

[edit routing-options multicast **interface** *interface-name*],
[edit routing-options multicast **interface** *interface-name* **reverse-oif-mapping**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable hierarchical bandwidth adjustment for all subscriber interfaces that are identified by their MLD or IGMP request from a specific multicast interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Managing Subscriber Overcommitment

no-rfc-1583

Syntax no-rfc-1583;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable compatibility with RFC 1583, *OSPF Version 2*. If the same external destination is advertised by AS boundary routers that belong to different OSPF areas, disabling compatibility with RFC 1583 can prevent routing loops.

Default Compatibility with RFC 1583 is enabled by default.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control-level—To add this statement to the configuration.

Related Documentation
- Disabling OSPFv2 Compatibility with RFC 1583

no-unicast-topology

Syntax no-unicast-topology;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Exclude an interface from the IPv4 unicast topologies.

Default IPv4 unicast topologies are disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring IS-IS Multicast Topologies

no-validate

Syntax no-validate *policy-name*;

Hierarchy Level [edit protocols bgp group *group-name* **family** (inet | inet flow)],
[edit protocols bgp group *group-name* neighbor *address* **family** (inet | inet flow)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (inet | inet flow)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (inet | inet flow)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Omits the flow route validation procedure after packets are accepted by a policy.

Options ***policy-name***—Import policy to match NLRI messages.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Enabling BGP to Carry Flow-Specification Routes

node-link-protection

Syntax node-ink-protection;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis interface *interface-name*],
[edit logical-routers *logical-router-name* routing-instances *routing-instance-name* protocols isis interface *interface-name*],
[edit protocols isis interface *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable node-link protection on the specified IS-IS interface. The Junos OS creates an alternate loop-free path to the primary next hop for all destination routes that traverse a protected interface. This alternate path avoids the primary next-hop routing device altogether and establishes a path through a different routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id*],
[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a not-so-stubby area (NSSA). An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas.

You cannot configure an area as being both a stub area and an NSSA.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **stub on page 1710**

options

Syntax

```
options {
  syslog (level level | upto level level);
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the types of system logging messages sent about the routing protocols process to the system message logging file. These messages are also displayed on the system console. You can log messages at a particular level, or up to and including a particular level.

Options

level *level*—Severity of the message. It can be one or more of the following levels, in order of decreasing urgency:

- **alert**—Conditions that should be corrected immediately, such as a corrupted system database.
- **critical**—Critical conditions, such as hard drive errors.
- **debug**—Software debugging messages.
- **emergency**—Panic or other conditions that cause the system to become unusable.
- **error**—Standard error conditions.
- **info**—Informational messages.
- **notice**—Conditions that are not error conditions, but might warrant special handling.
- **warning**—System warning messages.

upto level *level*—Log all messages up to a particular level.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ospf

Syntax ospf { ... }

Hierarchy Level
[edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable OSPF routing on the routing device.

You must include the **ospf** statement to enable OSPF on the routing device.

Default OSPF is disabled on the routing device.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum OSPF Configuration

ospf3

Syntax ospf3 { ... }

Hierarchy Level
[edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable OSPFv3 routing on the routing device.

You must include the **ospf3** statement to enable OSPFv3.

Default OSPFv3 is disabled on the routing device.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum OSPF Configuration

out-delay

Syntax out-delay *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],
[edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *address*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],

[edit protocols bgp group *group-name* **neighbor** *address*],
[edit routing-instances *routing-instance-name* protocols bgp],
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates.

Default If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

Options *seconds*—Output delay time.

Range: 0 through 65,535 seconds

Default: 0 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Applying Policies to BGP Routes

outbound-route-filter

Syntax

```

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a BGP peer to accept outbound route filters from a remote peer.

Options

accept—Specify that outbound route filters from a BGP peer be accepted.

inet—Specify that IPv4 prefix-based outbound route filters be accepted.

inet6—Specify that IPv6 prefix-based outbound route filters be accepted.

NOTE: You can specify that both IPv4 and IPv6 outbound route filters be accepted.

prefix-based—Specify that prefix-based filters be accepted.

The **bgp-orf-cisco-mode** statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Applying Filters Provided by BGP Peers to Outbound Routes

overload

Syntax

```
overload {
  advertise-high-metrics;
  timeout seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the local routing device so that it appears to be overloaded. You might want to do this when you want the routing device to participate in IS-IS routing, but do not want it to be used for transit traffic. Note that traffic to immediately attached interfaces continues to transit the routing device. You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.

NOTE: If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set.

Options

advertise-high-metrics—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

timeout *seconds*—Number of seconds at which the overloading is reset.

Default: 0 seconds

Range: 60 through 1800 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring IS-IS to Make Routing Devices Appear Overloaded

overload

Syntax

```
overload {
    timeout seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf topology (default | ipv4-multicast | *name*)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the local routing device so that it appears to be overloaded. You might do this when you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic.

NOTE: Traffic destined to immediately attached interfaces continues to reach the routing device.

Options

timeout *seconds*—(Optional) Number of seconds at which the overloading is reset. If no timeout interval is specified, the routing device remains in overload state until the **overload** statement is deleted or a timeout is set.

Range: 60 through 1800 seconds

Default: 0 seconds

NOTE: Multitopology Routing does not support the timeout option.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Do not send active open messages to the peer. Rather, wait for the peer to issue an open request.

Default
If you omit this statement, all explicitly configured peers are active, and each peer periodically sends open requests until its peer responds.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling Transmission of Open Requests to BGP Peers

passive

Syntax passive;

Hierarchy Level [edit logical-systems *logical-system-name* protocols isis **interface** *interface-name*],
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],

[edit routing-instances *routing-instance-name* protocols isis **interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Advertise the direct interface addresses on an interface or into a level on the interface without actually running IS-IS on that interface or level.

This statement effectively prevents IS-IS from running on the interface. To enable IS-IS on an interface, include the **interface** statement at the **[edit protocols isis]** or the **[edit routing-instances *routing-instance-name* protocols isis]** hierarchy level. To disable it, include the **disable** statement at those hierarchy levels. The three states are mutually exclusive.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- disable
- Configuring Levels on IS-IS Interfaces

passive

Syntax

```
passive {
    traffic-engineering {
        remote-node-id address;
    }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* **interface** *interface-name*],

[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Advertise the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.

To configure an interface in OSPF passive traffic engineering mode, include the **traffic-engineering** statement. Configuring OSPF passive traffic engineering mode enables the dynamic discovery of OSPF AS boundary routers.

Enable OSPF on an interface by including the **interface** statement at the **[edit protocols (ospf | ospf3) area *area-id*]** or the **[edit routing-instances *routing-instance-name* protocols ospf area *area-id*]** hierarchy levels. Disable it by including the **disable** statement, To prevent OSPF from running on an interface, include the **passive** statement. These three states are mutually exclusive.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the neighbor (peer) AS number.

The autonomous system (AS) numeric range in plain-number format provides BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

You can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options ***autonomous-system***—AS number.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format

Range: 0.0 through 65535.65535 in AS-dot notation format

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

pim-to-igmp-proxy

Syntax

```
pim-to-igmp-proxy {
  upstream-interface [ interface-names ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Internet Group Management Protocol (IGMP) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the **pim-to-igmp-proxy** statement enables you to use IGMP to forward IPv4 multicast traffic across the PIM sparse mode domains.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM-to-IGMP Message Translation

pim-to-mld-proxy

Syntax

```
pim-to-mld-proxy {
    upstream-interface [ interface-names ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Multicast Listener Discovery (MLD) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the **pim-to-mld-proxy** statement enables you to use MLD to forward IPv6 multicast traffic across the PIM sparse mode domains.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

policy

Syntax policy *policy-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)],
[edit routing-options (**aggregate** | **generate**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a routing policy when configuring an aggregate or generated route's destination prefix in the **routes** part of the **aggregate** or **generate** statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route and, if the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or *primary*, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.

Options ***policy-name***—Name of a routing policy.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a flow map policy.

Options ***policy-names***—Name of one or more policies for flow mapping.

Required Privilege Level routing—To view this statement in the configuration.

policy (SSM Maps)

Syntax policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-options multicast **ssm-map** *ssm-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to an SSM map.

Options ***policy-names***—Name of one or more policies for SSM mapping.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To view this statement in the configuration.

Related Documentation

- Example: Configuring SSM Mapping

ppm

Syntax

```
ppm {
  centralized;
}
```

Hierarchy Level [edit protocols lacp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure PPM processing options for Link Aggregation Control Protocol (LACP) packets.

This command configures the PPM processing options for LACP packets only. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by entering the **no-delegate-processing** configuration statement in the **[edit routing-options ppm]** statement hierarchy.

Default Distributed PPM processing is enabled for all packets that use PPM.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Distributed Periodic Packet Management on a J-EX Series Switch (CLI Procedure) on page 1451

ppm

Syntax

```
ppm {
  no-delegate-processing;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
no-delegate-processing statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Disable distributed periodic packet management (PPM) to the Packet Forwarding Engine (on routers), to access ports (on J-EX4200 switches), or line cards (on J-EX8200 switches).

After you disable PPM, PPM processing continues to run on the Routing Engine.

Default enabled

Options **no-delegate-processing**—Disable PPM to the Packet Forwarding Engine, access ports, or line cards. Distributed PPM is enabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the preference for routes learned from BGP.

At the BGP global level, the preference statement sets the preference for routes learned from BGP. You can override this preference in a BGP group or peer preference statement.

At the group or peer level, the preference statement sets the preference for routes learned from the group or peer. Use this statement to override the preference set in the BGP global preference statement when you want to favor routes from one group or peer over those of another.

Options ***preference***—Preference to assign to routes learned from BGP or from the group or peer.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: 170 for the primary preference

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-options (**aggregate** | **generate** | **static**) (defaults | route)],
[edit routing-options rib *routing-table-name* (**aggregate** | **generate** | **static**) (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Preference value for a static, aggregated, or generated route. You also can specify a secondary preference value (**preference2**), as well as colors, which are even finer-grained preference values (**color** and **color2**).

Options *preference*—Preference value. A lower number indicates a more preferred route.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: 5 (for static routes), 130 (for aggregate and generated routes)

type—(Optional) Type of route.

Range: 1 through 16

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (inet | inet6) (any | flow | labeled-unicast | multicast | unicast)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Limit the number of prefixes received on a BGP peering session and a rate-limit logging when injected prefixes exceed a set limit.

Options

maximum *number*—When you set the maximum number of prefixes, a message is logged when that number is exceeded.

Range: 1 through 4,294,967,295 ($2^{32} - 1$)

teardown <*percentage*>—If you include the **teardown** statement, the session is torn down when the maximum number of prefixes is reached. If you specify a percentage, messages are logged when the number of prefixes exceeds that percentage. After the session is torn down, it is reestablished in a short time unless you include the **idle-timeout** statement. Then the session can be kept down for a specified amount of time, or forever. If you specify **forever**, the session is reestablished only after you issue a **clear bgp neighbor** command.

Range: 1 through 100

idle-timeout (forever | *timeout-in-minutes*)—(Optional) If you include the **idle-timeout** statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify **forever**, the session is reestablished only after you intervene with a **clear bgp neighbor** command.

Range: 1 through 2400

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- accepted-prefix-limit
- Enabling Multiprotocol BGP

priority

Syntax
priority *number*;

Hierarchy Level
[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*],
[edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* **vrrp-inet6-group** *group-id*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure a switch's priority for becoming the master default routing platform. The routing platform with the highest priority within the group becomes the master.

Options
number—Routing platform's priority for being elected to be the master router in the VRRP group. A larger value indicates a higher priority for being elected.

Range: 1 through 255

Default: 100 (for backup routers)

NOTE: Priority 255 cannot be assigned to routed VLAN interfaces (RVIs).

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

priority

Syntax priority *number*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols isis interface *interface-name* level *level-number*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*],
[edit protocols isis interface *interface-name* level *level-number*],
[edit routing-instances *routing-instance-name* protocols isis interface *interface-name* level *level-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The interface's priority for becoming the designated router. The interface with the highest priority value becomes that level's designated router.

The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.

Options *number*—Priority value.

Range: 0 through 127

Default: 64

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast)] area *area-id* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the routing device's priority for becoming the designated routing devices. The routing device that has the highest priority value on the logical IP network or subnet becomes the network's designated router. You must configure at least one routing device on each logical IP network or subnet to be the designated router. You also should specify a routing device's priority for becoming the designated router on point-to-point interfaces.

Options *number*—Routing device's priority for becoming the designated router. A priority value of 0 means that the routing device never becomes the designated router. A value of 1 means that the routing device has the least chance of becoming a designated router.

Range: 0 through 255

Default: 128

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* **routing-options static** route *destination-prefix*],
[edit routing-instances *routing-instance-name* **routing-options static** route *destination-prefix*],
[edit **routing-options** rib inet6.0 **static** route *destination-prefix*],
[edit **routing-options static** route *destination-prefix*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure an independent metric or preference on a static route.

Options

address—IPv4, IPv6, or ISO network address of the next hop.

interface-name—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered Ethernet interface as the next-hop interface for a static route, specify **qualified-next-hop *interface-name***, where ***interface-name*** is the name of the IPv4 or IPv6 unnumbered Ethernet interface.

metric—Metric value.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

preference—Preference value. A lower number indicates a more preferred route.

Range: 0 through 4,294,967,295 ($2^{32} - 1$)

Default: 5

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring an Independent Preference for Static Routes

readvertise

Syntax (readvertise | no-readvertise);

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit logical-systems *logical-system-name* routing-options **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-options **static** (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether static routes are eligible to be readvertised by routing protocols:

- **readvertise**—Readvertise static routes.
- **no-readvertise**—Mark a static route as being ineligible for readvertisement; include the **no-readvertise** option when configuring the route.

Default readvertise

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

realm

Syntax

```
realm (ipv4-unicast | ipv4-multicast | ipv6-unicast) {
    area area-id {
        interface interface-name;
    }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **ospf3**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **ospf3**],
[edit protocols **ospf3**],
[edit routing-instances *routing-instance-name* protocols **ospf3**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure OSPFv3 to advertise address families other than unicast IPv6. The Junos OS maps each address family you configure to a separate realm with its own set of neighbors and link-state database.

Options

ipv4-unicast—Configure a realm for IPv4 unicast routes.

ipv4-multicast—Configure a realm for IPv4 multicast routes.

ipv6-multicast—Configure a realm for IPv6 multicast routes.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

receive

Syntax receive *receive-options*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit protocols **rip**],
[edit protocols rip group *group-name* **neighbor** *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip group *group-name* **neighbor** *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RIP receive options.

Options ***receive-options***—One of the following:

- **both**—Accept both RIP version 1 and version 2 packets.
- **none**—Do not receive RIP packets.
- **version-1**—Accept only RIP version 1 packets.
- **version-2**—Accept only RIP version 2 packets.

Default: both

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **send on page 1700**
- Configuring RIP Update Messages

receive

Syntax receive <none>;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* protocols ripng group *group-name* neighbor *neighbor-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],

[edit protocols ripng],
[edit protocols ripng group *group-name* neighbor *neighbor-name*],
[edit routing-instances *routing-instance-name* protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng group *group-name* neighbor *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable or disable receiving of update messages.

Options **none**—(Optional) Disable receiving update messages.

Default: Enabled

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **send on page 1701**
- Configuring RIPng Update Messages

redundant-sources

Syntax redundant-sources [*addresses*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **flow-map** *flow-map-name*],
[edit routing-options multicast **flow-map** *flow-map-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a list of redundant sources for multicast flows defined by a flow map.

Options ***addresses***—List of IPv4 or IPv6 addresses for use as redundant (backup) sources for multicast flows defined by a flow map.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Defining Flow Properties

reference-bandwidth

Syntax reference-bandwidth *reference-bandwidth*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the reference bandwidth used in calculating the default interface cost. The cost is calculated using the following formula:

```
cost = reference-bandwidth/bandwidth
```

Options ***reference-bandwidth***—Reference bandwidth, in megabits per second.

Default: 10 Mbps

Range: 9600 through 1,000,000,000,000 Mbps

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the Reference Bandwidth Used in IS-IS Metric Calculations

reference-bandwidth

Syntax reference-bandwidth *reference-bandwidth*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit protocols (**ospf** | **ospf3**)],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the reference bandwidth used in calculating the default interface cost. The cost is calculated using the following formula:

```
cost = ref-bandwidth/bandwidth
```

Options ***ref-bandwidth***—Reference bandwidth, in bits per second.

Default: 100 Mbps (100,000,000 bits)

Range: 9600 through 1,000,000,000,000 bits

NOTE: The default behavior is to use the reference-bandwidth value to calculate the cost of OSPF interfaces. You can override this behavior for any OSPF interface by configuring a specific cost with the metric statement.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. This operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.

The set of reserved AS numbers is in the range from 64,512 through 65,535.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Removing Private AS Numbers from AS Paths

resolution

Syntax

```
resolution {
  rib routing-table-name {
    import [ policy-names ];
    resolution-ribs [ routing-table-names ];
  }
}
```

Hierarchy Level

[edit routing-instances *routing-instance-name* routing-options **static** (defaults | route)],
[edit routing-options rib *routing-table-name* **static** (defaults | route)],
[edit routing-options **static** (defaults | route)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure statically configured routes to be deleted from or retained in the forwarding table when the routing protocol process shuts down normally:

- **retain**—Have a static route remain in the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.
- **no-retain**—Delete statically configured routes from the forwarding table when the routing protocol process shuts down normally.

Default **no-retain**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors.

Options ***seconds***—Interval to wait.

Range: 1 through 65,535 seconds

Default: 5 seconds

NOTE: You must configure link-state advertisement (LSA) retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because the Junos OS delays LSA acknowledgments by up to 2 seconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

rib (General)

Syntax

```
rib routing-table-name {
  aggregate {
    defaults {
      ... aggregate-options ...
    }
    route destination-prefix {
      policy policy-name;
      ... aggregate-options ...
    }
    generate {
      defaults {
        generate-options;
      }
      route destination-prefix {
        policy policy-name;
        generate-options;
      }
    }
    martians {
      destination-prefix match-type <allow>;
    }
  }
  static {
    defaults {
      static-options;
    }
    rib-group group-name;
    route destination-prefix {
      next-hop;
      static-options;
    }
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Create a routing table.

Explicitly creating a routing table with the ***routing-table-name*** statement is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group. Simply including the **passive** statement to indicate that a routing table is part of a routing table group is sufficient to create it.

NOTE: The IPv4 multicast routing table (inet.1) and the IPv6 multicast routing table (inet6.1) are not supported for this statement.

Default If you do not specify a routing table name with the ***routing-table-name*** statement, the software uses the default routing tables, which are **inet.0** for unicast routes and **inet.1** for the multicast cache.

Options ***routing-table-name***—Name of the routing table, in the following format:
protocol [***.identifier***]

- ***protocol*** is the protocol family. It can be **inet6** for the IPv6 family, **inet** for the IPv4 family, **iso** for the ISO protocol family, or ***instance-name*.iso.0** for an ISO routing instance.
- ***identifier*** is a positive integer that specifies the instance of the routing table.

Default: **inet.0**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- passive

rib (Route Resolution)

Syntax
```
rib routing-table-name {
  import [ policy-names ];
  resolution-ribs [ routing-table-names ];
}
```

Hierarchy Level
```
[edit logical-systems logical-system-name routing-instances routing-instance-name
  routing-options resolution],
[edit logical-systems logical-system-name routing-options resolution],
[edit routing-instances routing-instance-name routing-options resolution],
[edit routing-options resolution]
```

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a routing table name for route resolution.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Route Resolution

rib-group

Syntax rib-group *group-name*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit routing-instances *routing-instance-name* protocols bgp **family** inet (any | labeled-unicast | unicast | multicast)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** inet (any | labeled-unicast | unicast | multicast)],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** inet (any | labeled-unicast | unicast | multicast)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Add unicast prefixes to unicast and multicast tables.

Options
group-name—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens. You generally specify only one routing table group.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

rib-group

Syntax

```
rib-group {
    inet group-name;
    inet6 group-name;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **isis**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **isis**],
[edit protocols **isis**],
[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Install routes learned from IS-IS routing instances into routing tables in the IS-IS routing table group. You can install IPv4 routes or IPv6 routes.

Support for IPv6 routing table groups in IS-IS enables IPv6 routes that are learned from IS-IS routing instances to be installed into other routing tables defined in an IS-IS routing table group.

Options

group-name—Name of the routing table group.

inet—Install IPv4 IS-IS routes.

inet6—Install IPv6 IS-IS routes.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

rib-groups

Syntax

```
rib-groups {
  group-name {
    export-rib group-name;
    import-policy [ policy-names ];
    import-rib [ group-names ];
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.

Each routing table group must contain one or more routing tables that the Junos OS uses when importing routes (specified in the **import-rib** statement) and optionally can contain one routing table group that the Junos OS uses when exporting routes to the routing protocols (specified in the **export-rib** statement).

Options ***group-name***—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

rip

Syntax rip {...}

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable RIP routing on the routing device.

Default RIP is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum RIP Configuration

ripng

Syntax ripng {...}

Hierarchy Level [edit logical-systems *logical-system-name* protocols],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols],
[edit protocols],
[edit routing-instances *routing-instance-name* protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable RIPng routing on the routing device.

Default RIPng is disabled on the routing device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Minimum RIPng Configuration

route-distinguisher-id

Syntax route-distinguisher-id *address*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a route distinguisher identifier for a routing instance, specifying an IP address. If a route distinguisher is configured for a particular routing instance, that value supersedes the route distinguisher configured by this statement.

Options ***address***—IP address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Route Distinguishers for VRF and Layer 2 VPN Instances

route-record

Syntax route-record;

Hierarchy Level [edit logical-systems *logical-system-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Export the AS path and routing information to the traffic sampling process.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Route Recording for Flow Aggregation
- *Junos OS Network Interfaces Configuration Guide*

route-timeout

Syntax route-timeout *seconds*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip **group** *group-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols rip **group** *group-name*],
[edit protocols **rip**],
[edit protocols rip **group** *group-name*],
[edit routing-instances *routing-instance-name* protocols **rip**],
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the route timeout interval for RIP.

Options ***seconds***—Estimated time to wait before making updates to the routing table.

Range: 30 through 360 seconds

Default: 180 seconds

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring RIP Timers

route-timeout

Syntax route-timeout *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the route timeout interval for RIPng.

Options ***seconds***—Estimated time to wait before making updates to the routing table.

Range: 30 through 360 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring RIPng Timers

route-type-community

Syntax route-type-community (iana | vendor);

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | **ospf3**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an extended community value to encode the OSPF route type. Each extended community is coded as an eight-octet value. This statement sets the most significant bit to either an IANA or vendor-specific route type.

Options **iana**—Encode a route type with the value **0x0306**. This is the default value.

vendor—Encode the route type with the value **0x8000**.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring OSPF Domain IDs for VPNs

router-id

Syntax router-id *address*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the routing device's IP address.

NOTE: We strongly recommend that you configure the router identifier under the [edit routing-options] hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

Options ***address***—IP address of the routing device.

Default: Address of the first interface encountered by the Junos OS

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Router Identifiers for BGP and OSPF

routing-options

Syntax routing-options { ... }

Hierarchy Level [edit],
[edit logical-systems *logical-system-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],
[edit routing-instances *routing-instance-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure protocol-independent routing properties.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Protocol-Independent Routing Properties Configuration Statements

rpf-check-policy

Syntax rpf-check-policy [*policy-names*];

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply policies for disabling RPF checks on arriving multicast packets. The policies must be correctly configured.

Options ***policy-names***—Name of one or more multicast RPF check policies.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring RPF Policies

scope

Syntax
```
scope scope-name {
  interface [ interface-names ];
  prefix destination-prefix;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],
[edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-instances *routing-instance-name* routing-options multicast],
[edit routing-options multicast]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multicast scoping.

Options ***scope-name***—Name of the multicast scope.

The remaining statements are explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Creating a Named Scope for Multicast Scoping

scope-policy

Syntax scope-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* routing-options multicast],
[edit routing-options multicast]

NOTE: You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the scope statement to a specific routing instance at the [edit routing-instances *routing-instance-name* routing-options multicast] or [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast] hierarchy level.

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply policies for scoping. The policy must be correctly configured at the **edit policy-options policy-statement** hierarchy level.

Options ***policy-names***—Name of one or more multicast scope policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **scope on page 1698**
- Using a Scope Policy for Multicast Scoping

send

Syntax send *send-options*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* protocols rip group *group-name* **neighbor** *neighbor-name*],

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure OSPF to use MPLS label-switched paths (LSPs) as shortcut next hops. By default, shortcut routes calculated through OSPFv2 are installed in the**inet.3** routing table, and shortcut routes calculated through OSPFv3 are installed in the **inet6.3** routing table.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

source

Syntax

source [*addresses*];

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit logical-systems *logical-system-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **ssm-map** *ssm-map-name*],
[edit routing-options multicast **ssm-map** *ssm-map-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Specify IPv4 or IPv6 source addresses for an SSM map.

Options

addresses—IPv4 or IPv6 source addresses.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To view this statement in the configuration.

Related Documentation

- Example: Configuring SSM Mapping

source-routing

Syntax

```
source-routing {
   (ip | ipv6)
}
```

Hierarchy Level [edit routing-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable source routing.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling Source Routing

spf-options

Syntax

```
spf-options {
    delay milliseconds;
    holddown milliseconds;
    rapid-runs number;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols isis],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols isis],
[edit protocols isis],
[edit routing-instances *routing-instance-name* protocols isis]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a holddown interval after SPF algorithm runs the maximum number of times.

Options

delay *milliseconds*—Time interval between the detection of a topology change and when the SPF algorithm runs.

Range: 50 through 1000 milliseconds

Default: 200 milliseconds

holddown *milliseconds*—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.

Range: 2000 through 10,000 milliseconds

Default: 5000 milliseconds

rapid-runs *number*—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the holddown interval begins.

Range: 1 through 5

Default: 3

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a hold-down interval after the SPF algorithm runs the maximum number of times.

Options

delay ***milliseconds***—Time interval between the detection of a topology change and when the SPF algorithm runs.

Range: 50 through 8000 milliseconds

Default: 200 milliseconds

holddown ***milliseconds***—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.

Range: 2000 through 20,000 milliseconds

Default: 5000 milliseconds

rapid-runs ***number***—Maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the holddown interval begins.

Range: 1 through 5

Default: 3

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-options rib *routing-table-name*],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-options rib *routing-table-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure static routes to be installed in the routing table. You can specify any number of routes within a single **static** statement, and you can specify any number of **static** options in the configuration.

Options **defaults**—Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the **static** statement. This part of the **static** statement is optional.

route ***destination-prefix***—Destination of the static route.

- **defaults**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.
- **next-hop** ***address***—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).
- ***nsap-prefix***—***nsap-prefix*** is the network service access point (NSAP) address for ISO.

next-hop options—Additional information for how to manage forwarding of packets to the next hop.

- **discard**—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.
- ***iso-net***—Reach the next-hop routing device by specifying an ISO NSAP.
- **next-table** ***routing-table-name***—Name of the next routing table to the destination.
- **receive**—Install a receive route for this destination into the routing table.
- **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

static-options—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in ***static-options***. Each of the options is explained separately.

- **(active | passive)**;
- **as-path <***as-path***> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator** ***as-number in-address*****>**;
- **community [** ***community-ids*** **]**;
- **(install | no-install)**;
- **(metric | metric2 | metric3 | metric4)** ***value*** **<type** ***type*****>**;
- **(preference | preference2 | color | color2)** ***preference*** **<type** ***type*****>**;
- **(readvertise | no-readvertise)**;

- **(resolve | no-resolve)**;
- **(no-retain | retain)**;
- **tag** *string*;

The remaining statements are explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id*],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify that this area not be flooded with AS external link-state advertisements (LSA)s. You must include the **stub** statement when configuring all routing devices that are in the stub area.

The backbone cannot be configured as a stub area.

You cannot configure an area to be both a stub area and a not-so-stubby area (NSSA).

Options
no-summaries—(Optional) Do not advertise routes into the stub area. If you include the **default-metric** option, only the default route is advertised.

summaries—(Optional) Flood summary LSAs into the stub area.

The remaining statement is explained separately.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

subscriber-leave-timer

Syntax subscriber-leave-timer *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-options multicast **interface** *interface-name*],
[edit routing-instances *routing-instance-name* routing-options multicast **interface** *interface-name*],
[edit routing-options multicast **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Length of time before the multicast VLAN updates QoS data (for example, available bandwidth) for subscriber interfaces after it receives an IGMP leave message.

Options ***seconds***—Length of time before the multicast VLAN updates QoS data (for example, available bandwidth) for subscriber interfaces after it receives an IGMP leave message. Specifying a value of 0 results in an immediate update; this is the same as if the statement were not configured.

Range: 0 through 30

Default: 0 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Managing Subscriber Overcommitment

summaries

Syntax (summaries | no-summaries);

Hierarchy Level [edit logical-systems *logical-system-name* protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit logical-systems *logical-system-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**],
[edit protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast)] area *area-id* **nssa**],
[edit routing-instances *routing-instance-name* protocols (ospf | ospf3) **area** *area-id* **nssa**],
[edit routing-instances *routing-instance-name* protocols ospf3 **realm** (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* **nssa**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether or not area border routers advertise summary routes into an not-so-stubby area (NSSA):

- **summaries**—Flood summary link-state advertisements (LSAs) into the NSSA.
- **no-summaries**—Prevent area border routers from advertising summaries into an NSSA. If **default-metric** is configured for an NSSA, a Type 3 LSA is injected into the area by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols bgp group *group-name*],
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *neighbor-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Limiting TCP Segment Size for BGP

threshold

Syntax threshold suppress *value* <reuse *value*>;

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options **multicast** forwarding-cache],
[edit logical-systems *logical-system-name* routing-options **multicast** forwarding-cache],
[edit routing-instances *routing-instance-name* routing-options **multicast** forwarding-cache],
[edit routing-options **multicast** forwarding-cache]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the suppression and reuse thresholds for multicast forwarding cache limits.

Options

reuse *value*—Value at which to begin creating new multicast forwarding cache entries. This value is optional. If configured, this number should be less than the **suppress** value.

Range: 1 through 200,000

suppress *value*—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the **reuse** value.

Range: 1 through 200,000

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.

Default

The default BGP protocol-level tracing options are inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level. The default group-level trace options are inherited from the BGP protocol-level **traceoptions** statement. The default peer-level trace options are inherited from the group-level **traceoptions** statement.

Options

disable—(Optional) Disable the tracing operation. You can use this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *name*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place BGP tracing output in the file **bgp-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

BGP Tracing Flags

- **4byte-as**—4-byte AS events
- **bfd**—BFD protocol events
- **damping**—Damping operations
- **graceful-restart**—Graceful restart events
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets
- **refresh**—BGP refresh packets
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **filter**—Filter trace information. Applies only to **route** and **damping** tracing flags.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*****.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*****.0** is renamed ***trace-file*****.1** and ***trace-file*** is renamed ***trace-file*****.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*****k** to specify KB, ***x*****m** to specify MB, or ***x*****g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols **isis**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple **flag** statements.

Default

The default IS-IS protocol-level tracing options are those inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***name***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory **/var/log**. We recommend that you place IS-IS tracing output in the file **isis-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag ***flag***—Tracing operation to perform. To specify more than one flag, include multiple **flag** statements.

IS-IS Protocol-Specific Tracing Flags

- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets

- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDU packets
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure OSPF protocol-level tracing options.

To specify more than one tracing operation, include multiple **flag** statements.

Default

The default OSPF protocol-level tracing options are those inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place OSPF tracing output in the file **ospf-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis packets
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **spf**—Shortest-path-first (SPF) calculations.

Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations.

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

traceoptions (RIP)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **rip**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **rip**],
[edit protocols **rip**],
[edit routing-instances *routing-instance-name* protocols **rip**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set RIP protocol-level tracing options.

Default The default RIP protocol-level trace options are inherited from the global **traceoptions** statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file **/var/log/rip-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets
- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets

- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **receive-detail**—Provide detailed trace information for packets being received
- **send**—Packets being transmitted
- **send-detail**—Provide detailed trace information for packets being transmitted

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions (RIPng)

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols ripng],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ripng],
[edit protocols ripng],
[edit routing-instances *routing-instance-name* protocols ripng]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set RIPng protocol-level tracing options.

Default The default RIPng protocol-level trace options are inherited from the global **traceoptions** statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIPng tracing output in the file **/var/log/ripng-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.
If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

RIPng Tracing Options

- **error**—RIPng error packets
- **expiration**—RIPng route expiration processing
- **holddown**—RIPng hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIPng packets
- **request**—RIPng information packets such as request, poll, and poll entry packets

- **trigger**—RIPng triggered updates
- **update**—RIPng update packets

Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **receive-detail**—Provide detailed trace information for packets being received
- **send**—Packets being transmitted
- **send-detail**—Provide detailed trace information for packets being transmitted

no-world-readable—(Optional) Do not allow any user to read the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions (All Routing Protocols)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-options flow]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations that track all routing protocol functionality in the routing device.

To specify more than one tracing operation, include multiple **flag** statements.

Default If you do not include this statement, no global tracing operations are performed.

Options **Values:**

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place global routing protocol tracing output in the file **routing-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals

- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-synchronization**—Nonstop active routing synchronization
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

traffic-engineering (OSPF)

Syntax

```
traffic-engineering {
  <advertise-unnumbered-interfaces>;
  <credibility-protocol-preference>;
  ignore-lsp-metrics;
  multicast-rpf-routes;
  no-topology;
  shortcuts {
    lsp-metric-into-summary;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (**ospf** | ospf3)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (**ospf** | ospf3)],
[edit protocols (**ospf** | ospf3)],
[edit routing-instances *routing-instance-name* protocols (**ospf** | ospf3)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable the OSPF traffic engineering features.

Default

Traffic engineering support is disabled.

Options

advertise-unnumbered-interfaces—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. You do not need to include this statement if RSVP is able to signal unnumbered interfaces as defined in RFC 3477.

credibility-protocol-preference—(Optional) (OSPFv2 only) Specify to use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior of having the traffic engineering database prefer IS-IS routes even if OSPF routes are configured a with a lower, that is, preferred, preference value.

multicast-rpf-routes—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the **inet.2** routing table.

no-topology—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* routing-options multicast **pim-to-mld-proxy**],
[edit routing-options multicast **pim-to-igmp-proxy**],
[edit routing-options multicast **pim-to-mld-proxy**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge–facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the **pim-to-igmp-proxy** statement), or into corresponding MLD report or leave messages (if you include the **pim-to-mld-proxy** statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.

Options
interface-names—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ([ ]). For details about specifying interfaces, see the *Junos OS Network Interfaces Configuration Guide*.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

virtual-inet6-address

Syntax virtual-inet6-address [*addresses*];

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* vrrp-inet6-group *group-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv6 group. You can configure up to eight addresses.

NOTE: The address of an aggregated Ethernet interface (a LAG) or a routed VLAN interface (RVI) cannot be assigned as the virtual router address in a VRRP IPv6 group.

Options ***addresses***—Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface's physical address, the interface becomes the master virtual router for the group.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

virtual-link

Syntax

```
virtual-link neighbor-id router-id transit-area area-id {
    disable;
    authentication key <key-id identifier>;
    dead-interval seconds;
    hello-interval seconds;
    ipsec-sa name;
    retransmit-interval seconds;
    transit-delay seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf area *area-id*],
[edit protocols (ospf | ospf3) area *area-id*],
[edit routing-instances *routing-instance-name* protocols ospf area *area-id*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For backbone areas only, create a virtual link to use in place of an actual physical link. All area border routers and other routing devices on the backbone must be contiguous. If this is not possible and there is a break in OSPF connectivity, use virtual links to create connectivity to the OSPF backbone. When configuring virtual links, you must configure links on the two routing devices that form the end points of the link, and both these two routing devices must be area border routers. You cannot configure links through stub areas.

Options

neighbor-id *router-id*—IP address of the routing device at the remote end of the virtual link.

transit-area *area-id*—Area identifier of the area through which the virtual link transits. Virtual links are not allowed to transit the backbone area.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring OSPF Areas

virtual-link-local-address

Syntax virtual-link-local-address *ipv6-address*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address* vrrp-inet6-group *group-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a virtual link local address for a Virtual Router Redundancy Protocol (VRRP) IPv6 group. You must explicitly define a virtual link local address for each VRRP IPv6 group. The virtual link local address must be in the same subnet as the physical interface address.

Options ***ipv6-address***—Virtual link local IPv6 address for VRRP for an IPv6 group.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring VRRP for IPv6 (CLI Procedure) on page 1452

vrrp-inet6-group

Syntax

```
vrrp-inet6-group group-id {
  inet6-advertise-interval milliseconds;
    preempt{
      hold-time seconds;
    }
    priority number;
    virtual-inet6-address;
    virtual-link-local-address
  }
```

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family inet6 address *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a Virtual Router Redundancy Protocol (VRRP) IPv6 group.

Options ***group-id***—VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the **source-address-filter** statement. MAC addresses ranging from **00:00:5e:00:01:00** through **00:00:5e:00:01:ff** are reserved for VRRP, as defined in RFC 3768. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

Range: 0 through 255

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

CHAPTER 74

Operational Commands for Layer 3 Protocols

clear (ospf | ospf3) database

Syntax

clear (ospf | ospf3) database
<advertising-router (*router-id* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<logical-system (all | *logical-system-name*)>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<router>

Syntax (J-EX Series Switch)

clear (ospf | ospf3) database
<advertising-router (*router-id* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<router>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine. You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries.

CAUTION: This command is useful only for testing. Use it with care, because it causes significant network disruption.

Options

none—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

advertising-router (*router-id* | self)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

area *area-id*—(Optional) Discard entries for the LSAs in the specified area.

asbrsummary—(Optional) Discard summary AS boundary router LSA entries.

external—(Optional) Discard external LSAs.

instance *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.

inter-area-prefix—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

inter-area-router—(OSPFv3 only) (Optional) Discard interarea router LSAs.

intra-area-prefix—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

link-local—(Optional) Delete link-local LSAs.

lsa-id *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.

netsummary—(Optional) Discard summary network LSAs.

network—(Optional) Discard network LSAs.

nssa—(Optional) Discard not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Discard opaque area-scope LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

Required Privilege Level

clear (ospf | ospf3) neighbor

Syntax

clear (ospf | ospf3) neighbor
<area *area-id*>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<neighbor>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

clear (ospf | ospf3) neighbor
<area *area-id*>
<instance *instance-name*>
<interface *interface-name*>
<neighbor>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Tear down Open Shortest Path First (OSPF) neighbor connections.

Options

none—Tear down OSPF connections with all neighbors for all routing instances.

area *area-id*—(Optional) Tear down neighbor connections for the specified area only.

instance *instance-name*—(Optional) Tear down neighbor connections for the specified routing instance only.

interface *interface-name*—(Optional) Tear down neighbor connections for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear the state of the specified neighbor only.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Clear the state of the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

clear bgp neighbor

Syntax

clear bgp neighbor
<as *as-number*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>
<soft | soft-inbound>
<soft-minimum-igp>

Syntax (J-EX Series Switch)

clear bgp neighbor
<as *as-number*>
<instance *instance-name*>
<*neighbor*>
<soft | soft-inbound>
<soft-minimum-igp>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Perform one of the following tasks:

- Change the state of one or more Border Gateway Protocol (BGP) neighbors to **IDLE**. For neighbors in the **ESTABLISHED** state, this command drops the TCP connection to the neighbors and then reestablishes the connection.
- (**soft** or **soft-inbound** keyword only) Reapply export policies or import policies, respectively, and send refresh updates to one or more BGP neighbors without changing their state.

Options

none—Change the state of all BGP neighbors to **IDLE**.

as *as-number*—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

instance *instance-name*—(Optional) Apply this command only to neighbors for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

soft—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

soft-inbound—(Optional) Reapply any import policies and send refresh updates to neighbors without clearing the state.

soft-minimum-igp—(Optional) Provides soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

Required Privilege Level clear

clear bgp table

Syntax **clear bgp table *table-name***
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) **clear bgp table *table-name***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Request BGP to refresh routes in a specified routing table.

Options logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table-name—Request that BGP refresh routes in the specified table.

Additional Information In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the **clear bgp table** command to request that BGP refresh routes in a VPN instance table.

Required Privilege Level clear

List of Sample Output **clear bgp table private.inet.0 on page 1758**

Output Fields This command produces no output.

clear bgp table private.inet.0

```
user@host> clear bgp table private.inet.0
```

clear ipv6 neighbors

Syntax clear ipv6 neighbors
<all | host *hostname*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear IPv6 neighbor cache information.

Options none—Clear all IPv6 neighbor cache information.

all—(Optional) Clear all IPv6 neighbor cache information.

host *hostname*—(Optional) Clear the information for the specified IPv6 neighbors.

Required Privilege Level view

Related Documentation

clear isis adjacency

Syntax

clear isis adjacency
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>

Syntax (J-EX Series Switch)

clear isis adjacency
<instance *instance-name*>
<interface *interface-name*>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Remove entries from the Intermediate System-to-Intermediate System (IS-IS) adjacency database.

Options

none—Remove all entries from the adjacency database.

instance *instance-name*—(Optional) Clear all adjacencies for the specified routing instance only.

interface *interface-name*—(Optional) Clear all adjacencies for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear adjacencies for the specified neighbor only.

```

clear isis database

Syntax

clear isis database
<*entries*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<purge>

Syntax (J-EX Series Switch)

clear isis database
<*entries*>
<instance *instance-name*>
<purge>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Remove the entries from the Intermediate System-to-Intermediate System (IS-IS) link-state database, which contains prefixes and topology information. You can also use **purge** with any of the options to initiate a network-wide purge of link-state PDUs (LSPs) rather than the local deletion of entries from the IS-IS link-state database.

CAUTION: In a production network, the purge command option may cause short-term network-wide traffic disruptions. Use with caution!

Options

none—Remove all entries from the IS-IS link-state database for all routing instances.

entries—(Optional) Name of the database entry.

instance *instance-name*—(Optional) Clear all entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

purge—(Optional) Discard all entries in the IS-IS link-state database.

Required Privilege Level

clear isis overload

Syntax
clear isis overload
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear isis overload
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Reset the Intermediate System-to-Intermediate System (IS-IS) dynamic overload bit. This command can appear to not work, continuing to display **overload** after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.

Options
none—Reset the IS-IS dynamic overload bit.

instance *instance-name*—(Optional) Reset the IS-IS dynamic overload bit for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

clear isis statistics

Syntax
clear isis statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear isis statistics
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Set statistics about Intermediate System-to-Intermediate System (IS-IS) traffic to zero.

Options
none—Set IS-IS traffic statistics to zero for all routing instances.

instance *instance-name*—(Optional) Set IS-IS traffic statistics to zero for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

clear ospf overload

Syntax
clear ospf overload
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear ospf overload
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear the Open Shortest Path First version 2 (OSPFv2) overload bit and rebuild link-state advertisements (LSAs).

Options
none—Clear the overload bit and rebuild LSAs for all routing instances.

instance *instance-name*—(Optional) Clear the overload bit and rebuild LSAs for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

List of Sample Output
clear ospf overload on page 1768

Output Fields
When you enter this command, you are provided feedback on the status of your request.

clear rip general-statistics

Syntax
clear rip general-statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear rip general-statistics

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Routing Information Protocol (RIP) general statistics.

Options
none—Clear RIP general statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
clear

```
user@host> clear rip general-statistics
```

clear rip statistics

Syntax

clear rip statistics
<instance (all | *instance-name*)>
<logical-system (all | *logical-system-name*)>
<*neighbor*>

Syntax (J-EX Series Switch)

clear rip statistics
<instance (all | *instance-name*)>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Routing Information Protocol (RIP) statistics.

Options

none—Reset RIP counters for all neighbors for all routing instances.

instance (all | *instance-name*)—(Optional) Clear RIP statistics for all instances or for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear RIP statistics for the specified neighbor only.

Required Privilege Level

clear ripng general-statistics

Syntax
clear ripng general-statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
clear ripng general-statistics

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear Routing Information Protocol next generation (RIPng) general statistics.

Options
none—Clear RIPng general statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show (ospf | ospf3) interface

Syntax

show (ospf | ospf3) interface
<brief | detail | extensive>
<area *area-id*>
<*interface-name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ip4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) interface
<brief | detail | extensive>
<area *area-id*>
<*interface-name*>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the status of Open Shortest Path First (OSPF) interfaces.

Options

none—Display standard information about the status of all OSPF interfaces for all routing instances

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the interfaces that belong to the specified area.

interface-name—(Optional) Display information for the specified interface.

instance *instance-name*—(Optional) Display all OSPF interfaces under the named routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the interfaces for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Required Privilege Level

show ospf interface area area-id on page 1777
show ospf interface extensive (When Flooding Reduction Is Enabled) on page 1777

Output Fields Table 203 on page 1774 lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

Table 203: show (ospf | ospf3) interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface running OSPF version 2 or OSPF version 3.	All levels
State	State of the interface: **BDR**, **Down**, **DR**, **DRother**, **Loop**, **PtToPt**, or **Waiting**.	All levels
Area	Number of the area that the interface is in.	All levels
DR ID	Address of the area's designated router.	All levels
BDR ID	Backup designated router for a particular subnet.	All levels
Nbrs	Number of neighbors on this interface.	All levels
Type	Type of interface: **LAN**, **NBMA**, **P2MP**, **P2P**, or **Virtual**.	**detail extensive**
Address	IP address of the neighbor.	**detail extensive**
Mask	Netmask of the neighbor.	**detail extensive**
Prefix-length	(OSPFv3) IPv6 prefix length, in bits.	**detail extensive**
OSPF3-Intf-Index	(OSPFv3) OSPF version 3 interface index.	**detail extensive**
MTU	Interface's maximum transmission unit (MTU).	**detail extensive**
Cost	Interface's cost (metric).	**detail extensive**
DR addr	Address of the designated router.	**detail extensive**
BDR addr	Address of the backup designated router.	**detail extensive**
Adj count	Number of adjacent neighbors.	**detail extensive**
Secondary	Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface only for one area.	**detail extensive**
Flood Reduction	Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the **DoNotAge** bit set. As a result, LSAs are refreshed only when a change occurs.	**extensive**
Priority	Router priority used in designated router (DR) election on this interface.	**detail extensive**
Flood list	List of link-state advertisements (LSAs) that might be about to flood this interface.	**extensive**

Table 203: show (ospf | ospf3) interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Ack list	Acknowledgment list. List of pending acknowledgments on this interface.	**extensive**
Descriptor list	List of packet descriptors.	**extensive**
Hello	Configured value for the Hello timer.	**detail extensive**
Dead	Configured value for the Dead timer.	**detail extensive**
Auth type	(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: • **MD5**—MD5 mechanism is configured in accordance with RFC 2328. • **None**—No authentication method is configured. • **Password**—Simple password (RFC 2328) is configured.	**detail extensive**
Topology	(Multiarea adjacency) Name of topology: **default** or ***name***	
IPSec SA name	(OSPFv2) Name of the IPsec security association name	**detail extensive**
Active key ID	(OSPFv2 and MD5) Number from **0** to **255** that uniquely identifies an MD5 key.	**detail extensive**
Start time	(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as **Start time 1970 Jan 01 00:00:00 PST.**	**detail extensive**
ReXmit	Configured value for the Retransmit timer.	**detail extensive**
Stub, **Not Stub**, or **Stub NSSA**	Type of area.	**detail extensive**

show (ospf | ospf3) io-statistics

Syntax show (ospf | ospf3) io-statistics
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show (ospf | ospf3) io-statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Open Shortest Path First (OSPF) input and output statistics.

Options none—Display OSPF input and output statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

Output Fields Table 204 on page 1778 lists the output fields for the **show ospf io-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 204: show (ospf | ospf3) io-statistics Output Fields

Field Name	Field Description
Packets read	Number of OSPF packets read since the last time the routing protocol was started.
average per run	Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.
max run	Maximum number of packets for a given run among all scheduled runs.
Receive errors	Number of faulty packets received with errors.

show ospf io-statistics

show (ospf | ospf3) log

Syntax

show (ospf | osfp3) log
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<topology *topology-name*>

Syntax (J-EX Series Switch)

show (ospf | osfp3) log
<instance *instance-name*>
<topology *topology-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

Options

none—Display entries in the OSPF log of SPF calculations for all routing instances.

instance *instance-name*—(Optional) Display entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology *topology-name*—(Optional) Display entries for the specified topology.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields

Table 205 on page 1779 lists the output fields for the **show (ospf | ospf3) log** command. Output fields are listed in the approximate order in which they appear.

Table 205: show (ospf | ospf3) log Output Fields

Field Name	Field Description
When	Time, in weeks (**w**) and days (**d**), since the SPF calculation was made.
Type	Type of calculation: **Cleanup**, **External**, **Interarea**, **NSSA**, **Redist**, **SPF**, **Stub**, **Total**, or **Virtuallink**.
Elapsed	Amount of time, in seconds, that elapsed during the operation, or the time required to complete the SPF calculation. The start time is the time displayed in the **When** field.

show (ospf | ospf3) neighbor

Syntax

show (ospf | ospf3) neighbor
<brief | detail | extensive>
<area *area-id*>
<instance (all | *instance-name*)>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) neighbor
<brief | detail | extensive>
<area *area-id*>
<instance (all | *instance-name*)>
<interface *interface-name*>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Open Shortest Path First (OSPF) neighbors.

Options

none—Display standard information about all OSPF neighbors for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the OSPF neighbors for the specified area.

instance (all | *instance-name*—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

interface *interface-name*—(Optional) Display information about OSPF neighbors for the specified logical interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Display information about the specified OSPF neighbor.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields Table 206 on page 1783 lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 206: show (ospf | ospf3) neighbor Output Fields

Field Name	Field Description	Level of Output
Address	Address of the neighbor.	All levels
Interface	Interface through which the neighbor is reachable.	All levels
State	State of the neighbor: • **Attempt**—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor. • **Down**—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the **Down** state, although at a reduced frequency. • **Exchange**—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged. • **ExStart**—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number. • **Full**—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements. • **Init**—A Hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor's hello packet. • **Loading**—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the **Exchange** state. • **2Way**—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state **2Way** or greater.	All levels
ID	Router ID of the neighbor.	All levels
Pri	Priority of the neighbor to become the designated router.	All levels
Dead	Number of seconds until the neighbor becomes unreachable.	All levels

Table 206: show (ospf | ospf3) neighbor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Link state acknowledgment list	Number of link-state acknowledgments received.	**extensive**
Link state retransmission list	Total number of link-state advertisements retransmitted. For **extensive** output only, the following information is also displayed: • **Type**—Type of link advertisement: **ASBR**, **Sum**, **Extern**, **Network**, **NSSA**, **OpaqArea**, **Router**, or **Summary**. • **LSA ID**—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. • **Adv rtr**—Address of the routing device that sent the advertisement. • **Seq**—Link sequence number of the advertisement.	**detail extensive**
Neighbor-address	(OSPFv3 only) If the neighbor uses virtual links, the **Neighbor-address** is the site-local, local, or global address. If the neighbor uses a physical interface, the **Neighbor-address** is an IPv6 link-local address.	**detail extensive**
area	Area that the neighbor is in.	**detail extensive**
OSPF3-Intf-Index	(OSPFv3 only) Displays the OSPFv3 interface index.	**detail extensive**
opt	Option bits received in the hello packets from the neighbor.	**detail extensive**
DR or **DR-ID**	Address of the designated router.	**detail extensive**
BDR or **BDR-ID**	Address of the backup designated router.	**detail extensive**
Up	Length of time since the neighbor came up.	**detail extensive**
adjacent	Length of time since the adjacency with the neighbor was established.	**detail extensive**

show (ospf | ospf3) overview

Syntax

show (ospf | ospf3) overview
<brief | extensive>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) overview
<brief | extensive>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
Database protection introduced in Junos OS Release 10.2.

Description

Display Open Shortest Path First (OSPF) overview information.

Options

none—Display standard information about all OSPF neighbors for all routing instances.

brief | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display all OSPF interfaces under the named routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields

Table 207 on page 1787 lists the output fields for the **show ospf overview** command. Output fields are listed in the approximate order in which they appear.

Table 207: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels

Table 207: show ospf overview Output Fields *(continued)*

Field name	Field Description	Level of Output
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the holddown timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: **Current**, **Warning** (threshold), and **Allowed**.	All levels
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: **Current** and **Allowed**.	All levels
Restart	Graceful restart capability: **enabled** or **disabled**.	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels
Helper mode	Graceful restart helper capability: **enabled** or **disabled**.	All levels
Trace options	OSPF-specific trace options.	**extensive**
Trace file	Name of the file to receive the output of the tracing operation.	**extensive**
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: **Normal Stub**, **Not Stub**, or **Not so Stubby Stub**.	All levels

Table 207: show ospf overview Output Fields *(continued)*

Field name	Field Description	Level of Output
Authentication Type	Type of authentication: **None**, **Password**, or **MD5**.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

show (ospf | ospf3) route

Syntax

show (ospf | ospf3) route
<brief | detail | extensive>
<abr | asbr | extern | inter | intra>
<instance *instance-name*
<logical-system (all | *logical-system-name*)>
<network>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<router>
<topology *topology-name*>
<transit>

Syntax (J-EX Series Switch)

show (ospf | ospf3) route
<brief | detail | extensive>
<abr | asbr | extern | inter | intra>
<instance *instance-name*
<network>
<router>
<topology *topology-name*>
<transit>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First (OSPF) routing table.

Options

none—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

brief | detail | extensive—(Optional) Display the specified level of output.

abr—(Optional) Display routes to area border routers.

asbr—(Optional) Display routes to autonomous system border routers.

extern—(Optional) Display external routes.

inter—(Optional) Display interarea routes.

intra—(Optional) Display intra-area routes.

instance *instance-name*—(Optional) Display entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

network—(Optional) Display routes to networks.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Display routes to all routers.

topology *topology-name*—(OSPF only) (Optional) Display routes for a particular topology.

transit—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

Required Privilege Level view

show ospf3 route on page 1794
show ospf3 route detail on page 1794
show ospf route topology voice on page 1795

Output Fields Table 208 on page 1792 list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

Table 208: show (ospf | ospf3) route Output Fields

Field Name	Field Description	Output Level
Topology	Name of the topology.	All levels
Prefix	Destination of the route.	All levels
Path type	How the route was learned: • **Inter**—Interarea route • **Ext1**—External type 1 route • **Ext2**—External type 2 route • **Intra**—Intra-area route	All levels
Route type	The type of routing device from which the route was learned: • **AS BR**—Route to AS border router • **Area BR**—Route to area border router • **Area/AS BR**—Route to router that is both an **Area BR** and **AS BR**. • **Network**—Network router. • **Router**—Route to a router that is neither an **Area BR** nor an **AS BR**. • **Transit**—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link. • **Discard**—Route to a summary discard.	All levels
NH Type	Next-hop type: **LSP** or **IP**.	All levels
Metric	Route's metric value.	All levels
NH-interface	(OSPFv3 only) Interface through which the route's next hop is reachable.	All levels
NH-addr	(OSPFv3 only) IPv6 address of the next hop.	All levels

Table 208: show (ospf | ospf3) route Output Fields *(continued)*

Field Name	Field Description	Output Level
NextHop Interface	(OSPFv2 only) Interface through which the route's next hop is reachable.	All levels
Nexthop addr/label	(OSPFv2 only) If the **NH Type** is **IP**, then it is the address of the next hop. If the **NH Type** is **LSP**, then it is the name of the label-switched path.	All levels
Area	Area ID of the route.	**detail**
Origin	Router from which the route was learned.	**detail**
Type 7	Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).	**detail**
P-bit	Route was learned through NSSA LSA and the propagate bit was set.	**detail**
Fwd NZ	Forwarding address is nonzero. **Fwd NZ** is only displayed if the route is learned through an NSSA LSA.	**detail**
optional-capability	Optional capabilities propagated in the router LSA. This field is in the output for intraarea router routes only (when **Route Type** is **Area BR**, **AS BR**, **Area/AS BR**, or **Router**), not for interarea router routes or network routes. Three bits in this field are defined as follows: • **0x4 (V)**—Routing device is at the end of a virtual active link. • **0x2 (E)**—Routing device is an autonomous system boundary router. • **0x1 (B)**—Routing device is an area border router.	**detail**
priority	The priority assigned to the prefix: • **high** • **medium** • **low** NOTE: The **priority** field applies only to routes of type **Network**.	**detail**

show (ospf | ospf3) statistics

Syntax

show (ospf | ospf3) statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (J-EX Series Switch)

show (ospf | ospf3) statistics
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display OSPF statistics.

Options

none—Display OSPF statistics for all routing instances.

instance *instance-name*—(Optional) Display all statistics for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show ospf statistics on page 1797

Output Fields

Table 209 on page 1796 lists the output fields for the **show (ospf | ospf3) statistics** command. Output fields are listed in the approximate order in which they appear.

Table 209: show (ospf | ospf3) statistics Output Fields

Field Name	Field Description
Packet type	Type of OSPF packet.
Total Sent/Total Received	Total number of packets sent and received.
Last 5 seconds Sent/Last 5 seconds Received	Total number of packets sent and received in the last 5 seconds.
LSAs retransmitted	Total number of link-state advertisements transmitted, and number retransmitted in the last 5 seconds.
Receive errors	Number and type of receive errors.

show ospf statistics

LSAs retransmitted: 16, last 5 seconds: 0

Receive errors:
  862 no interface found
  115923 no virtual link found
```

show as-path

Syntax
show as-path
<brief | detail>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show as-path
<brief | detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the **as-path-prepend** action) or through aggregation.

Options
none—Display basic information about AS paths that the local routing device is using (same as brief).

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields
Table 210 on page 1798 lists the output fields for the **show as-path** command. Output fields are listed in the approximate order in which they appear.

Table 210: show as-path Output Fields

Field Name	Field Description	Level of Output
Total AS paths	Total number of AS paths.	**brief** none
Bucket	Bucket value. This value represents a traffic classification on the interface.	All levels
Count	Path reference count.	All levels
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. • **Atomic**—Route is an aggregate of several route prefixes. • **Aggregator**—Routing device has summarized a range of prefixes.	All levels

Table 210: show as-path Output Fields *(continued)*

Field Name	Field Description	Level of Output
domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.	**detail**
neighbor as	AS peer address.	**detail**
length	Length of the AS path.	**detail**
segments	Length of the AS segment descriptor.	**detail**
references	Path reference count.	**detail**

show as-path domain

Syntax
show as-path domain
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show as-path domain

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display autonomous system (AS) path domain information.

Options
none—(Optional) Display AS path domain information for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show as-path domain on page 1803

Output Fields
Table 211 on page 1802 lists the output fields for the **show as-path domain** command. Output fields are listed in the approximate order in which they appear

Table 211: show as-path domain Output Fields

Field Name	Field Description
Domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.
Primary	Primary AS number.
References	Path reference count.
***Number* Paths**	Number of known AS paths.
Flags	Information about the AS path: • **ASLoop**—Path contains an AS loop. • **Atomic**—Path includes the ATOMIC_AGGREGATE path attribute. • **Local**—Path was created by local aggregation. • **Master**—Path was created by the master routing instance.
Local AS	AS number of the local routing device.
Loops	How many times this AS number can appear in an AS path.

show as-path domain

```
user@host> show as-path domain
Domain: 1        Primary: 10458
    References:          3 Paths:      30383

show bgp bmp

Syntax **show bgp bmp**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about the BGP Monitoring Protocol (BMP).

Options This command has no options.

Required Privilege Level view

List of Sample Output **show bgp bmp on page 1805**

Output Fields Table 213 on page 1805 lists the output fields for the **show bgp bmp** command. Output fields are listed in the approximate order in which they appear.

Table 213: show bgp bmp Output Fields

Field Name	Field Description
BMP station address/port:	IP address and port number of monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.
BMP session state	Status of the BMP session: **UP** or **DOWN**.
Memory consumed by BMP	Memory used by the active BMP session.
Statistics timeout	Amount of time, in seconds, between transmissions of BMP data to the monitoring station.
Memory limit	Threshold, in bytes, at which the routing device stops collecting BMP data if it is exceeded.
Memory-connect retry timeout	Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded.

show bgp bmp

```
user@host> show bgp bmp
  BMP station address/port: 172.24.24.157+5454
  BMP session state: DOWN
  Memory consumed by BMP: 0
  Statistics timeout: 15
  Memory limit: 10485760
  Memory connect retry timeout: 600
```

show bgp group

Syntax

show bgp group
<brief | detail | summary>
<*group-name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<rtf>

Syntax (J-EX Series Switch)

show bgp group
<brief | detail | summary>
<*group-name*>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the configured Border Gateway Protocol (BGP) groups.

Options

none—Display group information about all BGP groups.

brief | detail | summary—(Optional) Display the specified level of output.

group-name—(Optional) Display group information for the specified group.

instance *instance-name*—(Optional) Display information about a particular BGP peer in the specified instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rtf—(Optional) Display BGP group route targeting information.

Output Fields

Table 214 on page 1806 describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

Table 214: show bgp group Output Fields

Field Name	Field Description	Level of Output
Group type or **Group**	Type of BGP group: **Internal** or **External**.	All levels

Table 214: show bgp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
AS	AS number of the peer. For internal BGP (IBGP), this number is the same as **Local AS**.	**brief detail** none
Local AS	AS number of the local routing device.	**brief detail** none
Name	Name of a specific BGP group.	**brief detail** none
Flags	Flags associated with the BGP group. This field is used by Dell Support (see “Requesting Technical Support” on page lxxi).	**brief detail** none
Export	Export policies configured for the BGP group with the **export** statement.	**brief detail** none
MED tracks IGP metric update delay	Time interval, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire	All
Total peers	Total number of peers in the group.	**brief detail** none
Established	Number of peers in the group that are in the established state.	All levels
Active/Received/Accepted/Damped	Multipurpose field that displays information about BGP peer sessions. The field’s contents depend upon whether a session is established and whether an established session was established in the main routing device or in a routing instance. • If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**. • If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the **inet.0** (main) and **inet.2** (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following: ◦ 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the **inet.0** routing table. ◦ 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the **inet.2** routing table.	**summary**
ip-addresses	List of peers who are members of the group. The address is followed by the peer’s port number.	All levels
Route Queue Timer	Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.	**detail**

Table 214: show bgp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
Route Queue	Number of prefixes that are queued up for sending to the peers in the group.	**detail**
inet.*number*	Number of active, received, accepted, and damped routes in the routing table. For example, **inet.0: 7/10/9/0** indicates the following: • 7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the **inet.0** routing table.	none
Table inet.*number*	Information about the routing table. • **Received prefixes**—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • **Active prefixes**—Number of prefixes received from the peer that are active in the routing table. • **Suppressed due to damping**—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. • **Advertised prefixes**—Number of prefixes advertised to a peer. • **Received external prefixes**—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table. • **Active external prefixes**—Number of prefixes received from the EBGP peers that are active in the routing table. • **Externals suppressed**—Number of routes received from EBGP peers currently inactive because of damping or other reasons. • **Received internal prefixes**—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table. • **Active internal prefixes**—Number of prefixes received from the IBGP peers that are active in the routing table. • **Internals suppressed**—Number of routes received from IBGP peers currently inactive because of damping or other reasons. • **RIB State**—Status of the graceful restart process for this routing table: **BGP restart is complete**, **BGP restart in progress**, **VPN restart in progress**, or **VPN restart is complete**.	**detail**
Groups	Total number of groups.	All levels
Peers	Total number of peers.	All levels
External	Total number of external peers.	All levels
Internal	Total number of internal peers.	All levels
Down peers	Total number of unavailable peers.	All levels
Flaps	Total number of flaps that occurred.	All levels
Table	Name of a routing table.	**brief**, none

Table 214: show bgp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tot Paths	Total number of paths.	**brief**, none
Act Paths	Number of active routes.	**brief**, none
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	**brief**, none
History	Number of withdrawn routes stored locally to keep track of damping history.	**brief**, none
Damp State	Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.	**brief**, none
Pending	Routes being processed by BGP import policy.	**brief**, none
Group	Group the peer belongs to in the BGP configuration.	**detail**
Receive mask	Mask of the received target included in the advertised route.	**detail**
Entries	Number of route entries received.	**detail**
Target	Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer.	**detail**
Mask	Mask which specifies that the peer receive routes with the given route target.	**detail**

show bgp neighbor

Syntax

show bgp neighbor
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor-address*>
<orf (detail | *neighbor-address*)

Syntax (J-EX Series Switch)

show bgp neighbor
<instance *instance-name*>
<*neighbor-address*>
<orf (*neighbor-address* | detail)

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Border Gateway Protocol (BGP) peers.

Options

none—Display information about all BGP peers.

instance *instance-name*—(Optional) Display information about BGP peers for only the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—(Optional) Display information for only the BGP peer at the specified IP address.

orf (detail | *neighbor-address*)—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the **detail** option to display detailed output.

Additional Information

For information about the **local-address, nlri**, **hold-time,** and **preference** statements, see the *Junos OS Routing Protocols Configuration Guide.*

Output Fields

Table 215 on page 1813 describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 215: show bgp neighbor Output Fields

Field Name	Field Description
Peer	Address of the BGP neighbor. The address is followed by the neighbor's port number.
AS	AS number of the peer.
Local	Address of the local routing device. The address is followed by the peer's port number.
Type	Type of peer: **Internal** or **External**.
State	Current state of the BGP session: • **Active**—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • **Connect**—BGP is waiting for the transport protocol connection to be completed. • **Established**—The BGP session has been established, and the peers are exchanging update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.
Flags	Internal BGP flags: • **Aggregate Label**—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • **CleanUp**—The peer session is being shut down. • **Delete**—This peer has been deleted. • **Idled**—This peer has been permanently idled. • **ImportEval**—At the last commit, this peer was identified as needing to reevaluate all received routes. • **Initializing**—The peer session is initializing. • **SendRtn**—Messages are being sent to the peer. • **Sync**—This peer is synchronized with the rest of the peer group. • **TryConnect**—Another attempt is being made to connect to the peer. • **Unconfigured**—This peer is not configured. • **WriteFailed**—An attempt to write to this peer failed.
Last state	Previous state of the BGP session: • **Active**—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • **Connect**—BGP is waiting for the transport protocol connection to be completed. • **Established**—The BGP session has been established, and the peers are exchanging update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.

Table 215: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Last event	Last activity that occurred in the BGP session: • **Closed**—The BGP session closed. • **ConnectRetry**—The transport protocol connection failed, and BGP is trying again to connect. • **HoldTime**—The session ended because the hold timer expired. • **KeepAlive**—The local routing device sent a BGP keepalive message to the peer. • **Open**—The local routing device sent a BGP open message to the peer. • **OpenFail**—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • **RecvKeepAlive**—The local routing device received a BGP keepalive message from the peer. • **RecvNotify**—The local routing device received a BGP notification message from the peer. • **RecvOpen**—The local routing device received a BGP open message from the peer. • **RecvUpdate**—The local routing device received a BGP update message from the peer. • **Start**—The peering session started. • **Stop**—The peering session stopped. • **TransportError**—A TCP error occurred.
Last error	Last error that occurred in the BGP session: • **Cease**—An error occurred, such as a version mismatch, that caused the session to close. • **Finite State Machine Error**—In setting up the session, BGP received a message that it did not understand. • **Hold Time Expired**—The session's hold time expired. • **Message Header Error**—The header of a BGP message was malformed. • **Open Message Error**—A BGP open message contained an error. • **None**—No errors occurred in the BGP session. • **Update Message Error**—A BGP update message contained an error.
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.

Table 215: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Options	Configured BGP options: • **AddressFamily**—Configured address family: **inet** or **inet-vpn**. • **AutheKeyChain**—Authentication key change is enabled. • **GracefulRestart**—Graceful restart is configured. • **HoldTime**—Hold time configured with the **hold-time** statement. The hold time is three times the interval at which keepalive messages are sent. • **Local Address**—Address configured with the **local-address** statement. • **Multihop**—Allow BGP connections to external peers that are not on a directly connected network. • **NLRI**—Configured MBGP state for the BGP group: **multicast**, **unicast**, or both if you have configured **nlri any**. • **Peer AS**—Configured peer autonomous system (AS). • **Preference**—Preference value configured with the **preference** statement. • **Refresh**—Configured to refresh automatically when the policy changes. • **Rib-group**—Configured routing table group.
Authentication key change	Name of the authentication key chain enabled.
Authentication algorithm	Type of authentication algorithm enabled: **hmac** or **md5**
Address families configured	Names of configured address families for the VPN.
Local Address	Address of the local routing device.
Holdtime	Hold time configured with the **hold-time** statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: • **TrafficStatistics**—Collection of statistics for labeled-unicast traffic is enabled.
Traffic statistics	Information about labeled-unicast traffic statistics: • **Options**—Options configured for collecting statistics about labeled-unicast traffic. • **File**—Name and location of statistics log files. • **size**—Size of all the log files, in bytes. • **files**—Number of log files.
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the **preference** statement.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.

Table 215: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Peer Index	Index of this peer in its group.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which the direct EBGP peering is established.
NLRI for restart configured on peer	Names of address families configured for restart.
NLRI advertised by peer	Address families supported by the peer: **unicast** or **multicast**.
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, *Route Refresh Capability for BGP-4*.
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting) and this peer should not wait for the **end-of-rib** marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.

Table 215: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Table inet.*number*	Information about the routing table: • **RIB State**—BGP is in the graceful restart process for this routing table: **restart is complete** or **restart in progress**. • **Bit**—Number that represents the entry in the routing table for this peer. • **Send state**—State of the BGP group: **in sync**, **not in sync**, or **not advertising**. • **Active prefixes**—Number of prefixes received from the peer that are active in the routing table. • **Received prefixes**—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • **Accepted prefixes**—Total number of prefixes from the peer that have been accepted by a routing policy. • **Suppressed due to damping**—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue **0** is for unicast NLRIs, and queue **1** is for multicast NLRIs.
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates recv	(**orf** option only) Number of outbound-route filters received for each configured address family. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Immediate	(**orf** option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.

Table 215: show bgp neighbor Output Fields *(continued)*

Field Name	Field Description
Filter	(**orf** option only) Type of prefix filter received: **prefix-based** or **extended-community**.
Received filter entries	(**orf** option only) List of received filters displayed.
seq	(**orf** option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(**orf** option only) Address for the prefix entry that matches the filter.
minlength	(**orf** option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(**orf** option only) Maximum prefix length, in bits, required to match this prefix.
match	(**orf** option only) For this prefix match, whether to **permit** or **deny** route updates.

show bgp neighbor (CLNS)

```
user@host> show bgp neighbor
Peer: 10.245.245.1+179 AS 200  Local: 10.245.245.3+3770 AS 100

show bgp summary

Syntax
show bgp summary
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show bgp summary
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Border Gateway Protocol (BGP) summary information.

Options
none—Display BGP summary information for all routing instances.

instance *instance-name*—(Optional) Display information for the specified instance only. The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

show bgp summary (Layer 2 VPN) on page 1826
show bgp summary (Layer 3 VPN) on page 1827

Output Fields
Table 216 on page 1824 describes the output fields for the **show bgp summary** command. Output fields are listed in the approximate order in which they appear.

Table 216: show bgp summary Output Fields

Field Name	Field Description
Groups	Number of BGP groups.
Peers	Number of BGP peers.
Down peers	Number of down BGP peers.
Table	Name of routing table.
Tot Paths	Total number of paths.
Act Paths	Number of active routes.
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.

Table 216: show bgp summary Output Fields *(continued)*

Field Name	Field Description
History	Number of withdrawn routes stored locally to keep track of damping history.
Damp State	Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.
Pending	Routes in process by BGP import policy.
Peer	Address of each BGP peer. Each peer has one line of output.
AS	Peer's AS number.
InPkt	Number of packets received from the peer.
OutPkt	Number of packets sent to the peer.
OutQ	Count of the number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is **0** because the queue usually is emptied quickly.
Flaps	Number of times the BGP session has gone down and then come back up.
Last Up/Down	Last time since the neighbor transitioned to or from the established state.
State|#Active /Received/Accepted /Damped	Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether an established session was established in the main routing device or in a routing instance. • If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**. • If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the **inet.0** (main) and **inet.2** (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following: ◦ 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the **inet.0** routing table. ◦ 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the **inet.2** routing table. • If a BGP session is established in a routing instance, the field indicates the established **(Establ)** state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, **Establ VPN-AB.inet.0: 2/4/0** indicates the following: ◦ The BGP session is established. ◦ Routes are received in the **VPN-AB.inet.0** routing table. ◦ The local routing device has two active routes, four received routes, and no damped routes from a BGP peer. When a BGP session is established, the peers are exchanging update messages.

Output Fields Table 217 on page 1828 describes the output fields for the **show ipv6 neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 217: show ipv6 neighbors Output Fields

Field Name	Field Description
IPv6 Address	Name of the IPv6 interface.
Linklayer Address	Link-layer address.
State	State of the link: **up**, **down**, **incomplete**, **reachable**, **stale**, or **unreachable**.
Exp	Number of seconds until the entry expires.
Rtr	Whether the neighbor is a routing device: **yes** or **no**.
Secure	Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: **yes** or **no**.
Interface	Name of the interface.

Output Fields
Table 218 on page 1830 describes the output fields for the **show isis adjacency** command. Output fields are listed in the approximate order in which they appear.

Table 218: show isis adjacency Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the neighbor is reachable.	All levels
System	System identifier (**sysid**), displayed as a name, if possible.	**brief**

Table 218: show isis adjacency Output Fields *(continued)*

Field Name	Field Description	Level of Output
L or Level	Level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2 An exclamation point (**!**) preceding the level number indicates that the adjacency is missing an IP address.	All levels
State	State of the adjacency: **Up**, **Down**, **New**, **One-way**, **Initializing**, or **Rejected**.	All levels
Hold (secs)	Remaining hold time of the adjacency.	**brief**
SNPA	Subnetwork point of attachment (MAC address of the next hop).	**brief**
Expires in	How long until the adjacency expires, in seconds.	**detail**
Priority	Priority to become the designated intermediate system.	**detail extensive**
Up/Down transitions	Count of adjacency status changes from **Up** to **Down** or from **Down** to **Up**.	**detail**
Last transition	Time of the last **Up/Down** transition.	**detail**
Circuit type	Bit mask of levels on this interface: **L1**=Level 1 router; **L2**=Level 2 router; **L1/L2**=both Level 1 and Level 2 router.	**detail**
Speaks	Protocols supported by this neighbor.	**detail extensive**
MAC address	MAC address of the interface.	**detail extensive**
Topologies	Supported topologies.	**detail extensive**
Restart capable	Whether a neighbor is capable of graceful restart: **Yes** or **No**.	**detail extensive**
Adjacency advertisement: Advertise	This router has signaled not to advertise this interface to its neighbors in their label-switched paths (LSPs).	**detail extensive**
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise the interface in the router's outbound LSPs.	**detail extensive**
IP addresses	IP address of this neighbor.	**detail extensive**

Table 218: show isis adjacency Output Fields *(continued)*

Field Name	Field Description	Level of Output

Transition log	List of recent transitions, including:
	• **When**—Time at which an IS-IS adjacency transition occurred.
	• **State**—Current state of the IS-IS adjacency (**up**, **down**, or **rejected**).
	  • **Up**—Adjacency is up and operational.
	  • **Down**—Adjacency is down and not available.
	  • **Rejected**—Adjacency has been rejected.
	• **Event**—Type of transition that occurred.
	  • **Seenself**—Possible routing loop has been detected.
	  • **Interface down**—IS-IS interface has gone down and is no longer available.
	  • **Error**—Adjacency error.
	• **Down reason**—Reason that an IS-IS adjacency is down:
	  • **3-Way Handshake Failed**—Connection establishment failed.
	  • **Address Mismatch**—Address mismatch caused link failure.
	  • **Aged Out**—Link expired.
	  • **ISO Area Mismatch**—IS-IS area mismatch caused link failure.
	  • **Bad Hello**—Unacceptable hello message caused link failure.
	  • **BFD Session Down**—Bidirectional failure detection caused link failure.
	  • **Interface Disabled**—IS-IS interface is disabled.
	  • **Interface Down**—IS-IS interface is unavailable.
	  • **Interface Level Disabled**—IS-IS level is disabled.
	  • **Level Changed**—IS-IS level has changed on the adjacency.
	  • **Level Mismatch**—Levels on adjacency are not compatible.
	  • **MPLS LSP Down**—Label-switched path (LSP) is unavailable.
	  • **MT Topology Changed**—IS-IS topology has changed.
	  • **MT Topology Mismatch**—IS-IS topology is mismatched.
	  • **Remote System ID Changed**—Adjacency peer system ID changed.
	  • **Protocol Shutdown**—IS-IS protocol is disabled.
	  • **CLI Command**—Adjacency brought down by user.
	  • **Unknown**—Unknown.

Output Fields Table 221 on page 1838 lists the output fields for the **show isis backup label-switched-path** command. Output fields are listed in the approximate order in which they appear.

Table 221: show isis backup label-switched-path Output Fields

Field Name	Field Description
Backup MPLS LSPs	List of MPLS LSPs designated as backup paths for IS-IS routes.
Egress	IP address of the egress routing device for the LSP.

Status	State of the LSP:
	• **Up**—The router can detect RSVP hello messages from the neighbor.
	• **Down**—The router has received one of the following indications:
	  ◦ Communication failure from the neighbor.
	  ◦ Communication from IGP that the neighbor is unavailable.
	  ◦ Change in the sequence numbers in the RSVP hello messages sent by the neighbor.
	• **Deleted**—LSP is no longer available as a backup path.

Last change	Time elapsed since the neighbor state changed either from up or down or from down to up. The format is ***hh*:*mm*:*ss***.
TE-metric	Configured traffic engineering metric.

Table 221: show isis backup label-switched-path Output Fields *(continued)*

Field Name	Field Description
Metric	Configured metric.

Output Fields

Table 223 on page 1844 describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

Table 223: show isis database Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface on which the LSP has been received; always **IS-IS** for this command.	All levels
level	Level of intermediate system: • **1**—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system. • **2**—Intermediate system routes between areas and toward other ASs.	All levels
LSP ID	Link-state PDU identifier.	All levels
Sequence	Sequence number of the link-state PDU.	All levels
Checksum	Checksum value of the link-state PDU.	All levels
Lifetime (secs)	Remaining lifetime of the link-state PDU, in seconds.	All levels
Attributes	Attributes of the specified database: **L1**, **L2**, **Overload**, or **Attached** (L1 only).	none **brief**
# LSPs	Total number of LSPs in the specified link-state database.	none **brief**
IP prefix	Prefix advertised by this link-state PDU.	**detail extensive**
IS neighbor	IS-IS neighbor of the advertising system.	**detail extensive**
ES neighbor	(J Series routers only) An ES-IS neighbor of the advertising system.	**detail extensive**
IP prefix	IPv4 prefix advertised by this link-state PDU.	**detail extensive**
V6 prefix	IPv6 prefix advertised by this link-state PDU.	**detail extensive**
Metric	Metric of the prefix or neighbor.	**detail extensive**
Header	• **LSP ID**—Link state PDU identifier of the header. • **Length**—Header length. • **Allocated Length**—Amount of length available for the header. • **Router ID**—Address of the local routing device. • **Remaining Lifetime**—Remaining lifetime of the link-state PDU, in seconds.	**extensive**

Table 223: show isis database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Packet	• **LSP ID**—The identifier for the link-state packet. • **Length**—Packet length. • **Lifetime**—Remaining lifetime, in seconds. • **Checksum**—The checksum of the LSP. • **Sequence**—The sequence number of the LSP. Every time the LSP is updated, this number increments. • **Attributes**—Packet attributes. • **NLPID**—Network layer protocol identifier. • **Fixed length**—Specifies the set length for the packet.	**extensive**
TLVs	• **Area Address**—Area addresses that the routing device can reach. • **Speaks**—Supported routing protocols. • **IP router id**—ID of the routing device (usually the IP address). • **IP address**—IPv4 address. • **Hostname**—Assigned name of the routing device. • **IP prefix**—IP prefix of the routing device. • **Metric**—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device. • **IP extended prefix**—Extended IP prefix of the routing device. • **IS neighbor**—Directly attached neighbor's name and metric. • **IS extended neighbor**—Directly attached neighbor's name, metric, and IP address.	**extensive**

show isis hostname

Syntax
show isis hostname
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis hostname

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Intermediate System-to-Intermediate System (IS-IS) hostname database information.

Options
none—Display IS-IS hostname database information.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show isis hostname on page 1850

Output Fields
Table 224 on page 1850 describes the output fields for the **show isis hostname** command. Output fields are listed in the approximate order in which they appear.

Table 224: show isis hostname Output Fields

Field Name	Field Description
System Id	System identifier mapped to the hostname.
Hostname	Hostname mapped to the system identifier.
Type	Type of mapping between system identifier and hostname. • **Dynamic**—Hostname mapping determined as described in RFC 2763, *Dynamic Hostname Exchange Mechanism for IS-IS*. • **Static**—Hostname mapping configured by user.

show isis hostname

```
user@host> show isis hostname
   IS-IS hostname database:
   System Id      Hostname                                        Type

show isis interface

Syntax
show isis interface
<brief | detail | extensive>
<*interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis interface
<brief | detail | extensive>
<*interface-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display status information about Intermediate System-to-Intermediate System (IS-IS)-enabled interfaces.

Options
none—Display standard information about all IS-IS-enabled interfaces.

brief | detail | extensive—(Optional) Display the specified level of output.

interface-name—(Optional) Display information about the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show isis interface on page 1853
show isis interface brief on page 1853
show isis interface detail on page 1853
show isis interface extensive on page 1853
show isis interface extensive (with LDP) on page 1854

Output Fields
Table 225 on page 1851 describes the output fields for the **show isis interface** command. Output fields are listed in the approximate order in which they appear.

Table 225: show isis interface Output Fields

Field Name	Field Description	Level of Output
interface-name	Name of the interface.	**detail**
Designated router	Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.	**detail**
Index	Interface index assigned by the Junos OS kernel.	**detail**
State	Internal implementation information.	**detail**
Circuit id	Circuit identifier.	**detail**

Table 225: show isis interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Circuit type	Circuit type: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2	**detail**
LSP interval	Interval between link-state PDUs sent from the interface.	**detail**
CSNP interval	Interval between complete sequence number PDUs sent from the interface.	**detail extensive**
Sysid	System identifier.	**detail**
Interface	Interface through which the adjacency is made.	none **brief**
L or Level	Level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2	All levels
CirID	Circuit identifier.	none **brief**
Level 1 DR	Level 1 designated intermediate system.	none **brief**
Level 2 DR	Level 2 designated intermediate system.	none **brief**
L1/L2 Metric	Interface's metric for Level 1 and Level 2. If there is no information, the metric is **0**.	none **brief**
Adjacency advertisement: Advertise	This routing device has signaled not to advertise this interface to its neighbors in their label-switched paths (LSPs).	**detail extensive**
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.	**detail extensive**
Adjacencies	Number of adjacencies established on this interface.	**detail**
Priority	Priority value for this interface.	**detail**
Metric	Metric value for this interface.	**detail**
Hello(s) / Hello Interval	Interface's hello interval.	**detail extensive**
Hold(s) / Hold Time	Interface's hold time.	**detail extensive**

Table 225: show isis interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Designated Router	Router responsible for sending network link-state advertisements, which describe all the routers attached to the network.	**detail**
Hello padding	Type of hello padding: • **Adaptive**—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. • **Loose**—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. • **Strict**—Padding is performed on all interface types and for all adjacency states, and is continuous.	**extensive**
LDP sync state	Current LDP synchronization state: **in sync**, **in holddown**, or **not supported**.	**extensive**
reason	Reason for being in the LDP sync state.	**extensive**
config holdtime	Configured value of the hold timer.	**extensive**
remaining	If the state is not in sync and the hold time is not infinity, then this field displays the number of seconds remaining.	**extensive**

show isis interface

show isis overview

Syntax **show isis overview**
<instance *instance-name*>
<**logical-system (all | *logical-system-name*)**>

Syntax (J-EX Series Switch) **show isis overview**
<instance *instance-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Intermediate System-to Intermediate System (IS-IS) overview information.

Options none—Display standard overview information about IS-IS for all routing instances.

instance *instance-name*—(Optional) Display overview information for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show isis overview on page 1856**

Output Fields Table 226 on page 1855 lists the output fields for the **show isis overview** command. Output fields are listed in the approximate order in which they appear.

Table 226: show isis overview Output Fields

Field Name	Field Description
instance	The IS-IS routing intance.
Router ID	Router ID of the routing device.
Adjacency holddown	Adjacency holddown capability: **enabled** or **disabled**.
Maximum Areas	Maximum number of IS-IS areas advertised by the routing device.
LSP life time	Lifetime of the link-state PDU, in seconds.
Attached bit evaluation	Attached bit capability: **enabled** or **disabled**.
SPF delay	Delay before performing consecutive Shortest Path First calculations.
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the holddown timer begins.

Table 226: show isis overview Output Fields *(continued)*

Field Name	Field Description
Overload bit at startup is set	Overload bit capability is enabled.
Overload high metrics	Overload high metrics capability: **enabled** or **disabled**.
Overload timeout	Time period after which overload is reset and the time that remains before the timer is set to expire.
Traffic engineering	Traffic engineering capability: **enabled** or **disabled**.
Restart	Graceful restart capability: **enabled** or **disabled**.
Restart duration	Time period for complete reacquisition of IS-IS neighbors.
Helper mode	Graceful restart helper capability: **enalbed** or **disabled**.
Level	IS-IS level: • **1**—Level 1 information • **2**—Level 2 information
IPv4 is enabled	IP Protocol version 4 capability is enabled.
IPv6 is enabled	IP Protocol version 6 capability is enabled.
CLNS is enabled	OSI CLNP Protocol capability is enabled. (J Series routers only)
Internal route preference	Preference value of internal routes.
External route preference	Preference value of external routes.
Wide area metrics are enabled	Wide area metrics capability is enabled.
Narrow metrics is enabled	Narrow metrics capability is enabled.

show isis overview `user@host> show isis overview`

Sample Output

```
Instance: master
  Router ID: 192.168.1.220
  Adjacency holddown: enabled
  Maximum Areas: 3
  LSP life time: 65535
  Attached bit evaluation: enabled
  SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
  Overload bit at startup is set
    Overload high metrics: disabled
```

```
  Overload timeout: 300 sec, expires in 295 seconds
IPv4 is enabled, IPv6 is enabled
Traffic engineering: enabled
Restart: Enabled
  Restart duration: 210 sec
  Helper mode: Enabled
Level 1
  Internal route preference: 15
  External route preference: 160
  Wide metrics are enabled, Narrow metrics are enabled
Level 2
  Internal route preference: 18
  External route preference: 165
  Wide metrics are enabled
```

show isis route

Syntax

show isis route
<*destination*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Syntax (J-EX Series Switch)

show isis route
<*destination*>
<inet | inet6>
<instance *instance-name*>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the routes in the Intermediate System-to-Intermediate System (IS-IS) routing table.

Options

none—Display all routes in the IS-IS routing table for all supported address families for all routing instances.

destination—(Optional) Destination address for the route.

inet | inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.

instance *instance-name*—(Optional) Display routes for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.

show isis route (CLNS) on page 1860

Output Fields

Table 227 on page 1859 describes the output fields for the **show isis route** command. Output fields are listed in the approximate order in which they appear.

Table 227: show isis route Output Fields

Field Name	Field Description
Current version	Number of the current version of the IS-IS routing table.
L1	Version of Level 1 SPF that was run.
L2	Version of Level 2 SPF that was run.
Prefix	Destination of the route.
L	IS-IS level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2
Version	Version of SPF that generated the route.
Metric	Metric value associated with the route.
Type	Metric type: **int** (internal) or **ext** (external).
Interface	Interface to the next hop.
Via	System identifier of the next hop, displayed as a name if possible.
ISO Routes	ISO routing table entries.
snpa	MAC address.

show isis route logical-system

show isis spf

Syntax

show isis spf (brief | log | results)
<instance *instance-name*>
<level (1 | 2)>
<logical-system (all | *logical-system-name*)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Syntax (J-EX Series Switch)

show isis spf (brief | log | results)
<instance *instance-name*>
<level (1 | 2)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Intermediate System-to-Intermediate System (IS-IS) shortest-path-first (SPF) calculations.

Options

brief—Display an overview of SPF calculations.

log—Display the log of SPF calculations.

results—Display the results of SPF calculations.

instance *instance instance-name*—(Optional) Display SPF calculations for the specified routing instance.

level (1 | 2)—(Optional) Display SPF calculations for the specified IS-IS level.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display SPF calculations for the specified topology only.

show isis statistics

Syntax
show isis statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show isis statistics
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display statistics about Intermediate System-to-Intermediate System (IS-IS) traffic.

Options
none—Display IS-IS traffic statistics for all routing instances.

instance *instance-name*—(Optional) Display statistics for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show isis statistics on page 1867

Output Fields
Table 229 on page 1866 describes the output fields for the **show isis statistics** command. Output fields are listed in the approximate order in which they appear.

Table 229: show isis statistics Output Fields

Field Name	Field Description
PDU type	Protocol data unit type: • **CSNP**—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU. • **IIH**—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems. • **LSP**—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area. • **PSNP**—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU; that is, when its link-state PDU database is out of date. The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device. • **Unknown**—The PDU type is unknown.
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.

Table 229: show isis statistics Output Fields *(continued)*

Field Name	Field Description
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.
SNP queue length	Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always **0**.
LSP queue length	Number of link-state PDUs waiting in the queue for processing. This value is almost always **0**.
SPF runs	Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.
Fragments rebuilt	Number of link-state link-state PDU fragments that the local system has computed.
LSP regenerations	Number of link-state PDUs that have been regenerated. A link state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
Purges initiated	Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

Options

none—Display standard information about all entries in the OSPFv3 link-state database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (*address* | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about interarea-prefix LSAs.

inter-area-router—(Optional) Display information about interarea-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

show ospf3 database summary on page 1877

Output Fields Table 230 on page 1869 lists the output fields for the **show ospf3 database** command. Output fields are listed in the approximate order in which they appear.

Table 230: show ospf3 database Output Fields

Field Name	Field Description	Level of Output
OSPF link state database, area *area-number*	Entries in the link-state database for this area.	**brief detail extensive**
OSPF AS SCOPE link state database	Entries in the AS scope link-state database.	**brief detail extensive**

Table 230: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
OSPF Link-Local link state database, interface *interface-name*	Entries in the link-local link-state database for this interface.	**brief detail extensive**
area	Area number. Area **0.0.0.0** is the backbone area.	All levels
Type	Type of link advertisement: **Extern**, **InterArPfx**, **InterArRtr**, **IntraArPrx** , **Link**, **Network**, **NSSA**, or **Router**.	**brief detail extensive**
ID	Link identifier included in the advertisement. An asterisk (*) preceding the identifier marks database entries that originated from the local routing device.	**brief detail extensive**
Adv Rtr	Address of the routing device that sent the advertisement.	**brief detail extensive**
Seq	Link sequence number of the advertisement.	**brief detail extensive**
Age	Time elapsed since the LSA was originated, in seconds.	**brief detail extensive**
Cksum	Checksum value of the LSA.	**brief detail extensive**
Len	Length of the advertisement, in bytes.	**brief detail extensive**
Router (Router Link-State Advertisements)		
bits	Flags describing the routing device that generated the LSP.	**detail extensive**
Options	Option bits carried in the router LSA.	**detail extensive**
For Each Router Link		
Type	Type of interface. The value of all other output fields describing a routing device interface depends on the interface's type: • **PointToPoint (1)**—Point-to-point connection to another routing device. • **Transit (2)**—Connection to a transit network. • **Virtual (4)**—Virtual link.	**detail extensive**
Loc-if-id	Local interface ID assigned to the interface that uniquely identifies the interface with the routing device.	**detail extensive**
Nbr-if-id	Interface ID of the neighbor's interface for this routing device link.	**detail extensive**
Nbr-rtr-id	Router ID of the neighbor routing device (for type 2 interfaces, the attached link's designated router).	**detail extensive**
Metric	Cost of the router link.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**

Table 230: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn*:*nn*:*nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn*:*nn*:*nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn*:*nn*:*nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
Network (Network Link-State Advertisements)		
Options	Option bits carried in the network LSA.	**detail extensive**
Attached Router	Router IDs of each of the routing devices attached to the link. Only routing devices that are fully adjacent to the designated router are listed. The designated router includes itself in this list.	**detail extensive**
InterArPfx (Interarea-Prefix Link-State Advertisements)		
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn*:*nn*:*nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn*:*nn*:*nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn*:*nn*:*nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
InterArRtr (Interarea-Router Link-State Advertisements)		
Dest-router-id	Router ID of the routing device described by the LSA.	**detail extensive**
options	Optional capabilities supported by the routing device.	**detail extensive**

Table 230: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	**detail extensive**
Prefix	IPv6 address prefix.	**extensive**
Prefix-options	Option bit associated with the prefix.	**extensive**
Extern (External Link-State Advertisements)		
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of the route, which depends on the value of **Type**.	**detail extensive**
Type *n*	Type of external metric: **Type 1** or **Type 2**.	**detail extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn:nn:nn* **ago**	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn:nn:nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn:nn:nn* **ago**	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Link (Link-State Advertisements)		
IPv6-Address	IPv6 link-local address on the link for which this link LSA originated.	**detail extensive**
Options	Option bits carried in the link LSA.	**detail extensive**
priority	Router priority of the interface attaching the originating routing device to the link.	**detail extensive**
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	**detail extensive**
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**

Table 230: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Installed *nn:nn:nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn:nn:nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn:nn:nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
IntraArPfx (Intra-Area-Prefix Link-State Advertisements)		
Ref-lsa-type	LSA type of the referenced LSA. • **Router**—Address prefixes are associated with a router LSA. • **Network**—Address prefixes are associated with a network LSA.	**detail extensive**
Ref-lsa-id	Link-state ID of the referenced LSA.	**detail extensive**
Ref-router-id	Advertising router ID of the referenced LSA.	**detail extensive**
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	**detail extensive**
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of this prefix. Expressed in the same units as the interface costs in the router LSAs.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *hh*:*mm*:*ss* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *hh*:*mm*:*ss*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *hh*:*mm*:*ss* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
***n* Router LSAs**	Number of router LSAs in the link-state database.	**summary**
***n* Network LSAs**	Number of network LSAs in the link-state database.	**summary**
***n* InterArPfx LSAs**	Number of interarea-prefix LSAs in the link-state database.	**summary**

Table 230: show ospf3 database Output Fields *(continued)*

Field Name	Field Description	Level of Output
***n* InterArRtr LSAs**	Number of interarea-router LSAs in the link-state database.	**summary**
***n* IntraArPfx LSAs**	Number of intra-area-prefix LSAs in the link-state database.	**summary**
Externals	Display of the external LSA database.	**summary**
***n* Extern LSAs**	Number of external LSAs in the link-state database.	**summary**
Interface ***interface-name***	Name of the interface for which link-local LSA information is displayed.	**summary**
***n* Link LSAs**	Number of link LSAs in the link-state database.	**summary**

Syntax (J-EX Series Switch)

show ospf database
<brief | detail | extensive | summary>
<advertising-router (*address* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<link-local>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<router>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the Open Shortest Path First version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

Options

none—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (*address* | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

asbrsummary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

Output Fields Table 231 on page 1879 describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

Table 231: show ospf database Output Fields

Field Name	Field Description	Level of Output
area	Area number. Area **0.0.0.0** is the backbone area.	All levels
Type	Type of link advertisement: **ASBRSum**, **Extern**, **Network**, **NSSA**, **OpaqArea**, **Router**, or **Summary**.	All levels
ID	LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.	All levels
Adv Rtr	Address of the routing device that sent the advertisement.	All levels
Seq	Link sequence number of the advertisement.	All levels
Age	Time elapsed since the LSA was originated, in seconds.	All levels
Cksum	Checksum value of the LSA.	All levels

Table 231: show ospf database Output Fields *(continued)*

Field Name	Field Description	Level of Output
Len	Length of the advertisement, in bytes.	All levels
Router	Router link-state advertisement information: • **bits**—Flags describing the routing device that generated the LSP. • **link count**—Number of links in the advertisement. • **id**—ID of a routing device or subnet on the link. • **data**—For stub networks, the subnet mask; otherwise, the IP address of the routing device that generated the LSP. • **type**—Type of link. It can be **PointToPoint**, **Transit**, **Stub**, or **Virtual**. • **TOS count**—Number of type-of-service (ToS) entries in the advertisement. • **TOS 0 metric**—Metric for ToS 0. • **TOS**—Type-of-service (ToS) value. • **metric**—Metric for the ToS.	**detail extensive**
Network	Network link-state advertisement information: • **mask**—Network mask. • **attached router**—ID of the attached neighbor.	**detail extensive**
Summary	Summary link-state advertisement information: • **mask**—Network mask. • **TOS**—Type-of-service (ToS) value. • **metric**—Metric for the ToS.	**detail extensive**
Gen timer	How long until the LSA is regenerated.	**extensive**
Aging time	How long until the LSA expires.	**extensive**
Installed *hh*:*mm*:*ss* ago	How long ago the route was installed.	**extensive**
expires in *hh*:*mm*:*ss*	How long until the route expires.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
Router LSAs	Number of router link-state advertisements in the link-state database.	**summary**
Network LSAs	Number of network link-state advertisements in the link-state database.	**summary**
Summary LSAs	Number of summary link-state advertisements in the link-state database.	**summary**

show policy damping

Syntax
show policy damping
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show policy damping

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about Border Gateway Protocol (BGP) route flap damping parameters.

Options
none—Display information about BGP route flap damping parameters.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information
In the output from this command, figure-of-merit values correlate to the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.

Required Privilege Level

List of Sample Output
show policy damping on page 1887

Output Fields
Table 232 on page 1886 describes the output fields for the **show policy damping** command. Output fields are listed in the approximate order in which they appear.

Table 232: show policy damping Output Fields

Field Name	Field Description
Halflife	Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.

Table 232: show policy damping Output Fields *(continued)*

Field Name	Field Description
Reuse merit	Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.
Suppress/cutoff merit	Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.
Maximum suppress time	Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.
Computed values	• **Merit ceiling**—Maximum merit that a flapping route can collect. • **Maximum decay**—Maximum decay half-life, in minutes.

show policy damping

```
user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453
```

show rip general-statistics

Syntax

Output Fields

Table 239 on page 1899 describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

Table 239: show route Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
number **destinations**	Number of destinations for which there are routes in the routing table.
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active). • **holddown** (routes that are in the pending state before being declared inactive). • **hidden** (routes that are not used because of a routing policy).

Table 239: show route Output Fields *(continued)*

Field Name	Field Description

destination-prefix	Route destination (for example:**10.0.0.1/24**). Sometimes the route information is presented in another format, such as:
	• ***MPLS-label*** (for example, **80001**).
	• ***interface-name*** (for example, **ge-1/0/2**).
	• ***neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id* :*source*** (Layer 2 circuit only; for example, **10.1.1.195:NoCtrlWord:1:1:Local/96**):
	  ◦ ***neighbor-address***—Address of the neighbor.
	  ◦ ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**.
	  ◦ ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.
	  ◦ ***vc-id***—Virtual circuit identifier.
	• ***source***—Source of the advertisement: **Local** or **Remote**.

[***protocol*, *preference*** **]**	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
weeks:days hours*:*minutes*:*seconds	How long the route been known (for example, **2w4d 13:11:14**, or 2 weeks, 4 days, 13 hours, 11 minutes and 14 seconds).
metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
localpref	Local preference value included in the route.
from	Interface from which the route was received.

Table 239: show route Output Fields *(continued)*

Field Name	Field Description
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set.
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • **Weight**—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • **Balance**—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing. • ***lsp-path-name***—Name of the label-switched path (LSP) used to reach the next hop. • ***label-action***—MPLS label and operation occurring at the next hop. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).

show route active-path

Syntax
show route active-path
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route active-path
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.

Options
none—Display all active routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route active-path on page 1903
show route active-path brief on page 1904
show route active-path detail on page 1904
show route active-path extensive on page 1905
show route active-path terse on page 1906

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail**, the **show route extensive**, or the **show route terse**.

show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32    *[Direct/0] 21:33:52
                    > via lo0.0
10.255.71.50/32    *[IS-IS/15] 00:18:13, metric 10
                    > to 100.1.2.1 via so-2/1/3.0
100.1.2.0/24       *[Direct/0] 00:18:36
                    > via so-2/1/3.0
100.1.2.2/32       *[Local/0] 00:18:41
                      Local via so-2/1/3.0
192.168.64.0/21    *[Direct/0] 21:33:52
                    > via fxp0.0
192.168.70.19/32   *[Local/0] 21:33:52
                      Local via fxp0.0
```

show route active-path brief

The output for the **show route active-path brief** command is identical to that for the **show route active-path** command. For sample output, see **show route active-path on page 1903**.

show route active-path detail

```
user@host> show route active-path detail

show route all

Syntax
show route all
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route all

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about all routes in all routing tables, including private, or internal, tables.

Options
none—Display information about all routes in all routing tables, including private, or internal, tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route all on page 1908

Output Fields
The output fields for the **show route all** command display all routing tables, including private, or hidden, routing tables. The output field table of the **show route** command does not display entries for private, or hidden, routing tables.

show route all
The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0                  *[MPLS/0] 2d 02:24:39, metric 1
                      Receive
1                  *[MPLS/0] 2d 02:24:39, metric 1

show route aspath-regex

Syntax

show route aspath-regex *regular-expression*
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show route aspath-regex *regular-expression*

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.

Options

regular-expression—Regular expression that matches an entire AS path.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

You can specify a regular expression as:

- An individual AS number
- A period wildcard used in place of an AS number
- An AS path regular expression that is enclosed in parentheses

You also can include the operators described in the table of AS path regular expression operators in the *Junos OS Policy Framework Configuration Guide*. The following list summarizes these operators:

- ***{m,n}***—At least *m* and at most *n* repetitions of the AS path term.
- ***{m}***—Exactly *m* repetitions of the AS path term.
- ***{m,}***—*m* or more repetitions of the AS path term.
- *******—Zero or more repetitions of an AS path term.
- ***+***—One or more repetitions of an AS path term.
- ***?***—Zero or one repetition of an AS path term.
- ***aspath_term | aspath_term***—Match one of the two AS path terms.

  When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:

  ```
  show route aspath-regex ".* 234 .*"
  ```

                     to 192.156.169.1 via 192.156.169.14(so-0/0/0)
...
```

show route best

Syntax
show route best *destination-prefix*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route best *destination-prefix*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.

Options
destination-prefix—Address or range of addresses.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route community

Syntax
show route community *as-number:community-value*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route community *as-number:community-value*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

Options
as-number:community-value—One or more community identifiers. ***as-number*** is the AS number, and ***community-value*** is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information
Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

show route damping

Syntax
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the Border Gateway Protocol (BGP) routes for which updates might have been reduced because of route flap damping.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

decayed—Display route damping entries that might no longer be valid, but are not suppressed.

history—Display entries that have already been withdrawn, but have been logged.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

suppressed—Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.

show route damping history on page 1925
show route damping history detail on page 1926

Output Fields
Table 240 on page 1922 lists the output fields for the **show route damping** command. Output fields are listed in the approximate order in which they appear.

Table 240: show route damping Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example,**inet.0**.	All levels
destinations	Number of destinations for which there are routes in the routing table.	All levels

Table 240: show route damping Output Fields *(continued)*

Field Name	Field Description	Level of Output
***number* routes**	Number of routes in the routing table and total number of routes in the following states: • **active** • **holddown** (routes that are in a pending state before being declared inactive) • **hidden** (the routes are not used because of a routing policy)	All levels
***destination-prefix* (entry, announced)**	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-**—A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.	All levels
Next-hop reference count	Number of references made to the next hop.	**detail extensive**
Source	IP address of the route source.	**detail extensive**
Next hop	Network layer address of the directly reachable neighboring system.	**detail extensive**
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**.	**detail extensive**
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.	**detail extensive**
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.	**detail extensive**
State	Flags for this route. For a description of possible values for this field, see the output field table for the **show route detail** command.	**detail extensive**
Local AS	AS number of the local routing device.	**detail extensive**
Peer AS	AS number of the peer routing device.	**detail extensive**

Table 240: show route damping Output Fields *(continued)*

Field Name	Field Description	Level of Output
Age	How long the route has been known.	**detail extensive**
Metric	Metric for the route.	**detail extensive**
Task	Name of the protocol that has added the route.	**detail extensive**
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set.	All levels
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	**brief** none
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**.	**brief** none
Communities	Community path attribute for the route. See the output field table for the **show route detail** command.	**detail extensive**
Localpref	Local preference value included in the route.	All levels
Router ID	BGP router ID as advertised by the neighbor in the open message.	**detail extensive**
Merit (last update/now)	Last updated and current figure-of-merit value.	**detail extensive**
damping-parameters	Name that identifies the damping parameters used, which is defined in the damping statement at the **[edit policy-options]** hierarchy level.	**detail extensive**
Last update	Time of most recent change in path attributes.	**detail extensive**

Table 240: show route damping Output Fields *(continued)*

Field Name	Field Description	Level of Output
First update	Time of first change in path attributes, which started the route damping process.	**detail extensive**
Flaps	Number of times the route has gone up or down or its path attributes have changed.	**detail extensive**
Suppressed	(**suppressed** keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it.	All levels
Reusable in	(**suppressed** keyword only) Time when a suppressed route will again be available.	All levels
Preference will be	(**suppressed** keyword only) Preference value that will be applied to the route when it is again active.	All levels

show route detail

Syntax
show route detail
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route detail
<*destination-prefix*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display detailed information about the active entries in the routing tables.

Options
none—Display all active entries in the routing table on all systems.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output
show route detail on page 1935

Output Fields
Table 241 on page 1927 describes the output fields for the **show route detail** command. Output fields are listed in the approximate order in which they appear.

Table 241: show route detail Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
number **destinations**	Number of destinations for which there are routes in the routing table.
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)

Table 241: show route detail Output Fields *(continued)*

Field Name	Field Description
route-destination **(entry, announced)**	Route destination (for example:**10.0.0.1/24**). The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as: • ***MPLS-label*** (for example, **80001**). • ***interface-name*** (for example, **ge-1/0/2**). • ***neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id*:*source*** (Layer 2 circuit only; for example, **10.1.1.195:NoCtrlWord:1:1:Local/96**). • ***neighbor-address***—Address of the neighbor. • ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**. • ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport • ***vc-id***—Virtual circuit identifier. • ***source***—Source of the advertisement: **Local** or **Remote**.
label stacking	**(**Next-to-the-last-hop routing device for MPLS only) Depth of the Multiprotocol Label Switching (MPLS) label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area; when the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 242 on page 1931.

Table 241: show route detail Output Fields *(continued)*

Field Name	Field Description
Next-hop reference count	Number of references made to the next hop.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing.
Label-switched-path *lsp-path-name*	Name of the label-switched path (LSP) used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 243 on page 1932.
Local AS	AS number of the local routing device.
Age	How long the route has been known.
Metric*n*	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
Task	Name of the protocol that has added the route.

Table 241: show route detail Output Fields *(continued)*

Field Name	Field Description
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Dell Support only (see "Requesting Technical Support" on page lxxi).
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 244 on page 1934 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or **Site Down**.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.

Table 241: show route detail Output Fields *(continued)*

Field Name	Field Description
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

Table 242 on page 1931 describes all possible values for the **Next-hop Types** output field.

Table 242: Next-Hop Types Output Field Values

Next-Hop Type	Description
broadcast (bcast)	Broadcast next hop.
deny	Deny next hop.
hold	Next hop is waiting to be resolved into a unicast or multicast type.
indexed (idxd)	Indexed next hop.
indirect (indr)	Indirect next hop.
local (locl)	Local address on an interface.
routed multicast (mcrt)	Regular multicast next hop.
multicast (mcst)	Wire multicast next hop (limited to the LAN).
multicast discard (mdsc)	Multicast discard.
multicast group (mgrp)	Multicast group member.
receive (recv)	Receive.
reject (rjct)	Discard. An ICMP unreachable message was sent.
resolve (rslv)	Resolving next hop.
unicast (ucst)	Unicast.
unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 243 on page 1932 describes all possible values for the **State** output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 243: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Clone	Route is a clone.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled and a path with a lower MED is available.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Local Preference	Path with a higher local preference value is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.

Table 243: State Output Field Values *(continued)*

Value	Description
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGP path is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with greater number of next hops is available.
Origin	Path with lower origin code is available.
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available
Router ID	Path through neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: • The route is damped. • The route is rejected by an import policy. • The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.

Table 244 on page 1934 describes the possible values for the **Communities** output field.

Table 244: Communities Output Field Values

Value	Description
area-number	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is **0**. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: *local AS number:link-bandwidth-number*	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that identifies the OSPF domain.
link-bandwidth-number	Link-bandwidth number: from **0** through **4,294,967,295** (bytes per second).
local AS number	Local AS number: from **1** through **65,535**.
options	1 byte. Currently this is only used if the route type is **5** or **7**. Setting the least significant bit in the field indicates that the route carries a type 2 metric.
origin	(Used with VPNs) Identifies where the route came from.
ospf-route-type	1 byte, encoded as **1** or **2** for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); **3** for summary routes; **5** for external routes (area number must be **0**); **7** for NSSA routes; or **129** for sham link endpoint addresses.
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x0306**. The format is *area-number:ospf-route-type:options*.
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x8000**. The format is *area-number:ospf-route-type:options*.
target	Defines which VPN the route participates in; **target** has the format *32-bit IP address:16-bit number*. For example, **10.19.0.0:100**.
unknown IANA	Incoming IANA codes with a value between **0x1** and **0x7fff**. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above **0x8000**. This code of the BGP extended community attribute is accepted, but it is not recognized.

show route exact

Syntax
show route exact *destination-prefix*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route exact *destination-prefix*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display only the routes that exactly match the specified address or range of addresses.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

destination-prefix—Address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route exact on page 1941
show route exact detail on page 1941
show route exact extensive on page 1943
show route exact terse on page 1943

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route export

Syntax
show route export
<brief | detail>
<instance <*instance-name*> | *routing-table-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route export
<brief | detail>
<instance <*instance-name*> | *routing-table-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.

Options
none—(Same as **brief**.) Display standard information about policy-based export for all instances and routing tables on all systems.

brief | detail—(Optional) Display the specified level of output.

instance <*instance-name*>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

routing-table-name—(Optional) Display information about a particular routing table (for example, **inet.0**) for which policy-based export is currently enabled. (For information about the different types of routing tables, see the *Junos OS Routing Protocols Configuration Guide*.)

Required Privilege Level
view

List of Sample Output
show route export on page 1945
show route export detail on page 1945
show route export instance detail on page 1945

Output Fields
Table 245 on page 1944 lists the output fields for the **show route export** command. Output fields are listed in the approximate order in which they appear.

Table 245: show route export Output Fields

Field Name	Field Description	Level of Output
Table or ***table-name***	Name of the routing tables that either import or export routes.	All levels
Routes	Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.	**brief** none
Export	Whether the table is currently exporting routes to other tables: **Y** or **N** (Yes or No).	**brief** none

Table 245: show route export Output Fields *(continued)*

Field Name	Field Description	Level of Output
Import	Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)	**detail**
Flags	(**instance** keyword only) Flags for this feature on this instance: • **config auto-policy**—The policy was deduced from the configured IGP export policies. • **cleanup**—Configuration information for this instance is no longer valid. • **config**—The instance was explicitly configured.	**detail**
Options	(**instance** keyword only) Configured option displays the type of routing tables the feature handles: • **unicast**—Indicates ***instance*.inet.0**. • **multicast**—Indicates ***instance*.inet.2**. • **unicast multicast**—Indicates ***instance*.inet.0** and ***instance*.inet.2**.	**detail**
Import policy	(**instance** keyword only) Policy that **route export** uses to construct the import-export matrix. Not displayed if the instance type is **vrf**.	**detail**
Instance	(**instance** keyword only) Name of the routing instance.	**detail**
Type	(**instance** keyword only) Type of routing instance: **forwarding**, **non-forwarding**, or **vrf**.	**detail**

show route export

Instance: black                          Type: non-forwarding
Instance: red                            Type: non-forwarding
```

show route extensive

Syntax
show route extensive
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route extensive
<*destination-prefix*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display extensive information about the active entries in the routing tables.

Options
none—Display all active entries in the routing table.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show route extensive (Access Route) on page 1957
show route extensive (Route Reflector) on page 1957

Output Fields
Table 246 on page 1946 describes the output fields for the **show route extensive** command. Output fields are listed in the approximate order in which they appear.

Table 246: show route extensive Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
***number* destinations**	Number of destinations for which there are routes in the routing table.
***number* routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active). • **holddown** (routes that are in the pending state before being declared inactive). • **hidden** (routes that are not used because of a routing policy).

Table 246: show route extensive Output Fields *(continued)*

Field Name	Field Description
route-destination **(entry, announced)**	Route destination (for example:**10.0.0.1/24**). The **entry** value is the number of route for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as: • ***MPLS-label*** (for example, **80001**). • ***interface-name*** (for example, **ge-1/0/2**). • ***neighbor-address*****:*****control-word-status*****:*****encapsulation type*****:*****vc-id*****:*****source*** (Layer 2 circuit only; for example, **10.1.1.195:NoCtrlWord:1:1:Local/96**). • ***neighbor-address***—Address of the neighbor. • ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**. • ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • ***vc-id***—Virtual circuit identifier. • ***source***—Source of the advertisement: **Local** or **Remote**.
TSI	Protocol header information.
label stacking	(Next-to-the-last-hop routing device for MPLS only) Depth of the Multiprotocol Label Switching (MPLS) label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
Level	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area; when the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.

Table 246: show route extensive Output Fields *(continued)*

Field Name	Field Description
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
Next-hop type	Type of next hop. For a description of possible values for this field, see the Output Field table in the **show route detail** command.
Next-hop reference count	Number of references made to the next hop.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing.
Label-switched-path *lsp-path-name*	Name of the label-switched path (LSP) used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Offset	Whether the metric has been increased or decreased by an offset value.
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.
label-operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Indirect next hops	When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.
State	State of the route (a route can be in more than one state). See the Output Field table in the **show route detail** command.

Table 246: show route extensive Output Fields *(continued)*

Field Name	Field Description
Inactive reason	If the route is inactive, the reason for its current state is indicated. Typical reasons include: • **Active preferred**—Currently active route was selected over this route. • **Always compare MED**—Path with a lower multiple exit discriminator (MED) is available. • **AS path**—Shorter AS path is available. • **Cisco Non-deterministic MED selection**—Cisco nondeterministic MED is enabled and a path with a lower MED is available. • **Cluster list length**—Path with a shorter cluster list length is available. • **Forwarding use only**—Path is only available for forwarding purposes. • **IGP metric**—Path through the next hop with a lower IGP metric is available. • **IGP metric type**—Path with a lower OSPF link-state advertisement type is available. • **Interior > Exterior > Exterior via Interior**—Direct, static, IGP, or EBGP path is available. • **Local preference**—Path with a higher local preference value is available. • **Next hop address**—Path with a lower metric next hop is available. • **No difference**—Path from a neighbor with a lower IP address is available. • **Not Best in its group**—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed). • **Number of gateways**—Path with a higher number of next hops is available. • **Origin**—Path with a lower origin code is available. • **OSPF version**—Path does not support the indicated OSPF version. • **RIB preference**—Route from a higher-numbered routing table is available. • **Route destinguisher**—64-bit prefix added to IP subnets to make them unique. • **Route metric or MED comparison**—Route with a lower metric or MED is available. • **Route preference**—Route with a lower preference value is available. • **Router ID**—Path through a neighbor with a lower ID is available. • **Unusable path**—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved. • **Update source**—Last tiebreaker is the lowest IP address value.
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
Task	Name of the protocol that has added the route.
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Dell Support only (see “Requesting Technical Support” on page lxxi).

Table 246: show route extensive Output Fields *(continued)*

Field Name	Field Description
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set.
AS path: I <Originator>	(For route reflected output only) Originator ID attribute set by the route reflector.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the **show route detail** command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.

Table 246: show route extensive Output Fields *(continued)*

Field Name	Field Description
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of **inet.0** resolving through **inet.0** and **inet.3**, this field indicates which routing table, **inet.0** or **inet.3**, provided the best path for a particular prefix.
Node path count	Number of nodes in the path.
Forwarding nexthops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

show route flow validation

Syntax
show route flow validation
<brief | detail>
<*ip-prefix*>
<table *table-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route flow validation
<brief | detail>
<*ip-prefix*>
<table *table-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display flow route information.

Options
none—Display flow route information.

brief | detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

ip-prefix—(Optional) IP address for the flow route.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *table-name*—(Optional) Name of the flow route table.

Required Privilege Level
view

List of Sample Output
show route flow validation on page 1959

Output Fields
Table 247 on page 1958 lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

Table 247: show route flow validation Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table (for example, **inet.0**).	All levels
prefix	Route address.	All levels
Active unicast route	Active route in the routing table.	All levels
Dependent flow destinations	Number of flows for which there are routes in the routing table.	All levels
Origin	Source of the route flow.	All levels

Table 247: show route flow validation Output Fields *(continued)*

Field Name	Field Description	Level of Output
Neighbor AS	Autonomous system identifier of the neighbor.	All levels
Flow destination	Number of entries and number of destinations that match the route flow.	All levels
Unicast best match	Destination that is the best match for the route flow.	All levels
Flags	Information about the route flow.	All levels

show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```

show route inactive-path

Syntax
show route inactive-path
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route inactive-path
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path.

Options
none—Display all inactive routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route inactive-path on page 1960
show route inactive-path detail on page 1961
show route inactive-path extensive on page 1962
show route inactive-path terse on page 1962

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route inactive-prefix

Syntax
show route inactive-prefix
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route inactive-prefix
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display inactive route destinations in each routing table.

Options
none—Display all inactive route destination.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route inactive-prefix on page 1963
show route inactive-prefix detail on page 1963
show route inactive-prefix extensive on page 1964
show route inactive-prefix terse on page 1964

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route inactive-prefix

```
user@host> show route inactive-prefix

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

127.0.0.1/32        [Direct/0] 00:04:54
                    > via lo0.0
```

show route inactive-prefix detail

```
user@host> show route inactive-prefix detail

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
127.0.0.1/32 (1 entry, 0 announced)
         Direct Preference: 0
                Next hop type: Interface
                Next-hop reference count: 1
                Next hop: via lo0.0, selected
                State: <Hidden Martian Int>
                Age: 4:51
                Task: IF
```

```
                    AS path: I00:04:54
                        > via lo0.0
```

show route inactive-prefix extensive

The output for the **show route inactive-prefix extensive** command is identical to that of the **show route inactive-path detail** command. For sample output, see **show route inactive-prefix detail on page 1963**.

show route inactive-prefix terse

```
user@host> show route inactive-prefix terse

inet.0: 18 destinations, 18 routes (17 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

A Destination        P Prf   Metric 1   Metric 2  Next hop        AS path
  127.0.0.1/32       D   0                      >lo0.0
```

show route instance

Syntax
show route instance
<brief | detail | summary>
<*instance-name*>
<logical-system (all | *logical-system-name*)>
<operational>

Syntax (J-EX Series Switch)
show route instance
<brief | detail | summary>
<*instance-name*>
<operational>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display routing instance information.

Options
none—(Same as **brief**) Display standard information about all routing instances.

brief | detail | summary—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**. (These options are not available with the **operational** keyword.)

instance-name—(Optional) Display information for a specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

operational—(Optional) Display operational routing instances.

Required Privilege Level
view

List of Sample Output
show route instance on page 1966
show route instance detail (Graceful Restart Complete) on page 1967
show route instance detail (Graceful Restart Incomplete) on page 1968
show route instance detail (VPLS Routing Instance) on page 1970
show route instance operational on page 1970
show route instance summary on page 1970

Output Fields
Table 248 on page 1965 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

Table 248: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or ***instance-name***	Name of the routing instance.	All levels
Operational Routing Instances	(**operational** keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: **forwarding**, **l2vpn**, **no-forwarding**, **vpls**, or **vrf**.	All levels

Table 248: show route instance Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	State of the routing instance: **active** or **inactive**.	**brief detail** none
Interfaces	Name of interfaces belonging to this routing instance.	**brief detail** none
Restart State	Status of graceful restart for this instance: **Pending** or **Complete**.	**detail**
Path selection timeout	Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is 300.	**detail**
Tables	Tables (and number of routes) associated with this routing instance.	none **brief detail**
Route-distinguisher	Unique route distinguisher associated with this routing instance.	**detail**
Vrf-import	VPN routing and forwarding instance import policy name.	**detail**
Vrf-export	VPN routing and forwarding instance export policy name.	**detail**
Vrf-import-target	VPN routing and forwarding instance import target community name.	**detail**
Vrf-export-target	VPN routing and forwarding instance export target community name.	**detail**
Fast-reroute-priority	Fast reroute priority setting for a VPLS routing instance: **high**, **medium**, or **low**. The default is **low**.	**detail**
Restart State	Restart state: • **Pending:*protocol-name***—List of protocols that have not yet completed graceful restart for this routing table. • **Complete**—All protocols have restarted for this routing table.	**detail**
Primary rib	Primary table for this routing instance.	**brief** none **summary**
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

show route instance

show route label

Syntax
show route label *label*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route label *label*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the routes based on a specified Multiprotocol Label Switching (MPLS) label value.

Options
label—Value of the MPLS label.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route label on page 1972
show route label detail on page 1973
show route label extensive on page 1973
show route label terse on page 1973

Output Fields
For information about output fields, see the output field table for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route label

```
user@host> show route label 100016

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
100016             *[VPN/170] 03:25:41
                    > to 10.12.80.1 via ge-6/3/2.0, Pop
```

show route label detail

```
user@host> show route label 100016 detail

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
100016 (1 entry, 1 announced)
        *VPN    Preference: 170
                Next-hop reference count: 2
                Source: 10.12.80.1
                Next hop: 10.12.80.1 via ge-6/3/2.0, selected
                Label operation: Pop
                State: <Active Int Ext>
                Local AS:     1
                Age: 3:23:31
                Task: BGP.0.0.0.0+179
                Announcement bits (1): 0-KRT

                Ref Cnt: 2
```

show route label extensive

The output for the show route label extensive command is identical to that of the **show route label detail** command. For sample output, see **show route label detail on page 1973**.

show route label terse

```
user@host> show route label 100016 terse

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

A Destination        P Prf   Metric 1   Metric 2  Next hop        AS path
* 100016             V 170                       >10.12.80.1
```

show route label-switched-path

Syntax
show route label-switched-path *path-name*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route label-switched-path *path-name*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the routes used in a Multiprotocol Label Switching (MPLS) label-switched path (LSP).

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output.

path-name—LSP tunnel name.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route label-switched-path on page 1974

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route label-switched-path

```
user@host> show route label-switched-path sf-to-ny
inet.0: 29 destinations, 29 routes (29 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.1.1/32          [MPLS/7] 00:00:06, metric 0

+ = Active Route, - = Last Active, * = Both
```

show route martians

Syntax

show route martians
<logical-system (all | *logical-system-name*)>
<table *routing-table-name*>

Syntax (J-EX Series Switch)

show route martians
<table *routing-table-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the martian (invalid and ignored) entries associated with each routing table.

Options

none—Display standard information about route martians for all routing tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display only the martian entries associated with a particular routing table.

Required Privilege Level

view

List of Sample Output

show route martians on page 1976

Output Fields

Table 249 on page 1976 lists the output fields for the **show route martians** command. Output fields are listed in the approximate order in which they appear

Table 249: show route martians Output Fields

Field Name	Field Description
table-name	Name of the route table in which the route martians reside.
destination-prefix	Route destination.
match value	Route match parameter.
status	Status of the route: **allowed** or **disallowed**.

show route martians

```
user@host> show route martians

inet.0:
             0.0.0.0/0 exact -- allowed
             0.0.0.0/8 orlonger -- disallowed

....
```

show route next-hop

Syntax

show route next-hop *next-hop*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show route next-hop *next-hop*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the routing table that are being sent to the specified next-hop address.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of ouput.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

next-hop—Next-hop address.

Required Privilege Level

show route no-community

Syntax

show route no-community
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show route no-community
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the route entries in each routing table that are not associated with any community.

Options

none—(Same as **brief**) Display the route entries in each routing table that are not associated with any community.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

show route protocol

Syntax
show route protocol *protocol*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route protocol *protocol*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the route entries in the routing table that were learned from a particular protocol.

Options
protocol—Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **esis**—End System-to-Intermediate System
- **flow**—Locally defined flow-specification route.
- **isis**—Intermediate System-to-Intermediate System
- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit
- **l2vpn**—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation

- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

NOTE: J-EX Series switches run a subset of these protocols. See the switch CLI for details.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

show route range

Syntax

show route range
<brief | detail | extensive | terse>
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show route range
<brief | detail | extensive | terse>
<*destination-prefix*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display routing table entries using a prefix range.

Options

none—Display standard information about all routing table entries using a prefix range.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

destination-prefix—(Optional) Destination and prefix mask for the range.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route range on page 1996
show route range destination-prefix on page 1997
show route range detail on page 1997
show route range extensive on page 1998
show route range terse on page 1999

Output Fields

For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route receive-protocol

Syntax show route receive-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)

Syntax (J-EX Series Switch) show route receive-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.

Options brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

protocol neighbor-address—Protocol transmitting the route (**bgp**, **dvmrp**, **msdp**, **pim**, **rip**, or **ripng**) and address of the neighboring router from which the route entry was received.

Additional Information The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.

Required Privilege Level view

List of Sample Output
show route receive-protocol bgp on page 2002
show route receive-protocol bgp extensive on page 2002
show route receive-protocol bgp extensive on page 2003
show route receive-protocol bgp detail (Layer 2 VPN) on page 2004
show route receive-protocol bgp extensive (Layer 2 VPN) on page 2004
show route receive-protocol bgp (Layer 3 VPN) on page 2005

show route receive-protocol bgp extensive (Layer 3 VPN) on page 2006

Output Fields Table 250 on page 2000 describes the output fields for the **show route receive-protocol** command. Output fields are listed in the approximate order in which they appear.

Table 250: show route receive-protocol Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example, **inet.0**.	All levels
number **destinations**	Number of destinations for which there are routes in the routing table.	All levels

Table 250: show route receive-protocol Output Fields *(continued)*

Field Name	Field Description	Level of Output
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** • **holddown** (routes in that are pending state before being declared inactive) • **hidden** (the routes are not used because of a routing policy)	All levels
Prefix	Destination prefix.	none **brief**
MED	Multiple exit discriminator value included in the route.	none **brief**
destination-prefix **(entry, announced)**	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.	**detail extensive**
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.	**detail extensive**
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.	**detail extensive**
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	All levels
Localpref or **Lclpref**	Local preference value included in the route.	All levels

Table 250: show route receive-protocol Output Fields *(continued)*

Field Name	Field Description	Level of Output
AS path	Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set.	All levels
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	**detail extensive**
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	**detail extensive**
Communities	Community path attribute for the route. See the Output Field table in the **show route detail** command for all possible values for this field.	**detail extensive**
Attrset AS	Number, local preference, and path of the AS that originated the route. These values are stored in the **Attrset** attribute at the originating routing device.	**detail extensive**
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	**detail extensive**
control flags	Control flags: **none** or **Site Down**.	**detail extensive**
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	**detail extensive**

show route resolution

Syntax

show route resolution
<brief | detail | extensive | summary>
<index *index*>
<logical-system (all | *logical-system-name*)>
<*prefix*>
<table *routing-table-name*>
<unresolved>

Syntax (J-EX Series Switch)

show route resolution
<brief | detail | extensive | summary>
<index *index*>
<*prefix*>
<table *routing-table-name*>
<unresolved>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

Options

none—Display standard information about all entries in the next-hop resolution database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

index *index*—(Optional) Show the index of the resolution tree.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix network/destination-prefix—(Optional) Display database entries for the specified address.

table *routing-table-name*—(Optional) Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled. (For information about the different types of routing tables, see the *Junos OS Routing Protocols Configuration Guide*.)

unresolved—(Optional) Display routes that could not be resolved.

Required Privilege Level

show route resolution detail on page 2008
show route resolution summary on page 2009
show route resolution unresolved on page 2009

Output Fields Table 251 on page 2008 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

Table 251: show route resolution Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.
Tree index	Tree index identifier.
Nodes	Number of nodes in the tree.
Reference count	Number of references made to the next hop.
Contributing routing tables	Routing tables used for next-hop resolution.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of **inet.0** resolving via **inet.0** and **inet.3**, this field indicates which routing table, **inet.0** or **inet.3**, provided the best path for a particular prefix.
Metric	Metric associated with the forwarding next hop.
Node path count	Number of nodes in the path.
Forwarding next hops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

show route resolution detail

```

```

show route snooping

Syntax

show route snooping
<brief | detail | extensive | terse>
<all>
<best *address/prefix*>
<exact *address*>
<range *prefix-range*>
<summary>
<table *table-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the routing table that were learned from snooping.

Options

none—Display the entries in the routing table that were learned from snooping.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

all—(Optional) Display all entries, including hidden entries.

best *address/prefix*—(Optional) Display the longest match for the provided address and optional prefix.

exact *address/prefix*—(Optional) Display exact matches for the provided address and optional prefix.

range *prefix-range*—(Optional) Display information for the provided address range.

summary—(Optional) Display route snooping summary statisitics.

table *table-name*—(Optional) Display information for the named table.

Required Privilege Level

show route source-gateway *address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route source-gateway *address*
<brief | detail | extensive | terse>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the entries in the routing table that were learned from a particular address. The **Source** field in the **show route detail** command output lists the source for each route, if known.

Options
brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

address—IP address of the system.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route source-gateway on page 2018
show route source-gateway detail on page 2019
show route source-gateway extensive on page 2021

Output Fields
For information about output fields, see the output field tables for the **show route** command, the **show route detail** command, the **show route extensive** command, or the **show route terse** command.

show route summary

Syntax
show route summary
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show route summary

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display summary statistics about the entries in the routing table.

Options
none—Display summary statistics about the entries in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show route summary on page 2025

Output Fields
Table 252 on page 2024 lists the output fields for the **show route summary** command. Output fields are listed in the approximate order in which they appear.

Table 252: show route summary Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
destinations	Number of destinations for which there are routes in the routing table.
routes	Number of routes in the routing table: • **active**—Number of routes that are active. • **holddown**—Number of routes that are in the hold-down state before being declared inactive. • **hidden**—Number of routes not used because of routing policy.
Direct	Routes on the directly connected network.
Local	Local routes.
protocol-name	Name of the protocol from which the route was learned. For example, **OSPF**, **RSVP**, and **Static**.

```

show route table

Syntax

show route table *routing-table-name*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show route table *routing-table-name*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the route entries in a particular routing table.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

routing-table-name—Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled. (For information about the different types of routing tables, see the *Junos OS Routing Protocols Configuration Guide*.)

show route terse

Syntax show route terse
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch) show route terse

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display a high-level summary of the routes in the routing table.

Options none—Display a high-level summary of the routes in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output **show route terse on page 2035**

Output Fields Table 253 on page 2033 describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

Table 253: show route terse Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, **inet.0**).
number **destinations**	Number of destinations for which there are routes in the routing table.
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)
route key	Key for the state of the route: • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route.
A	Active route. An asterisk (*) indicates this is the active route.
Destination	Destination of the route.

Table 253: show route terse Output Fields *(continued)*

Field Name	Field Description
P	Protocol through which the route was learned: • **A**—Aggregate • **B**—BGP • **C**—CCC • **D**—Direct • **G**—GMPLS • **I**—IS-IS • **L**—L2CKT, L2VPN, LDP, Local • **K**—Kernel • **M**—MPLS, MSDP • **O**—OSPF • **P**—PIM • **R**—RIP, RIPng • **S**—Static • **T**—Tunnel
Prf	Preference value of the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because if has a higher **LocalPref** value and a lower **Preference2** value.
Metric 1	First metric value in the route. For routes learned from BGP, this is the MED metric.
Metric 2	Second metric value in the route. For routes learned from BGP, this is the IGP metric.
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated.

show vrrp

Syntax
show vrrp
<brief | detail | extensive | summary>
<interface *interface-name*>
<track interfaces>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information and status about VRRP groups.

Options
none—(Same as brief) Display brief status information about all VRRP interfaces.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

interface *interface-name* —(Optional) Display information and status about the specified VRRP interface.

track interfaces—(Optional) Display information and status about VRRP track interfaces.

Output Fields
Table 254 on page 2036 lists the output fields for the **show vrrp** command. Output fields are listed in the approximate order in which they appear.

Table 254: show vrrp Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the logical interface.	**none, brief, extensive, summary**
Interface index	Physical interface index number, which reflects its initialization sequence.	**extensive**
Groups	Total number of VRRP groups configured on the interface.	**extensive**
Active	Total number of VRRP groups that are active (that is, whose interface state is either up or down).	**extensive**

Table 254: show vrrp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Interface VRRP PDU statistics	Nonerrored statistics for the logical interface: • **Advertisement sent**—Number of VRRP advertisement protocol data units (PDUs) that the interface has transmitted. • **Advertisement received**—Number of VRRP advertisement PDUs received by the interface. • **Packets received**—Number of VRRP packets received for VRRP groups on the interface. • **No group match received**—Number of VRRP packets received for VRRP groups that do not exist on the interface.	**extensive**
Interface VRRP PDU error statistics	Errored statistics for the logical interface: • **Invalid IPAH next type received**—Number of packets received that use the IP Authentication Header protocol (IPAH) and that do not encapsulate VRRP packets. • **Invalid VRRP ttl value received**—Number of packets received whose IP time-to-live (TTL) value is not 255. • **Invalid VRRP version received**—Number of packets received whose VRRP version is not 2. • **Invalid VRRP pdu type received**—Number of packets received whose VRRP PDU type is not 1. • **Invalid VRRP authentication type received**—Number of packets received whose VRRP authentication is not none, simple, or md5. • **Invalid VRRP IP count received**—Number of packets received whose VRRP IP count exceeds 8. • **Invalid VRRP checksum received**—Number of packets received whose VRRP checksum does not match the calculated value.	**extensive**
Physical interface	Name of the physical interface.	**detail, extensive**
Unit	Logical unit number.	All levels
Address	Address of the physical interface.	**none, brief, detail, extensive**
Index	Physical interface index number, which reflects its initialization sequence.	**detail, extensive**
SNMP ifIndex	SNMP index number for the physical interface.	**detail, extensive**
VRRP-Traps	Status of VRRP traps: **Enabled** or **Disabled**.	**detail, extensive**
Type and Address	Identifier for the address and the address itself: • **lcl**—Configured local interface address. • **mas**—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router. • **vip**—Configured virtual IP addresses.	**none, brief, summary**

Table 254: show vrrp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Interface state or **Int state**	State of the physical interface: • **down**—The device is present and the link is unavailable. • **not present**—The interface is configured, but no physical device is present. • **unknown**—The VRRP process has not had time to query the kernel about the state of the interface. • **up**—The device is present and the link is established.	**none, brief, extensive, summary**
Group	VRRP group number.	**none, brief, extensive, summary**
State	VRRP state: • **backup**—The interface is acting as the backup router interface. • **bringup**—VRRP is just starting, and the physical device is not yet present. • **idle**—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • **initializing**—VRRP is initializing. • **master**—The interface is acting as the master router interface. • **transition**—The interface is changing between being the backup and being the master router.	**extensive**
Priority	Configured VRRP priority for the interface.	**detail, extensive**
Advertisement interval	Configured VRRP advertisement interval.	**detail, extensive**
Authentication type	Configured VRRP authentication type: **none**, **simple**, or **md5**.	**detail, extensive**
Preempt	Whether preemption is allowed on the interface: **yes** or **no**.	**detail, extensive**
Accept-data mode	Whether the interface is configured to accept packets destined for the virtual IP address: **yes** or **no**.	**detail, extensive**
VIP count	Number of virtual IP addresses that have been configured on the interface.	**detail, extensive**
VIP	List of virtual IP addresses configured on the interface.	**detail, extensive**
Advertisement timer	Time until the advertisement timer expires.	**detail, extensive**
Master router	IP address of the interface that is acting as the master. If the VRRP interface is down, the output is **N/A**.	**detail, extensive**
Virtual router uptime	Time that the virtual router has been up.	**detail, extensive**
Master router uptime	Time that the master router has been up.	**detail, extensive**

Table 254: show vrrp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Virtual MAC	MAC address associated with the virtual IP address.	**detail, extensive**
Tracking	Whether tracking is **enabled** or **disabled**.	**detail, extensive**
Current priority	Current operational priority for being the VRRP master.	**detail, extensive**
Configured priority	Configured base priority for being the VRRP master.	**detail, extensive**
Priority hold-time	Minimum time interval, in seconds, between successive changes to the current priority. **Disabled** indicates no minimum interval.	**detail, extensive**
Remaining-time	(**track** option only) Displays the time remaining in the priority hold-time interval.	**detail**
Interface tracking	Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.	**detail extensive**
Interface/Tracked interface	Name of the tracked interface.	**detail extensive**
Int state/Interface state	Current operational state of the tracked interface: **up** or **down**.	**detail, extensive**
Int speed/Speed	Current operational speed, in bits per second, of the tracked interface.	**detail, extensive**
Incurred priority cost	Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.	**detail, extensive**
Threshold	Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred. An entry of **down** means that the corresponding priority cost is incurred when the interface is down.	**detail, extensive**
Route tracking	Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.	**detail, extensive**
Route count	The number of routes being tracked.	**detail, extensive**
Route	The IP address of the route being tracked.	**detail, extensive**
VRF name	The VPN routing and forwarding (VRF) routing instance that the tracked route is in.	**detail, extensive**
Route state	The state of the route being tracked: **up**, **down**, or **unknown**.	**detail, extensive**
Priority cost	Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.	**detail, extensive**

Table 254: show vrrp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Active	Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.	**detail, extensive**
Group VRRP PDU statistics	Number of VRRP advertisements sent and received by the group.	**extensive**
Group VRRP PDU error statistics	Errored statistics for the VRRP group: • **Bad authentication type received**—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be **none**, **simple**, or **md5** and must be the same for all routers in the VRRP group. • **Bad password received**—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group • **Bad MD5 digest received**—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router. • **Bad advertisement timer received**—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group. • **Bad VIP count received**—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance. • **Bad VIPADDR received**—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance.	**extensive**
Group state transition statistics	State transition statistics for the VRRP group: • **Idle to master transitions**—Number of times that the VRRP instance transitioned from the idle state to the master state. • **Idle to backup transitions**—Number of times that the VRRP instance transitioned from the idle state to the backup state. • **Backup to master transitions**—Number of times that the VRRP instance transitioned from the backup state to the master state. • **Master to backup transitions**—Number of times that the VRRP instance transitioned from the master state to the backup state.	**extensive**
VR state	VRRP information: • **backup**—The interface is acting as the backup router interface. • **bringup**—VRRP is just starting, and the physical device is not yet present. • **idle**—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • **initializing**—VRRP is initializing. • **master**—The interface is acting as the master router interface. • **transition**—The interface is changing between being the backup and being the master router.	**none, brief**
Timer	VRRP timer information: • **A**—Time, in seconds, until the advertisement timer expires. • **D**—Time, in seconds, until the Master is Dead timer expires.	**none, brief**

PART 16

IGMP Snooping and Multicast

CHAPTER 75

Understanding IGMP Snooping and Multicast

IGMP Snooping on J-EX Series Switches Overview

Internet Group Management Protocol (IGMP) snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, a LAN switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member interfaces. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces. J-EX Series Switches support IGMPv1, IGMPv2, and IGMPv3.

For details on IGMPv1, IGMPv2, and IGMPv3, see the following standards:

- For IGMPv1, see RFC 1112, *Host extensions for IP multicasting* at http://www.faqs.org/rfcs/rfc1112.html.
- For IGMPv2, see RFC 2236, *Internet Group Management Protocol, Version 2* at http://www.faqs.org/rfcs/rfc2236.html.
- For IGMPv3, see RFC 3376, *Internet Group Management Protocol, Version 3* at http://www.faqs.org/rfcs/rfc3376.html.

This IGMP snooping topic covers:

How IGMP Snooping Works

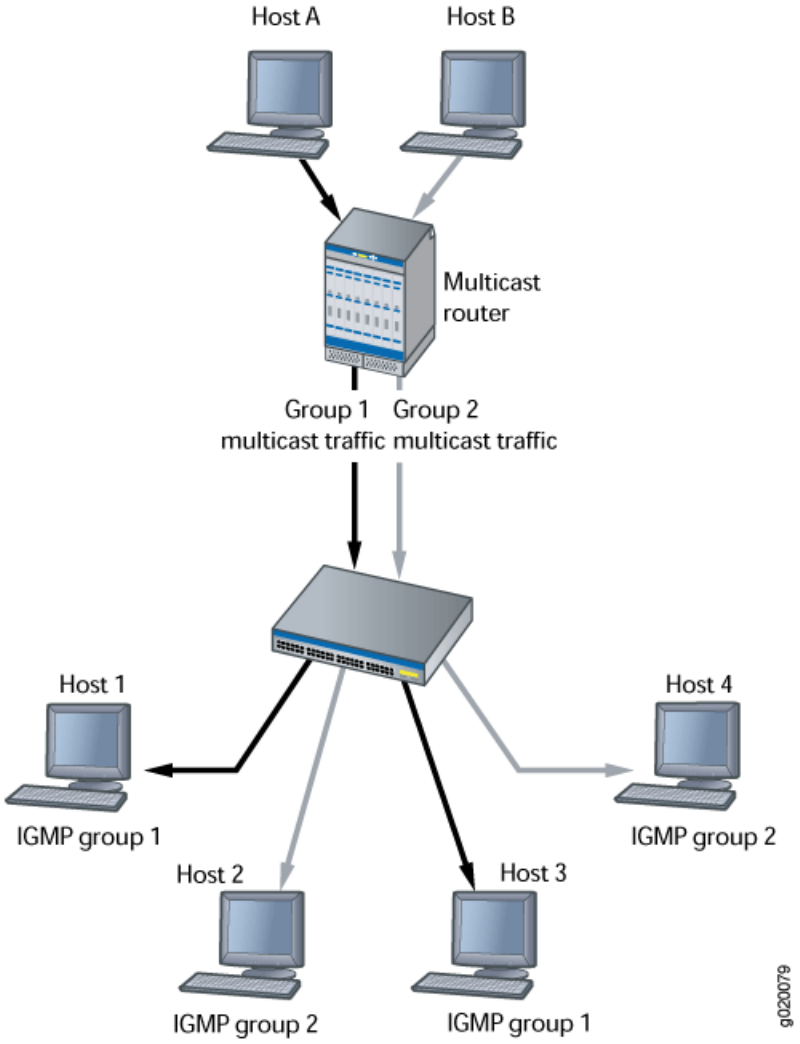
A J-EX Series switch usually learns *unicast* media access control (MAC) addresses by checking the source address field of the frames it receives. However, a *multicast* MAC

address can never be the source address for a packet. As a result, the switch floods multicast traffic on the VLAN, consuming significant amounts of bandwidth.

IGMP snooping regulates multicast traffic on a VLAN to avoid flooding. When IGMP snooping is enabled, the switch intercepts IGMP packets and uses the content of the packets to build a multicast cache table. The cache table is a database of multicast groups and their corresponding member ports. The cache table is then used to regulate multicast traffic on the VLAN.

When the switch receives multicast packets, it uses the cache table to selectively forward the packets only to the ports that are members of the destination multicast group. Figure 41 on page 2048 shows an example of IGMP traffic flow with IGMP snooping enabled.

Figure 41: IGMP Traffic Flow with IGMP Snooping Enabled



How IGMP Snooping Works with Routed VLAN Interfaces

Switches send traffic to hosts that are part of the same broadcast domain, but routers are needed to route traffic from one broadcast domain to another. Switches use a routed

VLAN interface (RVI) to perform these routing functions. IGMP snooping works with Layer 2 interfaces and RVIs to regulate multicast traffic in a switched network.

When a switch receives a multicast packet, the Packet Forwarding Engines in the switch perform an IP multicast lookup on the multicast packet to determine how to forward the packet to its local ports. From the results of the IP multicast lookup, each Packet Forwarding Engine extracts a list of Layer 3 interfaces (which can include VLAN interfaces) that have ports local to the Packet Forwarding Engine. If an RVI is part of this list, the switch provides a bridge multicast group ID for each RVI to the Packet Forwarding Engine.

A bridge multicast ID is assigned to direct Layer 3 interfaces and to RVIs. For VLANs that include multicast receivers, the bridge multicast ID includes a sub-next-hop ID. The sub-next-hop ID identifies the multicast Layer 2 interfaces in that VLAN that are interested in receiving the multicast stream. The switch ultimately assigns a next hop after it does a route lookup. The next hop includes all direct Layer 3 interfaces and RVIs. The Packet Forwarding Engine then forwards multicast traffic to the bridge multicast ID that includes all Layer 3 interfaces and RVIs that are multicast receivers for a given multicast group.

Figure 42 on page 2050 shows how multicast traffic is forwarded on a multilayer switch. In this illustration, multicast traffic is coming in through the **xe-0/1/0.0** interface. A multicast group has been formed by the Layer 3 interface **ge-0/0/2.0**, **vlan.0**, and **vlan.1**. The **ge-2/0/0.0** interface is a common trunk interface that belongs to both **vlan.0** and **vlan.1**. The letter “R” next to an interface name in the illustration indicates that a multicast receiver host is associated with that interface.

NOTE: Traffic sent to an access interface is untagged; traffic sent to a trunk interface is tagged. For more information on VLAN tagging, see “Understanding Bridging and VLANs on J-EX Series Switches” on page 1041.

Figure 42: IGMP Traffic Flow with Routed VLAN Interfaces

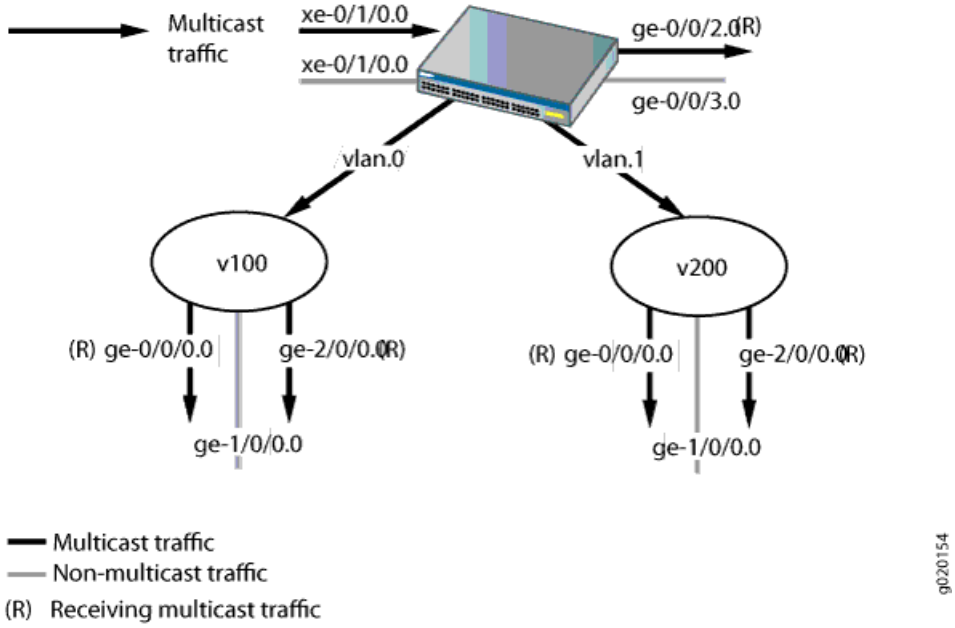


Table 255 on page 2050 shows the bridge multicast IDs and next hops that are created. The term **subnh** refers to a sub-next hop. The Packet Forwarding Engine will forward multicast traffic to bridge multicast ID9.

Table 255: Bridge Multicast IDs and Next Hops

ID Number	Type of Next Hop	Next Hop	Tag Information
ID1	RHN_UNICAST	ge-0/0/0.0	tag=off
ID2	RHN_UNICAST	ge-2/0/0.0	tag=on
ID3	RHN_FLOOD	[ID1, ID2]	
ID4	RHN_UNICAST	ge-0/0/1.0	tag=off
ID5	RHN_FLOOD	[ID4, ID2]	
ID6	RHN_UNICAST	vlan.0	subnh=ID3
ID7	RHN_UNICAST	VLAN.1	subnh=ID5
ID8	RHN_UNICAST	ge-0/0/2.0	
ID9	RHN_FLOOD	[ID6, ID7, ID8]	

How Hosts Join and Leave Multicast Groups

Hosts can join multicast groups in either of two ways:

- By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast group that the host is attempting to join.
- By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

To leave a multicast group, a host can either not respond to the periodic general IGMP queries, which results in a "silent leave" (the only leave option for hosts connected to switches running IGMPv1), or send a group-specific IGMPv2 leave message.

NOTE: A host does not leave a group if its link goes down—for example, if a user disconnects from the port. The host remains a member of the group until group membership times out and a silent leave occurs. This means that if another user connects to the port before the silent leave occurs, the host resumes receiving the group multicast traffic until the silent leave, even though it never sent an IGMP join message.

IGMP Snooping Support for IGMPv3

IGMPv3 allows IGMP snooping to filter multicast streams based on the source address of the multicast stream. Junos OS for J-EX Series switches supports IGMPv3 packets that are in INCLUDE or EXCLUDE mode.

When a host sends an IGMPv3 INCLUDE report through a switch interface to indicate that it wants to receive a multicast stream from a source address, the switch adds the source address to the source list. In INCLUDE mode, the switch requests that packets be sent to the specified multicast address only from those IP source addresses listed in the source-list parameter. However, because J-EX Series switches do not support forwarding on a per-source basis, the switch merges all IGMPv3 reports for a VLAN to create a **(*,G,V)** route with the appropriate next hop. This next hop contains all the interfaces on the VLAN that are interested in group **G**.

When IGMP snooping for IGMPv3 is used with an RVI, the same **(*,G,V)** route is added to the snooping information in the RVI's output interface list (**olist**).

When a host sends an IGMPv3 EXCLUDE report, the host indicates that it wants to join a multicast group and receive packets for that group *except* from those IP source addresses in the source-list parameter. However, because J-EX Series switches do not support forwarding on a per-source basis, the switch ignores the source information and creates a **(*,G,V)** route. A host can also send an EXCLUDE report in which the source-list parameter is empty, which is known as an EXCLUDE NULL report. An EXCLUDE NULL

report indicates that the host wants to join the multicast group and receive packets from all sources. The switch creates a **(*, G,V)** route in this case also.

Understanding Multicast VLAN Registration on J-EX Series Switches

Multicast VLAN registration (MVR) allows you to efficiently distribute IPTV multicast streams across an Ethernet ring-based Layer 2 network and reduce the amount of bandwidth consumed by this multicast traffic.

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which IPTV multicast traffic flows throughout the Layer 2 network. The J-EX Series Switch that is enabled for MVR selectively forward IPTV multicast traffic from interfaces on the MVLAN (source interfaces) to hosts that are connected to interfaces that are not part of the MVLAN. These interfaces are known as *MVR receiver ports*. The MVR receiver ports can receive traffic from a port on the MVLAN but cannot send traffic onto the MVLAN, and they remain in their own VLANs for bandwidth and security reasons.

This topic includes:

How MVR Works

In many ways, MVR is similar to IGMP snooping. Both monitor IGMP join and leave messages and build forwarding tables based on the media access control (MAC) addresses of the hosts sending those IGMP messages. Whereas IGMP snooping operates within a given VLAN to regulate multicast traffic, MVR can operate with hosts on different VLANs in a Layer 2 network to selectively deliver IPTV multicast traffic to requesting hosts, thereby reducing the amount of bandwidth needed to forward multicast traffic.

When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs. Interfaces that are on the MVLAN itself cannot be MVR receiver ports for that MVLAN.

NOTE: MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

MVR Modes

MVR operates in two modes: MVR transparent mode and MVR proxy mode. Both modes allow MVR to forward only one copy of a multicast stream to the Layer 2 network.

- MVR Transparent Mode on page 2053
- MVR Proxy Mode on page 2053

MVR Transparent Mode

In MVR transparent mode (the default mode), the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. Transparent mode is the default mode.

The switch handles IGMP packets destined for both the multicast source VLAN and multicast receiver VLANs in the same way that it handles them when MVR is not being used. That is, when a host on a VLAN sends IGMP join and leave messages, the switch floods the messages to all router interfaces in the VLAN. Similarly, when a VLAN receives IGMP queries from its router interfaces, it floods the queries to all interfaces in the VLAN.

If a host on a multicast receiver port joins an MVR group on the multicast receiver VLAN, the appropriate bridging entry is added and the MVLAN forwards that group's IPTV multicast traffic on that port (even though that port is not in the MVLAN). Likewise, if a host on a multicast receiver port leaves an MVR group on the multicast receiver VLAN, the appropriate bridging entry is deleted and the MVLAN stops forwarding that group's IPTV multicast traffic on that port. In addition, you can configure the switch to statically install the bridging entries on the multicast receiver VLAN.

MVR Proxy Mode

When you use MVR in proxy mode, the switch acts as a proxy for any MVR group in both the upstream and downstream directions. In the downstream direction, the switch acts as the querier for the groups in the MVR receiver VLANs. In the upstream direction, the switch originates the IGMP reports and leaves and answers IGMP queries from multicast routers. When the MVR receiver VLANs receive IGMP joins and leaves, the switch creates bridging entries on the MVLAN as needed, as it does in MVR transparent mode. In addition, the switch sends out IGMP joins and leaves on the MVLAN based on these bridging entries.

Configuring MVR proxy mode on the MVLAN automatically enables IGMP snooping proxy mode on all MVR receiver VLANs as well as on the MVLAN.

CHAPTER 76

Examples: IGMP Snooping and Multicast Configuration

Example: Configuring IGMP Snooping on J-EX Series Switches

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, a LAN switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member ports. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

Configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on J-EX Series switches.

This example describes how to configure IGMP snooping:

Requirements

This example uses the following software and hardware components:

- One J-EX4200-24T switch

Before you configure IGMP snooping, be sure you have:

- Configured the **employee-vlan** VLAN on the switch
- Assigned interfaces **ge-0/0/1**, **ge-0/0/2**, and **ge-0/0/3** to **employee-vlan**

See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 1070.

Overview and Topology

IGMP snooping controls multicast traffic in a switched network. With IGMP snooping enabled, a J-EX Series switch monitors the IGMP transmissions between a host and a multicast router to keep track of the multicast groups and associated member ports. The switch uses this information to make intelligent decisions and forward multicast traffic to the intended destination interfaces.

You can configure IGMP snooping on all interfaces in a VLAN or on individual interfaces. This example shows how to configure IGMP snooping on a J-EX Series switch.

The configuration setup for this example includes the VLAN **employee-vlan** on the switch.

Table 256 on page 2056 shows the components of the topology for this example.

Table 256: Components of the IGMP Snooping Topology

Properties	Settings
Switch hardware	One J-EX4200-24T switch
VLAN name	**employee-vlan**, tag **20**
Interfaces in **employee-vlan**	**ge-0/0/1**, **ge-0/0/2**, **ge-0/0/3**
Multicast IP address for **employee-vlan**	**225.100.100.100**

In this example, the switch is initially configured as follows:

- IGMP snooping is disabled on the VLAN.

Configuration

To configure basic IGMP snooping on a switch:

CLI Quick Configuration

To quickly configure IGMP snooping, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set igmp-snooping vlan employee-vlan
set igmp-snooping vlan employee-vlan interface ge-0/0/1 group-limit 50
set igmp-snooping vlan employee-vlan immediate-leave
set igmp-snooping vlan employee-vlan interface ge-0/0/3 static group 225.100.100.100
set igmp-snooping vlan employee-vlan interface ge-0/0/2 multicast-router-interface
set igmp-snooping vlan employee-vlan robust-count 4
```

Step-by-Step Procedure

Configure IGMP snooping:

1. Enable and configure IGMP snooping on the VLAN **employee-vlan**:

   ```
   [edit protocols]
   user@switch# set igmp-snooping vlan employee-vlan
   ```

2. Configure the limit for the number of multicast groups allowed on the **ge-0/0/1** interface to 50.

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/1 group-limit
50
```

3. Configure the switch to immediately remove a group membership from an interface when it receives a leave message from that interface without waiting for any other IGMP messages to be exchanged (IGMPv2 only):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan immediate-leave
```

4. Statically configure IGMP group membership on a port:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/3.0 static group
225.100.100.100
```

5. Statically configure an interface as a switching interface toward a multicast router (the interface to receive multicast traffic):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/2
multicast-router-interface
```

6. Change the number of timeout intervals the switch waits before timing out a multicast group to 4:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan robust-count 4
```

Results Check the results of the configuration:

```
user@switch# show protocols igmp-snooping
  vlan employee-vlan {
    robust-count 4;
    immediate-leave;
    interface ge-0/0/1 {
      group-limit 50;
    }
    interface ge-0/0/2 {
      multicast-router-interface;
    }
    interface ge-0/0/3 {
      static {
        group 255.100.100.100
      }
    }
  }
```

Example: Configuring Multicast VLAN Registration on J-EX Series Switches

Multicast VLAN registration (MVR) allows hosts that are not part of a multicast VLAN (MVLAN) to receive multicast streams from the MVLAN, allowing the MVLAN to be shared across the Layer 2 network and eliminating the need to send duplicate multicast streams to each requesting VLAN in the network. Hosts remain in their own VLANs for bandwidth and security reasons.

This example describes how to configure MVR on J-EX Series switches:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch

Before you configure MVR, be sure you have:

- Configured two or more VLANs on the switch. See “Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches” on page 1070.
- Connected the J-EX Series switch to a network that can transmit IPTV multicast streams from a video server.
- Connected a host that is capable of receiving IPTV multicast streams to an interface in one of the VLANs.

Overview and Topology

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which multicast traffic flows throughout the Layer 2 network. Multicast traffic can then be selectively forwarded from interfaces on the MVLAN (source ports) to hosts that are connected to interfaces (multicast receiver ports) that are not part of the multicast source VLAN. When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs.

You can configure MVR to operate in one of two modes: transparent mode (the default mode) or proxy mode. Both modes allow MVR to forward only one copy of a multicast stream to the Layer 2 network.

In transparent mode, the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. Figure 1 shows how MVR operates in transparent mode.

In proxy mode, the switch acts as a proxy for the IGMP multicast router in the MVLAN for MVR group memberships established in the MVR receiver VLANs and generates and sends IGMP packets into the MVLAN as needed. Figure 2 shows how MVR operates in proxy mode.

This example shows how to configure MVR in both transparent mode and proxy mode on a J-EX Series switch. The topology includes a video server that is connected to a multicast router, which in turn forwards the IPTV multicast traffic in the MVLAN to the Layer 2 network.

Figure 43 on page 2060 shows the MVR topology in transparent mode. Interfaces P1 and P2 on Switch C belong to service VLAN **s0** and MVLAN **mv0**. Interface P4 of Switch C also belongs to service VLAN **s0**. In the upstream direction of the network, only non-IPTV traffic is being carried in individual customer VLANs of service VLAN **s0**. VLAN **c0** is an example of this type of customer VLAN. IPTV traffic is being carried on MVLAN **mv0**. If any host on any customer VLAN connected to port P4 requests an MVR stream, switch C takes the stream from VLAN **mv0** and replicates that stream onto port P4 with tag **mv0**. IPTV traffic, along with other network traffic, flows form port P4 out to the Digital Subscriber Line Access Multiplexer (DSLAM) **D1**.

Figure 43: MVR Topology in Transparent Mode

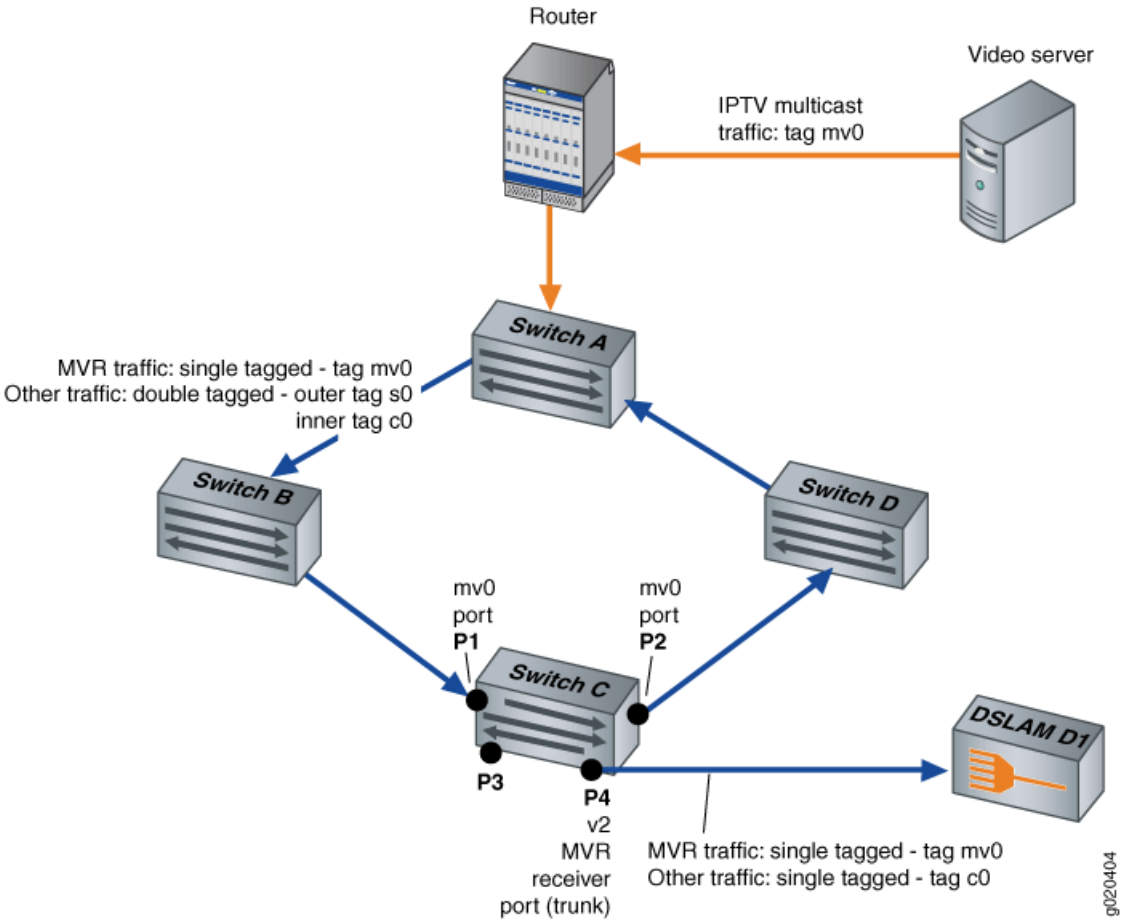

Figure 44 on page 2061 shows the MVR topology in proxy mode. Interfaces P1 and P2 on switch C belong to MVLAN **mv0** and customer VLAN **c0**. Interface P4 on switch C is an access port of customer VLAN **c0**. In the upstream direction of the network, only non-IPTV traffic is being carried on customer VLAN **c0**. Any IPTV traffic requested by hosts on VLAN **c0** is replicated untagged to port P4 based on streams received in MVLAN **mv0**. IPTV traffic flows from port P4 out to an IPTV-enabled device in Host 1. Other traffic, such as data and voice traffic, also flows from port P4 to other network devices in Host 1.

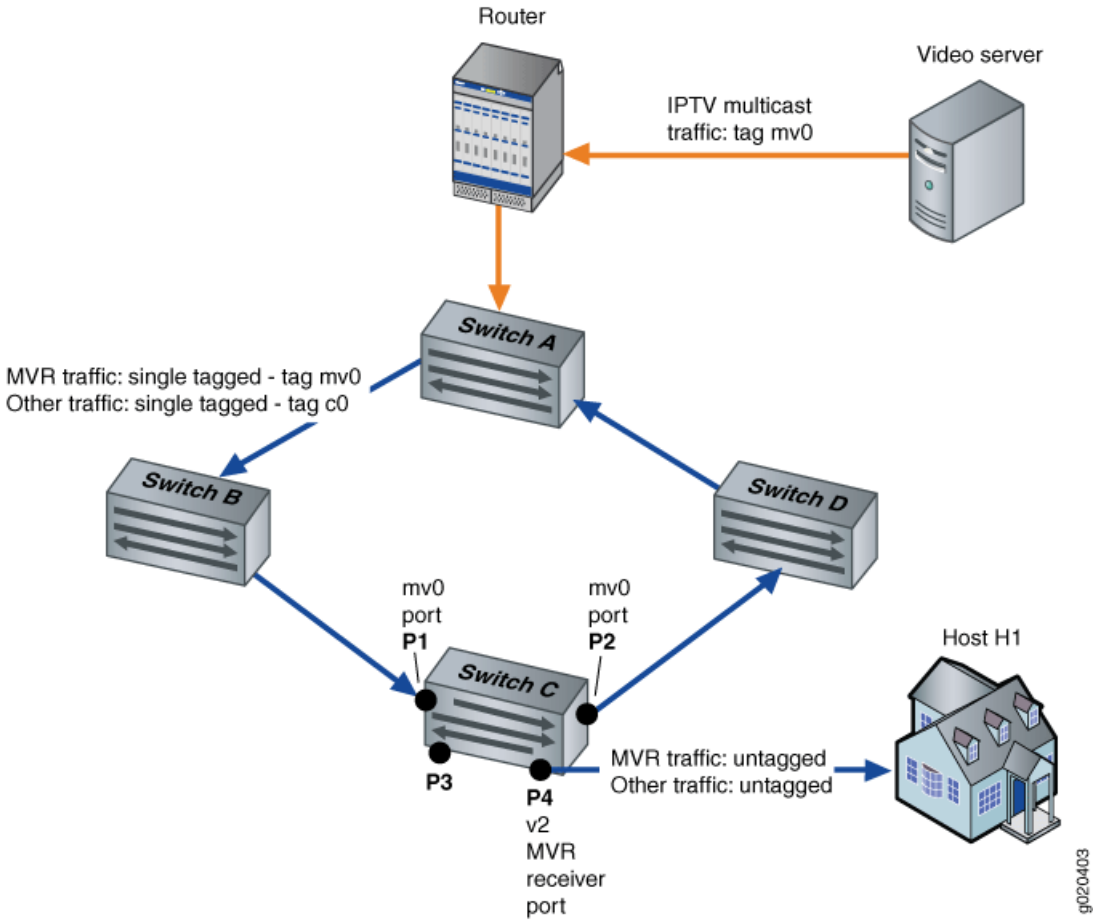
Figure 44: MVR Topology in Proxy Mode



For information on VLAN tagging, see “Understanding Bridging and VLANs on J-EX Series Switches” on page 1041.

Configuration

To configure MVR perform these tasks:

CLI Quick Configuration

To quickly configure MVR in proxy mode, copy the following commands and paste them into the switch terminal window. To quickly configure MVR in transparent mode (the default mode), do not copy and paste the final command line in the following block of lines:

```
[edit protocols igmp-snooping]
set vlan mv0 data-forwarding source groups 225.10.0.0/16
set vlan v2 data-forwarding receiver source-vlans mv0
set vlan v2 data-forwarding receiver install
set vlan mv0 proxy source-address 10.1.1.1
```

Step-by-Step Procedure

To configure MVR, perform these tasks:

1. Configure **mv0** to be an MVLAN:

```
[edit protocols igmp-snooping]
user@switch# set vlan mv0 data-forwarding source groups 225.10.0.0/16
```

2. Configure **v2** to be a multicast receiver VLAN with **mv0** as its source:

```
[edit protocols igmp-snooping]
user@switch# set vlan v2 data-forwarding receiver source-vlans mv0
```

3. (Optional) Install forwarding entries in the multicast receiver VLAN **v2**:

```
[edit protocols igmp-snooping]
user@switch# set vlan v2 data-forwarding receiver install
```

4. (Optional) Configure MVR in proxy mode:

```
[edit protocols igmp-snooping]
user@switch# set vlan mv0 proxy source-address 10.1.1.1
```

Results

Check the results of the configuration:

```
[edit protocols igmp-snooping]
user@switch# show
vlan mv0 {
  proxy {
    source-address 10.1.1.1;
  }
  data-forwarding {
    source {
      groups 225.10.0.0/16;
    }
  }
}
vlan v2 {
  data-forwarding {
    receiver {
      source-vlans mv0;
      install;
    }
  }
}
```

CHAPTER 77

Configuring IGMP Snooping and Multicast

Configuring IGMP Snooping (CLI Procedure)

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, a LAN switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member ports. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

You can configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on J-EX Series switches.

NOTE: You cannot configure IGMP snooping on a secondary VLAN.

To enable IGMP snooping and configure individual options as needed for your network by using the CLI:

1. Enable IGMP snooping on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan
```

2. Configure the limit for the number of multicast groups allowed on the **ge-0/0/1** interface to 50.

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/1 group-limit
50
```

3. Configure the switch to immediately remove a group membership from an interface when it receives a leave message from that interface without waiting for any other IGMP messages to be exchanged (IGMPv2 only):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan immediate-leave
```

4. Statically configure IGMP group membership on a port:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/3.0 static group
225.100.100.100
```

5. Statically configure an interface as a switching interface toward a multicast router (the interface to receive multicast traffic):

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/2.0
multicast-router-interface
```

6. Change the number of timeout intervals the switch waits before timing out a multicast group to 4:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan robust-count 4
```

Configuring IGMP Snooping (J-Web Procedure)

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, the J-EX Series switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated member interfaces. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

You can configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on J-EX Series switches.

To enable IGMP snooping and configure individual options using the J-Web interface:

1. Select **Configure** > **Switching** > **IGMP Snooping**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:
   - **Add**—Creates an IGMP snooping configuration for the VLAN.
   - **Edit**—Modifies an IGMP snooping configuration for the VLAN.
   - **Delete**—Deletes a selected VLAN from the IGMP snooping configuration.

   When you are adding or editing an IGMP snooping configuration, enter information as described in Table 257 on page 2065
3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

To disable IGMP snooping on a VLAN, select the VLAN from the list and click **Disable**.

Table 257: IGMP Snooping Configuration Fields

Field	Function	Your Action
VLAN Name	Specifies the VLAN on which to enable IGMP snooping.	Select a VLAN from the list to add it to the snooping configuration.
Immediate Leave	Immediately removes a multicast group membership from an interface when it receives a leave message from that interface without waiting for any other IGMP messages to be exchanged (IGMPv2 only).	To enable the option, select the check box. To disable the option, clear the check box.
Robust Count	Specifies the number of timeout intervals the switch waits before timing out a multicast group.	Type a value.

Table 257: IGMP Snooping Configuration Fields *(continued)*

Field	Function	Your Action
Interfaces List	Statically configures an interface as a switching interface toward a multicast router (the interface to receive multicast traffic).	Click one: • Add—Adds an interface to the IGMP snooping configuration. 1. Select an interface from the list. 2. Select **Multicast Router Interface**. 3. Type the maximum number of groups an interface can join. 4. In **Static**, choose one: ◦ Click **Add**, type a group IP address, and click **OK**. ◦ Select a group and click **Remove** to remove the group membership. • Edit—Edits the interface settings for the IGMP snooping configuration. • Remove—Deletes an interface configured for IGMP snooping.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping (CLI Procedure) on page 2063
- Changing the IGMP Snooping Group Query Membership Timeout Value (CLI Procedure) on page 2067
- IGMP Snooping on J-EX Series Switches Overview on page 2047

Changing the IGMP Snooping Group Query Membership Timeout Value (CLI Procedure)

Generally, you do not need to explicitly set the group membership timeout value for IGMP snooping groups on a J-EX Series switch. The group membership timeout value, which determines how long the switch waits before removing an IGMP snooping group from its multicast cache table. is implicitly set to 260 seconds when you configure IGMP snooping.

When you enable IGMP snooping on a switch, the **query-interval** and **query-response-interval** values are set to their default values and are applied to all VLANs created on the switch. The default values are:

- **query-interval**—125 seconds
- **query-response-interval**—10 seconds

The software automatically calculates the group membership timeout value for an IGMP snooping-enabled switch by multiplying the **query-interval** value by 2 and then adding the **query-response-interval** value. For example, using the default values: (125 x 2) + 10) = 260.

If you need to explicitly set the group membership timeout value, you reset the **query-interval** and **query-response-interval** values at the **[edit protocols igmp]** hierarchy level. (Notice that you are not resetting the values at the **[edit protocols igmp-snooping]** hierarchy level.) When you reset these values, the IGMP snooping configuration inherits the new values and recalculates the group membership timeout value accordingly. For more information on changing these values, see the *Junos OS Multicast Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

To change the IGMP snooping group membership timeout value to 350:

1. Configure the **query-interval** value to be 150:

```
[edit protocols]
user@switch# set igmp query-interval 150
```

2. Configure the **query-response-interval** value to be 50:

```
[edit protocols]
user@switch# set igmp query-response-interval 50
```

Configuring Multicast VLAN Registration (CLI Procedure)

Multicast VLAN registration (MVR) allows hosts that are not part of a multicast source VLAN (MVLAN) to still receive multicast streams from the MVLAN, allowing an MVLAN to be shared across a Layer 2 network. Hosts remain in their own VLANs for bandwidth and security reasons but are able to receive multicast streams from the MVLAN.

You can configure one or more VLANs on a switch to be MVLANs or MVR receiver VLANs. By default, MVR is not configured on J-EX Series switches.

NOTE: MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

NOTE: When configuring MVR, the following restrictions apply:

- You cannot enable multicast protocols on VLAN interfaces that are members of MVLANs.
- If you configure an MVLAN in proxy mode, IGMP snooping proxy mode will be automatically enabled on all MVR receiver VLANs of this MVLAN. If a VLAN is an MVR receiver VLAN for multiple MVLANs, all of the MVLANs must have proxy mode enabled or all must have proxy mode disabled. You can enable proxy mode only on VLANs that are configured as MVR source VLANs and that are not configured for Q-in-Q tunneling.
- After you configure a VLAN as an MVLAN, that VLAN is no longer available for other uses.

To configure MVR:

1. Configure the VLAN named **mv0** to be an MVLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 data-forwarding source groups 225.10.0.0/16
```

2. Configure the MVLAN **mv0** to be a proxy VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 proxy source–address 10.0.0.1
```

3. Configure the VLAN named **v2** to be an MVR receiver VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan v2 data-forwarding receiver source-vlans mv0
```

4. Install forwarding entries in the MVR receiver VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 data-forwarding receiver install
```

CHAPTER 78

Verifying IGMP Snooping and Multicast

Monitoring IGMP Snooping

Purpose Use the monitoring feature to view status and information about IGMP snooping configuration on your J-EX Series switch.

Action To display IGMP snooping details in the J-Web interface, select **Monitor > Switching > IGMP Snooping**.

To display IGMP snooping details in the CLI, enter the following commands:

- **show igmp-snooping vlans**
- **show igmp-snooping statistics**
- **show igmp-snooping route**

Meaning Table 258 on page 2069 summarizes the IGMP snooping details displayed.

Table 258: Summary of IGMP Snooping Output Fields

Field	Values
IGMP Snooping Monitor	
VLAN	The VLAN for which IGMP snooping is enabled.
Interfaces	Indicates the interfaces configured as switching interfaces that are associated with the multicast router.
Groups	Indicates the number of the multicast groups learned by the VLAN.
MRouters	Specifies the multicast router.
Receivers	Specifies the multicast receiver.
IGMP Route Information	

Table 258: Summary of IGMP Snooping Output Fields *(continued)*

Field	Values
VLAN	The VLAN for which IGMP snooping is enabled.
Group	Indicates the multicast groups learned by the VLAN.
Next-Hop	Specifies the next hop assigned by the switch after performing the route lookup.

Related Documentation

- **show igmp-snooping vlans on page 2187**
- **show igmp-snooping statistics on page 2185**
- **show igmp-snooping route on page 2183**
- Configuring IGMP Snooping (CLI Procedure) on page 2063
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055

Verifying That the IGMP Snooping Group Query Timeout Value Has Been Changed Correctly

Purpose Verify that the IGMP snooping group query timeout value has been changed correctly from its default value.

Action Display the IGMP protocol information:

```
user@switch> show configuration protocols igmp
query-interval 150;
query-response-interval 50;
accounting;
interface vlan.43 {
    version 2;
}
```

Display the IGMP snooping membership information, which contains the group query timeout value that was derived from the IGMP configuration:

```
user@switch> show show igmp-snooping membership detail
VLAN: v43 Tag: 43 (Index: 4)
      Group: 225.0.0.1
      Receiver count: 1, Flags: <v2-hosts>
          ge-0/0/15.0 Uptime: 00:00:05 timeout: 350
```

Meaning When you enable IGMP snooping on a switch, the **query-interval** and **query-response-interval** values are set to their default values and are applied to all VLANs created on the switch. The IGMP snooping group timeout value is derived from these default settings. Based on the default values, the initial IGMP snooping group query timeout value is 260.

To change the group query timeout value, change the **query-interval** and **query-response-interval** values at the **[edit protocols igmp]** hierarchy level. The IGMP snooping group query timeout value is then recalculated based on the new IGMP configuration settings.

The output from the **show protocols igmp** command shows the revised IGMP configuration settings for **query-interval** and **query-response-interval**. You know that these values have been revised because they are different from the default values. The output from the **show igmp-snooping membership detail** command shows the revised group query timeout value, **350**, which was derived from the new IGMP configuration settings.

accounting (Per Interface)

Syntax (accounting | no-accounting);

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable or disable the collection of IGMP join and leave event statistics for an interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Recording IGMP Join and Leave Events

accounting (Protocol)

Syntax accounting;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the collection of IGMP join and leave event statistics on the system.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Recording IGMP Join and Leave Events

address (Anycast RPs)

Syntax address *address* <forward-msdp-sa>;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp local** (inet | inet6) **anycast-pim rp-set**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local** (inet | inet6) **anycast-pim rp-set**],
[edit protocols **pim rp local** (inet | inet6) **anycast-pim rp-set**],
[edit routing-instances *routing-instance-name* protocols **pim rp local** (inet | inet6) **anycast-pim rp-set**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the anycast rendezvous point (RP) addresses in the RP set. Multiple addresses can be configured in an RP set. If the RP has peer Multicast Source Discovery Protocol (MSDP) connections, then the RP must forward MSDP source active (SA) messages.

Options ***address***—RP address in an RP set.

forward-msdp-sa—(Optional) Forward MSDP SAs to this address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

address (Local RPs)

Syntax address *address*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp local family** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)],
[edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the local rendezvous point (RP) address.

Options ***address***—Local RP address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs

anycast-pim

Syntax

```
anycast-pim {
  rp-set {
    address address <forward-msdp-sa>;
  }
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp local family** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)],
[edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure properties for anycast RP using PIM.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PIM Anycast with MSDP

assert-timeout

Syntax assert-timeout *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds.

Options ***seconds***—Time for routing device to wait before another assert message cycle.

Range: 5 through 210 seconds

Default: 180 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring the PIM Assert Timeout

auto-rp

Syntax

```
auto-rp {
  (announce | discovery | mapping);
  (mapping-agent-election | no-mapping-agent-election);
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure automatic RP announcement and discovery.

Options

announce—Configures the routing device to listen only for mapping packets and also to advertise itself if it is an RP.

discovery—Configures the routing device to listen only for mapping packets.

mapping—Configures the routing device to announce, listens for and generates mapping packets, and announces that the routing device is eligible to be an RP.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Auto-RP

bootstrap

Syntax

```
bootstrap {
  family (inet | inet6) {
    export [ policy-names ];
    import [ policy-names ];
    priority number;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols pim rp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols pim rp],
[edit protocols pim rp],
[edit routing-instances *routing-instance-name* protocols pim rp]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure parameters to control bootstrap routers and messages.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties

bootstrap-export

Syntax

```
bootstrap-export [ policy-names ];
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols pim rp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols pim rp],
[edit protocols pim rp],
[edit routing-instances *routing-instance-name* protocols pim rp]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply one or more export policies to control outgoing PIM bootstrap messages.

Options

policy-names—Name of one or more import policies.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties
- **bootstrap-import on page 2086**

bootstrap-import

Syntax bootstrap-import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more import policies to control incoming PIM bootstrap messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Bootstrap Properties
- **bootstrap-export on page 2085**

bootstrap-priority

Syntax bootstrap-priority *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether this routing device is eligible to be a bootstrap router. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap router.

Options ***number***—Priority for becoming the bootstrap router. A value of 0 means that the routing device is not eligible to be the bootstrap router.

Range: 0 through 255

Default: 0

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- *Junos OS Multicast Protocols Configuration Guide*

data-forwarding

Syntax

```
data-forwarding {
  source {
    groups group-prefix;
  }
  receiver {
    source-vlans vlan-list;
    install;
  }
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN to be a multicast source VLAN (MVLAN) or a multicast VLAN registration (MVR) receiver VLAN. Each data-forwarding VLAN, which can be a multicast source VLAN (MVLAN) or a multicast receiver VLAN, must have exactly one source statement or exactly one receiver statement. A data-forwarding VLAN can operate only in IGMPv2 mode.

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

dense-groups

Syntax
```
dense-groups {
    addresses;
}
```

Hierarchy Level
[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure which groups are operating in dense mode.

Options ***addresses***—Address of groups operating in dense mode.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Sparse-Dense Mode Properties

disable

Syntax
```
disable {
    interface interface-name
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IGMP snooping on all interfaces in a VLAN or on a specific VLAN interface.

Default If you do not specify an interface, all interfaces in the given VLAN are disabled.

Options ***interface-name*** —Name of the interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055

[edit protocols **pim rp local** family (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim** family (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim rp local** family (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Explicitly disable PIM at the protocol, interface or family hierarchy levels.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling PIM
- family (Disable PIM)

disable

Syntax disable;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable IGMP on the system.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Disabling IGMP

dr-election-on-p2p

Syntax dr-election-on-p2p;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable PIM designated router (DR) election on point-to-point (P2P) links.

Default No PIM DR election is performed on P2P links.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Designated Router Election on Point-to-Point Links

dr-register-policy

Syntax dr-register-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to control outgoing PIM register messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **rp-register-policy on page 2125**

embedded-rp

Syntax

```
embedded-rp {
  group-ranges {
    destination-ip-prefix</prefix-length>;
  }
  maximum-rps limit;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure properties for embedded IP version 6 (IPv6) RPs.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Embedded RP for IPv6

export (Bootstrap)

Syntax

```
export [ policy-names ];
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp bootstrap family** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap family** (inet | inet6)],
[edit protocols **pim rp bootstrap family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap family** (inet | inet6)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply one or more export policies to control outgoing PIM bootstrap messages.

Options

policy-names—Name of one or more import policies.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties
- **import (Bootstrap) on page 2103**

family (Bootstrap)

Syntax

```
family (inet | inet6) {
    export [ policy-names ];
    number;
    [ policy-names ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp bootstrap**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap**],
[edit protocols **pim rp bootstrap**],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure which IP protocol type bootstrap properties to apply.

Options

inet—Apply IP version 4 (IPv4) local RP properties.

inet6—Apply IPv6 local RP properties.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

[edit routing-instances *routing-instance-name* protocols **pim rp local**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure which IP protocol type local RP properties to apply.

Options

inet—Apply IP version 4 (IPv4) local RP properties.

inet6—Apply IPv6 local RP properties.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- *Junos OS Multicast Protocols Configuration Guide*

graceful-restart

Syntax

```
graceful-restart {
  disable;
  restart-duration seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure PIM sparse mode graceful restart.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Sparse Mode Graceful Restart

group

Syntax

group *ip-address*;

Hierarchy Level

[edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name* **interface** *interface-name* **static**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a static multicast group using a valid IP multicast address.

Default None.

Options ***ip-address*** —IP address of the multicast group receiving data on an interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055

group

Syntax

```
group multicast-group-address {
  exclude;
  group-count number;
  group-increment increment;
  source ip-address {
    source-count number;
    source-increment increment;
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name* **static**], [edit protocols igmp **interface** *interface-name* **static**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the IGMP multicast group address and (optionally) the source address for the multicast group being statically configured on an interface.

NOTE: You must specify a unique address for each group.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP Static Group Membership

group-limit

Syntax group-limit *limit*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a limit for the number of multicast groups allowed on the specified interface. After this limit is reached, new reports are ignored and related flows are not flooded on the interface.

Default No group limits are configured.

Options ***limit*** —Number that represents the maximum number of multicast groups allowed on the specified interface.

Range: 0 through 65535

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping (CLI Procedure) on page 2063

[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp static** address *address*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the address ranges of the multicast groups for which this routing device can be an RP.

Default

The routing device is eligible to be the RP for all IPv4 or IPv6 groups (**224.0.0.0/4** or **FF70::/12** to **FFF0::/12**).

Options

destination-mask—Addresses or address ranges for which this routing device can be an RP.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs
- Configuring PIM Embedded RP for IPv6

groups

Syntax groups *group-prefix*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding source**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the IP address range of the multicast VLAN (MVLAN) source interfaces.

Default Disabled.

Options ***group-prefix***—IP address range of the source group. Each MVLAN must have exactly one **groups** statement. If there are multiple MVLANs on the switch, their group ranges must be unique.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hello-interval

Syntax hello-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the router sends PIM hello packets out of an interface.

Options ***seconds***—Length of time between PIM hello packets.

Range: 0 through 255

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the PIM Hello Interval
- **hold-time on page 2099**

hold-time

Syntax hold-time *seconds*;

Hierarchy Level [edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the time period for which a neighbor is to consider the sending routing device (this routing device) to be operative (up).

Options *seconds*—Hold time.

Range: 0 through 255

Default: 0 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs

igmp-snooping

Syntax

```
igmp-snooping {
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag (detail | disable | receive | send);
  }
  vlan vlan-id | vlan-name {
    data-forwarding {
      source {
        groups group-prefix;
      }
      receiver {
        source-vlans vlan-list;
        install ;
      }
    }
    disable {
      interface interface-name;
    }
    immediate-leave;
    interface interface-name {
      group-limit limit;
      multicast-router-interface;
      static {
        group ip-address;
      }
    }
    proxy ;
    query-interval seconds;
    query-last-member-interval seconds;
    query-response-interval seconds;
    robust-count number;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable and configure IGMP snooping on J-EX Series switches.

The remaining statements are explained separately.

Default IGMP snooping is enabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping (CLI Procedure) on page 2063

immediate-leave

Syntax immediate-leave;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Applies only to switches running IGMPv2.) After the switch receives a leave group membership message from a host, immediately remove the group membership from the interface without waiting for any other IGMP messages to be exchanged.

NOTE: When configuring this statement, ensure that the IGMP interface has only one IGMP host connected. If more than one IGMPv2 host is connected to the switch through the same interface and one of the hosts sends a leave message, the switch removes all hosts on the interface from the multicast group. The switch loses contact with the hosts in the multicast group that did not send a leave message until they send join requests in response to the next general multicast listener query from the router.

Default The immediate-leave feature is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping (CLI Procedure) on page 2063

immediate-leave

Syntax immediate-leave;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*], [edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description When this statement is enabled on a routing device running IGMP version 2 (IGMPv2), after the routing device receives a leave group membership message from a host associated with the interface, the routing device immediately removes the group membership from the interface and suppresses the sending of any group-specific queries for the multicast group.

When this statement is enabled on a routing device running IGMP version 3 (IGMPv3), after the routing device receives a report with the type BLOCK_OLD_SOURCES, the routing device suppresses the sending of group-and-source queries but relies on the Junos OS-supported host tracking mechanism to determine whether or not it removes a particular source group membership from the interface.

NOTE: When issuing this command on IGMPv2 interfaces, ensure that the IGMP interface has only one IGMP host connected. If more than one IGMPv2 host is connected to a LAN through the same interface, and one host sends a done message, the routing device removes all hosts on the interface from the multicast group. The routing device loses contact with the hosts that properly remain in the multicast group until they send join requests in response to the next general multicast listener query from the router.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Specifying Immediate-Leave Host Removal for IGMP

import (Bootstrap)

Syntax import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit protocols **pim rp bootstrap** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more import policies to control incoming PIM bootstrap messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Bootstrap Properties
- **export (Bootstrap) on page 2091**

import (PIM)

Syntax import [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to routes being imported into the routing table from PIM. Use the **import** statement to filter PIM join messages from entering the network.

Options ***policy-names***—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Filtering Incoming PIM Join Messages

infinity

Syntax infinity [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim spt-threshold**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim spt-threshold**],
[edit protocols **pim spt-threshold**],
[edit routing-instances *routing-instance-name* protocols **pim spt-threshold**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to set the SPT threshold to infinity for a source-group address pair. Use the **infinity** statement to prevent the last-hop routing device from transitioning from the RPT rooted at the RP to an SPT rooted at the source for that source-group address pair.

Options ***policy-names***—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring the PIM SPT Threshold Policy

install

Syntax install;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding receiver**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Install forwarding entries in the multicast receiver VLAN. By default, only the multicast VLAN (MVLAN) installs forwarding entries for MVLAN groups.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable PIM on an interface and configure interface-specific properties.

Options

interface-name—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify **all**. For details about specifying interfaces, see the *Junos OS Network Interfaces Configuration Guide*.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface interface-name {
  group-limit limit;
  multicast-router-interface;
  static {
    group ip-address;
  }
}
```

Hierarchy Level [edit protocols igmp-snooping vlan *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable IGMP snooping on an interface and configure interface-specific properties.

The remaining statements are explained separately.

Default None.

Options ***interface-name***—Name of the interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface interface-name {
  disable;
  (accounting | no-accounting);
  group-policy [ policy-names ];
  immediate-leave;
  oif-map map-name;
  passive;
  promiscuous-mode;
  ssm-map ssm-map-name;
  static {
    group multicast-group-address {
      exclude;
      group-count number;
      group-increment increment;
      source ip-address {
        source-count number;
        source-increment increment;
      }
    }
  }
  version version;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable IGMP on an interface and configure interface-specific properties.

Options ***interface-name***—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify **all**. For details about specifying interfaces, see the *Junos OS Network Interfaces Configuration Guide*.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
The remaining statements are explained separately.

Description

Configure the routing device's RP properties.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Local PIM RPs

local-address

Syntax local-address *address*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp local family** (inet | inet6) **anycast-pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6) **anycast-pim**],
[edit protocols **pim rp local family** (inet | inet6) **anycast-pim**],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6) **anycast-pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's local address for anycast rendezvous point (RP). If this statement is omitted, the router ID is used as this address.

Options ***address***—Anycast RP IPv4 or IPv6 address, depending on **family** configuration.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring PIM Anycast with MSDP

mapping-agent-election

Syntax (mapping-agent-election | no-mapping-agent-election);

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp auto-rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp auto-rp**],
[edit protocols **pim rp auto-rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp auto-rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's mapping announcements as a mapping agent.

Options **mapping-agent-election**—Mapping agents do not announce mappings when receiving mapping messages from a higher-addressed mapping agent.

no-mapping-agent-election—Mapping agents always announce mappings and do not perform mapping agent election.

Default: mapping-agent-election

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Auto-RP

maximum-rps

Syntax maximum-rps *limit*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp embedded-rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp embedded-rp**],
[edit protocols **pim rp embedded-rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp embedded-rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Limit the number of RPs that the routing device acknowledges.

Options *limit*—Number of RPs.

Range: 1 through 500

Default: 100

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring PIM Embedded RP for IPv6

mode

Syntax mode (dense | sparse | sparse-dense);

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure PIM to operate in sparse, dense, or sparse-dense mode.

Options

dense—Operate in dense mode.

sparse—Operate in sparse mode.

sparse-dense—Operate in sparse-dense mode.

Default: sparse

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Dense Mode Properties
- Configuring PIM Sparse-Dense Mode Properties
- *Junos OS Multicast Protocols Configuration Guide*

multicast-router-interface

Syntax multicast-router-interface;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Statically configure an interface as a switching interface toward a multicast router (the interface to receive multicast traffic).

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping (CLI Procedure) on page 2063

neighbor-policy

Syntax neighbor-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a PIM interface-level policy to filter neighbor IP addresses.

Options ***policy-name***—Name of the policy that filters neighbor IP addresses. For details about configuring policy statements, see the *Junos OS Policy Framework Configuration Guide*.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit routing-instances *routing-instance-name* protocols]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enable PIM on the routing device.

The statements are explained separately.

Default

PIM is disabled on the routing device.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

priority (Bootstrap)

Syntax

priority *number*;

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)],
[edit protocols **pim rp bootstrap** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp bootstrap** (inet | inet6)]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the routing device's likelihood to be elected as the bootstrap router.

Options

number—Routing device's priority for becoming the bootstrap router. A higher value corresponds to a higher priority.

Range: 0 through a 32-bit number

Default: 0 (The routing device has the least likelihood of becoming the bootstrap router and sends packets with a priority of 0.)

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Bootstrap Properties
- **bootstrap-priority on page 2086**

priority (PIM Interfaces)

Syntax priority *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim interface** *interface-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim interface** *interface-name*],
[edit protocols **pim interface** *interface-name*],
[edit routing-instances *routing-instance-name* protocols **pim interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device's likelihood to be elected as the designated router.

Options ***number***—Routing device's priority for becoming the designated router. A higher value corresponds to a higher priority.

Range: 1 through a 32-bit number

Default: 1 (The routing device has the least likelihood of becoming the designated router.)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Interface Priority to Become the PIM Designated Router

priority (PIM RPs)

Syntax priority *number*;

Hierarchy Level [edit protocols **pim rp local family** (inet | inet6)],
[edit routing-instances *routing-instance-name* protocols **pim rp local family** (inet | inet6)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure this routing device's priority for becoming an RP. The bootstrap router uses this field when selecting the list of candidate RPs to send in the bootstrap message. A smaller number increases the likelihood that the routing device becomes the RP for local multicast groups. A priority value of 0 means that bootstrap router can override the group range being advertised by the candidate RP.

Options ***number***—Routing device's priority for becoming an RP. A lower value corresponds to a higher priority.

Range: 0 through 255

Default: 1

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Local PIM RPs

promiscuous-mode

Syntax promiscuous-mode;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that the interface accepts IGMP reports from hosts on any subnetwork.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Accepting IGMP Messages from Remote Subnetworks

proxy

Syntax proxy source-address *source-address*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that the VLAN operates in proxy mode. The proxy option is only accepted for a VLAN acting as a data-forwarding source.

Default Disabled.

Options **source-address *source-address***—IP address of the source VLAN to act as proxy.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

query-interval

Syntax query-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the querier router sends general host-query messages.

Options ***seconds***—Time interval.
Range: 1 through 1024
Default: 125 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Host-Query Message Interval
- **query-last-member-interval on page 2120**
- **query-response-interval on page 2120**

query-last-member-interval

Syntax query-last-member-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often the querier router sends group-specific query messages.

Options *seconds*—Time interval, in fractions of a second or seconds.

Range: 0.1 through 0.9, then in 1-second intervals 1 through 1024

Default: 1 second

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Last-Member Query Interval
- **query-interval on page 2119**
- **query-response-interval on page 2120**

query-response-interval

Syntax query-response-interval *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the querier router waits to receive a response to a host-query message from a host.

Options *seconds*—The query response interval must be less than the query interval.

Range: 1 through 1024

Default: 10 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Query Response Interval
- **query-interval on page 2119**
- **query-last-member-interval on page 2120**

receiver

Syntax

```
receiver {
  source-vlans vlan-list;
  install;
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a VLAN as a multicast receiver VLAN of the multicast VLAN (MVLAN).

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 48
- Example: Configuring Multicast VLAN Registration on J-EX Series Switches on page 2058

restart-duration

Syntax restart-duration *seconds*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim graceful-restart**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim graceful-restart**],
[edit protocols **pim graceful-restart**],
[edit routing-instances *routing-instance-name* protocols **pim graceful-restart**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the duration of the graceful restart interval.

Options ***seconds***—Time the routing device waits (in seconds) to complete PIM sparse mode graceful restart.

Range: 30 through 300

Default: 60

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring PIM Sparse Mode Graceful Restart

rib-group

Syntax rib-group *group-name*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a routing table group with PIM.

Options *group-name*—Name of the routing table group. The name must be one that you defined with the **rib-group** statement at the **[edit routing-options]** hierarchy level.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring a PIM RPF Routing Table

robust-count

Syntax robust-count *number*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of intervals the switch waits before removing a multicast group from the multicast forwarding table. The length of each interval is configured using the **query-interval** statement.

Default 2

Options *number* —Number of intervals the switch waits before timing out a multicast group.
Range: 2 through 10

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping (CLI Procedure) on page 2063

robust-count

Syntax robust-count *number*;

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Tune the expected packet loss on a subnet. This factor is used to calculate the group member interval, other querier present interval, and last-member query count.

Options *number*—Robustness variable.

Range: 2 through 10

Default: 2

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Modifying the IGMP Robustness Variable

rp

Syntax

```
rp {
    auto-rp {
        (announce | discovery | mapping);
        (mapping-agent-election | no-mapping-agent-election);
    }
    bootstrap {
        family (inet | inet6) {
            export [ policy-names ];
            import [ policy-names ];
            priority number;
        }
    }
    bootstrap-export [ policy-names ];
    bootstrap-import [ policy-names ];
    bootstrap-priority number;
    dr-register-policy [ policy-names ];
    embedded-rp {
        group-ranges {
            destination-ip-prefix</prefix-length>;
        }
        maximum-rps limit;
    }
    local {
        family (inet | inet6) {
            disable;
            address address;
            anycast-pim {
                rp-set {
                    address address <forward-msdp-sa>;
                }
                local-address address;
            }
            group-ranges {
                destination-ip-prefix</prefix-length>;
            }
            hold-time seconds;
            priority number;
        }
    }
    rp-register-policy [ policy-names ];
    static {
        address address {
            version version;
            group-ranges {
                destination-ip-prefix</prefix-length>;
            }
        }
    }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols pim],

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing device as an actual or potential RP. A routing device can be an RP for more than one group.

The remaining statements are explained separately.

Default If you do not include the **rp** statement, the routing device can never become the RP.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- *Junos OS Multicast Protocols Configuration Guide*

rp-register-policy

Syntax rp-register-policy [*policy-names*];

Hierarchy Level [edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply one or more policies to control incoming PIM register messages.

Options ***policy-names***—Name of one or more import policies.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Register Message Filtering on a PIM RP or DR
- **dr-register-policy on page 2090**

rp-set

Syntax

```
rp-set {
    address address <forward-msdp-sa>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim local family** (inet | inet6) **anycast-pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim local family** (inet | inet6) **anycast-pim**],
[edit protocols **pim local family** (inet | inet6) **anycast-pim**],
[edit routing-instances *routing-instance-name* protocols **pim local family** (inet | inet6) **anycast-pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a set of rendezvous point (RP) addresses for anycast RP. You can configure up to 15 RPs.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring PIM Anycast with MSDP

source

Syntax

```
source {
    groups group-prefix;
}
```

Hierarchy Level

[edit protocols **igmp-snooping vlan** *vlan-number* **data-forwarding**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure a VLAN to be a multicast source VLAN (MVLAN).

The remaining statement is explained separately.

Default

Disabled.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 48
- Example: Configuring Multicast VLAN Registration on J-EX Series Switches on page 2058
- Configuring Multicast VLAN Registration (CLI Procedure) on page 2068

source

Syntax

```
source ip-address {
    source-count number;
    source-increment increment;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name* **static group** *multicast-group-address*],
[edit protocols igmp **interface** *interface-name* **static group** *multicast-group-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the IP version 4 (IPv4) unicast source address for the multicast group being statically configured on an interface.

Options ***ip-address***—IPv4 unicast address.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP Static Group Membership

source-vlans

Syntax source-vlans *vlan-list*;

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-number* **data-forwarding receiver**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a list of multicast VLANs (MVLANs) from which this multicast receiver VLAN receives multicast traffic. Either all of these MVLANs must be in proxy mode or none of them can be in proxy mode.

Default Disabled.

Options ***vlan-list***—Names of the MVLANs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- [edit protocols] Configuration Statement Hierarchy on page 48
- Example: Configuring Multicast VLAN Registration on J-EX Series Switches on page 2058

spt-threshold

Syntax

```
spt-threshold {
  infinity [ policy-names ];
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring the PIM SPT Threshold Policy

ssm-map

Syntax

ssm-map *ssm-map-name*;

Hierarchy Level

[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Apply an SSM map to an IGMP interface.

Options

ssm-map-name—Name of SSM map.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring SSM Mapping

static

Syntax

```
static {
  address address {
    group-ranges {
      destination-ip-prefix</prefix-length>;
    }
    version version;
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim rp**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim rp**],
[edit protocols **pim rp**],
[edit routing-instances *routing-instance-name* protocols **pim rp**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure static RP addresses. The default static RP address is **224.0.0.0/4**. To configure other addresses, include one or more **address** statements. You can configure a static RP in a logical system only if the logical system is not directly connected to a source.

For each static RP address, you can optionally specify the PIM version and the groups for which this address can be the RP. The default PIM version is version 1.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Static PIM RPs

static (IGMP Snooping)

Syntax

```
static {
  group ip-address;
}
```

Hierarchy Level [edit protocols **igmp-snooping vlan** *vlan-id* | *vlan-name* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Statically define multicast groups on an interface.

The remaining statement is explained separately.

Default No multicast groups are statically defined.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IGMP Snooping on J-EX Series Switches on page 2055
- Configuring IGMP Snooping on J-EX Series Switches (CLI Procedure) on page 2063

static

Syntax

```
static {
  group multicast-group-address {
    exclude;
    group-count number;
    group-increment increment;
    source ip-address {
      source-count number;
      source-increment increment;
    }
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*], [edit protocols igmp **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Test multicast forwarding on an interface without a receiver host.

The remaining statements are explained separately.

Required Privilege Level routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation

- Enabling IGMP Static Group Membership

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols **pim**],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols **pim**],
[edit protocols **pim**],
[edit routing-instances *routing-instance-name* protocols **pim**]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure PIM tracing options.

To specify more than one tracing operation, include multiple **flag** statements.

Default

The default PIM trace options are those inherited from the routing protocol's **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options

disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the **pim-log** file.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

Range: 2 through 1000 files

Default: 2 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

PIM Tracing Flags

- **assert**—Assert messages
- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache

- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 0 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag (detail | disable | receive | send);
}
```

Hierarchy Level [edit protocols igmp-snooping]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for IGMP snooping.

Default The **traceoptions** feature is disabled by default.

Options

file *filename* —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number* —(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag* —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **general**—Trace general IGMP snooping protocol events.
- **leave**—Trace leave group messages (IGMPv2 only).
- **normal**—Trace normal IGMP snooping protocol events.
- **packets**—Trace all IGMP packets.
- **policy**—Trace policy processing.
- **query**—Trace IGMP membership query messages.
- **report**—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.

match *regex* —(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restricted file access to the user who created the file.

size *size* —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes

Range: 10 KB through 1 gigabytes

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

- Configuring IGMP Snooping (CLI Procedure) on page 2063

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols igmp],
[edit protocols igmp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure IGMP tracing options.

To specify more than one tracing operation, include multiple **flag** statements.

To trace the paths of multicast packets, use the **mtrace** command, as described in the *Junos OS System Basics and Services Command Reference*.

Default The default IGMP trace options are those inherited from the routing protocols **traceoptions** statement included at the **[edit routing-options]** hierarchy level.

Options **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place tracing output in the file **igmp-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

Range: 2 through 1000 files

Default: 2 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

IGMP Tracing Flags

- **leave**—Leave group messages (for IGMP version 2 only).
- **mtrace**—Mtrace packets. Use the **mtrace** command to troubleshoot the software.
- **packets**—All IGMP packets.

- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Do not allow users to read the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

version

Syntax
version *version*;

Hierarchy Level
[edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],
[edit protocols igmp **interface** *interface-name*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify the version of IGMP.

Options
version—IGMP version number.

Range: 1, 2, or 3

Default: IGMP version 2

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

vlan

Syntax

```
vlan (vlan-id | vlan-name) {
  data-forwarding {
    source {
      groups group-prefix;
    }
    receiver {
      source-vlans vlan-list;
      install ;
    }
  }
  disable {
    interface interface-name;
  }
  immediate-leave;
  interface interface-name {
    group-limit limit;
    multicast-router-interface;
    static {
      group ip-address;
    }
  }
  proxy ;
  query-interval seconds;
  query-last-member-interval seconds;
  query-response-interval seconds;
  robust-count number;
}
```

Hierarchy Level [edit protocols igmp-snooping]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure IGMP snooping parameters for a VLAN.

The remaining statements are explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range. For IGMP snooping, secondary private VLANs are not listed.

Default IGMP snooping options apply to the specified VLAN.

Options ***vlan-id***—Numeric tag for a VLAN.

Range: 0 through 4095. Tags 0 and 4095 are reserved by the Junos OS, and you should not configure them.

vlan-name—Name of a VLAN.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

CHAPTER 80

Operational Mode Commands for IGMP Snooping and Multicast

clear igmp membership

Syntax

clear igmp membership
<group *address-range*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear igmp membership
<group *address-range*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Internet Group Management Protocol (IGMP) group members.

Options

none—Clear all IGMP members on all interfaces and for all address ranges.

group *address-range*—(Optional) Clear all IGMP members that are in a particular address range. An example of a range is **224.2/16**. If you omit the destination prefix length, the default is **/32**.

interface *interface-name*—(Optional) Clear all IGMP group members on an interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

clear igmp statistics

Syntax

clear igmp statistics
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear igmp statistics
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Internet Group Management Protocol (IGMP) statistics.

Options

none—Clear IGMP statistics on all interfaces.

interface *interface-name*—(Optional) Clear IGMP statistics for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

clear igmp-snooping membership

Syntax clear igmp-snooping membership
<vlan *vlan-id* | *vlan-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear IGMP snooping membership information.

Options vlan *vlan-id* —Numeric tag identifier of the VLAN.

vlan *vlan-name* —Name of the VLAN.

Required Privilege Level view

clear multicast bandwidth-admission

Syntax

clear multicast bandwidth-admission
<group *group-address*>
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<source *source-address*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reapply IP multicast bandwidth admissions.

Options

none—Reapply multicast bandwidth admissions for all IPv4 forwarding entries in the master routing instance.

group *group-address*—(Optional) Reapply multicast bandwidth admissions for the specified group.

inet—(Optional) Reapply multicast bandwidth admission settings for IPv4 flows.

inet6—(Optional) Reapply multicast bandwidth admission settings for IPv6 flows.

instance *instance-name*—(Optional) Reapply multicast bandwidth admission settings for the specified instance. If you do not specify an instance, the command applies to the master routing instance.

interface *interface-name*—(Optional) Examines the corresponding outbound interface in the relevant entries and acts as follows:

- If the interface is congested, and it was admitted previously, it is removed.
- If the interface was rejected previously, the **clear multicast bandwidth-admission** command enables the interface to be admitted as long as enough bandwidth exists on the interface.
- If you do not specify an interface, issuing the **clear multicast bandwidth-admission** command readmits any previously rejected interface for the relevant entries as long as enough bandwidth exists on the interface.

To manually reject previously admitted outbound interfaces, you must specify the interface.

source *source-address*—(Optional) Use with the **group** option to reapply multicast bandwidth admission settings for the specified (source, group) entry.

Required Privilege Level

clear

clear multicast bandwidth-admission on page 2153

Output Fields When you enter this command, you are provided feedback on the status of your request.

clear multicast bandwidth-admission

```
user@host> clear multicast bandwidth-admission
```

clear multicast scope

Syntax

clear multicast scope
<inet | inet6>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear multicast scope
<inet | inet6>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear IP multicast scope statistics.

Options

none—(Same as **logical-system all**) Clear multicast scope statistics.

inet—(Optional) Clear multicast scope statistics for IPv4 family addresses.

inet6—(Optional) Clear multicast scope statistics for IPv6 family addresses.

interface *interface-name*—(Optional) Clear multicast scope statistics on a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

Related Documentation

Output Fields

When you enter this command, you are provided feedback on the status of your request.

clear multicast scope

```
user@host> clear multicast scope
```

clear multicast sessions

Syntax
clear multicast sessions
<logical-system (all | *logical-system-name*)>
<*regular-expression*>

Syntax (J-EX Series Switch)
clear multicast sessions
<*regular-expression*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear IP multicast sessions.

Options
none—(Same as **logical-system all**) Clear multicast sessions.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Clear only multicast sessions that contain the specified regular expression.

Required Privilege Level
clear

```

clear multicast statistics

Syntax

clear multicast statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear multicast statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear IP multicast statistics.

Options

none—Clear multicast statistics for all supported address families on all interfaces.

inet—(Optional) Clear multicast statistics for IPv4 family addresses.

inet6—(Optional) Clear multicast statistics for IPv6 family addresses.

instance *instance-name*—(Optional) Clear multicast statistics for the specified instance.

interface *interface-name*—(Optional) Clear multicast statistics on a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear pim join

Syntax

clear pim join
<*group-address*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear pim join
<*group-address*>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear the Protocol Independent Multicast (PIM) join and prune states.

Options

none—Clear the PIM join and prune states for all groups, family addresses, and instances.

group-address—(Optional) Clear the PIM join and prune states for a group address.

inet | inet6—(Optional) Clear the PIM join and prune states for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear the join and prune states for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim join** command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level

```

clear pim register

Syntax

clear pim register
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

clear pim register
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Protocol Independent Multicast (PIM) register message counters.

Options

none—Clear PIM register message counters for all family addresses, instances, and interfaces.

inet | inet6—(Optional) Clear PIM register message counters for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear register message counters for a specific PIM-enabled routing instance.

interface *interface-name*—(Optional) Clear PIM register message counters for a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim register** command cannot be used to clear the PIM register state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level

mtrace

Syntax mtrace *source*
<routing-instance *routing-instance-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display trace information about an IP multicast path.

Options *source*—Source hostname or address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

Additional Information The **mtrace** command for multicast traffic is similar to the **traceroute** command used for unicast traffic. Unlike **traceroute**, **mtrace** traces traffic backwards, from the receiver to the source.

Required Privilege Level view

List of Sample Output **mtrace source on page 2162**

Output Fields Table 259 on page 2161 describes the output fields for the **mtrace** command. Output fields are listed in the approximate order in which they appear.

Table 259: mtrace Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

mtrace from-source

Syntax

mtrace from-source source *source*
<brief | detail>
<extra-hops *extra-hops*>
<group *group*>
<interval *interval*>
<loop>
<max-hops *max-hops*>
<max-queries *max-queries*>
<multicast-response | unicast-response>
<no-resolve>
<no-router-alert>
<response *response*>
<routing-instance *routing-instance-name*>
<ttl *ttl*>
<wait-time *wait-time*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, the Junos OS returns additional information, such as packet rates and losses.

Options

brief | detail—(Optional) Display the specified level of output.

extra-hops *extra-hops*—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

group *group*—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

interval *interval*—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

loop—(Optional) Loop indefinitely, displaying rate and loss statistics.

max-hops *max-hops*—(Optional) Maximum hops to trace toward source. The range of values is **0** through **255**. The default value is **32** hops.

max-queries *max-queries*—(Optional) Maximum number of query attempts for any hop. The range of values is **1** through **32**. The default is **3**.

multicast-response—(Optional) Always request the response using multicast.

no-resolve—(Optional) Do not attempt to display addresses symbolically.

no-router-alert—(Optional) Do not use the router-alert IP option.

response *response*—(Optional) Send trace response to a host or multicast address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

source *source*—Source hostname or address.

ttl *ttl*—(Optional) IP time-to-live (TTL) value. You can specify a number between **0** and **255**. Local queries to the multicast group use a value of **1**. Otherwise, the default value is **127**.

unicast-response—(Optional) Always request the response using unicast.

wait-time *wait-time*—(Optional) Number of seconds to wait for a response. The default value is **3**.

Required Privilege Level view

List of Sample Output **mtrace from-source on page 2165**

Output Fields Table 260 on page 2164 describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

Table 260: mtrace from-source Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.
source	Source address.
Response Dest	Response destination address.
Overall	Average packet rate for all traffic at each hop.
Packet Statistics for Traffic From	Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop.

Table 260: mtrace from-source Output Fields *(continued)*

Field Name	Field Description
Receiver	IP address receiving the multicast.
Query source	IP address sending the mtrace query.

mtrace from-source

```
user@host> mtrace from-source source 192.1.4.2 group 225.1.1.1
Mtrace from 192.1.4.2 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.

Waiting to accumulate statistics...Results after 10 seconds:

Source        Response Dest    Overall     Packet Statistics For Traffic From
192.1.4.2 192.1.1.2    Packet      192.1.4.2 To 225.1.1.1
     v       __/  rtt    2 ms     Rate       Lost/Sent = Pct  Rate

```

mtrace to-gateway

Syntax

mtrace to-gateway gateway *gateway*
<brief | detail>
<extra-hops *extra-hops*>
<group *group*>
<interface *interface-name*>
<interval *interval*>
<loop>
<max-hops *max-hops*>
<max-queries *max-queries*>
<multicast-response | unicast-response>
<no-resolve>
<no-router-alert>
<response *response*>
<routing-instance *routing-instance-name*>
<ttl *ttl*>
<unicast-response>
<wait-time *wait-time*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display trace information about a multicast path from this router or switch to a gateway router or switch.

Options

gateway *gateway*—Send the trace query to a gateway multicast address.

brief | detail—(Optional) Display the specified level of output.

extra-hops *extra-hops*—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between **0** and **255**.

group *group*—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

interface *interface-name*—(Optional) Source address for sending the trace query.

interval *interval*—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10**.

loop—(Optional) Loop indefinitely, displaying rate and loss statistics.

max-hops *max-hops*—(Optional) Maximum hops to trace toward the source. You can specify a number between **0** and **255**.. The default value is **32**.

max-queries *max-queries*—(Optional) Maximum number of query attempts for any hop. You can specify a number between **0** and **255**.. The default value is **3**.

multicast-response—(Optional) Always request the response using multicast.

no-resolve—(Optional) Do not attempt to display addresses symbolically.

no-router-alert—(Optional) Do not use the router-alert IP option.

response *response*—(Optional) Send trace response to a host or multicast address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

ttl *ttl*—(Optional) IP time-to-live value. You can specify a number between **0** and **225**. Local queries to the multicast group use TTL **1**. Otherwise, the default value is **127**.

unicast-response—(Optional) Always request the response using unicast.

wait-time *wait-time*—(Optional) Number of seconds to wait for a response. The default value is **3**.

List of Sample Output **mtrace to-gateway on page 2169**

Output Fields Table 262 on page 2169 describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

Table 262: mtrace to-gateway Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief

Mrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerA.lab.mycompany.net (192.1.1.2)  PIM  thresh^ 1
 -2  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
```

```
 -3  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

show igmp group

Syntax
show igmp group
<brief | detail>
<*group-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show igmp group
<brief | detail>
<*group-name*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display Internet Group Management Protocol (IGMP) group membership information.

Options
none—Display standard information about membership for all IGMP groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display group membership for the specified IP address only.

logical-system (all | *logical-system-name)*—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields
Table 263 on page 2171 describes the output fields for the **show igmp group** command. Output fields are listed in the approximate order in which they appear.

Table 263: show igmp group Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface that received the IGMP membership report. A name of **local** indicates that the local routing device joined the group itself.	All levels
Group	Group address.	All levels
Group Mode	Mode the SSM group is operating in: **Include** or **Exclude**.	All levels
Source	Source address.	All levels

Table 263: show igmp group Output Fields *(continued)*

Field Name	Field Description	Level of Output
Source timeout	Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.	**detail**
Last reported by	Address of the host that last reported membership in this group.	All levels
Timeout	Time remaining until the group membership is removed.	**brief none**
Group timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	**detail**
Type	Type of group membership: • **Dynamic**—Host reported the membership. • **Static**—Membership is configured.	All levels

show igmp group (Include Mode)

```
user@host> show igmp group

List of Sample Output
show igmp interface on page 2177
show igmp interface brief on page 2177
show igmp interface detail on page 2177

Output Fields
Table 264 on page 2175 describes the output fields for the **show igmp interface** command. Output fields are listed in the approximate order in which they appear.

Table 264: show igmp interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
State	State of the interface: **Up** or **Down**.	All levels
Querier	Address of the routing device that has been elected to send membership queries.	All levels
Timeout	How long until the IGMP querier is declared to be unreachable, in seconds.	All levels
Version	IGMP version being used on the interface: **1** , **2** , or **3**.	All levels

Table 264: show igmp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Groups	Number of groups on the interface.	All levels
Immediate Leave	State of the immediate leave option: • **On**—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface. • **Off**—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.	All levels
Promiscuous Mode	State of the promiscuous mode option: • **On**—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces. • **Off**—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.	All levels
Passive	State of the passive mode option: • **On**—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves. • **Off**—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves. The **passive** statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the **on** state declaration: • **send-general-query**—The interface sends general queries. • **send-group-query**—The interface sends group-specific and group-source-specific queries. • **allow-receive**—The interface receives control traffic	All levels
OIF map	Name of the OIF map associated to the interface.	All levels
SSM map	Name of the source-specific multicast (SSM) map (if configured) used on the interface.	All levels
Configured Parameters	Information configured by the user: • **IGMP Query Interval**—Interval (in seconds) at which this router sends membership queries when it is the querier. • **IGMP Query Response Interval**—Time (in seconds) that the router waits for a report in response to a general query. • **IGMP Last Member Query Interval**—Time (in seconds) that the router waits for a report in response to a group-specific query. • **IGMP Robustness Count**—Number of times the router retries a query.	All levels

Table 264: show igmp interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Derived Parameters	Derived information: • **IGMP Membership Timeout**—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. • **IGMP Other Querier Present Timeout**—Time (in seconds) that the router waits for the IGMP querier to send a query.	All levels

show igmp interface

```
user@host> show igmp interface
Interface: at-0/3/1.0
    Querier: 10.111.30.1
    State:         Up Timeout:    None Version:  2 Groups:      4
Interface: so-1/0/0.0
    Querier: 10.111.10.1
    State:         Up Timeout:    None Version:  2 Groups:      2
Interface: so-1/0/1.0
    Querier: 10.111.20.1
    State:         Up Timeout:    None Version:  2 Groups:      4
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see **show igmp interface on page 2177**.

show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see **show igmp interface on page 2177**.

show igmp statistics

Output Fields
Table 265 on page 2178 describes the output fields for the **show igmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 265: show igmp statistics Output Fields

Field Name	Field Description
IGMP packet statistics	Heading for IGMP packet statistics for all interfaces or for the specified interface name.

Table 265: show igmp statistics Output Fields *(continued)*

Field Name	Field Description
IGMP Message type	Summary of IGMP statistics: • **Membership Query**—Number of membership queries sent and received. • **V1 Membership Report**—Number of version 1 membership reports sent and received. • **DVMRP**—Number of DVMRP messages sent or received. • **PIM V1**—Number of PIM version 1 messages sent or received. • **Cisco Trace**—Number of Cisco trace messages sent or received. • **V2 Membership Report**—Number of version 2 membership reports sent or received. • **Group Leave**—Number of group leave messages sent or received. • **Mtrace Response**—Number of Mtrace response messages sent or received. • **Mtrace Request**—Number of Mtrace request messages sent or received. • **Domain Wide Report**—Number of domain-wide reports sent or received. • **V3 Membership Report**—Number of version 3 membership reports sent or received. • **Other Unknown types**—Number of unknown message types received. • **IGMP v3 unsupported type**—Number of messages received with unknown and unsupported IGMP version 3 message types. • **IGMP v3 source required for SSM**—Number of IGMP version 3 messages received that contained no source. • **IGMP v3 mode not applicable for SSM**—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM).
Received	Number of messages received.
Sent	Number of messages sent.
Rx errors	Number of received packets that contained errors.
IGMP Global Statistics	Summary of IGMP statistics for all interfaces. • **Bad Length**—Number of messages received with length errors so severe that further classification could not occur. • **Bad Checksum**—Number of messages received with a bad IP checksum. No further classification was performed. • **Bad Receive If**—Number of messages received on an interface not enabled for IGMP. • **Rx non-local**—Number of messages received from senders that are not local. • **Timed out**—Number of groups that timed out as a result of not receiving an explicit leave message. • **Rejected Report**—Number of reports dropped because of the IGMP group policy. • **Total Interfaces**—Number of interfaces configured to support IGMP.

show igmp statistics

```
user@host> show igmp statistics

Table 266 on page 2181 lists the output fields for the **show igmp-snooping membership** command. Output fields are listed in the approximate order in which they appear.

Table 266: show igmp-snooping membership Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Interfaces	Interfaces that are members of the listed multicast group.	All
Tag	Numerical identifier of the VLAN.	**detail**

Table 266: show igmp-snooping membership Output Fields *(continued)*

Field Name	Field Description	Level of Output
Router interfaces	List of information about multicast router interfaces: • Name of the multicast router interface. • **static** or **dynamic**—Whether the multicast router interface is static or dynamic. • **Uptime**—For static interfaces, amount of time since the interface was configured as a multicast router interface. For dynamic interfaces, amount of time since the first query was received on interface. • **timeout**—Query timeout in seconds.	**detail**
Group	IP multicast address of the multicast group. The following information is provided for the multicast group: • Name of the interface belonging to the multicast group. • **timeout**—Time (in seconds) left until the entry for the multicast group is removed. • **Last reporter**—Last host to report membership for the multicast group. • **Receiver count**—Number of interfaces that have membership in a multicast group. • **Flags**—IGMP version of the host sending a join message. • **Include source**—Source addresses from which multicast streams are allowed based on IGMPv3 reports. Shown only for IGMPv3 joins.	**detail**

Output Fields Table 268 on page 2185 lists the output fields for the **show igmp-snooping statistics** command. Output fields are listed in the approximate order in which they appear.

Table 268: show igmp-snooping statistics Output Fields

Field Name	Field Description
Bad length	IGMP packet has illegal or bad length.
Bad checksum	IGMP or IP checksum is incorrect.
Invalid interface	Packet was received through an invalid interface.
Receive unknown	Unknown IGMP type.
Timed out	Number of timeouts for all multicast groups.
IGMP Type	Type of IGMP message (Query, Report, Leave, or Other).
Received	Number of IGMP packets received.
Transmitted	Number of IGMP packets transmitted.
Recv Errors	Number of general receive errors.

show igmp-snooping statistics

show multicast interface

Syntax
show multicast interface
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show multicast interface

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display bandwidth information about IP multicast interfaces.

Options
none—Display all interfaces that have multicast configured.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

List of Sample Output
show multicast interface on page 2192

Output Fields
Table 271 on page 2191 describes the output fields for the **show multicast interface** command. Output fields are listed in the approximate order in which they appear.

Table 271: show multicast interface Output Fields

Field Name	Field Description
Interface	Name of the multicast interface.
Maximum bandwidth (bps)	Maximum bandwidth setting, in bits per second, for this interface.
Remaining bandwidth (bps)	Amount of bandwidth, in bits per second, remaining on the interface.
Mapped bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface. NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface. This field does not appear in the output when the no QoS adjustment feature is disabled.
Local bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface. NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface. This field does not appear in the output when the no QoS adjustment feature is disabled.

Table 271: show multicast interface Output Fields *(continued)*

Field Name	Field Description
Reverse OIF mapping	State of the reverse OIF mapping feature (**on** or **off**). NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
Reverse OIF mapping no QoS adjustment	State of the no QoS adjustment feature (**on** or **off**) for interfaces that are using reverse OIF mapping. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
Leave timer	Amount of time a mapped interface remains active after the last mapping ends. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
No QoS adjustment	State (**on**) of the no QoS adjustment feature when this feature is enabled. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.

show multicast interface

```
user@host> show multicast interface
Interface               Maximum bandwidth (bps) Remaining bandwidth (bps)
fe-0/0/3                              10000000                          0
fe-0/0/3.210                          10000000                    -2000000
fe-0/0/3.220                         100000000                   100000000
fe-0/0/3.230                          20000000                    18000000
fe-0/0/2.200                         100000000                   100000000
```

show multicast mrinfo

Syntax show multicast mrinfo
<*host*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display configuration information about IP multicast networks, including neighboring multicast router addresses.

Options none—Display configuration information about all multicast networks.

host—(Optional) Display configuration information about a particular host. Replace *host* with a hostname or IP address.

Required Privilege Level view

List of Sample Output **show multicast mrinfo on page 2194**

Output Fields Table 272 on page 2193 describes the output fields for the **show multicast mrinfo** command. Output fields are listed in the approximate order in which they appear.

Table 272: show multicast mrinfo Output Fields

Field Name	Field Description
source-address	Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.
ip-address-1—>ip-address-2	Queried router interface address and directly attached neighbor interface address, respectively.
(*name* or *ip-address*)	Name or IP address of neighbor.

[*metric/threshold/type/flags*]	Neighbor's multicast profile:
	• ***metric***—Always has a value of **1**, because **mrinfo** queries the directly connected interfaces of a device.
	• ***threshold***—Multicast threshold time-to-live (TTL). The range of values is **0** through **255**.
	• ***type***—Multicast connection type: **pim** or **tunnel**.
	• ***flags***—Flags for this route:
	  ◦ **querier**—Queried router is the designated router for the neighboring session.
	  ◦ **leaf**—Link is a leaf in the multicast network.
	  ◦ **down**—Link status indicator.

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
  0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

show multicast next-hops

Syntax

show multicast next-hops
<brief | detail>
<*identifier-number*>
<inet | inet6>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show multicast next-hops
<brief | detail>
<*identifier-number*>
<inet | inet6>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the IP multicast next-hop table.

Options

none—Display standard information about all entries in the multicast next-hop table for all supported address families.

brief | detail—(Optional) Display the specified level of output.

identifier-number—(Optional) Show a particular next hop by ID number. The range of values is **1** through **65,535**.

inet | inet6—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

Output Fields

Table 273 on page 2195 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 273: show multicast next-hops Output Fields

Field Name	Field Description
ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.
Refcnt	Number of cache entries that are using this next hop.
KRefcount	Kernel reference count for the next hop.
Downstream interface	Interface names associated with each multicast next-hop ID.

show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
262142          4          2 so-1/0/0.0
262143          2          1 mt-1/1/0.49152
262148          2          1 mt-1/1/0.32769

Family: INET6
```

show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see **show multicast next-hops on page 2196**.

show multicast next-hops detail

The output for the **show multicast next-hops detail** command is identical to that for the **show multicast next-hops** command. For sample output, see **show multicast next-hops on page 2196**.

show multicast pim-to-igmp-proxy

Syntax
show multicast pim-to-igmp-proxy
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show multicast pim-to-igmp-proxy

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display configuration information about PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy.

Options
none—Display configuration information about PIM-to-IGMP message translation.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Table 274: show multicast pim-to-igmp-proxy Output Fields

Field Name	Field Description
Proxy state	State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: **enabled** or **disabled**.
interface-name	Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured.

show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

show multicast pim-to-mld-proxy

Syntax
show multicast pim-to-mld-proxy
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)
show multicast pim-to-mld-proxy

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display configuration information about PIM-to-MLD message translation, also known as PIM-to-MLD proxy.

Options
none—Display configuration information about PIM-to-MLD message translation.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level
view

```

show multicast route

Syntax

show multicast route
<brief | detail | extensive>
<active | all | inactive>
<group *group*>
<inet | inet6>
<instance *instance name*>
<logical-system (all | *logical-system-name*)>
<*regular-expression*>
<source-prefix *source-prefix*>

Syntax (J-EX Series Switch)

show multicast route
<brief | detail | extensive>
<active | all | inactive>
<group *group*>
<inet | inet6>
<instance *instance name*>
<*regular-expression*>
<source-prefix *source-prefix*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

Options

none—Display standard information about all entries in the multicast forwarding table for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

active | all | inactive—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

group *group*—(Optional) Display the cache entries for a particular group.

inet | inet6—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

source-prefix *source-prefix*—(Optional) Display the cache entries for a particular source prefix.

Required Privilege Level view

List of Sample Output

Output Fields Table 276 on page 2200 describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

Table 276: show multicast route Output Fields

Field Name	Field Description	Level of Output
Address family	IPv4 address family (**INET**) or IPv6 address family (**INET6**).	All levels
Group	Group address.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table.	All levels
Upstream interface	Name of the interface on which the packet with this source prefix is expected to arrive.	All levels
Downstream interface list	List of interface names to which the packet with this source prefix is forwarded.	All levels
Session description	Name of the multicast session.	**detail extensive**
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays **Forwarding statistics are not available**.	**detail extensive**
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the **show multicast nexthops** command.	**detail extensive**
Upstream protocol	Protocol running on the interface on which the packet with this source prefix is expected to arrive.	**detail extensive**
Route state	Whether the group is **Active** or **Inactive**.	**extensive**
Forwarding state	Whether the prefix is pruned or forwarding.	**extensive**
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of **never** indicates a permanent forwarding entry.	**extensive**
Wrong incoming interface notifications	Number of times that the upstream interface was not available.	**extensive**

show multicast route

show multicast rpf

Syntax

show multicast rpf
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*prefix*>
<summary>

Syntax (J-EX Series Switch)

show multicast rpf
<inet | inet6>
<instance *instance-name*>
<*prefix*>
<summary>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about multicast reverse-path-forwarding (RPF) calculations.

Options

none—Display RPF calculation information for all supported address families.

inet | inet6—(Optional) Display the RPF calculation information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about multicast RPF calculations for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Display the RPF calculation information for the specified prefix.

summary—(Optional) Display summary of all multicast RPF information.

Required Privilege Level

show pim bootstrap

Syntax

show pim bootstrap
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim bootstrap
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.

Options

none—Display PIM bootstrap router information for all routing instances.

instance *instance-name*—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show pim interfaces inet6 on page 2218

Output Fields
Table 282 on page 2216 describes the output fields for the **show pim interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 282: show pim interfaces Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
Name	Interface name.
State	State of the interface. The state also is displayed in the **show interfaces** command.

Table 282: show pim interfaces Output Fields *(continued)*

Field Name	Field Description
Mode	PIM mode running on the interface: • **Sparse**—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic. • **Dense**—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). • **Sparse-Dense**—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as **dense** is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as **sparse** is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules.
IP	Version number of the address family on the interface: **4** (IPv4) or **6** (IPv6).
V	PIM version running on the interface: **1** or **2**.
State	State of PIM on the interface: • **DR**—Designated router. • **NotDR**—Not the designated router. • **P2P**—Point to point.
NbrCnt	Number of neighbors that have been seen on the interface.
JoinCnt(sg)	Number of (s,g) join messages that have been seen on the interface.
JointCnt(*g)	Number of (*,g) join messages that have been seen on the interface.
DR address	Address of the designated router.

show pim interfaces

Syntax (J-EX Series Switch)

show pim join
<brief | detail | extensive>
<inet | inet6>
<instance *instance-name*>
<*range*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Protocol Independent Multicast (PIM) groups.

Options

none—Display the standard information about PIM groups for all supported family addresses for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Address range of the group, specified as ***prefix/prefix-length***.

List of Sample Output

Output Fields

Table 283 on page 2220 describes the output fields for the **show pim join** command. Output fields are listed in the approximate order in which they appear.

Table 283: show pim join Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
Family	Name of the address family: **inet** (IPv4) or **inet6** (IPv6).
R	Rendezvous Point Tree
S	Sparse
W	Wildcard
Group	Group address.
Source	Multicast source: • ***** (wildcard value) • ***ipv4-address*** • ***ipv6-address***
RP	Rendezvous point for the PIM group.
Flags	PIM flags: • **dense**—Dense mode entry. • **rptree**—Entry is on the rendezvous point tree. • **sparse**—Sparse mode entry. • **spt**—Entry is on the shortest-path tree for the source. • **wildcard**—Entry is on the shared tree.
Upstream interface	RPF interface toward the source address for the source-specific state **(S, G)** or toward the rendezvous point (RP) address for the non-source-specific state **(*, G)**.
Upstream neighbor	Information about the upstream neighbor: **Direct**, **Local**, **Unknown**, or a specific IP address.
Upstream state	Information about the upstream interface: • **Join to RP**—Sending a join to the rendezvous point. • **Join to Source**—Sending a join to the source. • **Local RP**—Sending neither joins nor prunes toward the RP, because this router is the rendezvous point. • **Local Source**—Sending neither joins nor prunes toward the source, because the source is locally attached to this routing device. • **Prune to RP**—Sending a prune to the rendezvous point. • **Prune to Source**—Sending a prune to the source.

Table 283: show pim join Output Fields *(continued)*

Field Name	Field Description
Downstream neighbors	Information about downstream interfaces: • **Interface**—Interface name for the downstream neighbor. NOTE: A pseudo PIM-SM interface appears for all IGMP-only interfaces. • **Interface address**—Address of the downstream neighbor. • **State**—Information about the downstream neighbor: **join** or **prune**. • **Flags**—PIM join flags: **R (RPtree),S (Sparse)**, **W (Wildcard)**, or **zero**.
Assert Timeout	Length of time between assert cycles on downstream interface. Not displayed if assert timer is null.
Timeout	Time remaining until the downstream join state is updated (in seconds). If the downstream join state is not updated before this keepalive timer reaches zero, the entry is deleted. If there is a directly connected host, **Timeout** is **Infinity**.

show pim neighbors

Syntax

show pim neighbors
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim neighbors
<brief | detail>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Protocol Independent Multicast (PIM) neighbors.

Options

none—(Same as **brief**) Display standard information about PIM neighbors for all supported family addresses for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information about PIM neighbors for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about neighbors for the specified PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 284 on page 2224 describes the output fields for the **show pim neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 284: show pim neighbors Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Interface	Interface through which the neighbor is reachable.	All levels
Neighbor addr	Address of the neighboring PIM routing device.	All levels

Table 284: show pim neighbors Output Fields *(continued)*

Field Name	Field Description	Level of Output
IP	IP version: **4** or **6**.	All levels
V	PIM version running on the neighbor: **1** or **2**.	All levels
Mode	PIM mode of the neighbor: **Sparse**, **Dense**, **SparseDense**, or **Unknown**. When the neighbor is running PIM version 2, this mode is always **Unknown**.	All levels
Option	Can be one or more of the following: • **B**—Bidirectional Capable. • **H**—Hello Option Holdtime. • **G**—Generation Identifier. • **P**—Hello Option DR Priority. • **L**—Hello Option LAN Prune Delay.	**brief** none
Uptime	Time the neighbor has been operational since the PIM process was last initialized, in the format ***dd:hh:mm:ss*** **ago** for less than a week and ***nwnd:hh:mm:ss*** **ago** for more than a week.	All levels
Address	Address of the neighboring PIM router.	**detail**
BFD	Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: **Enabled**, **Operational state is up**, or **Disabled**.	**detail**
Hello Option Holdtime	Time for which the neighbor is available, in seconds. The range of values is **0** through **65,535.**	**detail**
Hello Default Holdtime	Default holdtime and the time remaining if the **holdtime** option is not in the received hello message.	**detail**
Hello Option DR Priority	Designated router election priority. The range of values is **0** through **255**.	**detail**
Hello Option Generation ID	9- or 10-digit number used to tag hello messages.	**detail**
Hello Option LAN Prune Delay	Time to wait before the neighbor receives prune messages, in the format **delay** ***nnn*** **ms override** ***nnnn*** **ms**.	**detail**
Join Suppression supported	Neighbor is capable of join suppression.	**detail**
Rx Join	Information about joins received from the neighbor. • **Group**—Group addresses in the join message. • **Source**—Address of the source in the join message. • **Timeout**—Time for which the join is valid.	**detail**

show pim neighbors

show pim rps

Syntax

show pim rps
<brief | detail | extensive>
<*group-address*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim rps
<brief | detail | extensive>
<*group-address*>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about Protocol Independent Multicast (PIM) rendezvous points (RPs).

Options

none—Display standard information about PIM RPs for all groups and family addresses for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

group-address—(Optional) Display the RPs for a particular group. If you specify a group address, the output lists the routing device that is the RP for that group.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about RPs for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

Output Fields

Table 285 on page 2228 describes the output fields for the **show pim rps** command. Output fields are listed in the approximate order in which they appear.

Table 285: show pim rps Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels

Table 285: show pim rps Output Fields *(continued)*

Field Name	Field Description	Level of Output
Family	Name of the address family: **inet** (IPv4) or **inet6** (IPv6).	All levels
RP address	Address of the rendezvous point.	All levels
Type	Type of RP: • **auto-rp**—Address of the RP known through the Auto-RP protocol. • **bootstrap**—Address of the RP known through the bootstrap router protocol (BSR). • **embedded**—Address of the RP known through an embedded RP (IPv6). • **static**—Address of RP known through static configuration.	**brief** none
Holdtime	How long to keep the RP active, with time remaining, in seconds.	All levels
Timeout	How long until the local routing device determines the RP to be unreachable, in seconds.	All levels
Groups	Number of groups currently using this RP.	All levels
Group prefixes	Addresses of groups that this RP can span.	**brief** none
Learned via	Address and method by which the RP was learned.	**detail extensive**
Time Active	How long the RP has been active, in the format ***hh*:*mm*:*ss***.	**detail extensive**
Device Index	Index value of the order in which the Junos OS finds and initializes the interface.	**detail extensive**
Subunit	Logical unit number of the interface.	**detail extensive**
Interface	Either the encapsulation or the de-encapsulation logical interface, depending on whether this routing device is a designated router (DR) facing an RP router, or is the local RP, respectively.	**detail extensive**
Group Ranges	Addresses of groups that this RP spans.	**detail extensive**
Active groups using RP	Number of groups currently using this RP.	**detail extensive**
total	Total number of active groups for this RP.	**detail extensive**

Table 285: show pim rps Output Fields *(continued)*

Field Name	Field Description	Level of Output
Register State for RP	Current register state for each group: • **Group**—Multicast group address. • **Source**—Multicast source address for which the PIM register is sent or received, depending on whether this router is a designated router facing an RP router, or is the local RP, respectively: • **First Hop**—PIM-designated routing device that sent the Register message (the source address in the IP header). • **RP Address**—RP to which the Register message was sent (the destination address in the IP header). • **State**: On the designated router: ◦ **Send**—Sending Register messages. ◦ **Probe**—Sent a null register. If a Register-Stop message does not arrive in 5 seconds, the designated router resumes sending Register messages. ◦ **Suppress**—Received a Register-Stop message. The designated router is waiting for the timer to resume before changing to **Probe** state. • On the RP: ◦ **Receive**—Receiving Register messages.	**extensive**
Anycast-PIM rpset	If anycast RP is configured, the addresses of the RPs in the set.	**extensive**
Anycast-PIM local address used	If anycast RP is configured, the local address used by the RP.	**extensive**
Anycast-PIM Register State	If anycast RP is configured, the current register state for each group: • **Group**—Multicast group address. • **Source**—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively. • **Origin**—How the information was obtained: ◦ **DIRECT**—From a local attachment ◦ **MSDP**—From the Multicast Source Discovery Protocol (MSDP) ◦ **DR**—From the designated router	**extensive**

show pim source

Syntax

show pim source
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*source-prefix*>

Syntax (J-EX Series Switch)

show pim source
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<*source-prefix*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.

Options

none—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

source-prefix—(Optional) Display the state for source RPF states in the given range.

Output Fields

Table 286 on page 2233 describes the output fields for the **show pim source** command. Output fields are listed in the approximate order in which they appear.

Table 286: show pim source Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
RPF Address	Address of the source or reverse path.

Table 286: show pim source Output Fields *(continued)*

Field Name	Field Description
Prefix/length	Prefix and prefix length for the route used to reach the RPF address.
Upstream interface	RPF interface toward the source address.
Neighbor address	Address of the RPF neighbor used to reach the source address.

show pim source

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
    Prefix 10.255.14.144/32
    Upstream interface Local
    Upstream neighbor Local

Source 10.255.70.15
    Prefix 10.255.70.15/32
    Upstream interface so-1/0/0.0
    Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see **show pim source on page 2234**.

show pim source detail

```
user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
    Prefix 10.255.14.144/32
    Upstream interface Local
    Upstream neighbor Local
    Active groups:228.0.0.0
        239.1.1.1
        239.1.1.1

Source 10.255.70.15
    Prefix 10.255.70.15/32

show pim statistics

Syntax

show pim statistics
<inet |inet6)>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (J-EX Series Switch)

show pim statistics
<inet |inet6)>
<instance *instance-name*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display Protocol Independent Multicast (PIM) statistics.

Options

none—Display PIM statistics.

inet | inet6—(Optional) Display IPv4 or IPv6 PIM statistics.

instance *instance-name*—(Optional) Display statistics for a specific routing instance enabled by Protocol Independent Multicast (PIM).

interface *interface-name*—(Optional) Display statistics about the specified interface.

logical-system (all | *logical-system-name)*—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 287 on page 2235 describes the output fields for the **show pim statistics** command. Output fields are listed in the approximate order in which they appear.

Table 287: show pim statistics Output Fields

Field Name	Field Description
PIM statistics	PIM statistics for all interfaces or for the specified interface.
PIM message type	Message type for which statistics are displayed.
Received	Number of received statistics.
Sent	Number of messages sent of a certain type.

Table 287: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Rx errors	Number of received packets that contained errors.
V2 Hello	PIM version 2 hello packets.
V2 Register	PIM version 2 register packets.
V2 Register Stop	PIM version 2 register stop packets.
V2 Join Prune	PIM version 2 join and prune packets.
V2 Bootstrap	PIM version 2 bootstrap packets.
V2 Assert	PIM version 2 assert packets.
V2 Graft	PIM version 2 graft packets.
V2 Graft Ack	PIM version 2 graft acknowledgement packets.
V2 Candidate RP	PIM version 2 candidate RP packets.
V1 Query	PIM version 1 query packets.
V1 Register	PIM version 1 register packets.
V1 Register Stop	PIM version 1 register stop packets.
V1 Join Prune	PIM version 1 join and prune packets.
V1 RP Reachability	PIM version 1 RP reachability packets.
V1 Assert	PIM version 1 assert packets.
V1 Graft	PIM version 1 graft packets.
V1 Graft Ack	PIM version 1 graft acknowledgement packets.
AutoRP Announce	Auto-RP announce packets.
AutoRP Mapping	Auto-RP mapping packets.
AutoRP Unknown type	Auto-RP packets with an unknown type.
Anycast Register	Auto-RP announce packets.
Anycast Register Stop	Auto-RP announce packets.
Global Statistics	Summary of PIM statistics for all interfaces.

Table 287: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Hello dropped on neighbor policy	Number of hello packets dropped because of a configured neighbor policy.
Unknown type	Number of PIM control packets received with an unknown type.
V1 Unknown type	Number of PIM version 1 control packets received with an unknown type.
Unknown Version	Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.
Neighbor unknown	Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.
Bad Length	Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.
Bad Checksum	Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet.
Bad Receive If	Number of PIM control packets received on an interface that does not have PIM configured.
Rx Bad Data	Number of PIM control packets received that contain data for TCP. Bad register packets.
Rx Intf disabled	Number of PIM control packets received on an interface that has PIM disabled.
Rx V1 Require V2	Number of PIM version 1 control packets received on an interface configured for PIM version 2.
Rx V2 Require V1	Number of PIM version 2 control packets received on an interface configured for PIM version 1.
Rx Register not RP	Number of PIM register packets received when the router is not the RP for the group.
Rx Register no route	Number of PIM register packets received when the RP does not have a unicast route back to source.
Rx Register no decap if	Number of PIM register packets received when the RP does not have a de-encapsulation interface.
Null Register Timeout	Number of NULL register timeout packets.
RP Filtered Source	Number of PIM packets received when the router has a source address filter configured for the RP.

Table 287: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Rx Unknown Reg Stop	Number of register stop messages with an unknown type.
Rx Join/Prune no state	Number of join and prune messages received for which the router has no state.
Rx Join/Prune on upstream if	Number of join and prune messages received on the interface used to reach the upstream router, toward the RP.
Rx Join/Prune messages dropped	Number of join and prune messages received and dropped.
Rx sparse join for dense group	Number of PIM sparse mode join messages received for a group that is configured for dense mode.
Rx Graft/Graft Ack no state	Number of graft and graft acknowledgement messages received for which the router has no state.
Rx Graft on upstream if	Number of graft messages received on the interface used to reach the upstream router, toward the RP.
Rx CRP not BSR	Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.
Rx BSR when BSR	Number of BSR messages received in which the PIM message type is Bootstrap.
Rx BSR not RPF if	Number of BSR messages received on an interface that is not the RPF interface.
Rx unknown hello opt	Number of PIM hello packets received with options that Junos OS does not support.
Rx data no state	Number of PIM control packets received for which the router has no state for the data type.
Rx RP no state	Number of PIM control packets received for which the router has no state for the RP.
Rx aggregate	Number of PIM aggregate MDT packets received.
Rx malformed packet	Number of PIM control packets received with a malformed IP unicast or multicast address family.
No RP	Number of PIM control packets received with no RP address.
No register encap if	Number of PIM register packets received when the first-hop router does not have an encapsulation interface.

Table 287: show pim statistics Output Fields *(continued)*

Field Name	Field Description
No route upstream	Number of PIM control packets received when the router does not have a unicast route to the the interface used to reach the upstream router, toward the RP.
Nexthop Unusable	Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.
RP mismatch	Number of PIM control packets received for which the router has an RP mismatch.
RPF neighbor unknown	Number of PIM control packets received for which the router has an unknown RPF neighbor for the source.
Rx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Tx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Embedded-RP invalid addr	Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.
Embedded-RP limit exceed	Number of times the limit configure with the **maximum-rps** statement is exceeded. The **maximum-rps** statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.
Embedded-RP added	Number of packets in which the embedded RP for IPv6 is added. The following receive events trigger extraction of an IPv6 embedded RP address on the router: • Multicast Listener Discovery (MLD) report for an embedded RP multicast group address • PIM join message with an embedded RP multicast group address • Static embedded RP multicast group address associated with an interface • Packets sent to an embedded RP multicast group address received on the DR An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.
Embedded-RP removed	Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.
Rx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.

Table 287: show pim statistics Output Fields *(continued)*

Field Name	Field Description
Tx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.

PART 17

Access Control

CHAPTER 81

802.1X and MAC RADIUS Authentication Overview

Security Features for J-EX Series Switches Overview

The Junos operating system (Junos OS) is a network operating system that has been hardened through the separation of control forwarding and services planes, with each function running in protected memory. The control-plane CPU is protected by rate limiting, routing policy, and firewall filters to ensure switch uptime even under severe attack. In addition, the switches fully integrate with the Juniper Networks Unified Access Control (UAC) product to provide both standards-based 802.1X port-level access and Layer 2 through Layer 4 policy enforcement based on user identity. Access port security features such as dynamic Address Resolution Protocol (ARP) inspection, DHCP snooping, and MAC limiting are controlled through a single Junos OS CLI command.

J-EX Series Ethernet Switches provide the following hardware and software security features:

Console Port—Allows use of the console port to connect to the Routing Engine through an RJ-45 cable. You then use the command-line interface (CLI) to configure the switch.

Out-of-Band Management—A dedicated management Ethernet port on the rear panel allows out-of-band management.

Software Images—All Junos OS images are signed by Juniper Networks certificate authority (CA) with public key infrastructure (PKI).

User Authentication, Authorization, and Accounting (AAA)—Features include:

- User and group accounts with password encryption and authentication.
- Access privilege levels configurable for login classes and user templates.
- RADIUS authentication, TACACS+ authentication, or both, for authenticating users who attempt to access the switch.
- Auditing of configuration changes through system logging or RADIUS/TACACS+.

802.1X Authentication—Provides network access control. Supplicants (hosts) are authenticated when they initially connect to a LAN. Authenticating supplicants before they receive an IP address from a DHCP server prevents unauthorized supplicants from gaining access to the LAN. EX Series switches support Extensible Authentication Protocol (EAP) methods, including EAP-MD5, EAP-TLS, EAP-TTLS, and EAP-PEAP.

Port Security—Access port security features include:

- DHCP snooping—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP-address/MAC-address binding database (called the DHCP snooping database).
- Dynamic ARP inspection (DAI)—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons.
- MAC limiting—Protects against flooding of the Ethernet switching table.
- MAC move limiting—Detects MAC movement and MAC spoofing on access ports.
- Trusted DHCP server—With a DHCP server on a trusted port, protects against rogue DHCP servers sending leases.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. The source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is allowed for further processing if the source IP address to source MAC address binding is valid; if the binding is not valid, the packet is discarded.
- DHCP option 82—Also known as the DHCP relay agent information option. Helps protect the EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- Unrestricted proxy ARP—The switch responds to all ARP messages with its own MAC address. Hosts that are connected to the switch's interfaces cannot communicate

directly with other hosts. Instead, all communications between hosts go through the switch.

- Restricted proxy ARP—The switch does not respond to an ARP request if the physical networks of the source and target of the ARP request are the same. It does not matter whether the destination host has the same IP address as the incoming interface or a different (remote) IP address. An ARP request for a broadcast address elicits no reply.

Device Security—Storm control permits the switch to monitor unknown unicast and broadcast traffic and drop packets, or shut down, or temporarily disable the interface when a specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN. You can enable storm control on access interfaces or trunk interfaces.

Firewall Filters—Allow auditing of various types of security violations, including attempts to access the switch from unauthorized locations. Firewall filters can detect such attempts and create audit log entries when they occur. The filters can also restrict access by limiting traffic to source and destination MAC addresses, specific protocols, or, in combination with policers, to specified data rates to prevent denial of service (DoS) attacks.

Policers—Provide rate-limiting capability to control the amount of traffic that enters an interface, which acts to counter DoS attacks.

Encryption Standards—Supported standards include:

- 128-, 192-, and 256-bit Advanced Encryption Standard (AES)
- 56-bit Data Encryption Standard (DES) and 168-bit 3DES

Understanding Authentication on J-EX Series Switches

You can control access to your network through a J-EX Series Switch using several different authentication methods—802.1X, MAC RADIUS, or captive portal. Authentication prevents unauthorized devices and users from gaining access to your LAN. For 802.1X and MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server. For captive portal authentication, the switch allows the devices to get an IP address, and allows DHCP, DNS and ARP packets.

You can allow end devices to access the network without authentication by including the MAC address of the end device in the static MAC bypass list or, for captive portal, by including the MAC address of the end device in the authentication whitelist.

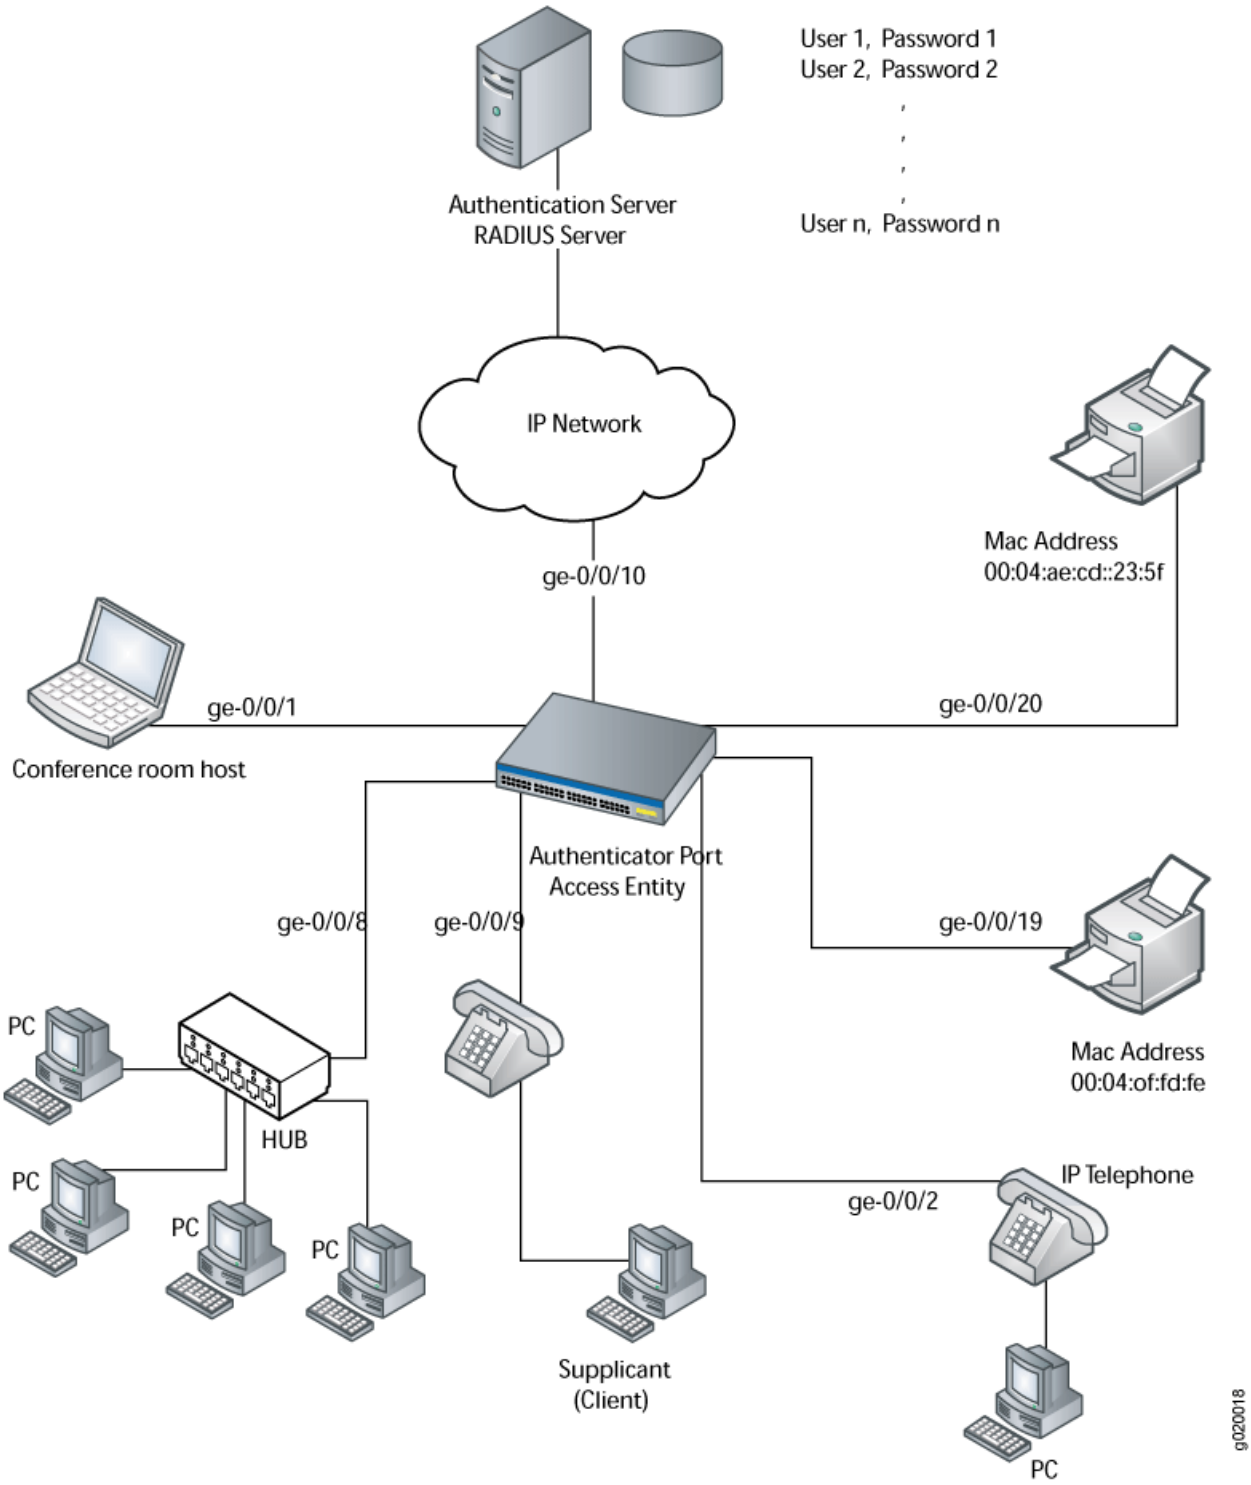
You can configure 802.1X, MAC RADIUS, and captive portal on the same interface and in any combination, except that you cannot configure MAC RADIUS and captive portal on an interface without also configuring 802.1X. If you configure multiple authentication methods on a single interface, the switch falls back to another method if the first method is unsuccessful. For a description of the process flow when multiple authentication methods are configured on an interface, see “Authentication Process Flow for EX Series Switches” on page 2255.

This topic covers:

A Basic Authentication Topology

Figure 45 on page 2249 illustrates a basic deployment topology for authentication on a J-EX Series switch:

Figure 45: Example Authentication Topology



802.1X Authentication

802.1X is an IEEE standard for port-based network access control (PNAC). It provides an authentication mechanism to allow devices to access a LAN. The 802.1X authentication feature on a J-EX Series switch is based upon the IEEE 802.1D standard *Port-Based Network Access Control*.

The communication protocol between the end device and the switch is Extensible Authentication Protocol Over LAN (EAPOL). EAPOL is a version of EAP designed to work with Ethernet networks. The communication protocol between the authentication server and the switch is RADIUS.

During the authentication process, the switch completes multiple message exchanges between the end device and the authentication server. While 802.1X authentication is in process, only 802.1X traffic is allowed. Other traffic, such as DHCP and HTTP, is blocked at the data link layer.

NOTE: You can configure both the maximum number of times an EAPOL request packet is retransmitted and the timeout period between attempts. For information, see "Configuring 802.1X Interface Settings (CLI Procedure)" on page 2331.

An 802.1X authentication configuration for a LAN contains three basic components:

- *Supplicant* (also called end device)—Supplicant is the IEEE term for an end device that requests to join the network. The device can be responsive or nonresponsive. A responsive device is 802.1X-enabled and provides authentication credentials—specifically, a username and password for EAP MD5, or a username and client certificates for EAP-TLS, EAP-TTLS, and EAP-PEAP. A nonresponsive device is not 802.1X-enabled, but can be authenticated through a MAC-based authentication method.
- *Authenticator port access entity*—The IEEE term for the authenticator. The J-EX Series switch is the authenticator, and it controls access by blocking all traffic to and from end devices until they are authenticated.
- *Authentication server*—The authentication server contains the backend database that makes authentication decisions. It contains credential information for each end device that is allowed to connect to the network. The authenticator forwards credentials supplied by the end device to the authentication server. If the credentials forwarded by the authenticator match the credentials in the authentication server database, access is granted. If the credentials forwarded do not match, access is denied. The J-EX Series switches support RADIUS authentication servers.

MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices that are not 802.1X-enabled but that you want to allow to access the LAN.

The EAP method supported for MAC RADIUS authentication on J-EX Series switches is EAP-MD5.

If both 802.1X-enabled end-devices and end devices that are not 802.1X-enabled connect to an interface, you can configure both 802.1X and MAC RADIUS authentication methods on the interface. In this case, the switch will first attempt to authenticate using 802.1X, and if that method fails, it will attempt to authenticate the end device using MAC RADIUS authentication.

If you know that only non-802.1X-enabled end devices will connect on that interface, you can eliminate the delay that occurs while the switch determines that the end device is not non-802.1X-enabled by configuring the **mac-radius restrict** option. When this option is configured, the switch will not attempt to authenticate the end device through 802.1X but instead immediately sends a request to the RADIUS server for authentication of the MAC address of the end device. If the MAC address of an end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device on the interface to which it is connected.

This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface. When you configure **mac-radius restrict** on an interface to eliminate this delay, the switch drops all 802.1X packets.

Captive Portal Authentication

Captive portal authentication (hereafter referred to as captive portal) allows you to authenticate users on J-EX Series switches by redirecting Web browser requests to a login page that requires users to input a username and password before they are allowed access to the network. Captive portal controls network access by requiring users to provide information that is authenticated against a RADIUS server database using EAP-MD5. You can also use captive portal to display an acceptable-use policy to users before they access your network.

Junos OS for J-EX Series switches provides a template that allows you to easily design and modify the look of the captive portal login page. You enable specific interfaces for captive portal. The first time an end device connected to a captive portal interface attempts to access a web page, the switch presents the captive portal login page. Upon successful authentication, the user is allowed access to the network and to continue to the original page requested.

NOTE: If Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) is enabled, Hypertext Transfer Protocol (HTTP) requests are redirected to an HTTPS connection for the captive portal authentication process. After authentication, the end device is returned to the HTTP connection.

If there are end devices that are not HTTP-enabled connected to the captive portal interface, you can allow them to bypass captive portal authentication by adding their MAC address to an authentication whitelist.

When the user is authenticated by the RADIUS server, any per-user policies (attributes) associated with that user are also sent to the switch.

Captive portal on J-EX Series switches has the following limitations:

- The captive portal interface must be configured for **family ethernet-switching** and set to port mode **access**.
- Captive portal does not support dynamic assignment of VLANs downloaded from the RADIUS server.
- If the user is idle for more than about 5 minutes and there is no traffic passed, the user must log back in to the captive portal.

Static MAC Bypass of Authentication

You can allow end devices to access the LAN without authentication on a RADIUS server by including their MAC addresses in the static MAC bypass list (also known as the exclusion list).

You might choose to include a device in the bypass list to:

- Allow non-802.1X-enabled devices access to the LAN.
- Eliminate the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

When you configure static MAC on the switch, the MAC address of the end device is first checked in a local database (a user-configured list of MAC addresses). If a match is found, the end device is successfully authenticated and the interface is opened up for it. No further authentication is done for that end device. If a match is not found and 802.1X authentication is enabled on the switch, the switch attempts to authenticate the end device through the RADIUS server.

For each MAC address, you can also configure the VLAN to which the end device is moved or the interfaces on which the host connects.

Fallback of Authentication Methods

You can configure one or more authentication methods on a single interface and thus enable fallback to the next method if the first or second method fails.

If an interface is configured in multiple supplicant mode, all end devices connecting through the interface must use either captive portal or a combination of 802.1X and MAC RADIUS, captive portal cannot be mixed with 802.1X or MAC RADIUS. Therefore, if there is already an end device on the interface that was authenticated through 802.1X or MAC RADIUS authentication, then additional end devices authenticating do not fall back to captive portal. If only 802.1X authentication or MAC RADIUS authentication is configured, some end devices can be authenticated using 802.1X and others can still be authenticated using MAC RADIUS.

Fallback of authentication methods occurs in the following order:

1. 802.1X authentication—If 802.1X is configured on the interface, the switch sends EAPOL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the switch checks whether MAC RADIUS authentication is configured on the interface.

2. MAC RADIUS authentication—If MAC RADIUS authentication is configured on the interface, the switch sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the switch checks whether captive portal is configured on the interface.
3. Captive portal authentication—If captive portal is configured on the interface, the switch attempts to authenticate using this method after attempting any other configured authentication methods. If an end device is authenticated on the interface using captive portal, this becomes the active authentication method on the interface. When captive portal is the active authentication method, the switch falls back to 802.1X authentication if there are no sessions in the authenticated state and if the interface receives an EAP packet.

802.1X for J-EX Series Switches Overview

IEEE 802.1X provides network edge security, protecting Ethernet LANs from unauthorized user access.

How 802.1X Authentication Works

802.1X authentication works by using an *Authenticator Port Access Entity* (the switch) to block all traffic to and from a supplicant (end device) at the port until the supplicant's credentials are presented and matched on the *Authentication server* (a RADIUS server). When authenticated, the switch stops blocking traffic and opens the port to the supplicant.

The end device is authenticated in either *single* mode, *single-secure* mode, or *multiple* mode:

- **single**—Authenticates only the first end device. All other end devices that connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the end devices’ authentication.
- **single-secure**—Allows only one end device to connect to the port. No other end device is allowed to connect until the first logs out.
- **multiple**—Allows multiple end devices to connect to the port. Each end device will be authenticated individually.

Network access can be further defined using VLANs and firewall filters, which both act as filters to separate and match groups of end devices to the areas of the LAN they require.

802.1X Features Overview

802.1X features on J-EX Series Switches are:

- Guest VLAN—Provides limited access to a LAN, typically just to the Internet, for supplicants that fail 802.1X authentication.
- Server-reject VLAN—Provides limited access to a LAN, typically just to the Internet, for end devices that fail MAC RADIUS authentication.
- Dynamic VLAN—Enables a supplicant, after authentication, to be a member of a VLAN dynamically.
- Private VLAN—Enables configuration of 802.1X authentication on interfaces that are members of private VLANs (PVLANs).
- Dynamic changes to a user session—Allows the switch administrator to terminate an already authenticated session. This feature is based on support of the RADIUS Disconnect Message defined in RFC 3576.
- Support for VoIP—Supports IP telephones. If the phone is 802.1X-enabled, it is authenticated like any other supplicant. If the phone is not 802.1X-enabled, but has another 802.1X-compatible device connected to its data port, that device is authenticated, and then VoIP traffic can flow to and from the phone (providing that the interface is configured in single mode and not in single-secure mode).

  NOTE: Configuring a VoIP VLAN on private VLAN (PVLAN) interfaces is not supported.

- RADIUS accounting—Sends accounting information to the RADIUS accounting server. Accounting information is sent to the server whenever a subscriber logs in or logs out and whenever a subscriber activates or deactivates a subscription.
- Vendor Specific Attributes (VSAs)—Supports the **Juniper-Switching-Filter** attribute on the RADIUS authentication server that can be used further define a supplicant's access during the 802.1X authentication process. Centrally configuring VSAs on the authentication server does away with the need to configure these same attributes in the form of firewall filters on every switch in the LAN to which the supplicant may connect to the LAN. This feature is based on RLI 4583, AAA RADIUS BRAS VSA Support.

Supported Features Related to 802.1X Authentication

802.1X does not replace other security technologies. 802.1X works together with port security features, such as DHCP snooping, dynamic ARP inspection (DAI), and MAC limiting, to guard against spoofing.

Supported features related to authentication include:

- Static MAC bypass—Provides a bypass mechanism to authenticate devices that are not 802.1X-enabled (such as printers). Static MAC bypass connects these devices to 802.1X-enabled ports, bypassing 802.1X authentication.
- MAC RADIUS authentication—Provides a means to enable or disable MAC authentication independently of whether 802.1X authentication is enabled.

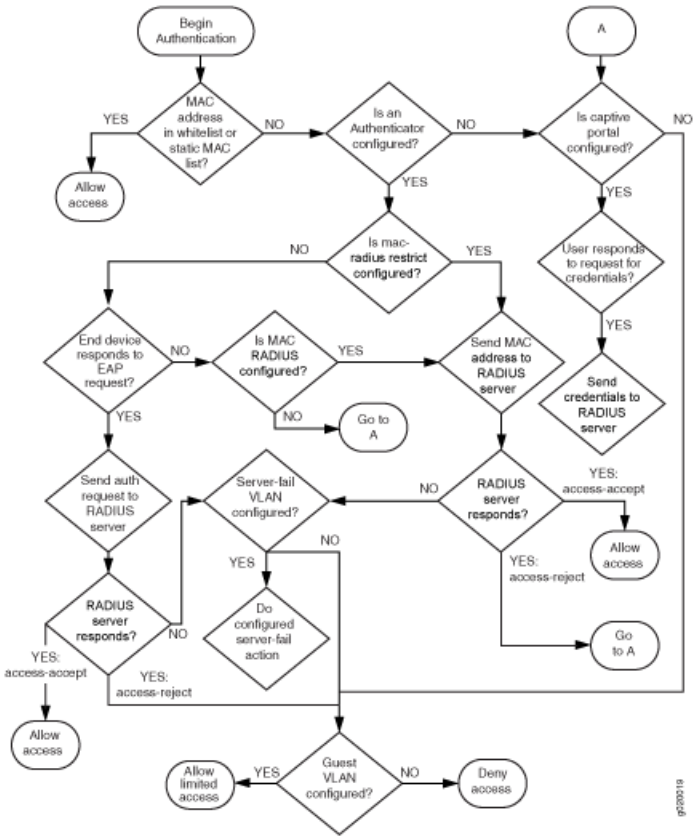
Authentication Process Flow for EX Series Switches

You can control access to your network through a J-EX Series switch by using several different authentication methods—802.1X, MAC RADIUS, or captive portal.

Figure 46 on page 2256 illustrates the authentication process:

Figure 46: Authentication Process Flow for a J-EX Series Switch



The basic authentication process works like this:

1. Authentication is initiated by an end device sending an EAP request or a data packet.
2. If the MAC address of the end device is in the static MAC bypass list or the authentication whitelist, the switch accepts the end device without querying the authentication server and allows the end device to access the LAN.
3. If the MAC address is not in the static MAC bypass list or the authentication whitelist, the switch checks whether an **authenticator** statement is configured on the interface. If an authenticator is not configured, the switch checks for captive portal configuration—skip to Step 6.

   If an authenticator is configured:

   a. The switch checks whether the **mac-radius restrict** statement is configured on the interface. If **mac-radius restrict** is configured, the switch does not attempt 802.1X authentication—skip to Step 5. If it is configured, go on to Step 2.

   b. The switch sends either an EAP request (if the end device initiated contact with a data packet) or an EAP response (if the end device initiated contact with an EAPOL-start message).

   c. If there is no response, the switch tries sending an EAP request two more times.

NOTE: You can configure both the maximum number of times an EAPOL request packet is retransmitted and the timeout period between attempts. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 2331.

d. If the end device does not respond to the EAP messages sent by the switch, the switch checks for MAC RADIUS configuration—skip to Step 4. If it does respond, go on to step 5.

e. When an EAP request is received from the end device, the switch sends an authentication request message to the authentication server.

   If the authentication server does not respond, the switch checks whether there is a server fail VLAN configured. If there is a server fail VLAN, the switch performs the configured server fail fallback operation. If there is no server fail VLAN, skip to Step 6.

f. The authentication server sends an access-accept or access-reject message. If the authentication server sends an access-reject message, skip to Step 8.

4. If the end device does not respond to the EAP messages, the switch checks whether MAC RADIUS authentication is configured on the interface. If it is not configured, skip to Step 6.
5. If MAC RADIUS authentication is configured on the interface:

   a. The switch sends a MAC RADIUS authentication request to the authentication server. The switch sends only one such request.

      If the authentication server does not respond, the switch checks whether there is a server fail VLAN configured on the switch. If there is a server fail VLAN, the switch performs the configured server fail fallback operation. If there is no server fail VLAN, skip to Step 8.

   b. The authentication server sends an access-accept or access-reject message. If the authentication server sends an access-reject message, go on to Step 6.

6. If MAC RADIUS authentication is not configured on the interface or if the authentication server responds with an access-reject message for MAC RADIUS authentication, the switch checks whether captive portal is configured on the interface. If captive portal is not configured on the interface, skip to Step 8.
7. If captive portal authentication is configured on the interface:

   a. The switch sends a request to the user on the end device for captive portal authentication information.

   b. The switch sends the captive portal authentication information to the authentication server.

   c. The authentication server sends an access-accept or access-reject message.

      If the server sends an access-reject message, go on to Step 8.

NOTE: If an end device is authenticated on the interface using captive portal, this becomes the active authentication method on the interface. When captive portal is the active authentication method, the switch falls back to 802.1X authentication if there are no sessions in the authenticated state and if the interface receives an EAP packet.

8. The switch checks whether there is a guest VLAN configured on the switch. If a guest VLAN is configured, the switch allows the end device limited access to the LAN.

Understanding Server Fail Fallback and Authentication on J-EX Series Switches

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends an Extensible Authentication Protocol Over LAN (EAPOL) access-reject message.

J-EX Series Switches use authentication to implement access control in an enterprise network. If 802.1X, MAC RADIUS, or captive portal authentication are configured on the interface, end devices are evaluated at the initial connection by an authentication (RADIUS) server. If the end device is configured on the authentication server, the device is granted access to the LAN and the J-EX Series switch opens the interface to permit access.

A RADIUS server timeout occurs if no RADIUS authentication servers are reachable when a supplicant logs in and attempts to access the LAN. Server fail fallback allows you to specify one of four actions to be taken towards end devices awaiting authentication when the server is timed out:

- *Permit* authentication, allowing traffic to flow from the end device through the interface as if the end device were successfully authenticated by the RADIUS server.
- *Deny* authentication, preventing traffic from flowing from the end device through the interface. This is the default.
- *Move* the end device to a specified VLAN. (The VLAN must already exist on the switch.)
- *Sustain* authenticated end devices that already have LAN access and *deny* unauthenticated end devices. If the RADIUS servers time out during reauthentication, previously authenticated end devices are reauthenticated and new users are denied LAN access.

Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by an end device's first attempt at authentication through the RADIUS server.

Server fail fallback allows you to specify that an end device be moved to a specified VLAN if the switch receives an EAPOL accept-reject message. The configured VLAN name overrides any attributes sent by the server.

Understanding Dynamic VLANs for 802.1X on J-EX Series Switches

Dynamic VLANs, in conjunction with the 802.1X authentication process, provide secure access to the LAN for supplicants belonging to different VLANs on a single port.

When this feature is configured, a supplicant becomes a member of a VLAN dynamically after 802.1X authentication is successful. Successful authentication requires that the VLAN ID or VLAN name exist on the switch and match the VLAN ID or VLAN name sent by the RADIUS server during authentication.

If the VLAN does not exist, the supplicant is unauthenticated. If a guest VLAN is established, the unauthenticated supplicant is automatically moved to the guest VLAN.

- Understanding Guest VLANs for 802.1X on J-EX Series Switches on page 2259

Understanding Guest VLANs for 802.1X on J-EX Series Switches

Guest VLANs, in conjunction with 802.1X authentication, provide secure access to the LAN for corporate guests and for supplicants who fail the 802.1X authentication process.

When a corporate visitor attempts to authenticate on the LAN, and authentication fails, the visitor is moved to a guest VLAN. A guest VLAN typically provides access only to the Internet.

A guest VLAN can also provide limited access to the LAN in cases when authentication fails for supplicants that are not visitors. When authentication fails, the switch receives an Access-Reject message for the client, and checks if a guest VLAN is configured on that port. If so, it moves that user alone to the guest VLAN. If the Access-reject message

contains optional VLAN information, then the user is moved to the VLAN specified by the RADIUS server and not to the locally configured guest-VLAN.

Authentication can fail for many reasons:

- The host device does not have supplicant software on it (for example, the host is not 802.1X-enabled, such as a printer).
- The supplicant provided invalid credentials—a username or password that were not authenticated by the authentication server.

For hosts that are not 802.1X-enabled, the guest VLAN could allow limited access to a server from which the non-802.1X-enabled host can download the supplicant software and attempt authentication again.

Understanding 802.1X and RADIUS Accounting on J-EX Series Switches

J-EX Series Switches support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on a J-EX Series switch permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. In the event that the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between a switch and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The switch forwards an accounting-request packet containing an event record to the accounting server. For example, a supplicant is authenticated through 802.1X authentication and connected to the LAN. The event record associated with this supplicant contains an Acct-Status-Type attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request will contain an Acct-Status-Type attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.

3. The RADIUS accounting server logs these events as start-accounting or stop-accounting records. The records are in a file. On FreeRADIUS, the file name is the server's address; for example, 122.69.1.250.
4. The accounting server sends an accounting-response packet back to the switch confirming it has received the accounting request.
5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches

J-EX Series Switches use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to quickly identify a variety of devices, resulting in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in the Junos OS.

LLDP-MED goes one step further, exchanging IP-telephony messages between the switch and the IP telephone. These TLV messages provide detailed information on PoE policy. The PoE Management TLVs let the switch ports advertise the power level and power priority needed.

The switch also uses these protocols to ensure that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p CoS and 802.1Q tag information can be sent to the IP telephone.

J-EX Series switches support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.

- **System Description**—The system description containing information about the software and current image running on the system. This information is not configurable, but taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports; for example, bridge or router. This information is not configurable, but based on the model of the product.
- **Management Address**—The IP management address of the local system.

J-EX Series switches support the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises MDI power support, PSE power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is not configurable, but based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises if the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

J-EX Series switches support the following LLDP-MED TLVs:

- **LLDP MED Capabilities**—A TLV that advertises the primary function of the port. The capabilities values range 0 through 15:
  - **0**—Capabilities
  - **1**—Network Policy
  - **2**—Location Identification
  - **3**—Extended Power via MDI-PSE
  - **4**—Inventory
  - **5–15**—Reserved
- LLDP-MED Device Class Values:
  - **0**—Class not defined.
  - **1**—Class 1 Device.
  - **2**—Class 2 Device.
  - **3**—Class 3 Device.
  - **4**—Network Connectivity Device
  - **5–255**—Reserved.

- **Network Policy**—A TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.
- **Endpoint Location**—A TLV that advertises the physical location of the endpoint.
- **Extended Power via MDI**—A TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

Understanding 802.1X and VoIP on J-EX Series Switches

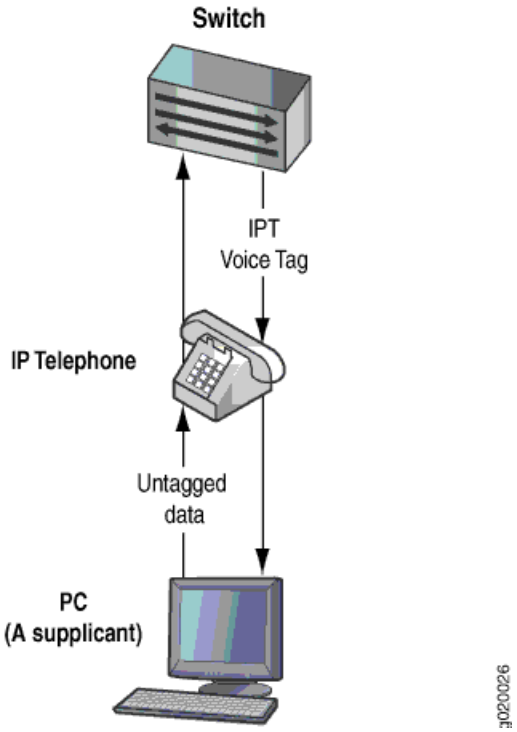
When you use Voice over IP (VoIP), you can connect IP telephones to the switch and configure IEEE 802.1X authentication for 802.1X-compatible IP telephones. The 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access.

VoIP is a protocol used for the transmission of voice through packet-switched networks. VoIP transmits voice calls using a network connection instead of an analog phone line.

When VoIP is used with 802.1X, the RADIUS server authenticates the phone, and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) provides the class-of-service (CoS) parameters to the phone.

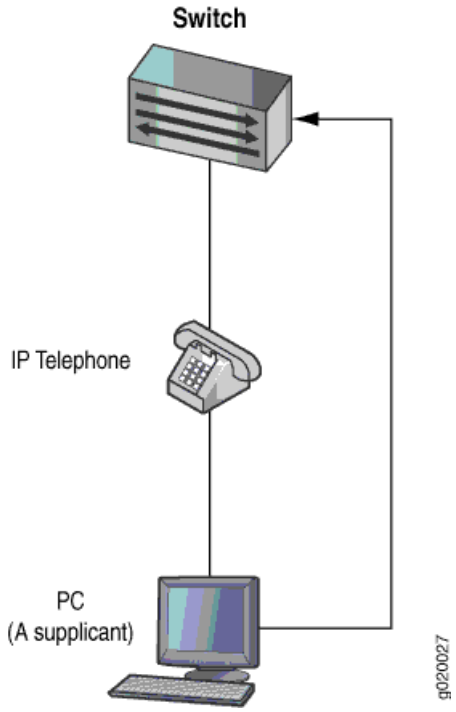
You can configure 802.1X authentication to work with VoIP in multiple supplicant or single supplicant mode. In *multiple-supplicant* mode, the 802.1X process allows multiple supplicants to connect to the interface. Each supplicant will be authenticated individually. For an example of a VoIP multiple supplicant topology, see Figure 47 on page 2264.

Figure 47: VoIP Multiple Supplicant Topology



If an 802.1X-compatible IP telephone does not have an 802.1X host but has another 802.1X-compatible device connected to its data port, you can connect the phone to an interface in single-supplicant mode. In *single-supplicant* mode, the 802.1X process authenticates only the first supplicant. All other supplicants who connect later to the interface are allowed full access without any further authentication. They effectively "piggyback" on the first supplicant's authentication. For an example of a VoIP single supplicant topology, see Figure 48 on page 2265 .

Figure 48: VoIP Single Supplicant Topology



If an IP telephone does not support 802.1X, you can configure VoIP to bypass 802.1X and LLDP-MED and have the packets forwarded to a VoIP VLAN,

Understanding 802.1X and VSAs on J-EX Series Switches

J-EX Series Switches support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS). Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are clear text fields sent from the RADIUS server to the switch as a result of the 802.1X authentication success or failure. The 802.1X authentication prevents unauthorized user access by blocking a supplicant at the port until the supplicant is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with 802.1X authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the 802.1X authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches. For more information, see “Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch” on page 2296.

VSAs are only supported for 802.1X single-supplicant configurations and multiple-supplicant configurations.

CHAPTER 82

Examples: Access Control Configuration

Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch

802.1X is the IEEE standard for Port-Based Network Access Control (PNAC). You use 802.1X to control network access. Only users and devices providing credentials that have been verified against a user database are allowed access to the network. You can use a RADIUS server as the user database for 802.1X authentication, as well as for MAC RADIUS authentication.

This example describes how to connect a RADIUS server to a J-EX Series switch, and configure it for 802.1X:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Configured users on the RADIUS authentication server.

Overview and Topology

The J-EX Series switch acts as an authenticator Port Access Entity (PAE). It blocks all traffic and acts as a control gate until the supplicant (client) is authenticated by the server. All other users and devices are denied access.

Figure 49 on page 2269 shows one J-EX4200 switch that is connected to the devices listed in Table 288 on page 2270.

Figure 49: Topology for Configuration

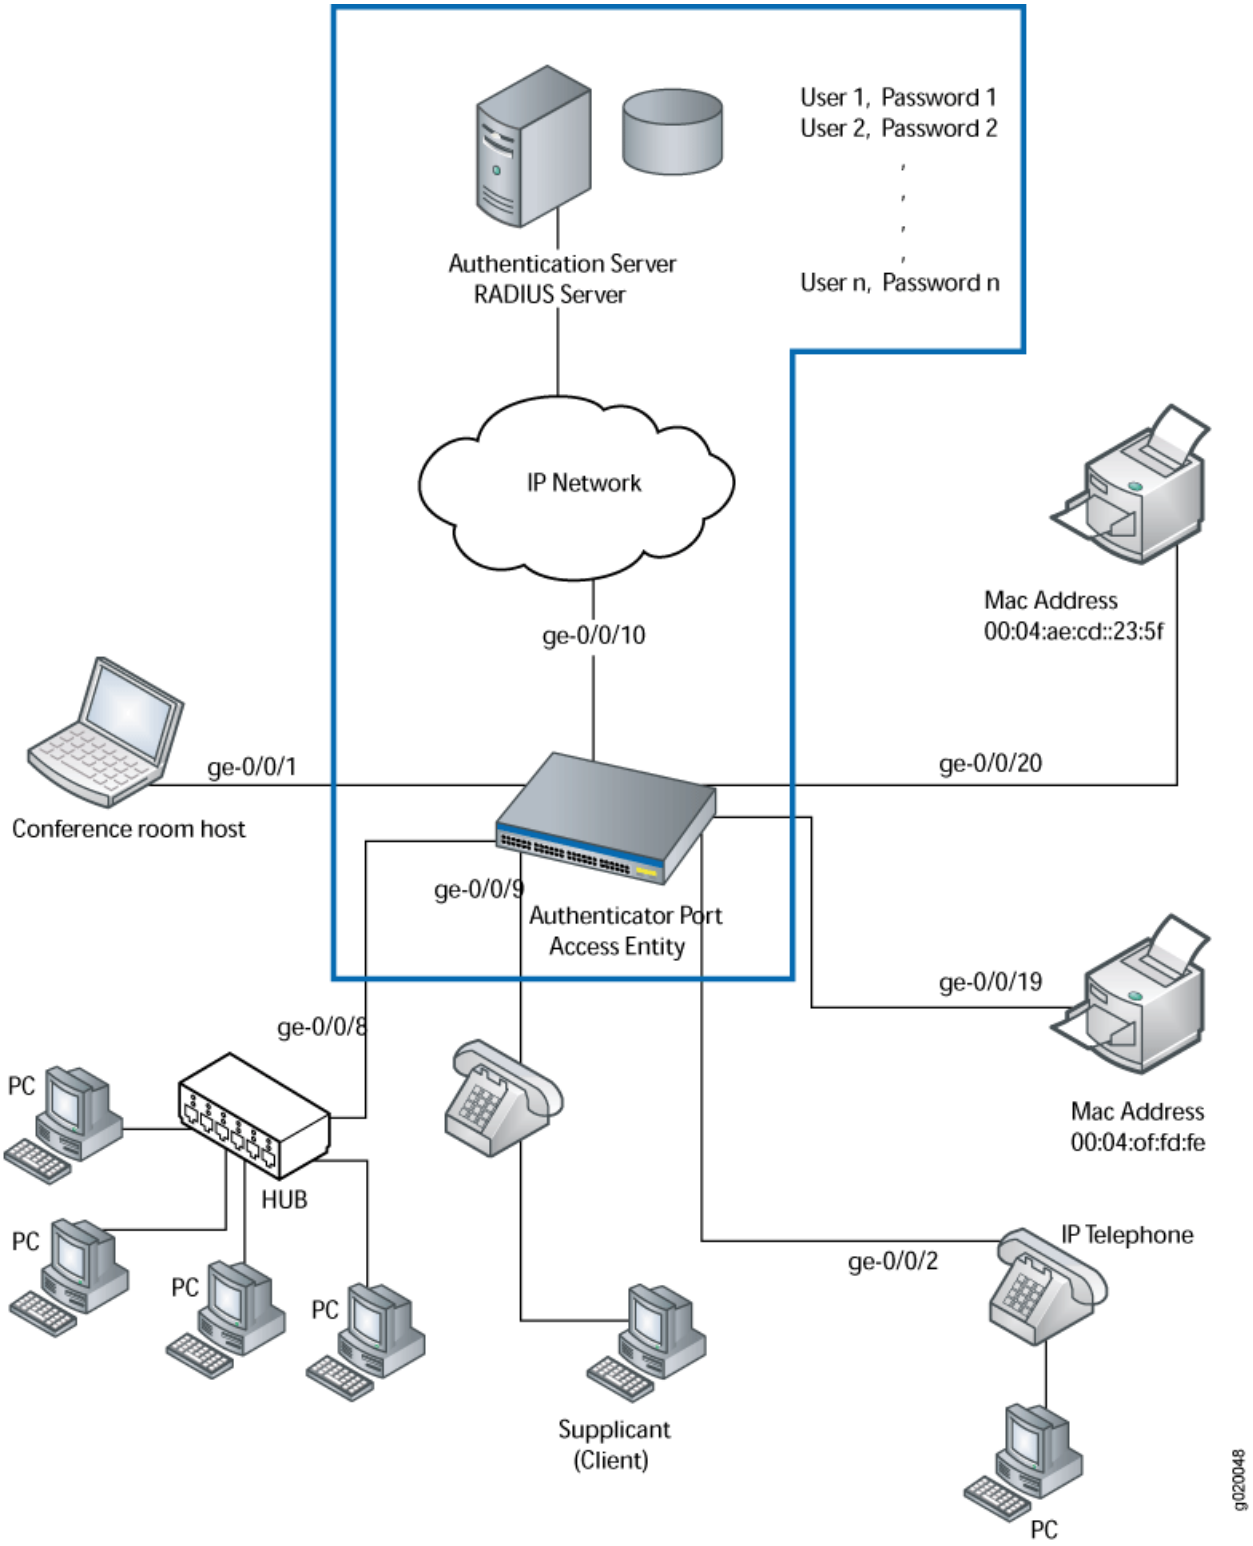

Table 288: Components of the Topology

Property	Settings
Switch hardware	J-EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE ports (**ge-0/0/8** through **ge-0/0/23**)
VLAN name	**default**
One RADIUS server	Backend database with an address of **10.0.0.100** connected to the switch at port **ge-0/0/10**

In this example, connect the RADIUS server to access port **ge-0/0/10** on the J-EX4200 switch. The switch acts as the authenticator and forwards credentials from the supplicant to the user database on the RADIUS server. You must configure connectivity between the J-EX4200 and the RADIUS server by specifying the address of the server and configuring the secret password. This information is configured in an access profile on the switch.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, please see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Configuration

CLI Quick Configuration

To quickly connect the RADIUS server to the switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set access radius-server 10.0.0.100 secret juniper
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server 10.0.0.100 10.2.14.200
```

Step-by-Step Procedure

To connect the RADIUS server to the switch:

1. Define the address of the server, and configure the secret password. The secret password on the switch must match the secret password on the server:

   ```
   [edit access]
   user@switch# set radius-server 10.0.0.100 secret juniper
   ```

2. Configure the authentication order, making **radius** the first method of authentication:

   ```
   [edit access profile]
   user@switch# set profile1 authentication-order radius
   ```

3. Configure a list of server IP addresses to be tried in order to authenticate the supplicant:

   ```
   [edit access profile]
   user@switch# set profile1 radius authentication-server 10.0.0.100 10.2.14.200
   ```

Results

Display the results of the configuration:

```
user@switch> show configuration access
```

```
radius-server {
  10.0.0.100
    port 1812;
    secret "$9$qPT3ApBSrv69rvWLVb.P5"; ## SECRET-DATA
    }
  }
  profile profile1{
    authentication-order radius;
    radius {
      authentication-server 10.0.0.100 10.2.14.200;
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verify That the Switch and RADIUS Server are Properly Connected on page 2271

Verify That the Switch and RADIUS Server are Properly Connected

Purpose Verify that the RADIUS server is connected to the switch on the specified port.

Action Ping the RADIUS server to verify the connection between the switch and the server:

```
user@switch> ping 10.0.0.100
PING 10.0.0.100 (10.0.0.100): 56 data bytes
64 bytes from 10.93.15.218: icmp_seq=0 ttl=64 time=9.734 ms
64 bytes from 10.93.15.218: icmp_seq=1 ttl=64 time=0.228 ms
```

Meaning ICMP echo request packets are sent from the switch to the target server at 10.0.0.100 to test whether it is reachable across the IP network. ICMP echo responses are being returned from the server, verifying that the switch and the server are connected.

Related Documentation

- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 2290

- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 2340

Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to a J-EX Series Switch

Server fail fallback allows you to specify how 802.1X supplicants connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends an EAP Access-Reject message.

You use 802.1X to control network access. Only users and devices (supplicants) providing credentials that have been verified against a user database are allowed access to the network. You use a RADIUS server as the user database.

This example describes how to configure an interface to move a supplicant to a VLAN in the event of a RADIUS server timeout:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.
- Disable firewall filters on the interface. Firewall filters interfere with server fail fallback operation.
- Configured users on the authentication server.

Overview and Topology

A RADIUS server timeout occurs if no authentication RADIUS servers are reachable when a supplicant logs in and attempts to access the LAN. Using server fail fallback, configure alternative options for supplicants attempting LAN access. You can configure the switch to accept or deny access to supplicants or to maintain the access already granted towards supplicants before the RADIUS server timeout. Additionally, you can configure the switch to move supplicants to a specific VLAN if a RADIUS timeout occurs or if the RADIUS server sends an EAP Access-Reject message. Figure 50 on page 2273 shows the topology used for this example. The RADIUS server is connected to the J-EX4200 switch on access port **ge-0/0/10**. The switch acts as the authenticator Port Access Entity (PAE) and forwards credentials from the supplicant to the user database on the RADIUS server. The switch blocks all traffic and acts as a control gate until the supplicant is authenticated by the authentication server. A supplicant is connected to the switch through interface **ge-0/0/1**.

Figure 50: Topology for Configuration

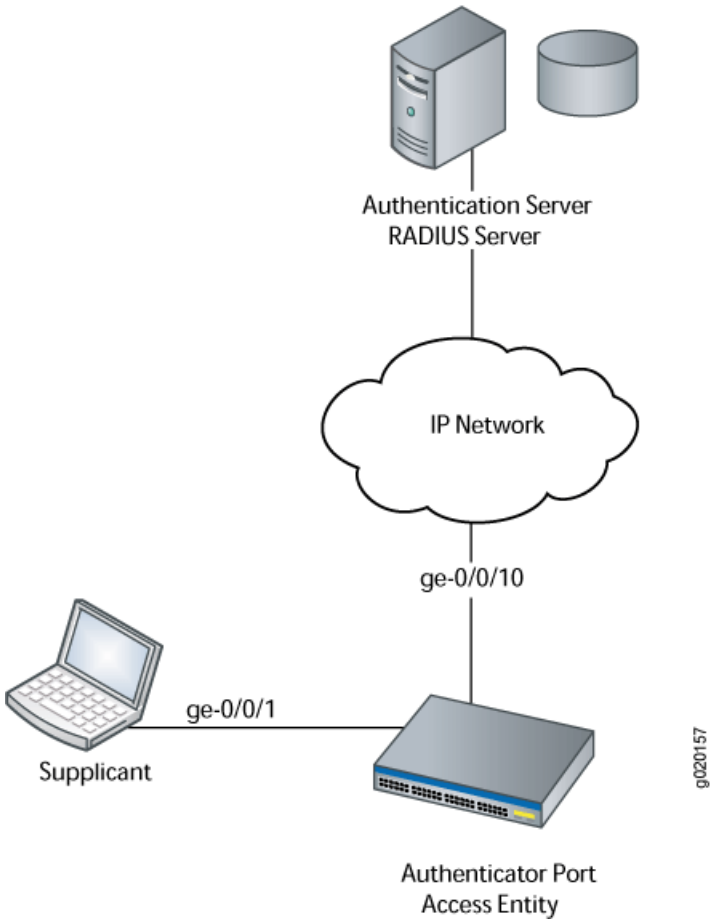

Table 289 on page 2273 describes the components in this topology.

Table 289: Components of the Topology

Property	Settings
Switch hardware	J-EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports.
VLAN names	**default** VLAN **vlan-sf** VLAN
Supplicant	Supplicant attempting access on interface **ge-0/0/1**
One RADIUS server	Backend database with an address of **10.0.0.100** connected to the switch at port **ge-0/0/10**

In this example, configure interface **ge-0/0/1** to move a supplicant attempting access to the LAN during a RADIUS timeout to another VLAN. A RADIUS timeout prevents the normal exchange of EAP messages that carry information from the RADIUS server to the switch and permit the authentication of a supplicant. The **default** VLAN is configured on

interface **ge-0/0/1**. When a RADIUS timeout occurs, supplicants on the interface will be moved from the **default** VLAN to the VLAN named **vlan-sf**.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Configuration

To configure server fail fallback on the switch:

CLI Quick Configuration

To quickly configure server fail fallback on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit protocols dot1x authenticator]
set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

Step-by-Step Procedure

To configure an interface to divert supplicants to a specific VLAN when a RADIUS timeout occurs (here, the VLAN is **vlan-sf**):

1. Define the VLAN to which supplicants are diverted:

```
[edit protocols dot1x authenticator]
user@switch# set interface server-fail vlan-name vlan-sf
```

Results

Display the results of the configuration:

```
user@switch> show configuration
  interfaces {
    ge-0/0/1 {
      unit 0 {
        family ethernet-switching {
          vlan {
            members default;
          }
        }
      }
    }
  protocols {
    dot1x {
      authenticator {
        authentication-profile-name profile52;
        interface {
          ge-0/0/1.0 {
            server-fail vlan-name vlan-sf;
          }
        }
      }
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout on page 2275

Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout

Purpose Verify that the interface moves supplicants to an alternative VLAN during a RADIUS timeout.

Action Display the VLANs configured on the switch; the interface **ge-0/0/1.0** is a member of the **default** VLAN:

```
user@switch> show vlans
Name            Tag     Interfaces
default
                        ge-0/0/0.0, ge-0/0/1.0*, ge-0/0/5.0*, ge-0/0/10.0,
                        ge-0/0/12.0*, ge-0/0/14.0*, ge-0/0/15.0, ge-0/0/20.0
v2              77
                        None
vlan-sf         50
                        None
mgmt
                        me0.0*
```

Display 802.1X protocol information on the switch to view supplicants that are authenticated on interface **ge-0/0/1.0**:

```
user@switch> show dot1x interface brief
802.1X Information:
Interface     Role           State           MAC address          User
ge-0/0/1.0    Authenticator  Authenticated   00:00:00:00:00:01    abc
ge-0/0/10.0   Authenticator  Initialize
ge-0/0/14.0   Authenticator  Connecting
ge-0/0/15.0   Authenticator  Initialize
ge-0/0/20.0   Authenticator  Initialize
```

A RADIUS server timeout occurs. Display the Ethernet switching table to show that the supplicant with the MAC address **00:00:00:00:00:01** previously accessing the LAN through the **default** VLAN is now being learned on the VLAN named **vlan-sf**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 1 learned
  VLAN              MAC address       Type         Age Interfaces
  v1                *                 Flood          - All-members
  vlan-sf           00:00:00:00:00:01 Learn       1:07 ge-0/0/1.0
  default           *                 Flood          - All-members
```

Display 802.1X protocol information to show that interface **ge-0/0/1.0** is connecting and will open LAN access to supplicants:

```
user@switch> show dot1x interface brief
```

```
802.1X Information:
Interface     Role           State          MAC address          User
ge-0/0/1.0    Authenticator  Connecting
ge-0/0/10.0   Authenticator  Initialize
ge-0/0/14.0   Authenticator  Connecting
ge-0/0/15.0   Authenticator  Initialize
ge-0/0/20.0   Authenticator  Initialize
```

Meaning The command **show vlans** displays interface **ge-0/0/1.0** as a member of the **default** VLAN. The command **show dot1x interface brief** shows that a supplicant (**abc**) is authenticated on interface **ge-0/0/1.0** and has the MAC address **00:00:00:00:00:01**. A RADIUS server timeout occurs, and the authentication server cannot be reached by the switch. The command **show-ethernet-switching table** shows that MAC address **00:00:00:00:00:01** is learned on VLAN **vlan-sf**. The supplicant has been moved from the **default** VLAN to the **vlan-sf** VLAN. The supplicant is then connected to the LAN through the VLAN named **vlan-sf**.

Related Documentation

- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 2290
- Configuring Server Fail Fallback (CLI Procedure) on page 2337

Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on a J-EX Series Switch

802.1X on J-EX Series switches provides LAN access to users who do not have credentials in the RADIUS database. These users, referred to as guests, are authenticated and typically provided with access to the Internet.

This example describes how to create a guest VLAN and configure 802.1X authentication for it.

- Requirements on page 2276
- Overview and Topology on page 2277
- Configuration of a Guest VLAN That Includes 802.1X Authentication on page 2279
- Verification on page 2280

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator interface access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure guest VLAN authentication, be sure you have:

- Installed your J-EX Series switch. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial switch configuration. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.

Overview and Topology

As part of IEEE 802.1X Port-Based Network Access Control (PNAC), you can provide limited network access to supplicants who do not belong to a VLAN authentication group by configuring authentication to a guest VLAN. Typically, guest VLAN access is used to provide Internet access to visitors to a corporate site. However, you can also use the guest VLAN feature to provide supplicants that fail 802.1X authentication to a corporate LAN with access to a VLAN with limited resources.

Figure 51 on page 2278 shows the conference room connected to the switch at interface **ge-0/0/1**.

Figure 51: Topology for Guest VLAN Example

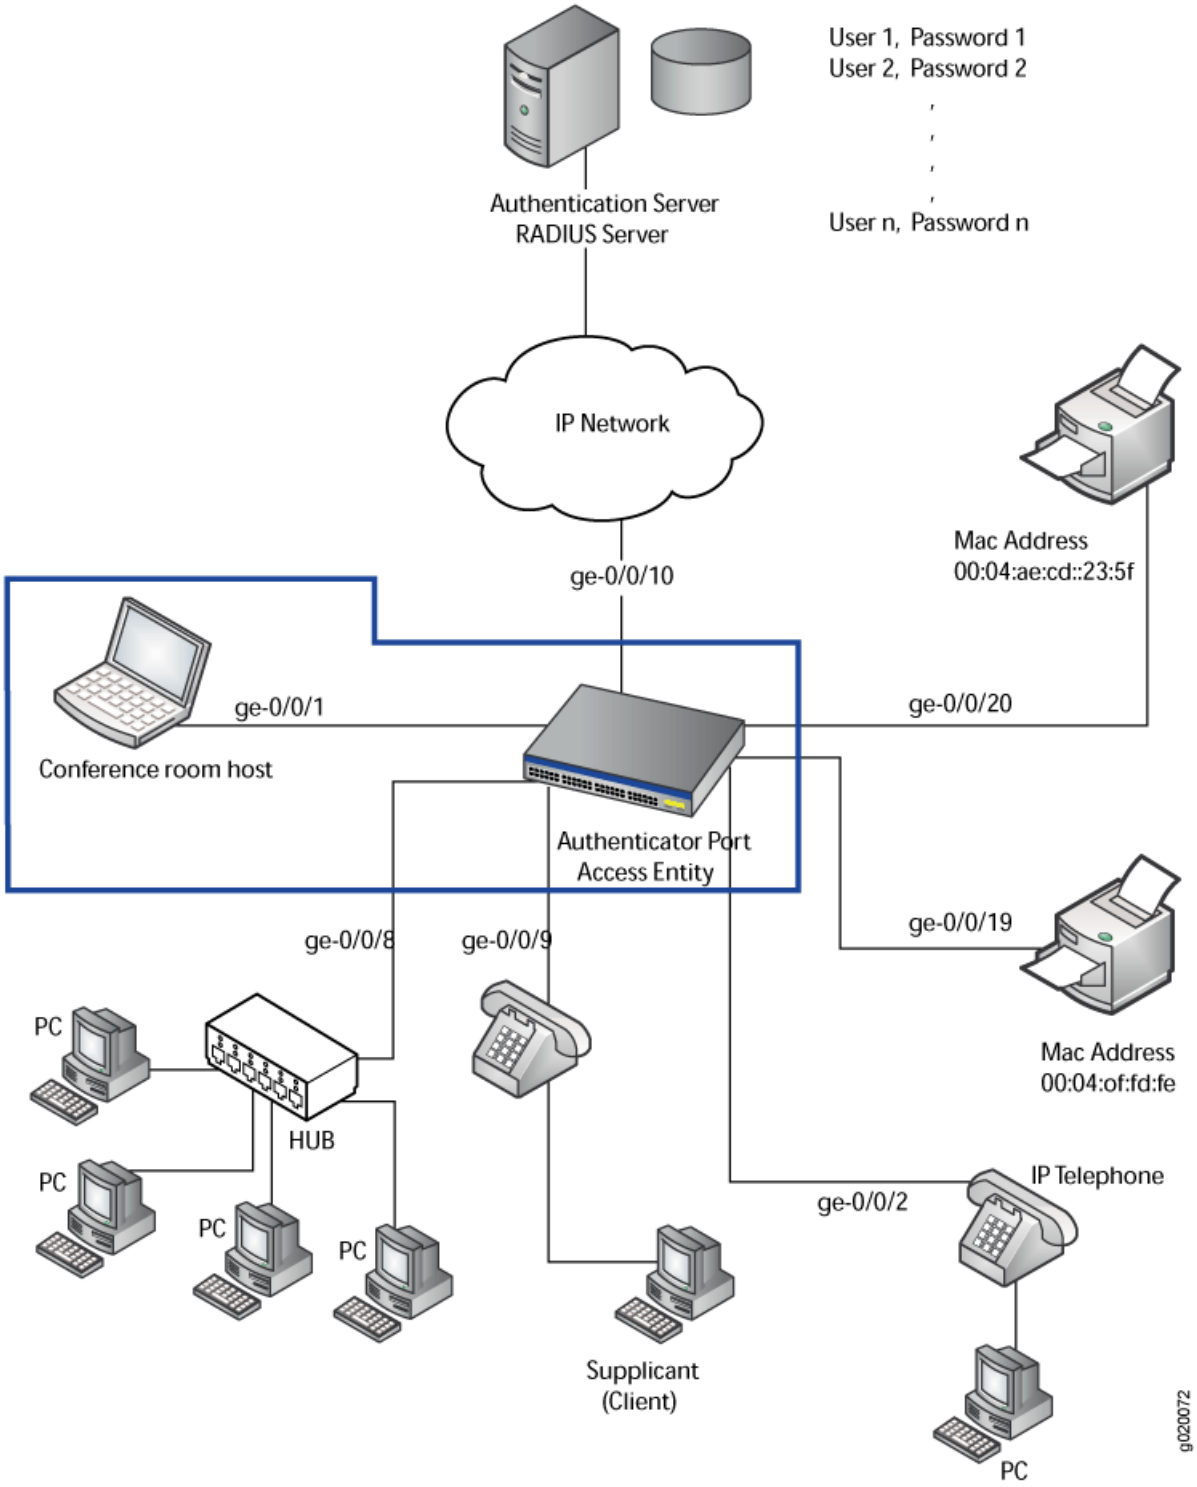

Table 290: Components of the Guest VLAN Topology

Property	Settings
Switch hardware	J-EX4200 switch, 24 Gigabit Ethernet interfaces: 8 PoE interfaces (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE interfaces (**ge-0/0/8** through **ge-0/0/23**)
VLAN names and tag IDs	**sales**, tag **100** **support**, tag **200** **guest-vlan**, tag **300**
One RADIUS server	Backend database connected to the switch through interface **ge-0/0/10**

In this example, access interface **ge-0/0/1** provides LAN connectivity in the conference room. Configure this access interface to provide LAN connectivity to visitors in the conference room who are not authenticated by the corporate VLAN.

Configuration of a Guest VLAN That Includes 802.1X Authentication

To create a guest VLAN and configure 802.1X authentication, perform these tasks:

CLI Quick Configuration

To quickly configure a guest VLAN, with 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans guest-vlan vlan-id 300
set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

Step-by-Step Procedure

To configure a guest VLAN that includes 802.1X authentication on a J-EX Series switch:

1. Configure the VLAN ID for the guest VLAN:

   ```
   [edit]

   user@switch# set vlans guest-vlan vlan-id 300
   ```

2. Configure the guest VLAN under **dot1x** protocols:

   ```
   [edit]

   user@switch# set protocols dot1x authenticator interface all guest-vlan guest-vlan
   ```

Results

Check the results of the configuration:

```
user@switch> show configuration
protocols {
    dot1x {
        authenticator {
            interface {
                all {
                    guest-vlan {
                        guest-vlan;
                    }
                }
            }
        }
    }
```

```
}
vlans {
  guest-vlan {
    vlan-id 300;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Guest VLAN is Configured on page 2280

Verifying That the Guest VLAN is Configured

Purpose Verify that the guest VLAN is created and that an interface has failed authentication and been moved to the guest VLAN.

Action Use the operational mode commands:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/3.0*
dynamic         40
                        None
guest           30
                        None
guest-vlan      300
                        ge-0/0/1.0*
vlan_dyn
                        None
```

```
user@switch> show dot1x interface ge-0/0/1.0 detail
ge-0/0/1.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: guest-vlan
  Number of connected supplicants: 1
    Supplicant: user1, 00:00:00:00:13:23
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
```

```
Session Reauth interval: 60 seconds
Reauthentication due in 50 seconds
```

Meaning The output from the **show vlans** command shows **guest-vlan** as the the name of the VLAN and the VLAN ID as **300**.

The output from the **show dot1x interface ge-0/0/1.0 detail** command displays the **Guest VLAN membership** field, indicating that a supplicant at this interface failed 802.1X authentication and was passed through to the **guest-vlan**.

Example: Configuring Static MAC Bypass of Authentication on a J-EX Series Switch

To allow devices to access your LAN through 802.1X-configured interfaces without authentication, you can configure a static MAC bypass list on the J-EX Series switch. The static MAC bypass list, also known as the exclusion list, specifies MAC addresses that are allowed on the switch without a request to an authentication server.

You can use static MAC bypass of authentication to allow connection for devices that are not 802.1X-enabled, such as printers. If a host's MAC address is compared and matched against the static MAC address list, the nonresponsive host is authenticated and an interface opened for it.

This example describes how to configure static MAC bypass of authentication for two printers:

- Requirements on page 2281
- Overview and Topology on page 2282
- Configuration on page 2284
- Verification on page 2285

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

Before you configure static MAC authentication, be sure you have:

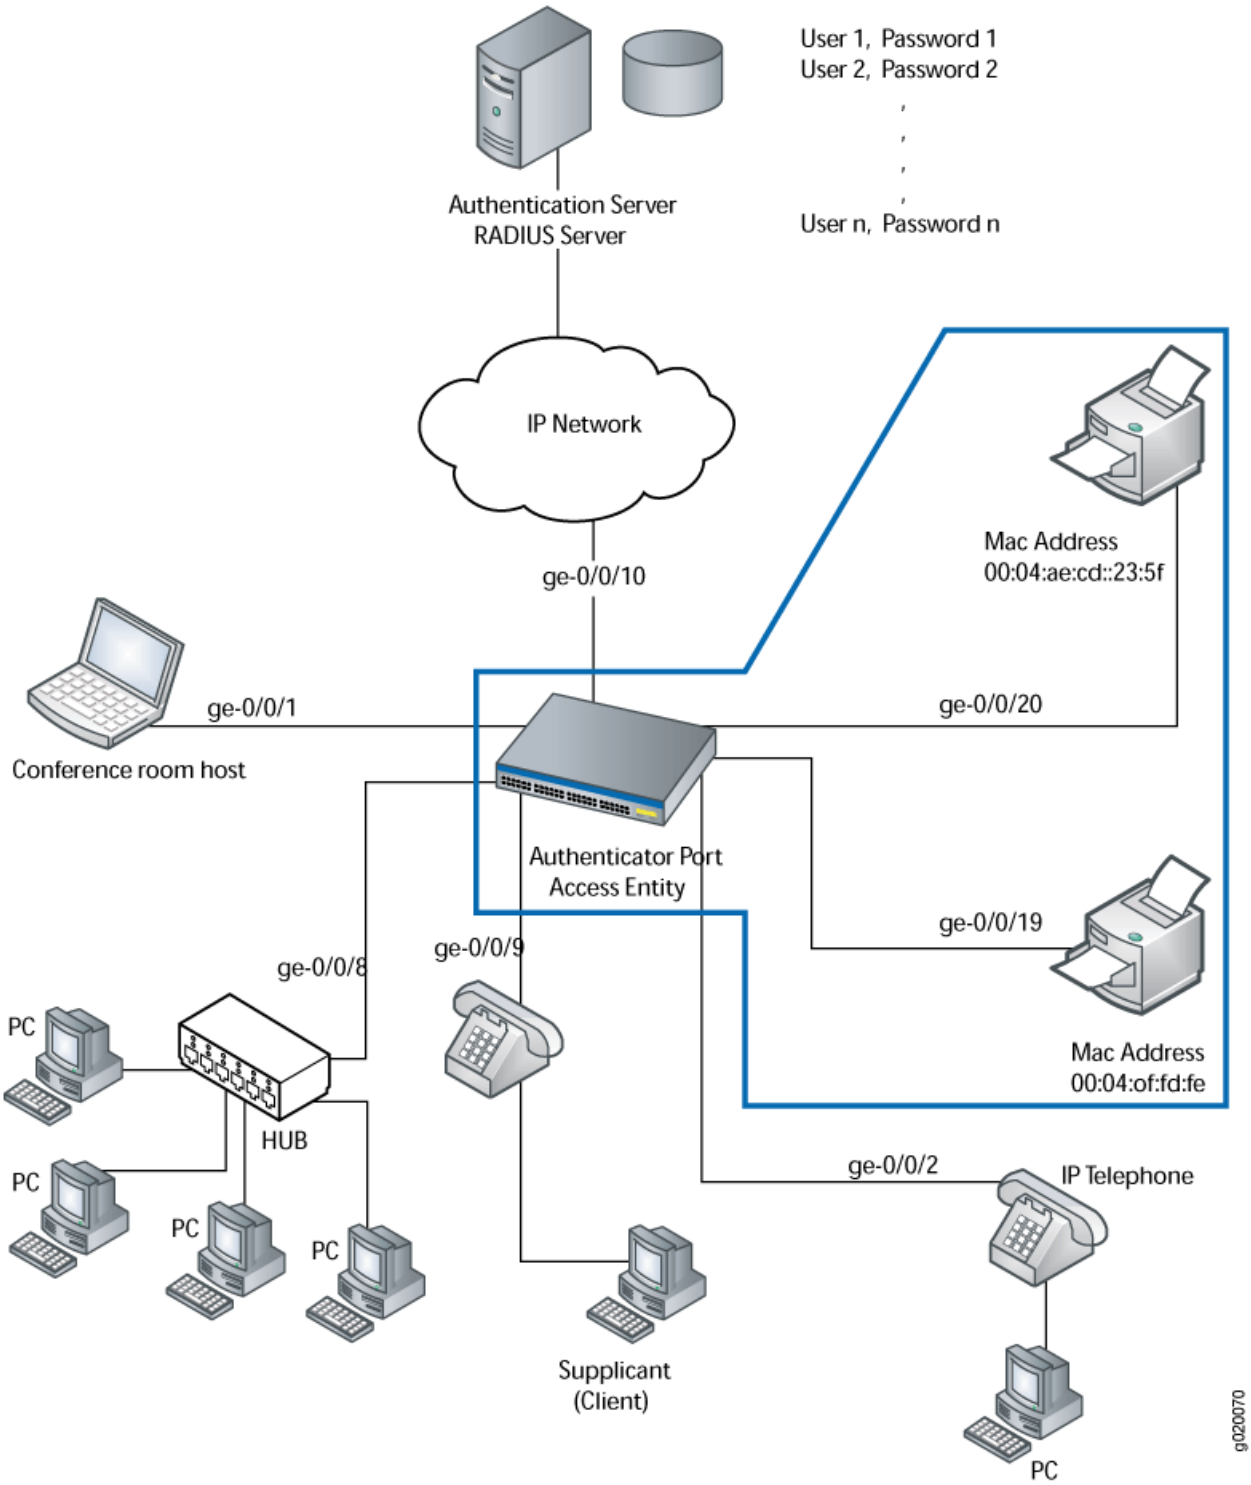
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.

Overview and Topology

To permit printers access to the LAN, add them to the static MAC bypass list. The MAC addresses on this list are permitted access without authentication from the RADIUS server.

Figure 52 on page 2283 shows the two printers connected to the J-EX4200.

Figure 52: Topology for Static MAC Authentication Configuration



The interfaces shown in Table 291 on page 2284 will be configured for static MAC authentication.

Table 291: Components of the Static MAC Authentication Configuration Topology

Property	Settings
Switch hardware	J-EX4200, 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/23**)
VLAN name	**default**
Connections to integrated printer/fax/copier machines (no PoE required)	**ge-0/0/19**, MAC address 00:04:0f:fd:ac:fe **ge-0/0/20**, MAC address 00:04:ae:cd:23:5f

The printer with the MAC address 00:04:0f:fd:ac:fe is connected to access interface **ge-0/0/19**. A second printer with the MAC address 00:04:ae:cd:23:5f is connected to access interface **ge-0/0/20**. Both printers will be added to the static list and bypass 802.1X authentication.

Configuration

To configure static MAC authentication, perform these tasks:

CLI Quick Configuration

To quickly configure static MAC authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator authenticaton-profile-name profile1
set protocols dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
set protocols dot1x interface all supplicant multiple
```

Step-by-Step Procedure

Configure static MAC authentication:

1. Configure the authentication profile name (access profile name) to use for authentication:

   ```
   [edit protocols]
   user@switch# set dot1x authenticator authentication-profile-name profile1
   ```

2. Configure MAC addresses **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f** as static MAC addresses:

   ```
   [edit protocols]
   user@switch# set dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
   ```

3. Configure the 802.1X authentication method:

   ```
   [edit protocols]
   user@switch# set dot1x interface all supplicant multiple
   ```

Results

Display the results of the configuration:

```
user@switch> show
interfaces {
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        vlan members default;
      }
    }
```

```
    }
    ge-0/0/20 {
      unit 0 {
        family ethernet-switching {
          vlan members default;
        }
      }
    }
  }
  protocols {
    dot1x {
      authenticator {
        authentication-profile-name profile1
        static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f];
        interface {
          all {
            supplicant multiple;
          }
        }
      }
    }
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying Static MAC Bypass of Authentication on page 2285

Verifying Static MAC Bypass of Authentication

Purpose Verify that the MAC address for both printers is configured and associated with the correct interfaces.

Action Use the operational mode command:

```
user@switch> show dot1x static-mac-address

MAC address           VLAN-Assignment          Interface
00:04:0f:fd:ac:fe     default                  ge-0/0/19.0
00:04:ae:cd:23:5f     default                  ge-0/0/20.0
```

Meaning The output field **MAC address** shows the MAC addresses of the two printers.

The output field **Interface** shows that the MAC address **00:04:0f:fd:ac:fe** can connect to the LAN through interface **ge-0/0/19.0** and that the MAC address **00:04:ae:cd:23:5f** can connect to the LAN through interface **ge-0/0/20.0**.

- Configuring 802.1X Authentication (J-Web Procedure) on page 2332
- Configuring Static MAC Bypass of Authentication (CLI Procedure) on page 2334
- Configuring 802.1X Interface Settings (CLI Procedure) on page 2331
- Understanding MAC RADIUS Authentication on J-EX Series Switches

Example: Configuring MAC RADIUS Authentication on a J-EX Series Switch

To permit hosts that are not 802.1X-enabled to access the LAN, you can configure MAC RADIUS authentication on the switch interfaces to which the non-802.1X-enabled hosts are connected. When MAC RADIUS authentication is configured, the switch will attempt to authenticate the host with the RADIUS server using the host's MAC address.

This example describes how to configure MAC RADIUS authentication for two non-802.1X-enabled hosts:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the J-EX Series switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch" on page 2267.
- Performed basic bridging and VLAN configuration on the switch. See "Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch" on page 1063.
- Performed basic 802.1X configuration. See "Configuring 802.1X Interface Settings (CLI Procedure)" on page 2331.

Overview and Topology

IEEE 802.1X Port-Based Network Access Control (PNAC) authenticates and permits devices access to a LAN if the devices can communicate with the switch using the 802.1X protocol (are 802.1X-enabled). To permit non-802.1X-enabled hosts to access the LAN, you can configure MAC RADIUS authentication on the interfaces to which the hosts are connected. When the MAC address of the non-802.1X-enabled host appears on the interface, the switch consults the RADIUS server to check whether it is a permitted MAC address. If the MAC address of the host is configured as permitted on the RADIUS server, the switch opens LAN access to the nonresponsive host.

You can configure both MAC RADIUS authentication and 802.1X authentication methods on a single interface configured for multiple supplicants. Additionally, if an interface is

only connected to a non-802.1X-enabled host, you can enable MAC RADIUS and not enable 802.1X authentication using the **mac-radius restrict** option, and thus avoid the delay that occurs while the switch determines that the device is does not respond to EAP messages.

Figure 53 on page 2287 shows the two printers connected to the switch.

Figure 53: Topology for MAC RADIUS Authentication Configuration

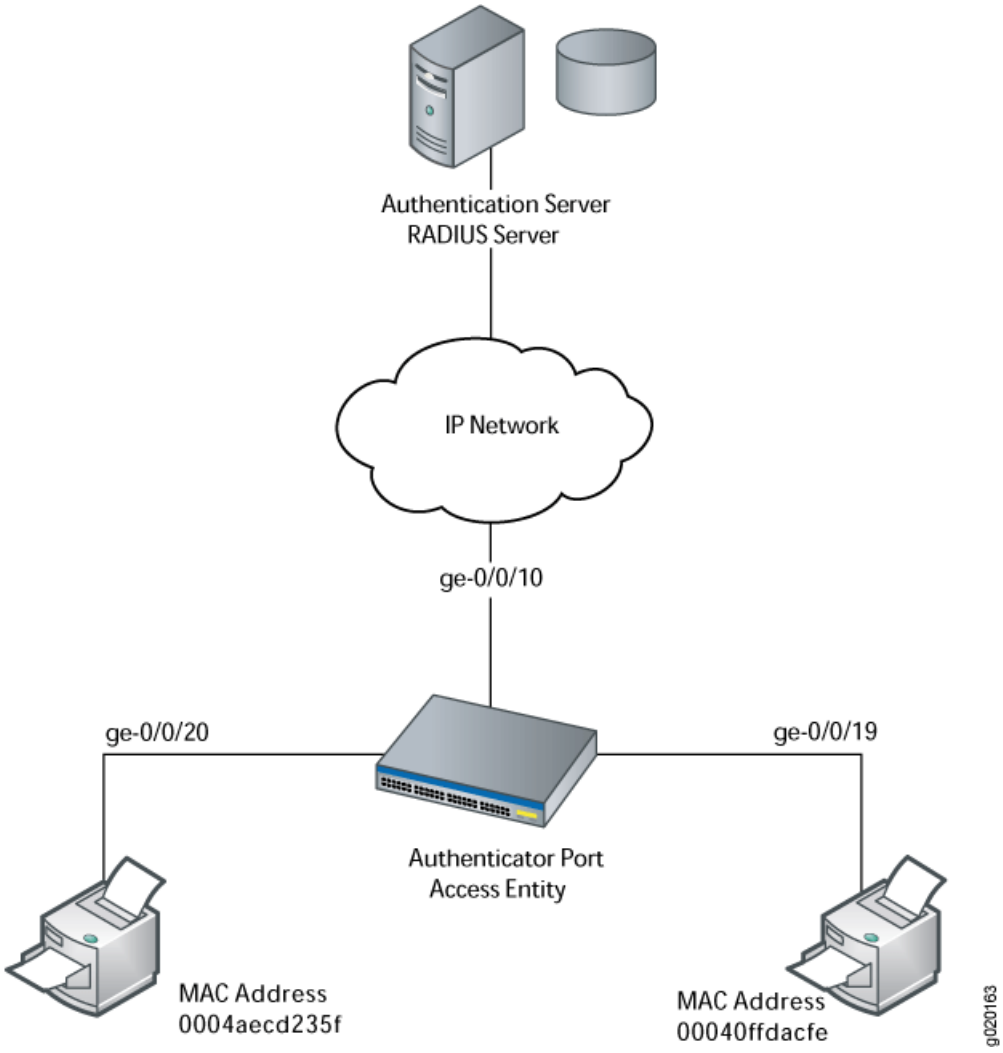

Table 292 on page 2287 shows the components in the example for MAC RADIUS authentication.

Table 292: Components of the MAC RADIUS Authentication Configuration Topology

Property	Settings
Switch hardware	J-EX4200 ports (**ge-0/0/0** through **ge-0/0/23**)
VLAN name	**default**

Table 292: Components of the MAC RADIUS Authentication Configuration Topology *(continued)*

Property	Settings
Connections to printers (no PoE required)	**ge-0/0/19**, MAC address 00040ffdacfe **ge-0/0/20**, MAC address 0004aecd235f
RADIUS server	Connected to the switch on interface **ge-0/0/10**

The printer with the MAC address 00040ffdacfe is connected to access interface **ge-0/0/19**. A second printer with the MAC address 0004aecd235f is connected to access interface **ge-0/0/20**. In this example, both interfaces are configured for MAC RADIUS authentication on the switch, and the MAC addresses (without colons) of both printers are configured on the RADIUS server. Interface **ge-0/0/20** is configured to eliminate the normal delay while the switch attempts 802.1X authentication; MAC RADIUS authentication is enabled and 802.1X authentication is disabled using the **mac-radius restrict** option.

Configuration

To configure MAC RADIUS authentication on the switch, perform these tasks:

CLI Quick Configuration

To quickly configure MAC RADIUS authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/19 mac-radius
set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

NOTE: You must also configure the two MAC addresses as usernames and passwords on the RADIUS server, as is done in Step 2 of the step-by-step procedure.

Step-by-Step Procedure

Configure MAC RADIUS authentication on the switch and on the RADIUS server:

1. On the switch, configure the interfaces to which the printers are attached for MAC RADIUS authentication, and configure interface **ge-0/0/20**, so that only MAC RADIUS authentication is used:

   ```
   [edit]
   user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
   user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
   ```

2. On the RADIUS server, configure the MAC addresses **00040ffdacfe** and **0004aecd235f** as usernames and passwords:

   ```
   [root@freeradius]#
   edit /etc/raddb
   vi users
   00040ffdacfe Auth-type:=EAP, User-Password = "00040ffdacfe"
   0004aecd235f Auth-type:=EAP, User-Password = "0004aecd235f"
   ```

Results

Display the results of the configuration on the switch:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile52;
      interface {
        ge-0/0/19.0 {
          mac-radius;
        }
        ge-0/0/20.0 {
          mac-radius {
            restrict;
          }
        }
      }
    }
  }
}
```

Verification

Verify that the supplicants are authenticated:

- Verifying That the Supplicants Are Authenticated on page 2289

Verifying That the Supplicants Are Authenticated

Purpose After supplicants are configured for MAC RADIUS authentication on the switch and on the RADIUS server, verify that they are authenticated and display the method of authentication:

Action Display information about 802.1X-configured interfaces **ge-0/0/19** and **ge-0/0/20**:

```
user@switch> show dot1x interface ge-0/0/19.0 detail
ge-0/0/19.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
```

```
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds

user@switch> show dot1x interface ge-0/0/20.0 detail
ge-0/0/20.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Enabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user102, 00:04:ae:cd:23:5f
      Operational state: Authenticated
      Authentcation method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The sample output from the **show dot1x interface detail** command displays the MAC address of the connected host in the **Supplicant** field. On interface **ge-0/0/19**, the MAC address is **00:04:0f:fd:ac:fe**, which is the MAC address of the first printer configured for MAC RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**. On interface **ge-0/0/20**, the MAC address is **00:04:ae:cd:23:5f**, which is the MAC address of the second printer configured for MAC RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**.

Related Documentation

- Configuring MAC RADIUS Authentication (CLI Procedure) on page 2335

- Understanding MAC RADIUS Authentication on J-EX Series Switches

Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch

802.1x Port-Based Network Access Control (PNAC) authentication on J-EX Series switches provides three types of authentication to meet the access needs of your enterprise LAN:

- Authenticate the first host (supplicant) on an authenticator port, and allow all others also connecting to have access.
- Authenticate only one supplicant on an authenticator port at one time.

- Authenticate multiple supplicants on an authenticator port. Multiple supplicant mode is used in VoIP configurations.

This example configures a J-EX4200 switch to use IEEE 802.1X to authenticate supplicants that use three different administrative modes:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure the ports for 802.1X authentication, be sure you have:

- Installed your J-EX Series switch.
- Performed the initial switch configuration. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Configured users on the authentication server.

Overview and Topology

As shown in Figure 54 on page 2292, the topology contains a J-EX4200 access switch connected to the authentication server on port **ge-0/0/10**. Interfaces **ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/11** will be configured for three different administrative modes.

Figure 54: Topology for Configuring Supplicant Modes

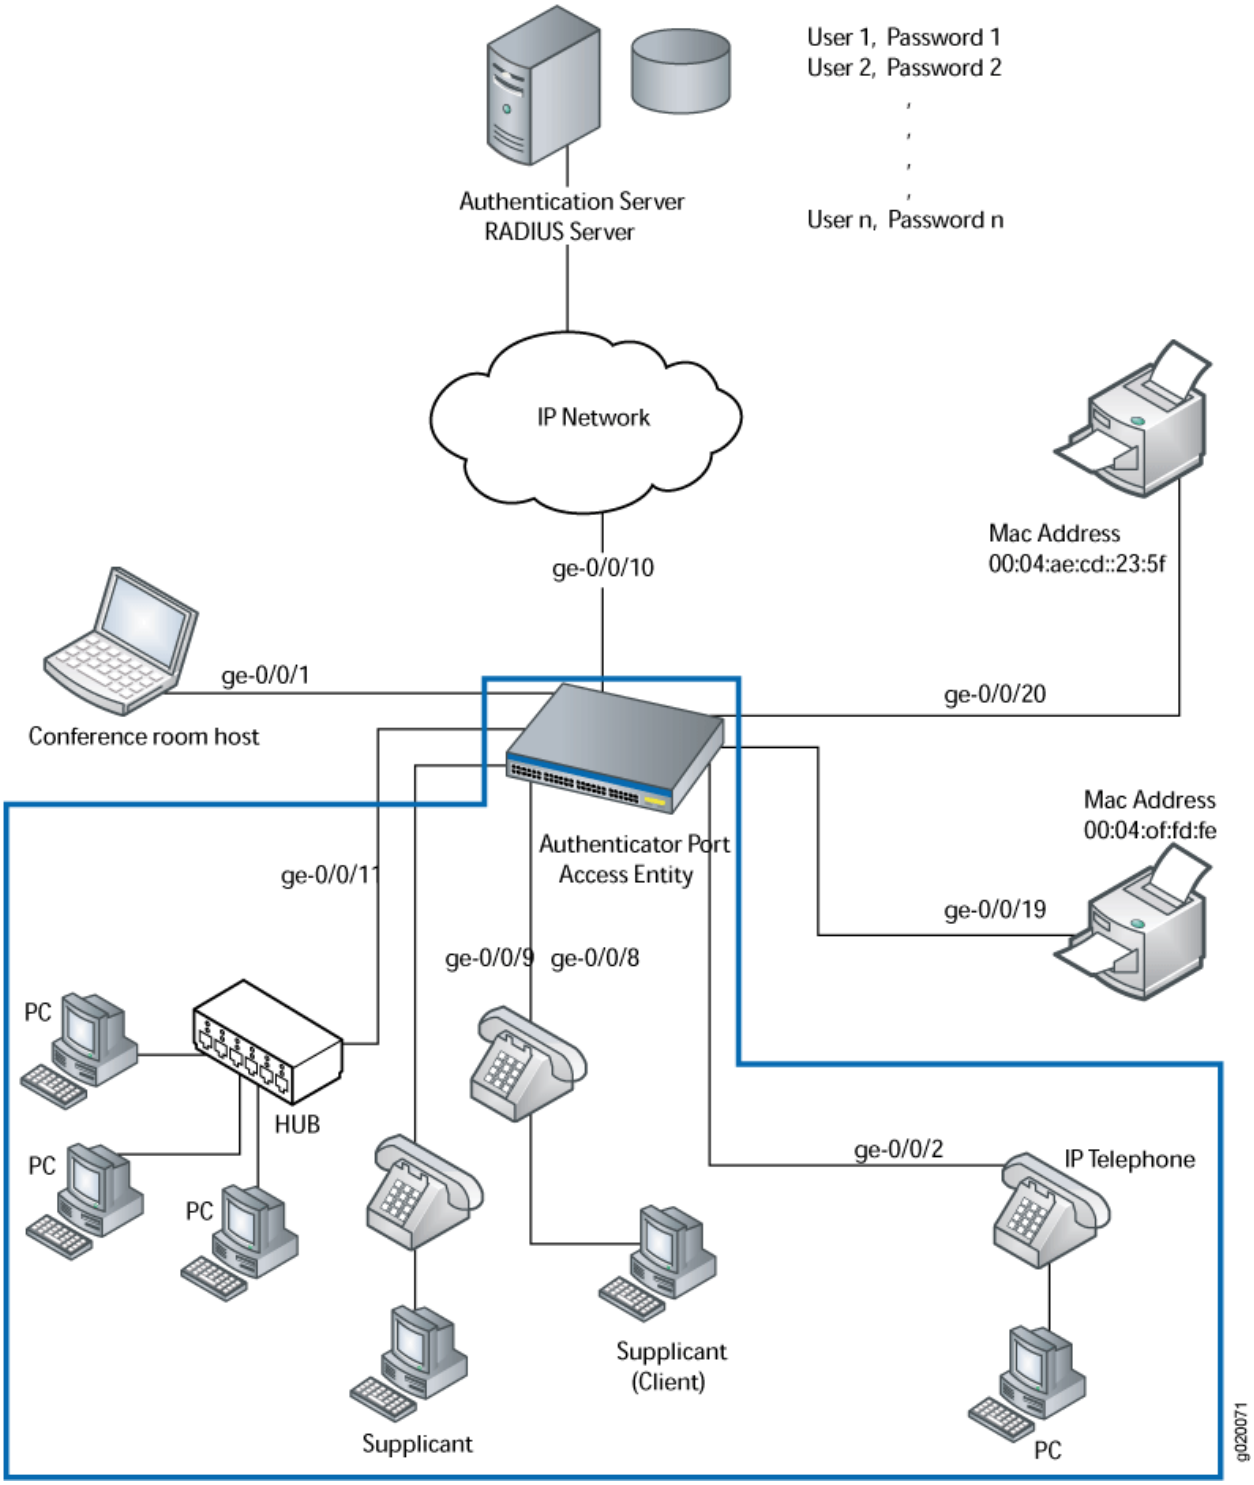

Table 293: Components of the Supplicant Mode Configuration Topology

Property	Settings
Switch hardware	J-EX4200 switch, 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE ports (**ge-0/0/8** through **ge-0/0/23**)
Connections to Avaya phones—with integrated hub, to connect phone and desktop PC to a single port; (requires PoE)	**ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/11**

To configure the administrative modes to support supplicants in different areas of the Enterprise network:

- Configure access port **ge-0/0/8** for single supplicant mode authentication.
- Configure access port **ge-0/0/9** for single secure supplicant mode authentication.
- Configure access port **ge-0/0/11** for multiple supplicant mode authentication.

Single supplicant mode authenticates only the first supplicant that connects to an authenticator port. All other supplicants connecting to the authenticator port after the first supplicant has connected successfully, whether they are 802.1X-enabled or not, are permitted free access to the port without further authentication. If the first authenticated supplicant logs out, all other supplicants are locked out until a supplicant authenticates.

Single-secure supplicant mode authenticates only one supplicant to connect to an authenticator port. No other supplicant can connect to the authenticator port until the first supplicant logs out.

Multiple supplicant mode authenticates multiple supplicants individually on one authenticator port. If you configure a maximum number of devices that can be connected to a port through port security, the lesser of the configured values is used to determine the maximum number of supplicants allowed per port.

Configuration of 802.1X to Support Multiple Supplicant Modes

To configure 802.1X authentication to support multiple supplicants, perform these tasks:

CLI Quick Configuration

To quickly configure the ports with different 802.1X authentication modes, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/8 supplicant single
set protocols dot1x authenticator interface ge-0/0/9 supplicant single-secure
set protocols dot1x authenticator interface ge-0/0/11 supplicant multiple
```

Step-by-Step Procedure

Configure the administrative mode on the interfaces:

1. Configure the supplicant mode as single on interface **ge-0/0/8**:

   ```
   [edit protocols]
   user@switch# set dot1x authenticator interface ge-0/0/8 supplicant single
   ```

2. Configure the supplicant mode as single secure on interface **ge-0/0/9**:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/9 supplicant single-secure
```

3. Configure multiple supplicant mode on interface **ge-0/0/11**:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/11 supplicant multiple
```

Results Check the results of the configuration:

```
[edit]
user@access-switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
        )
        ge-0/0/9.0 {
          supplicant single-secure;
        )
        ge-0/0/11.0 {
          supplicant multiple;
        )
      }
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the 802.1X Configuration on page 2294

Verifying the 802.1X Configuration

Purpose Verify the 802.1X configuration on interfaces **ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/5**.

Action Verify the 802.1X configuration with the operational mode command **show dot1x interface**:

```
user@switch> show dot1x interface ge-0/0/8.0 detail
ge-0/0/8.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
```

```
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>

user@switch> show dot1x interface ge-0/0/9.0 detail
ge-0/0/9.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single-Secure
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0

user@switch> show dot1x interface ge-0/0/11.0 detail
ge-0/0/11.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

Meaning The **Supplicant mode** output field displays the configured administrative mode for each interface. Interface **ge-0/0/8.0** displays **Single** supplicant mode. Interface **ge-0/0/9.0** displays **Single Secure** supplicant mode. Interface **ge-0/0/11.0** displays **Multiple** supplicant mode.

- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339
- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 2340
- Understanding Authentication onJ-EX Series Switches on page 2248

Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch

You can use RADIUS server attributes and a port-based firewall filter to centrally apply terms to multiple supplicants connected to a J-EX Series switch in your enterprise. Terms are applied following a supplicant's successful authentication through 802.1X.

J-EX Series switches support port-based firewall filters. Port firewall filters are configured on a single J-EX Series switch, but in order for them to operate throughout an enterprise, they have to be configured on multiple switches. To reduce the need to configure the same port firewall filter on multiple switches, you can instead apply the filter centrally on the RADIUS server using RADIUS server attributes.

The following example uses FreeRADIUS to apply a port firewall filter on a RADIUS server. For specifics on configuring your server, consult the documentation that was included with your RADIUS server.

This example describes how to configure a port firewall filter with terms, create counters to count packets for the supplicants, apply the filter to user profiles on the RADIUS server, and display the counters to verify the configuration:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Set up a connection between the switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch" on page 2267.
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See "Configuring 802.1X Interface Settings (CLI Procedure)" on page 2331 and "Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch" on page 2290.

- Configured users on the RADIUS authentication server (in this example, the user profiles for Supplicant 1 and Supplicant 2 in the topology are modified on the RADIUS server).

Overview and Topology

When the 802.1X configuration on an interface is set to **multiple** supplicant mode, you can apply a single port firewall filter configured through the Junos OS CLI on the J-EX Series switch to any number of users (supplicants) on one interface by adding the filter centrally to the RADIUS server. Only a single filter can be applied to an interface; however, the filter can contain multiple terms for separate supplicants.

For more information about firewall filters, see “Firewall Filters for J-EX Series Switches Overview” on page 2721.

RADIUS server attributes are applied to supplicants after the supplicants are successfully authenticated using 802.1X. To authenticate the supplicants, the switch forwards a supplicant’s credentials to the RADIUS server. The RADIUS server matches the credentials forwarded by the switch against preconfigured information about the supplicant located in the supplicant’s user profile on the RADIUS server. If a match is made, the RADIUS server instructs the switch to open an interface to the supplicant. Traffic then flows from and to the supplicant on the LAN. Further instructions configured in the port firewall filter and added to the supplicant’s user profile using a RADIUS server attribute further define the access that the supplicant is granted. Filtering terms configured in the port firewall filter are applied to the supplicant after 802.1X authentication is complete.

Figure 55 on page 2298 shows the topology used for this example. The RADIUS server is connected to the J-EX4200 switch on access port **ge-0/0/10**. Two supplicants are accessing the LAN on interface **ge-0/0/2**. Supplicant 1 has a MAC address of **00:50:8b:6f:60:3a**. Supplicant 2 has a MAC address of **00:50:8b:6f:60:3b**.

Figure 55: Topology for Firewall Filter and RADIUS Server Attributes Configuration

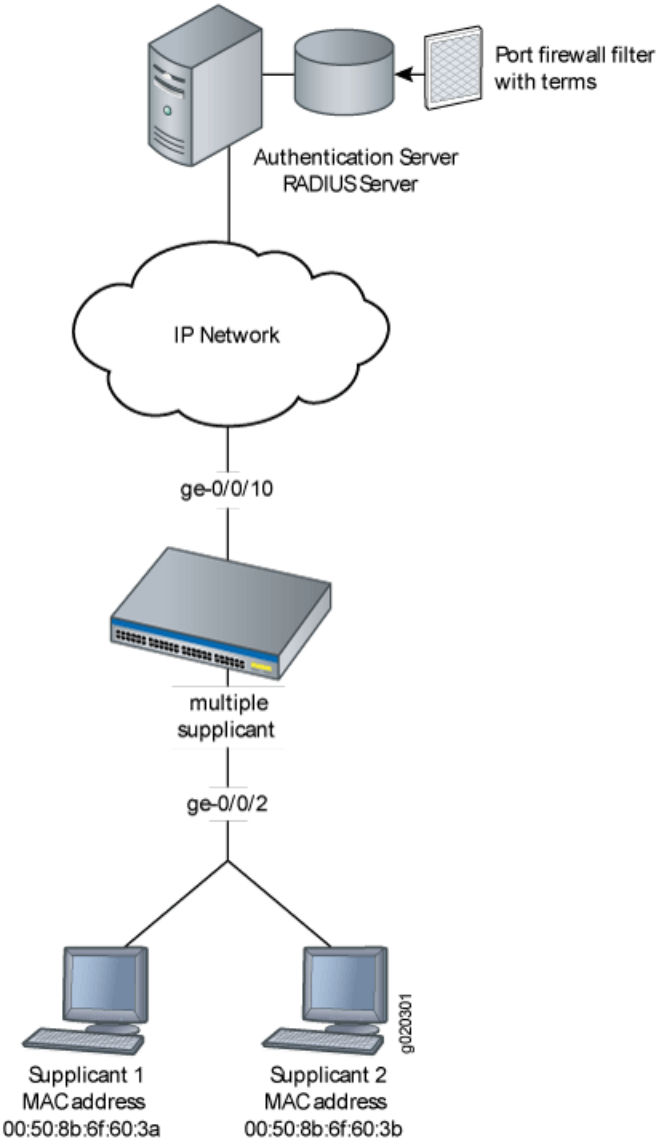

Table 294 on page 2298 describes the components in this topology.

Table 294: Components of the Firewall Filter and RADIUS Server Attributes Topology

Property	Settings
Switch hardware	J-EX4200 access switch, 24 Gigabit Ethernet ports, 8 PoE ports.
One RADIUS server	Backend database with an address of **10.0.0.100** connected to the switch at port **ge-0/0/10**.
802.1X supplicants connected to the switch on interface **ge-0/0/2**	• **Supplicant 1** has MAC address **00:50:8b:6f:60:3a**. • **Supplicant 2** has MAC address **00:50:8b:6f:60:3b**.

Table 294: Components of the Firewall Filter and RADIUS Server Attributes Topology *(continued)*

Property	Settings
Port firewall filter to be applied on the RADIUS server	**filter1**
Counters	**counter1** counts packets from Supplicant 1, and **counter2** counts packets from Supplicant 2.
User profiles on the RADIUS server	• Supplicant 1 has the user profile **supplicant1**. • Supplicant 2 has the user profile **supplicant2**.

In this example, you configure a port firewall filter named **filter1**. The filter contains terms that will be applied to the supplicants based on the MAC addresses of the supplicants. When you configure the filter, you also configure the counters called **counter1** and **counter2**. Packets from each supplicant will be counted, helping you verify that the configuration is working. Then, you check to see that the RADIUS server attribute is available on the RADIUS server and apply the filter to the user profiles of each supplicant on the RADIUS server. Finally, you verify the configuration by displaying output for the two counters.

NOTE: For more information about authentication, authorization, and accounting (AAA) services, see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Configuring the Port Firewall Filter and Counters

Configure a port firewall filter and counters:

CLI Quick Configuration

To quickly configure a port firewall filter with terms for Supplicant 1 and Supplicant 2 and create parallel counters for each supplicant, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term supplicant1 from source-mac-address
00:50:8b:6f:60:3a
set firewall family ethernet-switching filter filter1 term supplicant2 from source-mac-address
00:50:8b:6f:60:3b
set firewall family ethernet-switching filter filter1 term supplicant1 then count counter1
set firewall family ethernet-switching filter filter1 term supplicant2 then count counter2
```

Step-by-Step Procedure

To configure a port firewall filter and counters on the switch:

1. Configure a port firewall filter (here, **filter1**) with terms for each supplicant based upon the MAC address of each supplicant:

   ```
   [edit firewall family ethernet-switching]

   user@switch# set filter filter1 term supplicant1 from source-mac-address
   00:50:8b:6f:60:3a
   user@switch# set filter filter1 term supplicant2 from source-mac-address
   00:50:8b:6f:60:3b
   ```

2. Create two counters that will count packets for each supplicant:

```
[edit firewall family ethernet-switching]

user@switch# set filter filter1 term supplicant1 then count counter1
user@switch# set filter filter1 term supplicant2 then count counter2
user@switch# set filter filter1 term supplicant2 then count counter2
```

Results Display the results of the configuration:

```
user@switch> show configuration
  firewall {
    family ethernet-switching {
      filter filter1 {
        term supplicant1 {
          from {
            source-mac-address {
              00:50:8b:6f:60:3a;
            }
          }
          then count counter1;
          then policer p1;
        }
        term supplicant2 {
          from {
            source-mac-address {
              00:50:8b:6f:60:3b;
            }
          }
          then count counter2;
        }
      }
    }
  }
  policer p1 {
    if-exceeding {
      bandwidth-limit 1m;
        burst-size-limit 1k;
      }
      then discard;
    }
```

Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server

Verify that the RADIUS server attribute needed to apply a filter on the RADIUS server is on the server and apply the port firewall filter to each supplicant's user profile on the RADIUS server:

Step-by-Step Procedure To verify that the RADIUS server attribute **Filter-ID** is on the RADIUS server and to apply the filter to the user profiles:

1. Display the dictionary **dictionary.rfc2865** on the RADIUS server, and verify that the attribute **Filter-ID** is in the dictionary:

   ```
   [root@freeradius]# cd usr/share/freeradius/dictionary.rfc2865
   ```

2. Close the dictionary file.

3. Display the local user profiles of the supplicants to which you want to apply the filter (here, the user profiles are called **supplicant1** and **supplicant2**):

```
[root@freeradius]# cat /usr/local/etc/raddb/users
```

The output shows:

```
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
        Tunnel-Type = VLAN,
        Tunnel-Medium-Type = IEEE-802,
        Tunnel-Private-Group-Id = "1005"

supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
        Tunnel-Type = VLAN,
        Tunnel-Medium-Type = IEEE-802,
        Tunnel-Private-Group-Id = "1005"
```

4. Apply the filter to both user profiles by adding the line **Filter-Id = "filter1"** to each profile, and then close the file:

```
[root@freeradius]# cat /usr/local/etc/raddb/users
```

After you paste the line into the files, the files look like this:

```
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
        Tunnel-Type = VLAN,
        Tunnel-Medium-Type = IEEE-802,
        Tunnel-Private-Group-Id = "1005",
        Filter-Id = "filter1"

supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
        Tunnel-Type = VLAN,
        Tunnel-Medium-Type = IEEE-802,
        Tunnel-Private-Group-Id = "1005",
        Filter-Id = "filter1"
```

Verification

Verify that the filter has been applied to the supplicants:

- Verifying That the Filter Has Been Applied to the Supplicants on page 2301

Verifying That the Filter Has Been Applied to the Supplicants

Purpose After supplicants are authenticated, verify that the filter configured on the switch and added to each supplicant's user profile on the RADIUS server has been applied:

Action Display information about firewall filter **filter1**:

```
user@switch> show firewall filter filter1
Filter: filter1
Counters:
Name                                                Bytes              Packets
counter1                                              128                    2
counter2                                               64                    1
```

Meaning The output of the command **show firewall filter filter1** displays **counter1** and **counter2**. Packets from Supplicant 1 are counted using **counter1**, and packets from Supplicant 2 are counted using **counter2**. The output from the command displays packets incrementing for both counters. The filter has been applied to both supplicants.

Related Documentation

- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 2290
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 2755
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339
- Understanding Authentication onJ-EX Series Switches on page 2248
- Understanding 802.1X and VSAs on J-EX Series Switches on page 2266

Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch

You can configure voice over IP (VoIP) on a J-EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol forwards VoIP parameters from the switch to the phone. You also configure 802.1X authentication to allow the telephone access to the LAN. Authentication is done through a backend RADIUS server.

This example describes how to configure VoIP on a J-EX Series switch to support an Avaya IP phone, as well as the LLDP-MED protocol and 802.1X authentication:

- Requirements on page 2302
- Overview and Topology on page 2303
- Configuration on page 2305
- Verification on page 2307

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An Avaya 9620 IP telephone that supports LLDP-MED and 802.1X

Before you configure VoIP, be sure you have:

- Installed your J-EX Series switch. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial switch configuration. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see “Configuring PoE (CLI Procedure)” on page 3021.

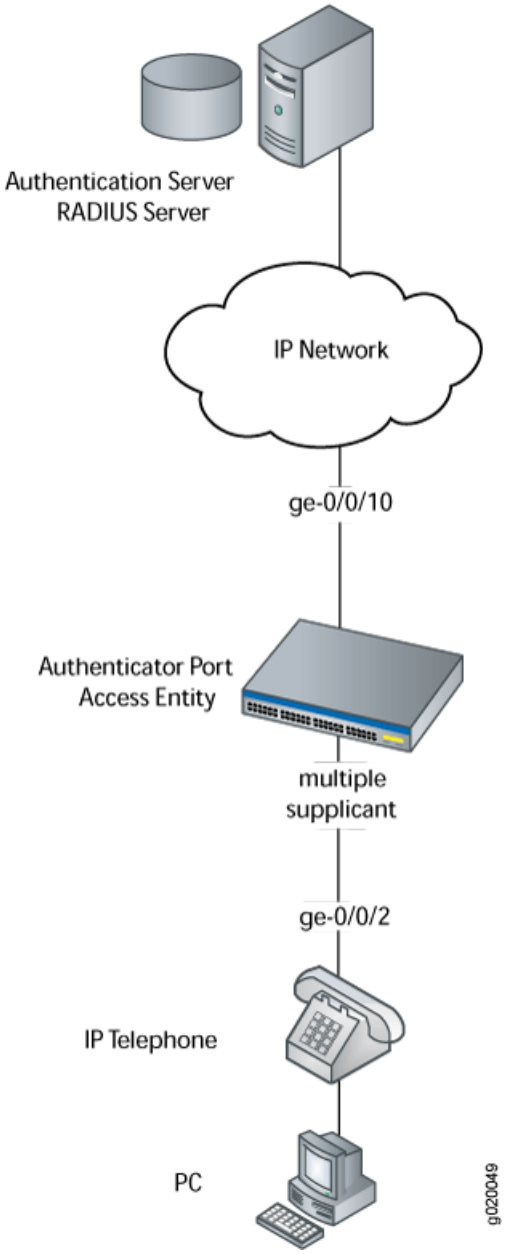
NOTE: If the IP address isn't configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the **voip** statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

Overview and Topology

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface **ge-0/0/2** on the J-EX4200 switch is connected to an Avaya 9620 IP telephone. Avaya phones have a built-in bridge that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one interface on the switch. The J-EX Series switch is connected to a RADIUS server on interface **ge-0/0/10** (see Figure 56 on page 2304).

Figure 56: VoIP Topology



In this example, you configure VoIP parameters and specify the forwarding class **assured-forward** for voice traffic to provide the highest quality of service.

Table 295 on page 2304 describes the components used in this VoIP configuration example.

Table 295: Components of the VoIP Configuration Topology

Property	Settings
Switch hardware	J-EX4200 switch

Table 295: Components of the VoIP Configuration Topology *(continued)*

Property	Settings
VLAN names	**data-vlan** **voice-vlan**
Connection to Avaya phone—with integrated hub, to connect phone and desktop PC to a single interface (requires PoE)	**ge-0/0/2**
One RADIUS server	Provides backend database connected to the switch through interface **ge-0/0/10**.

As well as configuring a VoIP for interface **ge-0/0/2**, you configure:

- 802.1X authentication. Authentication is set to **multiple** supplicant to support more than one supplicant's access to the LAN through interface **ge-0/0/2**.
- LLDP-MED protocol information. The switch uses LLDP-MED to forward VoIP parameters to the phone. Using LLDP-MED ensures that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p class of service and 802.1Q tag information can be sent to the IP telephone.

NOTE: A PoE configuration is not necessary if an IP telephone is using a power adapter.

Configuration

To configure VoIP, LLDP-MED, and 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, LLDP-MED, and 802.1X, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2.0
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Step-by-Step Procedure

To configure VoIP with LLDP-MED and 802.1X:

1. Configure the VLANs for voice and data:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

2. Associate the VLAN **data-vlan** with the interface:

```
[edit vlans]
user@switch# set data-vlan interface ge-0/0/2.0
```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

5. Configure LLDP-MED protocol support:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2.0
```

6. To authenticate an IP phone and a PC connected to the IP phone on the interface, configure 802.1X authentication support and specify **multiple** supplicant mode:

NOTE: If you do not want to authenticate any device, skip the 802.1X configuration on this interface.

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Results Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
    ge-0/0/2 {
        unit 0 {
            family ethernet-switching {
                port-mode access;
                vlan {
                    members data-vlan;
                }
            }
        }
    }
}
protocols {
    lldp-med {
        interface ge-0/0/2.0;
    }
    dot1x {
        authenticator {
            interface {
                ge-0/0/2.0 {
                    supplicant multiple;
                }
            }
```

```
    }
  }
}
vlans {
  data-vlan {
    vlan-id 77;
    interface {
      ge-0/0/2.0;
    }
  }
  voice-vlan {
    vlan-id 99;
  }
}
ethernet-switching options {
  voip {
    interface ge-0/0/2.0 {
      vlan voice-vlan;
      forwarding-class assured-forwarding;
    }
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying LLDP-MED Configuration on page 2307
- Verifying 802.1X Authentication for IP Phone and Desktop PC on page 2308
- Verifying the VLAN Association with the Interface on page 2309

Verifying LLDP-MED Configuration

Purpose Verify that LLDP-MED is enabled on the interface.

Action

```
user@switch> show lldp detail
LLDP                     : Enabled
Advertisement interval   : 30 Second(s)
Transmit delay           : 2 Second(s)
Hold timer               : 2 Second(s)
Config Trap Interval     : 300 Second(s)
Connection Hold timer    : 60 Second(s)

LLDP MED                 : Enabled
MED fast start count     : 3 Packet(s)

Interface      LLDP       LLDP-MED    Neighbor count
all            Enabled    -           0
ge-0/0/2.0     -          Enabled     0

Interface     VLAN-id     VLAN-name
ge-0/0/0.0    0           default
ge-0/0/1.0    0           employee-vlan
ge-0/0/2.0    0           data-vlan
ge-0/0/2.0    99          voice-vlan
ge-0/0/3.0    0           employee-vlan
```

```
ge-0/0/8.0    0          employee-vlan
ge-0/0/10.0   0          default
ge-0/0/11.0   20         employee-vlan
ge-0/0/23.0   0          default

LLDP basic TLVs supported:
Chassis identifier, Port identifier, Port description, System name, System
description, System capabilities, Management address.

LLDP 802 TLVs supported:
Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port
VLAN name.

LLDP MED TLVs supported:
LLDP MED capabilities, Network policy, Endpoint location, Extended power
Via MDI.
```

Meaning The **show lldp detail** output shows that both LLDP and LLDP-MED are configured on the **ge-0/0/2.0** interface. The end of the output shows the list of supported LLDP basic TLVs, 802.3 TLVs, and LLDP-MED TLVs that are supported.

Verifying 802.1X Authentication for IP Phone and Desktop PC

Purpose Display the 802.1X configuration to confirm that the VoIP interface has access to the LAN.

Action

```
user@switch> show dot1x interface ge/0/0/2.0 detail
ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

Verifying the VLAN Association with the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch> show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  down     default                unblocked
ge-0/0/1.0  down     employee-vlan          unblocked
ge-0/0/5.0  down     employee-vlan          unblocked
ge-0/0/3.0  down     employee-vlan          unblocked
ge-0/0/8.0  down     employee-vlan          unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     employee-vlan          unblocked
ge-0/0/23.0 down     default                unblocked
ge-0/0/2.0  up       voice-vlan             unblocked
                     data-vlan              unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267
- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 2290
- Defining CoS Forwarding Classes (CLI Procedure) on page 2918
- Defining CoS Forwarding Classes (J-Web Procedure) on page 2918
- Configuring LLDP-MED (CLI Procedure) on page 2346

Example: Configuring VoIP on a J-EX Series Switch Without Including 802.1X Authentication

You can configure voice over IP (VoIP) on a J-EX Series switch to support IP telephones.

To configure VoIP on a J-EX Series switch to support an IP phone that does not support 802.1X authentication, you must either add the MAC address of the phone to the static MAC bypass list or enable MAC RADIUS authentication on the switch.

This example describes how to configure VoIP on a J-EX Series switch without 802.1X authentication using static MAC bypass of authentication:

- Requirements on page 2310
- Overview on page 2310
- Configuration on page 2310
- Verification on page 2313

Requirements

This example uses the following hardware and software components:

- An IP telephone

Before you configure VoIP, be sure you have:

- Installed your J-EX Series switch. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial switch configuration. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.
- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see “Configuring PoE (CLI Procedure)” on page 3021.

NOTE: If the IP address isn't configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the **voip** statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN’s ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface **ge-0/0/2** on the J-EX4200 switch is connected to a non-802.1X IP phone.

To configure VoIP on a J-EX Series switch to support an IP phone that does not support 802.1X authentication, add the MAC address of the phone as a static entry in the authenticator database and set the supplicant mode to multiple.

Configuration

To configure VoIP without 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2.0
set protocols dot1x authenticator authentication-profile-name auth-profile
set protocols dot1x authenticator static 00:04:f2:11:aa:a7
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Step-by-Step Procedure

To configure VoIP without 802.1X:

1. Configure the VLANs for voice and data:

   ```
   [edit vlans]
   user@switch# set data-vlan vlan-id 77
   user@switch# set voice-vlan vlan-id 99
   ```

2. Associate the VLAN **data-vlan** with the interface:

   ```
   [edit vlans]
   user@switch# set data-vlan interface ge-0/0/2.0
   ```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
   user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
   ```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

   ```
   [edit ethernet-switching-options]
   user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
   user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
   ```

5. Configure LLDP-MED protocol support:

   ```
   [edit protocols]
   user@switch# set lldp-med interface ge-0/0/2.0
   ```

6. Set the authentication profile (see “Configuring 802.1X Interface Settings (CLI Procedure)” on page 2331 and “Configuring 802.1X RADIUS Accounting (CLI Procedure)” on page 2339):

   ```
   [edit protocols]
   set dot1x authenticator authentication-profile-name auth-profile
   ```

7. Add the MAC address of the phone to the static MAC bypass list:

   ```
   [edit protocols]
   set dot1x authenticator static 00:04:f2:11:aa:a7
   ```

8. Set the supplicant mode to multiple:

```
[edit protocols]
set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

Results Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
protocols {

    }
  }
```

```
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying LLDP-MED Configuration on page 2313
- Verifying Authentication for the Desktop PC on page 2314
- Verifying the VLAN Association with the Interface on page 2314

Verifying LLDP-MED Configuration

Purpose Verify that LLDP-MED is enabled on the interface.

Action

```
user@switch> show lldp detail
LLDP                     : Enabled
Advertisement interval   : 30 Second(s)
Transmit delay           : 2 Second(s)
Hold timer               : 2 Second(s)
Config Trap Interval     : 300 Second(s)
Connection Hold timer    : 60 Second(s)

LLDP MED                 : Enabled
MED fast start count     : 3 Packet(s)

Interface      LLDP       LLDP-MED    Neighbor count
all            Enabled    -           0
ge-0/0/2.0     -          Enabled     0

Interface     VLAN-id     VLAN-name
ge-0/0/0.0    0           default
ge-0/0/1.0    0           employee-vlan
ge-0/0/2.0    0           data-vlan
ge-0/0/2.0    99          voice-vlan
ge-0/0/3.0    0           employee-vlan
ge-0/0/8.0    0           employee-vlan
ge-0/0/10.0   0           default
ge-0/0/11.0   20          employee-vlan
ge-0/0/23.0   0           default

LLDP basic TLVs supported:
Chassis identifier, Port identifier, Port description, System name, System
description, System capabilities, Management address.

LLDP 802 TLVs supported:
Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port
VLAN name.

LLDP MED TLVs supported:
LLDP MED capabilities, Network policy, Endpoint location, Extended power
Via MDI.
```

Meaning The **show lldp detail** output shows that both LLDP and LLDP-MED are configured on the **ge-0/0/2.0** interface. The end of the output shows the list of supported LLDP basic TLVs, 802.3 TLVs, and LLDP-MED TLVs that are supported.

Verifying Authentication for the Desktop PC

Purpose Display the 802.1X configuration for the desktop PC connected to the VoIP interface through the IP phone.

Action

```
user@switch>  show dot1x interface ge/0/0/2.0 detail
ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

Meaning The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

Verifying the VLAN Association with the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch>  show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  down     default                unblocked
ge-0/0/1.0  down     employee-vlan          unblocked
ge-0/0/5.0  down     employee-vlan          unblocked
ge-0/0/3.0  down     employee-vlan          unblocked
ge-0/0/8.0  down     employee-vlan          unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     employee-vlan          unblocked
ge-0/0/23.0 down     default                unblocked
ge-0/0/2.0  up       voice-vlan             unblocked
                     data-vlan              unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302
- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 2315
- Understanding 802.1X and VoIP on J-EX Series Switches on page 2263
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 2261

Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support

You can configure voice over IP (VoIP) on a J-EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol is sometimes used with IP phones to forward VoIP parameters from the switch to the phone. Not all IP phones support LLDP-MED, however.

This example describes how to configure VoIP on a J-EX Series switch without LLDP-MED and without 802.1X:

- Requirements on page 2315
- Overview on page 2316
- Configuration on page 2316
- Verification on page 2317

Requirements

This example uses the following hardware and software components:

- One J-EX4200 switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- A IP phone that does not support LLDP-MED.

Before you configure VoIP, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Configured the IP phone as a member of the voice VLAN.
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. See “Configuring PoE (CLI Procedure)” on page 3021.

Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

To configure VoIP on a J-EX Series switch to support an IP phone that does not support LLDP-MED, add the port to which you want to connect the IP phone as a member of the voice VLAN and configure the data VLAN as the native VLAN on the J-EX Series switch. This configuration ensures that the voice traffic and data traffic do not affect each other.

In this example, the interface ge-0/0/2 on the J-EX4200 switch is connected to a non-LLDP-MED IP phone.

NOTE: The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

Configuration

To configure VoIP without LLDP-MED or 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members voice-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan
```

Step-by-Step Procedure

Configure VoIP:

1. Configure the VLANs for data and voice:

   ```
   [edit vlans]
   user@switch# set data-vlan vlan-id 77
   user@switch# set voice-vlan vlan-id 99
   ```

2. Configure the VLAN **data-vlan** on the interface:

   ```
   [edit vlans]
   user@switch# set data-vlan interface ge-0/0/2.0
   ```

3. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

   ```
   [edit ethernet-switching-options]
   user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
   ```

```
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

4. Add the interface as a member of the voice VLAN:

```
[edit interfaces]
set ge-0/0/2 unit 0 family ethernet-switching vlan members voice-vlan
```

5. Configure **data-vlan** as native to this trunk interface:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan
```

Results Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
    ge-0/0/2 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members voice-vlan;
                }
                native-vlan-id data-vlan;
            }
        }
    }
}
vlans {
    data-vlan {
        vlan-id 77;
        interface {
            ge-0/0/2.0;
        }
    }
    voice-vlan {
        vlan-id 99;
    }
}
ethernet-switching options {
    voip {
        interface ge-0/0/2.0 {
            vlan voice-vlan;
            forwarding-class assured-forwarding;
        }
    }
}
```

Verification

To confirm that the configuration is working properly, perform the following task:

- Verifying the VLAN Association With the Interface on page 2318

Verifying the VLAN Association With the Interface

Purpose Display the interface state and VLAN membership.

Action

```
user@switch>  show ethernet-switching interfaces
 Ethernet-switching table: 0 entries, 0 learned

user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  down     default                unblocked
ge-0/0/1.0  down     employee-vlan          unblocked
ge-0/0/5.0  down     employee-vlan          unblocked
ge-0/0/3.0  down     employee-vlan          unblocked
ge-0/0/8.0  down     employee-vlan          unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     employee-vlan          unblocked
ge-0/0/23.0 down     default                unblocked
ge-0/0/2.0  up       voice-vlan             unblocked
                     data-vlan              unblocked
```

Meaning The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302
- Example: Configuring VoIP on a J-EX Series Switch Without Including 802.1X Authentication on page 2309
- Understanding 802.1X and VoIP on J-EX Series Switches on page 2263
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 2261

Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

On J-EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- Requirements on page 2319
- Overview and Topology on page 2319
- Configuration on page 2321
- Verification on page 2322

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

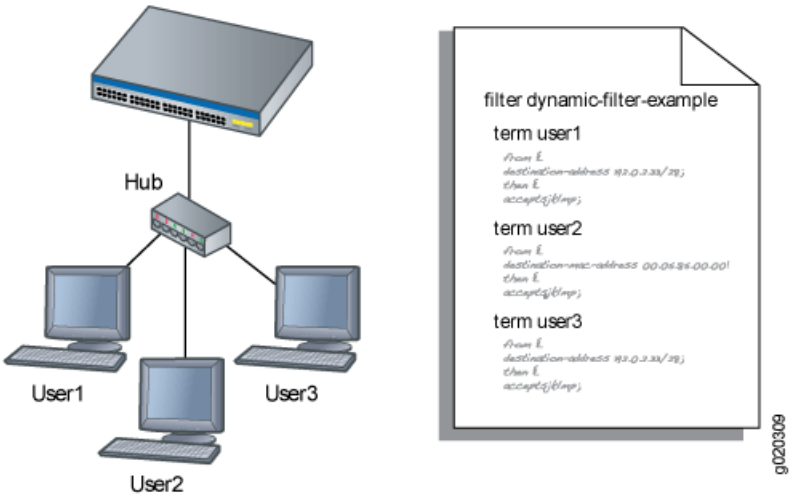
- Set up a connection between the switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See “Configuring 802.1X Interface Settings (CLI Procedure)” on page 2331 and “Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch” on page 2290.
- Configured users on the RADIUS authentication server.

Overview and Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or an nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in Figure 57 on page 2320, when User1 is authenticated by the J-EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User2 is authenticated, another term is added to the firewall filter, and so on.

Figure 57: Conceptual Model: Dynamic Filter Updated for Each New User

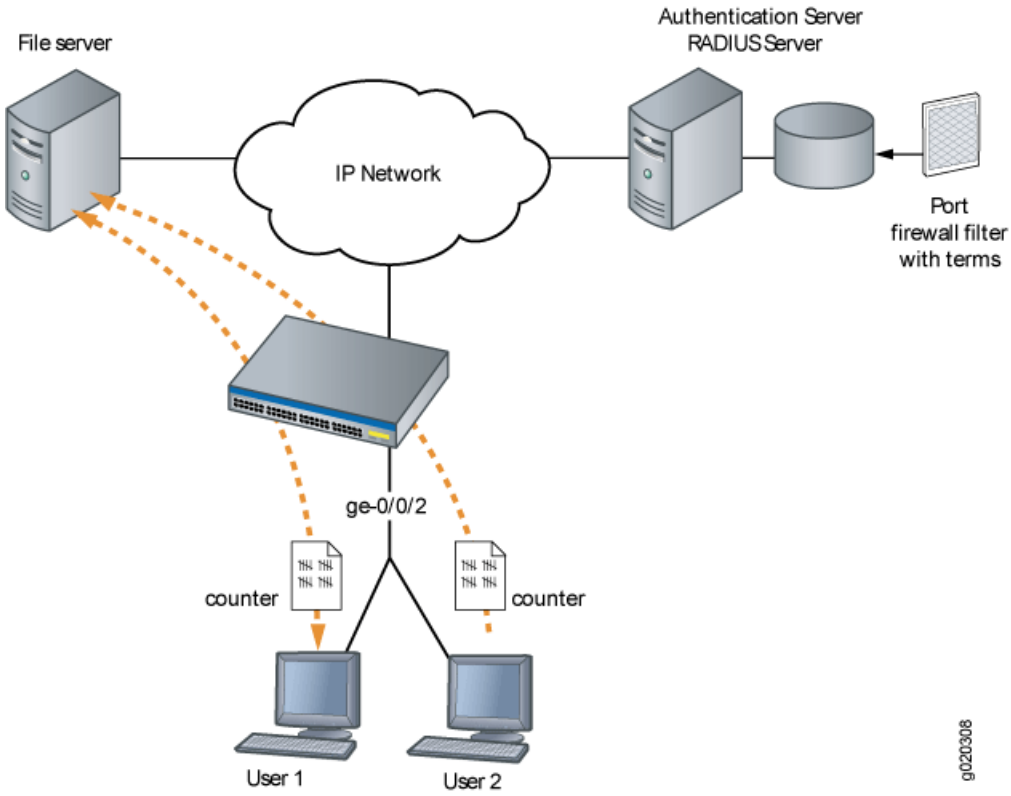


This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

NOTE: If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface **ge-0/0/2** to the file server, which is located on subnet **192.0.2.16/28**. Figure 58 on page 2321 shows the network topology for this example.

Figure 58: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server



Configuration

To configure firewall filters for multiple supplicants on 802.1X-enabled interfaces:

- Configuring Firewall Filters on Interfaces with Multiple Supplicants on page 2321

Configuring Firewall Filters on Interfaces with Multiple Supplicants

CLI Quick Configuration

To quickly configure firewall filters on an interface enabled for multiple supplicants, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/2 supplicant multiple
set firewall family ethernet-switching filter filter1 term term1 from destination-address
192.0.2.16/28
set firewall family ethernet-switching filter filter1 term term1 then count counter1
```

Step-by-Step Procedure

To configure firewall filters on an interface enabled for multiple supplicants:

1. Configure interface **ge-0/0/2** for multiple supplicant mode authentication:

   ```
   [edit protocols dot1x]
   user@switch# set authenticator interface ge-0/0/2 supplicant multiple
   ```

2. Configure a firewall filter to count packets from each user. As each new user is authenticated on this multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1

user@switch# set filter filter1 term term2 then policer p1
```

Results Check the results of the configuration:

```
user@switch> show configuration

firewall {
    family ethernet-switching {
        filter filter1 {
            term term1 {
                from {
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then count counter1;
                term term2 {
                from {
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then policer p1;
            }
        }
    }
    policer p1 {
        if-exceeding {
            bandwidth-limit 1m;
                burst-size-limit 1k;
            }
            then discard;
        }
}
protocols {
    dot1x {
        authenticator
            interface ge-0/0/2 {
                supplicant multiple;
            }
        }
    }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying Firewall Filters on Interfaces with Multiple Supplicants on page 2322

Verifying Firewall Filters on Interfaces with Multiple Supplicants

Purpose Verify that firewall filters are functioning on the interface with multiple supplicants.

Action

1. Check the results with one user authenticated on the interface. In this case, the user is authenticated on **ge-0/0/2**:

```
user@switch> show dot1x firewall

Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```

2. When a second user, User2, is authenticated on the same interface, **ge-0/0/2**, you can verify that the filter includes the results for both of the users authenticated on the interface:

```
user@switch>  show dot1x firewall

Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```

Meaning The results displayed by the **show dot1x firewall** output reflect the dynamic filter created with the authentication of each new user. User1 accessed the file server located at the specified destination address 100 times, while User2 accessed the same file server 400 times.

Related Documentation

- Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch on page 2296
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 2755
- Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 2340

Example: Setting Up Captive Portal Authentication on a J-EX Series Switch

You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

This example describes how to set up captive portal on a J-EX Series switch:

Requirements

This example uses the following hardware and software components:

- A J-EX4200 Series switch

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See “Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch” on page 1063.
- Generated an SSL certificate and installed it on the switch. See “Generating SSL Certificates to Be Used for Secure Web Access” on page 398.
- Configured basic access between the J-EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.
- Designed your captive portal login page. See “Designing and Modifying a Captive Portal Authentication Login Page on a J-EX Series Switch” on page 2351.

Overview and Topology

This example shows the configuration required on the switch to enable captive portal on an interface. To permit a printer connected to the captive portal interface to access the LAN, add its MAC address to the authentication whitelist. The MAC addresses on this list are permitted access on the interface without captive portal authentication.

The topology for this example consists of one J-EX Series switch connected to a RADIUS authentication server. One interface on the switch is configured for captive portal. In this example, the interface is configured in single supplicant mode.

Configuration

To configure captive portal on your switch:

CLI Quick Configuration

To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window:

```
[edit]
set system services web-management https local-certificate my-signed-cert
set services captive-portal secure-authentication https
set services captive-portal interface ge-0/0/10.0
set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
set custom-options post-authentication-url http://www.my-home-page.com
```

Step-by-Step Procedure

To configure captive portal on the switch:

1. To create a secure channel for Web access to the switch, configure captive portal for HTTPS:

   a. Associate the security certificate with the Web server and enable HTTPS on the switch:

   ```
   [edit]
   user@switch# set system services web-management https local-certificate
   my-signed-cert
   ```

NOTE: You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

b. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

2. Enable an interface for captive portal:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10
```

3. (Optional) Allow specific clients to bypass captive portal authentication:

```
[edit]
user@switch# set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
```

NOTE: Optionally, you can use set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0 to limit the scope to the interface.

If the MAC address has already been learned on the interface, you must clear it using the **clear captive-portal interface *interface-name***) before adding it to the whitelist. Otherwise the new entry for the MAC address will not be added to the ethernet switching table and the authentication bypass will not be allowed.

4. (Optional) To redirect clients to a specified page rather than the page they originally requested, configure the post-authentication URL:

```
[edit services captive-portal]
user@switch# set custom-options post-authentication-url
http://www.my-home-page.com
```

Results Display the results of the configuration:

```
[edit]
user@switch# show
system {
    services {
        web-management {
            https {
                local-certificate my-signed-cert;
            }
        }
    }
}
security {
    certificates {
        local {
            my-signed-cert {
```

```
            "-----BEGIN RSA PRIVATE KEY-----\nMIICXwIBAAKBgQDk8sUggnXdDUmr7T
              vLv63yJq/LRpDASfIDZlX3z9ZDe1Kfk5C9\nr/tkyvzv
              ...
              Pt5YmvWDoGo0mSjoE/liH0BqYdh9YGqv3T2IEUfflSTQQHEOShS0ogWDHF\
              nnyOb1O/vQtjk20X9NVQg JHBwidssY9eRp\n-----END CERTIFICATE-----\n";
              ## SECRET-DATA
          }
        }
      }
    }
    services {
      captive-portal {
        interface {
          ge-0/0/10.0;
        }
        secure-authentication https;
      }
    }
    ethernet-switching-options {
      authentication-whitelist {
        00:10:12:e0:28:22/48;
      }
    }
```

Verification

To confirm that captive portal authentication is configured and working properly, perform these tasks:

- Verifying That Captive Portal Is Enabled on the Interface on page 2326
- Verify That Captive Portal Is Working Correctly on page 2326

Verifying That Captive Portal Is Enabled on the Interface

Purpose Verify that captive portal is configured on interface **ge-0/0/10**.

Action Use the operational mode command **show captive-portal interface *interface-name* detail**:

```
user@switch> show captive-portal interface ge-0/0/10.0 detail
ge-0/0/10.0
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Configured CP session timeout: 3600 seconds
  Server timeout: 15 seconds
```

Meaning The output confirms that captive portal is configured on interface ge-0/0/10 with the default settings for number of retries, quiet period, CP session timeout, and server timeout.

Verify That Captive Portal Is Working Correctly

Purpose Verify that captive portal is working on the switch.

Action Connect a client to interface **ge-0/0/10**. From the client, open a Web browser and request a webpage. The captive portal login page that you designed should be displayed. After

you enter your login information and are authenticated against the RADIUS server, the Web browser should display either the page you requested or the post-authentication URL that you configured.

Troubleshooting

To troubleshoot captive portal, perform these tasks:

Troubleshooting Captive Portal

Problem The switch does not return the captive portal login page when a user connected to a captive portal interface on the switch requests a Web page.

Solution You can examine the ARP, DHCP, HTTPS, and DNS counters—if one or more of these counters are not incrementing, this provides an indication of where the problem lies. For example, if the client cannot get an IP address, you might check the switch interface to determine whether the DHCP counter is incrementing—if the counter increments, the DHCP packet was received by the switch.

```
user@switch> show captive-portal firewall ge-0/0/10.0
ge-0/0/10.0
  Filter name: dot1x_ge-0/0/10
Counters:
Name                              Bytes              Packets
dot1x_ge-0/0/10_CP_arp             7616                  119
dot1x_ge-0/0/10_CP_dhcp               0                    0
dot1x_ge-0/0/10_CP_http               0                    0
dot1x_ge-0/0/10_CP_https              0                    0
dot1x_ge-0/0/10_CP_t_dns              0                    0
dot1x_ge-0/0/10_CP_u_dns              0                    0
```

CHAPTER 83

Configuring Access Control

Specifying RADIUS Server Connections on a J-EX Series Switch (CLI Procedure)

IEEE 802.1X and MAC RADIUS authentication both provide network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from devices at the interface until the supplicant's credentials or MAC address are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

To use 802.1X or MAC RADIUS authentication, you must specify the connections on the switch for each RADIUS server to which you will connect.

To configure a RADIUS server on the switch:

1. Define the IP address of the RADIUS server, the RADIUS server authentication port number, and the secret password. You can define more than one RADIUS server. The secret password on the switch must match the secret password on the server:

```
[edit access]
user@switch# set radius-server 10.0.0.100 port 1812 secret abc
```

NOTE: Specifying the authentication port is optional, and port 1812 is the default. However, we recommend that you configure it in order to avoid confusion as some RADIUS servers might refer to an older default.

2. (Optional) Specify the IP address by which the switch is identified by the RADIUS server. If you do not specify this, the RADIUS server uses the address of the interface sending the RADIUS request. We recommend that you specify this IP address because if the request gets diverted on an alternate route to the RADIUS server, the interface relaying the request might not be an interface on the switch.

```
[edit access]
user@switch# set access radius-erver source-address 10.93.14.100
```

3. Configure the authentication order, making **radius** the first method of authentication:

```
[edit access]
user@switch# set profile profile1 authentication-order radius
```

4. Create a profile and specify the list of RADIUS servers to be associated with the profile. For example, you might choose to group your RADIUS servers geographically by city. This feature enables easy modification whenever you want to change to a different sent of authentication servers.

```
[edit access profile]
user@switch# set atlanta radius authentication-server 10.0.0.100 10.2.14.200
```

5. Specify the group of servers to be used for 802.1X or MAC RADIUS authentication by identifying the profile name:

```
[edit access profile]
user@switch# set protocols dot1x authenticator authentication-profile-name denver
```

6. Configure the IP address of the J-EX Series switch in the list of clients on the RADIUS server. For specifics on configuring the RADIUS server, consult the documentation for your server.

Related Documentation

- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339

Configuring 802.1X Interface Settings (CLI Procedure)

IEEE 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from a supplicant (client) at the interface until the supplicant's credentials are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

NOTE: You can also specify an 802.1X exclusion list to specify supplicants can that can bypass authentication and be automatically connected to the LAN. See “Configuring Static MAC Bypass of Authentication (CLI Procedure)” on page 2334.

Before you begin, specify the RADIUS server or servers to be used as the authentication server. See “Specifying RADIUS Server Connections on a J-EX Series Switch (CLI Procedure)” on page 2330.

To configure 802.1X on an interface:

1. Configure the supplicant mode as **single** (authenticates the first supplicant), **single-secure** (authenticates only one supplicant), or **multiple** (authenticates multiple supplicants):

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 supplicant multiple
```

2. Enable reauthentication and specify the reauthentication interval:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5/0 reauthentication interval 5
```

3. Configure the interface timeout value for the response from the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 supplicant-timeout 5
```

4. Configure the timeout for the interface before it resends an authentication request to the RADIUS server:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 server-timeout 5
```

5. Configure how long, in seconds, the interface waits before retransmitting the initial EAPOL PDUs to the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 transmit-period 60
```

6. Configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 maximum-requests 5
```

Configuring 802.1X Authentication (J-Web Procedure)

To configure 802.1X settings on a J-EX Series switch using the J-Web interface:

1. Select **Configure** > **Security** > **802.1X**.

   The 802.1X screen displays a list of interfaces, whether 802.1X security has been enabled, and the assigned port role.

   When you select an interface, the **Details of 802.1x configuration on port** section displays 802.1X details for that interface.

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:

   - RADIUS Servers—Specifies the RADIUS server to be used for authentication. Select the check box to specify a server. Click **Add** or **Edit** to add or modify the RADIUS server settings. Enter information as specified in Table 296 on page 2333.
   - Exclusion List—Excludes hosts from the 802.1X authentication list by specifying the MAC address. Click **Add** or **Edit** in the Exclusion list screen to include or modify the MAC addresses. Enter information as specified in Table 297 on page 2333.
   - Edit—Specifies 802.1X settings for the selected interface

- Apply 802.1X Profile—Applies an 802.1X profile based on the port role. If a message appears asking whether you want to configure a RADIUS server, click **Yes**.
- 802.1X Configuration—Configures custom 802.1X settings for the selected interface. If a message appears asking if you want to configure a RADIUS server, click **Yes**. Enter information as specified in Table 296 on page 2333. To configure 802.1X settings, enter information as specified in Table 298 on page 2333.

- Delete—Deletes 802.1X authentication configuration on the selected interface.

Table 296: RADIUS Server Settings

Field	Function	Your Action
IP Address	Specifies the IP address of the server.	Enter the IP address in dotted decimal notation.
Password	Specifies the login password.	Enter the password.
Confirm Password	Verifies the login password for the server.	Reenter the password.
Server Port Number	Specifies the port with which the server is associated.	Type the port number.
Source Address	Specifies the source address of the switch using which the switch can communicate with the server.	Type the IP address in dotted decimal notation.
Retry Attempts	Specifies the number of login retries allowed after a login failure.	Type the number.
Timeout	Specifies the time interval to wait before the connection to the server is closed.	Type the interval in seconds.

Table 297: 802.1X Exclusion List

Field	Function	Your Action
MAC Address	Specifies the MAC address to be excluded from 802.1X authentication.	Enter the MAC address.
Exclude if connected through the port	Specifies that the host can bypass authentication if it is connected through a particular interface.	Select to enable the option. Select the port through which the host is connected.
Move the host to the VLAN	Specifies moving the host to a specific VLAN once the host is authenticated.	Select to enable the option. Select the VLAN from the list.

Table 298: 802.1X Port Settings

Field	Function	Your Action
Supplicant Mode		

Table 298: 802.1X Port Settings *(continued)*

Field	Function	Your Action
Supplicant Mode	Specifies the mode to be adopted for supplicants: • Single—allows only one host for authentication. • Multiple—allows multiple hosts for authentication. Each host is checked before being admitted to the network. • Single authentication for multiple hosts—Allows multiple hosts but only the first is authenticated.	Select a mode.
Authentication		
Enable re-authentication	Specifies enabling reauthentication on the selected interface.	1. Select to enable reauthentication. 2. Enter the timeout for reauthentication in seconds.
Action on authentication failure	Specifies the action to be taken in case the host does not respond, leading to an authentication failure.	Select one: • Move to the Guest VLAN—Select the VLAN to move the interface to. • Deny—The host is not permitted access.
Timeouts	Specifies timeout values for each action.	Enter the value in seconds for: • Port waiting time after an authentication failure • EAPOL retransmitting interval • Max. EAPOL requests • Maximum number of retries • Port timeout value for the response from the supplicant • Port timeout value for the response from the RADIUS server

Configuring Static MAC Bypass of Authentication (CLI Procedure)

You can configure a static MAC bypass list (sometimes called the exclusion list) on the switch to specify MAC addresses of devices allowed access to the LAN without 802.1X or MAC RADIUS authentication requests to the RADIUS server.

To configure the static MAC bypass list:

- Specify a MAC address to bypass authentication:

```
[edit protocols dot1x]
user@switch# set authenticator static 00:04:0f:fd:ac:fe
```

- Configure a supplicant to bypass authentication if connected through a particular interface:

```
[edit protocols dot1x]
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5
```

- You can configure a supplicant to be moved to a specific VLAN after it is authenticated:

```
[edit protocols dot1x]
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5
vlan-assignment default-vlan
```

Related Documentation

Configuring MAC RADIUS Authentication (CLI Procedure)

You can permit devices that are not 802.1X-enabled LAN access by configuring MAC RADIUS authentication on the J-EX Series switch interfaces to which the hosts are connected.

NOTE: You can also allow non-802.1X-enabled devices to access the LAN by configuring their MAC address for static MAC bypass of authentication.

You can configure MAC RADIUS authentication on an interface that also allows 802.1X authentication, or you can configure either authentication method alone.

If both MAC RADIUS and 802.1X authentication are enabled on the interface, the switch first sends the host three EAPOL requests to the host. If there is no response from the host, the switch sends the host's MAC address to the RADIUS server to check whether it is a permitted MAC address. If the MAC address is configured as permitted on the RADIUS server, the RADIUS server sends a message to the switch that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.

If MAC RADIUS authentication is configured on the interface but 802.1X authentication is not (by using the **mac-radius restrict** option), the switch attempts to authenticate the MAC address with the RADIUS server without delaying by attempting 802.1X authentication first.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the J-EX Series switch and the RADIUS server. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.

To configure MAC RADIUS authentication using the CLI:

- On the switch, configure the interfaces to which the nonresponsive hosts are attached for MAC RADIUS authentication, and add the **restrict** qualifier for interface **ge-0/0/20** to have it use only MAC RADIUS authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

- On a RADIUS authentication server, create user profiles for each nonresponsive host using the MAC address (without colons) of the nonresponsive host as the username and password (here, the MAC addresses are **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f**):

```
[root@freeradius]#
edit /etc/raddb
vi users
00040ffdacfe Auth-type:=Local, User-Password = "00040ffdacfe"
0004aecd235f Auth-type:=Local, User-Password = "0004aecd235f"
```

Configuring Server Fail Fallback (CLI Procedure)

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends an Extensible Authentication Protocol Over LAN (EAPOL) access-reject message.

802.1X user authentication works by using an *authenticator port access entity* (the J-EX Series switch) to block all traffic to and from an end device at the interface until the end device's credentials are presented and matched on the *authentication server* (a RADIUS server). When the end device has been authenticated, the switch stops blocking and opens the interface to the end device.

When you set up 802.1X or MAC RADIUS authentication on the switch, you specify a primary authentication server and one or more backup authentication servers. If the primary authentication server cannot be reached by the switch and the secondary authentication servers are also unreachable, a RADIUS server timeout occurs. Because the authentication server grants or denies access to the end devices awaiting authentication, the switch does not receive access instructions for end devices attempting access to the LAN and normal authentication cannot be completed. Server fail fallback allows you to configure authentication alternatives that permit the switch to take appropriate actions toward end devices awaiting authentication or reauthentication.

To configure basic server fail fallback options using the CLI:

- Configure an interface to allow traffic to flow from a supplicant to the LAN if a RADIUS server timeout occurs (as if the supplicant had been successfully authenticated by a RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail permit
```

- Configure an interface to prevent traffic flow from an end device to the LAN (as if the end device had failed authentication and had been rejected by the RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail deny
```

- Configure an interface to move an end device to a specified VLAN if a RADIUS server timeout occurs (in this case, the VLAN name is **vlan1**):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail vlan-name vlan1
```

- Configure an interface to recognize already connected end devices as reauthenticated if there is a RADIUS timeout during reauthentication (new users will be denied access):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail use-cache
```

- Configure an interface that receives an EAPOL access-reject message from the authentication server to move end devices attempting LAN access on the interface to a specified VLAN already configured on the switch (in this case, the VLAN name is **vlan-sf**):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-reject-vlan vlan-sf
```

Configuring 802.1X RADIUS Accounting (CLI Procedure)

RADIUS accounting permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure basic RADIUS accounting using the CLI:

1. Specify the accounting servers to which the switch will forward accounting statistics:

```
[edit access]
user@switch# set profile profile1 radius accounting-server [122.69.1.250 122.69.1.252]
```

2. Define the RADIUS accounting servers:

```
[edit access]
user@switch# set radius-server 122.69.1.250 secret juniper

user@switch# set radius-server 122.69.1.252 secret juniper1
```

3. Enable accounting for an access profile:

```
[edit access]
user@switch# set profile profile1 accounting
```

4. Configure the RADIUS servers to use while sending accounting messages and updates:

```
[edit access]
user@switch# set profile profile1 accounting order radius none
```

5. Configure the statistics to be collected on the switch and forwarded to the accounting server:

```
[edit access]
user@switch# set profile profile1 accounting order accounting-stop-on-access-deny
user@switch# set profile profile1 accounting order accounting-stop-on-failure
```

6. Display accounting statistics collected on the switch:

```
user@switch> show network-access aaa statistics accounting

Accounting module statistics
  Requests received: 1
  Accounting Response failures: 0
  Accounting Response Success: 1
  Requests timedout: 0
```

7. Open an accounting log on the RADIUS accounting server using the server's address, and view accounting statistics:

```
[root@freeradius]# cd /usr/local/var/log/radius/radacct/122.69.1.250
[root@freeradius 122.69.1.250]# ls

detail-20071214

[root@freeradius 122.69.1.250]# vi details-20071214
```

```

Filtering 802.1X Supplicants Using RADIUS Server Attributes

There are two ways to configure the RADIUS server with port firewall filters:

- Include a match statement and corresponding action in the **Juniper-Firewall-Filter** attribute. The **Juniper-Firewall-Filter** attribute is a vendor-specific attribute (VSA) in the Juniper dictionary on the RADIUS server. Use this attribute to configure simple filter conditions for authenticated users. Nothing needs to be configured on the switch; all of the configuration is on the RADIUS server.
- Apply a local firewall filter to users authenticated through the RADIUS server. Use this method for more complex filters. The firewall filter must be configured on each switch.

This example describes using FreeRADIUS software to configure VSAs. For specifics on configuring your server, consult the AAA documentation that was included with your server.

This topic includes the following tasks:

1. Configuring Match Statements on the RADIUS Server on page 2341
2. Applying a Port Firewall Filter from the RADIUS Server on page 2343

Configuring Match Statements on the RADIUS Server

You can configure simple filter conditions using the **Juniper-Switching-Filter** attribute in the Juniper dictionary on the RADIUS server. These filters are then sent to a switch whenever a new user is authenticated successfully. The filters are created and applied on all J-EX Series switches that authenticate users through that RADIUS server without the need to configure anything on each individual switch.

To configure the **Juniper-Switching-Filter** attribute, enter one or more match conditions and a resulting action using the CLI for the RADIUS server. Enter the match statement plus an action statement enclosed within quotes (" ") using the following syntax:

```
match <destination-mac mac-address> <source-vlan vlan-name> <source-dot1q-tag
  tag> <destination-ip ip-address> <ip-protocol protocol-id> <source-port port>
  <destination-port port>
}
action [allow | deny] <forwarding-class class-of-service> <loss-priority (low | medium |
  high)>
}
```

See “VSA Match Conditions and Actions for J-EX Series Switches” on page 2348 for definitions of match statement options.

To configure match conditions on the RADIUS server:

1. Verify that the Juniper dictionary is loaded on your RADIUS server and includes the filtering attribute **Juniper-Switching-Filter**, attribute ID 48:

   ```
   [root@freeradius]# cat /usr/local/share/freeradius/dictionary.juniper

   #  dictionary.juniper
   #
   # Version:      $Id: dictionary.juniper,v 1.2.6.1 2005/11/30 22:17:25
   aland Exp
   $
   #  VENDOR          Juniper                          2636
   BEGIN-VENDOR    Juniper
   ATTRIBUTE       Juniper-Local-User-Name               1       string
   ATTRIBUTE       Juniper-Allow-Commands                2       string
   ATTRIBUTE       Juniper-Deny-Commands                 3       string
   ATTRIBUTE       Juniper-Allow-Configuration           4       string
   ATTRIBUTE       Juniper-Deny-Configuration            5       string
   ATTRIBUTE       Juniper-Switching-Filter              48      string
   <–
   ```

2. Enter the match conditions and actions. For example:

   - To deny authentication based on the 802.1Q tag (here, the 802.1Q tag is **10**):

     ```
     [root@freeradius]#
     cd /usr/local/etc/raddb
     vi users
     ```

     For each relevant user, add the **Juniper-Switching-Filter** attribute:

     ```
     Juniper-Switching-Filter = "match source-dot1q-tag 10 action deny"
     ```

- To deny access based on a destination IP address:

  ```
  [root@freeradius]# cd /usr/local/etc/raddb
  vi users
  ```

  For each relevant user, add the **Juniper-Switching-Filter** attribute:

  ```
  Juniper-Switching-Filter = “match destination-ip 192.168.1.0/31 action deny”
  ```

- To set the packet loss priority (PLP) to **high** based on a destination MAC address and the IP protocol:

  ```
  [root@freeradius]# cd /usr/local/etc/raddb
  vi users
  ```

  For each relevant user, add the **Juniper-Switching-Filter** attribute:

  ```
  Juniper-Switching-Filter = "match destination-mac 00:04:0f:fd:ac:fe, ip-protocol 2,
  forwarding-class high, action loss-priority high"
  ```

  NOTE: For the forwarding-class option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored. You must specify both the forwarding class and the packet loss priority.

3. Stop and restart the RADIUS process to activate the configuration.

Applying a Port Firewall Filter from the RADIUS Server

You can apply a firewall filter to user policies on the RADIUS server. The RADIUS server can then specify the firewall filters that are to be applied to each user that requests to authenticate. Use this method when the firewall filter has more extensive conditions or you want to use different conditions for the same filter on different switches. The firewall filters must be configured on each switch.

For more information about firewall filters, see “Firewall Filters for J-EX Series Switches Overview” on page 2721.

To apply a port firewall filter centrally from the RADIUS server:

NOTE: If port firewall filters are also configured locally for the interface, then VSAs take precedence if they conflict with the filters. If the VSAs and the local port firewall filters do not conflict, they are merged.

1. Create the firewall filter on the local switch. In this example, the filter is called **filter1**.
2. Open the users file on the RADIUS server:

   ```
   [root@freeradius]#
   cd /usr/local/pool/raddb
   vi users
   ```

3. For each relevant user, add the filter (here, the filter ID is **filter1**):

   ```
   Filter-Id = "filter1"
   ```

   

   NOTE: Multiple filters are not supported on a single interface. However, you can support multiple filters for multiple users that are connected to the switch on the same interface by configuring a single filter with policies for each of those users.

4. Stop and restart the RADIUS process to activate the configuration.

Related Documentation

- Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on a J-EX Series Switch on page 2296
- Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on J-EX Series Switches on page 2755
- Configuring 802.1X Interface Settings (CLI Procedure) on page 2331
- Understanding 802.1X and VSAs on J-EX Series Switches on page 2266

Configuring LLDP (CLI Procedure)

J-EX Series switches use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to quickly identify a variety of devices, resulting in a LAN that interoperates smoothly and efficiently.

This topic describes:

Enabling LLDP on Interfaces

LLDP is enabled on all interfaces by default. If it is disabled, you can enable LLDP by configuring it on all interfaces or specific interfaces.

To configure LLDP on all interfaces or on a specific interface:

```
[edit protocols lldp]
user@switch# set interface all
```

Configuring for Fast Start

You can specify the number of LLDP-MED advertisements sent from the switch in the first second after it has detected an LLDP-capable device. The default is 3; to set it to another value:

```
[edit protocols lldp]
user@switch# set fast-start 8
```

Adjusting LLDP Advertisement Settings

You can adjust the following settings for LLDP advertisements for troubleshooting or verification purposes. For normal operations, we recommend that you do not adjust these settings from the default values.

- To specify the frequency at which LLDP advertisements are sent (in seconds):

  ```
  [edit protocols lldp]
  user@switch# set advertisement-interval 45
  ```

- To determine the length of time LLDP information is held before it is discarded (the multiplier value is used in combination with the **advertisement-interval** value):

  ```
  [edit protocols lldp]
  user@switch# set hold-multiplier 5
  ```

Adjusting SNMP Notification Settings of LLDP Changes

You can adjust the following settings for SNMP notifications of LLDP changes. If the values are not specified or the interval values are set to **0**, the notifications are disabled.

- To specify the frequency at which LLDP database changes are sent (in seconds):

```
[edit protocols lldp]
user@switch# set lldp-configuration-notification-interval 600
```

- To specify the frequency at which changes in topology global statistics are sent (in seconds):

```
[edit protocols lldp]
user@switch# set ptopo-configuration-trap-interval 600
```

- To specify the holding time (used in combination with the **ptopo-configuration-trap-interval** value) to determine the length of time that topology global statistics are held before they are is discarded (in seconds):

```
[edit protocols lldp]
user@switch# set ptopo-configuration-maximum-hold-time 2147483647
```

Specifying a Management Address for the LLDP Management TLV

You can configure an IP management address to be used in the LLDP Management type, length, and value (TLV).

To configure the management address:

```
[edit protocols lldp]
user@switch# set management-address 192.168.0.0
```

Related Documentation

- Configuring LLDP (J-Web Procedure) on page 2345
- Configuring LLDP-MED (CLI Procedure) on page 2346
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 2261

Configuring LLDP (J-Web Procedure)

Use the LLDP Configuration page to configure LLDP global and port settings for a J-EX Series switch on the J-Web interface.

To configure LLDP:

1. Select **Configure** > **Switching** > **LLDP**.

   The LLDP Configuration page displays LLDP Global Settings and Port Settings.

   The second half of the screen displays operational details for the selected port.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. To modify LLDP Global Settings, click **Global Settings**.

   Enter information as described in Table 299 on page 2346.

3. To modify Port Settings, click **Edit** in the Port Settings section.

   Enter information as described in Table 300 on page 2346.

Table 299: Global Settings

Field	Function	Your Action
Advertising interval	Specifies the frequency of outbound LLDP advertisements. You can increase or decrease this interval.	Type the number of seconds.
Hold multiplier	Specifies the multiplier factor to be used by an LLDP-enabled switch to calculate the time-to-live (TTL) value for the LLDP advertisements it generates and transmits to LLDP neighbors.	Type the required number in the field.
Fast start count	Specifies the number of LLDP advertisements sent in the first second after the device connects. The default is 3. Increasing this number results in the port initially advertising LLDP–MED at a faster rate for a limited time.	Type the Fast start count.

Table 300: Edit Port Settings

Field	Function	Your Action
LLDP Status	Specifies whether LLDP has been enabled on the port.	Select one: **Enabled**, **Disabled**, or **None**.
LLDP-MED Status	Specifies whether LLDP–MED has been enabled on the port.	Select **Enable** from the list.

Related Documentation

- Configuring LLDP (CLI Procedure) on page 2344
- Configuring LLDP-MED (CLI Procedure) on page 2346
- Understanding 802.1X and LLDP and LLDP-MED on J-EX Series Switches on page 2261

Configuring LLDP-MED (CLI Procedure)

Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) is an extension of LLDP. The J-EX Series switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations.

LLDP-MED is turned on by default on J-EX Series switches.

This topic describes:

Enabling LLDP-MED on Interfaces

LLDP-MED is enabled on all interfaces by default. If it is disabled, you can enable LLDP-MED by configuring it on all interfaces or on specific interfaces.

To configure LLDP-MED on all interfaces or on a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0
```

Configuring Location Information Advertised by the Switch

You can configure the location information that is advertised from the switch to the LLDP-MED device. You can specify a civic-based location (geographic location) or a location based on an elin (emergency location identification string):

- To specify a location by geography:

```
[edit protocols lldp-med]

user@switch# set interface ge-0/0/2.0 location civic-based country-code US

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 1 ca-value “El Dorado County”

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 2 ca-value CA

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 3 ca-value Somerset

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 6 ca-value “Mount Aukum Road”

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 19 ca-value 6450

user@switch# set interface ge-0/0/2.0 location civic-based ca-type 21 ca-value “Holiday Market”
```

- To specify a location using an **elin** string:

```
[edit protocols lldp-med]

user@switch# set interface ge-0/0/2.0 location elin 4085551212
```

Configuring for Fast Start

You can specify the number of LLDP-MED advertisements sent from the switch in the first second after it has detected an LLDP-MED device. The default is 3; to set it to another value:

```
[edit protocols lldp-med]
user@switch# set fast-start 6
```

VSA Match Conditions and Actions for J-EX Series Switches

J-EX Series switches support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of 802.1X authentication success.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are accept a packet or discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match **10.1.1.0/24** OR **11.1.1.0/24**), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

Table 301 on page 2348 describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

Table 301: Match Conditions

Option	Description
destination-mac *mac-address*	Destination media access control (MAC) address of the packet.
source-vlan *source-vlan*	Name of the source VLAN.

Table 301: Match Conditions *(continued)*

Option	Description
source-dot1q-tag *tag*	Tag value in the dot1q header, in the range **0** through **4095**.
destination-ip *ip-address*	Address of the final destination node.
ip-protocol *protocol-id*	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms: **ah**, **egp (8)**, **esp (50**, **gre (47)**, **icmp (1)**, **igmp (2)**, **ipip (4)**, **ipv6 (41)**, **ospf (89)**, **pim (103)**, **rsvp (46)**, **tcp (6)**, or **udp (17)**
source-port *port*	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the **ip-protocol** match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under **destination-port**.
destination-port *port*	TCP or UDP destination port field. Normally, you specify this match in conjunction with the **ip-protocol** match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): **afs (1483)**, **bgp (179)**, **biff (512)**, **bootpc (68)**, **bootps (67)**, **cvspserver (2401)**, **cmd (514)**, **dhcp (67)**, **domain (53)**, **eklogin (2105)**, **ekshell (2106)**, **exec (512)**, **finger (79)**, **ftp (21)**, **ftp-data (20)**, **http (80)**, **https (443)**, **ident (113)**, **imap (143)**, **kerberos-sec (88)**, **klogin (543)**, **kpasswd (761)**, **krb-prop (754)**, **krbupdate (760)**, **kshell (544)**, **ldap (389)**, **login (513)**, **mobileip-agent (434)**, **mobilip-mn (435)**, **msdp (639)**, **netbios-dgm (138)**, **netbios-ns (137)**, **netbios-ssn (139)**, **nfsd (2049)**, **nntp (119)**, **ntalk (518)**, **ntp (123)**, **pop3 (110)**, **pptp (1723)**, **printer (515)**, **radacct (1813)**, **radius (1812)**, **rip (520)**, **rkinit (2108)**, **smtp (25)**, **snmp (161)**, **snmptrap (162)**, **snpp (444)**, **socks (1080)**, **ssh (22)**, **sunrpc (111)**, **syslog (514)**, **telnet (23)**, **tacacs-ds (65)**, **talk (517)**, **tftp (69)**, **timed (525)**, **who (513)**, **xdmcp (177)**, **zephyr-clt (2103)**, **zephyr-hm (2104)**

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. Table 302 on page 2349 shows the actions that you can specify in a term.

Table 302: Actions for VSAs

Option	Description
(**allow** | **deny**)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.
forwarding-class *class-of-service*	(Optional) Classify the packet in one of the following forwarding classes: • **assured-forwarding** • **best-effort** • **expedited-forwarding** • **network-control**

Table 302: Actions for VSAs *(continued)*

Option	Description
loss-priority (**low** | **medium** | **high**)	(Optional) Set the packet loss priority (PLP) to **low**, **medium**, or **high**. Specify both the forwarding class and loss priority.

Related Documentation

Configuring Captive Portal Authentication (CLI Procedure)

Configure captive portal authentication (hereafter referred to as captive portal) on a J-EX Series switch so that users connected to the switch are authenticated before being allowed to access the network. When the user requests a webpage, a login page is displayed that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See "Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch" on page 1063.
- Generated an SSL certificate and installed it on the switch. See "Generating SSL Certificates to Be Used for Secure Web Access" on page 398.
- Configured basic access between the J-EX Series switch and the RADIUS server. See "Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch" on page 2267.
- Designed your captive portal login page. See "Designing a Captive Portal Authentication Login Page on a J-EX Series Switch" on page 2351.

This topic includes the following tasks:

Configuring Secure Access for Captive Portal

To configure secure access for captive portal:

1. Associate the security certificate with the Web server and enable HTTPS on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate
my-signed-cert
```

NOTE: You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

2. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

Enabling an Interface for Captive Portal

To enable an interface for use with captive portal authentication:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10
```

Configuring Bypass of Captive Portal Authentication

You can allow specific clients to bypass captive portal authentication:

```
[edit]
user@switch# set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
```

NOTE: Optionally, you can use set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0 to limit the scope to the interface.

If the MAC address of the client that you want to configure for authentication bypass has already been learned on the interface, you must clear it using the **clear captive-portal interface *interface-name*** before adding it to the whitelist. Otherwise the new entry for the MAC address will not be added to the ethernet switching table and the authentication bypass will not be allowed.

Related Documentation

- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Understanding Captive Portal Authentication

Designing a Captive Portal Authentication Login Page on a J-EX Series Switch

You can set up captive portal authentication on your switch to redirect all Web browser requests to a login page that requires the user to input a username and password before they are allowed access. Upon successful authentication, the user is allowed access to the network and to continue to the original page requested.

The Junos OS provides a customizable template for the captive portal window that allows you to easily design and modify the look of the captive portal login page. You can modify the design elements in the template to change the look of your captive portal login page and to add instructions or information to the page. You can also modify any of the design elements of an existing captive portal login page.

Figure 59 on page 2352 shows an example of a captive portal login page:

Figure 59: Example of a Captive Portal Login Page

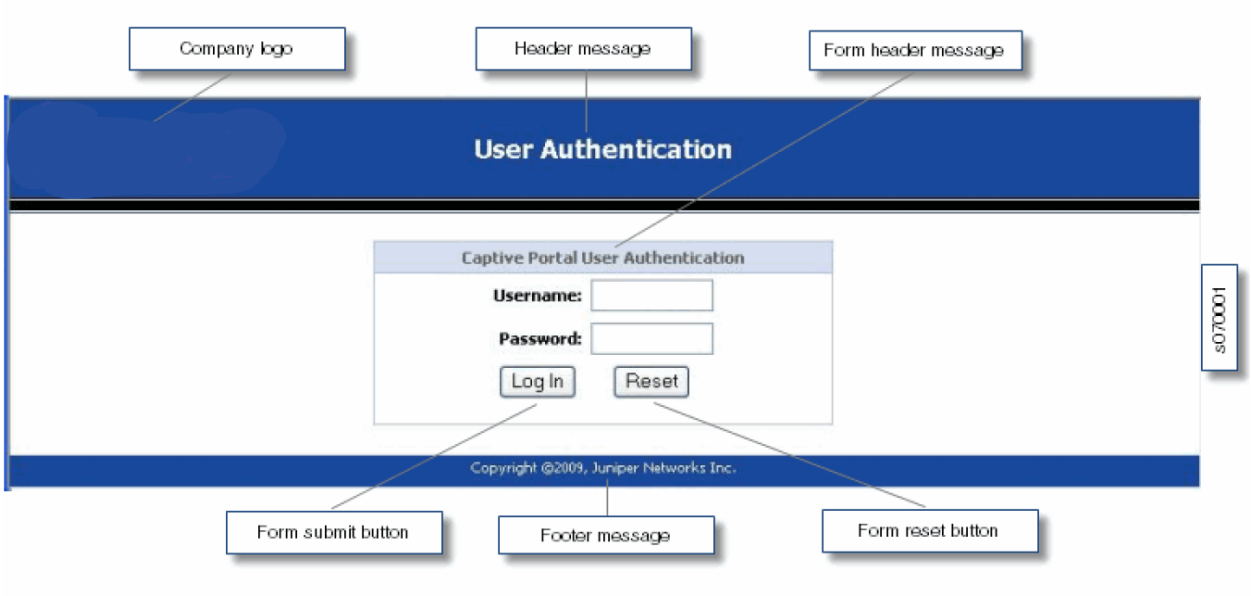

Table 303 on page 2352 summarizes the configurable elements of a captive portal login page.

Table 303: Configurable Elements of a Captive Portal Login Page

Element	CLI Statement	Description
Banner message	**banner-message** *text-string*	The first screen displayed before the captive portal login page is displayed (not shown). The page header says "**Terms and Conditions of Use: Please read the following terms of use and disclaimers carefully before using this network.**" The configurable banner message appears in the body of the page. The default text is "**Terms and Conditions**." A button labeled **Agree** gives the user access to the captive portal login page.
Footer background color	**footer-bgcolor** *hex-color*	The HTML hexadecimal code for the background color of the captive portal login page footer.
Footer message	**footer-message** *text-string*	For example, you can include copyright information and links to additional information such as help instructions, legal notices, or a privacy policy.
Form header background color	**form-header-bgcolor** *hex-color*	The HTML hexadecimal code for the background color of the header bar across the top of the form area of the captive portal login page.
Form header message	**form-header-message** *text-string*	Text displayed in the header bar across the top of the form area of the captive portal login page. For example, **Welcome to My Cafe**. The default text is **Captive Portal User Authentication**.
Form reset button label	**form-reset-label** *label-name*	Label appearing in the button that the user can select to clear the username and password fields on the form, for example, **Reset** or **Clear**.

Table 303: Configurable Elements of a Captive Portal Login Page *(continued)*

Element	CLI Statement	Description
Form submit button label	**form-submit-label** ***label-name***	Label appearing in the button that user selects to submit their login information—for example, **Log In** or **OK**.
Header background color	**header-bgcolor** ***hex-color***	The HTML hexadecimal code for the background color of the captive portal login page header.
Header logo	**header-logo** ***filename***	Filename of the file containing the image of the logo that you want to appear at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format. You can upload a logo image file to the switch. Copy the logo to the /var/tmp directory on the switch (during the commit the files are saved to persistent locations).
Header message	**header-message** ***text-string***	Text displayed in the page header. The default text is **User Authentication**.
Post-authentication URL	**post-authentication-url** ***url***	URL to which the users are directed upon successful authentication. The default is to redirect users to the page they had originally requested.

To design the captive portal login page:

1. (Optional) Upload your logo image file to the switch:

```
user@switch> file copy
ftp://username:prompt@ftp.hostname.net/var/tmp/my-logo.jpeg
```

2. Configure the custom options to specify the background colors and text displayed in the captive portal page:

```
[edit system services captive-portal]
user@switch# set custom-options header-bgcolor #006600
set custom-options header-message “Welcome to Our Network”
set custom-options banner-message “Please enter your username and password:”
set custom-options footer-message “Copyright ©2009, Our Network”
```

NOTE: For the custom options that you do not specify, the value is taken from the standard template.

Related Documentation

- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323

CHAPTER 84

Verifying 802.1X and MAC RADIUS Authentication

Monitoring 802.1X Authentication

Purpose Use the monitoring feature to display details of authenticated users and users who have failed authentication.

Action To display authentication details in the J-Web interface, select **Monitoring > Security > 802.1X**.

To display authentication details in the CLI, enter the following commands:

- **show dot1x interface detail | display xml**
- **show dot1x interface detail <*interface*> | display xml**
- **show dot1x auth-failed-users**

Meaning The details displayed include:

- A list of authenticated users.
- The total number of users connected.
- A list of users who have failed authentication

You can also specify an interface for which the details must be displayed.

Related Documentation

- Configuring 802.1X Authentication (J-Web Procedure) on page 2332
- Configuring 802.1X Interface Settings (CLI Procedure) on page 2331
- Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on a J-EX Series Switch on page 2290

Verifying 802.1X Authentication

Purpose Verify that supplicants are being authenticated on an interface on a J-EX Series switch with the interface configured for 802.1X authentication, and display the method of authentication being used.

Action Display detailed information about an interface configured for 802.1X (here, the interface is **ge-0/0/16**):

```
user@switch> show dot1x interface ge-0/0/16.0 detail
ge-0/0/16.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Strict: Disabled
  Reauthentication: Enabled Reauthentication interval: 40 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 1
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user5, 00:30:48:8C:66:BD
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: v200
      Reauthentication due in 17 seconds
```

Meaning The sample output from the **show dot1x interface detail** command shows that the **Number of connected supplicants** is 1. The supplicant that was authenticated and is now connected to the LAN is known as **user5** on the RADIUS server and has the MAC address **00:30:48:8C:66:BD**. The supplicant was authenticated by means of the 802.1X authentication method called **Radius** authentication. When the **Radius** authentication method is used, the supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. The sample output also shows that the supplicant is connected to VLAN **v200**.

Other 802.1X authentication methods supported on J-EX Series switches in addition to the **RADIUS** method are:

- **Guest VLAN**—A nonresponsive host is granted Guest-VLAN access.
- **MAC Radius**—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.
- **Server-fail deny**—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default.

- **Server-fail permit**—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server.
- **Server-fail use-cache**—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are granted access, but new supplicants are denied LAN access.
- **Server-fail VLAN**—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)

access

Syntax

```
access {
  profile profile-name {
    authentication-order [ldap radius | none];
    accounting {
      order [radius | none];
      accounting-stop-on-access-deny;
      accounting-stop-on-failure;
    }
    radius {
      accounting-server [server-addresses];
      authentication-server [server-addresses];
    }
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure authentication, authorization, and accounting (AAA) services.

The statements are explained separately.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339

accounting

Syntax

```
accounting {
  order radius | none;
    accounting-stop-on-access-deny;
    accounting-stop-on-failure;
  }
}
```

Hierarchy Level [edit **access profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication order for authentication, authorization, and accounting (AAA) services.

Default Not enabled

Options **none**—Use no authentication for specified subscribers.

radius—Use RADIUS authentication for specified subscribers.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

accounting (Access Profile)

Syntax

```
accounting {
  accounting-stop-on-access-deny;
  accounting-stop-on-failure;
  coa-immediate-update;
  immediate-update;
  order [ accounting-method ];
  statistics (time | volume-time);
  update-interval minutes;
}
```

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS accounting parameters and enable RADIUS accounting for an access profile.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access
- Configuring How Accounting Statistics Are Collected for Subscriber Access

accounting

Syntax

```
accounting {
  events [ login change-log interactive-commands ];
  destination {
    radius {
      server {
        server-address {
          accounting-port port-number;
          secret password;
          source-address address;
          retry number;
          timeout seconds;
        }
      }
    }
    tacplus {
      server {
        server-address {
          port port-number;
          secret password;
          single-connection;
          timeout seconds;
        }
      }
    }
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure audit of TACACS+ or RADIUS authentication events, configuration changes, and interactive commands.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting
- Configuring TACACS+ System Accounting

accounting-port

Syntax accounting-port *port-number*;

Hierarchy Level [edit system accounting destination radius server *server-address*],
[edit system radius-server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the accounting port number on which to contact the RADIUS server.

Options *number*—Port number on which to contact the RADIUS server.
Default: 1813

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Authentication
- Configuring RADIUS System Accounting

accounting-server

Syntax accounting-server [*server-addresses*];

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Default Not enabled

Options *server-addresses*—One or more addresses of RADIUS authentication servers.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

accounting-session-id-format

Syntax accounting-session-id-format (decimal | description);

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the format the router or switch uses to identify the accounting session.

Default **decimal**

Options **decimal**—Use the decimal format.

description—Use the generic format, in the form: **jnpr** *interface-specifier*:*subscriber-session-id*.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Server Options for Subscriber Access
- Configuring Authentication and Accounting Parameters for Subscriber Access

accounting-stop-on-access-deny

Syntax accounting-stop-on-access-deny;

Hierarchy Level [edit **access profile** *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configures the authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if the AAA server denies access to a supplicant.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

accounting-stop-on-access-deny

Syntax accounting-stop-on-access-deny;

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS accounting to send an Acct-Stop message when the AAA server refuses a client request for access.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access

accounting-stop-on-failure

Syntax accounting-stop-on-failure;

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if a supplicant fails AAA authorization, but the RADIUS server grants access. For example, a supplicant might fail AAA authentication due to an internal error such as a timeout.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267

accounting-stop-on-failure

Syntax accounting-stop-on-failure;

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS accounting to send an Acct-Stop message when client access fails AAA but the AAA server grants access.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access

address

Syntax address *address-or-prefix*;

Hierarchy Level [edit access **address-pool** *pool-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the IP address or prefix value for clients.

Options ***address-or-prefix***—An address or prefix value.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring the Address Pool for L2TP Network Server IP Address Allocation

address-pool

Syntax

```
address-pool pool-name {
    address address-or-prefix;
    address-range <low lower-limit> <high upper-limit>;
}
```

Hierarchy Level [edit access]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allocate IP addresses for clients.

Options ***pool-name***—Name assigned to an address pool.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Address Pool for L2TP Network Server IP Address Allocation

address-range

Syntax address-range <low *lower-limit*> <high *upper-limit*>;

Hierarchy Level [edit access **address-pool** *pool-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the address range.

Options

- **high** ***upper-limit***—Upper limit of an address range.
- **low** ***lower-limit***—Lower limit of an address range.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Address Pool for L2TP Network Server IP Address Allocation

advertisement-interval

Syntax advertisement-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.

Default Disabled.

Options *seconds*—(Optional) The number of seconds.

Range: 5 through 32,768 seconds

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

attributes

Syntax

```
attributes {
  exclude {
    accounting-authentic [ accounting-on | accounting-off ];
    accounting-delay-time [ accounting-on | accounting-off ];
    accounting-session-id [ access-request | accounting-on | accounting-off | accounting-stop
      ];
    accounting-terminate-cause [ accounting-off ];
    called-station-id [ access-request | accounting-start | accounting-stop ];
    calling-station-id [ access-request | accounting-start | accounting-stop ];
    class [ accounting-start | accounting-stop ];
    dhcp-gi-address [ access-request | accounting-start | accounting-stop ];
    dhcp-mac-address [ access-request | accounting-start | accounting-stop ];
    output-filter [ accounting-start | accounting-stop ];
    event-timestamp [ accounting-on | accounting-off | accounting-start | accounting-stop
      ];
    framed-ip-address [ accounting-start | accounting-stop ];
    framed-ip-netmask [ accounting-start | accounting-stop ];
    input-filter [ accounting-start | accounting-stop ];
    input-gigapackets [ accounting-stop ];
    input-gigawords [ accounting-stop ];
    interface-description [ access-request | accounting-start | accounting-stop ];
    nas-identifier [ access-request | accounting-on | accounting-off | accounting-start |
      accounting-stop ];
    nas-port [ access-request | accounting-start | accounting-stop ];
    nas-port-id [ access-request | accounting-start | accounting-stop ];
    nas-port-type [ access-request | accounting-start | accounting-stop ];
    output-gigapackets [ accounting-stop ];
    output-gigawords [ accounting-stop ];
  }
  ignore {
    framed-ip-netmask;
    input-filter;
    logical-system-routing-instance;
    output-filter;
  }
}
```

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how the router or switch processes RADIUS attributes.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring How RADIUS Attributes Are Used for Subscriber Access

authentication-order

Syntax authentication-order [**ldap radius | none**];

Hierarchy Level [edit **access profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

Default Not enabled

Options **ldap**—Lightweight Directory Access Protocol.

none—No authentication for specified subscribers.

radius—Remote Authentication Dial-In User Service authentication.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339

authentication-order

Syntax authentication-order [*authentication-methods*];

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the order in which the Junos OS tries different authentication methods when verifying that a client can access the router or switch. For each login attempt, the software tries the authentication methods in order, from first to last.

Default password

Options **password**—Verify the client using the information configured at the **[edit access profile *profile-name* client *client-name*]** hierarchy level.

radius—Verify the client using RADIUS authentication services.

NOTE: For subscriber access management, you must always specify the radius method. Subscriber access management does not support the password keyword (the default), and authentication fails when no method is specified.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Specifying the Authentication and Accounting Methods for Subscriber Access
- Configuring Access Profiles for L2TP or PPP Parameters
- Example: Configuring CHAP Authentication with RADIUS

authentication-profile-name

Syntax authentication-profile-name *access-profile-name*;

Hierarchy Level [edit protocols **dot1x authenticator**],
[edit services **captive-portal**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the name of the access profile to be used for 802.1X, MAC RADIUS, or captive portal authentication.

Default No access profile is specified.

Options ***access-profile-name***—Name of the access profile. The access profile is configured at the [**edit access profile**] hierarchy level and contains the RADIUS server IP address and other information used for authentication.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267

- Configuring 802.1X Authentication (J-Web Procedure) on page 2332
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

authentication-server

Syntax authentication-server [*server-addresses*];

Hierarchy Level [edit **access profile** *profile-name* **radius**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Default Not enabled

Options ***server-addresses*** —Configure one or more RADIUS server addresses.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267
- **show network-access aaa statistics authentication on page 2506**
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267

authentication-whitelist

Syntax

```
authentication-whitelist {
  mac-address {
  interface interface-name;
  vlan-assignment ( vlan-id |vlan-name);
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MAC addresses for which RADIUS authentication is to be bypassed.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

authenticator

Syntax

```
authenticator {
  authentication-profile-name access-profile-name;
  interface (all | [ interface-names ]) {
    disable;
    guest-vlan ( vlan-id | vlan-name);
    mac-radius <restrict>;
    maximum-requests number;
    no-reauthentication;
    quiet-period seconds;
    reauthentication {
      interval seconds;
    }
    retries number;
    server-fail (deny | permit | use-cache | vlan-id | vlan-name);
    server-reject-vlan (vlan-id | vlan-name);
    server-timeout seconds;
    supplicant (single | single-secure | multiple);
    supplicant-timeout seconds;
    transmit-period seconds;
  }
  static mac-address {
    interface interface-name;
    vlan-assignment vlan-identifier;
  }
}
```

Hierarchy Level [edit protocols dot1x]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an authenticator for 802.1X authentication.

The statements are explained separately.

Default No static MAC address or VLAN is configured.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

captive-portal

Syntax

```
captive-portal {
  authentication-profile-name authentication-profile-name
  custom-options {
    banner-message string;
    footer-bgcolor color;
    footer-message string;
    form-header-bgcolor color;
    form-header-message string;
    form-reset-label label name;
    form-submit-label label name;
    header-bgcolor color;
    header-logo filename;
    header-message string;
    post-authentication-url url-string;
  }
  interface (all | [interface-names]) {
    quiet-period seconds;
    retries number-of-retries;
    server-timeout seconds;
    reauthentication-timeout seconds;
    supplicant (multiple | single | single-secure);
  }
  secure-authentication (http | https);
}
```

Hierarchy Level [edit services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure captive portal to authenticate clients connected to the switch for access to the network.

The remaining statements are explained separately.

Default Captive portal is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ca-type

Syntax

```
ca-type {
  number {
    ca-value value;
  }
}
```

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name* **location civic-based**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the address elements. These elements are included in the location information to be advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

For further information about the values that can be used to comprise the location,, refer to RFC 4776, *Dynamic Host Configuration Protocol (DHCPv4 and DHCPv6) Option for Civic Addresses Configuration Information*. A subset of those values is provided below.

The **ca-value** statement is explained separately.

Default Disabled.

Options **value**—Civic address elements that represent the civic or postal address. Values are:

- **0**—A code that specifies the language used to describe the location.
- **16**—The leading-street direction, such as “N”.
- **17**—A trailing street suffix, such as “SW”.
- **18**—A street suffix or type, such as “Ave” or “Platz”.
- **19**—A house number, such as “6450”.
- **20**—A house-number suffix, such as “A” or “1/2”.
- **21**—A landmark, such as “Stanford University”.
- **22**—Additional location information, such as “South Wing”.
- **23**—The name and occupant of a location, such as “Carrillo's Holiday Market”.
- **24**—A house-number suffix, such as “95684”.
- **25**—A building structure, such as “East Library”.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 2489**

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302
- Configuring LLDP-MED (CLI Procedure) on page 2346

ca-value

Syntax ca-value *value*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*) **location civic-based ca-type** *number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure location information, such as street address and city, that is indexed by the **ca-type** code. This information is advertised from the switch to the MED and is used during emergency calls to identify the location of the MED.

Default Disabled.

Options *value*—Specify a value that correlates to the **ca-type**. See **ca-type** for a list of codes and suggested values.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 2489**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302
- Configuring LLDP-MED (CLI Procedure) on page 2346

civic-based

Syntax

```
civic-based {
  what number;
  country-code code;
  ca-type {
    number {
      ca-value value;
    }
  }
}
```

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*) **location**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the geographic location to be advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

The statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 2489**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302
- Configuring LLDP-MED (CLI Procedure) on page 2346

country-code

Syntax country-code *code*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the two-letter country code to include in the location information. Location information is advertised from the switch to the MED, and is used during emergency calls to identify the location of the MED. The country code is required when configuring LLDP-MED based on location.

Default Disabled.

Options ***code***—Two-letter ISO 3166 country code in capital ASCII letters; for example, US or DE.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 2489**
- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302
- Configuring LLDP-MED (CLI Procedure) on page 2346

custom-options

Syntax

```
custom-options {
  banner-message string;
  footer-bgcolor color;
  footer-message string;
  form-header-bgcolor color;
  form-header-message string;
  form-reset-label label name;
  form-submit-label label name;
  header-bgcolor color;
  header-logo filename;
  header-message string;
  post-authentication-url url-string;
}
```

Hierarchy Level [edit services **captive-portal**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the design elements of a captive portal login page.

Options

banner-message—The first screen displayed before the captive portal login page is displayed—for example, a disclaimer message.

Range: 1–2047 characters

footer-bgcolor —The hexadecimal color code for the color of the footer bar across the bottom of the captive portal login page—for example, #2E8B57 (sea green).

Values: # symbol followed by six characters.

footer-message—Text message displayed in the footer bar across the bottom of the captive portal login page.

Range: 1–2047 characters

form-header-bgcolor —The hexadecimal color code for the background color of the header bar across the top of the form area of the captive portal login page.

Values: # symbol followed by six characters.

form-header-message—Text message displayed in the header bar across the top of the form area of the captive portal login page.

Range: 1–255 characters

Default: **Captive Portal User Authentication**

form-reset-label—Label displayed in the button that the user can select to clear the username and password fields on the form.

Range: 1–255 characters

Default: **Reset**

form-submit-label —Label displayed in the button that the user selects to submit their login information—for example, **Log In** or **OK**.

Range: 1–255 characters

Default: Log In

header-bgcolor—The hexadecimal color code for the color of the header bar across the top of the captive portal login page.

Values: # symbol followed by six characters.

header-logo—Filename of the file containing the image of the logo displayed at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.

header-message—Text displayed in the header bar across the bottom of the captive portal login page.

Range: 1–2047 characters

Default: User Authentication

post-authentication-url—URL to which the users are directed upon successful authentication—for example **www.mycafe.com**.

Range: 1–255 characters

Default: The page originally requested by the user.

Required Privilege Level

routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

destination

Syntax

```
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        secret password;
        source-address address;
        retry number;
        timeout seconds;
      }
    }
  }
  tacplus {
    server {
      server-address {
        port port-number;
        secret password;
        single-connection;
        timeout seconds;
      }
    }
  }
}
```

Hierarchy Level [edit system accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication server.

Options The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting
- Configuring TACACS+ System Accounting

disable

Syntax disable;

Hierarchy Level [edit protocols **dot1x authenticator** interface (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable 802.1X authentication on a specified interface or all interfaces.

Default 802.1X authentication is disabled on all interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

disable

Syntax disable;

Hierarchy Level [edit protocols lldp],
[edit protocols interface lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the LLDP configuration on the switch or on one or more interfaces.

Default If you do not configure LLDP, it is disabled on the switch and on specific switch interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

dot1x

Syntax

```
dot1x {
  authenticator {
    authentication-profile-name access-profile-name;
    interface (all | [ interface-names ]) {
      disable;
      guest-vlan (vlan-id | vlan-name);
      mac-radius <restrict>;
      maximum-requests number;
      no-reauthentication;
      quiet-period seconds;
      reauthentication {
        interval seconds;
      }
      retries number;
      server-fail (deny | permit | use-cache | vlan-id | vlan-name);
      server-reject-vlan (vlan-id | vlan-name);
      server-timeout seconds;
      supplicant (single | single-secure | multiple);
      supplicant-timeout seconds;
      transmit-period seconds;
    }
    static mac-address {
      interface interface-names;
      vlan-assignment (vlan-id |vlan-name);
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure 802.1X authentication for Port-Based Network Access Control. 802.1X authentication is supported on interfaces that are members of private VLANs (PVLANs).

The remaining statements are explained separately.

Default 802.1X is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

elin

Syntax elin *number*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name* **location**)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the Emergency Line Identification Number (ELIN) as location information. Location information is advertised from the switch to the MED device and is used during emergency calls to identify the location of the MED device.

Default Disabled.

Options ***number***—Configure a 10-digit number (area code and telephone number).

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

ethernet-port-type-virtual

Syntax ethernet-port-type-virtual;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the physical port type the router or switch uses to authenticate clients. The router or switch passes a port type of **ethernet** in RADIUS attribute 61 (NAS-Port-Type) by default. This statement specifies a port type of **virtual**.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

events

Syntax events [*events*];

Hierarchy Level [edit system **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the types of events to track and log.

Options ***events***—Event types; can be one or more of the following:

- **change-log**—Audit configuration changes.
- **interactive-commands**—Audit interactive commands (any command-line input).
- **login**—Audit logins.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

  output-gigapackets [ accounting-stop ];
  output-gigawords [ accounting-stop ];
}
```

Hierarchy Level [edit access profile *profile-name* radius **attributes**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to exclude the specified attributes from the specified type of RADIUS message.

Not all attributes are available in all types of RADIUS messages. By default, the router or switch includes the specified attributes in RADIUS Access-Request, Acct-On, Acct-Off, Acct-Start, and Acct-Stop messages.

Options RADIUS attribute type—RADIUS attribute or Juniper Networks VSA number and name.

- **accounting-authentic**—RADIUS attribute 45, Acct-Authentic.
- **accounting-delay-time**—RADIUS attribute 41, Acct-Delay-Time.
- **accounting-session-id**—RADIUS attribute 44, Acct-Session-Id.
- **accounting-terminate-cause**—RADIUS attribute 49, Acct-Terminate-Cause.
- **called-station-id**—RADIUS attribute 30, Called-Station-Id.
- **calling-station-id**—RADIUS attribute 31, Calling-Station-Id.

- **class**—RADIUS attribute 25, Class.
- **dhcp-gi-address**—Juniper VSA 26-57, DHCP-GI-Address.
- **dhcp-mac-address**—Juniper VSA 26-56, DHCP-MAC-Address.
- **event-timestamp**—RADIUS attribute 55, Event-Timestamp.
- **framed-ip-address**—RADIUS attribute 8, Framed-IP-Address.
- **framed-ip-netmask**—RADIUS attribute 9, Framed-IP-Netmask.
- **input-filter**—Juniper VSA 26-10, Ingress-Policy-Name.
- **input-gigapackets**—Juniper VSA 26-42, Acct-Input-Gigapackets.
- **input-gigawords**—RADIUS attribute 52, Acct-Input-Gigawords.
- **interface-description**—Juniper VSA 26-53, Interface-Desc.
- **nas-identifier**—RADIUS attribute 32, NAS-Identifier.
- **nas-port**—RADIUS attribute 5, NAS-Port.
- **nas-port-id**—RADIUS attribute 87, NAS-Port-Id.
- **nas-port-type**—RADIUS attribute 61, NAS-Port-Type.
- **output-filter**—Juniper VSA 26-11, Egress-Policy-Name.
- **output-gigapackets**—Juniper VSA 25-43, Acct-Output-Gigapackets.
- **output-gigawords**—RADIUS attribute 53, Acct-Output-Gigawords.

RADIUS message type

- **access-request**—RADIUS Access-Accept messages.
- **accounting-off**—RADIUS Accounting-Off messages.
- **accounting-on**—RADIUS Accounting-On messages.
- **accounting-start**—RADIUS Accounting-Start messages.
- **accounting-stop**—RADIUS Accounting-Stop messages.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access

fast-start

Syntax fast-start *count*;

Hierarchy Level [edit protocols lldp-med]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) advertisements sent from the switch in the first second after it has detected an LLDP-MED device (such as an IP telephone).

Options **count**—Number of advertisements.

Range: 1 through 10

Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show lldp on page 2489**

forwarding-class

Syntax forwarding-class < assured-forwarding | best-effort | expedited-forwarding |network-control >;

Hierarchy Level [edit **ethernet-switching-options voip interface** <all | *interface-name* | access-ports]>

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches, configure the forwarding class used to handle packets on the VoIP interface.

Default Disabled.

Options *class*—Forwarding class:

- **assured-forwarding**— Assured forwarding (AF)—Provides a group of values you can define and includes four subclasses: AF1, AF2, AF3, and AF4, each with three drop probabilities: low, medium, and high.
- **best-effort**—Provides no service profile. For the best effort forwarding class, loss priority is typically not carried in a class-of-service (CoS) value, and random early detection (RED) drop profiles are more aggressive.
- **expedited-forwading**—Provides a low loss, low latency, low jitter, assured bandwidth, end-to-end service.
- **network-control**—Provides a typically high priority because it supports protocol control.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

guest-vlan

Syntax guest-vlan (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the VLAN to which an interface is moved when no 802.1X supplicants are connected on the interface. The VLAN specified must already exist on the switch.

Default None

Options ***vlan-id***—VLAN tag identifier of the guest VLAN.

vlan-name—Name of the guest VLAN.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

hold-multiplier

Syntax hold-multiplier *number*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded. The default value is 4 (or 120 seconds).

Default Disabled.

Options *number*—A number used as a multiplier.
Range: 2 through 10
Default: 4 (or 120 seconds)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

ignore

Syntax

```
ignore {
  framed-ip-netmask;
  input-filter;
  logical-system-routing-instance;
  output-filter;
}
```

Hierarchy Level [edit access profile *profile-name* radius **attributes**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. By default, the router or switch processes the attributes it receives from the external server.

Options

framed-ip-netmask—Framed-IP-Netmask (RADIUS attribute 9).

input-filter—Ingress-Policy-Name (VSA 26-10).

logical-system-routing-instance—Virtual-Router (VSA 26-1).

output-filter—Egress-Policy-Name (VSA 26-11).

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access

immediate-update

Syntax

```
immediate-update;
```

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to send an Acct-Update message to the RADIUS accounting server on receipt of a response (for example, an ACK or timeout) to the Acct-Start message.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface (all | [ interface-names ]) {
  disable;
  guest-vlan (vlan-name | vlan-id);
  mac-radius <restrict>;
  maximum-requests number;
  no-reauthentication;
  quiet-period seconds;
  reauthentication {
    interval seconds;
  }
  retries number;
  server-fail (deny | permit | use-cache | vlan-id | vlan-name);
  server-reject-vlan (vlan-id | vlan-name);
  server-timeout seconds;
  supplicant (single | single-secure | multiple);
  supplicant-timeout seconds;
  transmit-period seconds;
}
```

Hierarchy Level [edit protocols **dot1x authenticator**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure 802.1X authentication for Port-Based Network Access Control for all interfaces or for specific interfaces.

Options **all**—Configure all interfaces for 802.1X authentication.

[***interface-names***]— List of names of interfaces to configure for 802.1X authentication.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface-description-format

Syntax interface-description-format (adapter | sub-interface);

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the information that is included in or omitted from the interface description that the router or switch passes to RADIUS for inclusion in the RADIUS attribute 87 (NAS-Port-Id). By default, the router or switch includes both the subinterface and the adapter in the interface description.

Options **adapter**—Include only the adapter in the interface description.

sub-interface—Include only the subinterface in the interface description.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access

interface (Captive Portal)

Syntax

```
interface (all | [interface-names]) {
  quiet-period seconds;
  reauthentication-timeout seconds;
  retries number-of-retries;
  server-timeout seconds;
  supplicant ( multiple | single | single-secure);
}
```

Hierarchy Level [edit service captive-portal]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure captive portal authentication for all interfaces or for specific interfaces.

Options

all—All interfaces to be configured for captive portal authentication.

[*interface-names*]—List of names of interfaces to be configured for captive portal authentication.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface (all | interface-name) {
  disable;
}
```

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol (LLDP) on all interfaces or on a specific interface.

Default None

Options

all—All interfaces on the switch.

interface-name—Name of a specific interface.

The remaining statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface (all | interface-name) {
    disable;
    location {
        elin number;
        civic-based {
            what number;
            country-code code;
            ca-type {
                number {
                    ca-value value;
                }
            }
        }
    }
}
```

Hierarchy Level [edit protocols lldp-med]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) on all interfaces or on a specific interface.

Default Not enabled

Options **all**—All interfaces on the switch.

interface-name—Name of a specific interface.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface

Syntax interface [*interface-names*];

Hierarchy Level [edit protocols **dot1x authenticator authentication-profile-name static** *mac-address*], [edit **ethernet-switching-options authentication-whitelist**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interfaces on which the specified MAC addresses are allowed to bypass RADIUS authentication and allowed to connect to the LAN without authentication.

Options ***interface-names***—List of interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface

Syntax

```
interface (all | [interface-name] | access-ports) {
  vlan vlan-name );
  forwarding-class <assured-forwarding | best-effort | expedited-forwarding |
    network-control>;
}
```

Hierarchy Level [edit ethernet-switching-options voip]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable voice over IP (VoIP) for all interfaces or specific interfaces.

Options **all** | ***interface-name*** | **access-ports**—Enable VoIP on all interfaces, on a specific interface, or on all access ports.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up VoIP with 802.1X and LLDP-MED on a J-EX Series Switch on page 2302

- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 2315

lldp

Syntax

```
lldp {
  disable;
  advertisement-interval seconds;
  fast-start number;
  hold-multiplier number;
  interface (all | [interface-name]) {
    disable;
  }
  lldp-configuration-notification-interval seconds;
  management-address ip-management-address;
  ptopo-configuration-maximum-hold-time seconds;
  ptopo-configuration-trap-interval seconds;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag (detail | disable | receive | send);
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The statements are explained separately.

Default LLDP is enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

lldp-configuration-notification-interval

Syntax lldp-configuration-notification-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often SNMP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, trap notifications of database changes are disabled.

Default SNMP trap notifications of LLDP database changes are disabled.

Options ***seconds***—Interval between trap notifications about LLDP database changes.
Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show lldp on page 2489**

lldp-med

Syntax

```
lldp-med {
  disable;
  fast-start number;
  interface (all | interface-name) {
    disable;
    location {
      elin number;
      civic-based {
        what number;
        country-code code;
        ca-type {
          number {
            ca-value value;
          }
        }
      }
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Link Layer Discovery Protocol–Media Endpoint Discovery. LLDP-MED is an extension of LLDP. The switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations for emergency services. LLDP-MED is defined in the standard ANSI/TIA-1057 by the Telecommunications Industry Association (TIA).

The statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

location

Syntax

```
location {
  elin number;
  civic-based {
    what number;
    country-code code;
    ca-type{
      number {
        ca-value value;
      }
    }
  }
}
```

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the location information. Location information is advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

The statements are explained separately.

Default Disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

- Configuring LLDP-MED (CLI Procedure) on page 2346

mac-radius

Syntax mac-radius <flap-on-disconnect> <restrict>;

Hierarchy Level [edit protocols **dot1x authenticator interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.

If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.

To restrict authentication to MAC RADIUS only, use the **restrict** option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.

Options

flap-on-disconnect—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the **restrict** option is also set.

restrict—(Optional) Restricts authentication to MAC RADIUS only. When **mac-radius restrict** is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

management-address

Syntax management-address *ip-management-address*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the management address of the switch to be used in the LLDP Management type, length, and value (TLV) .

Default LLDP Management TLV uses the IP address of the switch's management Ethernet interface (**me0**) or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis.

Options ***ip-management-address***—Management address for the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

maximum-requests

Syntax maximum-requests *number*;

Hierarchy Level [edit protocols dot1x authenticator interface (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out.

Default Two retransmission attempts

Options ***number***—Number of retransmission attempts.
Range: 1 through 10
Default: 2

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring 802.1X Interface Settings (CLI Procedure) on page 2331

nas-identifier

Syntax nas-identifier *identifier-value*;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the value for the client RADIUS attribute 32 (NAS-Identifier). This attribute is used for authentication and accounting requests.

Options ***identifier-value***—String to use for authentication and accounting requests.

Range: 1 to 64 characters

Required Privilege Level admin—To view this statement in the configuration.
admin–control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access

nas-port-extended-format

Syntax

```
nas-port-extended-format {
  adapter-width width;
  port-width width;
  slot-width width;
  stacked-vlan-width width;
  vlan-width width;
}
```

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute.

Options

adapter-width *width*—Number of bits in the adapter field.

port-width *width*—Number of bits in the port field.

slot-width *width*—Number of bits in the slot field.

stacked-vlan-width *width*—Number of bits in the SVLAN ID field.

vlan-width *width*—Number of bits in the VLAN ID field.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access

no-reauthentication

Syntax no-reauthentication;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, disables reauthentication.

Default Not disabled

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

options

Syntax

```
options {
  accounting-session-id-format (decimal | description);
  client-accounting-algorithm (direct | round-robin);
  client-authentication-algorithm (direct | round-robin);
  ethernet-port-type-virtual;
  interface-description-format [sub-interface | adapter];
  nas-identifier identifier-value;
  nas-port-extended-format {
    adapter-width width;
    port-width width;
    slot-width width;
    stacked-vlan-width width;
    vlan-width width;
  }
  revert-interval interval;
  vlan-nas-port-stacked-format;
}
```

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the options used by RADIUS authentication and accounting servers.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Parameters for Subscriber Access
- RADIUS Server Options for Subscriber Access

order

Syntax order [**radius | none**];

Hierarchy Level [edit **access profile** *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending accounting messages and updates.

Default Not enabled

Options **none**—No accounting for specified subscribers.

radius—Remote Authentication Dial-In User Service accounting for specified subscribers.

[radius | none]— Use multiple types of accounting in the order specified. RADIUS accounting is initially used. However, if RADIUS servers are not available, no accounting is done.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339

order

Syntax order [*accounting-method*];

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the order in which the Junos OS tries different accounting methods for client activity. When a client logs in, the software tries the accounting methods in the specified order.

Options ***accounting-method***—One or more accounting methods. When a client logs in, the software tries the accounting methods in the following order, from first to last. The only valid value is **radius** for RADIUS accounting.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access

port

Syntax port *port-number*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the RADIUS server.

Options ***port-number***—Port number on which to contact the RADIUS server.
Default: 1812 (as specified in RFC 2865)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Router or Switch Interaction with RADIUS Servers
- Configuring Authentication and Accounting Parameters for Subscriber Access

port (RADIUS Server)

Syntax port *port-number*;

Hierarchy Level [edit system radius-server *address*],
[edit system accounting destination **radius server** *address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the RADIUS server.

Options ***number***—Port number on which to contact the RADIUS server.
Default: **1812** (as specified in RFC 2865)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Authentication

port (TACACS+ Server)

Syntax port *port-number*;

Hierarchy Level [edit system accounting destination tacplus server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the TACACS+ server.

Options *number*—Port number on which to contact the TACACS+ server.
Default: 49

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ System Accounting

profile

Syntax

```
profile profile-name {
  accounting {
    order [radius | none];
    accounting-stop-on-access-deny;
    accounting-stop-on-failure;
  }
  authentication-order [authentication-method];
  radius {
    accounting-server [server-addresses];
    authentication-server [server-addresses];
  }
}
```

Hierarchy Level [edit access]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

Default Not enabled

Options *profile-name* —Profile name of up to 32 characters.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339

ptopo-configuration-maximum-hold-time

Syntax ptopo-configuration-maximum-hold-time *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure how long to maintain the physical topology database entries. The physical topology identifies the devices on the network and their physical interconnections.

Options ***seconds***—Time to maintain physical topology database entries.
Default: 300
Range: 1 through 2147483647

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show lldp on page 2489**

ptopo-configuration-trap-interval

Syntax ptopo-configuration-trap-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how often SNMP trap notifications are sent regarding changes in physical topology global statistics.

Default SNMP trap notifications of changes in physical topology global statistics are disabled.

Options ***seconds***—Interval between SNMP trap notifications about physical topology global statistics.
Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

quiet-period

Syntax quiet-period *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the number of seconds the interface remains in the wait state following a failed authentication attempt by a supplicant before reattempting authentication.

Default 60 seconds

Options ***seconds***—Number of seconds the interface remains in the wait state.
Range: 0 through 65,535 seconds
Default: 60 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show network-access aaa statistics authentication on page 2506**
- Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch on page 2267

quiet-period (Captive Portal)

Syntax quiet-period *seconds*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure time, in seconds, after a user exceeds the maximum number of retries before they can attempt to authenticate.

Options ***seconds***—Number of seconds.
Range: 1–65535
Default: 60

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

radius

Syntax

```
radius {
  accounting-server [server-addresses];
  authentication-server [server-addresses];
}
```

Hierarchy Level [edit **access profile** *profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Remote Authentication Dial-In User Service (RADIUS) servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple **radius**statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

The statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

radius-server

Syntax

```
radius-server server-address {
    accounting-port port-number;
    port port-number;
    retry attempts;
    routing-instance routing-instance-name;
    secret password;
    source-address source-address;
    timeout seconds;
}
```

Hierarchy Level

[edit access],
[edit access profile *profile-name*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure RADIUS for subscriber access management, L2TP, or PPP.

To configure multiple RADIUS servers, include multiple **radius-server** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Options

server-address—Address of the RADIUS authentication server.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication for L2TP
- Configuring the PPP Authentication Protocol
- Configuring RADIUS Authentication
- Configuring Authentication and Accounting Parameters for Subscriber Access

reauthentication

Syntax

```
reauthentication {
    interval seconds;
}
```

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, specify reauthentication parameters.

Default 3600 seconds.

Options **disable**—Disables the periodic reauthentication of the supplicant.

interval *seconds* —Sets the periodic reauthentication time interval. The range is 1 through 65,535 seconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

retries

Syntax retries *number*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

Default 3 retries

Options ***number*** —Number of retries.
Range: 1 through 10
Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring 802.1X Interface Settings (CLI Procedure) on page 2331

retries (Captive Portal)

Syntax retries *number-of-tries*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of times the user can attempt to submit authentication information.

Options ***number-of-tries***—Number of authentication attempts by user.
Range: 1–65535
Default: 3

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

retry

Syntax retry *attempts*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the number of times that the router or switch is allowed to attempt to contact a RADIUS authentication or accounting server.

Options ***attempts***—Number of times that the router is allowed to attempt to contact a RADIUS server.

Range: 1 through 10

Default: 3

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **timeout on page 2454**

retry

Syntax retry *number*;

Hierarchy Level [edit system radius-server *server-address*],
[edit system accounting destination radius server *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.

Options *number*—Number of retries allowed for contacting a RADIUS server.

Range: 1 through 10

Default: 3

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication
- Configuring RADIUS System Accounting
- **timeout on page 2453**

revert-interval

Syntax revert-interval *interval*;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time the router or switch waits after a server has become unreachable. The router or switch rechecks the connection to the server when the specified interval expires. If the server is then reachable, it is used in accordance with the order of the server list.

Options *interval*—Amount of time to wait.

Range: 0 through 4294967295 seconds

Default: 60 seconds

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Server Options for Subscriber Access
- Configuring Authentication and Accounting Parameters for Subscriber Access

routing-instance

Syntax routing-instance *routing-instance-name*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the routing instance used to send RADIUS packets to the RADIUS server.

Options ***routing-instance-name***—Routing instance name.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the PPP Authentication Protocol
- Configuring Authentication and Accounting Parameters for Subscriber Access

secret

Syntax secret *password*;

Hierarchy Level [edit access profile *profile-name* **radius-server** *server-address*],
[edit access radius-disconnect *client-address*],
[edit access **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the password to use with the RADIUS server. The secret password used by the local router or switch must match that used by the server.

Options ***password***—Password to use; it can include spaces if the character string is enclosed in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Authentication and Accounting Parameters for Subscriber Access
- Configuring Router or Switch Interaction with RADIUS Servers
- Example: Configuring CHAP Authentication with RADIUS
- Configuring RADIUS Authentication for L2TP
- Configuring the RADIUS Disconnect Server for L2TP

secret

Syntax secret *password*;

Hierarchy Level [edit system accounting destination radius **server** *server-address*],
[edit system accounting destination tacplus **server** *server-address*],
[edit system radius-server *server-address*],
[edit system **tacplus-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the password to use with the RADIUS or TACACS+ server. The secret password used by the local router or switch must match that used by the server.

Options ***password***—Password to use; can include spaces included in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Authentication
- Configuring TACACS+ Authentication
- Configuring TACACS+ System Accounting
- Configuring RADIUS System Accounting

secure-authentication

Syntax secure-authentication (http | https);

Hierarchy Level [edit services **captive-portal**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable HTTP or HTTPS access on the captive portal interface.

Default **http**

Options **http**—Enables HTTP access on the captive portal interface.

https—Enables HTTPS access on the captive portal interface. HTTPS is recommended.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

server (RADIUS Accounting)

Syntax

```
server {
  server-address {
    accounting-port port-number;
    retry number
    secret password;
    source-address address;
    timeout seconds;
  }
}
```

Hierarchy Level [edit system accounting destination radius]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS logging.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting

server (TACACS+ Accounting)

Syntax

```
server {
  server-address {
    port port-number;
    secret password;
    single-connection;
    timeout seconds;
  }
}
```

Hierarchy Level [edit system accounting destination tacplus]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure TACACS+ logging.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ System Accounting

server-fail

Syntax server-fail (deny | permit | use-cache | *vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches configured for 802.1X authentication, specify the server fail fallback action the switch takes when all RADIUS authentication servers are unreachable.

When you specify the action ***vlan-name*** or ***vlan-id***, the VLAN must already be configured on the switch.

Default Authentication is denied.

Options **deny**—Force fail the supplicant authentication. No traffic will flow through the interface.

permit—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.

use-cache—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.

vlan-id—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

vlan-name—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

server-reject-vlan

Syntax server-reject-vlan (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPOL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPOL Access-Reject message is ignored.

When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.

Default None

Options ***vlan-id*** —Numeric identifier of the VLAN to which the supplicant is moved.

vlan-name—Name of the VLAN to which the supplicant is moved.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

server-timeout

Syntax server-timeout *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-name*])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure the amount of time a port will wait for a reply when relaying a response from the supplicant to the authentication server before timing out and invoking the server-fail action.

Default 30 seconds

Options ***seconds*** —Number of seconds.
Range: 1 through 60 seconds
Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

server-timeout (Captive Portal)

Syntax server-timeout *seconds*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the time in seconds an interface will wait for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.

Options ***seconds***—Number of seconds.
Range: 1–65535
Default: 20

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

session-expiry

Syntax session-expiry *seconds*;

Hierarchy Level [edit services **captive-portal interface** (all | *interface-names*)]]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum duration in seconds of a session.

Options ***seconds***—Duration of session.
Range: 1 through 65535
Default: 3600

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Setting Up Captive Portal Authentication on a J-EX Series Switch on page 2323
- Configuring Captive Portal Authentication (CLI Procedure) on page 2350

single-connection

Syntax single-connection;

Hierarchy Level [edit system accounting destination tacplus-server *server-address*]
[edit system **tacplus-server** *server-address*],

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ Authentication
- Configuring TACACS+ System Accounting

source-address

Syntax source-address *source-address*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a source address for each configured RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address.

Options ***source-address***—A valid IPv4 address configured on one of the router or switch interfaces. On M Series routers only, the source address can be an IPv6 address and the UDP source port is 514.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Router or Switch Interaction with RADIUS Servers
- Configuring Authentication and Accounting Parameters for Subscriber Access
- Example: Configuring CHAP Authentication with RADIUS

source-address (NTP, RADIUS, System Logging, or TACACS+)

Syntax source-address *source-address*;

Hierarchy Level [edit system accounting destination radius **server** *server-address*],
[edit system accounting destination tacplus **server** *server-address*],
[edit system **ntp**],
[edit system radius-server *server-address*],
[edit system **syslog**],
[edit system **tacplus-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine.

Options ***source-address***—A valid IP address configured on one of the router or switch interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all **host *hostname*** statements at the **[edit system syslog]** hierarchy level, but not for messages directed to the other Routing Engine..

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Synchronizing and Coordinating Time Distribution Using NTP
- Specifying an Alternative Source Address for System Log Messages

static

Syntax

```
static mac-address {
  interface interface-names;
  vlan-assignment (vlan-id |vlan-name );
}
```

Hierarchy Level [edit protocols **dot1x authenticator authentication-profile-name**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.

Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.

You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.

Options ***mac-address*** —The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

statistics

Syntax statistics (time | volume-time);

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to collect time statistics, or both volume and time statistics, for the sessions being managed by AAA.

Options **time**—Collect uptime statistics only.

volume-time—Collect both volume and uptime statistics. This option is not available for Mobile IP.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Mobile IP Home Agent Elements and Behavior
- Configuring Authentication and Accounting Parameters for Subscriber Access

supplicant

Syntax supplicant (multiple | single | single-secure);

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-names*])],
[edit services **captive-portal interface** (all | *interface-names*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the method used to authenticate clients for 802.1X or captive portal authentication.

Default **single**

Options

single—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.

single-secure—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.

multiple—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

supplicant-timeout

Syntax supplicant-timeout *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-name*])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, configure how long the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request.

Default 30 seconds

Options ***seconds*** —Number of seconds.
Range: 1 through 60 seconds
Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

tacplus

Syntax

```
tacplus {
  server {
    server-address {
      port port-number;
      secret password;
      single-connection;
      timeout seconds;
    }
  }
}
```

Hierarchy Level [edit system accounting destination]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Terminal Access Controller Access Control System Plus (TACACS+).

Options ***server-address***—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ System Accounting

timeout

Syntax timeout *seconds*;

Hierarchy Level [edit system radius-server *server-address*],
[edit system **tacplus-server** *server-address*],
[edit system accounting destination radius server server-address],
[edit system accounting destination tacplus server server-address]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time that the local router or switch waits to receive a response from a RADIUS or TACACS+ server.

Options ***seconds***—Amount of time to wait.

Range: 1 through 90 seconds

Default: 3 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication
- Configuring TACACS+ Authentication
- **retry on page 2438**

timeout (RADIUS)

Syntax timeout *seconds*;

Hierarchy Level [edit access **radius-server** *server-address*],
[edit access profile *profile-name* **radius-server** *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time that the local router or switch waits to receive a response from a RADIUS server.

Options ***seconds***—Amount of time to wait.

Range: 1 through 90 seconds

Default: 3 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag ;
}
```

Hierarchy Level [edit protocols dot1x]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for the 802.1X protocol.

Default Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

file *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabytes number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size**option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **config-internal**—Trace internal configuration operations.
- **general**—Trace general operations.
- **normal**—Trace normal operations.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **state**—Trace protocol state changes.
- **task**—Trace protocol task operations.
- **timer**—Trace protocol timer operations.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restricted file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify gigabyte

Range: 10 KB through 1gigabyte

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag (detail | disable | receive | send);
}
```

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for the LLDP protocol.

Default Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **config**—Trace configuration operations.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restrict file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB
Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

transmit-delay

Syntax transmit-delay *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the delay between 2 successive LLDP advertisements.

Default Disabled.

Options *seconds*—Number of seconds between two successive LLDP advertisements.
Range: 1 through 8192 seconds
Default: 2

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show lldp on page 2489**
- Configuring LLDP (CLI Procedure) on page 2344

transmit-period

Syntax transmit-period *seconds*;

Hierarchy Level [edit protocols **dot1x authenticator interface** (all | [*interface-name*])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For 802.1X authentication, how long the port waits before retransmitting the initial EAPOL PDUs to the supplicant.

Default 30 seconds

Options *seconds*—Number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant.

Range: 1 through 65,535 seconds

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring 802.1X Interface Settings (CLI Procedure) on page 2331
- 802.1X for J-EX Series Switches Overview on page 2253

update-interval

Syntax update-interval *minutes*;

Hierarchy Level [edit access profile *profile-name* **accounting**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the amount of time that the router or switch waits before sending a new accounting update.

Options ***minutes***—Amount of time between updates, in minutes.

Range: 10 through 1440 minutes

Default: No updates

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access

vlan-assignment

Syntax vlan-assignment (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols **dot1x authenticator authentication-profile-name static** *mac-address*], [edit **ethernet-switching-options authentication-whitelist**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.

Options ***vlan-id*** | ***vlan-name***—The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

vlan-nas-port-stacked-format

Syntax vlan-nas-port-stacked-format;

Hierarchy Level [edit access profile *profile-name* radius **options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS attribute 5 (NAS-Port) to include the S-VLAN ID, in addition to the VLAN ID, for subscribers on Ethernet interfaces.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Authentication and Accounting Parameters for Subscriber Access

vlan

Syntax vlan (*vlan-id* | *vlan-name* | untagged);

Hierarchy Level [edit **ethernet-switching-options voip interface** (all | [*interface-name* | access-ports])

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches, specify the VLAN name or VLAN tag identifier associated with the VLAN to be sent from the authenticating server to the IP phone.

Options *vlan-name*—Name of a VLAN.

vlan-id—The VLAN tag identifier.

Range: 0 through 4095. Tags 0 and 4095 are reserved by the Junos OS, and you should not configure them.

untagged—Allow untagged VLAN traffic.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring VoIP on a J-EX Series Switch Without Including LLDP-MED Support on page 2315

voip

Syntax

```
voip {
  interface (all | [interface-name | access-ports]) {
    vlan vlan-name );
    forwarding-class <assured-forwarding | best-effort | expedited-forwarding |
      network-control>;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure voice over IP (VoIP) interfaces.

The statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

what

Syntax what *number*;

Hierarchy Level [edit protocols **lldp-med interface** (all | *interface-name*) **location civic-based**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the location to which the DHCP entry refers. This information is advertised, along with other location information, from the switch to the MED. It is used during emergency calls to identify the location of the MED.

Options **0** and **1** should not be used unless it is known that the DHCP client is in close physical proximity to the server or network element.

Default 1

Options *number*—Location:

- **0**—Location of the DHCP server.
- **1**—Location of a network element believed to be closest to the client.
- **2**—Location of the client.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

CHAPTER 86

Operational Commands for 802.1X

clear captive-portal

Syntax **clear captive-portal (firewall** [*interface-names*] **| interface (all |** [*interface-names*]**) | mac-address** [*mac-addresses*])

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Reset the authentication state of a captive portal interface or captive-portal firewall statistics on one or more interfaces.

Options

firewall [*interface-names*]—Resets captive portal statistics on all interfaces or on the specified interface.

interface (all | *interface-names*)—Resets the authentication state of users connected to all interfaces or the specified interfaces.

mac-address *mac-addresses*—Resets the authentication state for the specified MAC addresses.

List of Sample Output

clear captive-portal interface on page 2467
clear captive-portal interface on page 2467
clear captive-portal mac-address on page 2467
clear captive-portal firewall on page 2467

Output Fields Table 304 on page 2466 lists the output fields for the **clear captive-portal interface** command. (The **clear captive-portal firewall** and **clear captive-portal mac-address** commands have no output). Output fields are listed in the approximate order in which they appear.

Table 304: clear captive-portal interface Output Fields

Field Name	Field Description
Interface	Interface on which captive portal has been configured.

Table 304: clear captive-portal interface Output Fields *(continued)*

Field Name	Field Description
State	The state of the port: • **Authenticated**—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback. • **Authenticating**—The client is authenticating through the RADIUS server. • **Connecting**—Switch is attempting to contact the RADIUS server. • **Initialize**—The interface link is down. • **Held**—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.
MAC address	The MAC address of the connected client on the interface.
User	Users connected to the captive portal interface.

clear captive-portal interface

```
user@switch> clear captive-portal interface
ge-0/0/3.0
```

clear captive-portal interface

```
user@switch> clear captive-portal interface
Captive Portal Information:
Interface      State          MAC address          User
ge-0/0/3.0     Authenticated  00:03:47:e1:ba:b9    aclallow
ge-0/0/5.0     Connecting
ge-0/0/7.0     Connecting
ge-0/0/9.0     Connecting
```

clear captive-portal mac-address

```
user@switch> clear captive-portal mac-address 00:03:47:e1:ba:b9
```

This command has no output.

clear captive-portal firewall

```
user@switch> clear captive-portal firewall
```

This command has no output.

clear dot1x

Syntax **clear dot1x**
(interface (all | [*interface-names*]) | mac-address [*mac-addresses*])

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Reset the authentication state of a port. When you reset a port, reauthentication on the port is also triggered. The switch sends out a multicast message on the port to restart the authentication of all connected supplicants. If a MAC address is reset, then the switch sends out a unicast message to that specific MAC address to restart authentication.

If a supplicant is sending traffic when the **clear dot1x interface** command is issued, the authenticator immediately initiates reauthenticataion. This process happens very quickly, and it may seem that reauthentication did not occur. To verify that reauthentication has happened, issue the operational mode command **show dot1x interface detail**. The value for **Reauthentication due** and **Reauthentication interval** will be about the same.

Options all—(Optional) Clears all ports, or specific ports or specific MAC addresses.

interface *interface-names*—(Optional) Resets the authentication state of all supplicants connected to the specified ports (when the port is an authenticator) or for itself (when the port is a supplicant).

mac-address *mac-addresses*—Resets the authentication state only for the specified MAC addresses.

List of Sample Output **clear dot1x interface on page 2468**
clear dot1x mac-address on page 2468

clear dot1x interface

```
user@switch> clear dot1x interface ge-1/0/0 ge-2/0/0 ge-2/0/0 ge5/0/0]
```

clear dot1x mac-address

```
user@switch> clear dot1x mac—address 00:04:ae:cd:23:5f
```

clear lldp neighbors

Syntax
clear lldp neighbors
<interface *interface*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear the learned remote neighbor information on all or selected interfaces.

Options
none—Clear the remote neighbor information on all interfaces.

interface *interface*—(Optional) Clear the remote neighbor information from one or more selected interfaces.

Required Privilege Level
view

clear lldp statistics

Syntax
clear lldp statistics
<interface *interface*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear LLDP statistics on one or more interfaces.

Options
none—Clears LLDP statistics on all interfaces.

interface *interface-names*—(Optional) Clear LLDP statistics on one or more interfaces.

List of Sample Output **show captive-portal authentication-failed-users on page 2471**

Output Fields Table 305 on page 2471 lists the output fields for the **show captive-portal authentication-failed-users** command. Output fields are listed in the approximate order in which they appear.

Table 305: show captive-portal authentication-failed-users Output Fields

Field Name	Field Description	Level of Output
Interface	The MAC address configured to bypass captive portal authentication.	**all**
MAC address	The MAC address configured statically on the interface.	**all**
User	Name of the user that has failed captive portal authentication.	**all**

show captive-portal authentication-failed-users

```
user@switch> show captive-portal authentication-failed-users

Interface     MAC address          User
ge-0/0/10.0    00:00:00:10:00:02    md5user02
```

show captive-portal firewall

Syntax

show captive-portal firewall
<brief | detail>
<*interface-name*>
<*interface-name* detail>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the firewall filters for each user that is authenticated on each captive portal interface.

Options

none—Display all the firewall filters on all captive portal interfaces.

brief | detail—(Optional) Display the specified level of output.

interface-name—(Optional) Display all the terms of the firewall filters for the specified interface.

interface-name detail—(Optional) Display all of the terms of the firewall filters for the specified interface.

show captive-portal interface

Syntax
show captive-portal interface
<interface-name>
detail

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the current operational state of all captive portal interfaces with the list of connected users and the configured values of captive portal attributes on the interfaces.

Options
none—Display all captive portal interfaces.

interface-name—(Optional) Display the state for the specified captive portal interface and lists the MAC address and user names of any clients authenticated on the interface.

interface-name detail—(Optional) Displays the configured values of captive portal attributes on the specified captive portal interface.

Required Privilege Level
view

Output Fields
Table 306 on page 2474 lists the output fields for the **show captive-portal interface** command. Output fields are listed in the approximate order in which they appear.

Table 306: show captive-portal interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface on which captive portal has been configured.	All levels

Table 306: show captive-portal interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	The state of the interface: • **Authenticated**—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback. • **Authenticating**—The client is authenticating through the RADIUS server. • **Connecting**—Switch is attempting to contact the RADIUS server. • **Initialize**—The interface link is down. • **Held**—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.	All levels
MAC address	The MAC address of the connected client on the interface..	brief
User	Users connected to the captive portal interface.	brief
Supplicant mode	Mode used to authenticate clients—multiple, single, or single-supplicant.	detail
Number of retries	Number of times the user can attempt to submit authentication information.	detail
Quiet period	Time, in seconds, after a user exceeds the maximum number of retries before they can attempt to authenticate.	detail
Configured CP session timeout	Time, in seconds, that a client can be idle before the session expires.	detail
Server timeout	Time, in seconds, that an interface will wait for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.	detail
Number of connected supplicants	Number of users connecting through the captive portal interface. Information for each user includes: • **Supplicant**—User name and MAC address. • **Operational state**—See State (above). • **Dynamic CP session timeout**—Timeout value dynamically downloaded from the RADIUS server for this user, if any. • **CP Session expiration due in**—Time remaining in session.	detail

Output Fields Table 307 on page 2477 lists the output fields for the **show dot1x** command. Output fields are listed in the approximate order in which they appear.

Table 307: show dot1x Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a port.	All levels
MAC address	The MAC address of the connected supplicant on the port.	All levels

Table 307: show dot1x Output Fields *(continued)*

Field Name	Field Description	Level of Output
Role	The 802.1X authentication role of the interface. When 802.1X is enabled on an interface, the role is **Authenticator**. As **Authenticator**, the interface blocks LAN access until a supplicant is authenticated through 802.1X or MAC RADIUS authentication.	**brief**, **detail**
State	The state of the port: • **Authenticated**—The supplicant has been authenticated through the RADIUS server or has been permitted access through server fail fallback. • **Authenticating**—The supplicant is authenticating through the RADIUS server. • **Held**—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.	**brief**
Administrative state	The administrative state of the port: • **auto**—Traffic is allowed through the port based on the authentication result. (Default) • **force-authorize**—All traffic flows through the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to **dynamic**. • **force-unauthorize**—All traffic drops on the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to **dynamic**.	**detail**
Supplicant	The mode for the supplicant: • **single**—Authenticates only the first supplicant. All other supplicants who connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication. • **single-secure**—Allows only one supplicant to connect to the port. No other supplicant is allowed to connect until the first supplicant logs out. • **multiple**—Allows multiple supplicants to connect to the port. Each supplicant is authenticated individually.	**detail**
Quiet period	The number of seconds the port remains in the wait state following a failed authentication exchange with the supplicant before reattempting the authentication. The default value is 60 seconds. The range is 0 through 65,535 seconds.	**detail**
Transmit period	The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant. The default value is 30 seconds. The range is 1 through 65,535 seconds.	**detail**
MAC radius	MAC RADIUS authentication: • **enabled**—The switch sends an EAPOL request to the connecting host to attempt 802.1X authentication and if the connecting host is unresponsive, the switch tries to authenticate using the MAC address. • **disabled**—The default. The switch will not attempt to authenticate the MAC address of the connecting host.	**detail**

Table 307: show dot1x Output Fields *(continued)*

Field Name	Field Description	Level of Output
MAC radius restrict	The authentication method is restricted to MAC RADIUS only. 802.1X authentication is not enabled.	**detail**
Reauthentication	The reauthentication state: • **disable**—Periodic reauthentication of the client is disabled. • **interval**—Sets the periodic reauthentication time interval. The default value is 3600 seconds. The range is 1 through 65,535 seconds.	**detail**
Supplicant timeout	The number of seconds the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request. The default value is 30 seconds. The range is 1 through 60 seconds.	**detail**
Server timeout	The number of seconds the port waits for a reply when relaying a response from the supplicant to the authentication server before timing out. The default value is 30 seconds. The range is 1 through 60 seconds.	**detail**
Maximum EAPOL requests	The maximum number of retransmission times of an EAPOL request packet to the supplicant before the authentication session times out. The default value is 2. The range is 1 through 10.	**detail**
Number of clients bypassed because of authentication	The number of non-802.1X clients granted access to the LAN by means of static MAC bypass. The following fields are displayed: • **Client**—MAC address of the client. • **vlan** —The name of the VLAN to which the client is connected.	**detail**
Guest VLAN member	The VLAN to which a supplicant is connected when the supplicant is authenticated using a guest VLAN. If a guest VLAN is not configured on the interface, this field displays <**not configured**>.	**detail**
Number of connected supplicants	The number of supplicants connected to a port.	**detail**
Supplicant	The user name and MAC address of the connected supplicant.	**detail**

Table 307: show dot1x Output Fields *(continued)*

Field Name	Field Description	Level of Output
Authentication method	The 802.1X authentication method used for a supplicant: • **Guest VLAN**—A supplicant is connected to the LAN through the guest VLAN. • **MAC Radius**—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected. • **Radius**—A supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. • **Server-fail deny**—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default. • **Server-fail permit**—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server. • **Server-fail use-cache**—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are reauthenticated, but new supplicants are denied LAN access. • **Server-fail VLAN**—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)	**detail**
Authenticated VLAN	The VLAN to which the supplicant is connected.	**detail**
Dynamic filter	User policy filter sent by the RADIUS server.	**detail**
Session Reauth interval	The configured reauthentication interval.	**detail**
Reauthentication due in	The number of seconds in which reauthentication will occur again for the connected supplicant.	**detail**

show dot1x authentication-failed-users

Syntax show dot1x authentication-failed-users

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Displays supplicants (users) that have failed 802.1X authentication.

Required Privilege Level view

```

show dot1x firewall

Syntax show dot1x firewall <interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Displays information about the firewall filters for each user or nonresponsive host that is authenticated on each 802.1X-enabled interface that is configured for multiple supplicants. For example, if the firewall filter is configured with a term for counters, the command shows the count for each user.

Options interface *interface-names*—(Optional) Display information for the specified interface.

Required Privilege Level view

List of Sample Output

show ethernet-switching interfaces on page 2487
show ethernet-switching interfaces ge-0/0/15 brief on page 2488
show ethernet-switching interfaces ge-0/0/2 detail (Blocked by RTG rtggroup) on page 2488
show ethernet-switching interfaces ge-0/0/15 detail (Blocked by STP) on page 2488
show ethernet-switching interfaces ge-0/0/17 detail (Disabled by bpdu-control) on page 2488
show ethernet-switching interfaces detail (C-VLAN to S-VLAN Mapping) on page 2488

Output Fields Table 310 on page 2486 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 310: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	All levels
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**, **summary**
VLAN members	Name of a VLAN.	none, **brief**, **detail**, **summary**
Tag	Number of the 802.1Q-tag.	All levels

Table 310: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tagging	Specifies whether the interface forwards 802.1Q-tagged or untagged traffic.	All levels
Blocking	The forwarding state of the interface: • **unblocked**—Traffic is forwarded on the interface. • **blocked**—Traffic is not being forwarded on the interface. • **Disabled by bpdu control**—The interface is disabled due to receiving BPDUs on a protected interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. • **blocked by RTG**—The specified redundant trunk group is disabled. • **blocked by STP**—The interface is disabled due to a spanning tree protocol error. • **MAC limit exceeded**—The interface is temporarily disabled due to a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **MAC move limit exceeded**—The interface is temporarily disabled due to a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **Storm control in effect**—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.	none, **brief**, **detail**, **summary**
Index	The VLAN index internal to the Junos OS.	**detail**
mapping	The C-VLAN to S-VLAN mapping information: • **dot1q-tunneled**—The interface maps all traffic to the S-VLAN (all-in-one bundling). • **native**—The interface maps untagged and priority tagged packets to the S-VLAN. • **push**—The interface maps packets to a firewall filter to an S-VLAN. • **policy-mapped**—The interface maps packets to a specifically defined S-VLAN. • *integer*—The interface maps packets to the specified S-VLAN.	**detail**

show lldp

Syntax
show lldp
<detail>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol–Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

Options
none—Display LLDP information for all interfaces.

detail—(Optional) Display detailed LLDP information for all interfaces.

Required Privilege Level
view

Related Documentation

List of Sample Output
show lldp on page 2492
show lldp (detail) on page 2492

Output Fields
Table 311 on page 2489 lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 311: show lldp Output Fields

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be **enabled** or **disabled**. NOTE: If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as **disabled**.	All levels
Advertisement interval	Frequency, in seconds, at which LLDP advertisements are sent. This value is set by the **advertisement-interval** configuration statement.	All levels
Transmit delay	Delay between two successive LLDP advertisements. The delay is set to 2 seconds.	All levels
Hold timer	Multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded. This value is set by the **hold-multiplier** configuration statement.	All levels

Table 311: show lldp Output Fields *(continued)*

Field Name	Field Description	Level of Output
Notification interval	How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications of database changes are disabled. This value is set by the **lldp-configuration-notification-interval** configuration statement.	All levels
Config Trap Interval	How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications of topology changes are disabled. This value is set by the **ptopo-configuration-trap-interval** configuration statement.	All levels
Connection Hold timer	Amount of time the system maintains dynamic topology entries. This value is set by the **ptopo-configuration-maximum-hold-time** configuration statement.	All levels
LLDP-MED	LLDP-MED operating state. The state can be **enabled** or **disabled**.	All levels
LLDP-MED fast start count	Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second. This value is set by the **fast-start** configuration statement.	All levels
Interface	Name of the interface for which LLDP configuration information is being reported.	All levels
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.	All levels
LLDP	LLDP operating state. The state can be **enabled** or **disabled**.	All levels
LLDP-MED	LLDP–MED operating state. The state can be **enabled** or **disabled**.	All levels
Neighbor count	Total number of new LLDP neighbors detected since the last switch reboot.	**detail**
Interface	Name of the interface that is advertising VLAN information.	All levels
Vlan-id	VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.	**detail**
Vlan-name	VLAN name associated with the VLAN ID.	**detail**

Table 311: show lldp Output Fields *(continued)*

Field Name	Field Description	Level of Output
LLDP basic TLVs supported	Basic TLVs supported on the switch: • **Chassis identifier**—TLV that advertises the MAC address associated with the local system. • **Port identifier**—TLV that advertises the port identification for the specified port in the local system. • **Port description**—TLV that advertises the user-configured port description. • **System name**—TLV that advertises the user-configured name of the local system. • **System description**—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable. • **System capabilities**—TLV that advertises the primary functions performed by the system—for example, bridge or router. • **Management address**—TLV that advertises the IP management address of the local system.	**detail**
Supported LLDP 802 TLVs	802.3 TLVs supported on the switch: • **Power via MDI**—TLV that advertises MDI power support, PSE power pair, and power class information. • **Link aggregation**—TLV that advertises if the interface is aggregated and its aggregated interface ID. • **Maximum frame size**—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames. • **Port VLAN tag**—TLV that advertises the VLAN tag configured on the interface. • **Port VLAN name**—TLV that advertises the VLAN name configured on the interface.	**detail**

Supported LLDP MED TLVs	LLDP-MED TLVs supported on the switch:
	• **LLDP MED capabilities**—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15:
	  ◦ **0**—Capabilities
	  ◦ **1**—Network Policy
	  ◦ **2**—Location Identification
	  ◦ **3**—Extended Power via MDI-PSE
	  ◦ **4**—Inventory
	  ◦ **5–15**—Reserved
	• **Network policy**—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points.
	• **Endpoint location**—TLV that advertises the physical location of the endpoint.
	• **Extended power Via MDI**—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

Output Fields Table 312 on page 2493 lists the output fields for the **show lldp local-information** command. Output fields are listed in the approximate order in which they appear.

Table 312: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information about the local system (the switch): • **Chassis ID**—MAC address associated with the switch. • **System name**—User-configured name of the switch. • **System descr**—System description containing information about the switch model and the current software image running on the switch. This information is taken from the software and is not configurable.
System Capabilities	Capabilities (such as **bridge** or **router**) that are supported or enabled on the system.
Management Information	Details of the management information: **Port Name**, **Port Address** (such as **10.204.34.35**), **Address Type** (such as **ipv4** or **ipv6**), **Port ID** (SNMP interface index), **Subtype**, and **Interface Subtype**.
Interface Name	Name of the local interface.
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the local interface belongs.
Interface ID	SNMP interface index.
Interface description	User-configured port description.
Status	Administrative status of the interface: either **up** or **down**.
Tunneling	Status of tunneling on the interface: either **enabled** or **disabled**.

```

show lldp neighbors

Syntax

show lldp neighbors
<interface *interface*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the information about neighboring devices learned by the switch by using the Link Layer Discovery Protocol (LLDP).

Options

none—Display LLDP neighbor information for all interfaces.

interface *interface*—(Optional) Display LLDP neighbor information for a selected interface.

Required Privilege Level

view

List of Sample Output

show lldp neighbors on page 2497
show lldp neighbors interface xe-3/0/4.0 on page 2497
show lldp neighbors interface (for a VoIP Avaya Telephone with LLDP-MED Support) on page 2498

Output Fields

Table 313 on page 2495 lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 313: show lldp neighbors Output Fields

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.
Chassis ID	List of chassis identifiers for neighbors.
Port info	List of port information gathered from neighbors. This could be the port identifier or port description.
System name	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both the local system (the switch) and a neighbor system on the interface (appears when the **interface** option is used).
Local Information	Information about the local system (appears when the **interface** option is used).
Index	Local interface index (appears when the **interface** option is used).

Table 313: show lldp neighbors Output Fields *(continued)*

Field Name	Field Description
Time mark	Date and timestamp of information (appears when the **interface** option is used).
Time to live	Number of seconds for which this information is valid (appears when the **interface** option is used).
Local Interface	Name of the local physical interface (appears when the **interface** option is used).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the **interface** option is used).
Local Port ID	Local interface SNMP index (appears when the interface option is used).
Ageout Count	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the interface option is used).
Neighbor Information	Information about a neighbor system on the interface (appears when the **interface** option is used).
Chassis type	Type of chassis identifier supplied, such as **MAC address** (appears when the **interface** option is used).
Chassis ID	Chassis identifier of the chassis type listed (appears when the **interface** option is used).
Port type	Type of port identifier supplied, such as **locally assigned** (appears when the **interface** option is used).
Port ID	Port identifier of the port type listed (appears when the **interface** option is used).
Port description	Port description (appears when the **interface** option is used).
System name	Name supplied by the system on the interface (appears when the **interface** option is used).
System Description	Description supplied by the system on the interface (appears when the **interface** option is used).
System capabilities	Capabilities (such as **Bridge**, **Router**, and **Telephone**) that are supported or enabled by the system on the interface (appears when the **interface** option is used).
Management Info	Details of management information: **Address Type** (such as **ipv4** or **ipv6**), **Address** (such as **10.204.34.35**), **Port ID**, **Subtype**, **Interface Subtype**, and organization identifier (**OID**) (appears when the **interface** option is used).

Table 313: show lldp neighbors Output Fields *(continued)*

Field Name	Field Description
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details may include: **Media endpoint class** (such as Class 3 for communication devices such as IP phones), **MED Hardware revision**, **MED Firmware revision**, **MED Software revision**, **MED Serial number**, **MED Manufacturer name**, **MED Model name**.
Organization Info	One or more entries listing remote information by organizationally unique identifier (**OUI**), **Subtype**, **Index**, and **Info** (appears when the **interface** option is used).

List of Sample Output **show lldp remote-global-statistics on page 2502**

Output Fields Table 314 on page 2501 describes the output fields for the **show lldp remote-global-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 314: show lldp remote-global-statistics Output Fields

Field Name	Field Description
LLDP Remote Database Table Counters	Information about remote database table counters.
LastchangeTime	Time elapsed between LLDP agent startup and the last change to the remote database table information.
Inserts	Number of insertions made in the remote database table.
Deletes	Number of deletions made in the remote database table.
Drops	Number of LLDP frames dropped from the remote database table because of errors.
Ageouts	Number of remote database table entries that have aged out of the table.

show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
user@host> show lldp remote-global-statistics
   LLDP Remote Database Table Counters
   LastchangeTime          Inserts    Deletes    Drops    Ageouts
   00:00:76 (76 sec)       192        0          0        0
```

show lldp statistics

Syntax **show lldp statistics**
<interface *interface*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display LLDP statistics for all interfaces or for the specified interface.

Options none—Display LLDP statistics for all interfaces.

interface *interface*—(Optional) Display LLDP statistics for the specified interface.

Required Privilege Level view

show lldp statistics interface xe-3/0/0.0 on page 2504

Output Fields Table 315 on page 2503 lists the output fields for the **show lldp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 315: show lldp statistics Output Fields

Field Name	Field Description
Interface	Name of the interface.
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs. NOTE: Because LLDP packets are transmitted and received on member interfaces only, statistics are available only for the member interfaces, not for the aggregated interface.
Received	Total number of LLDP frames received on an interface.
Unknown TLVs	Number of unrecognized LLDP TLVs received on an interface.
With Errors	Number of invalid LLDP TLVs received on an interface.
Discarded	Number of LLDP TLVs received and then discarded on an interface.
Transmitted	Total number of LLDP frames that were transmitted on an interface.
Untransmitted	Total number of LLDP frames that were untransmitted on an interface.

- **accounting-stop-on-access-deny on page 2374**
- Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 2339

List of Sample Output **show network-access aaa statistics accounting on page 2505**

Output Fields Table 316 on page 2505 lists the output fields for the **show network-access aaa statistics accounting** command. Output fields are listed in the approximate order in which they appear.

Table 316: show network-access aaa statistics accounting Output Fields

Field Name	Field Description
Requests received	The number of accounting-request packets sent from a switch to a RADIUS accounting server.
Accounting Response failures	The number of accounting-response failure packets sent from the RADIUS accounting server to the switch.
Accounting Response Success	The number of accounting-response success packets sent from the RADIUS accounting server to the switch.
Requests timedout	The number of requests-timedout packets sent from the RADIUS accounting server to the switch.

show network-access aaa statistics accounting

```
user@switch> show network-access aaa statistics accounting
Accounting module statistics
  Requests received: 1
  Accounting Response failures: 0
  Accounting Response Success: 1
  Requests timedout: 0
```

show network-access aaa statistics authentication

Syntax **show network-access aaa statistics authentication**

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display authentication, authorization, and accounting (AAA) authentication statistics.

Required Privilege Level view

List of Sample Output **show network-access aaa statistics authentication on page 2507**

Output Fields Table 318 on page 2507 lists the output fields for the **show network-access aaa statistics dynamic-requests** command. Output fields are listed in the approximate order in which they appear.

Table 318: show network-access aaa statistics dynamic-requests Output Fields

Field Name	Field Description
Requests received	The number of dynamic requests received by the RADIUS server.
Processed successfully	The number of dynamic requests successfully processed by the RADIUS server.
Errors during processing	The number of errors that occurred while the RADIUS server was processing the dynamic request.
Silently dropped	The number of silently dropped requests.

show network-access aaa statistics authentication

```
user@switch> show network-access aaa statistics dynamic-requests
Dynamic-requests module statistics
  Requests received: 0
  Processed successfully: 0
  Errors during processing: 0
  Silently dropped: 0
```

PART 18

Rate Limiting

CHAPTER 87

Rate Limiting Overview

Understanding Storm Control on J-EX Series Switches

A traffic storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. Storm control enables the switch to monitor traffic levels and to drop broadcast and unknown unicast packets when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading the LAN. As an alternative to having the switch drop packets, you can configure it to shut down interfaces or temporarily disable interfaces (see the **action-shutdown** statement or the **port-error-disable** statement) when the storm control level is exceeded.

The factory default configuration enables storm control on all switch interfaces, with the storm control level set to 80 percent of the combined broadcast and unknown unicast streams. You can change the storm control level for an interface by specifying a bandwidth value for the combined broadcast and unknown unicast traffic streams. You can also selectively disable storm control on the broadcast stream or on the unknown unicast stream.

Broadcast, multicast, and unicast packets are part of normal LAN operation, so to recognize a storm, you must be able to identify when traffic has reached a level that is abnormal for your LAN. Suspect a storm when operations begin timing out and network response times slow down. As more packets flood the LAN, network users might be unable to access servers or e-mail.

Monitor the level of broadcast and unknown unicast traffic in the LAN when it is operating normally. Use this data as a benchmark to determine when traffic levels are too high. Then configure storm control to set the level at which you want to drop broadcast traffic, unknown unicast traffic, or both.

NOTE: When you configure storm control bandwidth on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control bandwidth of 15000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30000 Kbps of combined broadcast and unknown unicast traffic.

Understanding Unknown Unicast Forwarding on J-EX Series Switches

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward and unknown unicast traffic to a specific trunk interface. This channels the unknown unicast traffic to a single interface.

CHAPTER 88

Example: Rate Limiting Configuration

Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on the J-EX Series switch to rate limit broadcast traffic and unknown unicast traffic at a specified level and to drop packets when the specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN.

This example shows how to configure storm control on a single J-EX Series switch:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch

Overview and Topology

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the storm control level, of broadcast traffic and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second of the combined broadcast and unknown unicast streams.

NOTE: The factory default configuration enables storm control on all interfaces at 80 percent of the combined broadcast and unknown unicast streams.

Storm control monitors the incoming broadcast traffic and unknown unicast traffic and compares it with the level that you specify. If broadcast traffic and unknown unicast traffic exceed the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure it to shut down interfaces or temporarily disable interfaces (see the**action-shutdown** statement or the **port-error-disable** statement) when the storm control level is exceeded.

The topology used in this example consists of one J-EX Series switch with 24 ports. The switch is connected to various network devices. This example shows how to configure the storm control level on interface **ge-0/0/0** by setting the level to a traffic rate of 15000 Kbps, based on the traffic rate of the combined broadcast and unknown unicast streams. If broadcast traffic and unknown unicast traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

Configuration

CLI Quick Configuration

To quickly configure storm control based on the traffic rate in kilobits per second of the combined broadcast and unknown unicast streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set ethernet-switching-options storm-control interface ge-0/0/0 bandwidth 15000
```

Step-by-Step Procedure

To configure storm control:

1. Specify the traffic rate in kilobits per second of the combined broadcast and unknown unicast streams on a specific interface:

```
[edit ethernet-switching-options]
user@switch# set storm-control interface ge-0/0/0 bandwidth 15000
```

Results

Display the results of the configuration:

```
[edit ethernet-switching-options]
user@switch# show storm-control
interface ge-0/0/0.0 {
   bandwidth 15000;
}
```

CHAPTER 89

Configuring Rate Limiting

Configuring Unknown Unicast Forwarding (CLI Procedure)

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific trunk interface. From there, the destination MAC address can be learned and added to the Ethernet switching table. You can configure each VLAN to divert unknown unicast traffic to different trunk interfaces or use one trunk interface for multiple VLANs.

To configure unknown unicast forwarding options using the CLI:

NOTE: Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

1. Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is **employee**):

```
[edit ethernet-switching-options]
user@switch# set unknown-unicast-forwarding vlan employee
```

2. Specify the trunk interface to which all unknown unicast traffic will be forwarded:

```
[edit ethernet-switching-options ]
user@switch# set unknown-unicast-forwarding vlan employee interface ge-0/0/3.0
```

Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

An Ethernet switching access interface on a J-EX Series switch might shut down or be disabled as a result of one of the following port-security or storm-control configurations:

- MAC limiting—**mac-limit** statement is configured with action **shutdown**.
- MAC move limiting—**mac-move-limit** statement is configured with action **shutdown**.
- Storm control—**storm-control** statement is configured with the action **shutdown**.

You can configure the switch to automatically restore the disabled interfaces to service after a specified period of time. Autorecovery applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

NOTE: You must specify the disable timeout value for the interfaces to recover automatically. There is no default disable timeout. If you do not specify a timeout value, you need to use the clear ethernet-switching port-error command to clear the errors and restore the interfaces or the specified interface to service.

To configure autorecovery from the disabled state due to MAC limiting, MAC move limiting, or storm control shutdown actions:

```
[edit ethernet-switching-options]
user@switch# set port-error-disable disable-timeout 60
```

CHAPTER 90

Verifying Rate Limiting Configuration

Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface

Purpose Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single trunk interface instead of flooding unknown unicast packets across all interfaces that are members of the same VLAN.

Action Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is **v1**):

```
user@switch> show configuration ethernet-switching-options

unknown-unicast-forwarding {
    vlan v1 {
        interface ge-0/0/7.0;
    }
}
```

Display the Ethernet switching table:

```
user@switch> show ethernet-switching table vlan v1
Ethernet-switching table: 3 unicast entries
  VLAN              MAC address       Type         Age Interfaces
  v1                *                 Flood          - All-members
  v1                00:01:09:00:00:00 Learn         24 ge-0/0/7.0
  v1                00:11:09:00:01:00 Learn         37 ge-0/0/3.0
```

Meaning The sample output from the **show configuration ethernet-switching-options** command shows that the unknown unicast forwarding interface for VLAN **v1** is interface **ge-0/0/7**. The **show ethernet-switching table** command shows that an unknown unicast packet is received on interface **ge-0/0/3** with the destination MAC address (DMAC) **00:01:09:00:00:00** and the source MAC address (SMAC) of **00:11:09:00:01:00**. This shows that the SMAC of the packet is learned in the normal way (through the interface **ge-0/0/3.0**), while the DMAC is learned on interface **ge-0/0/7**.

Related Documentation

- Configuring Unknown Unicast Forwarding (CLI Procedure) on page 2515

Verifying That the Port Error Disable Setting Is Working Correctly

Purpose Verify that the port error disable setting is working as expected on MAC limited, MAC move limited and rate-limited interfaces on a J-EX Series switch.

Action Display information about interfaces:

```
user@switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  up       T1122                  unblocked
ge-0/0/1.0  down     default                MAC limit exceeded
ge-0/0/2.0  down     default                MAC move limit exceeded
ge-0/0/3.0  down     default                Storm control in effect
ge-0/0/4.0  down     default                unblocked
ge-0/0/5.0  down     default                unblocked
ge-0/0/6.0  down     default                unblocked
ge-0/0/7.0  down     default                unblocked
ge-0/0/8.0  down     default                unblocked
ge-0/0/9.0  up       T111                   unblocked
ge-0/0/10.0 down     default                unblocked
ge-0/0/11.0 down     default                unblocked
ge-0/0/12.0 down     default                unblocked
ge-0/0/13.0 down     default                unblocked
ge-0/0/14.0 down     default                unblocked
ge-0/0/15.0 down     default                unblocked
ge-0/0/16.0 down     default                unblocked
ge-0/0/17.0 down     default                unblocked
ge-0/0/18.0 down     default                unblocked
ge-0/0/19.0 up       T111                   unblocked
ge-0/1/0.0  down     default                unblocked
ge-0/1/1.0  down     default                unblocked
ge-0/1/2.0  down     default                unblocked
ge-0/1/3.0  down     default                unblocked
```

Meaning The sample output from the **show ethernet-switching interfaces** command shows that three of the down interfaces specify the reason that the interface is disabled:

- **MAC limit exceeded**—The interface is temporarily disabled due to a **mac-limit** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.
- **MAC move limit exceeded**—The interface is temporarily disabled due to a **mac-move-limit** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.
- **Storm control in efffect** —The interface is temporarily disabled due to a **storm-control** error. The disabled interface is automatically restored to service when the **disable-timeout** expires.

action-shutdown

Syntax action-shutdown;

Hierarchy Level [edit **ethernet-switching-options storm-control**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Shut down or disable interfaces when the storm control level is exceeded, as follows:

- If you set both the **action-shutdown** and the **port-error-disable** statements, the interfaces are disabled temporarily and recover automatically when the disable timeout expires.
- If you set the **action-shutdown** statement and do not the specify the **port-error-disable** statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. You must issue the **clear ethernet-switching port-error** command to clear the port error and restore the interfaces to service.

Default The **action-shutdown** option is not enabled. When the storm control level is exceeded, the switch drops unknown unicast and broadcast messages on the specified interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

bandwidth

Syntax bandwidth *bandwidth*;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the storm control level as the bandwidth in kilobits per second of the combined broadcast and unknown unicast streams.

NOTE: When you configure storm control bandwidth on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control bandwidth of 15000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30000 Kbps of combined broadcast and unknown unicast traffic.

Default If you omit the **bandwidth** statement when you configure storm control on an interface, the storm control level defaults to 80 percent of the combined broadcast and unknown unicast streams.

Options **bandwidth**—Traffic rate in kilobits per second of the combined broadcast and unknown unicast streams.

Range: 100 through 10000000

Default: None

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 2513
- Understanding Storm Control on J-EX Series Switches on page 2511

disable-timeout

Syntax disable-timeout *timeout*;

Hierarchy Level [edit **ethernet-switching-options port-error-disable**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify how long the Ethernet-switching interfaces remain in a disabled state due to the MAC limiting, MAC move liming, or storm control errors.

Default The disable timeout is not enabled.

Options ***timeout*** —Amount of time, in seconds, that the disabled state remains in effect. The disabled interface is automatically restored to service when the specified timeout is reached.

Range: 10 through 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

          network-control>;
      }
    }
  }
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Ethernet switching options.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

interface

Syntax

```
interface (all | interface-name) {
    bandwidth bandwidth;
    no-broadcast;
    no-unknown-unicast;
}
```

Hierarchy Level [edit ethernet-switching-options storm-control]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable and configure storm control on all interfaces or on the specified interface.

If you do not include the **bandwidth** statement, the storm control level defaults to 80 percent of the combined broadcast and unknown unicast streams.

Default The factory default configuration enables storm control on all switch interfaces at the default level of 80 percent of the combined broadcast and unknown unicast streams.

Options **all**—All interfaces. The storm control settings configured with the **all** option affect only those interfaces that have not been individually configured for storm control.

interface-name—Name of an interface. The storm control settings configured with the ***interface-name*** option override any settings configured with the **all** option.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface

Syntax interface *interface-name*;

Hierarchy Level [edit **ethernet-switching-options unknown-unicast-forwarding vlan**(all|*vlan-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the interface to which unknown unicast packets will be forwarded.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show vlans on page 1263**
- **show ethernet-switching table on page 1249**

- Understanding Unknown Unicast Forwarding on J-EX Series Switches on page 2512

no-broadcast

Syntax no-broadcast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable storm control for broadcast traffic for the specified interface or for all interaces.

Default Storm control is enabled for both unknown unicast traffic and broadcast traffic.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 2513
- Understanding Storm Control on J-EX Series Switches on page 2511

no-unknown-unicast

Syntax no-unknown-unicast;

Hierarchy Level [edit **ethernet-switching-options storm-control interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable storm control for unknown unicast traffic for the specified interface or for all interfaces.

Default Storm control is enabled for both unknown unicast traffic and broadcast traffic.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding Storm Control on J-EX Series Switches on page 2511

port-error-disable

Syntax

```
port-error-disable {
  disable-timeout timeout ;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, and rate-limiting configuration options for shutting down the interface; and allow the interface to recovery automatically from the error condition after a specified period of time:

NOTE: The **port-error-disable** configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after **port-error-disable** has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the clear ethernet-switching port-error command.

- If you have enabled **mac-limit** with the **shutdown** option and enable **port-error-disable**, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.
- If you have enabled **mac-move-limit** with the **shutdown** option and you enable **port-error-disable**, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.
- If you have enabled **storm-control** with the **action-shutdown** option and you enable **port-error-disable**, the switch disables (rather than shuts down) the interface when broadcast traffic and unknown unicast traffic exceeds the specified levels.

Default Not enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

storm-control

Syntax

```
storm-control {
  action-shutdown;
  interface (all | interface-name) {
    bandwidth bandwidth;
    no-broadcast;
    no-unknown-unicast;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure storm control on the switch.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Storm Control to Prevent Network Outages on J-EX Series Switches on page 2513

unknown-unicast-forwarding

Syntax

```
unknown-unicast-forwarding {
  vlan (all | vlan-name){
    interface interface-name;
  }
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the switch to forward all unknown unicast packets in a VLAN or on all VLANs to a particular interface.

NOTE: Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

The remaining statements are explained separately.

Default Unknown unicast packets are flooded to all interfaces that belong to the same VLAN.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

vlan

Syntax

```
vlan (all | vlan-name) {
  interface interface-name;
}
```

Hierarchy Level [edit **ethernet-switching-options unknown-unicast-forwarding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a VLAN from which unknown unicast packets will be forwarded or specify that the packets will be forwarded from all VLANS. Unknown unicast packets are forwarded from a VLAN to a specific trunk interface.

The **interface** statement is explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options all—All VLANs.

vlan-name—Name of a VLAN.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

CHAPTER 92

Operational Mode Commands for Rate Limiting

show ethernet-switching interfaces

Syntax show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about switched Ethernet interfaces.

Options none—(Optional) Display brief information for Ethernet switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet switching information for a specific interface.

Required Privilege Level view

List of Sample Output

show ethernet-switching interfaces on page 2537
show ethernet-switching interfaces ge-0/0/15 brief on page 2538
show ethernet-switching interfaces ge-0/0/2 detail (Blocked by RTG rtggroup) on page 2538
show ethernet-switching interfaces ge-0/0/15 detail (Blocked by STP) on page 2538
show ethernet-switching interfaces ge-0/0/17 detail (Disabled by bpdu-control) on page 2538
show ethernet-switching interfaces detail (C-VLAN to S-VLAN Mapping) on page 2538

Output Fields Table 319 on page 2536 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 319: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	All levels
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**, **summary**
VLAN members	Name of a VLAN.	none, **brief**, **detail**, **summary**
Tag	Number of the 802.1Q-tag.	All levels

Table 319: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tagging	Specifies whether the interface forwards 802.1Q-tagged or untagged traffic.	All levels
